YYYYYYYYYYYYYYY-YYYY-Y00-90-0000-00AAA-681B-A (37 characters)

## 2.1.4 Identification of damaged hardware

These data modules (information code 682) provide a precise identification of damaged hardware (structure, system, harness) and a reference to a data module that provides damage assessment data.

This heading provides data and information to identify:

- product frame zones
- product frame systems
- engine assemblies and/or modules
- product frame and engine components
- product frame and engine wiring harnesses

### 2.1.4.1 Identification of product frame zones

Data modules must be provided showing the zoning arrangement and giving the zone numbers of the Product depending on the configuration, if applicable. Related tables in each of these data modules give the zone identifier (description) and the data module code for more information on the single zones. Refer to [Chap 3.9.5.2.11.4](#).

ICN-S3627-S1000D0357-001-01  
 Fig 2 Identification of air vehicle system frame zones - Example

Table 2 Identification of zones

Zone No.	Description	Data module
21	Left main landing gear compartment	YY-A-00-90-00-21A-682A-A
22	Right main landing gear compartment	YY-A-00-90-00-22A-682A-A
23	Center fuselage	YY-A-00-90-00-23A-682A-A
24	Left fuselage	YY-A-00-90-00-24A-682A-A
25	Right fuselage	YY-A-00-90-00-25A-682A-A
26	Upper fuselage	YY-A-00-90-00-26A-682A-A
...		

Data modules must be coded:

YY-Y-00-90-00-00A-682A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-90-0000-00AAA-682A-A (37 characters)

where "A" or "AAA", in the disassembly code variant, can be used to provide different data modules depending on the product configuration

#### 2.1.4.2

Identification of product frame systems

Separate data modules must be provided for each zone. Each data module contains the data module code for description of significant structure in this zone. A related table contains for each zone, its zone number, its description and the data module code for identification of systems in this zone. Refer to [Chap 3.9.5.2.11.4](#).

Table 3 Identification of systems

Zone 21 - Left main landing gear compartment		
System	Applicable	Data module
Landing gear system and arrester hook	X	YY-A-00-90-YY-SSA-682A-A

Oxygen system		
Escape system and canopy		
Interphone and communications system		

Applicable to: All

S1000D-A-05-02-0114-00A-040A-A

Chap 5.2.1.14

---

**Zone 21 - Left main landing gear compartment**

---

System	Applicable	Data module
Defensive aids system		
Miscellaneous utilities	X	YY-A-00-90-YY-SSA-682A-A
...		

---

Data modules must be coded:

YY-Y-00-90-00-**SSA**-682A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-90-0000-**SSAAA**-682A-A (37 characters)

#### 2.1.4.3

Identification of engine assemblies and/or modules

Data modules must be provided consisting of a three-quarter front view illustration showing the engine assemblies/modules depending on the engine configuration, if applicable. An illustration in each of these data modules gives the assembly/module number, its identification and the data module code where the damage assessment data of the given hardware is provided. Refer to [Chap 3.9.5.2.11.4](#).

Data modules must be coded:

YY-Y-72-00-00-00**A**-682A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y72-00-0000-00**AAA**-682A-A (37 characters)

where "A" or "AAA", in the disassembly code variant, can be used to provide different data modules depending on the product configuration

ICN-S3627-S1000D0358-001-01

Fig 3 Identification of engine assemblies/modules - Example

## 2.1.4.4

## Identification of components

Illustrations must show all the components identified by an item number according to their location on the product frame or the engine. A location view indicates, as required, the area of the product frame or the engine subject to the illustration.

A related table must provide for each component (example only):

- Name
- Data module code providing the damage assessment data
- The presence, if any, of a power supply to the component
- The system to which it is related

The last two items are used to support and confirm the recognition of the component itself.

*Table 4 Identification of components - Example*

Item No.	Name	Data module applicable to the main system	Related systems
1	AB Fuel pump	YY-A-73-13-01-00A-684A-A	O
2	Oil cooler	YY-A-79-24-01-00A-684A-A	F
3	AB overload SV	YY-A-73-13-03-00A-684A-A	E
4	AB Fuel filter	YY-A-73-13-02-00A-684A-A	D
5	Secondary oil filter	YY-A-79-22-02-00A-684A-A	
6	Emergency regulation electrical actuator	YY-A-73-12-04-00A-684A-A	E
7	Oil pressure switch	YY-A-79-23-01-00A-684A-A	E
8	Main oil filter	YY-A-79-22-01-00A-684A-A	
9	Tacho-generator	YY-A-74-11-01-00A-684A-A	
10	Accessory support	YY-A-79-21-01-00A-684A-A	A D
11	HP oil pump	YY-A-79-21-02-00A-684A-A	
12	Oil distributor	YY-A-79-21-03-00A-684A-A	
13	N stop corrector	YY-A-75-31-01-00A-684A-A	
14	6 bar starting SV	YY-A-73-21-04-00A-684A-A	E
15	80 bar by-pass SV	YY-A-73-21-07-00A-684A-A	E
16	Main pressuring and dump valve	YY-A-73-11-05-00A-684A-A	D
17	Overboard drain valve	YY-A-73-12-06-00A-684A-A	D
18	HV Ignition box	YY-A-74-11-01-00A-684A-A	
19	AB Ignition SV	YY-A-73-13-02-00A-684A-A	E
20	Oil de-aerator	YY-A-79-21-11-00A-684A-A	
21	Main fuel pump	YY-A-73-11-01-00A-684A-A	
22	Oil pressure filling adapter	YY-A-79-21-09-00A-684A-A	D

Item No.	Name	Data module applicable to the main system	Related systems
23	Drain valve (Combustion chamber)	YY-A-73-31-01-00A-684A-A	D

Key to "Related systems" [Table 4](#):

- E = Electric power
- F = Fuel
- O = Oil
- A = Air
- D = Drain

If a component occurs in more than one system (eg, oil, fuel) the data module code of the damage assessment must be given in the table for one of them (eg, fuel system). The relation with the other systems must be indicated with a key in the table.

Data modules for the product frame must be coded:

YY-Y-00-90-YY-00A-682A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-90-YY00-00AAA-682A-A (37 characters)

where "YY" corresponds to the system as defined in the SNS used for the Product

Data modules for the engine must be coded:

YY-Y-YY-YY-YY-00A-682A-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-682A-B (37 characters)

where "YY-YY-YY" or "YYY-YY-YYYY" corresponds to the SNS used for the Product

ICN-S3627-S1000D0359-001-01

Fig 4 Identification of engine components - Example

ICN-S3627-S1000D0360-001-01

Fig 5 Identification of air vehicle system frame components - Example

Applicable to: All

S1000D-A-05-02-0114-00A-040A-A

Chap 5.2.1.14

#### 2.1.4.5 Identification of wiring harnesses

These data modules contain:

- the principle and standard procedures to identify harnesses
- information necessary to identify harnesses, their bundles and connectors

##### Note

If the principle and standard procedures described under this heading are available in an existing general BDR publication, BDR procedures must refer to the relevant data modules contained in the general BDR publication.

##### 2.1.4.5.1 Identification

The number of illustrations required will be dependent on the given harness. For example:

- Harness and its attachments mounted on the hardware. Refer to [Fig 6](#).
- Description of the harness components. Refer to [Chap 3.9.5.2.9.3](#).
- Schematic diagrams (harness, leads, etc)

Data modules must be coded:

YY-Y-YY-YY-YY-00A-682A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-682A-A (37 characters)

where "YY-YY-YY" or "YYY-YY-YYYY" corresponds to the SNS used for the Product

##### 2.1.4.5.2 Identification principle

As electrical circuits are complicated, it is recommended to provide, as an identification principle, the method of identifying the wiring from the detected damaged area (eg, the routing, splits, the components reached).

Illustrations and/or diagrams must describe the identification principle.

Data modules must be coded:

YY-Y-YY-YY-YY-00A-682A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-682A-A (37 characters)

where "YY-YY-YY" or "YYY-YY-YYYY" corresponds to the SNS used for the Product

##### 2.1.4.5.3 Standard identification procedures

These data modules provide the general procedures to be applied when identifying a damaged harness in order to:

- prevent possible damage to the component it is connected to
- identify leads by means of continuity measurement

Data modules must be coded:

YY-Y-YY-YY-YY-00A-682A-A (17 characters)

thru

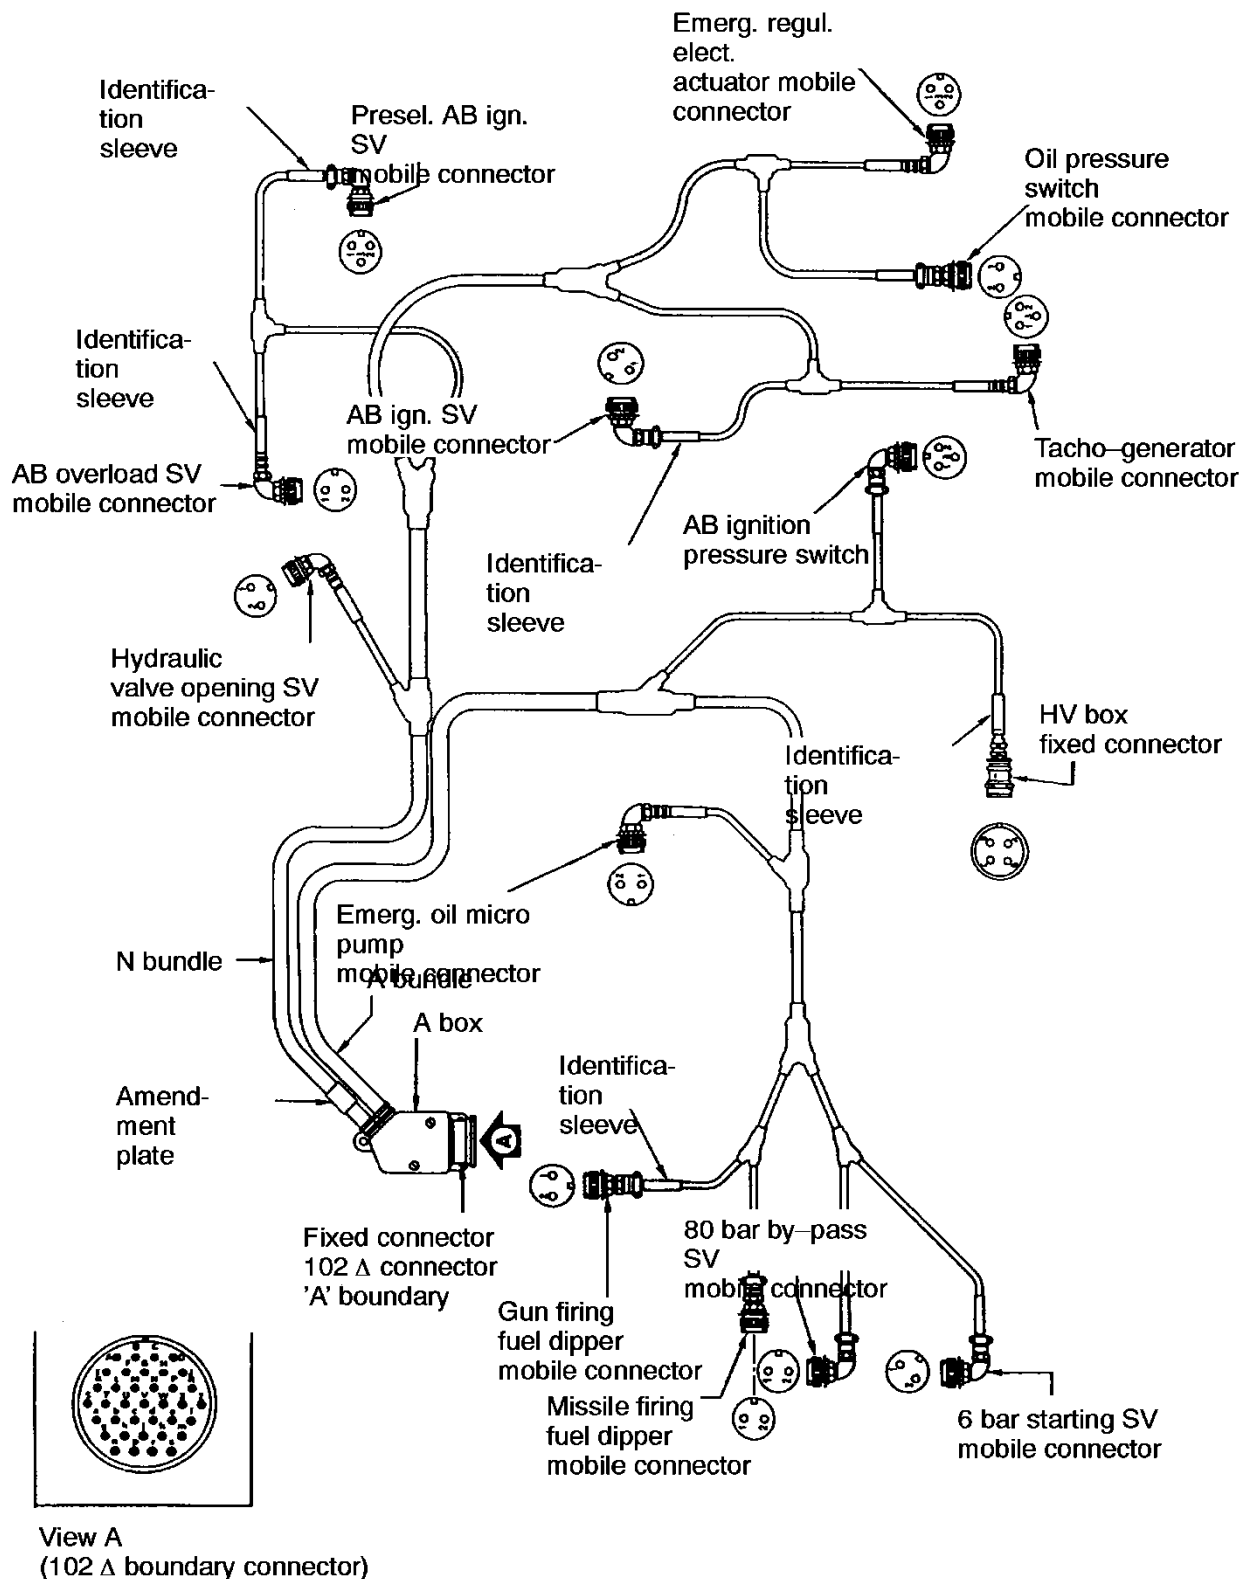

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-682A-A (37 characters)

where "YY-YY-YY" or "YYY-YY-YYYY" corresponds to the SNS used for the Product

## 2.1.5 Damage assessment

### 2.1.5.1 General

These data modules (information code 683) provide, for a damaged and identified item (zone, component, etc), the necessary data and information:

- to establish the effect of the item on the product frame or engine operation
- if the item can be left damaged without repair or isolation
- whether it can be repaired and/or isolated
- for the relevant action that must be applied
- for the consequences of the actions on the product frame or engine utilization (mission, limitation, etc)

#### Note

If the project or the organization decides to create separate data modules for the last listed information, their data module code must follow the rule given in this paragraph, but the information code must be 684 (Utilization degradation). Refer to [Para 2.1.5.3](#).

### 2.1.5.2 Structural damage categories

For assessment purposes structural damages must be given in three categories (refer to [Para 1.3.2](#)):

- Category 1 items must be highlighted (in red if color is useable)
- Category 2 items must be highlighted (in yellow if color is useable)
- Category 3 items are not highlighted (normally shown only for reference)

### 2.1.5.3 Structural damage limits categories

For assessment purposes structural damage limits must be given for penetration, fragmentation and fire and overheat.

#### 2.1.5.3.1 *Structural damage limits, penetration*

The limits for penetration damage must be given in terms of maximum permitted hole diameter and minimum undamaged edge distance.

Where possible, penetration damage limits are shown on an illustration of the structure as a number - in a circle - representing the maximum permitted hole diameter in mm. In cases where the limits for "as received" damage differ from those for "cleaned out" damage (refer to [Para 1.3.2](#)), the "as received" limit must be additionally shown as a number in inverted commas.

Where it is not possible to include the limits on the illustration or when the limits are complex, they must be included in a data list or given as notes.

#### 2.1.5.3.2 *Structural damage limits, fragmentation*

The limits for fragmentation damage must be given in terms of maximum permitted diameter of the damage area, maximum diameter of any hole, maximum number of holes in the damaged area and minimum undamaged edge distance. Where the limits for "as received" damage differ from those for "cleaned out" damage, this must be stated.

#### 2.1.5.3.3 *Structural damage limits, fire and overheat*

The limits for fire and overheat damage must be given in terms of critical temperature indication (level of temperature), conductivity, ultimate tensile strength and hardness.

### 2.1.5.4 Component function ability

The importance of a component regarding the product frame and engine operation must be given in three categories. Refer to [Para 1.3.2](#).

### 2.1.5.5 Damage assessment of structures

These data modules provide for each zone of the product frame or assembly/module of the engine a list of their significant structures.

This list must contain:

- the identification of the significant structure
- the data module code where its damage assessment data is given. Illustrations support this list as required.

Data modules for the Product must be coded:

YY-Y-00-90-00-**SSA**-683Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-90-0000-**SSAAA**-683Y-A (37 characters)

Data modules for the engine must be coded:

YY-Y-72-**SS**-00-00A-683Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y72-**SS**-0000-00AAA-683Y-A (37 characters)

Tables provide damage assessment data for each significant structure. They must contain:

- its name (M)
- its damage category (M). Refer to [Para 2.1.5.2](#).
- damage limits (M). Refer to [Para 2.1.5.3](#).
- the level of temperature (critical temperature) attained in utilization (O)
- the original material and its alternatives or substitute that can be used in repair and are contained in the BDR kit (O). Refer to [Para 2.1.9](#).
- the data module code (information code 684) where repair ability and/or tolerated damages are provided. If a significant structure cannot be repaired and/or no damage is tolerated, "non-repairable" and/or "no damage tolerated" must be recorded in the table.

Data modules for significant structures must be coded:

YY-Y-**YY-YY-YY-YYY**-683Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-**YYY-YY-YYYY-YYYYY**-683Y-A (37 characters)

where "**YY-YY-YY-YYY**" or "**YYY-YY-YYYY-YYYYY**" corresponds to the coding of the structure as used in the product breakdown

Edge distance between holes 80 mm

ICN-S3627-S1000D0365-001-01

Fig 10 Damage assessment of significant structures - Example

2.1.5.6 Damage assessment of components and parts  
These data modules provide the data and information necessary for:

- assessment of the damage to components and parts of each system (eg, pipes)
- determination of the possible actions to be carried out on each of these items
- evaluation of the effect of these actions on the product frame or engine operation

**Note**

Wiring harnesses are covered in [Para 2.1.5.7](#).

The necessary illustrations with the identification of the items (callout with the item number) must be provided for each system.

Related tables for parts and components containing the following information must be provided:

- 1 Description (for parts)
  - Item number (M)
  - Physical and maximum operational characteristics (O)
- 2 Name (of component)
  - Name (M)
- 3 Repair ability
  - Data module code of the procedure to repair the component. If a component is not repairable then state "Not repairable". (M)
- 4 Function category
  - Category of the component (M). Refer to [Para 2.1.5.4](#).
- 5 Isolation
  - Data module code of the procedure to isolate the component. If isolation is not applicable then state "Not applicable". (M)
- 6 Special operation instruction
  - Particular operation instruction due to repair and/or isolation of a component must be given. If no subsequent limitation occurs then state "No limitation". (M)

**Note**

This last information must not be included in "damage assessment" if the project or the organization decides to create it separately as "degradation data". Refer to [Para 2.1.6](#).

*Table 5 Damage assessment - Example of table for piping*

**Chap 5.2.1.14**

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-683Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-683Y-Z (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYYY" corresponds to the coding of the harness as used in the product breakdown

## 2.1.6 Utilization degradation

The damage assessment (refer to [Para 2.1.5](#)) includes the utilization degradation. However if the project or the organization decides to isolate them, they must be tabulated (information code 684). For each system or component (if data differ between them) the table provides the consequences on the utilization (eg, mission, operating limitations) of the product frame or the engine with the non-repaired damage or following the action done on damaged hardware.

**Business rule decision point BRDP-S1-00434 - Separate data modules for utilization degradation in BDAR information sets:**

- Decide whether to prepare separate data modules for degradation information, or to include this information in the damage assessment data modules.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-684Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-684Y-Z (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYYY" corresponds to the coding of the damaged hardware as used in the product breakdown

## 2.1.7 Repair and isolation procedures

Repair (information code 685) and isolation (information code 686) procedures use the hardware making up the BDR kit. Refer to [Para 2.1.9](#).

The procedures must be broken down as given in the following paragraphs.

### 2.1.7.1 Standard procedures

Standard procedures provide the methods not specific to the product frame or the engine (eg, repair of pipes, wires, normal isolation).

Data modules for repair must be coded:

YY-Y-YY-YY-YY-YYY-685Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-685Y-Z (37 characters)

Data modules for isolation must be coded:

YY-Y-YY-YY-YY-YYY-686Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-686Y-Z (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYYY" corresponds to the coding of the damaged hardware as used in the product breakdown

**Note**

If the content described under this heading is available in an existing general BDR publication, BDR standard procedures must refer to the relevant data modules contained in the general BDR publication.

## 2.1.7.2

**Repair of structures**

These data modules provide the procedures specific to product frame or engine structures, otherwise refer to standard procedures. Refer to [Para 2.1.7.1](#).

Tolerances, if any, must be given in the procedure.

Illustrations must be used wherever possible to describe the procedures. Text is used only to complete the understanding of the illustrations.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-685Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-685Y-A (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYYY" corresponds to the coding of the structure as used in the product breakdown

## 2.1.7.3

**Repair of components and parts**

These data modules provide the procedures specific to the systems (including electrical), otherwise refer to standard procedures. Refer to [Para 2.1.7.1](#).

The procedures must be described step by step. Illustrations support the procedures as required.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-685Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-685Y-A (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYYY" corresponds to the coding of the component or part as used in the product breakdown

## 2.1.7.4

**Isolation of systems and components**

These data modules provide step-by-step procedures to isolate damaged portions of a system or of one of its damaged components.

Illustrations and/or diagrams support the procedures as required.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-686Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-686Y-A (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYYY" corresponds to the coding of the damaged hardware as used in the product breakdown

### 2.1.8 Function test after battle damage repair

Function test after battle damage repair (information code 687) procedures must be given to ensure that repaired systems can fulfill the requirements of the mission. These procedures must be designed to take only a minimum of time. If available, full use must be made of on-board test facilities.

If the isolation or repair involves limitations in operating instructions of the product frame or the engine, it must be noted in the procedure to inform the crew/operator of the limitations.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-687Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-687Y-A (37 characters)

where "YY-YY-YY-YYY" or "YYY-YY-YYYY-YYYYY" corresponds to the coding of the hardware as used in the product breakdown

### 2.1.9 Battle damage repair kit

A list of the hardware contained in the BDR kit (for the definition, refer to [Para 1.3.2](#)) must be provided. Items as shown below are subdivided into:

- support equipment and tools
- materials
- expendables
- consumables

The relevant data to be given for each kind of hardware must be defined by the project or the organization.

Data modules must be coded:

YY-Y-00-90-00-00A-688A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-90-0000-00AAA-688A-A (37 characters)

where "A" or "AAA", in the disassembly code variant, can be used to provide different data modules depending on the product configuration

## 2.2 Generated information

### 2.2.1 General

Generated information is based on and must be prepared from source data stored in the BDARP data modules. The source data can be used to generate this information within a page-oriented BDARP as well as within an interactive BDARP.

Source data are:

- structure items
- system components
- system parts
- harness data
- material data

These source data include all pertinent information that is used for assessment and degradation.

Generated information within an interactive BDARP is described in [Para 2.3](#). Examples of generated information for a page-oriented BDARP such as zone-oriented and/or system-oriented breakdown, mission related breakdown etc, are given below.

Specific projects can have reduced or expanded requirements with regard to the given content of the lists. Generated data are not part of the data exchange. Therefore no data module code is allocated.

#### **2.2.2 Structure item list**

A structure item list must be produced for the material frame or engine based on each assigned zone, in numerical order, providing the following information:

- name
- part number
- zone
- applicability
- damage category
- damage Limit
- material

#### **2.2.3 System part list ordered by zone**

A system part list must be produced for the product frame or the engine based on each effected zone, in system numbering order, providing the following information:

- pipe description
- pipe identification
- pipe diameter
- maximum working temperature
- system breakdown code or Functional item code
- part number
- zone
- applicability
- degradation information
- material

#### **2.2.4 System part list ordered by system**

A system part list must be produced for the product frame or the engine based on each effected system, providing the information as shown in [Para 2.2.3](#).

#### **2.2.5 System component list ordered by zone**

A system component list must be produced for the product frame or the engine based on each effected zone, in system numbering order, providing the following information:

- name
- reference designator
- system breakdown code
- part number
- zone
- applicability
- degradation information

#### **2.2.6 System component list ordered by system**

A system component list must be produced for the product frame or the engine based on each affected system, providing the information as shown in [Para 2.2.5](#).

## 2.3 Interactive BDARP functionalities

The following paragraphs describe the possible functionalities for an interactive BDARP.

### Business rule decision point BRDP-S1-00435 - Interactive BDARP:

- Decide whether to produce an interactive BDARP and define the required functionalities.

### 2.3.1 Assessment protocol function

#### 2.3.1.1 General

During an assessment of the product frame or the engine, important information will be recorded to allow quick decision for further actions required regarding the damaged hardware.

#### 2.3.1.2 Assessment protocol information

The assessment protocol provides information depending on a performed assessment as follows:

- lists all damages for each affected zone
- lists damages (for structure items), which need no repair
- lists damages (for structure items), which cannot be repaired, replacement only
- lists damages (for structure items), which must be repaired, including reference to the required procedure
- lists system part and component information for each affected system

Another list provides degradation information ordered by component function ability and associated mission. Isolation information, special operation instruction and reference to the required function tests must be given.

### 2.3.2 Direct entry

#### 2.3.2.1 System parts and components

The direct entry functionality allows direct access to information about the damaged hardware. If the assessor knows the unique identifier of a damaged hardware, for example the reference designator of a system component, it is not necessary to navigate to the damaged hardware via the normal information access. This is because there is identification of the zone using the zone illustrations, identification of the required system from the associated table to get reference to the system component illustration, identification on the illustration of the damaged component and the associated table and at least get reference to the degradation information.

#### 2.3.2.2 Harnesses

Direct entry of a harness number will show all available information including degradation information to that harness. If the project documentation contains an interactive wiring publication and more information is required (eg, wiring information on the damaged harness), the interactive BDARP can be linked to the interactive wiring publication to provide further detailed information.

### 2.3.3 Context sensitive data presentation

Context sensitive extract of basic information and additional details must be displayed for all generated information and other interactive functionalities.

## Chapter 5.2.1.15

Chap No./Document No.	Title
<a href="#">Chap 5.2.1.5</a>	Common information sets - Illustrated parts data
<a href="#">Chap 5.2.1.9</a>	Common information sets - Equipment information

## **1 General**

### **1.1 Purpose**

The preparation and coding of Illustrated Tool and Equipment (ITE) information data modules must follow the rules contained here.

## 1.2 Scope

It covers the rules for the preparation of information for the identification and use of Support Equipment (SE) and special tools, in the following just called equipment, to:

- maintain and operate on the ground, the air vehicle, land or sea system engine, airborne equipment and nominated assemblies in accordance with the agreed upon maintenance plan
- carryout general functions on the Product, for example, tow, moor, park

### Note

The ITE information set normally contains the equipment for on-air vehicle, land or sea system maintenance but its use can be extended to other levels of maintenance if required by the project.

## 2 Illustrated tool and support equipment information

### 2.1 General requirements

The ITE information set must contain the following types of data modules:

- introduction
- alphanumeric index and lists
- equipment information

### 2.2 Introduction

The introduction data modules contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

An explanation of the presentation of each of the following must be given:

- the alphanumeric index
- how each equipment entry is presented

Where applicable, references can be made to the appropriate equipment information set.

Data modules must be coded:

YY-Y-00-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-00-0000-**NN**AAA-018Y-A (37 characters)

where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed

The information code variant is used to distinguish between the different Information sets.

### 2.3 Alphanumeric index and lists

The index and the lists can be divided in separate data modules for each chapter/system.

Data modules must be coded:

YY-Y-**SS**-00-00-00A-**XXX**A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y**SS**-00-0000-00AAA-**XXX**A-A (37 characters)

where

- "SS" identifies the system of the first or major use of the equipment. When only one data module is used, "SS" must be "00".
- "XXX", the information code:
  - 014 - Alphanumeric index
  - 061 - Special SE and tools
  - 062 - Standard SE and tools
  - 063 - Government supplied SE and tools
  - 064 - Locally made SE and tools

### 2.3.1 Alphanumeric index

The alphanumeric index data module must list all the equipment included in the ITE data modules. The table consists of the following columns. Refer to [Table 2](#):

- 1 Part No.: The part number of the equipment must be as given in the IPD. The arrangement must start with the letters A thru Z followed by the numerals 0 thru 9.
- 2 CAGE code: Identifies the supplier or design authority by its CAGE code
- 3 Name: The name of the equipment as given in the IPD. The identifying noun or keyword must always be first, followed by the necessary adjectives, for example, "Tool, spring compression".
- 4 Used in procedure/data module code: The data module code of the procedure where each equipment is required

### 2.3.2 Support equipment and tools

As a complement to the alphanumeric index one or more of the following support equipment and tools data modules can be included:

- Special SE and tools
- Standard SE and tools
- Government supplied SE and tools
- Locally made SE and tools

The lists are presented with the same table as for the alphabetical index. Refer to [Table 2](#). The examples in [Table 2](#) use 17 character data module coding.

*Table 2 Alphanumeric index - Example of data module E1-A-72-00-00-00A-014A-A*

Part No. (1)	CAGE code (2)	Name (3)	Used in procedure/data module code (4)

Part No. (1)	CAGE code (2)	Name (3)	Used in procedure/data module code (4)
HU25322	K0680	Cutter	E1-A-72-32-30-00A-920A-A
HU25445	K0680	Rig, flow	E1-A-72-32-10-00A-640A-A

## 2.4 Equipment information

### 2.4.1 General

For each item of equipment, a separate data module must be allocated.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-066A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-066A-A (37 characters)

### 2.4.2 Presentation of the equipment entries

Equipment information data modules must give the following data:

- Title: The identifying noun or keyword must always be first, followed by the necessary adjectives. The same wording as given in the description column of the alphanumerical index must be used.
- Application: A brief description of the equipment to enable the user to readily understand what it is used for. Related tools or equipment needed to do the task must also be given.
- Dimensions: For large equipment, their dimensions must be given to assist the user to handle the equipment.
- Mass: For heavy equipment, the mass must be given to assist the user to handle the equipment.
- Parts list: A standard tabular presentation must be used to give parts information on the equipment. Equipment, which the user can repair or replace parts on, must have a parts breakdown given in this table. Equipment which the user cannot repair or replace parts on must only have data on the SE or special tool itself.
- For complex equipment (if the parts list exceeds one page) a reference can be made to the detailed parts data module. Refer to [Chap 5.2.1.9](#) Equipment Maintenance Information and [Chap 5.2.1.5](#) IPD information.
- An illustration: The table must be followed by the necessary illustrations showing the equipment and, wherever possible, its location if in use.

The parts list table must consist of the following columns. Refer to [Fig 1](#), [Fig 2](#) and [Fig 3](#):

- 1 Fig ref: The figure number followed by the item number of the part on the illustration. The numbers are separated by a dash (eg, "1-3" is Fig 1 and Item No. 3).
- 2 Part number: The part number of the equipment and, if applicable, the part number of the parts which can be repaired or replaced
- 3 Name: The number of the equipment and its parts
- 4 Units per assembly: The number of units required for the next higher assembly

## 1 General

### 1.1 Scope

This chapter covers two different categories of information: the preparation of the information set containing collections of several Service Bulletins (SB) and the preparation of the information set of data modules that constitute an individual SB.

#### 1.1.1 Collections of several Service bulletins

The information for a collection of several SB must contain the following topics:

- Introduction. Refer to [Para 2.1.2.1](#).
- Numerical index. Refer to [Para 2.1.2.2](#).
- Cross-reference index. Refer to [Para 2.1.2.3](#).
- Individual Service bulletins. Refer to [Para 2.2](#).

#### 1.1.2 Individual Service bulletin

This covers the rules for the preparation of SB information to apply a modification, a special and/or temporary inspection to an in-service Product or part of the Product. Refer to [Para 2.2](#).

### 1.2 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for SB information sets.

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Service bulletin content

### 2.1 Collections of several Service bulletins

#### 2.1.1 General

This category of SB information set is made up of a collection of several individual SB.

#### 2.1.2 Technical content

##### 2.1.2.1 Introduction

This data module, introduction, must give:

- the purpose and scope of the SB publication
- the organization of the SB publication
- abbreviations and terms

Data modules must be coded:

YY-Y-YY-YY-00-**NN**A-018Y-D (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-0000-**NN**AAA-018Y-D (37 characters)

Where "**NN**" in the disassembly code is a sequential number starting from "00" if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

#### 2.1.2.2 Numeric index

This data module must give a numerical index of all effective SB.

*Table 2 Numeric index*

Service bulletin DMC	Title	Date
YY-A-72-21-00-05A-930A-C	Engine - Fan frame Replacement of oil supply tube	1994-12-21
...		
...		
YY-A-72-21-00-06A-930A-A	Engine - Fan frame Deletion of safety Wire	1995-02-10
...		

Data modules must be coded:

YY-Y-YY-YY-00-00A-013A-D (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-0000-00AAA-013A-D (37 characters)

#### 2.1.2.3 Cross-reference index

This data module must give a cross-reference index of all effective SB.

*Table 3 Cross-reference index*

Title	Service bulletin DMC	Date
Engine - Fan frame Replacement of oil supply tube	YY-A-72-21-00-05A-930A-C	1994-12-21
Engine - Fan frame Deletion of safety Wire	YY-A-72-21-00-06A-930A-A	1995-02-10
...		

Data modules must be coded:

YY-Y-YY-YY-00-00A-013B-D (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-0000-00AAA-013B-D (37 characters)

## 2.2 Individual Service bulletin content

### 2.2.1 General

A SB provides a single source to notify the customers of the following types of recommendations:

- Modifications to the Product or part of the Product, including embedded software, which affect performance, improve reliability, increase safety of operation, provide improved economy or facilitate maintenance or operation.
- Substitution of one part with another superseding part when it is not completely interchangeable both functionally and physically or when change is considered to be sufficiently urgent or critical that special scheduling or record of accomplishment will be required.
- Special inspection/check to determine if the Product or part of the Product is in safe operating condition.
  - One-time inspection/check to detect a flaw or manufacturing error
  - Special inspection/check required to be performed until a corrective action (modification) can be taken. The modification information can be issued as a revision of the SB which transmits the inspection instructions.
  - Special checks of an urgent nature, such as pressure check, functional checks, etc, required to detect an incipient failure
- Replacement of one part with another part or addition of an alternate part even though these parts are completely interchangeable both functionally and physically.
- Substitution of one embedded software program by another which change component function and the part number of the programmed memory device, requiring a record of accomplishment.
- Conversion from one model to another.
- Changes affecting the interchangeability of parts.
- Reduction of existing life limits or establishment of first time life limits for components.
- Changes affecting characteristics of the product that can have an impact on the operation of the product.
- Evaluation of a part temporarily installed on the product. The SB can describe the initial installation of the part to be evaluated, removal for evaluation and the reinstallation of original part to return on initial product configuration.
- At the direction of the manufacturer, a SB will be used to transmit other types of information considered to be important enough for a record of accomplishment to appear in the SB file (eg, approved oils).

A SB once issued must not be cancelled. In case the original intent of the SB becomes invalidated, a revision to the original SB, or a new SB, must be issued for the purpose of restoring the units already modified to the original or preferred configuration. If a new SB is issued that supersedes the original SB, then a revision to the invalidated SB can also be issued in order to stop progression of its accomplishment.

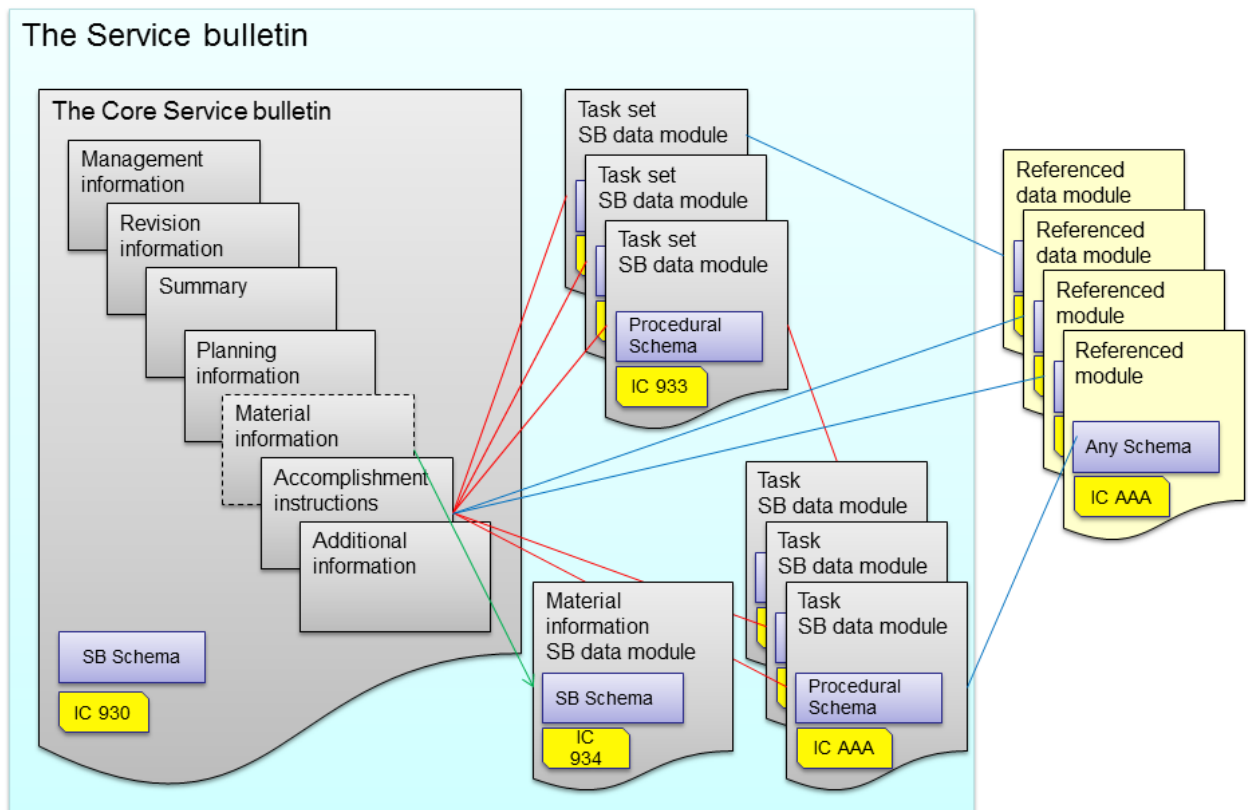

SB must not be used to cover routine recommended inspections/checks, standard repairs, or revisions to maintenance practices or shop procedures.

### 2.2.2 Technical content

A SB consists of a package of data modules with the following information:

- A core SB (supported by the SB data module)
- Optional material information (if not included in the core SB data module)(supported by the SB data module)
- Optional tasks and/or task sets (if not included in the core SB data module) (supported by - the procedural data module). Refer to [Fig 1](#).

ICN-S3627-S1000D0616-001-01

Fig 1 SB divided into a set of data modules.

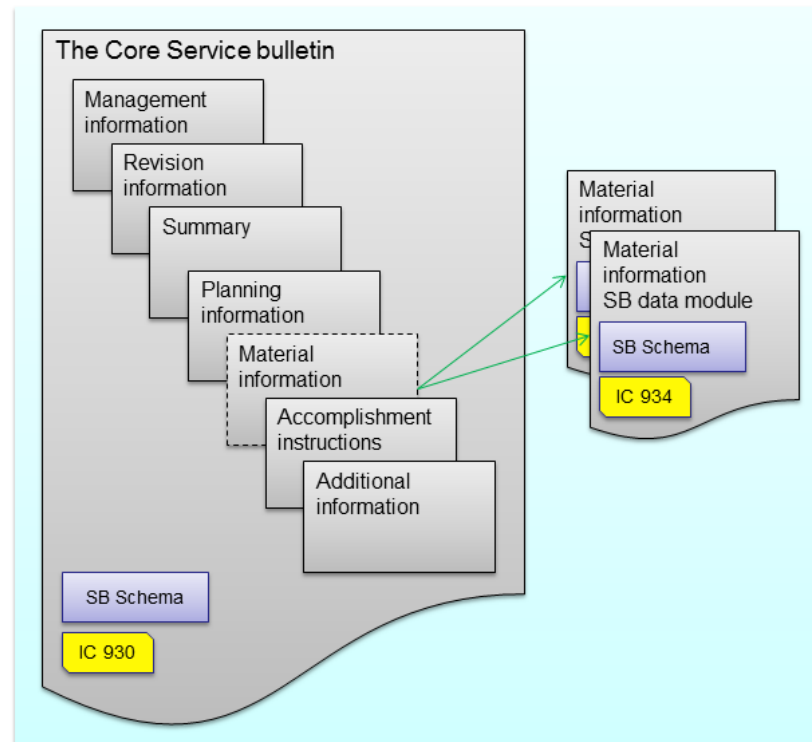

The SB can refer to already existing data modules for maximum reuse of information (the "yellow background" data modules). These data modules are not seen as being a part of the SB and have thus a "normal" data module code.

#### 2.2.2.1

##### Material information

##### **Business rule decision point BRDP-S1-00436 - Use of external material information in Service bulletins:**

- Decide whether material information must be a part of the "core" SB data module or if it can (depending on the volume) be presented in one or more referenced separate SB data modules. Refer to [Fig 2](#).

ICN-S3627-S1000D0617-001-01

*Fig 2 The Core SB data module with external material information.*

#### 2.2.2.2

##### Accomplishment instruction

If they are not simple ones, the detailed accomplishment instructions are given in one or more separate data modules, marked as "Task set SB data module/Task SB data module" in the illustrations. Refer to [Fig 1](#).

##### Note

Simple one means simple check SB or SB without material involved in accomplishment. Accomplishment Instructions involving more than three levels of hierarchy or illustrations must refer to procedural data module(s) for the detailed instructions.

Accomplishment instruction can from its content make references to already existing data module (marked as "Referenced data module").

All referenced data modules must be listed in the reference table of the SB ("Table 1 References") the same way they are in other data modules. If the Material Information is delivered as a separate data modules (one or more) these must also be included in the listing.

The data module belonging to the SB ("Task set SB data module" and/or "Task SB data module" and "Material Information data module" if delivered in separate data module) can be listed in the Management information paragraph defining the boundaries of the SB. The Core SB is assumed to be part of the SB but is not specifically listed in its own Management information paragraph.

### 2.2.3 Data module coding

To assist in the codification of data modules, the rules which follow can be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-**SS-SS-MM-NNY-YYYY-Z** (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-**YSS-SS-MMMM-NNYYY-YYYY-Z** (37 characters)

Where:

- "**SS-SS**" or "**YSS-SS**", the system and subsystem/sub-subsystem are the ones already used, for the same assembly/part in the CSDB.

#### Note

Y is the material item category code if used.

- "**MM**" or "**MMMM**" in the unit or assembly, is a sequential number of the Service bulletins, starting from "01" or "0001" used to differentiate the various SB which can be applied on the same system and subsystem/sub-subsystem.

#### Note

MM and MMMM allows for alphanumeric characters. Refer to [Chap 4.3.3](#).

- "**NN**", in the disassembly code
  - for task, task set and material information data modules which are part of a specific SB this is a sequential number starting from "01"
  - for all other SB, use populate it normally. Refer to [Chap 4.3.4](#).
- "**YYY**", in the information code must be:
  - 930 - Service bulletin core data module
  - 933 - Accomplishment procedure - Task set procedural data module for the SB
  - 934 - Material information data module
  - Any information code - Task procedural data module

#### Note

There will be no conflict with component SB issued by a component manufacturer as the components are recommended to have their own model identification code.

Identification of revisions follows the standard S1000D revision mechanism as described in [Chap 3.5](#).

Data modules developed for the specific SB must use standard data module codes with the SNS and information codes assigned using S1000D basic rules.

Example 1:

The third SB applicable to the low turbine shaft of an engine (72-54-00):

- YY-A-72-54-03-00A-930A-C

Example 2:

The second task set belonging to the twelfth SB to the low turbine shaft of an engine (72-54-00):

- YY-A-72-54-12-02A-933A-C

#### Example 3:

The material information data module belonging to the fourth SB to the low turbine shaft of an engine (72-54-00):

- YY-A-72-54-04-00A-934A-A

#### Example 4:

A set of data modules representing a core SB (IC 930) applicable to spoilers installed on wings (57-70), with a separate material information data module (IC 934) and two separate task set data modules (IC 933). Specific installation (IC 720) and removal (IC 520) task SB data modules are also delivered with the SB. The project for this example decided to use a four digit unit or assembly (sequence number). The SB is aimed for accomplishment at workshop level with the first task set with to item location code A (YYYY-A-57-70-0001-01A-933A-A) to be fulfilled on object:

- YYYY-A-57-70-0001-00A-930A-C
- YYYY-A-57-70-0001-01A-934A-C
- YYYY-A-57-70-0001-01A-933A-A
- YYYY-A-57-70-0001-02A-933A-C
- YYYY-A-57-70-0001-01A-720A-C
- YYYY-A-57-70-0001-01A-520A-C

### 2.2.4 Service bulletin types

There are two types of SB: Alert and Standard.

#### Business rule decision point BRDP-S1-00437 - Treatment of alert and standard Service bulletins:

- Decide whether or not to allow classifying Service bulletins as Alert.

#### 2.2.4.1 Alert Service bulletins

Alert SB must be issued to mitigate matters requiring urgent attention and must be limited to items affecting safety of the product's users. Alert SB must be classified by populating the element `<productSafety>` with the attribute `safetyLabel` containing the value of "alert". Refer to [Chap 3.9.5.1](#).

#### 2.2.4.2 Standard Service bulletins

Standard SB must be issued when a SB is required but an Alert SB is not required. Standard SB can be indicated by populating the element `<productSafety>` with the attribute `safetyLabel` containing the value of "standard". Refer to [Chap 3.9.5.1](#).

### 2.2.5 Compliance recommendation

Compliance recommendation specifies the SB priority for business planning.

Compliance recommendation is based on compliance categories:

The compliance categories can be:

- Service bulletin must be accomplished

Used for SB that are mandated or that the manufacturer expects will be mandated by regulators.

- Service bulletin recommended to be accomplished to prevent significant operational disruptions

For SB that are not in the category above. Significant operational disruptions can include extensive repairs, in-flight turn back/ diversions, aborted takeoff, in-flight shutdown and major delays.

- Service bulletin to introduce improvements

For SB that are not in the categories above. Improvements can include passenger comfort, reliability, environmental improvement, operational improvement, economics and product life extension.

- Service bulletin for convenience or option

For SB that are not in the categories above.

The manufacturer must include a compliance category in the SB. Compliance category must be given in the SB Management Information topic "Compliance". Refer to [Para 2.2.6.1.1](#). The SB Compliance category must also be given in the Planning information topic "Compliance". Refer to [Para 2.2.6.4.5](#).

#### **Business rule decision point BRDP-S1-00438 - Service bulletin compliance categories:**

- Decide whether to use the four compliance categories or to define others.

### **2.2.6 Core Service bulletin**

The core SB includes the following main topics and structure:

- Management information
- Revision information
- Summary
- Planning information
- Material information
- Accomplishment instructions
- Additional information

Refer to [Chap 3.9.5.2.15](#).

The content of the Core SB will consist of the following main topics:

#### **2.2.6.1 Management Information**

Information that is useful and/or required by end users and/or regulatory authorities to manage the process of utilizing a SB. The information given in this paragraph is semantically organized in order to allow automatic processing/extraction. Refer to [Chap 3.9.5.2.15.1](#). This information can be referenced from the planning information main topic.

The list of information that is present in the SB management information is:

- compliance. Refer to [Para 2.2.6.1.1](#)
- Service bulletin task type. Refer to [Para 2.2.6.1.2](#)
- list of product modifications. Refer to [Para 2.2.6.1.3](#)
- Service bulletin impacts. Refer to [Para 2.2.6.1.4](#)
- list of concurrent Service bulletins. Refer to [Para 2.2.6.1.5](#)
- Service bulletin accomplishment limit. Refer to [Para 2.2.6.1.6](#)
- Service bulletin estimated time, duration and external time required. Refer to [Para 2.2.6.1.7](#)
- original Service bulletin issue date. Refer to [Para 2.2.6.1.8](#)
- approval identifier. Refer to [Para 2.2.6.1.9](#)
- list of Service bulletin approved data modules. Refer to [Para 2.2.6.1.10](#)

- replaced Service bulletin. Refer to [Para 2.2.6.1.11](#)
- project specific properties. Refer to [Para 2.2.6.1.12](#)

#### 2.2.6.1.1 *Compliance*

A code delineating which of the four available compliance categories is applicable to this SB.

#### 2.2.6.1.2 *Service bulletin task type*

SB task types "categorize" a SB by its main activity. When a SB accomplishes multiple task types, the primary or most relevant one can be selected here. The following values are allowed:

- Modification - used when the main activity described in the SB is to modify the product
- Inspection - used when the main activity described in the SB is to inspect the product
- Repair - used when the main activity described in the SB is to repair the product.
- Evaluation - used when the main activity described in the SB is to evaluate item or function on the product or the full product itself.
- Administrative - used when the SB is issued to provide information to customer and that no work has to be performed on the product

#### 2.2.6.1.3 *List of product modifications*

A "design change" defined by the manufacturer and implemented (embodied) before or after product delivery installed with the SB. List the manufacturer's internal tracking numbers for product changes that are being described in the SB. An optional classification of the modification can be associated to each product modification, to describe the regulatory or approval impacts of the modification.

#### 2.2.6.1.4 *Service bulletin impacts*

The impacts of the SB on the product can be various. The project or the organization can define their own impacts. The impacts can include:

- Impact on weight and balance: Indicates if the SB has a significant impact on product weight. Indicates if the SB has a significant impact on product balance. For weight a value (including + or -) and unit of measure must be included. This structure can include applicability to address different results for different product instances.
- Impact on electrical load AC and DC: Indicates whether the SB has an impact on product alternative current load. Indicates whether the SB has an impact on product direct current load. The values of electrical Load increase or decrease for the whole product (+ or -, including unit of measure) can be included. This structure can include applicability to address different results for different product instances.
- Impact on publications: maintenance or operational: This must be populated when incorporation of this SB also requires operators to modify their maintenance or operational publications.
- Impact on Electrical Structure Network (ESN) load: Indicates whether the SB has an impact on the load of Electrical Structure Network that supports the return of the current on relevant products. The values of electrical Load increase or decrease for the whole product (+ or -, including unit of measure) can be included. This structure can include applicability to address different results for different product instances.

#### **Business rule decision point BRDP-S1-00439 – Minimum impact on weight in Service bulletins:**

- Decide the threshold for minimum impact on weight that must be reported in a Service bulletin.

#### **Business rule decision point BRDP-S1-00440 - Minimum impact on balance in Service bulletins:**

- Decide the threshold for minimum impact on balance that must be reported in a Service bulletin.

**Business rule decision point BRDP-S1-00441 - Minimum impact on electrical load to be reported in Service bulletins:**

- Decide the threshold for minimum impact on electrical load that must be reported in a Service bulletin.

**Business rule decision point BRDP-S1-00442 – Definitions and use of maintenance and operational publications in Service bulletins:**

- Decide on the precise definitions of "maintenance publications" and "operational publications" and whether to separate them into different listings in the Impact on publications.

**2.2.6.1.5** *List of concurrent Service bulletins*

Optional list of SB and Modifications which must be accomplished before or simultaneously with the current one and a list of SB and Modifications which must not be accomplished before the current one, based on applicability.

**2.2.6.1.6** *Service bulletin accomplishment limit*

Optional information related to interval, threshold, time limit to perform the SB. This topic informs the customer when he must accomplish the SB: for inspection SB, the limit (Flight Cycle, Flight hours, etc) not to exceed, the grace period after issuance of the SB, the repetitive interval between two inspections if necessary.

**2.2.6.1.7** *Service bulletin estimated time, duration and external time required*

A global view of how important the SB is in term of resources for the customer. Multiple values can indicate different options to complete the SB and returned to service. External time required is a Y/N flag, plus an optional list of references to procedures that are not included in SB estimated time and SB duration (eg, Vendor SB), to other procedures outside of the control of the manufacturer. Use applicability to address different results for different product instances.

**2.2.6.1.8** *Original Service bulletin issue date*

The date of the first issue of this SB.

**2.2.6.1.9** *Approval identifier*

Optional identifier given by a manufacturer's approval authority.

**2.2.6.1.10** *List of Service bulletin approved data modules*

Optionally used to clearly define which data modules are within the (approved) SB. Refer to the data modules with "blue background" in [Fig 1](#).

**2.2.6.1.11** *Replaced Service bulletin*

Optionally used in the case where an SB is no longer valid and is replaced by another one. The reference to the SB replacing this SB is placed here.

**2.2.6.1.12** *Project specific properties*

Metadata for SB specific to a project or an organization. The properties are mainly flags that give characteristics of the SB. For example, a project or an organization might want to indicate whether or not the SB affects passenger comfort, reliability of the product or the life structure of the product. Refer to [Chap 3.9.5.2.15.1](#).

**2.2.6.2** *Revision information*

This main topic must include the revision history and reason for change associated to a SB issue.

For example, "This section transmits Issue 002 to Service bulletin 747-21-15." Each SB dataset (paper or digital) must contain the latest issue number, the original date of issue and the date of the latest issue

**Note**

Different releases of SB will be referred to using the issue number of the core SB data module for that SB.

The revision information main topic can:

- Indicate whether or not additional work is required if operators complied with a previous issue of the SB. If additional work is required, the additional work must be described.
- Contain a comprehensive summary of the reason for the revision
- List the dates and numbers of all previous issues

The revision information main topic can contain a history of previous issue's reasons. The revision information can also contain instruction concerning filing of the SB issue.

**2.2.6.3****Summary**

The Summary must give an overview of the SB but must not contain sufficient information to perform the work of the SB.

The content of the Summary paragraph is intended to be descriptive content.

The Summary can contain but is not limited to:

- The reason of the SB/Background
- Action/Description/Nature of the work (on product, on components)
- A general evaluation of impacted airworthiness items as well as benefits
- A global assessment of commercial items / material information
- Compliance
- Industry Support Information
- Applicability of the SB
- Concurrent requirements
- Global estimation of workload and elapsed time to accomplish the SB
- General illustration showing where the work has to be done

**2.2.6.4****Planning information**

This main topic must contain the information required to permit the operator to determine if the SB has to be applied to its component and to plan its accomplishment.

All mandatory topics must be present in the SB even when not necessary for that SB. In such a case the content must be marked as "No information". Refer to [Chap 3.9.5.2.15](#).

The information can be presented under the following headings:

**2.2.6.4.1*****Applicability***

Specifies the product to which the SB is applicable. Lists model, part numbers and serial numbers, or otherwise clearly identified product affected, when not specified in the status section of the data modules.

A SB number must apply to one model or product type only. The product must be identified using a manufacturer's unique identification number.

This paragraph can be mainly derived from the applicability statement as described in [Chap 3.9.5.3](#).

This topic can also contain details on how serial numbers or product identifiers can be grouped by configurations when several product configurations are described in the SB. The definition of these configurations can be detailed to ease SB preparation.

As applicable, paragraphs must be included beneath the applicability to state the production introduction by product serial number or equivalent unique identifier.

#### 2.2.6.4.2 *Concurrent requirements (Previous modifications)*

Use this topic to describe known previous modifications to parts affected by the SB. Normally, only the SB which introduced the last change of part number affected by the modification will be listed, if this part has not yet been introduced in the logistic system, such as IPD.

When applicable state if other SB, or portions thereof, must be accomplished in conjunction with or prior to accomplishment of the subject SB. When applicable state if other SB must not be accomplished prior to accomplishment of the subject SB. The evolution of the relevant parts can be included here.

This topic can reference the topic List of concurrent SB. Refer to [Para 2.2.6.1.5](#).

#### 2.2.6.4.3 *Reason*

Provides sufficient facts to assist the operator in determining the applicability to, or effect on, his operation. This information must be prepared in quantitative terms to permit the operator's evaluation as follows:

- Objective - State immediate effect the new part will have
- Problem and effect - State problem with present part, what has happened and/or what might happen if the problem is not resolved
- Solution - State how the new part or procedure will alleviate the problem

#### 2.2.6.4.4 *Description*

Provides a brief but complete statement outlining what the SB does.

#### 2.2.6.4.5 *Compliance*

This is the compliance category of the SB (refer to [Para 2.2.5](#)) and also the compliance recommendation to the operator for incorporation of the SB including accomplishment limits (refer to [Para 2.2.6.1.6](#)).

In establishing these recommendations due consideration has to be given to availability of personnel and materials as well as the normal maintenance periods of the product. Limits if specified in hours, cycles, calendar time, etc, must be justified by the technical facts. Language such as "at the earliest opportunity where personnel and facilities are available" or "at the next suitable planned maintenance period" is preferable.

These recommendations must be supported by the detailed reasons for issuance of the SB. Where alternate methods of compliance are known, they must be included. If no alternate methods of compliance are known at the time of issuance, language must be included to allow operators to use alternative means of compliance acceptable to the manufacturer.

For category "Service bulletin must be accomplished" the manufacturer must recommend accomplishment before XX hours, YY cycles, a specific date and/or interval.

For other categories, the manufacturer can provide a recommendation for accomplishment. The compliance recommendation and the method and rate of implementation will be consistent, yet sufficiently flexible so as not to impede the orderly and safe operation of individual operator's product.

If the manufacturer is aware the SB is associated with regulatory action, a statement to that effect must be included. Available details of that action can be provided.

An example of presentation is given in [Fig 3](#).

### **Compliance Classification**

- ✓ Service bulletin must be accomplished

Service bulletin recommended to be accomplished to prevent significant operational disruptions

Service bulletin to introduce improvements

Service bulletin for convenience or option.

FAA Airworthiness Directive 2011-XX-XX is related to this Service bulletin

### **Accomplishment timescale**

Accomplishment of this Service bulletin is recommended at the earliest opportunity where the manpower and facilities are available.

ICN-S3627-S1000D0792-001-01

*Fig 3 Compliance - Display example*

#### **2.2.6.4.6 Approval (commercial application)**

If approval is required this approval must be stated.

#### **2.2.6.4.7 Manpower**

Provides an estimate of man hours required to accomplish the intent of the SB.

In cases where the SB can be accomplished in independent portions, the estimated man hours required must be detailed separately for each portion.

When appropriate, man hours can be illustrated by a chart to help customers to assess the workload and elapsed time necessary to accomplish the SB. It must be provided as a complement and not as replacement of figures.

#### **2.2.6.4.8 Weight and balance**

The total increase or decrease in weight will be provided if the thresholds stated by the project or the organization are equaled or exceeded for the Product. Refer to [Para 2.2.6.1.4](#).

The total change to balance or center of gravity will be provided if the thresholds stated by the project or the organization are equaled or exceeded for the Product. Refer to [Para 2.2.6.1.4](#).

If the change to weight or balance is below thresholds specified by the project or the organization the statement "Not affected" or "Not changed" will be used. In cases where the SB is separated into phases and the product can be returned to service between phases, weight and balance data must be provided for each phase.

#### **2.2.6.4.9 Electrical load data**

The total to electrical loads will be provided if the thresholds stated by the project or the organization are equaled or exceeded for the Product (refer to [Para 2.2.6.1.4](#). If there is no effect, state "Not changed".

#### **2.2.6.4.10 Software accomplishment summary**

If the SB involves any change to product software, include the information here. The information must support software change approval by providing the required traceability of the change history.

#### **2.2.6.4.11 Referenced documentation**

State sources of information used in preparation of the SB such as other SB, engineering drawings, government regulatory body directives, maintenance procedures and illustrated parts data, supplier documents, etc. This list must encompass all references made in any data module that is part of the SB.

Applicable to: All

**DMC-S1000D-A-05-02-0116-00A-040A-A\_008-00\_EN-US**

**Chap 5.2.1.16**

---

**2.2.6.4.12** *Documentation affected*

A list of documents (such as data modules, technical publications and operational manuals) which have been or will be revised as a result of the SB.

**2.2.6.4.13** *Industry support information*

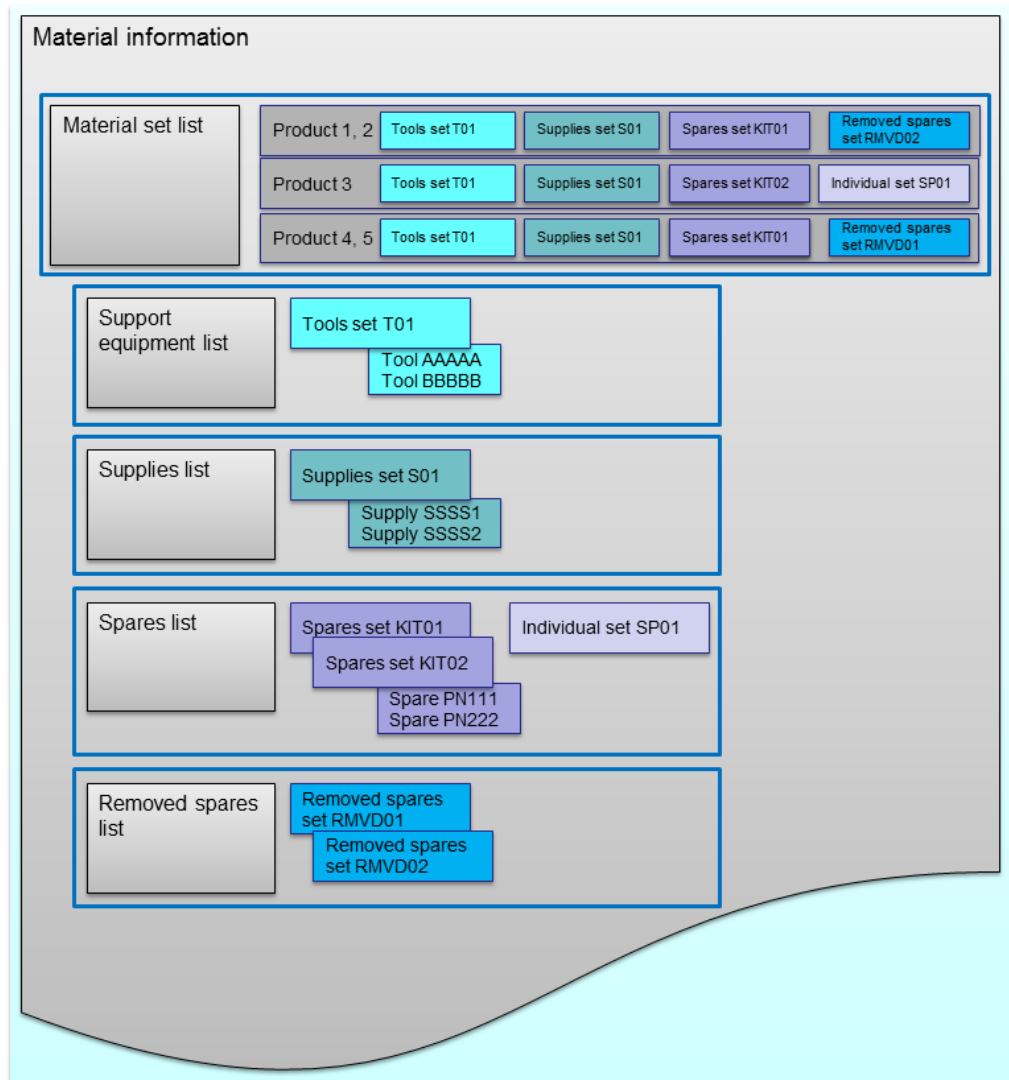

In cases where concessions must be granted, the information must be included in this paragraph.

**2.2.6.5** *Material information*

Furnishes the operator with necessary information needed for planning and procurement. The Material information main topic can be delivered within the core SB data module or in one or several dedicated data modules depending on the volume of the Material information and the project or the organization decision. When Material information is delivered as an individual data module, it will inherit the data module code from the core SB except for the information code which must be IC 934. In that latter case, the Material information main topic of the core SB data module (IC 930) contains one or several references to the Material information data modules (IC 934). Refer to [Chap 3.9.5.2.15.2](#).

The Material Information main topic is divided in five topics according to the material necessary for SB accomplishment. Refer to [Fig 4](#). The topics are:

- materials sets list. Refer to [Para 2.2.6.5.5](#)
- support equipment set or Individual and external Support equipment. Refer to [Para 2.2.6.5.1](#)
- supplies set or Individual and external Supplies. Refer to [Para 2.2.6.5.1](#)
- spares set or Individual and external Spares. Refer to [Para 2.2.6.5.1](#)
- removed or modified Spares (set or item). Refer to [Para 2.2.6.5.6](#)

ICN-S3627-S1000D0618-002-01

Fig 4 Organization of SB Material Information.

#### 2.2.6.5.1 Topics dedicated to new materials

Three major topics are defined for description of new material installed or used to accomplish the SB:

- Support equipment set list (tools)
- Supplies set list (consumables)
- Spares set list (new parts)

Each of these three topics can be organized:

- by set of items (spare or supply or support equipment). A set of items can represent the physical kit concept. Refer to [Para 2.2.6.5.2](#).
- by individual item. Refer to [Para 2.2.6.5.3](#).

These topics can also refer to additional documentation when additional items to use within the SB are described in a referenced data module or external publication. Refer to [Para 2.2.6.5.4](#).

#### 2.2.6.5.2 Set of items content description

Each set of items can be defined by the following associated properties:

- A type (eg, spare set, support equipment set, supply set)
- An identifier and an Issue number of the set
- A textual description of the set
- If the set of items is procurable or not
- If the set of items is provided by the customer or not
- A standard list of attributes attached to the set (eg, applicability, change marking)
- Name and short name of the set of items
- A list of items (eg, spares, supplies, support equipment). For each item, associated information can be described in the same way as if it was delivered as an individual item. Refer to [Para 2.2.6.5.3](#).
- Procurement information associated to the set of items (eg, price, availability, supplier, industry support information)
- Link to the relevant accomplishment instruction where the set of items is used
- Other information relevant to the new part (eg, reference to new maintenance procedure)
- Optional list of notes related to the set of items

#### 2.2.6.5.3 Individual item content description

When the material is delivered as individual item (outside any kit), the following information can be supplied:

- A type (eg, spare set, support equipment set, supply set)
- If the individual item is procurable or not
- If the individual item is provided by the customer or not
- The standard list of attributes must be attached to the set (eg, applicability, change marking)
- the item identifier
- quantity of item (eg, present in the set or necessary to accomplish the SB)
- Reference to one or several drawings where the item is represented and associated item identifier in the drawing
- Procurement information associated to the individual item (eg, price, availability, supplier, industry support information)
- Link to the relevant accomplishment instruction where the item is used
- Other information relevant to the new part (eg, reference to new maintenance procedure)
- Optional list of references to note related to the item

#### 2.2.6.5.4 Reference to other documentation (external material set)

It is possible to add references to other data modules where support equipment, supplies or spares are mentioned and are applicable to the SB. The reference to other documentation can be addressed as a set of information. So, similar properties than for a set of material can be associated to the reference to other documentation.

Properties associated to the reference:

- A type (eg, spare, tool or support equipment)
- An identifier and an Issue number of the set of the reference
- If the items referenced in the documentation are procurable or not
- If the items referenced in the documentation are provided by the customer or not
- The standard list of attributes must be attached to the set (eg, applicability, change marking)
- references to a data module, publication module or external publication
- Optional textual content

#### 2.2.6.5.5 Topic dedicated to material set list

A material set list describes the grouping of:

- spares sets, support equipment sets or supplies sets
- individual spares, supplies or support equipment
- references to other documentation

This topic is mainly designed to provide a single place where to define the full list of references to material (material set or individual items or external documentation) applicable to a set of product. One list of material refers to one or several spare/supply/support equipment set or individual item which is defined once in the topics described in Topics dedicated to new materials (refer to [Para 2.2.6.5.1](#)). These spare/supply/support equipment sets or individual items or external documentation can be referenced from several material lists if they are applicable to several groups of products. Reference to removed material set or individual removed material can also be made from the lists of material.

If this topic is not used (marking it as "not relevant"), applicability of each necessary set or individual item can be directly set at spare/supply/support equipment set or item level.

Each material set list is defined by the following properties associated to the material set:

- An identifier and an issue number of the material set list
- If the material set list is procurable or not
- If the material set list is provided by the customer or not
- The standard list of attributes must be attached to the material set (eg, applicability, change marking)
- Name and short name of the material set list
- A list of references (with quantity necessary per product and potential note) to:
  - spare set, supply set, support equipment set definition
  - references to individual spare, individual supply, individual support equipment definition
  - references to other documentation necessary for the SB accomplishment
  - references to removed set of material or individual removed material definition
- Procurement information associated to the material set list (price, availability, supplier, industry support information)

#### Note

Material set list can refer to other material set list to create hierarchy (top kits, sub kits).

#### 2.2.6.5.6 *Topic dedicated to removed or modified material*

List the removed or modified parts and their relation with the new parts that replace them. The removed or modified part can be organized by set of parts or by individual part.

A list of removed parts can be managed and described within set of removed parts. A set of removed parts can be defined with the following information:

- A type of removed part set
- An identifier and an issue number of the removed part set
- The standard list of attributes must be attached to the set (applicability, change marking, etc)
- Name and short name of the set of removed parts
- A list of removed parts (spares). For each part, associated information can be given in the same way as if it was delivered as an individual item. Refer to [Para 2.2.6.5.2](#).
- Industry support information related to the removed set of parts
- Link to the relevant accomplishment instruction where the removed set of parts is used
- Other information relevant to the removed part (eg, reference to new maintenance procedure)
- Optional list of notes related to the set of removed parts

When the removed spares are described as individual items, the following information can be supplied:

- Identification and quantity of removed spare. Qualification of the removed spare can be given as retained, discarded or modified.
- Reference to drawing and identification of the item on the drawing
- Property of the removed spare subject to a project or an organization decision
  - support codes: alphabetical codes used to determine parts availability. Examples of codes:
    - A = Old parts will no longer be supplied
    - B = Old parts will be supplied until inventory is depleted
    - C = Old parts will be supplied until 1996-03-31
    - D = Old parts will be supplied for a product not modified by this SB
    - E = Old parts will be supplied, and can be used for other locations
  - Indicating whether the removed spare is potentially present on customer shop and how it must be processed after SB embodied (to discard, to send back to supplier, to modify, etc)
- Interchange information (new spare installed, interchangeability, drawing reference of the new spare). Information related to the replacing part can be:
  - Simple reference of the replacing spare without inter-changeability/mixability condition. The drawing/illustration as well as the graphic item of the replacing part can be referenced
  - Reference of the replacing spare with inter-changeability/mixability condition. The interchangeability condition has to be compliant with the definition given in part technical repository and reuse the same model if necessary
  - Reference of the replacing spare with specific SB inter-changeability/mixability condition (temporary interchangeability/mixability condition)
  - Reference to modified (altered) part that has been removed, modified and re-installed on the product
- Industry support information for the removed spare
- Link to the relevant accomplishment instruction where the spare is used
- Optional list of references to note related to the removed spare

#### 2.2.6.6 Accomplishment instructions

The main topic "Accomplishment instructions" contains the step by step procedures (refer to [Fig 1](#)) for accomplishing the intent of the SB. For complex procedures, these can be broken down into a hierarchy of task sets (refer to [Fig 1](#)) and procedures.

The SB task set is an approved set of working instructions that must be completed before the product can be operated (refer to [Chap 9.2](#)). The types of SB task sets can include modification, inspection, repair, evaluation, and administrative (list not exhaustive). Within a SB task set, the following topics can be present: General information, Job set-up, Procedure, Test and Job close-up.

The SB procedure is a part of a SB task set. A SB task set is broken down into SB procedures that contain working instruction to do in a zone, by a person with indicated skill, using dedicated material set (kit). There are several types of SB procedures (eg, removal, installation, test). The SB procedure can be considered as a basis for Job-card production. A SB procedure can be done simultaneously with other SB procedures.

The accomplishment instructions (in the core SB) will be a high level set of hierarchically arranged steps, primarily referring to data modules. The steps are not intended to contain the detailed instructions/procedures themselves. However, in the case where no illustrations are

required and no parts are consumed it can be possible to include a simple procedure directly in the core SB without using any referenced procedural data modules.

#### 2.2.6.7 Additional information

The optional main topic Additional information can include additional information to support SB procedures or instructions (eg, inspection techniques, supplemental pricing information, equipment information or revisions to tables of limits).

Additional information can also contain a chart depicting like production components (eg, part, combination of parts, subassemblies or units) vs modification bypass relationships and the relationship of the different SB raised against these like components.

This main topic is descriptive and can be split into several topics.

## Chapter 5.2.1.17

### ***References***

*Table 1 References*

Chap No./Document No.	Title
<a href="#">Chap 4.3</a>	Information management - Data module code

## 1 General

### 1.1 Purpose

The preparation and coding of Material Data (MD) information data modules must follow the rules contained here.

### 1.2 Scope

The rules covered here enable skilled personnel to order, store and use materials/products. The MD information must contain the following topics:

- Introduction
- Material data sheets
- List of suppliers
- Numerical index
- Alphabetical index
- List of hazardous material

The material data information provides a single source of information for all products needed for maintenance. Any information set can refer to the material data information set. The procedures described in these publications will refer to a product per its data module code.

### 1.3 Standard and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Material data

### 2.1 General

The complete set of MD data modules is specified in [Para 2.2](#).

### 2.2 Technical content

#### 2.2.1 General requirements

The material data information set is made up of individual data sheets for all material or products. Each data sheet is the subject of the data module.

#### 2.2.2 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They are also to contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-50-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-50-0000-**NN**AAA-018Y-A (37 characters)

where "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

#### 2.2.3 Data module coding

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-00-50-**SS**-**NNA**-**XXXA**-**C** (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-50-**SS00**-**NNAAA**-**XXXA**-**C** (37 characters)

where

- "**SS**", in the subsystem/sub-subsystem code, must be used as follows:
  - 00 - Products/Material used for complete air vehicle, land or sea system
  - 20 - Products/Material used for the complete system without engine
  - 70 - Products/Material used for engine
- "20" and "70" are optional
- "**NN**", in the disassembly code, is a sequential number starting from "01"
- "**XXX**", in the information code, must be "077" for any consumables except dangerous ones which will be coded "074"

Examples:

Hydrochloric acid 36%	YY-A-00-50-00-01A-074A-C
Sulphuric acid, pure	YY-A-00-50-00-14A-074A-C
Alumina 60 mesh	YY-A-00-50-70-01A-077A-C
Accelerator BZ	YY-A-00-50-20-25A-077A-C

#### 2.2.4 Material data sheet

All products are identified by a separate data module.

These data modules must give technical data on the products. They are also to present sufficient information on each product such as alternatives or substitutes.

The data modules must furthermore give the purchasing agent necessary information to obtain the material/product with the minimum of difficulties. They are also to assist the stock clerk in storage of the product.

Listed below are the requirements for the eleven entries of a material data sheet.

##### Note

If an entry is not fulfilled, "None" must be stated.

- 1 Material identification name: It is the common name that best identifies the material/product. This is usually the brand name or generic name.
- 2 Identifier Number (IN): It is assigned for the material/product by the project. It is used to referencing in procedures. Once assigned, the IN is not to be used for any other product or material. If a product or a material becomes unavailable for procurement, the IN must be cancelled and never used again for another product or material.
- 3 Description: It provides any other information on the material/product to aid their identification. Its function, such as cleaning agent, lubricating coating, and the form or state of product such as paste, liquid, gas, etc, is also to be stated.
- 4 Trade name: It consists of the usual name of a material/product given by the manufacturer.
- 5 Supplier trade name code: All data sheets must have at least one supplier listed. It is preferred to have several. Suppliers are identified by their trade name code to simplify the list in the data sheet.

- 6 Specification references: It lists any known international or national specifications which can define the material/product, or to which the product is usually manufactured (eg, North Atlantic Treaty Organization (NATO) stock number, USA spec, UK spec).
- 7 Storage information: Storage conditions of the material/product are provided, such as temperature limits, shelf life limitation. If normal storage is acceptable the information section will include the following statement: "Standard".
- 8 Packaging information: This information is provided to assist both the purchasing agent and the stock clerk. Package sizes, shape, etc, should be indicated. Packaging data will be that used by the supplier listed in the data sheet at time of issue of the sheet.
- 9 Transportation information: This information is provided to assist both the purchasing agent and the stock clerk. Data must include color codes when they exist and helpful information relative to any restrictions or problems related to transporting the material/product from supplier to the user. It is also to carry the classifications according to risk such as "harmful", "inflammable", "combustible", "poisonous" and the flash points of inflammable substances. Hazardous classes must be given in accordance with regulations such as International Air Transport Association (IATA) regulations.
- 10 Specification requirements/General characteristics: It provides the appropriate data to aid the procurement and/or identification of the material/product. The data can be general, or in some cases, data shown can relate to both specification requirements and general characteristics.
- 11 Disposal information: It provides the information required to ensure the proper procedures are identified to dispose of the hazardous waste and environmental pollutants in an environmentally acceptable manner.

Data modules are coded as given in [Para 2.2.2](#).

Examples of data sheets with data relative to a chemical product and an abrasive product are given in [Fig 1](#) and [Fig 2](#).

### 2.2.5 List of suppliers

This data module must give a list of suppliers. The list can be deduced from the data modules previously defined. For each supplier, in alphabetic order, this list must give the information described in [Table 2](#), as available.

*Table 2 List of suppliers*

Trade code address	Supplier code	Identifier number	Material identification name
Turco	XXXXX	IN 1001	Nitric acid
Turco France 35 imp. Industrie F91200 Athis-Mons		IN 1027	Descaler
...			

Data modules must be coded:

YY-Y-00-50-00-00A-019A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-50-0000-00AAA-019A-A (37 characters)

Applicable to: All

**S1000D-A-05-02-0117-00A-040A-A**

**Chap 5.2.1.17**

## 2.2.6 Numeric index

This data module must give a numeric index of all identifier numbers. This index can be deduced from the data modules previously defined. For each identifier number, in alphanumeric order, this list must give the information described in [Table 3](#).

*Table 3 Numeric index*

Identifier number	Material identification name
IN 2034	Alodine
IN 2333	Accelerator BZ
...	

Data modules must be coded:

YY-Y-00-50-00-00A-013A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-50-0000-00AAA-013A-A (37 characters)

## 2.2.7 Alphabetic index

This data module must give an alphabetic index of all Material identification names. This index can be deduced from the data modules previously defined. For each material/product, in alphabetic order, this list must give the information described in [Table 4](#).

*Table 4 Alphabetic index*

Material identification name	Identifier code
Accelerator BZ	IN 2333
Alodine	IN 2034
...	

Data modules must be coded:

YY-Y-00-50-00-00A-014A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-50-0000-00AAA-014A-A (37 characters)

## 2.2.8 List of hazardous material

Hazardous materials will be listed in a separate data module "List of hazardous materials" per potential hazard class given by IATA regulations. Refer to [Table 5](#).

*Table 5 Hazard classes*

Class	Potential hazard
1	Explosive
2	Compressed gases
3	Flammable liquids

Applicable to: All

**S1000D-A-05-02-0117-00A-040A-A**

**Chap 5.2.1.17**

---

Data modules must be coded:

YY-Y-00-50-00-00A-016A-A (17 characters)

Chap No./Document No.	Title
None	

#### **1 General**

##### **1.1 Purpose**

This chapter contains the rules for the preparation and coding of data modules for Common Information and Data (CID) information.

##### **1.2 Scope**

It covers the rules for the preparation of consolidated lists of common information and data. The CID information contains one or more of the following:

- List of Abbreviations (LOA) - IC 005

Applicable to: All

**S1000D-A-05-02-0118-00A-040A-A**

**Chap 5.2.1.18**

- List of Terms (LOT) - IC 006
- List of Symbols (LOS) - IC 007
- List of Applicable Specifications and Documentation (LOASD) - IC 00V (alternative IC 017)

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Common information and data

### 2.1 Technical content

#### 2.1.1 General requirements

The CID consists of the compiled lists given in [Para 1.2](#). The abbreviations, terms, symbols, applicable specifications and documentation are derived from the introduction data modules prepared for each information set. If the project does not prepare individual LOA, LOT, LOS and LOASD for each information set, the lists in the CID have to be prepared from scratch.

#### 2.1.2 List of abbreviations

Non-standard abbreviations used in the information set are listed in a list of abbreviations. The list must be presented as an informal table with the abbreviations in alphabetic order together with the full wording. Refer to [Fig 1](#).

Data modules must be coded:

YY-Y-00-00-00-00A-005Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00AAA-005Y-Z (37 characters)

The information code variant is used to distinguish between its use in different Information sets.

#### 2.1.3 List of terms

Non-standard terms used in the information set are listed in a list of terms. The list must be presented as an informal table with the terms in alphabetic order together with the amplification of their meaning. Refer to [Fig 2](#).

Data modules must be coded:

YY-Y-00-00-00-00A-006Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00AAA-006Y-Z (37 characters)

The information code variant is used to distinguish between its use in different Information sets.

#### 2.1.4 List of symbols

Non-standard symbols used in the information set are presented in a list of symbols. The list must be presented as an informal table with the symbol together with the explanation of their meaning. Refer to [Fig 3](#).

Data modules must be coded:

YY-Y-00-00-00-00A-007Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00AAA-007Y-Y (37 characters)

The information code variant is used to distinguish between its use in different Information sets.

---

**2.1.5 List of applicable specifications and documentation**

Specifications and documents which are necessary to read or follow when using the information set are presented in a list of applicable specifications and documentation. The list must be presented as an informal table. Refer to [Fig 4](#).

Data modules must be coded:

YY-Y-00-00-00-00A-00VY-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00AAA-00VY-Z (37 characters)

The information code variant is used to distinguish between its use in different Information sets.

## 1 General

### 1.1 Purpose

The preparation and coding of training information data modules must follow the rules contained here.

### 1.2 Scope

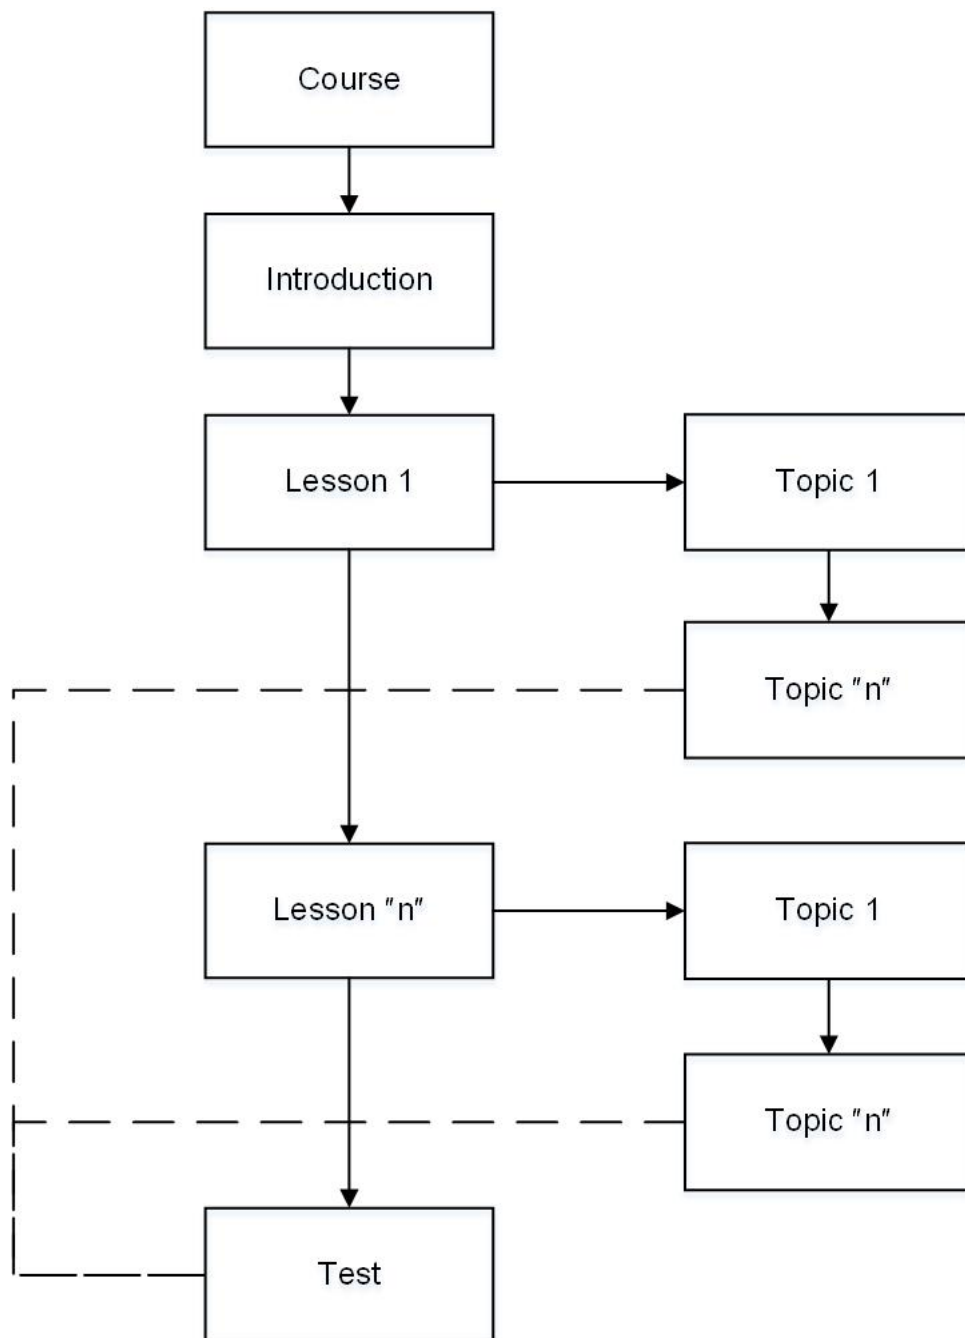

Planning and content of training information is covered here. The information set described in the chapter is intended as a generic information set and it is acknowledged that different projects will have different requirements.

Data modules produced using this information set must cover the requirements for the preparation of information applicable to training, which will enable personnel to be trained on the Product to a suitable level, as specified by the project. This chapter uses the following elements as a general example of training content:

#### Note

The elements can be single or multiple. Refer to [Fig 1](#).

- course
- introduction
- module (optional aggregation)
- lesson
- topic
- test
- ...

ICN-83007-0000000114-001-01

Fig 1 Training information set content

## 1.3 Standards and definitions

### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

### 1.3.2 Definitions

The following definitions are given for training information in data modules:

- **Planning** - Definition of information needed to for lesson planning
- **Course** - Related series of lessons

- **Lesson** - Instructional aggregate consisting of multiple topics with one terminal learning objective
- **Topic** - Smallest instructional unit associated with one enabling learning objective
- **Terminal Learning Objective (TLO)** - A TLO is a primary, measurable objective that defines the knowledge or skill a learner must master to successfully complete a lesson
- **Test** - Knowledge check through testing. Method of test can be a scenario, practice etc, and will be dependent on the project.
- **Enabling Learning Objective (ELO)** - An ELO is a subordinate objective that supports the achievement of a TLO. An ELO defines the skills a learner must master to successfully complete a topic.

## 1.4 Data module codes for training data modules

The item location code for training data module is set to "T", for those projects that either have legacy training data modules or have no requirement to be Shareable Content Object Reference Model (SCORM) conformant and they do not use learn code and/or learn event code.

Project that have a requirement to be SCORM conformant use the learn code and/or learn event code. Refer to [Chap 4.3.9](#) and [Chap 4.3.10](#).

The item location code for SCORM conformant training data module is set to "T" when the information is purely training information. When operation and/or maintenance data modules are integrated in a training event and used in conjunction with learn and/or learn event code, the item location code of those training data module must have the same value "A", "B", "C" or "D" as the referenced operation and/or maintenance data module. Refer to [Chap 4.3.8](#).

## 2 Training

### 2.1 Planning information

Planning information describes learning needs and goals, instructional design models, task analyses, learning taxonomies, and other information necessary to the lesson planning process.

This is an essential part of the process of defining training information. Refer to [Chap 3.9.7](#).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-Z-YYA (21 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-YYYY-Z-YYA (41 characters)

### 2.2 Training information

Training data modules contain only information that is specific to training. Any procedures that are already written, or planned to be written, as maintenance data modules must be presented as a link from the training data modules. Refer to [Chap 3.9.5.1](#) and [Chap 3.9.5.2.1.2](#).

#### 2.2.1 Introduction

The introduction data modules contain an explanation of the purpose, scope, structure, special format and use of the technical content.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-018Y-Z-YYA (21 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-018Y-Z-YYA (41 characters)

### 2.2.2 Course

The method of course delivery must be agreed to within a project. This can be met several ways utilizing SCORM to create a compliant package or using a SCORM content package.

The SCORM content package coding methodology utilized will depend on the course delivery mechanism. Refer to [Chap 4.15.1](#).

### 2.2.3 Module

A course module is an optional aggregate consisting of multiple lessons and multiple TLO. A SCORM content package is used to describe the course module.

The course module data module(s) specify:

- course module introduction
- course module objective

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-Z-YYA (21 characters)

thru

YYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYY-YYYY-Z-YYA (41 characters)

### 2.2.4 Lesson

A module lesson is an instructional aggregate consisting of multiple topics with one TLO. A TLO is a primary, measurable objective that defines the knowledge or skill a learner must master to successfully complete a lesson. The format and construct of the lessons will be agreed to within the project. A SCORM content package can be used to describe the lesson. Refer to [Chap 4.15.1](#). The lesson data modules specify:

- lesson introduction
- lesson objective

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-Z-YYA (21 characters)

thru

YYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYY-YYYY-Z-YYA (41 characters)

#### Note

The above data module coding must be used for those data modules that specifically contain training information only. Maintenance data modules that are being repurposed for training must be coded in the normal way for maintenance data modules and are not changed for use in training.

### 2.2.5 Topic

The lesson topic is the smallest instructional unit associated with one ELO, which is a subordinate objective that supports the achievement of a TLO. A SCORM content package can be used to describe the lesson. Refer to [Chap 4.15.1](#).

The format and construct of the topics will be agreed to within the project. The topic data module(s) specify:

- topic introduction
- topic objective
- topic content that is not contained in maintenance data modules
- maintenance data modules

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-Z-YYA (21 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-YYYY-Z-YYA (41 characters)

#### Note

The above data module coding must be used for those data modules that specifically contain training information only. Maintenance data modules that are being repurposed for training must be coded in the normal way for maintenance data modules and are not changed for use in training.

## 2.2.6 Test and sequencing

Testing and sequencing uses the process data module. For details on the specific use of this data module type, the state table and logic engine, refer to [Chap 4.11](#). Alternatively testing and sequencing can be based on other means supported by the learning information functionality of S1000D. Refer to [Chap 3.9.5.2.13](#), [Chap 3.9.5.2.17](#) and [Chap 4.15.1](#).

### 2.2.6.1

#### Test

This aspect will cover knowledge checks, practice sessions, assessment and feedback through testing. The method of testing can be scenario based, practice based, etc, and will be as agreed to within the project. The format and construct of the tests will be agreed within the project. The test data modules specify:

- knowledge check
- practice sessions
- assessment
- feedback

Note that within some projects that this information can be interactive and integrated into a higher level LMS. In these cases the project will decide on the integration and feedback mechanisms.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-Z-YYA (21 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-YYYY-Z-YYA (41 characters)

#### Note

The above data module coding must be used for those data modules that specifically contain training information only. Maintenance data modules that are being repurposed for training must be coded in the normal way for maintenance data modules and are not changed for use in training.

### 2.2.6.2

#### Sequencing

The sequencing through data modules is achieved using the process data module.

### 2.2.6.3

#### Example constructs

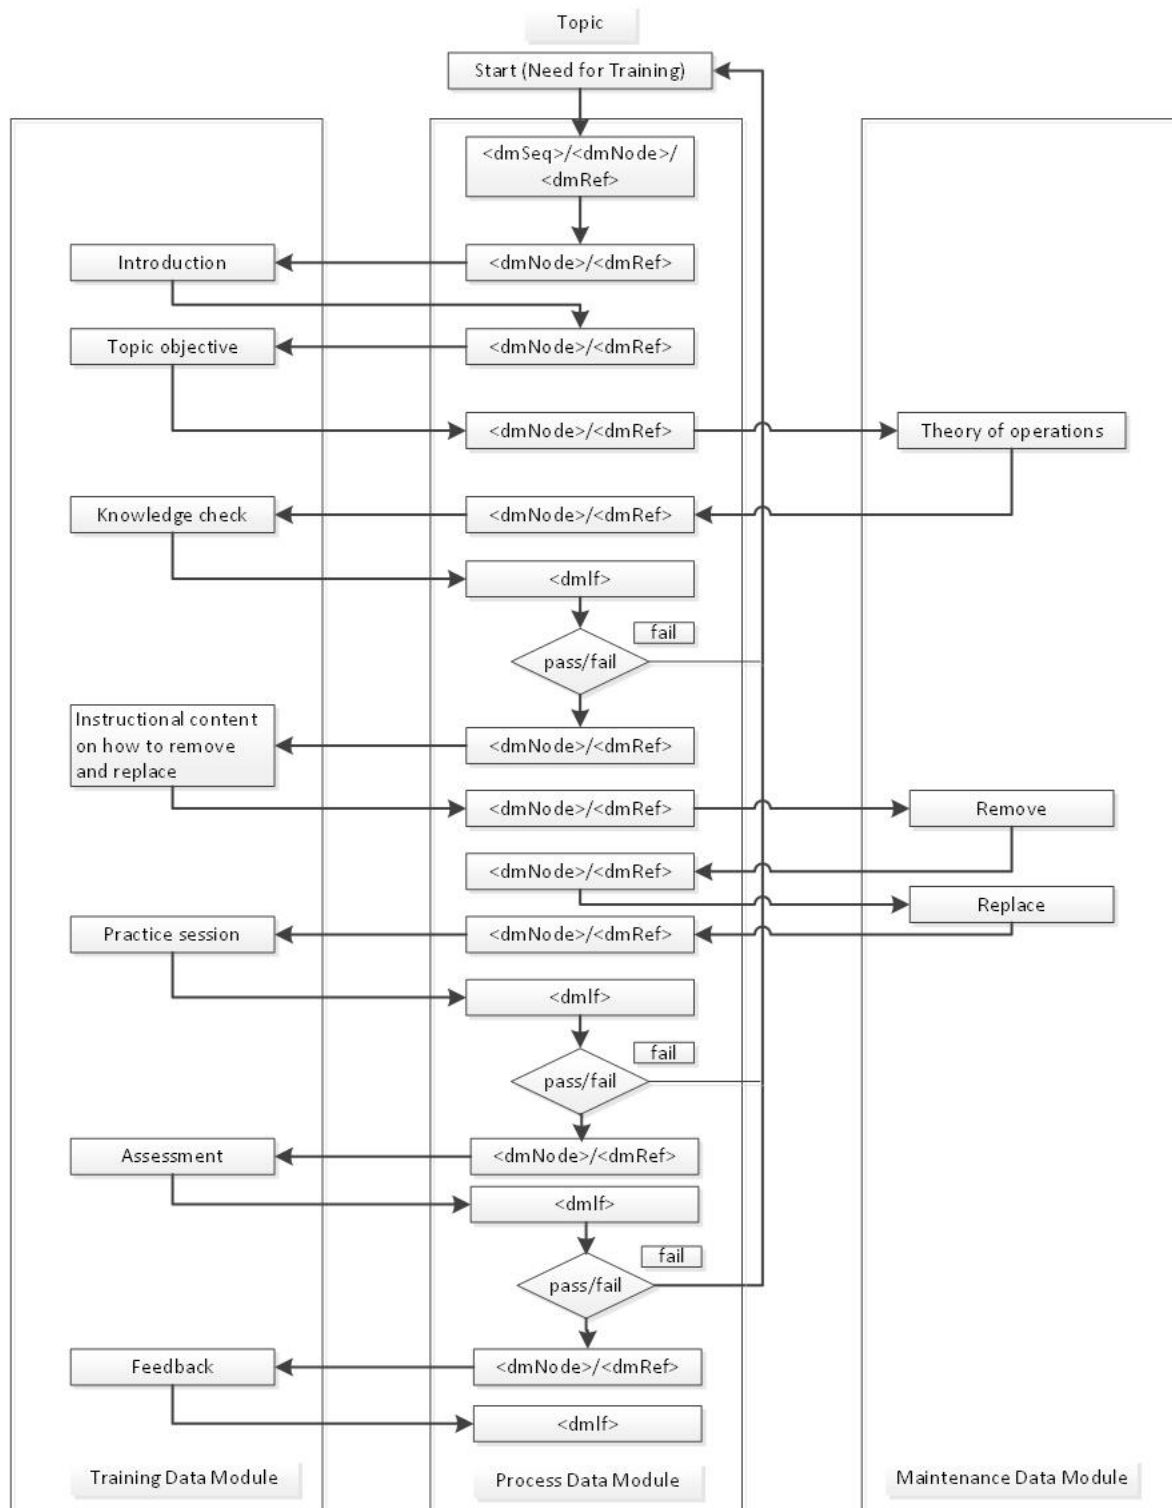

[Fig 2](#) shows an example topic construct that utilizes training and maintenance data. The example shows the possible flow of information, question points and the possible feedback/return paths. These are identified in four types:

- Sequencing, using the process data module

- 
- Traversal to a maintenance data module after training content has been delivered via a training data module
  - Return to the practice session data module after test. This would be invoked by establishing pass/forwarding criteria within the process data module.
  - Feedback to the user

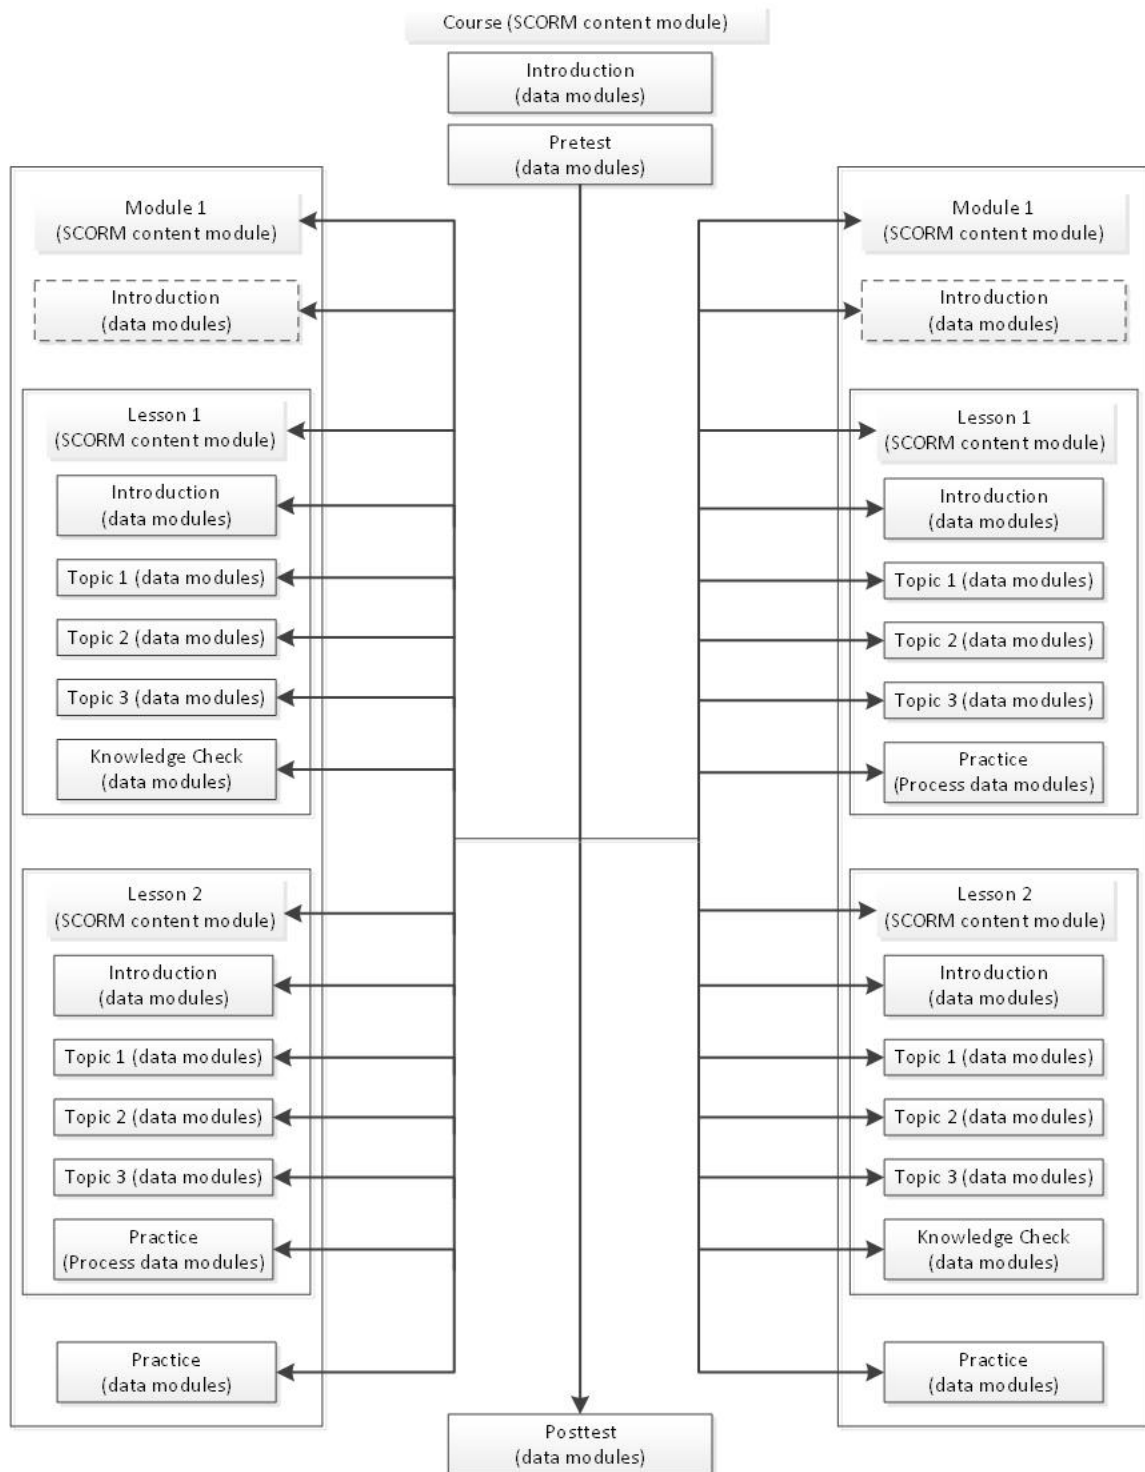

The decision boxes in [Fig 2](#) represent the IF expression within the process data module.

[Fig 3](#) shows an example course construct that utilizes the SCORM content package to "build" the course.

ICN-83007-000000109-001-01

Fig 2 Example - Topic construct

#### **1 General**

##### **1.1 Purpose**

The rules for the preparation and coding of the List of Applicable Publications (LOAP) information are given below.

## 1.2 Scope

The rules for the preparation of information for listing the applicable publications and other documents including individual data modules (not included in any of the technical publications) to enable the users to select the publications they require for planning, and to maintain, operate and support the Product are covered.

The LOAP is a publication which lists all technical publications and documents included in the technical publication package for a Product, a project or a part thereof. It is commonly used as a customized contractual document and during the delivery phase of the initial publication package. The LOAP is also frequently used during the in-service phase by the end users as well as administrators to have a configured overview of the publications and documents contracted for.

SCORM content package modules, SCO content data modules and learning data modules must not be listed in the LOAP.

### Note

During the in-service phase, the LOAP can become a consolidated LOAP including publications and documents produced and delivered by the contractor and other organizations.

The LOAP information set includes front matter data modules and one or more publication list data modules. It can also include an introduction data module.

For automatic population based on a publication module or for authoring as detailed in [Para 2.2](#), the publication list data modules can use:

- the front matter Schema (with the attribute `frontMatterType` set to the value "`fm05`" Publication list data modules), refer to [Chap 3.9.5.2.16](#) for details

or

- the descriptive Schema

As an alternative to deliver a LOAP according to [Para 2.2](#), a publication module can be used. In this case, the receiver of the information can produce the publication list data modules by using the front matter Schema (attribute value "`fm05`") or integrate the data into an IETP.

### Business rule decision point BRDP-S1-00445 - Use of a set of publication list data modules or a publication module for the LOAP:

- Decide whether to use a set of publication list data modules or a publication module to list the applicable publications and other documents including individual data modules.

### Business rule decision point BRDP-S1-00446 - Schema to use for the publication list data modules of the LOAP:

- Decide whether to use the front matter Schema or the descriptive Schema for the publication list data modules.

### Business rule decision point BRDP-S1-00447 - One consolidated or several separate publication list data modules for the LOAP:

- Decide whether to deliver the publications and documents listed in one data module/publication module (with one or more lists presented as tables) or as separate data modules/publication modules (eg, by operational publications or maintenance publications).

## 2 List of applicable publications

### 2.1 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2.2 Content

### 2.2.1 General

The LOAP must contain front matter as required and one or more publication list data modules (refer to [Para 2.2.2.2](#)) listing the references to all applicable publication modules, data modules, legacy technical publications or documents for the Product, the project or a part thereof as agreed with the customer.

#### Note

An alternative to creating individual data modules including front matter is to use the publication module. Refer to the respective business rule decision point in [Para 1.2](#).

The information in the publication list data modules can be grouped (eg, by operational, maintenance, equipment, support equipment, training equipment publications). The listing must be in alphanumeric sequence of the publication code, or equivalent, which is the entry to all lists. The listing can include unpublished publications or documents.

#### Business rule decision point BRDP-S1-00448 - Inclusion of unpublished publications and documents in the LOAP:

- Decide whether to include publications and documents those are not published.

#### Note

When used as a contractual document, all publications and documents, published or not, must be included.

### 2.2.2 Technical content

#### 2.2.2.1 Introduction

The introduction data module must provide information as specified in [Chap 5.3.1.2](#). It must be coded:

YY-Y-00-40-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-40-0000-**NNAAA**-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

#### 2.2.2.2 Data module coding

To assist in the coding of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules for publication lists must be coded:

YY-Y-00-40-00-**NNA**-014A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-40-0000-**NNAAA**-014A-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed

#### 2.2.2.3 Publication list data modules

The referenced publications and documents are listed in one or more publication list data modules using the front matter or the descriptive Schema. The publication list data modules include one or more lists presented as tables. Refer to [Table 2](#). The content of each entry is given in [Para 2.2.2.4](#). When using the front matter Schema, refer to [Chap 3.9.5.2.16](#) for details.

## 2.2.2.4

Populating the publication list data modules

Each entry in a publication list data module must include:

- **publication code** - the publication module code given in [Chap 4.9.1](#) or any other relevant publication or document code or number

It is recommended to markup the entry as element `<pmRef>`, element `<externalPubRef>` or element `<dmRef>` when using the descriptive Schema.

**Note**

In case of individual data modules, the data module code is used as entry in the table. Refer to the example given in [Table 3](#).

- **title** - the title of the publication or document. For equipment publications, the manufacturer's part number or reference number can, by project decision, be given as additional information.
- **issue identifier** - either or both of:
  - Issue number - the issue number of the publication or document
  - Issue date - the issue date of the publication or document
- **security classification** - the security classification/confidentiality of the complete publication as given in [Chap 3.9.5.1](#)

**Note**

If the publication is distributed for example on a CD-ROM, the security classification must correspond to the highest classified information on the entire CD-ROM.

- **publisher** - the company name or the CAGE code of the responsible company for the complete publication or document
- **media information** - gives information on which type of media the publication or document is available and its identifier (code) if different from the publication or document code

Each entry can also include:

- **language** - the language in which the publication or document is written

**Business rule decision point BRDP-S1-00449 - Markup of the publication entry as a link in the LOAP:**

- Decide whether to markup the publication entry as a link when using the descriptive Schema.

**Business rule decision point BRDP-S1-00450 - Include the manufacturer's part number or reference number in the LOAP:**

- Decide whether to include and present the manufacturer's part number or reference number.

**Business rule decision point BRDP-S1-00451 - Use of language in the LOAP:**

- Decide whether to include and present the language of the publication or document in the entries.

The column headers in the examples given below must be used.

[Table 2](#) shows an example of a publication list for aircrew publications. Example data module code of the list: 1B-A-00-40-00-01A-014A-A.

[Table 3](#) shows an example of a publication list for maintenance publications. Example data module code of the list: 1B-A-00-40-00-02A-014A-A.

[Table 4](#) shows an example of a publication list for engine publications. Example data module code of the list: 1B-A-00-40-00-03A-014A-A.

[Table 5](#) shows an example of a publication list for component and support equipment publications. Example data module code of the list: 1B-A-00-40-00-05A-014A-A.

*Table 2 Aircrew publications - Example*

Publication code	Title	Issue date	Publisher	Media information
		Issue No.	Security classification	
1B-D9460-00001-00	Aircrew manual, Batch 1	2003-09-04	C0419 Restricted	CD-ROM
1B-D9460-00002-00	Flight crew checklist	2003-09-04	C0419 Restricted	Paper

*Table 3 Maintenance publications - Example*

Publication code	Title (Language)	Issue date	Publisher	Media information
		Issue No.	Security classification	
1B-D9460-00105-00	Air vehicle maintenance planning (English)	2003-09-04	C0419 Restricted	CD-ROM 1B-D9460-00100-00-CD <sup>1</sup>
1B-D9460-00128-00	Air vehicle maintenance (English)	2003-09-04	C0419 Restricted	CD-ROM 1B-D9460-00100-00-CD <sup>1</sup>
1B-D9460-01001-00	IPD - Air vehicle (English)	2003-09-04	C0419 Unclassified	CD-ROM 1B-D9460-00100-00-CD <sup>2</sup>
1B-D9460-01001-00	IPD - Air vehicle (English)	2003-09-04	C0419 Unclassified	Paper 1B-D9460-01001-00-P <sup>2</sup>
F2-A-12-00-00-00A-200A-A	Servicing - No-step areas	2002-10-04	C0419 Unclassified	Paper <sup>3</sup>

1 These publications are included in an air vehicle publication.

2 This IPD is published on a CD and as a paper version.

3 This document is a data module. The only reference is the data module code.

Table 4 Engine publications - Example

Publication code	Title	Issue date	Publisher	Media information
		Issue No.	Security classification	
1B-D9460-00504-00	Engine manual	2003-09-04	D3309	CD-ROM
		002	Restricted	1B-D3309-0004

<a href="#">Chap 9.2</a>	Terms and data dictionary - Glossary of terms, abbreviations and acronyms
S4000M	International specification for developing scheduled maintenance programs

## 1 General

### 1.1 Scope

This chapter covers the rules for the preparation of information applicable to Maintenance checklists and inspection which will enable skilled personnel to perform required checks and services of the Product. It contains information about the necessary requirement for preventive checks and maintenance. The information contains the following topics:

- Preventive maintenance checks and services
- Checking unpacked equipment conditions
- Preventive maintenance inspections
- Special inspections

The data and information are based on technical analyses using the objectives of an efficient maintenance program.

### 1.2 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Maintenance checklists and inspection information.

### 1.3 Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate.

- **Preventive Maintenance Checks and Services (PMCS):** Periodic inspection and maintenance at scheduled intervals to ensure that the equipment and its components remain mission capable and in good operating condition. In aircraft, checks are required of mandatory safety-of-flight items. Lubrication is part of PMCS.

## 2 Maintenance checklists and inspections

### 2.1 Introduction

If required, the introduction data modules contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

A list of terms can be included which defines conditions (eg, excessive), damage (eg, crack) and other relevant terms (eg, inspection types).

Data modules must be coded:

YY-Y-05-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-00-0000-**NN**AAA-018Y-A (37 characters)

Where "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

## 2.2 Data module coding

To assist in the codification of data modules the rules which follow must be used in addition to those given in [Chap 4.3](#).

### 2.2.1 Preventive maintenance checks and services

Data modules must be coded:

YY-Y-05-10-**SS**-**NN**A-200Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-10-**SS**00-**NN**AAA-200Y-A (37 characters)

Where:

- "**SS**", the system to which data and information are applicable. Refer to [Chap 8.2](#).
- "**NN**", the subsystem if it is necessary to split the system into several subsystems, if not, use "00". Refer to [Chap 8.2](#).

Example:

- Data and information about PMCS for parts of the landing gear, system 32, is coded: 1Y-A-05-10-32-00A-200A-A

### 2.2.2 Checking unpacked equipment conditions

Data modules must be coded:

YY-Y-05-20-**SS**-**NN**A-870Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-20-**SS**00-**NN**AAA-870Y-A (37 characters)

Where:

- "**SS**" is the system to which data and information are applicable. Refer to [Chap 8.2](#).
- "**NN**" is the subsystem if it is necessary to split the system into several subsystems (if not, use "00"). Refer to [Chap 8.2](#).

Example:

- Data and information about Checking unpacked equipment conditions of the landing gear, system 32, is coded: 1Y-A-05-20-32-00A-870A-A

### 2.2.3 Preventive maintenance inspections

Data modules must be coded:

YY-Y-05-**XX**-00-**NNA**-310Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-**XX**-0000-**NNAAA**-310Y-A (37 characters)

Where:

- "**XX**" gives the inspection type:
  - 40 - Scheduled check (eg, Preflight inspection).
  - 50 - Unscheduled check (eg, Inspection after hard landing)
  - 60 - Acceptance and functional check flight
- "**NN**" is a sequential number to identify a specific check.

Example:

- The definition of a Check after hard landing is coded: 1F-A-05-50-00-18A-000A-A

### 2.2.4 Special inspections

Data modules must be coded:

YY-Y-05-**XX**-00-**NNA**-310Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-**XX**-0000-**NNAAA**-310Y-A (37 characters)

Where:

- "**XX**" gives the inspection type:
  - 40 - Scheduled check (eg, Preflight inspection).
  - 50 - Unscheduled check (eg, Inspection after hard landing)
  - 60 - Acceptance and functional check flight
- "**NN**" is a sequential number to identify a specific check.

Example:

- The definition of a Check after hard landing is coded: 1F-A-05-50-00-18A-000A-A

## 2.3 Preventive maintenance checks and services

The PMCS data module are prepared and based upon the principles of the analysis for the scheduled maintenance program (according to S4000M, Reliability Centered Maintenance (RCM) logic, etc) and includes PMCS information, periodic lubrication instruction and applicable scheduled corrosion inspections.

- Each line entry is built up from the items defined below
- Each item is filled up as necessary in accordance with the description given
- Only one value is given for each item. If items are subject to various values, as many line entries as values are provided

### 2.3.1 Item number

Item numbers are assigned to the PMCS procedures. The PMCS procedures are arranged in a logical sequence requiring minimum time and motion on the part of the persons performing

them, and are arranged to minimize the interference between persons performing the checks simultaneously on the same end item.

### 2.3.2 Intervals

The designated interval (eg, "Before", "During", "After", "Weekly") when each check is to be performed are included. Procedures done first or most frequently (eg, "before" checks and services) appear prior to "During" and "After" checks and services. When more advantageous to the user, intervals are subgrouped by crewmembers. The "core" PMCS intervals which can be used are as follows:

- Before
- During
- After
- Daily
- Weekly
- Monthly
- Quarterly
- Semiannually
- Annually
- Periodic
- Intermediate (Aviation only)
- Man-hour/day (Aviation only)
- Phased (Aviation only)
- Other

### 2.3.3 Duration or man-hours

When specified by the acquiring activity, duration or man-hours that are required to complete all prescribed lubrication services must be included. Man-hours must be stated to the nearest 10th of an hour.

### 2.3.4 Equipment

Information identifying the item or system to be checked is identified in as few words as possible to clearly identify the item. Usually the common name (eg, bumper, gas can and mounting bracket, front axle) will be enough.

### 2.3.5 PMCS Procedure

The procedure by which each check is to be performed, as well as any information required to accomplish each check or service, including lubrication, appropriate tolerances, adjustment limits, and instrument gage readings is provided. Illustrations are prepared to identify the location or the process of the task being performed and must be integrated with the procedures. Whenever replacement or repair is recommended, the maintenance task is included or the applicable maintenance data module is referenced. Any periodic/scheduled lubrication procedures required for the equipment are included in the PMCS procedures.

### 2.3.6 Equipment not ready or available

A brief statement of the condition ("Equipment not available if it is malfunctioning") that would cause the equipment to be less than fully ready to perform its assigned mission is provided. If the procedure contains detail steps the statement is placed opposite the applicable task.

## 2.4 Checking unpacked equipment conditions

Instructions can be prepared for a condition check of the shipment (including that of pallets, containers, boxes, and legibility of markings). The information lists each item of a component by location that requires inspection. The information can be contained in tabular format.

- Each line entry is built up from the items defined below.
- Each item is filled up as necessary in accordance with the description given.

- Only one value is given for each item. If items are subject to various values, as many line entries as values are provided (except items where several values are allowed)

#### 2.4.1 Location

The location includes a short description describing the location of the item being inspected.

#### 2.4.2 Equipment item

Information identifying the item that requires inspection stated in as few words as possible. Usually the common name (eg, bumper, gas can and mounting bracket, front axle) is enough.

#### 2.4.3 Equipment item

Information identifying the item that requires inspection is stated in as few words as possible. Usually the common name (eg, bumper, gas can and mounting bracket, front axle) is enough.

#### 2.4.4 Action

For each item listed, an inspection action is provided and, when needed, a reference can be made to an associated data module. Each component item can require multiple actions and subordinate actions to describe the inspection requirements. Each first level action can provide a separate reference to a data module for further details on an inspection or an action to be taken.

#### 2.4.5 Remarks

Any additional remarks are included in the remarks section.

### 2.5 Preventive maintenance services inspections

A data module can be developed for each specific inspection interval (eg, daily, intermediate, periodic, 10 h/14 day, 30 h/42day), as applicable to the aircraft. Inspection checklists are divided by areas of the aircraft (eg, nose, fuselage, tail). All items requiring inspection must be listed in the logical sequence of inspection that would require a minimum of time and motion on the part of the individual performing the inspection. The checklist data can be contained in a table.

Each data module contains the following information:

- Sequence number. Refer to [Para 2.5.1](#).
- Work area. Refer to [Para 2.5.2](#).
- Procedures. Refer to [Para 2.5.3](#).
- Task duration. Refer to [Para 2.5.4](#).

#### 2.5.1 Sequence number

Each inspection must be assigned a sequence number.

#### 2.5.2 Work area

If applicable, each inspection can be assigned a work area.

#### 2.5.3 Procedures

All procedures required to perform each of the required inspections are captured. When an inspection item is not to be performed during each inspection, the interval/frequency must be stated within in the procedure (eg, Perform only every 2nd inspection).

#### 2.5.4 Task duration

The time required perform the inspection task must be captured.

### 2.6 Special inspections

Items that qualify for special inspections (eg, hard landings, sudden stoppage, over speed) are included. These inspections are grouped under specific aircraft areas. A line drawing of the

aircraft or accessory showing sequence for inspection by area is included. The area identified must include all surfaces, materials, components, and equipment pertaining to that specific location. The following inspection data entries must be included, as applicable, and can be presented in tabular format.

**2.6.1 Zone**

Zone must include area name and number.

**2.6.2 Item number**

Inspection number must be captured.

**2.6.3 Interval**

The designated interval when inspections are to be performed is captured for the purpose of creating columns to identify when each inspection should be performed.

**2.6.4 Equipment item**

Information identifying the item that requires inspection is stated in as few words as possible.

**2.6.5 Inspection procedure**

All procedures required to perform each of the required inspections are captured. When an inspection item is not to be performed during each inspection, the interval/frequency must be stated within in the procedure (eg, Perform only every 2nd inspection).

#### **1 General**

This chapter provides the references for the preparation and coding of air specific Information sets.

#### **2 Air specific information sets**

Guidance is given in the following chapters:

- Use of generic information. Refer to [Chap 5.2.2.1](#).
- Structure repair information. Refer to [Chap 5.2.2.2](#).
- Cross servicing information. Refer to [Chap 5.2.2.3](#).
- Engine maintenance information. Refer to [Chap 5.2.2.4](#).
- Power plant build-up information. Refer to [Chap 5.2.2.5](#).
- Engine standard practices information. Refer to [Chap 5.2.2.6](#).
- Aircrew information. Refer to [Chap 5.2.2.7](#).

<a href="#">Chap 5.2.1.3</a>	Common information sets - Maintenance information
<a href="#">Chap 5.2.1.3.4</a>	Maintenance information - Corrosion control
<a href="#">Chap 5.2.1.14</a>	Common information sets - Battle damage assessment and repair information
<a href="#">Chap 8.2.5</a>	Maintained SNS - Air vehicle, engines and equipment

## **1 General**

### **1.1 Purpose**

The preparation and coding of Air vehicle Structure Repair (ASR) information data modules must follow the rules contained here.

### **1.2 Scope**

The rules covered here enable skilled personnel to assess and repair damage. Battle Damage Assessment and Repair (BDAR) information is covered in [Chap 5.2.1.14](#).

In accordance with the SNS (refer to [Chap 8.2.5](#)), the breakdown of the ASR information must be as follows:

Applicable to: All

**S1000D-A-05-02-0202-00A-040A-A**

**Chap 5.2.2.2**

- System 51           Standard practices - Structures
- System 52           Doors
- System 53           Fuselage
- System 54           Nacelles/Pylons
- System 55           Stabilizers
- System 56           Windows and canopies
- System 57           Wings

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Structure repair information

### 2.1 General

Repairs due to corrosion damage must be included where necessary. Identification, classification and removal of corrosion are part of the Corrosion Control (CC) information set. Refer to [Chap 5.2.1.3.4](#).

Instructions for one time (ferry) flight repairs, temporary repairs and critical area repairs include information on flight restrictions to be imposed (if applicable) until such time as permanent repairs have been completed.

Illustrations, diagrams and related tables are included in the information with such additions as can be required to illustrate detailed repair of the air vehicle.

The ASR information set includes an overview illustration of each major structure group. Index numbers identify all items in the group which can be repaired, or where a repair is done by replacement. A complementary table also lists the items and gives such information as figure number, index number, description, material specification and gauge (thickness), and cross references to where repair limits and repair schemes can be found.

Standard repair illustrations are provided. Such illustrations show the materials and dimensions of repair items, the types, sizes, pitch and edge distances of fasteners etc. Further illustrations are included of specific repairs.

Illustrations are included for the major structural components (wing, stabilizer, etc) which will provide contour data and dimensions necessary for the construction of locally made templates, support fixtures, and repair jigs for use in repairing the principal components. Where applicable, contour data include the list of contour and master dimension drawings or links to design information.

Illustrations of structural repair kits (and explanation of the use of each kit) are provided, when applicable.

### 2.2 Technical content

#### 2.2.1 Introduction

If required, the introduction data modules contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-00-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-000-00-0000-**NNAAA**-018Y-A (37 characters)

where "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

## 2.2.2 Standard practices - Structures

For system 51, this information covers, but is not limited to, the following contents:

### 2.2.2.1 General description of air vehicle structure

Using information code 041, these data modules describe the air vehicle, such as:

- type of construction
- special materials used
- classification of damage
- types of repair
- major structural group breakdown

### 2.2.2.2 Aerodynamic smoothness requirements

Using information code 361, these data modules give information on aerodynamic smoothness requirements for the air vehicle and permissible contour variations, gaps and mismatch data.

### 2.2.2.3 Clean-up of dents, cracks and scratches

Using information code 649, these data modules give information on negligible and/or minor dents, cracks, scratches and the description of the surface treatment after their repair.

### 2.2.2.4 Airframe sealing

Using information code 259, these data modules give information on all areas requiring sealing, type of seal required in each area, sealing procedures to be used, etc. General fuel tank sealing is described separately.

### 2.2.2.5 Pressure check

Using information code 362, these data modules give information on special pressure testing of sealed compartments wherever such testing will be required after repair to check for leakage or structural integrity.

#### Note

General pressure testing is included within the maintenance information set. Refer to [Chap 5.2.1.3](#).

### 2.2.2.6 Materials

Using information code 072, these data modules give the following information:

- Description of materials including extrusions, formed sections, sheet, sealants, adhesives and special materials used in air vehicle repair. Where possible, permissible alternatives are given.
- Materials to be covered such as:
  - Metallic: Steel, aluminum alloys, titanium alloys, nickel-based alloys, copper, lithium etc
  - Non-metallic: Protective coating materials, sealants and related products, fiber reinforced materials, miscellaneous materials, etc, as far as they are not contained in the list of consumable materials
- Material identification and conversion table

Alternatives for metallic and non-metallic materials are given. These are presented in tabular form with table headings as shown in [Table 2](#). An example of a note belonging to the table is also given.

Table 2 Extruded rubber standard sections - Example

Original design material		Alternative material		Other usable material	
Specification	User nation	Specification	User nation	Specification	User nation
XXXXX	FRG	XXXXX	UK	YYYYY	US
		XXXXX	IT	TTTTT	UK
		XXXXX	SP	ZZZZZ	IT
				WWWWW	SP
				VVVVV	FRG
				TTTTT	NL

**Note**

Commercial semi-finished produce name: Sealing profile, DTD 5583 Grade 50.  
Delivery state: Dimensions see Fig 1, Detail A.  
Method of retention: Integral buttons.

- 2.2.2.7 Fasteners  
Using information code 078, these data modules describe all fastener types, materials and sizes and give procedures for fastener installation and removal including preparing the hole. For replacement of fasteners, alternative fastener types and sizes are given.  
Installation and removal of Heli-coil wire thread inserts are described.
- 2.2.2.8 Support of air vehicle for repair  
Using information code 670, these data modules give information on support of adjacent air vehicle structure during repair to prevent structure deformation.
- 2.2.2.9 Alignment/Symmetry check procedures  
Using information code 272, these data modules give information on measuring of the air vehicle structure after special events and repair of primary structure.
- 2.2.2.10 Control surface rebalancing  
– Using information code 271 (if applicable), these data modules give information on requirements and procedures for balancing of control surfaces.
- 2.2.2.11 Standard repairs  
Using information code 663, these data modules give information on typical repairs. Which are those, considered applicable to more than one major structure group (system 52 thru 57), for example skin patches, extrusion repairs, honeycomb type structures, formed structure repairs, special material repairs, metal-to-metal bonding, repair of fittings and replacement of bushings and bearings and other standard repairs as welding, heat treatments, forming. This information includes precautions necessary to prevent damage by drilling into hidden structures and building in assembly stresses.
- 2.2.3 Major structural components of the air vehicle**
- 2.2.3.1 General  
The systems 52 thru 57 contain the information of the major structural components. Each major structural component is broken down to system/subsystem level and the information then divided into:
- Identification

Applicable to: All

S1000D-A-05-02-0202-00A-040A-A

Chap 5.2.2.2

- Damage evaluation
- Repair information
- Inspection information

The major structural components are the following:

- Doors, as system 52
- Fuselage, as system 53
- Nacelles/Pylons, as system 54
- Stabilizers, as system 55
- Windows and canopies, as system 56
- Wings, as system 57

#### 2.2.3.2 Identification

Using information code 041, these data modules identify the materials used in the manufacture of the major assemblies. Illustrations and text concerning the air vehicle structure include concise description, material and significant drawing numbers. Where applicable, material information clearly defines the final heat treatment condition.

For typical structure component identification a tabular form is used. [Table 3](#) gives an example.

*Table 3 Structure component identification - Example*

Item (1)	Description (2)	Material specification (3)	Thickness (mm) (4)	Repair limits/remarks (5)
1				
2				
2A				
3				

Table description:

- 1 **Item** - All required items, shown on the appropriate illustration, are listed in this column, in sequential order, beginning with Item 1. For the addition of new items, numbers 1A, 1B, 1C, etc, can be used.
- 2 **Description** - This column contains the exact description of structural components shown in the appropriate illustrations
- 3 **Material specification** - All information concerning the type of materials (metallic and non-metallic) and, if available, the appropriate production methods (machined, chemically etched, welded etc) are given here
- 4 **Thickness (mm)** - Information concerning the maximum thickness of structural components, made from sheet material, is given in this column
- 5 **Repair Limits/Remarks** - This column gives the repair limits by reference to that part of information where the repair limits are given. If the item cannot be repaired but must be replaced, then the word "Replace" is inserted.

For existing specific or general repairs refer to the corresponding information.

For recommendation to replace the item refer to the information that tells you how to replace it.

- 2.2.3.3 Damage evaluation  
Using information code 661, these data modules give the following information:
- 2.2.3.3.1 *Negligible damage*  
Damage or distortion that is permitted to exist as it is, or can be corrected by simple repair methods such as blending a scratch, removing a dent, stop drilling a crack etc, without placing restrictions on flight.
- 2.2.3.3.2 *Negligible damage limits*  
The negligible damage limits are defined. If necessary, graphs or suitable illustrations can be used.
- 2.2.3.3.3 *Repairable damage*  
Damage which exceeds negligible limits but is not great enough to require repair by replacement is classified repairable. Repairable damage is further classified into standard repair schemes and specific repair schemes.
- 2.2.3.4 Inspection criteria  
Using information code 284, these data modules give the criteria for the following inspections:
- Preliminary external and internal inspection for skin buckles, deformation, etc
  - Detailed visual inspection for obvious damage areas, including information about critical points and access. Inspection methods and techniques, such as:
    - fire or heat damage (inspection using testers and discoloration of paintwork)
    - corrosion damage
    - pressure testing for strength or leaks
    - delaminated structure
  - For inspections after hazardous incidents (eg, excessive g, heavy landings, lightning strikes, emergency stop with the arrestor hook) and for inspections for corrosion, cross references are made to the air vehicle maintenance and the corrosion control information sets or associated data modules
  - Identification of those areas requiring the design authority to produce a repair scheme
  - Identification of the non-destructive inspection method to be used to determine the extent of damage, and reference to the applicable non-destructive inspection information
- 2.2.3.5 Classification of structure  
Using information code 667, these data modules give the classification of structural items. Structural items must be classified into primary and secondary structure. Specific repair information as given in [Para 2.2.3.6.3](#) must refer to this classification.
- 2.2.3.6 Repairs
- 2.2.3.6.1 *General*  
Using information codes 600, 662, 663, 664 and 665, sufficient information is given to enable the operator to carry out permissible repairs. One-time flight repairs (fly-in repairs), temporary repairs and specific repairs are shown for each major part or component, when applicable.
- 2.2.3.6.2 *Standard repairs and application*  
Refer to [Para 2.2.2.11](#).
- 2.2.3.6.3 *Special repair procedure*  
Using information code 664, these data modules give complete repair procedures and show compliance with all relevant design requirements.
- Illustrations of the members or components showing where the various types of repairs must be employed are given. The areas where each type must be used are indicated by shading or other appropriate means. When a combination of two or more repairs will weaken or over-stiffen the member above the safe limit, the combination is indicated and a caution is given to prohibit

such a combination. All specific repairs are identified by drawing, document or other reference number, as applicable.

Contour data and dimensions necessary for the construction of templates and repair jigs for use in repairing the principal components are provided at the end of each section.

Where a repair procedure involves more than one structural element, the repair must be contained under the subject with the lowest assigned subject number.

Wherever possible, standard parts are specified for use in repair or replacement. References in the information to these parts are made by the applicable part number.

**2.2.3.6.4**    *Temporary repairs*

Using information code 662, these data modules give complete repair procedures for a repair which fully restores the load carrying capacity of the structure, but is not necessarily aerodynamically smooth, nor able to satisfy fatigue considerations or interchangeability requirements. The temporary repair is replaced with a permanent repair at the earliest opportunity.

**2.2.3.6.5**    *Fly-in repairs*

Using information code 665, these data modules give complete repair procedures for a repair which restores a structural member to its load bearing capacity sufficiently so that the air vehicle can be flown to either a maintenance depot or the manufacturer for permanent repairs to be carried out.

**2.2.3.6.6**    *Procedures for replaceable structure assemblies*

These data modules contain replacement procedures, with complementary illustrations if necessary, for those structural component assemblies, subassemblies or items required to be replaced within the agreed upon repair policy and where a procedure is deemed necessary. Some of these replacement procedures can be covered in the air vehicle maintenance information set or associated data modules.

**2.2.3.6.7**    *Inspection and testing after repairs*

These data modules give the procedures for the inspections and tests (eg, pressure tests), if required after repair, (if appropriate by cross reference to the corresponding air vehicle maintenance information set or associated data modules).

**2.2.3.6.8**    *Structure inspection*

Using information code 285, these data modules give the structure inspections for allowable damage limits. Using information code 286, these data modules give the structure inspections for repair.

## Chapter 5.2.2.3

### *Air specific information sets - Cross servicing information*

STANAG Number 3430

North Atlantic Treaty Organization (NATO) - Standardization Agreement for Air vehicle cross-servicing guide

IEC Publication 60617

Graphical symbols for diagrams

## 1 General

### 1.1 Purpose

The preparation and coding of Air vehicle Cross-Servicing Guide (ACSG) information data modules must follow the rules contained here.

### 1.2 Scope

The rules covered here enable personnel, who can be unfamiliar with the specific Product, to safely service the air vehicle.

The detailed specification incorporates all the North Atlantic Treaty Organization (NATO) Standardization Agreement (STANAG) Number 3430 at Edition 7. Separate reference to the STANAG is therefore not necessary.

Air vehicle cross-servicing can be divided into two categories as follows:

- **Stage A cross-servicing:** The servicing of an air vehicle on airfields/ships. The servicing includes refueling, replenishment of fluids and gasses, drag chutes if applicable, starting facilities and ground handling.
- **Stage B cross-servicing:** The servicing of an air vehicle on airfields/ships which enables the air vehicles to be flown on an operational mission. The servicing includes all Stage A services plus the loading of weapons and/or film/video tapes and the replenishment of chaff or flares. This includes the processing and interpretation of any exposed film/video tapes from the previous mission.

The air vehicle cross-servicing guide must contain sufficient detailed information to permit the airfield/ship personnel to follow the correct procedure to cross-service the air vehicle without having to make reference to other national manuals. Detachable or reproducible checklists suitable for flight line use must be included whenever deemed appropriate.

### 1.3 Topics covered in a cross-servicing guide

The air vehicle cross-servicing guide must contain the following topics:

- Leading particulars
- Air vehicle handling, launching and recovery
- Replenishment, servicing points, engine starting and cooling
- Inspection and servicing procedures
- Main systems
- Armament
- Locally-manufactured items
- Glossary

When a topic does not apply the data module code and title must be included followed by the words "Not applicable".

**1.3.1 Minimum services required for air vehicle cross-servicing****1.3.1.1 Stage A**

The following services must be provided by those airfields/ships which have been assigned Stage A operational air vehicle cross-servicing requirements:

- Appropriate, fully maintained documentation
- Fuel, oil and lubricants in such quantities to ensure an adequate supply for servicing of air vehicles to enable them to return to their assigned base
- Adaptors to permit the use of available equipment in servicing specified types of air vehicle
- Facilities for replenishing gaseous and liquid oxygen
- Engine starting facilities
- Shelters to protect air vehicles being cross-serviced. When there are insufficient shelters, the priority for aircraft protection will be determined by the local operational commander.
- Facilities for towing and maneuvering air vehicles, including placing in shelters
- Trained ground crews to perform specified cross-servicing activities, including the recovery, drying, repacking and re-installation of drag chutes
- External power to enable navigation system stabilization

**Note**

Safety pins will be carried in air vehicles on all flights for all items which require pinning after flight. Items which are not normally carried on air vehicles must be pre-positioned by the home nation or locally manufactured by the host airfield/ship.

**1.3.1.2 Stage B**

The following services must be provided by those-airfield/ships which have been assigned Stage B operational air vehicle cross-servicing requirements:

- All services required for Stage A cross-servicing including sufficient quantities of replenishment materials to meet projected operational air vehicle cross-servicing requirements.
- Appropriate, fully maintained, air vehicle weapons loading schedules.
- Special arming tools, instructions, and equipment, necessary to prepare specified types of air vehicles for operational use as necessary.
- Fitting instructions and supplies of jettisonable fuel tanks for specified air vehicles.
- Ground handling equipment necessary for bomb loading, rocket installation, etc. Operational stores (ammunition, bombs, rockets, mines, torpedoes, sonobuoys, underwater sound charges, magnetic tape, chaff, flares, film, video tapes, etc) of types and quantities needed to meet the operational air vehicle cross-servicing requirements.
- Sufficient trained weapon loading teams to meet projected operational air vehicle cross-servicing requirements.
- Facilities for film processing and interpretation.
- Personnel trained in processing and interpretation, and in the uploading and downloading of the appropriate reconnaissance vehicles.

**1.3.2 Responsibilities of air vehicle captains**

Air vehicle captains must:

- ensure that all cross-servicing actions have been completed by checking the signatures of the responsible crew chief in the appropriate documents, by visual inspection and by preflight pilot's check
- brief the ground crew on duties and signals expected/desired in pre-departure activities.
- sign the appropriate acceptance documents on the completion of the air vehicle cross-servicing
- sign the appropriate foggy for services not provided free of charge, if applicable

## 1.4 Standard and definitions

The standards and definitions given in this specification are applicable with no exceptions.

## 2 Cross-servicing Information

### 2.1 General

#### 2.1.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-00-00-NNY-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-NNYYY-018Y-A (37 characters)

where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

#### 2.1.2 List of abbreviations

This data module must give a list of all the abbreviation followed by the word, word combination, expression or phrase abbreviated.

Data modules must be coded:

YY-Y-00-00-00-00Y-005Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-005Y-A (37 characters)

#### 2.1.3 List of technical terms

This data module must give a list, in alphabetical order, of the technical terms used in the ACSG both lists must be presented in. Data modules must be coded:

Data modules must be coded:

YY-Y-00-00-00-00Y-006Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-006Y-A (37 characters)

#### 2.1.4 List of symbols

This data module must give a list of all symbols (information code 007), and their meanings, used in the ACSG. If a recognized international standard for symbols (eg, IEC Publication 60617) is used, this must be stated. Any symbols not from an agreed upon standards list must be defined in a data module with information code 007. Any symbols from a recognized standard can reference the definition in the respective publication.

Data modules must be coded:

YY-Y-00-00-00-00Y-007Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-007Y-A (37 characters)

### 2.1.5 List of warnings

This data module must give a list of all standard warnings applicable to the ACSG as a whole (eg, those warnings associated with dangerous electrical voltages or with hazardous materials such as asbestos, beryllium, and polytetrafluoroethylene). Warning applicable to particular maintenance procedural information (eg, to release nitrogen pressure before disconnecting a pipe) must be included within the procedure, immediately before the operation/step where the danger exists. For further information on warnings, refer to [Chap 3.9.3](#).

Data modules must be coded:

YY-Y-00-00-00-00Y-012Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-012Y-A (37 characters)

### 2.1.6 List of applicable specifications and documentation

This data module must give a complete list of all specifications and documentation (eg, NATO Standards) which have been cross-referred to in the ACSG.

Data modules must be coded:

YY-Y-00-00-00-00Y-00VY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-00VY-A (37 characters)

## 2.2 Technical content

### 2.2.1 Leading particulars

Where possible, cross references must be made to existing descriptive data modules. Refer to [Chap 5.2.1.2](#).

#### 2.2.1.1 General description and operation of the air vehicle

These data modules must include a brief description of the air vehicle, its operation, and any relevant information enabling a distinction to be made between the different Marks or Models of the air vehicles covered by the ACSG.

Data modules must be coded:

YY-Y-00-00-00-**NNY**-040Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-**NNYYY**-040Y-A (37 characters)

#### 2.2.1.2 Safety charts

These data modules must include safety charts must be a tabular presentation, illustrated where necessary, to inform personnel of the avoidable hazards associated with the air vehicle, including all non-apparent hazards such as inter-related functions of systems, seat and canopy ejection systems and other cartridge operated devices. The safety charts must not replace or duplicate specific cautions and warnings included wherever applicable throughout the ACSG. The column headings of the safety charts must be as follows:

- 1 Servicing
- 2 Operation
- 3 Precautions

Applicable to: All

**S1000D-A-05-02-0203-00A-040A-A**

**Chap 5.2.2.3**

#### 4 Remarks

Data modules must be coded:

YY-Y-00-00-00-00Y-012Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-012Y-A (37 characters)

#### 2.2.1.3 Danger areas

This data module on danger areas must include such danger areas as:

- auxiliary power unit and engine running danger areas
- high power radio transmission
- microwave radiation hazards
- area swept by guns and weapons

Data modules must be coded:

YY-Y-00-00-00-00Y-012Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-012Y-A (37 characters)

#### 2.2.1.4 Walkways

These data modules must include illustrations showing the permitted walkways on the air vehicle.

Data modules must be coded:

YY-Y-12-00-00-**NNY**-010Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-00-0000-**NNYYY**-010Y-A (37 characters)

#### 2.2.1.5 Dimensions and weight data

These data modules must show a three view (top, front and side) line illustrations of the air vehicle, showing the principal overall dimensions, and a tabular presentation of the air vehicle dimension and weight.

Data modules must be coded:

YY-Y-YY-**YY**-YY-**NNY**-030Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-**YY**-YY-0000-**NNYYY**-030Y-A (37 characters)

where "YY-**YY**" or "YYY-**YY**", is 06-10 and 08-40

#### 2.2.1.6 Access and inspection openings diagrams

These data modules must give illustrations showing only those openings used in cross-servicing.

Data modules must be coded:

YY-Y-06-40-00-**NNY**-010Y-A (17 characters)

thru

Applicable to: All

**S1000D-A-05-02-0203-00A-040A-A**

**Chap 5.2.2.3**

YYYYYYYYYYYYYYY-YYYY-Y06-4000-0000-NNYYYY-010Y-A (37 characters)

- 2.2.1.7 Interior arrangements of compartments  
These data modules must give illustrations showing the compartment arrangement as necessary for servicing, rescue and firefighting.

Data modules must be coded:

YY-Y-06-30-40-**NNY**-010Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y06-30-0000-**NNYYYY**-010Y-A (37 characters)

- 2.2.1.8 Radio and radar equipment essential for flight  
These data modules must give information on the radio and radar equipment which is essential for flight, presented in illustration and tabular form and covering:

- type of equipment
- location
- identification
- frequency and function
- power source
- circuit breaker or fuse amperage

Data modules must be coded:

YY-Y-YY-**YY**-YY-**NNY**-010Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-**YY**-YY-0000-**NNYYYY**-010Y-A (37 characters)

where "YY-**YY**" or "YYY-**YY**", is 23-00 and 34-00

- 2.2.1.9 Armament installation  
These data modules must give information on which is necessary to permit servicing of air vehicle which on arrival has armaments installed. Air vehicle safety requirements prohibit servicing of air vehicle having installed explosive armament except during controlled exercises, therefore brief instructional procedures and related safety precautions must be included when applicable. Full consideration must be given to the fact that standard handling equipment will, in most cases, not be available.

Data modules must be coded:

YY-Y-12-00-00-**NNY**-012Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-00-0000-**NNYYYY**-012Y-A (37 characters)

## 2.2.2 Air vehicle handling, launching and recovery

### Note

Where possible, cross references must be made to existing maintenance procedural data modules. (Refer to [Chap 5.2.1.3](#)).

- 2.2.2.1 List of handling equipment requirements  
This data module must, in tabular form, list all the handling equipment and tools needed to do the instructions given in the ACSG. The list must be so designed as to permit the assembly of the equipment must be identified by an item number. The item number must be used in the text

Applicable to: All

**S1000D-A-05-02-0203-00A-040A-A**

**Chap 5.2.2.3**

and the illustrations whenever equipment is referred to in text or on illustrations. Sufficient information must be given, including drawings of attachment points, etc, for the items to be made by an NATO or Partnership for Peace (PfP) nation. The drawing must be contained in the topic "Locally-manufactured items" of the ACSG. Refer to [Para 2.2.7](#). All equipment normally carried on the air vehicle must be included and so identified.

The data module must be coded:

YY-Y-00-00-00-00Y-060Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-060Y-A (37 characters)

#### 2.2.2.2

Performance parameters for launching and recovery of air vehicles

- The maximum and minimum field take-off gross weights, distances and velocities must be given in the following format:
  - Field take-off distances to lift off: **ft/m at** and **lb/kg gross weight**
  - Field take-off velocity at lift off: **kt/km/h at** and **lb/kg gross weight**
- For carrier borne air vehicles, give the address of the appropriate national authority from which launch and arresting information can be obtained. Also give the recommended performance parameters, illustrated where necessary, for take-off and recovery on landing platforms of ocean-going vessels and escorts. Particular emphasis must be given to clearance areas required. These must be presented as shown in [Fig 1](#).

ICN-AE-A-05020203-A-D0216-00039-A-001-01

Fig 1 Helicopter clearance requirements

- 2.2.2.3 Handling safety chart  
These data modules must give all warnings and cautions specifically related to air vehicle handling, crash removal, and approaching the air vehicle immediately after landing. The handling safety chart must be presented in tabular form.
- Data modules must be coded:
- YY-Y-YY-YY-**NNY**-012Y-A (17 characters)
- thru
- YYYYYYYYYYYYYY-YYYY-YYY-**YY**-0000-**NN**YYY-012Y-A (37 characters)
- where "YY-YY" or "YYY-YY", is 07-40 and 09-10
- 2.2.2.4 Air vehicle overturn danger chart  
These data modules must give information on the air vehicle overturn imminence with respect to gross weight, sea state and ship roll axis. The information must be presented in tabular form.
- Data modules must be coded:
- YY-Y-10-20-00-**NNY**-010Y-A (17 characters)
- thru
- YYYYYYYYYYYYYY-YYYY-Y10-20-0000-**NN**YYY-010Y-A (37 characters)
- 2.2.2.5 Methods of grounding  
These data modules must give detailed procedures and requirements for grounding the air vehicle.
- Data modules must be coded:
- YY-Y-00-10-00-**NNY**-010Y-A (17 characters)
- thru
- YYYYYYYYYYYYYY-YYYY-Y00-10-0000-**NN**YYY-010Y-A (37 characters)
- 2.2.2.6 Towing and winching  
These data modules must give procedures and equipment for both forward and, if permitted, backward towing and winching. Illustrations must be used where necessary. Details of sheltering the air vehicle in hardened shelters must be given. The maximum force to be applied during normal towing or winching must be specified to ensure that the correct shear pins can be fitted to the tow bar, when applicable.
- Data modules must be coded:
- YY-Y-09-10-00-**NNY**-010Y-A (17 characters)
- thru
- YYYYYYYYYYYYYY-YYYY-Y09-10-0000-**NN**YYY-010Y-A (37 characters)
- 2.2.2.7 Deck securing and picketing (mooring)  
These data modules must give illustrations and if necessary data, of the approved method of deck securing and picketing (mooring).
- Data modules must be coded:
- YY-Y-10-20-00-**NNY**-010Y-A (17 characters)
- thru

YYYYYYYYYYYYYYY-YYYY-Y10-20-0000-**NN**YYY-010Y-A (37 characters)

- 2.2.2.8 Nose, wing, fin and rotor blade folding and unfolding  
These data modules must give procedures for folding and unfolding the nose, wings, rudder, fin and rotor blades. Any special precautions necessary when external stores are installed must also be given.

Data modules must be coded:

YY-Y-10-00-00-**NN**Y-010Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-00-0000-**NN**YYY-010Y-A (37 characters)

- 2.2.2.9 Gust locking procedures  
These data modules must give illustrations, incorporating if necessary procedures, for locking and unlocking movable surfaces.

Data modules must be coded:

YY-Y-00-30-00-**NN**Y-**YYY**Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-30-0000-**NN**YYY-**YYY**Y-A (37 characters)

where "**YYY**" are the information codes:

- 520 - Remove procedures
- 720 - Install procedures

- 2.2.2.10 Safety devices and protective covers  
These data modules must give illustrations, incorporating if necessary procedures, to remove and install safety devices and protective covers. Whenever possible, substitute methods for protective covers must be given.

Data modules must be coded:

YY-Y-00-30-00-**NN**Y-**YYY**Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-30-0000-**NN**YYY-**YYY**Y-A (37 characters)

where "**YYY**" are the information codes:

- 520 - Remove procedures
- 720 - Install procedures

- 2.2.2.11 Emergency access and crew evacuation  
These data modules must give illustrations showing the areas concerned, and the methods of gaining emergency access to those areas for crew evacuation. Details of the crew harness release must be included on the illustrations.

Data modules must be coded:

YY-Y-95-00-00-**NN**Y-010Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y95-00-0000-**NN**YYY-010Y-A (37 characters)

- 2.2.2.12 **Firefighting**  
 These data modules must give illustrations showing information to help fighting fires. The illustrations must include the location of all combustible materials in tanks, reservoirs, lines, etc. The information is intended to help NATO and PfP standard fire-fighting techniques, by giving all such data which is specific to the air vehicle.
- Data modules must be coded:
- YY-Y-00-00-00-**NNY**-010Y-A (17 characters)
- thru
- YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-**NNYYY**-010Y-A (37 characters)
- 2.2.2.13 **Slings and hoisting**  
 These data modules must give illustrations, procedures and data on:
- the method of slinging and hoisting the air vehicle
  - the location of the center of gravity
  - the minimum hook height necessary to complete the lift
  - the air vehicle attitude limits (angular displacement from level) that precludes the use of the sling
  - all relevant safety precautions
  - and pre hoisting procedures (eg, removal of external stores, folding rotors or wings)
- Data modules must be coded:
- YY-Y-07-30-00-**NNY**-000Y-A (17 characters)
- thru
- YYYYYYYYYYYYYYY-YYYY-Y07-30-0000-**NNYYY**-000Y-A (37 characters)
- 2.2.2.14 **Jacking**  
 These data modules must give illustrations, procedures and data on:
- the location, and if necessary the installation, of the jack pads
  - the maximum jacking weight of the air vehicle
  - the minimum capacity of the jack required at each jacking point
  - the distance from the ground to the jack pad with the tires deflated and the landing gear shock struts fully compressed
  - the distance from the ground to the jack pad with the landing gear shock struts fully extended and a 51 mm (2 in.) clearance beneath a correctly inflated tire
- Data modules must be coded:
- YY-Y-07-10-00-**NNY**-000Y-A (17 characters)
- thru
- YYYYYYYYYYYYYYY-YYYY-Y07-10-0000-**NNYYY**-000Y-A (37 characters)
- 2.2.3 Replenishment, servicing points, engine starting and cooling**
- Note**  
 Where possible, cross references must be made to existing maintenance procedural data modules. Refer to [Chap 5.2.1.3](#).
- 2.2.3.1 **Servicing and drain points**  
 These data modules must give illustrations identifying every point on the air vehicle requiring replenishment or drawing. NATO symbols and code numbers must be used as appropriate.

Data modules must be coded:

YY-Y-12-00-00-**NNY**-000Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-00-0000-**NNYYY**-000Y-A (37 characters)

#### 2.2.3.2 List of consumables

This data module must give a list of consumable materials with acceptable and emergency alternatives. The list must be presented in tabular form. The materials must be identified by the appropriate NATO stock numbers and also by appropriate important specifications.

The data module must be coded:

YY-Y-00-00-00-00Y-070Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-00YYY-070Y-A (37 characters)

#### 2.2.3.3 Types of replenishment connections for charging main vehicles

These data modules must give details of the type of coupling or fitting. If the connection is not to a NATO standard, manufacturing drawings must be given. Alternatively, manufacturing drawings can be replaced by a list of foreign sources which will supply details of the connection. These sources must be available to all other NATO nations subscribing to STANAG 3430, Responsibilities for air vehicle cross-servicing.

Data modules must be coded:

YY-Y-12-10-00-**NNY**-060Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-10-0000-**NNYYY**-060Y-A (37 characters)

#### 2.2.3.4 Capacity of systems and methods of replenishment or charging

These data modules must give all capacities and procedures for replenishment or charging. Sufficient data must be given to enable other nations to determine the servicing requirements.

Data modules must be coded:

YY-Y-12-10-00-**NNY**-200Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-10-0000-**NNYYY**-200Y-A (37 characters)

#### 2.2.3.5 Lubricating charts and symbols

These data modules must identify all items requiring preflight or daily lubrication and give sufficient illustrations to enable identification of all such lubrication points. A chart must be given identifying the symbols used for the periodicity (eg, preflight, daily) and the method of application (eg, by hand, brush, oil can, power gun, flexible extension).

Data modules must be coded:

YY-Y-12-20-00-**NNY**-240Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-20-0000-**NNYYY**-240Y-A (37 characters)

- 2.2.3.6 External hydraulic power application  
These data modules must give illustrations containing the procedure on how to apply external hydraulic power to the air vehicle hydraulic system. Requirements for normal and maximum pressure, normal and maximum flow rates, maximum fluid temperature, and minimum filtration, must also be given.  
  
Data modules must be coded:  
  
YY-Y-29-20-00-**NNY**-100Y-A (17 characters)  
  
thru  
  
YYYYYYYYYYYYYYY-YYYY-Y29-20-0000-**NNYYY**-100Y-A (37 characters)
- 2.2.3.7 External electrical power application  
These data modules must give illustrations containing procedures, complete with the appropriate safety precautions, on how to apply external electrical power to the air vehicle electrical system. Requirements for voltage and frequency regulation, current type and magnitude, phase and power factor for both servicing and engine start, must also be given.  
  
Data modules must be coded:  
  
YY-Y-24-20-00-**NNY**-100Y-A (17 characters)  
  
thru  
  
YYYYYYYYYYYYYYY-YYYY-Y24-20-0000-**NNYYY**-100Y-A (37 characters)
- 2.2.3.8 External pneumatic power application  
These data modules must give illustrations containing procedures on how to apply external pneumatic power to the air vehicle pneumatic systems. Requirements for nominal pressure, flow, temperature, and engine start time must also be given.  
  
Data modules must be coded:  
  
YY-Y-36-00-00-**NNY**-100Y-A (17 characters)  
  
thru  
  
YYYYYYYYYYYYYYY-YYYY-Y36-00-0000-**NNYYY**-100Y-A (37 characters)
- 2.2.3.9 Engine starting  
These data modules must give illustrations and necessary data required by the ground crew to help the pilot start the air vehicle's engines.  
  
Data modules must be coded:  
  
YY-Y-71-00-00-**NNY**-100Y-A (17 characters)  
  
thru  
  
YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NNYYY**-100Y-A (37 characters)
- 2.2.3.10 External air conditioning requirements  
These data modules must give illustrations containing the procedure to supply conditioned air to compartments or garments. Requirements for mass flow, temperature, pressure, filtration, maximum permissible moisture content and dehumidification following cooling, must also be given.  
  
Data modules must be coded:  
  
YY-Y-21-00-00-**NNY**-100Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y21-00-0000-**NN**YYY-100Y-A (37 characters)

#### 2.2.3.11

##### Drag chutes

These data modules must give illustrations and procedures for packing and stowing the drag chutes.

Data modules must be coded:

YY-Y-32-80-00-**NN**Y-700Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y32-80-0000-**NN**YYY-700Y-A (37 characters)

#### 2.2.4

##### Inspection and servicing procedures

Where possible, cross references must be made to existing maintenance procedural and planning data modules. Refer to [Chap 5.2.1.3](#) and [Chap 5.2.1.6](#).

#### 2.2.4.1

##### Access and inspection procedures

These data modules must give illustrations to show how access is obtained to enable inspection procedures to be done efficiently.

Data modules must be coded:

YY-Y-06-40-00-**NN**Y-010Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y06-40-0000-**NN**YYY-010Y-A (37 characters)

#### 2.2.4.2

##### Inspection

These data modules must give details of post-flight, preflight and turn-around inspections for an air vehicle staying up to 48 hours. Also given must be:

- all precautions necessary whilst doing the inspections
- required entries in the air vehicle's servicing forms
- inspections to be done immediately after landing (which are therefore only applicable to post-flight and turn-around inspections) such as checking the engine oil level within 15 minutes of engine shut down

The inspections must cover the air vehicle being service in, or out, of a hardened shelter.

For the presentations of post-flight, preflight and turn-around inspections, refer [Chap 5.2.1.6](#).

Data modules must be coded:

YY-Y-12-20-00-**NN**Y-281Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y12-20-0000-**NN**YYY-281Y-A (37 characters)

#### 2.2.5

##### Main system

These data modules must give only the information concerning the main systems, and their control, which is essential for safety of flight and is necessary for doing minimum essential servicing not covered elsewhere in the ACSG. Applicable testing must be given following the recommended servicing.

Data modules must be coded:

YY-Y-YY-YY-YY-NNY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-0000-NNYYY-YYYY-A (37 characters)

where:

- "YY-YY" or "YYY-YY", the codes are given in [Chap 8.2.5](#).
- "YYY" are the information codes:
  - 282 - Unscheduled inspections
  - 283 - Special regular inspections
  - 284 - Special irregular inspections
  - 300 - Examinations, tests and checks

## 2.2.6 Armament - Non-nuclear munitions

These data modules must include unloading procedures for all non-nuclear munitions, including all relevant safety precautions, and any essential information on non-nuclear munitions relevant for cross-servicing.

Data modules must be coded:

YY-Y-14-40-00-NNY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-40-0000-NNYYY-YYYY-A (37 characters)

where "YYY" are the information codes:

- 500 - Disconnect, remove and disassemble procedures
- 700 - Assemble, install and connect procedures

## 2.2.7 Locally-manufactured items

These data modules must contain a list and manufacturing drawings of all items which can be manufactured locally to enable servicing to be done. The drawings must contain sufficient information on the materials needed to enable suitable alternatives to be selected.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-064Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-064Y-A (37 characters)

## 1 General

### 1.1 Purpose

This chapter contains the detailed specification for preparation and coding, where appropriate, of data modules for Engine Shop Maintenance (ESM) information.

### 1.2 Scope

This detailed specification covers the requirement for the preparation of information applicable to engine shop maintenance which will enable skilled personnel to perform the maintenance of the basic engine and a limited maintenance on its components.

#### 1.2.1 Engine shop maintenance information

The ESM information must contain the following topics:

- 1 Description of how are made and the functions, where appropriate, of basic engines, modules, assemblies and their components. Definitions are given in [Para 1.3.2](#).
- 2 Technical data and information needed to gain access to and to maintain the previous hardware and a maximum number of parts that remain with the engine when it is removed from the air vehicle.

- 3 Fault isolation on the systems on-the-engine.
- 4 Data and information required to perform the maintenance of the components on the engine or off-the-engine. In this case, the maintenance must be limited, otherwise procedures to maintain the removed component must be provided as component maintenance information. Refer to [Chap 5.2.1.9](#).

The maintenance of items such as brackets, standoff's connecting the components to the basic engine, module or assembly is part of the ESM information.

#### Note

This detailed specification is also applicable to airborne auxiliary power plants (SNS 49-00).

### 1.2.2 Engine base maintenance information

The Engine Base Maintenance (EBM) information provides the same kind of information as the ESM but the depth of the maintenance is limited.

### 1.2.3 Engine depot maintenance information

The Engine Depot Maintenance (EDM) information provides the information of the ESM described in [Para 1.2.1](#), item 4 excluded.

#### Note

Because EBM and/or EDM are extractions of ESM, the rest of this detailed specification deals only with ESM unless otherwise mentioned.

## 1.3 Standards and definitions

### 1.3.1 Standards

The standards given in this specification are applicable with no exceptions.

### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate.

- **Basic engine:** Those units and items which are used:
  - to induce and convert fuel/air mixture into thrust/power
  - to transmit power to the propeller shaft, if any, and accessory drives
  - to supplement the function of other defined systems external to the engine
  - to control and direct the flow of internal lubricationThe nacelle and the reverser are excluded.
- **Basic module or assembly:** Module or assembly which make up respectively a basic modular or non-modular engine. Within this definition, a basic module or assembly has no installed components.
- **Lists of consumables and material:** These lists cover several data modules. They must contain for each item the following elements (refer to [Fig 2](#)):
  - The code number of the item
  - Its supplier code
  - Its description

Reference to the material data information (refer to [Chap 5.2.1.17](#)) for dangerous items must be given under the heading "Remarks".

#### Note

If these lists cover only one data module, they are provided in its data module content (refer to [Chap 3.9.5.2](#)).

- **Lists of special support equipment, tools and software:** These lists cover several data modules. They must contain for each item the following elements (refer to [Fig 3](#)):
  - The code number of the item
  - Its part number and its manufacturer code
  - Its description

For special items locally made, the mention "locally made" must be indicated under the heading of the list "Remarks".

#### Note

If these lists cover only one data module, they are provided in its data module content (refer to [Chap 3.9.5.2](#)).

- **Lists of standard support equipment and tools:** These lists cover several data modules. They must contain for each item the following elements (refer to [Fig 4](#)):
  - The code number of the item
  - Its description
  - Its characteristics (so as the operator can select and use the equipment of its choice)

They can be divided into nature of items, for example:

- tools
- test and calibration equipment

#### Note

If these lists cover only one data module, they are provided in its data module content (refer to [Chap 3.9.5.2](#)).

- **Major module:** Assembly of several modules managed as an entity (eg, a core engine)
- **Major part:** Significant item, part, subassembly or assembly to which a disassembly code and variant are given
- **Part Identifier (PI):** Code defined by the manufacturer identifying an item in a procedure and on the relevant figures (callout). To have an easier reading of the procedures, it is recommended to give the part identifier a group of numbers (eg, rotatables PI 300, expendables PI 600). If major parts are listed, their part identifiers must be the disassembly code and its variant.
- **Parts list:** List covering several data modules. It provides the user with information on items (eg, parts, subassemblies, collections of associated parts) which are identified in the procedures. The parts list (refer to [Fig 5](#)) must indicate for each item:
  - the part identifier
  - its part number and its manufacturer code
  - its name

Additional information defined by the project or the organization can be provided as required under the heading of the parts list "Remarks" (eg, modification number applicable to the item). Parts lists can be supported by illustrations as required. Each item must be identified on the illustration by its part identifier.

#### Note

If these lists cover only one data module, they are provided in its data module content (refer to [Chap 3.9.5.2](#)).

---

**Business rule decision point BRDP-S1-00452 - Additional information in parts lists for engine maintenance information sets:**

- Decide whether to indicate additional information under the heading of the parts list "Remarks" (eg, modification number applicable to the item).

Utopia Ministry of Defence

CLASSIFICATION

STEP	PROCEDURE
100	<u>HOW TO PREPARE THE LP TURBINE-DISK BEFORE THE INSTALLATION OF THE STAGE 2 TURBINE BLADES (Fig. 1) (Fig. 2)</u>
101	Install the plate (Ref. No. 2) on the module 6 blade installation-fixture (M0734).
102	Put the module 6 blade installation-fixture (M0734) around the stage 2 LP turbine-disk (08). This disk is on the disk support (M0742) in position on the multi-purpose workstand (M0085).
103	Adjust the plate (M0734) (Ref. No. 2) at 10 mm from the top edge of the stage 2 LP turbine-disk (08) with the adjustment posts and a depth gauge.
104	Find the recess No. 1 of the stage 2 LP turbine-disk (08). <u>NOTE</u> : The recess No. 1 is between the 2 spherical marks.
110	<u>HOW TO INSTALL THE STAGE 2 TURBINE-BLADES (Fig. 3)</u>
111	Get the stage 2 turbine-blade (06) No. 1 which is in its case in the module 6 blade storage crate (M0139).
112	Install the stage 2 turbine-blade (06) No. 1 in the recess No. 1 of the stage-2 LP turbine disk (08). The leading edge must be up. <u>NOTE</u> : Use degrip oil (P0636) to make the installation easier.
113	Install the 66 other stage 2 turbine blades (06) in the specified position sequence. Install a sealing plate (301) between 2 blades. <u>NOTE</u> : The installation occurs in the COUNTERCLOCKWISE DIRECTION WHEN YOU LOOK AT THE FRONT FACE of the stage 2 LP turbine-disk (08).
114	Operate the adjusting posts (Ref. No. 4) and regularly lower the plate (M0734) (Ref. No. 2). When the plate lowers, the 67 stage 2 turbine blades (06) also lower slowly (Fig. 1). <u>NOTE</u> : Push the sealing plates. <u>NOTE</u> : Lightly hit with a plastic mallet the blade roots one after the other to make sure they are in the correct position.
115	Continue with the installation of the stage 2 turbine-blades (06) until they are against the stage 2 turbine blade-retainer (07).

## **2 Engine maintenance information**

### **2.1 General**

The complete set of ESM data modules is specified in [Para 2.2](#), [Para 2.3](#) and [Para 2.4](#).

The ESM information must contain the following topics:

- information for the engine depending on its design concept: modular or non-modular
- information for its systems

Descriptions of these topics are given in the following paragraphs.

#### **2.1.1 Content for a modular engine**

The ESM must provide as required the following information:

- for the engine
  - Description and operation of the engine as a whole
  - Procedures
    - to remove Quick Engine Change (QEC)
    - to breakdown an engine into major modules and/or modules
    - to build up a desired engine from major modules and/or modules
    - to install the QEC
    - to test the engine
- for major modules
  - Description and operation of the major modules
  - Procedures
    - to breakdown major modules into modules
    - to build up major modules from modules
    - to test major modules if required
    - to store them
- for modules
  - Description and operation of the modules
  - Procedures
    - to undress modules (removal of components, piping, harnesses, etc)
    - to disassemble basic modules into subassemblies and/or parts
    - to maintain disassembled basic modules
    - to build up and dress modules
    - to test modules if required
    - to store them

#### **Note**

Actions on modules or components installed on an engine are provided in the procedures of the relevant item.

#### **2.1.2 Content for a non-modular engine**

The ESM must provide as required the following information:

- for the engine
  - Description and operation of the engine as a whole
  - Procedures

- to undress the engine (removal of QEC, components, piping, harnesses, etc)
- to breakdown the basic engine into assemblies (ie, compressors, combustion chamber)
- to build up a desired basic engine from assemblies
- to dress it
- to test the engine
- to store it
- for assemblies
  - Description and operation of the assemblies
  - Procedures
    - to disassemble assemblies into subassemblies and/or parts
    - to maintain disassembled assemblies
    - to build up assemblies
    - to store them

#### Note

Actions on assemblies or components installed on the engine are provided in the procedures of the relevant item.

### 2.1.3 Content for the systems

This heading is applicable to modular or non-modular engines.

The following information must be provided as required for the different systems:

- Description and operation of the systems and their components
- Procedures
  - for testing or fault isolating components on or off-the-engine
  - to maintain the systems and their components

The maintenance of components given here above must be limited otherwise they must be subject to Component Maintenance (CM) information sets ([Chap 5.2.1.9](#)).

The content of the topics dedicated to:

- Engines ([Para 2.1.1](#) and [Para 2.1.2](#)) must be provided in accordance with [Para 2.2](#).
- Components ([Para 2.1.3](#)) must be provided in accordance with the paragraph Equipment information of [Chap 5.2.1.9](#).

## 2.2 Technical content

### 2.2.1 General requirements

The technical content provides two categories of information:

- Technical data and descriptions. Refer to [Para 2.3](#).
- Maintenance procedures. Refer to [Para 2.4](#).

### 2.2.2 Data module coding

To assist in the codification of data modules, information codes are given and supplemented by additional specific requirements and/or explanations in subsequent paragraphs in addition to the rules given in [Chap 4.3](#).

### 2.2.3 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-72-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y72-00-0000-**NN**AAA-018Y-A (37 characters)

where "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed

The information code variant is used to distinguish between the different Information sets.

## 2.3 Technical data and descriptions

### 2.3.1 Technical data

These data modules must contain a brief outline of the nature of the item. They must also provide all special or important physical, electrical/electronic, mechanical and operational characteristics and performances. These characteristics and performances must be supported by illustrations as required.

Critical values and special precautions must be provided.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-030A-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-030A-B (37 characters)

### 2.3.2 Description of how it is made and its function

These data modules must contain description of how an item is made and its function when the item requires limited information.

The information must be given in accordance with [Para 2.3.3](#) and [Para 2.3.4](#).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-040A-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-040A-B (37 characters)

### 2.3.3 Description of how it is made

These data modules must provide the user with the means of becoming familiar with the item and of locating the main assemblies, modules, components or parts complying with the maintenance concept applied in the procedures. It is also to include interrelationship between subsystems.

Attention must be drawn to manufacturing or adjustment procedures (eg, rotation in one direction only).

Illustrations must support the description so as to simplify, shorten or make it easier to understand. They must describe the main elements and parts which have a particular importance.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-041A-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-041A-B (37 characters)

#### 2.3.4 Description of function

These data modules must provide the user with information and data to explain how the item functions.

Function is not to provide "how to operate an item".

Function must be described accurately and, whenever possible, illustrated with any of the following functional diagrams and/or lists enabling the user to understand and follow the fault isolation procedures:

- Block diagram used to simplify complex circuits to facilitate fault isolation. It allows understanding the function and operation of the system, subsystem, etc. It shows the arrangement of the system components and current/signal flow thru the system. The test and measurement points as well as terminal points mentioned in the procedures must be represented.
- Schematic diagram which can replace block diagram for simple items or complete it for complex items when required. In the latter case, references must enable to cross-refer easily from the block diagram to the schematic diagram and vice versa.
- Wiring diagram provided to identify the terminal points, interconnections and components in order to easily detect any fault in the item.
- List of all wires shown on a wiring diagram for complex components. It must be arranged in termination order and give the following information: pin number (whether used or not), wire number, reference of the wiring diagram on which they appear, to-from routine and applicability. Unused and spare wires must be identified.
- Circuit diagram for visual identification of components on the item.

All input/output signals must be identified.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-042A-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-042A-B (37 characters)

## 2.4 Maintenance

All the Work Sheets (WS) provided as required must only define the mandatory workflow to perform a work. Any other use of a WS in this annex is excluded (eg, work management in the workshop).

### 2.4.1 Setting-up of parts lists

Parts lists ([Para 1.3.2](#)) are set up as required for maintenance procedures and are relative to a given SNS.

Depending on the complexity of the item, the project or the organization will define which level of detail is applicable to the SNS. An example of setting-up parts lists is given hereafter.

Example:

Parts lists decided for the engine as model identification code JE:

- for the engine as a whole JE-A-72-00-00-00A-075A-D
- for the inlet casing module JE-A-72-21-00-00A-075A-D
- for the LP compressor module JE-A-72-31-00-00A-075A-D

## 2.4.2 Setting-up of other lists

The other lists ([Para 1.3.2](#)) must be dedicated lists. They are set up for a given SNS, except for Repair (information code 600) for which procedures are related to individual parts. In this case, lists set up for the information code 600 are applicable to the couple SNS-disassembly code and variant.

Example:

Dedicated list and its coding:

- List of special support equipment and tools to assemble the LP compressor JE-A-73-31-00-00A-704A-C where, in information code "704", the primary code "7" indicates "Assemble" and "04" the list of special support equipment and tools (used when assembling).

## 2.4.3 Servicing

These data modules must contain:

- Job Instructions (JI) for the servicing itself
- As required, WS for the workflow of the instructions necessary to perform servicing such as drain of storage fluid (information code 228), filling oil (information code 212), bleeding (information code 231)

Clean and apply surface protection (information code 250) must provide the methods specific to the items, otherwise, the preferred method is by referencing to engine standard practices.

Paint and varnish removals must be included in cleaning. Cleaning procedures must take the repairs previously applied to the item into account such as bounded or brazed parts.

Data modules must be coded:

YY-Y-YY-YY-YYY-2YYY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-2YYY-B (37 characters)

## 2.4.4 Examinations, tests and checks

### 2.4.4.1 Visual examinations

These data modules must provide the methods specific for examining items, otherwise, the preferred method is by referencing to engine standard practices.

Procedures must provide:

- JI for the examination itself such as borescope examination
- As required, WS for the workflow of the instructions necessary to perform examinations such as removal of harnesses or pipes for access, equipment calibration, close-up actions

Based on the results of visual examinations, the following status must be given in the procedure:

- Acceptance for continued operation
- Complementary checks to be performed in accordance with referenced data module in the procedure
- Repairable in accordance with repair procedures referenced in the procedure
- No longer serviceable or repairable

Data modules must be coded:

YY-Y-YY-YY-YYY-31YY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-31YY-B (37 characters)

#### 2.4.4.2 Test preparation

These data modules must contain the procedures and data to be carried out on an item, its assemblies or components before installation/connection on and/or removal from test bench or test equipment.

The procedures must provide:

- JI for simple tests preparation
- As required, WS for the workflow of the instructions necessary to perform tests preparation such as removal of blanking, checks of connectors, checks of short circuits to avoid damage of the test bench, checks of connections (pneumatic, hydraulic, etc)

If there is more than one test, each individual test must have its own test preparation.

If insulation tests are required, they must precede the function tests.

When test assembly diagrams are required, they must indicate all the standard equipment needed (oscilloscope, flow-meter, power supply, etc) with their name or their code given in the list of standard equipment. Refer to [Para 1.3.2](#).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-33YY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-33YY-B (37 characters)

#### 2.4.4.3 Function tests

These data modules contain tests to evaluate as required the operational efficiency and integrity of an engine, modules or components after maintenance actions.

Function tests must provide:

- JI describing the tests and providing acceptance limits
- As required, WS or charts ([Fig 7](#) and [Fig 8](#)) for the workflow of the instructions necessary to perform function tests and to close up such as test preparation, calibrating, servicing

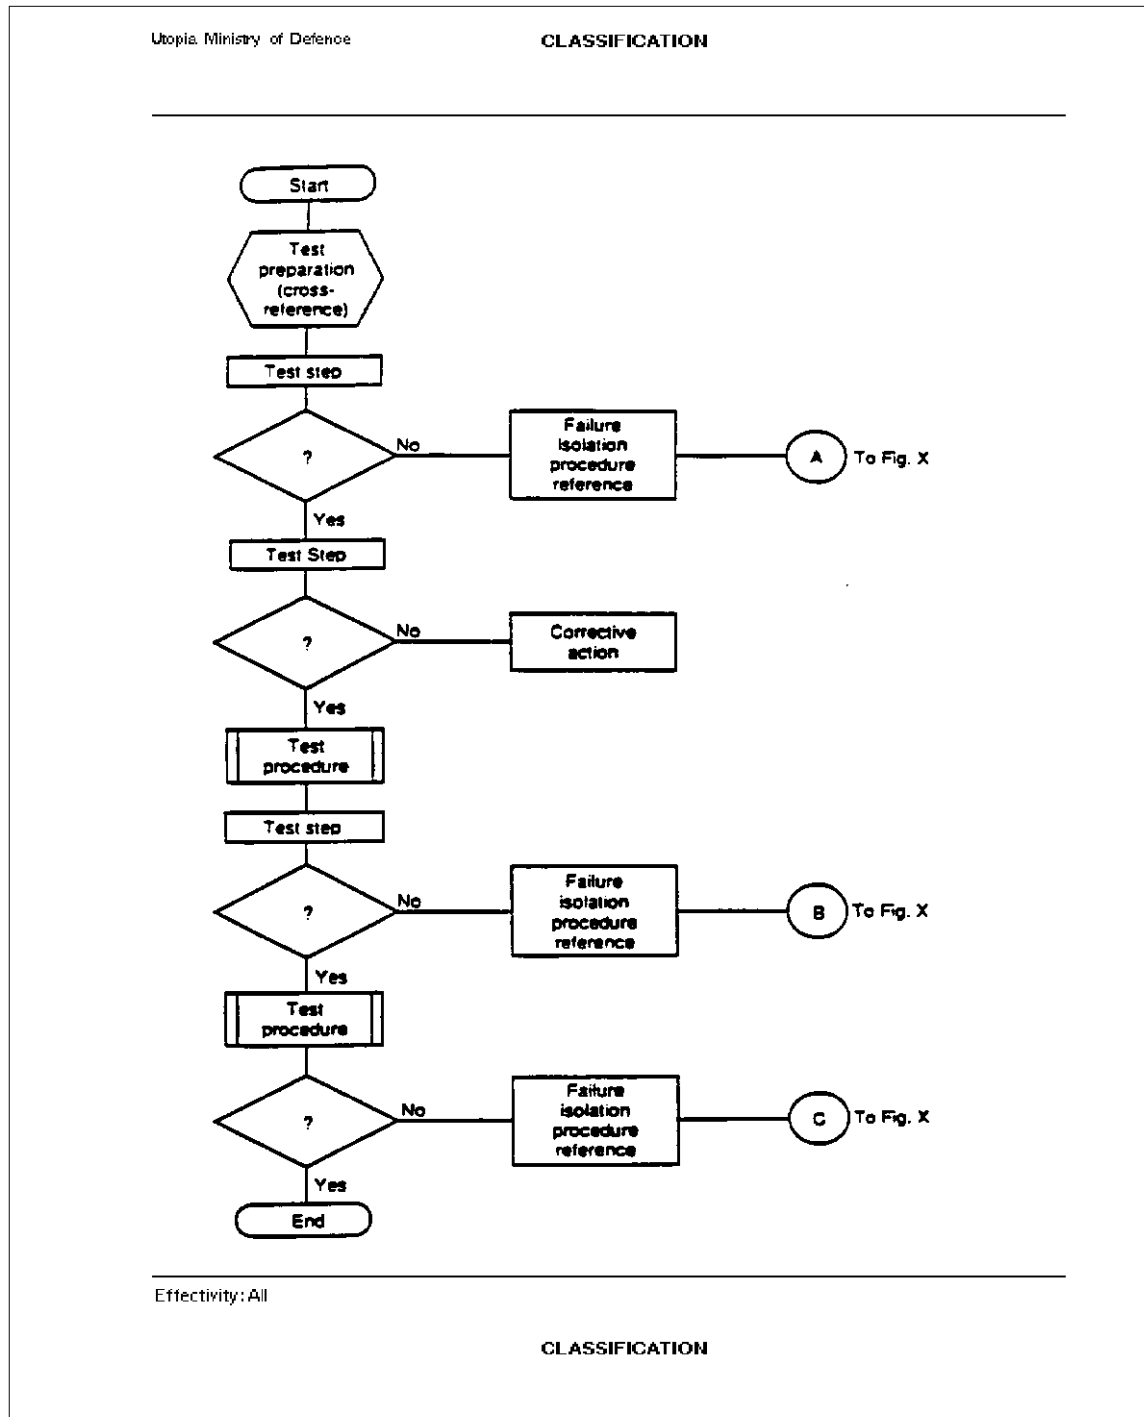

Special conditions applicable to the test must be specified and their characteristics given (eg, climatic conditions, room temperature, relative humidity, max speed and direction of the wind).

To minimize the amount of engine running necessary to perform the tests after several maintenance actions (eg, a module replacement, work on the oil system and adjustment of a fuel component), a matrix can be provided to select the sequence of JI so that the appropriate level of test is applied.

For items requiring a complex environment, the procedure must give at the applicable step the code of the standard equipment contained in the relevant list. Refer to [Para 1.3.2](#).

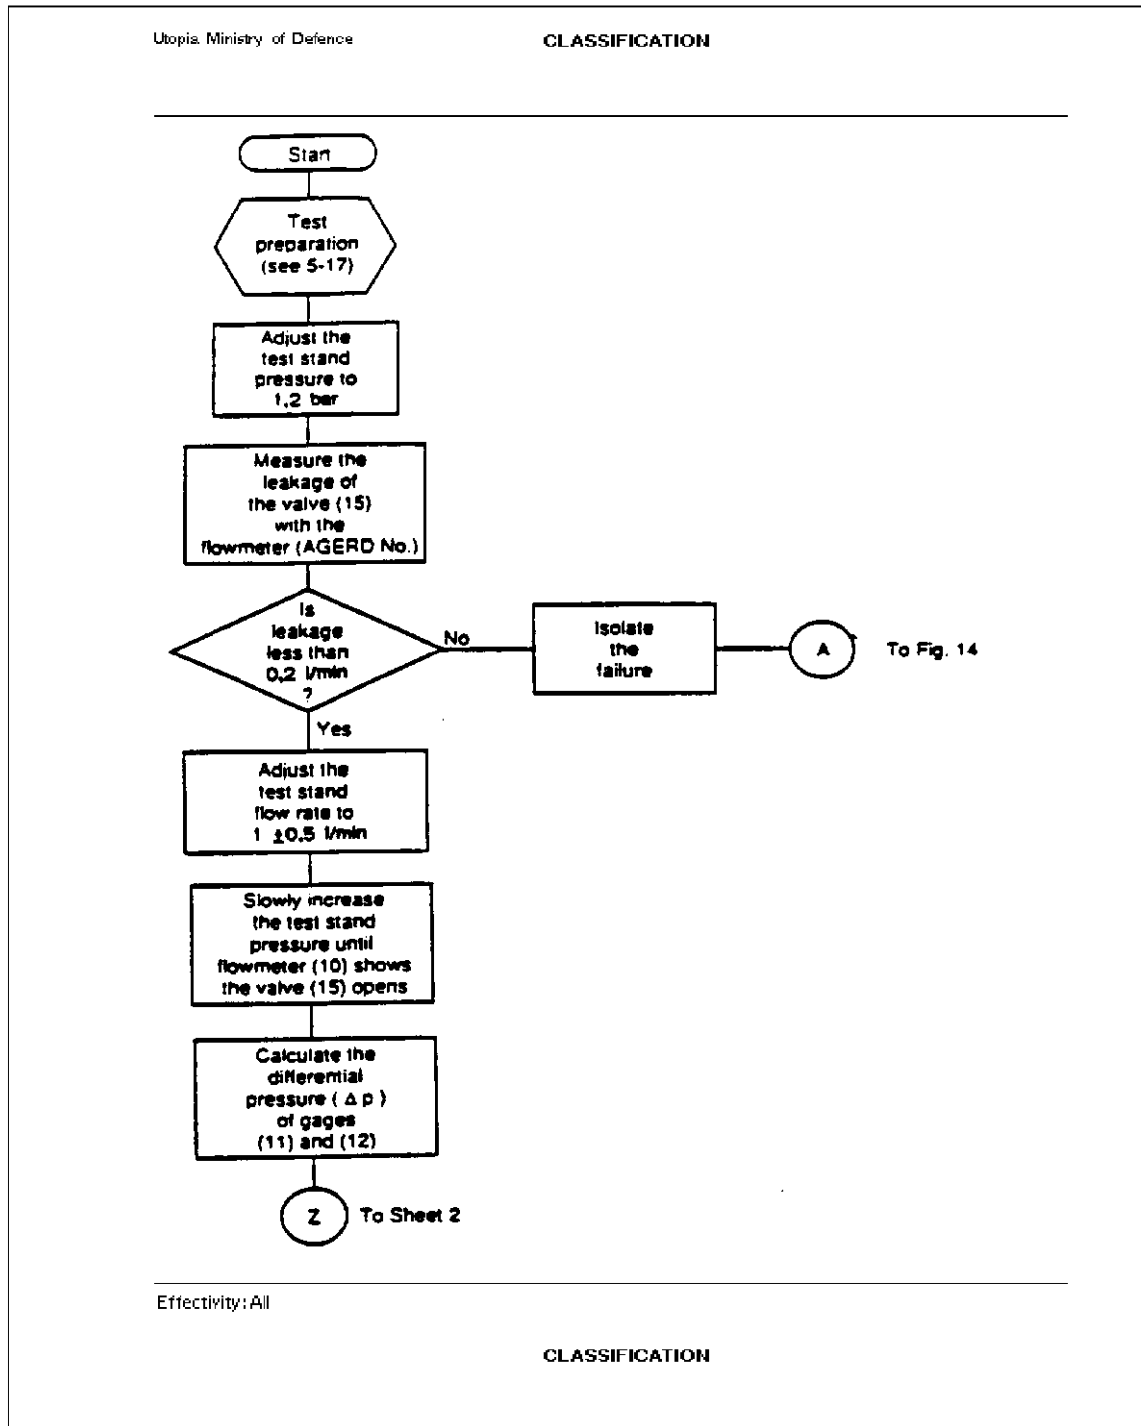

The various power sources must be indicated with their characteristics and tolerances.

Fig 8 Testing - Example (Sheet 1 of 2)

ICN-S3627-S1000D0118-A-001-01

Fig 8 Testing - Example (Sheet 2 of 2)

## 2.4.4.4

## Structure tests, checks

These data modules must contain the detailed procedures needed to determine the status of parts (ie, repairable), to be scrapped, serviceable. Refer also to visual examination [Para 2.4.4.1](#).

The different levels of serviceability must be covered where acceptability standards depending on the maintenance process exist (eg, blade checks in-situ or as disassembled part).

The procedures must provide:

- JI for structure tests or for checks such as dye penetrant test (information code 351), check of an actuator stroke length (information code 361)
- As required, WS for the workflow of the instructions necessary to be performed to check the item

Only procedures specific to the item must be described, otherwise, refer to engine standard practices.

Illustrations must be used to indicate critical stress zones, to locate and to identify defects. Defects can be coded and the procedure must refer to these codes whenever those defects are mentioned. Refer to [Fig 9](#).

Any systematic or as-required measurements must be located on an illustration as simple as possible for easy reading. If dimensions, tolerances and clearances are coded on the illustration, their values must be given on a separate table. Refer to [Fig 10](#).

Permissible in-service/service wear tolerances and clearances must be provided.

Based on the known results of the structure test or of the check, the following status of the item must be given in the procedure:

- Acceptance for continued operation
- Repairable in accordance with repair procedures which must be referenced in the JI
- No longer serviceable or repairable

Measurements, clearances and torques which are specific to assembly procedures must not be mentioned in check procedures but in the relevant content (eg, ensuring assembly clearance by machining a spacer to length).

Data module for **structure tests** must be coded:

YY-Y-YY-YY-YY-YYY-35YY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-35YY-B (37 characters)

Data module for **checks** must be coded:

YY-Y-YY-YY-YY-YYY-36YY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-36YY-B (37 characters)

#### 2.4.5 Fault isolation procedures

These data modules must contain the procedures required to detect presumed malfunctions in the item and to isolate the faulty component or part in order to proceed with its replacement or repair.

Fault isolation must make possible to detect the faulty item in order to:

- remove it without systematic disassembly. However removals can result in the possible disassembly of peripheral parts
- make any adjustments in situ required by repair or replacement of an items
- carry out overall testing of subassemblies or items after repair.

The content must be written essentially as a function of the following criteria:

- Clear specification of values and tolerances applicable to in-service item
- Rapid fault isolation in order to minimize the item turn-around time
- Limiting of repair work to the absolute minimum

The procedures must be provided in form of JI. They must be arranged in such a manner that they will progressively isolate and identify each assembly, subassembly or parts.

Whenever possible, fault isolation procedures must make maximum use of built-in self-test features and must require a minimum of test equipment and repair tools. If Built-In Test Equipment (BITE) is installed, specific procedures of the BITE must be provided and precede the detailed performance test procedure.

JI is preferably to be presented by flow charts ([Fig 11](#) and [Fig 12](#)) except where tabular forms, descriptive language or any combination of these three forms as well as computer language presentation is more appropriate.

A single combined testing and fault isolation is not permissible.

Procedures must be provided using a test point/location method of testing rather than tests used by the manufacturer for item specification approval. These methods must identify the minimum test points/locations and must indicate the range for input and output parameters such as flow rate, pressures, ratings, voltages, wave shapes, etc, needed to insure the proper functioning and integrity of the item. Time constants to be observed between the application of an input parameter and the measurement of its output, or between two steps of the procedures must be clearly indicated.

The choice of the procedure to be used is essentially governed by the design of the item.

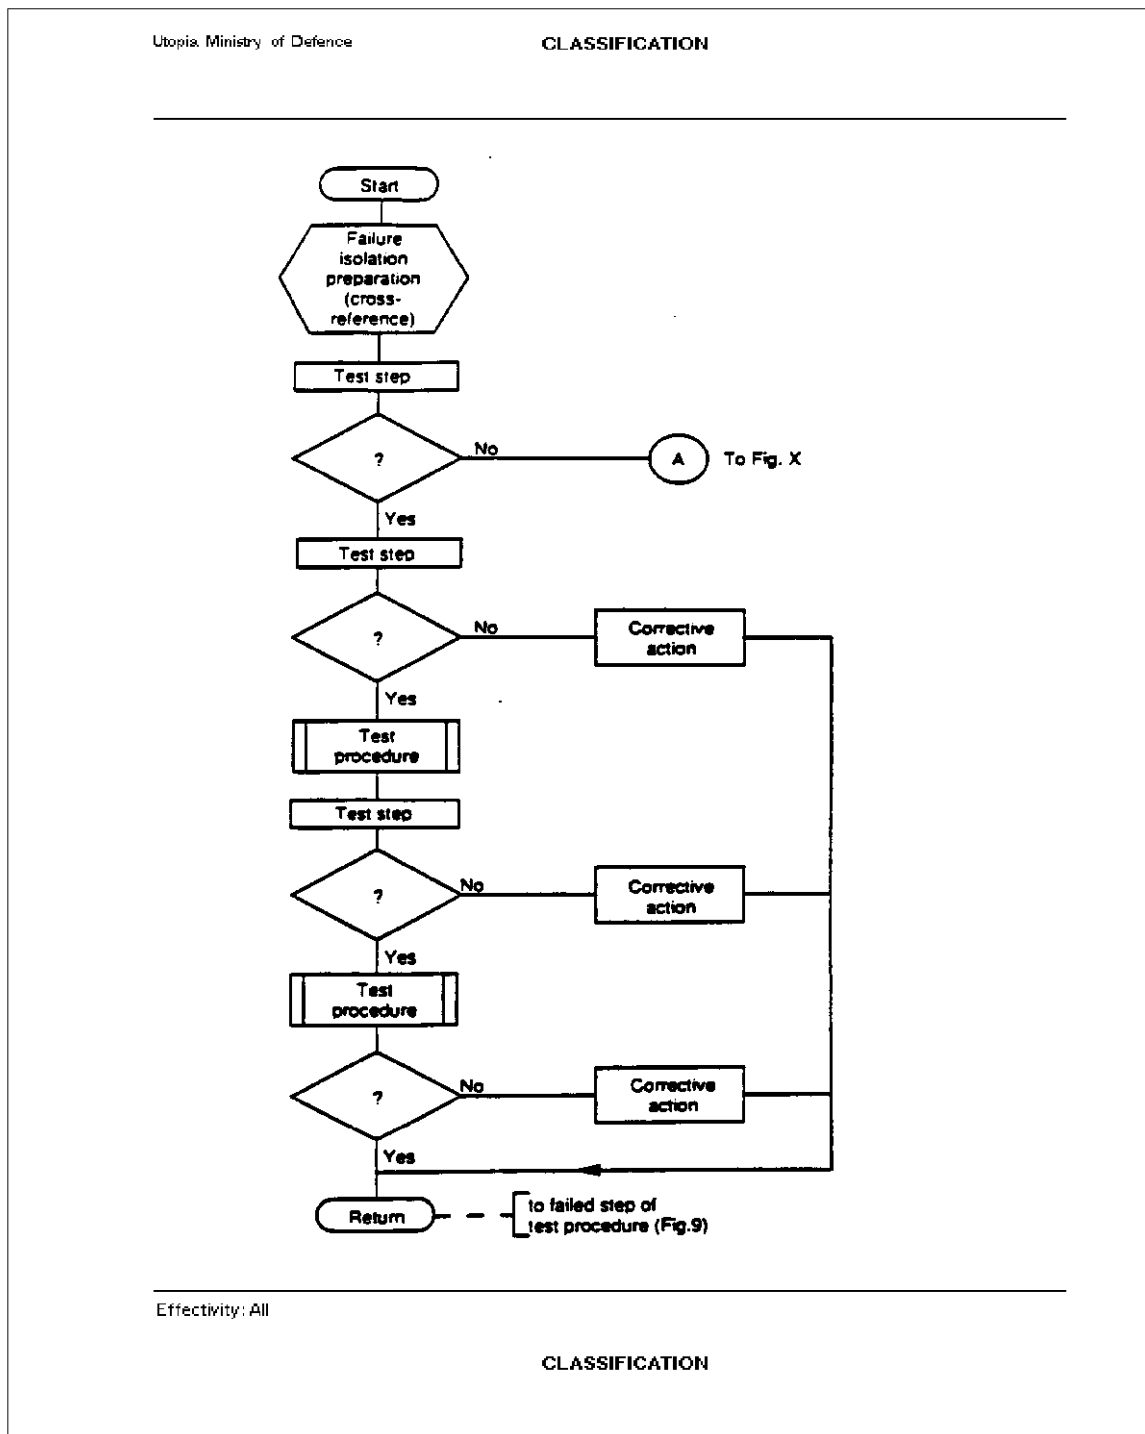

Repairs to be done during the fault isolation process must refer to relevant data module or to engine standard practices, except if they are simple (eg, fuse change). In this case, repair information must be given at the applicable step in the procedure.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-4YYY-B (17 characters)

thru

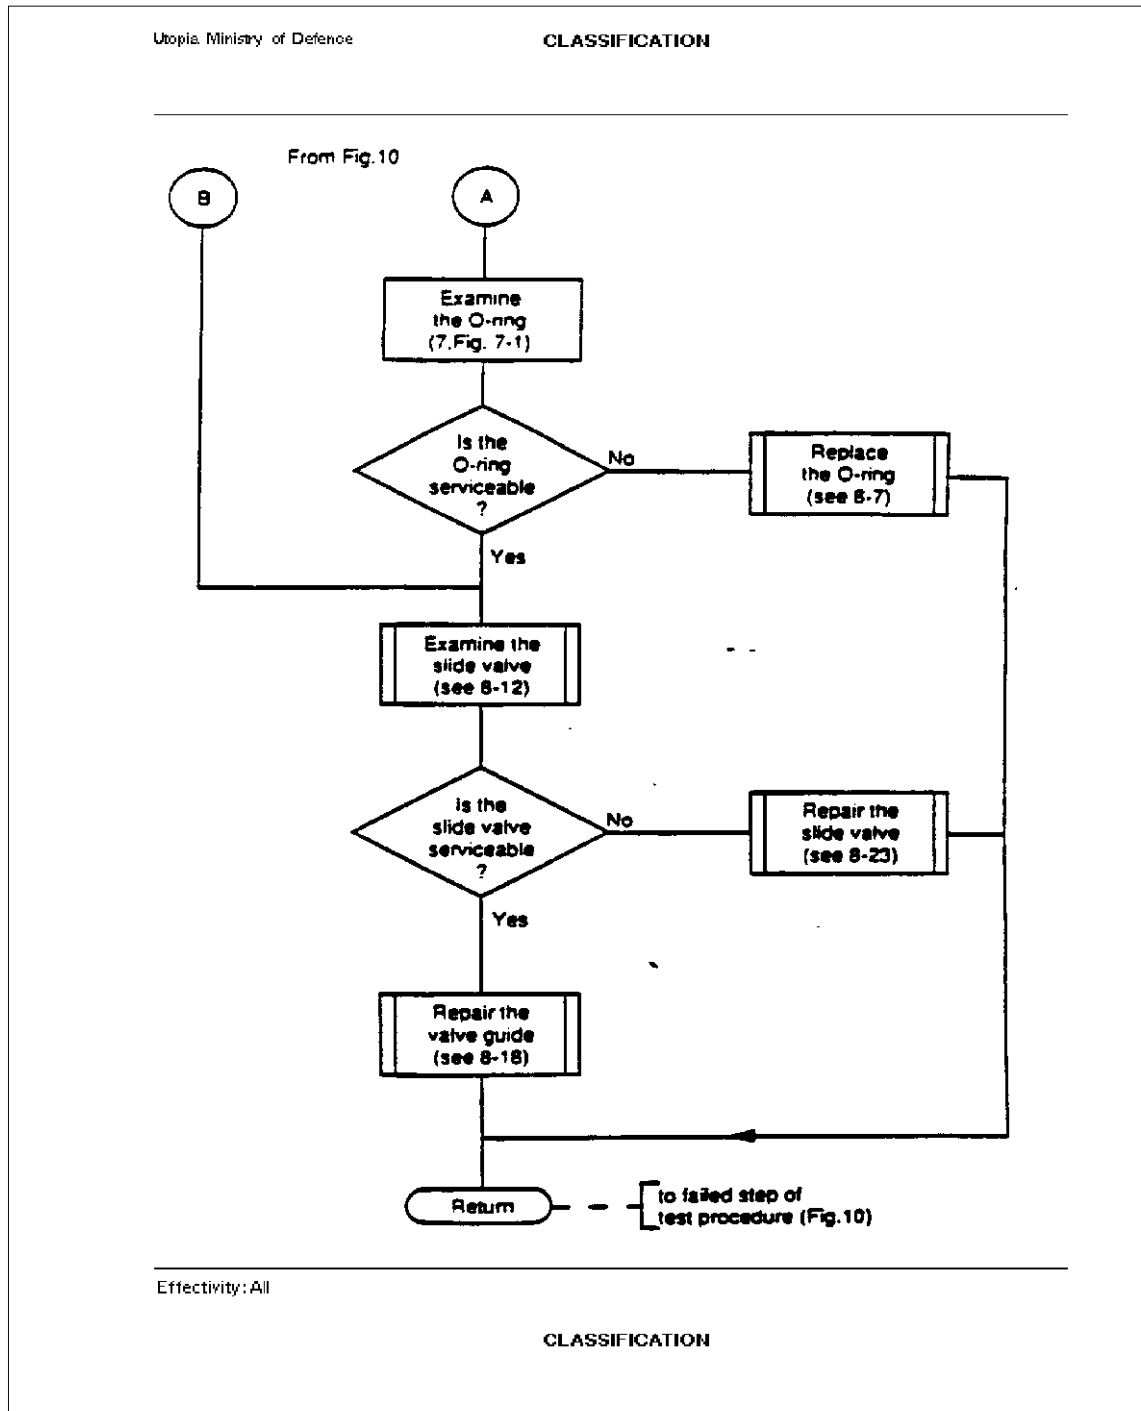

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-4YYY-B (37 characters)

ICN-S3627-S1000D0123-A-001-01

Fig 12 Fault isolation - Example (Sheet 2 of 2)

#### 2.4.6 Disconnect, remove and disassemble procedures

These data modules must contain:

- JI for the disconnection, removal or disassembly itself of a given item. All measurement and/or values that must be documented prior to an individual action being performed must be provided in the applicable step in the JI. Matched set must be indicated.
- As required, WS for the workflow of the instructions necessary to gain access with the minimum of disturbance, to disconnect or remove other serviceable items and subsequently remove the given item. No unnecessary actions must be carried out such as opening of permanent joints, unsoldering of connections, etc.

Cleaning of items before any disassembling must be referenced.

Procedures can be supported by illustrations or sequence charts as required.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-5YYY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-5YYY-B (37 characters)

#### 2.4.7 Repair and locally make procedures and data

These data modules must contain detailed repair processes and data required to restore a worn or damaged part to serviceable conditions.

The process applied to a part is not to change the interchangeability

- of the repaired part

thru

- of the assembly repaired with a repair size part

Each repair must be identified. This identifier is not to be changed or reused. A cross reference must be provided between the identifier and the data module code of the procedure to perform the repair.

If several repairs are applicable to the same part, a table can be provided to select the sequence of JI so that the instructions are not duplicated unnecessarily. Refer to [Fig 13](#). This table must be subject of a data module.

The procedures must provide:

- JI for the repair itself of the item. It must include illustrations, drawings, machining specifications, dimensions, etc, as required for carrying out work correctly
- As required, WS for the workflow of the instructions necessary to perform the repair

Only procedures specific to the item must be provided, otherwise, refer to engine standard practices ([Chap 5.2.2.6](#)).

Repair parts must be listed in the parts list set up in accordance with [Para 2.4.1](#). The procedure must refer to the part identifier whenever those parts are mentioned.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-6XXY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-6XXY-B (37 characters)

where "6XX" indicates the information codes 610 thru 659

Procedures must state where repaired parts must be marked.

"How to mark" on the repaired parts must be included in the procedure for simple marking, otherwise, it must refer to engine standard practices or relevant data module.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-691Y-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-691Y-B (37 characters)

If parts can be locally manufactured, procedures must provide all dimensional data, materials, processing and QA data.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-670Y-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-670Y-B (37 characters)

#### 2.4.8 Assemble, install and connect procedures

These data modules must provide:

- JI for the assembly, installation or connection itself of the item
- As required, WS for the workflow of the instructions necessary to have the desired assembled, installed or connected item such as checks, assembling, storage fluid replacement, closing up areas opened to get access

Assembly fits and clearances, adjustments and torque values must be given in the applicable steps. Matched set must be detailed.

Procedures must be supported by illustrations or flow charts as required.

If the use of special tools is not self-explanatory, data modules must provide data and information for their utilization.

Only special locking procedures must be described. They must be provided at the applicable step.

However, if an item (eg, a component) requires complex or numerous locking operations, a separate procedure could be given in accordance with [Para 2.4.9](#) Locking procedures. In this case, reference to this relevant locking procedure must be made in the assembly procedure.

Calibration or tests which cannot be performed after final assembly or which are easier to perform during assembly must be given at the applicable step.

Steps which are not to be accomplished:

- until after testing
- until after item installation on the engine, a module, etc, must be clearly indicated. Instructions to put on a tag on the item specifying the incompleteness of the tasks must be mentioned in the procedure

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-7YYY-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-7YYY-B (37 characters)

#### 2.4.9 Locking procedures

These data modules are applicable to items requiring complex or numerous locking operations.

JI must provide step-by-step instructions necessary to secure that each part is locked on the item.

Illustrations must be provided to allow the user to visually identify the parts to be locked. Each part must be listed. This list must enable the user to record that each locking operation has been correctly carried out (eg, signature, stamp).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-712Y-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-712Y-B (37 characters)

#### 2.4.10 Storage procedures and data

These data modules must provide:

- JI for the storage and the removal of storage itself of an item
- As required, WS for the workflow of the instructions necessary to perform the work

The procedures must provide the detailed instructions:

- to apply preservation when packing an item and to remove this preservation when unpacking it such as wrapping, blanking, consumable spraying. Data and instructions relative to air pressurization, humidity, temperature control, etc, must be provided.

Data modules for preservation packing applying must be coded:

YY-Y-YY-YY-YY-YYY-81YY-B (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-81YY-B (37 characters)

Data modules for preservation packing removing must be coded:

YY-Y-YY-YY-YY-YYY-82YY-B (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-82YY-B (37 characters)

- to put in or remove from a container an item.  
Data modules for putting in from a container must be coded:

YY-Y-YY-YY-YY-YYY-830Y-B (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-830Y-B (37 characters)

Data modules for removing from a container must be coded:

YY-Y-YY-YY-YY-YYY-840Y-B (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-840Y-B (37 characters)

- to extend the shelf lives.  
Data modules must be coded:

YY-Y-YY-YY-YY-YYY-85YY-B (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-85YY-B (37 characters)

- to transport items installed in containers. Only special handling must be provided.  
Data modules must be coded:

YY-Y-YY-YY-YY-YYY-86YY-B (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-86YY-B (37 characters)

- to prepare an item removed from storage before introduction into service. These procedures must provide the required workflow of instructions necessary to prepare the item such as:

- Build-up of the item from several other items removed from storage
- Replacement of storage fluids, filling, etc
- Tests applicable when preparing the item. These tests must be specific tests to prepare the item, otherwise they must be referred to the relevant test (eg, function test [Para 2.4.4.3](#))

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-87YY-B (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-87YY-B (37 characters)

- to decide, after the checks of the condition of storage of an item and its physical integrity when remove from storage:
  - if it is acceptable to be prepared before introduction into service
  - what maintenance actions must be taken depending on the condition of the container, of blanking, etc.

This information can be given in the form of textual description, table or flow charts. Refer to [Fig 14](#).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-88YY-B (17 characters)

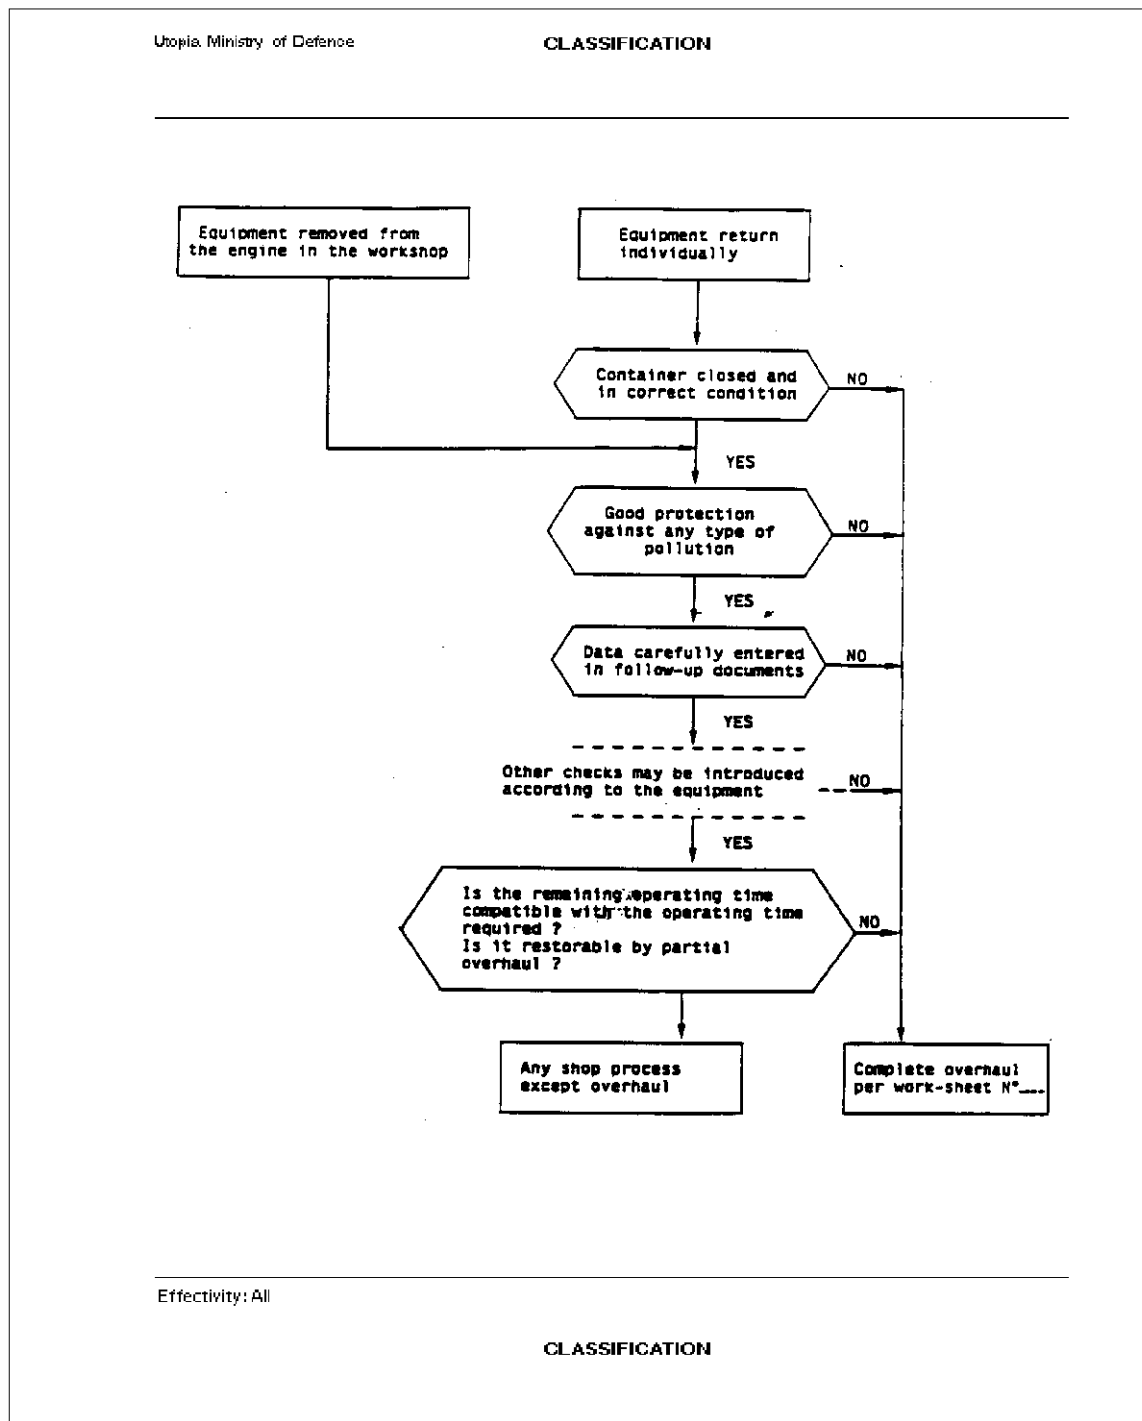

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYYY-88YY-B (37 characters)

#### Note

On-condition maintenance cannot be applied to an item subject to this type of maintenance if it is removed from a damaged container.

ICN-S3627-S1000D0125-A-001-01

Fig 14 Removal from storage - Example of incoming checks

**2.4.11 Data of items in storage**

Shelf lives and Inspection Intervals when in storage must be listed.

The list must contain:

- The description of the item
- Its manufacturer code and part number
- The shelf life or Inspection Interval (value and unit)
- The data module code of the procedure to be performed when limits are reached

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-89YY-B (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-89YY-B (37 characters)

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 4.3</a>	Information management - Data module code
<a href="#">Chap 9.2</a>	Terms and definitions - Terms, acronyms and subject index

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Power Plant Build-up (PPB) information.

### 1.2 Scope

It covers the rules for the preparation of information applicable to power plant build-up which will enable skilled personnel to equip a bare engine delivered by the manufacturer for installation on the air vehicle by the addition or transfer of parts and components. The PPB information must contain the following:

- Description and indexes
- Accessory assembly
- Power plant build-up

### 1.3 Standards and definitions

#### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

#### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate.

- **Bare engine:** An engine which is fully completed internally, but on which no external parts or components have been installed.
- **Engine:** An engine which is equipped with external parts supplied by the engine manufacturer.
- **Sequential grouping:** Any coherent package of logical sequenced information which describes a complete action. The action can consist of the completion of either a maximum convenience assembly or the installation of an accessory or system.
- **Maximum convenience assembly:** Two or more components, fittings and/or packings, or any externally mounted accessories which, for practical reasons, must be assembled prior to being installed on the power plant.

## 2 Power plant build-up information

### 2.1 Data module coding

To assist in the codification of data modules, information codes are given and supplemented by additional specific requirements and/or explanations in subsequent paragraphs in addition to the rules given in [Chap 4.3](#).

In this chapter "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

### 2.1.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-71-00-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NNAAA**-018Y-A (37 characters)

The information code variant is used to distinguish between the different Information sets.

### 2.1.2 General description of the power plant

The engine description data modules will provide the following information:

- 1 Bare engine configuration and engine configuration
- 2 Zoning and location of the various attachment points, captive nuts, flanges, etc
- 3 List of equipment items to be installed on the bare engine
- 4 List of equipment items to be installed on the bare engine at delivery
- 5 List of equipment items calling for a maintenance action (servicing, test, etc), once the engine has been built-up

Data modules must be coded:

YY-Y-71-00-00-**NNA**-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NNAAA**-000A-A (37 characters)

### 2.1.3 Special tools, fixtures and equipment

Special tools and equipment required to carry out the power plant build-up must be listed giving information such as. Refer to [Table 2](#).

- Name
- Part number
- Manufacturer code (CAGE code)
- Usage

Data modules must be coded:

YY-Y-71-00-00-**NNA**-061A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NNAAA**-061A-A (37 characters)

Table 2 Table of special tools, fixtures and equipment - Example

Name	Part No.	CAGE	Usage
Engine accessory hoist	196k4005-501	51563	Support CSD or generator
Nose cowl sling	196k4009-1	51563	Hoist nozzle cowl
Nozzle dolly	196k4003-1	51563	Support exhaust nozzle
Exhaust plug support	196k4008-1	51563	Support exhaust plug
Primary nozzle sling	196k4004-1	51563	Hoist primary nozzle
Crank wrench	196k8009-1	51563	Rotate fuel condition control

#### 2.1.4 Vendor codes

Vendor codes must be shown for applicable vendor parts in the text to facilitate identification of the vendor. This list must be arranged in numerical sequence and give for each vendor supplying parts for PPB the following information. Refer to [Table 3](#).

- Vendor code - CAGE code
- Name of vendor
- Address of vendor

Data modules must be coded:

YY-Y-71-00-00-**NNA**-019A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NNAAA**-019A-A (37 characters)

Table 3 Table of vendor codes - Example

CAGE	Vendor
C0202	Pall Filtrationstechnik GmbH Philipp-Reis-Strasse 66072 Dreieich-Sprendlingen, Germany
D2638	Elektro-Metall Expost GmbH Manchinger Strasse 1 68070 Ingolstadt, Germany
F0230	ABG-Secma SA BP 502 75725 Paris Cedex 15, France
00153	Edcliff Instruments, Inc 1711 South Mountain Avenue Monrovia, CA 91016-4256
00357	Van Dusan Aircraft Supplies Teterboro Airport, 500 Industrial Ave Teterboro, NJ 07608

Applicable to: All

S1000D-A-05-02-0205-00A-040A-A

Chap 5.2.2.5

### 2.1.5 Consumables

All consumables materials, such as lubricants, greases, etc, which are prescribed for use during emergency accessory assembly and build-up procedures must be listed by name, specification and application or use. Refer to [Table 4](#).

Data modules must be coded:

YY-Y-71-00-00-**NN**A-017A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NN**AAA-017A-A (37 characters)

*Table 4 Table of consumables - Example*

Name	Specification	Use
Alcohol, polyvinyl	S-122	Release
Ethyl acetate	TT-E-751	Clean surface prior to dissimilar metals protection
Grease, graphite	MIL-T-5544	Lubrication of bolts
Hydraulic fluid	Aerospatiale Spec. 307.110	Hydraulic system lubricant
Liquid shim	EA934NA	Drain mast shim
Lubricant, anti-seize	MIL-L-25681	Bolts threads, high temperature
Lubricant, dry film	MIL-L-23398	Pneumatic duct couplings
Lubricant, oil	MIL-L-7808 MIL-L-23699	Engine oil system, general
Oil, lubricating molybdenum disulfide	DOD-L25681	General purpose
Petrolatum	VVP-236	Packing lubricant
...		

### 2.1.6 Standard practices

The standard practices must include standard torques and locking methods as well as assembly practices or processes which are new, unique or manufacturer specified for a particular application. It also includes procedures to ensure serviceability of a new converted engine such as cleaning, inspection, repair and servicing. Refer to [Fig 1](#).

Data modules must be coded:

YY-Y-71-00-00-**NN**A-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NN**AAA-YYYY-A (37 characters)

Utopia Ministry of Defence

### 2.1.7

#### Numeric index

The numeric index data module must consist of a complete listing of all parts required in the accessory assembly and power plant build-up data modules. All parts used must be listed by part number in alphanumeric order. The index must facilitate identifying the location of given part or accessory when only the part number is known. Refer to [Table 5](#).

Data modules must be coded:

YY-Y-71-00-00-**NNA**-013A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y71-00-0000-**NNAAA**-013A-A (37 characters)

## 2.3 Accessory assembly

The accessory assembly data modules must contain the following information:

- General requirements
- Procedural information

### 2.3.1 General requirements

These data modules must list all the accessories requiring build-up and assembly information which must be completed as a maximum convenience assembly prior to installation as part of power plant build-up. All externally mounted accessories, engine support type as well as aircraft-support type, which require completion as an assembly must be included in these data modules. The accessory assembly information must be numbered so that each sequential grouping is separated from the others by its figure number. Each sequential grouping must be detailed in its corresponding procedural data modules. When it is necessary to assemble together two or more components to facilitate power plant build-up, the resulting maximum convenience assembly must be completed in accordance with a sequential grouping which must be included in this section. This information is also to include any checking operations to be performed on the accessory assembly prior to its installation on engine. Refer to [Table 7](#).

Data modules must be coded:

YY-Y-71-00-01-**NNA**-700Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y71-00-0100-**NNAAA**-700Y-A (37 characters)

### 2.3.2 Procedural information

Procedural information must include the parts list with the applicable part numbers. Item numbers must be assigned in the sequence-of-build order, without gaps.

#### Note

Procedural information must be the necessary information in step-by-step format, to accomplish the maximum convenience assembly.

The parts required to perform each maximum convenience assembly must be listed with their item numbers, part numbers, name and units per assembly. Torque values and value tolerances, special tools and lubricants and other relevant information for the accomplishment of each step must be included in the applicable step. Vendor codes must be listed for vendor parts to facilitate identification of the vendor.

#### Note

Identification of each vendor code listed must be made in the Introduction data module.

The title of the procedural information must be identical to the title of the supporting illustration. The maximum convenience assembly must also be cross-referenced to Next Higher Assembly (NHA) which must be the power plant build-up sequential grouping where the installation of the maximum convenience assembly onto the power plant is accomplished. Refer to [Fig 2](#).

The illustration must consist of a completed view of the maximum convenience assembly with views showing the exploded detail parts. The index numbers assigned to the exploded parts must correspond to the item numbers listed in the procedural information. Refer to [Fig 3](#).

Data modules must be coded:

## 6 Oil pressure transmitter preassembly

- 6.1 Install union (10) and packing (15) lubricated with engine oil to top of transmitter (5).
- 6.2 Torque union to 15,3 to 16,9 Nm (135 to 150 lb in).
- 6.3 Install elbow (20) lubricated packing (15) and nut (25) in bottom of transmitter. Leave nut fingertight.

## 2.4 Power plant build-up

The power plant build-up information must be divided into the following parts:

- Major installation
- Attachment fittings installation
- Power plant build-up

Complete assembly information, including illustrations and step-by-step procedures for the installation of each accessory and system in a logical sequence of assembly from the bare engine to the completed power plant, must be included.

### 2.4.1 Major installation

Illustrations must be included which will allow leaders, with index numbers, to point out the location of the different sequential groupings. Tables must be included which will list the sequential groupings in a logical sequence of power plant build-up. This major installation of sequential groupings must be arranged with all installation data first, followed by Tables. Index numbers on the illustrations must tie the depicted installation to the corresponding name entry. Refer to [Fig 4](#) and [Fig 5](#).

#### Note

The index number must correspond with the applicable sequential grouping figure number.

Data modules must be coded:

#### 2.4.2 Attachment fitting installation

Sequential groupings must be included as required to show each attachment fitting in its correct position on the engine flanges. All attachment fittings supplied by the engine and air vehicle manufacturers must be included. Each attachment fitting must be illustrated with a leader and index number. A locator drawing must be included at the top of each illustration to indicate the area being shown. All attach hardware required to secure each flange must be illustrated and indexed. There must be as many sequential groupings as necessary to show the illustration of each attachment fitting with its attachment hardware. The index numbers on the illustration of each bracket installation sequential grouping must be keyed to the corresponding parts list item numbers. The attachment fitting installed in accordance with each sequential grouping must be itemized in a logical sequence order. The parts list must consist of several columns showing the figure and item number, manufacturer's part number, open column for airline part numbers, flange location, hole location and installation configuration for each attachment fitting. Any special information must be included with the corresponding part numbers, with the procedure keyed to the parts list using the item numbers in parentheses. Refer to [Fig 4](#).

### 2.4.3 Power plant build-up

Accessories and systems must be installed in a logical sequence of build order. A sequence grouping installation can consist of the installation of a single accessory or more than one accessory in an area being built-up, or, if the method of installation requires a complete system.

The illustrations must show the accessories, plumbing, components and associated hardware in the installed condition. For purposes of clarity, the affected parts must be illustrated in relief on the power plant by use of contrasting line weights. Detail views must be included as necessary to explode fittings, packing and other parts not exposed in the assembled view. Index numbers assigned to the exploded parts must correspond to the item numbers listed on the following parts list pages. A locator drawing must be included at the top of each illustration to indicate the particular area being shown. The procedural information for power plant build-up must be prepared in the same format and style used for the accessory build-up procedures. Installation of a maximum convenience assembly, completed in accordance with information contained in the accessory assembly data modules, must be called out in the power plant build-up data modules. These assemblies must be identified in the power plant build-up data modules by referencing the applicable figure number and, when existing, the installation part number, as listed in the accessory build-up data modules. Refer to [Fig 5](#).

Data modules must be coded:

YY-Y-71-00-02-**NN**A-710Y-A (17 characters)

thru

**Chap 5.2.2.6**

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Engine Standard Practices (ESP) information.

### 1.2 Scope

It covers the requirements for the preparation of information applicable to engine standard practices which will enable skilled personnel to process standard procedures on engine parts. It also gives information concerning the preparation, check and regeneration of chemical solutions.

The standard practice must be referenced in the engine maintenance information, service bulletins, etc, to prevent the repetition of the detailed processes in these separate publications.

### 1.3 Standards and definitions

#### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

#### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate.

- **Standard practice:** A unique process used repetitively in the shop maintenance of air vehicle parts. It is a single detailed process of sequential operations to perform a specific task usually accomplished within a localized area of an engine shop.

As a general rule, a standard practice is a complete process within itself and must not normally specify the required application of another standard practice or process, or of selected sections of another standard practice or process.

The standard practice must only refer to material data information.

A standard practice does not apply to only one part or group of parts. It is not a repair procedure.

A process with a single application does not justify classification as standard practice. Such a process, however, can justify a standard practice classification when its application becomes more frequent.

- **Chemical solution:** A mixture of separate products. A data module is issued for each chemical solution. Content and numbering are defined in [Para 2.6](#).

## 2 Content

### 2.1 General

The complete set of ESP data modules is specified in [Para 2.2](#) thru [Para 2.7](#) Technical content and subsequent paragraphs.

### 2.2 Technical content

#### 2.2.1 General requirements

The standard practice must provide a single source for all standard processes needed in the maintenance of an engine.

#### 2.2.2 Data module coding

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-**70-SS-MM-NN**A-YYYY-C (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y**70-SS-MM**00-**NN**AAA-YYYY-C (37 characters)

Where:

- "70" = standard practice
- "SS", the section code, gives the groups of standard practice.  
"00" identifies general information and chemical solutions. "10" the first group, etc.
- "MM", in the subject code, is a sequential number, starting from "01", for chemical solutions and mixtures. For other groups "00" must be used.
- "NN", in the disassembly code, is a sequential number starting from "01". "00" is used for general information, if needed. "99" is always used for chemical solutions and mixtures.

### 2.2.3 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-70-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y16-00-0000-**NN**AAA-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

## 2.3 General standard practices

Basic standard practices data module code are assigned. Refer to [Para 2.7](#).

The general standard practice must not comply with the format of test or process standards and must not specify a detailed process.

The general standard practice must define the group and include any information pertinent to the entire group. It must not include any requirements pertinent to any specific process. It must contain general, descriptive, background information to assist the technician in processing a part.

## 2.4 Test standard practice

### 2.4.1 General

Each group of standard practices can have special test standard practices which must be classified at the beginning of the group.

The test standard practice must be used to evaluate process control and quality by indirect means. Samples are processed before or with the engine part, or in a like manner, and separately tested to evaluate the quality of the processed engine part.

The test standard practice need not comply with the format of process standards, but must specify the actual test methods and acceptability criteria. It must specify that the process applicable to the test part/specimen ([Para 2.4.2](#)) is identical to that applied on engine parts but generally must not describe the process applied.

---

**2.4.2 Test standard practice content**

The test standard practice includes two types of samples:

- Test part
- Test specimen

**2.4.2.1 Test part**

A test part is a reusable part to which a process is applied. Inspection results are usually compared to a reference measurement/value.

The test standard practice must define the test part, the process applied, the test method applied, and the acceptability limits.

The process, test method, and acceptability limits for the test part are usually identical to those applied to the engine part.

Each different test part must require a separate test standard practice.

**2.4.2.2 Test specimen**

A test specimen is a non-reusable part or sample to which a process is applied. The application and/or testing of the process usually require destruction of the specimen.

The test standard practice must define the test specimen, the process applied, the test method applied and the acceptability limits.

The process, test method, and acceptability limits for the test specimen are usually identical to those applied to the engine part.

Each different test specimen must require a separate test standard practice.

**2.5 Process standard practice****2.5.1 Process standard practice content**

The title of the process standard practice must identify the process in the least number of words required to distinguish one from another.

Example:

"Removal of tungsten carbide coating from titanium" is required if separate standard practices exist for removal of different coatings from different metals. Otherwise "Removal of coating" would be sufficient.

Each standard practice data module must contain the following headings:

- General
- Equipment
- Materials
- Procedure

**2.5.1.1 General**

This section must contain a description of the purpose of the standard practice, often only a repeat of the title when the title is very explicit. It must be a longer description, usually, when the title is brief and general.

Warnings, cautions or notes must occur in this paragraph only when they are of a general nature.

**2.5.1.2 Equipment**

This section must identify the general requirements or condition of equipment required for this practice. It must not usually specify the exact size, model, specification or brand name of equipment, but when a standard practice defines the procedure for specific equipment, the

specific equipment must be listed. When there are no equipment requirements, N/A must be entered.

#### 2.5.1.3

##### Materials

This section must list all the chemical solutions and/or consumable products required for this practice. When there are no material requirements "N/A" must be entered.

When more than one material or group of materials is listed, each must be identified by a separate paragraph with identifier and title.

When materials are listed, they must be identified by the name and code used on the material data information and/or chemical solution description.

The standard practice process must make reference to the material data information where all products, product specifications, etc, are separately identified and controlled.

#### 2.5.1.4

##### Procedure

This section must include the detailed sequential steps to accomplish the task.

When reference is made to the materials, they must be identified as in [Para 2.5.1.3](#).

All procedure details must be included. Standard practice procedure must also include all necessary visual inspection to ensure its correct application.

## 2.6

### Chemical solutions and mixtures information

#### 2.6.1

##### Content

Information must be provided for preparation, use and regeneration of each chemical solution/mixture.

It must:

- provide the data necessary to make the initial solution
  - list of ingredients
  - initial mix quantity or concentration
  - temperature
- specify any test necessary for the solution during initial mixing and/or periodic intervals
- specify any regeneration action required

##### Note

If a single product requires regeneration and check action a chemical solution data module must be issued.

#### 2.6.2

##### Chemical solution/mixture data module numbering

Chemical solution/mixture data modules must be numbered following the rules given in [Para 2.2.2](#).

Example:

Alkaline permanganate	YY-A-70-00-01-99A-081A-C
Acid stripping solution	YY-A-70-00-02-99A-081A-C
...	...
...	...
Inhibited phosphoric acid	YY-A-70-00-34-99A-081A-C
Alkaline cleaner for titanium	YY-A-70-00-76-99A-081A-C

## 2.7

Chap 5.2.2.6

Dry abrasive blast cleaning with fruit stones	YY-A-70-20-00-25A-252A-C
Wet abrasive blast cleaning-very fine	YY-A-70-20-00-26A-252A-C
Wet abrasive blast cleaning-fine	YY-A-70-20-00-27A-252A-C
Wet abrasive blast cleaning-medium	YY-A-70-20-00-28A-252A-C
Wet abrasive blast cleaning-coarse	YY-A-70-20-00-29A-252A-C
Removal of surface coatings	
Removal of chromium plate from steels and austenitic alloys-Electrolytic process	YY-A-70-20-00-31A-653A-C
Removal of chromium plate from steels and austenitic alloys-Chemical process	YY-A-70-20-00-32A-653A-C
Removal of copper and silver plate from steels - Chemical process	YY-A-70-20-00-33A-653A-C
Removal of copper and silver plate from steels -Electrolytic process	YY-A-70-20-00-34A-653A-C
Removal of nickel plate from steels and austenitic alloys -Chemical process	YY-A-70-20-00-35A-653A-C
Removal of acid anodize treatments from aluminum alloys -Chemical process	YY-A-70-20-00-36A-653A-C
Removal of nickel/cadmium plating from low alloy, stainless and martensitic steels - Chemical process	YY-A-70-20-00-37A-653A-C
Removal of cadmium plating from low alloy steels -Chemical process	YY-A-70-20-00-38A-653A-C
Removal of phosphating (granodizing treatment) -Chemical process	YY-A-70-20-00-39A-653A-C
Removal of chemical oxidation from aluminum alloys -Chemical process	YY-A-70-20-00-40A-653A-C
Removal of black oxide finish -Chemical process	YY-A-70-20-00-41A-653A-C
Removal of tungsten carbide thermal spray coating from titanium -Electrolytic method	YY-A-70-20-00-42A-653A-C
Removal of tungsten carbide thermal spray coating -Mechanical process	YY-A-70-20-00-43A-651A-C
Removal of cobalt, chromium, nickel, tungsten alloy thermal spray coating from nickel-base alloys -Mechanical process	YY-A-70-20-00-44A-651A-C
Removal of nickel-aluminum and Cu-Ni-In thermal spray coating except from low alloy steels -Chemical process	YY-A-70-20-00-45A-653A-C
Removal of aluminum thermal spray coating - Chemical process	YY-A-70-20-00-46A-653A-C
Removal of tungsten carbide thermal sprayed coatings from nickel or cobalt base alloys - Molten salt	YY-A-70-20-00-47A-653A-C
Removal of alumina-titanium (top coat) with Ni-Al (bond coat) thermal spray coatings except from low alloy steels	YY-A-70-20-00-48A-653A-C
Removal of plasma sprayed and tungsten carbide coating from titanium, steel, and stainless steel -Chemical process	YY-A-70-20-00-49A-653A-C
Removal of aluminum paint -Mechanical process	YY-A-70-20-00-50A-651A-C
Removal of aluminum paint -Chemical process	YY-A-70-20-00-51A-653A-C

Removal of epoxy silicone paint with aluminum pigment from all materials except titanium alloys -Chemical process	YY-A-70-20-00-52A-653A-C
Removal of polyurethane paint -Chemical process	YY-A-70-20-00-53A-653A-C
Removal of rubber masking	YY-A-70-20-00-54A-653A-C
Stripping silicone rubber from titanium and aluminum	YY-A-70-20-00-55A-653A-C
Removal of polyurethane paint with diphase products	YY-A-70-20-00-56A-653A-C
Removal of RTV 147-148 with hollow glass beads coating -Mechanical process	YY-A-70-20-00-57A-651A-C
Removal of RTV 147-148 with hollow glass beads coating -Chemical process	YY-A-70-20-00-58A-653A-C

#### 2.7.4

#### 70-30-00 Inspection

##### Hardness Measurement

General	YY-A-70-30-00-00A-356A-C
Brinell Hardness Testing	YY-A-70-30-00-01A-356A-C
Vickers Hardness Testing	YY-A-70-30-00-02A-356A-C
Rockwell Hardness Testing	YY-A-70-30-00-03A-356A-C
Portable Rockwell Hardness Testing	YY-A-70-30-00-04A-356A-C

##### Fluorescent penetrant inspection

General	YY-A-70-30-00-10A-351A-C
Test of fluorescent-penetrant process	YY-A-70-30-00-11A-390A-C
Test of fluorescent-penetrant	YY-A-70-30-00-12A-390A-C
Test of emulsifier or remover	YY-A-70-30-00-13A-390A-C
Fluorescent-penetrant inspection -Stationary water-washable	YY-A-70-30-00-14A-351A-C
Fluorescent-penetrant inspection -Stationary post-emulsifiable	YY-A-70-30-00-15A-351A-C
Fluorescent-penetrant inspection -Portable water-washable	YY-A-70-30-00-16A-351A-C
Fluorescent-penetrant inspection -Portable post-emulsifiable	YY-A-70-30-00-17A-351A-C
Fluorescent-penetrant inspection stationary - Electrostatic spraying process	YY-A-70-30-00-18A-351A-C

##### Magnetic particle inspection

General	YY-A-70-30-00-20A-352A-C
Magnetic particle inspection -Symbols	YY-A-70-30-00-21A-013A-C
Test of magnetic particle inspection process	YY-A-70-30-00-22A-280A-C
Magnetic particle inspection	YY-A-70-30-00-23A-352A-C

##### Radiographic inspection

General	YY-A-70-30-00-30A-354A-C
---------	--------------------------

##### Ultrasonic inspection

General	YY-A-70-30-00-40A-355A-C
Immersion ultrasonic inspection of engine run titanium hardware	YY-A-70-30-00-41A-355A-C

##### Miscellaneous inspection

Capillary inspection of open face honeycomb structures	YY-A-70-30-00-51A-369A-C
--	--------------------------

Check of locking efficiency of swaged or riveted self-locking nuts and self-locking inserts	YY-A-70-30-00-52A-369A-C
Airflow measurement	YY-A-70-30-00-53A-363A-C
Special inspection for surface fretting or wear	YY-A-70-30-00-54A-310A-C

#### Eddy current inspection

General	YY-A-70-30-00-60A-353A-C
Two (2) MHz eddy current inspection of bores	YY-A-70-30-00-61A-353A-C
Five (5) MHz manual eddy current inspection of titanium alloy rotating engine hardware	YY-A-70-30-00-62A-353A-C

### 2.7.5

#### 70-40-00 Repair principles

Blending	YY-A-70-40-00-01A-650A-C
Hand blending	YY-A-70-40-00-02A-655A-C
Power blending	YY-A-70-40-00-03A-655A-C

#### Insert installation

Replacement of swaged self-locking inserts	YY-A-70-40-00-11A-628A-C
Replacement of ring-locked fluid port inserts	YY-A-70-40-00-12A-628A-C
Replacement of key-locked insert in aluminum alloy	YY-A-70-40-00-13A-628A-C
Replacement and installation of thread inserts	YY-A-70-40-00-14A-628A-C
Replacement of ring-locked fluid fittings	YY-A-70-40-00-15A-628A-C
Replacement of ring-locked studs	YY-A-70-40-00-16A-628A-C
Replacement of key-locked studs in a aluminum alloy	YY-A-70-40-00-17A-628A-C
Replacement of crimped nuts	YY-A-70-40-00-18A-628A-C

#### Riveting

Rivet symbols/specifications	YY-A-70-40-00-21A-013A-C
Formed rivet assemblies	YY-A-70-40-00-22A-624A-C
Huck bolt rivet assemblies	YY-A-70-40-00-23A-624A-C
Blind rivet assemblies	YY-A-70-40-00-24A-624A-C
Huck blind rivet assemblies	YY-A-70-40-00-25A-624A-C
Visu-lok blind bolt rivet assemblies	YY-A-70-40-00-26A-624A-C
Hi-lok bolt rivets assemblies	YY-A-70-40-00-27A-624A-C

#### Machining

General	YY-A-70-40-00-30A-650A-C
Turning	YY-A-70-40-00-31A-658A-C
Milling	YY-A-70-40-00-32A-656A-C
Grinding	YY-A-70-40-00-33A-655A-C
Broaching	YY-A-70-40-00-34A-654A-C
Drilling	YY-A-70-40-00-35A-652A-C
Tapping	YY-A-70-40-00-36A-657A-C
Electrical discharge machining (EDM)	YY-A-70-40-00-37A-653A-C
Electro-chemical machining (ECM)	YY-A-70-40-00-38A-653A-C
Tribo-finishing	YY-A-70-40-00-39A-648A-C

#### Fusion welding

General	YY-A-70-40-00-50A-627A-C
Test specimen inspection	YY-A-70-40-00-51A-390A-C
Parts inspection	YY-A-70-40-00-52A-390A-C
Gas shielded tungsten arc welding of steels, nickel and cobalt alloys	YY-A-70-40-00-53A-627A-C

Gas shielded tungsten arc welding of titanium alloys	YY-A-70-40-00-54A-627A-C
Gas shielded tungsten arc welding of aluminum alloys	YY-A-70-40-00-55A-627A-C
Shielded metal arc welding of steels, nickel and cobalt alloys	YY-A-70-40-00-56A-627A-C
Plasma arc welding	YY-A-70-40-00-57A-627A-C
Electron beam welding	YY-A-70-40-00-58A-627A-C
Automatic welding	YY-A-70-40-00-59A-627A-C

#### Resistance welding

General	YY-A-70-40-00-70A-627A-C
Test specimen inspection	YY-A-70-40-00-71A-390A-C
Parts inspection	YY-A-70-40-00-72A-121A-C
Spot welding	YY-A-70-40-00-73A-627A-C
Beam welding	YY-A-70-40-00-74A-627A-C

#### Brazing

General	YY-A-70-40-00-80A-623A-C
Inspection of brazing test specimens	YY-A-70-40-00-81A-390A-C
High temperature furnace brazing	YY-A-70-40-00-82A-623A-C
Oxy-acetylene torch brazing	YY-A-70-40-00-83A-623A-C
Induction brazing	YY-A-70-40-00-84A-623A-C

#### Thermal spraying

General	YY-A-70-40-00-90A-612A-C
Stamping test	YY-A-70-40-00-91A-390A-C
Bend test	YY-A-70-40-00-92A-390A-C
Tensile bond test	YY-A-70-40-00-93A-390A-C
Metallographic examination	YY-A-70-40-00-94A-390A-C
Lap shear test	YY-A-70-40-00-95A-390A-C
Scratch hardness test	YY-A-70-40-00-96A-390A-C
Plasma and flame thermal spraying	YY-A-70-40-00-97A-612A-C

#### Heat treatment

General	YY-A-70-40-00-98A-630A-C
Heat treatment furnace approval	YY-A-70-40-00-99A-030A-C
Localized heat treatment equipment approval	YY-A-70-40-00-A1A-030A-C
Furnace heat treatment	YY-A-70-40-00-A2A-638A-C
Localized heat treatment	YY-A-70-40-00-A3A-638A-C

### 2.7.6

#### 70-50-00 Surface preparation

##### Abrasive blast surface preparation

Dry abrasive blast -fine	YY-A-70-50-00-01A-649A-C
Dry abrasive blast -medium	YY-A-70-50-00-02A-649A-C
Dry abrasive blast -coarse	YY-A-70-50-00-03A-649A-C
Wet abrasive blast -fine	YY-A-70-50-00-04A-649A-C
Wet abrasive blast -medium	YY-A-70-50-00-05A-649A-C

##### Surface conditioning

General	YY-A-70-50-00-10A-630A-C
Almen test of surface conditioning intensity	YY-A-70-50-00-11A-390A-C
Test for minimum shot size and deformed shot	YY-A-70-50-00-12A-390A-C
Test for broken glass beads	YY-A-70-50-00-13A-390A-C
Surface stressing by glass bead peening	YY-A-70-50-00-14A-635A-C
Surface stressing by steel shot peening	YY-A-70-50-00-15A-635A-C

### Etching procedure for fluorescent-penetrant inspection

Local swab etching (all materials)	YY-A-70-50-00-21A-653A-C
Immersion (dip) etching for inconel	YY-A-70-50-00-22A-653A-C
Immersion (dip) etching for titanium	YY-A-70-50-00-23A-653A-C
Bonding test for fluorinated polymers	YY-A-70-50-00-24A-653A-C
Preparation of fluorinated polymers before blending	YY-A-70-50-00-25A-653A-C

## 2.7.7

### 70-60-00 Coating application

#### Electrolytic surface coating

General	YY-A-70-60-00-00A-640A-C
Nickel Plating on steel -testing	YY-A-70-60-00-01A-390A-C
Copper plating on stainless steel	YY-A-70-60-00-02A-647A-C
Nickel plating on steel -high stress, watts type	YY-A-70-60-00-03A-647A-C
Nickel plating on steel -low stress, sulfamate type	YY-A-70-60-00-04A-647A-C
Chromium plating on high stress stainless steels and austenitic alloys	YY-A-70-60-00-05A-647A-C
Chromium plating on low stress carbon steels	YY-A-70-60-00-06A-647A-C
Silver plating on steel	YY-A-70-60-00-07A-647A-C
Diffused Ni/Cd plating on steel	YY-A-70-60-00-08A-647A-C
Cadmium plating on steel	YY-A-70-60-00-09A-647A-C
Chromium plating on aluminum and aluminum alloys	YY-A-70-60-00-10A-647A-C
Selective contact copper plating	YY-A-70-60-00-11A-647A-C
Selective contact nickel plating	YY-A-70-60-00-12A-647A-C
Selective contact silver plating	YY-A-70-60-00-13A-647A-C
Diffused Ni/Cd selective contact plating	YY-A-70-60-00-14A-647A-C
Chromic acid anodizing	YY-A-70-60-00-15A-641A-C
Sulphuric acid anodizing	YY-A-70-60-00-16A-641A-C
Hard anodizing	YY-A-70-60-00-17A-641A-C

#### Chemical surface coating

General	YY-A-70-60-00-20A-640A-C
Manganese phosphate coating	YY-A-70-60-00-21A-644A-C
Oxide film coating of aluminum alloys	YY-A-70-60-00-22A-649A-C
Spot touch-up of oxide film coating on aluminum alloys for appearance and protection	YY-A-70-60-00-23A-649A-C
Spot touch-up of oxide film coating on aluminum alloys for protection	YY-A-70-60-00-24A-649A-C
Zinc phosphate coating	YY-A-70-60-00-25A-644A-C
Black oxide coating	YY-A-70-60-00-26A-641A-C
Spot touch-up of black oxide coating	YY-A-70-60-00-27A-641A-C

#### Application of dry film lubricants

General	YY-A-70-60-00-30A-243A-C
Application of molybdenum disulfide dispersed in modified epoxy resin binder	YY-A-70-60-00-31A-243A-C
Application of micrographite pigment dispersed in a thermoplastic binder	YY-A-70-60-00-32A-243A-C
Application of colloidal graphite dispersed in an epoxy binder	YY-A-70-60-00-33A-243A-C
Application of molybdenum disulfide dispersed in polyimide resin	YY-A-70-60-00-34A-243A-C

Application of molybdenum disulfide and other dry film lubricants dispersed in an inorganic binder and non-flammable solvent	YY-A-70-60-00-35A-243A-C
Application of PTFE lubricant varnish	YY-A-70-60-00-36A-243A-C

#### Application of paints

Bend test of paint	YY-A-70-60-00-41A-390A-C
Application of aluminum pigment silicone paint	YY-A-70-60-00-42A-257A-C
Application of epoxy-silicone aluminum pigment paint with catalyzer	YY-A-70-60-00-43A-257A-C
Application of mineral base aluminum paint	YY-A-70-60-00-44A-257A-C
Application of anti-erosion paint	YY-A-70-60-00-45A-257A-C
Application of epoxy resin paint	YY-A-70-60-00-46A-257A-C
Application of primer for protection of inner surfaces	YY-A-70-60-00-47A-257A-C
Application of an epoxy polyimide paint	YY-A-70-60-00-48A-257A-C
Application of protective varnish	YY-A-70-60-00-49A-257A-C
Diffused aluminum-silicon paint	YY-A-70-60-00-50A-257A-C
Application of intumescent fire retardant paint	YY-A-70-60-00-51A-257A-C

#### Application of adhesives

Shear test	YY-A-70-60-00-61A-390A-C
Application of a two part epoxy adhesive	YY-A-70-60-00-62A-621A-C
Application of a one part epoxy adhesive	YY-A-70-60-00-63A-621A-C
Application of a modified epoxy adhesive	YY-A-70-60-00-64A-621A-C
Bonding of silicone elastomer seals to metal surfaces	YY-A-70-60-00-65A-621A-C
Application of a two-part sealing elastomer	YY-A-70-60-00-66A-621A-C
Application of sealing adhesive	YY-A-70-60-00-67A-621A-C
Application of a modified epoxy adhesive film	YY-A-70-60-00-68A-621A-C
Application of a modified epoxy adhesive foam	YY-A-70-60-00-69A-621A-C

#### Application of elastomer sealant

Application of polysulfide elastomer sealant	YY-A-70-60-00-71A-621A-C
Application of silicone elastomer adhesive/sealant	YY-A-70-60-00-72A-621A-C
Localized application of silicone abradable coating charged with hollow glass beads on non-metallic materials	YY-A-70-60-00-73A-621A-C
Application of polysulfide and toluene elastomer sealant	YY-A-70-60-00-74A-621A-C
Application of mineral charged epoxy coating	YY-A-70-60-00-75A-621A-C
Application of aluminum charged epoxy resin	YY-A-70-60-00-76A-621A-C
Application of epoxy abradable coating charged with hollow glass beads	YY-A-70-60-00-77A-621A-C
Application of phenolic microballoons charged epoxy coating	YY-A-70-60-00-78A-621A-C

### 2.7.8

#### 70-70-00 Assembly

General	YY-A-70-70-00-00A-700A-C
Tightening methods	YY-A-70-70-00-01A-711A-C
Locking methods	YY-A-70-70-00-02A-712A-C

#### **1 General**

##### **1.1 Purpose**

Information data modules are prepared and codified, where appropriate, using the rules contained here.

##### **1.2 Scope**

It covers the rules for the preparation of information needed to provide aircrew with the necessary degree of understanding of the air vehicle and its systems and the procedures to

Applicable to: All

**S1000D-A-05-02-0207-00A-040A-A**

**Chap 5.2.2.7**

operate the air vehicle, its systems and equipment to their full potential under normal and failure modes. Unnecessary theory and superfluous engineering detail which are not of direct concern to the aircrew are excluded. Avoid including information that is a duplication of procedures, techniques or any other material contained in other documents (air vehicle/equipment publications, regulations or official publications).

Performance information must be included.

## 1.3 Standards, definitions, writing style and references

### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate:

- **Procedure:** A narrative description of a process that the aircrew must complete to place an air vehicle or system in a desired state.
- **Drill:** A list of actions to be carried out by the aircrew to complete a procedure.
- **Checklist:** A compilation of all drills related to the normal and emergency operation of the air vehicle.

### 1.3.3 Writing style

Where data modules for system description and operation are used in common for aircrew and maintainer information, they are written in the style, scope and depth appropriate to aircrew data modules.

### 1.3.4 References

References to any other documents are minimized. Avoid repetition of information, ensure related subject matter is adequately referenced so that the reader does not overlook important supplementary information. Such references in a data module to other modules are made by reference to the data module code.

## 2 Aircrew information

### 2.1 General

Description and operation (functioning) of the air vehicle is given in the relevant system (systems 21 and up). To present both aircrew and maintainer information at the most general level of description use the same description and operation data modules where possible. As description and operation data modules become more detailed and aircrew or maintainer orientated use different data modules.

System 15 of the SNS is reserved for the remainder of the aircrew information, to the extent that it is not covered in the various system chapters in a manner appropriate to aircrew. It is specifically arranged for the preparation of flight information (eg, flight manuals, operating data manuals and flight crew checklists).

System 05-60-YY of the SNS has been designated for the acceptance/functional check flight.

### 2.2 Technical content

#### 2.2.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-15-00-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-00-0000-**NN**AAA-018Y-A (37 characters)

where "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

## **2.2.2 Description and operation of systems**

### **2.2.2.1 Data module coding**

To assist in the data modules coding, the rules which follow are used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-YY-**Y0**-00-00A-043A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y-YY-**Y0**-0000-00AAA-043A-A (37 characters)

where "**YY-Y0**": In general the bulk of aircrew information will be at system level, "YY-00", but can for complex systems be broken down to subsystem level, "YY-Y0".

### **2.2.2.2 General**

Description and operation must include normal operation of systems and equipment, and, if applicable, malfunction analysis information and alternate operation. To describe all systems adequately, theory of operation of direct concern to aircrew can be included. The information provided is relevant and sufficiently detailed to enable aircrew to convert to and subsequently operate the air vehicle safely and effectively without recourse to associated engineering documents. Some systems will require separate normal and emergency operation, malfunction analysis and alternate methods of operation to provide optimum utilization of malfunctioning equipment. Each major air vehicle is covered under a major heading. If necessary, major systems are divided into subsystems and/or equipment. Each component control and indication of the major air vehicle is covered under separate subordinate headings. The name of the system is used as the primary heading and the name of each control or indication as the subordinate heading.

### **2.2.2.3 Description and operation**

The description and operation of each air vehicle are covered in data modules as follows:

- An introductory paragraph must cover the concept of the system and explain the function of the system and how it affects or is affected by any other system. Information on the peculiarities and automatic features of the system are given regarding items such as source of power to operate the system (eg, electric or hydraulic power source) and means by which the system accomplishes its functions. Specific controls can be mentioned but, in order to maintain the general nature of this introductory paragraph, must not be discussed. In some cases (especially automatic systems) it can be advisable to explain the internal mechanization of the system, including operational moding, so that the aircrew can fully appreciate what can be expected of the system. Where appropriate, software and its effects on the system are discussed.
- Each control contributing to the operation of the system is described and its location established. The description must include the function of the control and the end result produced when the control is selected to each of its possible options. The means by which the control accomplishes the end result is stated (eg, mechanically or hydraulically). The specific action that a control actually accomplishes rather than simply stating the action it is supposed to accomplish is stated, for example, "The landing gear lever mechanically releases the up-locks and electrically positions the hydraulic selector valve" and not "the landing gear lever operates the landing gear". Any effect that this control can have on any

other system or which other systems can have on the control is stated. If operating the control requires any special technique or action, it is stated. If practical, a separate paragraph is devoted to each control and the name of the control is employed as the paragraph heading. Descriptions of controls used in normal operation of a system are listed first, followed by descriptions of those controls used as back-up to the normal controls.

- All dedicated indications and warning devices, which are part of the system, are described. This description must include location, function, power source and interpretation of the indications. If an indication is very closely related to a single control, it is described in the paragraph covering the control. A control used to set, produce or adjust an indication is covered under the indication paragraph.
- Each multifunction control must be uniquely identified by location and number, for example (STICK) (ST), BUTTON No.1(1). The function of each control can be given in chart or tabular form. The description must include all functions available for use within the subject system, any indications associated with the operation of the control and any captions/legends or changes to associated indications which can be displayed to prompt selection/deselection of the control. A description is given of the end result produced when the control is operated, both to the subject system and, where applicable, any other system. A full description of multifunction controls is given in the relevant data module.
- Each multifunction display or readout contributing to the operation of the subject system is described. This description must include the various display formats available for use within the subject system, together with pertinent display symbology and the interpretation of relevant mnemonics, graphics, color, etc. Each display is described in its "normal" configuration and also in any other selectable or automatically entered formats (including any additional or changed symbology, either by selection or automatic moding). Fault and warning conditions, which are part of an integrated system, must also be included. A full description of multifunction displays and readouts is given in the relevant data module.
- Include illustrations to illustrate all indications and controls and whenever the illustration helps to describe the operation of the equipment. All types of illustration permitted by [Chap 3.9.2](#) can be used.

## 2.2.3 Flight information

The flight information data modules are used to build up the flight manual and operating data manual.

### 2.2.3.1 Data module coding

To assist in the data modules coding, the following rules are used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-15-SY-YY-NNA-XXX-Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-SY-YY00-NNAAA-XXX-Y-A (37 characters)

where:

- "15" = Aircrew information
- "SY", in the subsystem code, gives the subsystem, "00" for General, "10" for Aircraft release/Operating limitations, etc. Refer to [Chap 8.2.1](#).
- "Y-YY", in the subsystem and unit or assembly code, is used for further break down by project or organization decision, except for subsystem "40", emergency procedures, which are given in [Para 2.2.3.6](#). Where no breakdown is needed or relevant, "0-00" is used.
- "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed
- "XXX" is the information codes related to the data modules given in [Para 2.2.3.2](#) thru [Para 2.2.3.10](#)

- 2.2.3.2 General  
These data modules contain an Introduction, which gives a general overview of the salient features of the air vehicle (including leading particulars not covered elsewhere within System 15) and its intended use.
- Data modules must be coded:
- YY-Y-15-0Y-YY-NNA-043A-A (17 characters)
- thru
- YYYYYYYYYYYYYYY-YYYY-Y15-0Y-YY00-NNAAA-043A-A (37 characters)
- 2.2.3.3 Aircraft release/operating limitations  
These data modules cover all limitations that must be observed throughout the cleared operating envelope.
- Data modules must be coded:
- YY-Y-15-1Y-YY-NNA-043A-A (17 characters)
- thru
- YYYYYYYYYYYYYYY-YYYY-Y15-1Y-YY00-NNAAA-043A-A (37 characters)
- 2.2.3.4 Flight characteristics  
These data modules describe in narrative form the unique flight characteristics of the air vehicle throughout all phases of flight.
- Comprehensive coverage of the handling of the air vehicle is provided throughout all phases of flight, including information such as asymmetric flight, conditions leading to departure, ground resonance and auto rotation characteristics. The recovery technique for all conditions that could be classified as out of control flight is emphasized. Detailed coverage of the technique to be employed in accomplishing operations such as taxiing, take-off, climb, instrument flight and landing are required under all configurations. All precautions to be observed during the various operations are covered.
- Data modules must be coded:
- YY-Y-15-2Y-YY-NNA-043A-A (17 characters)
- thru
- YYYYYYYYYYYYYYY-YYYY-Y15-2Y-YY00-NNAAA-043A-A (37 characters)
- 2.2.3.5 Normal procedures
- 2.2.3.5.1 General  
These data modules must contain in narrative and/or checklist form all normal procedures required to accomplish a flight. Details and discussions of the operation of the system are covered in the appropriate system chapters. The handling of installed equipment is included, if this is not satisfactorily covered in the system chapters with regard to aircrew. Checking and proper positioning of installed equipment controls can be included if neglect of these operations would affect the safety or the efficiency of the flight. Function, operation or effect of controls is repeated here only as required for emphasis. The use of warnings, cautions and notes is kept to a minimum so that their importance is not degraded.
- Data modules must be coded:
- YY-Y-15-3Y-YY-NNA-XXXY-A (17 characters)
- thru

YYYYYYYYYYYYYYY-YYYY-Y15-3Y-YY00-NNAAA-XXXY-A (37 characters)

where "XXX" is:

- 121 - Pre-operation procedures (crew)
- 131 - Normal operation procedures (crew)
- 151 - Post-operation procedures (crew)

If no breakdown of the information is needed or relevant, the information code 131 is used.

For flight crew checklist information codes 125, 135 and 155, refer to [Para 2.2.4](#).

#### 2.2.3.5.2 *Special procedures*

Procedures for air vehicles flown under special conditions, such as scramble or missions requiring intermediate operational stops, can be developed. Under these conditions, only certain items of the pre-flight, engine run-up and other applicable procedures need to be accomplished to assure a safe operation. Intermediate stops are defined as stops such as refueling, crew change or re-arming etc. A code can be developed to identify each item of a normal procedure that must be performed during the special operation, (eg, external power connected items not coded can be checked at the discretion of the aircrew, except when an air vehicle has been "cocked" for scramble).

#### 2.2.3.5.3 *Alert procedures*

The addition of alert procedures must have no effect on the normal procedures. The arrangement of the normal procedures must remain unchanged and reference can be made to the alert procedures in the normal procedures. Since aircrew on alert status use the alert procedures as a master checklist, the alert procedures must include all the steps of the procedures required to operate the air vehicle under the alert concept. The alert procedures must start by referring the aircrew to the preceding normal procedures by directing them to perform the interior and exterior inspections as set forth in the normal checklist. Once the member of aircrew is in the midst of the alert checklist he must not be referred back to the normal procedures until he has completed all alert checks, even if this means repetition of an identical phase contained in the normal procedures. As found necessary, each phase of alert operation must include an explanation of the purpose of that phase. Amplification of the alert procedural entries is avoided if such amplification is already provided in the normal procedures.

#### 2.2.3.5.4 *External inspection diagrams*

Diagrams covering the paths to be followed and the various checks to be made during the exterior inspection of the air vehicle are included as necessary. The paths must not pass thru danger areas.

#### 2.2.3.6 *Emergency procedures*

##### 2.2.3.6.1 *General*

These data modules must contain in narrative and/or checklist form the procedures to be followed to meet any emergency that could reasonably be expected. Emergency operation is covered only if it affects flight safety or the ability to complete the mission. Emergency systems and equipment are described in the various system chapters. Each emergency is listed and the symptoms which can be felt or observed, together with the indications provided by the warning system and other instrumentation, are described. If applicable, multifunction display readouts giving emergency information (actions to be taken, special information) are included in a comprehensive form, as illustrations showing the layout of the electronic displays and in listed form. The effects of the emergency on air vehicle operation and handling and/or the effects on individual system operation must also be described. Include explanatory notes to cover any points in the emergency situation or in the emergency procedure, the significance of which cannot be immediately apparent to the aircrew. All precautions to be observed in coping with an emergency are discussed. Normally, combinations of emergencies are not covered because of the numerous possible combinations. Many emergencies will require some urgency in landing the aircraft. Emergency procedures requiring expedition in landing are written with full consideration of the expected time-to-failure after initial malfunction of the critical system.

Data modules must be coded:

YY-Y-15-4Y-YY-NNA-141Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-4Y-YY00-NNAAA-141Y-A (37 characters)

where "4Y" is:

- 41 - General
- 42 - Ground emergencies
- 43 - Take-off emergencies
- 44 - System related emergencies
- 45 - Single or multi-engine failures
- 46 - Approach/landing emergencies
- 47 - Avionic system failures
- 48 - Other emergencies or failures
- 49 - Multifunction display readouts giving emergency information

If no breakdown is needed or relevant, the information code 40 is used.

For flight crew checklist information code 145, refer to [Para 2.2.4](#).

#### 2.2.3.6.2 *Helicopters*

On helicopters some equipment malfunctions require the air vehicle to "Land immediately", others historically lead to rapid deterioration of serviceability of a critical system which in turn requires the crew to "Land as soon as possible". Other equipment malfunctions result in a less rapid deterioration of flying qualities and a less urgent requirement to land. For those malfunctions the term "Land as soon as practicable" has been designated. Therefore, these three terms are defined in the first data module within this section (data module code: YY-Y-15-41-00-01A-141A-A) and used throughout the section as general guidance where appropriate, to relate to the aircrew the degree of urgency in landing:

- "Land immediately" - An emergency will be declared and the air vehicle landed at once even if, for example, the outcome is ditching or landing in trees. The consequences of continued flight are likely to be more hazardous than those of landing at a site normally considered to be unsuitable.
- "Land as soon as possible" - An emergency will be declared and flight continued for no longer than necessary to accomplish a safe but unhurried landing at the nearest site.
- "Land as soon as practicable" - Emergency conditions are less urgent and the air vehicle is landed at the nearest aviation location or, if one is not reasonably close, at a safe landing site selected for subsequent convenience.

#### 2.2.3.6.3 *Fixed-wing air vehicles*

On fixed-wing air vehicles some equipment malfunctions require the crew to "Land as soon as possible". Other equipment malfunctions result in a less rapid deterioration of flying qualities and a less urgent requirement to land. For those malfunctions the term "Land as soon as practicable" has been designated. Therefore, these two terms are defined in the first data module within this section (data module code: YY-Y-15-41-00-01A-141A-A) and used throughout the section as general guidance to relate to the aircrew the degree of urgency in landing:

- "Land as soon as possible" - An emergency will be declared and the air vehicle landed at the nearest airfield with a runway suitable for a safe landing.
- "Land as soon as practicable" - Emergency conditions are less urgent and the air vehicle is landed at the nearest airfield where it can be landed safely and practical assistance for the air vehicle type can be expected.

#### 2.2.3.6.4 Arrangement of emergencies

Emergencies must, if applicable, be arranged in the following sequence:

- 1 **Ground emergencies:** These are the emergencies, which might occur during the aircrew manning the air vehicle until the commencement of the take-off phase.
- 2 **Take-off emergencies:** These are the emergencies, which might occur during the phase from take-off on the ground until airborne with the climb configuration or emergency landing configuration established.
- 3 **System related emergencies:** These are emergencies, which can occur during any phase of operation, therefore they must not be associated with a particular phase of operation, unless otherwise stated.
- 4 **Single or multi-engine failures:** These failures must include all resulting emergencies. Procedures are given to cover all phases of flight including the landing portion. Avoid, if feasible, references to other applicable drills, consolidated drills are preferred.
- 5 **Approach/landing emergencies:** These emergencies must include all system failures that require special procedures to accomplish the approach and landing.
- 6 **Avionic system failures:** These emergencies must contain information with regard to failures of the avionic system and provide procedures which can enable the crew to complete the mission successfully.
- 7 **Other emergencies or failures:** Any other emergency or failure appropriate to role or air vehicle type.

#### 2.2.3.6.5 Illustrations

Illustrations can be added to explain emergency procedures.

#### 2.2.3.6.6 General emergency procedures

In the general emergency procedures data modules (data module code: YY-Y-15-41-00-01A-141A-A), a statement of the three basic rules are included. This example statement refers:

Example:

In all emergencies, the overriding consideration must be to:

- 1 Maintain air vehicle control
- 2 Analyze the situation
- 3 Take proper action"

#### 2.2.3.7 Special conditions

These data modules must provide information pertaining to the operation of air vehicles under special conditions (eg, adverse weather and climatic conditions). It is primarily narrative in nature. Presentations in the form of procedural items are used only to cover specific procedures that are characteristic of adverse weather operations.

Data modules must be coded:

YY-Y-15-5Y-YY-NNA-XXXY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-5Y-YY00-NNAAA-XXXY-A (37 characters)

where "XXX" is:

- 043 - Description of function attributed to crew (functional breakdown)
- 131 - Normal operation procedures (crew)

- 141 - Emergency operation procedures (crew)

#### 2.2.3.8 Performance data

##### 2.2.3.8.1 *General*

These data modules must provide the data to be used by the operators for flight planning purposes and are the best available data. They must also allow performance studies and comparisons to be made.

Data modules must be coded:

YY-Y-15-6Y-YY-NNA-030A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-6Y-YY00-NNAAA-030A-A (37 characters)

##### 2.2.3.8.2 *Fundamental elements*

The base from which the operating data are calculated must have taken into account the following fundamental elements:

- The performance datum of the air vehicle must be defined
- The performance datum of the engines must be defined
- The level of performance appropriate to service use must be specified
- The criteria for scheduling the standard of performance must be specified

##### 2.2.3.8.3 *Performance datum of air vehicle*

This datum must cover all phases of flight, extremes of the flight envelope, ambient conditions, air vehicle and external stores configurations for which the air vehicle must be cleared or certificated.

##### 2.2.3.8.4 *Performance datum of engines*

This datum must cover all phases of flight, extremes of the flight envelope and ambient conditions for which the air vehicle must be cleared or certificated.

##### 2.2.3.8.5 *Variations from datum performance*

The assumptions made to account for the variations from the datum performance of both the air vehicle and engines during the service life of the air vehicle are defined. These assumptions are applied in the calculation of the performance data presented in any output.

##### 2.2.3.8.6 *Standards of performance*

Several standards of performance can be appropriate dependent on the levels of risk determined by the operational role of the air vehicle. The criteria in the standard of performance are applied, as appropriate, in the calculation of the performance data presented in the output for each standard of performance. Such standards are to be agreed upon as a project or an organization requirement.

#### **Business rule decision point BRDP-S1-00453 - Standards of performance data in aircrew information:**

- Decide on the standards of performance to be used in the calculation.

##### 2.2.3.8.7 *Phases of flight*

Performance data can be required at some of the conditions or phases of flight listed below. These data must cover all phases of flight, extremes of the flight envelope, ambient conditions, air vehicle and external stores configurations for which the air vehicle must be cleared or certificated. Data must be provided with all engines operating and with one or more engines inoperative, as required.

- Take-off from dry, wet or contaminated runway surfaces
- Initial climb-out and obstacle clearance
- Hovering inside and outside the ground effect

- Flyaway, vertical or run-on landings, or other options following an engine failure in hover/ low speed flight
- Vertical climb
- Translational climb
- Net flight path profiles
- Cruising flight for maximum range and endurance or any other appropriate speed
- Supersonic flight
- Maximum altitude
- Combat and/or maneuvering flight or boundaries
- Specific excess power boundaries
- Tactical low level and/or terrain following operations
- Carrier/Ship-borne operations
- Descent
- Holding
- Approach and landing
- Overshoot and/or baulked landing
- Ferry flight information
- Flight in abnormal configurations
- Effects of, or performance with, external stores and/or underslung loads carried
- Effects of, or performance with, sand, ice, foreign object, weapon countermeasure or other engine intake protection devices fitted
- Any other appropriate conditions required

The above data can be required for:

- Normal operations
- Mission planning
- Operations from restricted sites or airfields and/or requiring steep climb-out or approach profiles
- Operations when higher than normal risks are accepted and authorized

#### 2.2.3.8.8 *Presentation*

Performance data can be presented in the most appropriate form, including reference to external software using basic aerodynamic algorithms.

#### 2.2.3.9 Role operation/Weapon system techniques

##### 2.2.3.9.1 *Descriptions*

These data modules describe the armament/role system, controls and installed equipment and will be included only to the extent that they are not covered in the various system chapters in a manner appropriate to aircrew.

Data modules must be coded:

YY-Y-15-7Y-YY-NNA-043A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-7Y-YY00-NNAAA-043A-A (37 characters)

##### 2.2.3.9.2 *Safety requirements*

These data modules specify all safety requirements relevant to the armament/role system fitted.

Data modules must be coded:

YY-Y-15-7Y-YY-NNA-012A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-7Y-YY00-NNAAA-012A-A (37 characters)

#### 2.2.3.9.3 Normal and reversionary procedures

These data modules must contain in narrative and/or checklist form, as necessary, all normal and reversionary procedures relating to weapon delivery/role operation/equipment operation to be followed from the time the aircrew arrive at the air vehicle until they depart from the air vehicle and to an extent that it is not covered in the appropriate system chapters or in Normal procedures. Refer to [Para 2.2.3.5](#).

Data modules must be coded:

YY-Y-15-7Y-YY-NNA-XXX-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-7Y-YY00-NNAAA-XXX-A (37 characters)

where "XXX" is:

- 121 - Pre-operation procedures (crew)
- 131 - Normal operation procedures (crew)
- 151 - Post-operation procedures (crew)

If no breakdown of the information code is needed or relevant, the information code 131 is used.

#### 2.2.3.9.4 Emergency procedures

These data modules must contain in narrative and/or checklist form, as necessary, all emergency procedures relating to weapon delivery/role operation not covered in the appropriate system chapters or in emergency procedures Refer to [Para 2.2.3.6](#).

Data modules must be coded:

YY-Y-15-7Y-YY-NNA-141Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-7Y-YY00-NNAAA-141Y-A (37 characters)

#### 2.2.3.9.5 Weapons procedures and sample problems

These data modules describe the weapons planning procedures and give in charts and in tabular form the data related to weapon delivery/role operations.

- **Scope:** The basis for the charts and tables and assumptions used with respect to temperature, pressure, atmospheric density etc, are discussed including appropriate reference line illustrations and definitions. The appropriate planning software program applicable to the air vehicle weapon aiming system is identified.
- **Description of charts and tables:** Sample problems for each type of delivery mode for each weapon will only be required if it is decided that it is necessary for the aircrew to be able to carry out manual calculations.

Data modules must be coded:

YY-Y-15-7Y-YY-NNA-030Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-7Y-YY00-NNAAA-030Y-A (37 characters)

#### 2.2.3.10 Configurations

These data modules must contain the various stores configurations, including weapons, fuel tanks, and special pods carried both internally and externally and include details of the effect on weight, drag index, limitations and flight envelope where they are not covered in flight characteristics (refer to [Para 2.2.3.4](#)), performance data (refer to [Para 2.2.3.8](#)) or role operation/weapon system procedures (refer to [Para 2.2.3.9](#)) data modules.

Data modules must be coded:

YY-Y-15-8Y-YY-NNA-020A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-8Y-YY00-NNAAA-020A-A (37 characters)

## 2.2.4 Flight crew checklist

### 2.2.4.1 General

The purpose of the flight crew checklist must provide aircrew with drills for normal operation of the air vehicle, for air vehicle and system malfunctions, for emergency procedures and for special operations. Include relevant operating data to enable the air vehicle to be operated safely and effectively.

### 2.2.4.2 Structure

By project or organization decision the checklist can be built up according to either of the following two models:

- **Multi-data modules checklist:** A compilation of separate data modules, each containing the drills of the corresponding aircrew information data module.
- **Comprehensive checklist:** Checklist consisting of one data module, containing all necessary drills related to one section (eg, normal procedures, emergency procedures) of the aircrew information.

#### **Business rule decision point BRDP-S1-00455 - Select model for checklist for structures in aircrew information:**

- Decide which of the two models are used to structure checklists.

### 2.2.4.3 Data module coding

#### 2.2.4.3.1 *Multi-data modules checklist*

The checklist data modules must have the same data module code as its Aircrew Information (AI) procedure data modules, except for the information code.

Example:

- AI procedure DMC-1Y-A-15-44-YY-NNA-141A-A (system related emergencies)
- Checklist DMC-1Y-A-15-44-YY-NNA-145A-A

#### 2.2.4.3.2 *Comprehensive checklist*

The checklist must have a data module code with the same section/subsystem number, as the AI section/subsystem to which it relates.

Example:

- AI procedure DMC-1Y-A-15-4Y-YY-NNA-141A-A (emergency procedures, any data module)
- Checklist DMC-1Y-A-15-40-00-NNA-145A-A

### 2.2.4.4 Preparation

Flight crew checklist are to incorporate all drills relating to equipment operation, including those required by non-flight deck aircrew, appropriate to the specific air vehicle and role. The order of drills will be project specific. Include limitations and operating data required by the project or the organization.

### 2.2.4.5 Sequence of phases, actions and checks

Phases, actions and checks are arranged chronologically and designed to avoid requiring the member of aircrew to retrace his steps. Ensure all checks are made from left to right or top to bottom, except where chronology must take precedence. Group checks on the ground to

minimize control manipulation and ground operating time. Phases can be added or deleted and checks can be rearranged to other phases to provide for specific situations.

#### 2.2.4.6 Brevity

All instructions are concise, but brevity must not be achieved at the expense of accuracy or clarity.

#### 2.2.4.7 Order of drills

The checklist must contain the following information, other information can be added as required by projects:

- **Normal drills:** Those drills which deal with the normal operation of the air vehicle and its equipment is laid out in chronological order, starting from the time that the aircrew approach the air vehicle before flight until the time that they leave the air vehicle after engine shutdown.
- **Operating data:** As required.
- **Limitations:** As required.
- **System malfunction and emergency drills:** Single system emergency drills are written under generic headings such as "Fires", "Hydraulic system failures" etc. These drills are presented in bold face to indicate that they are drills that must be memorized. Complex emergency drills, which require actions on more than one system (eg, following an engine shutdown), must, where possible, be presented in full to prevent the need for cross reference to other drills.

#### **Business rule decision point BRDP-S1-00456 - Order of drills in aircrew information:**

- Decide whether the order of drills will be project specific. Limitations and operating data required by the project must be included.

#### **Business rule decision point BRDP-S1-00457 - Supplementing the order of drills in aircrew information:**

- Decide whether to supplement the order of drills checklist listing.

#### 2.2.4.8 Numbering

Numbering of checks within each drill can be used as individual project requirements dictate.

#### **Business rule decision point BRDP-S1-00458 - Numbering of checks within drills in aircrew information:**

- Decide on the numbering of checks within each drill.

#### 2.2.4.9 Emergency drills

Emergency drills must normally start with the indications of the failure.

#### 2.2.4.10 Special checks

An asterisk [\*] or obelus (dagger marking) [†] can be used to identify special checks (eg, alert or quick turn round checks). The meanings of such markings must be explained in the "Notes to Users" or at the head of the group of checks where the markings are used.

#### 2.2.4.11 Tables

If used, tables are normally be set to the full width of the area of the checklist. Column headings are in upper and lowercase, and columns are separated by vertical lines. Horizontal lines can be used as required.

#### 2.2.4.12 Illustrations

Illustrations must not be used, unless it is impracticable to show the data effectively in any other way.

- 
- 2.2.4.13    **Safety precautions**  
Where applicable, a summary of safety precautions are provided. The summary must precede the normal drills and must include all general precautions.
- 2.2.4.14    **Name**  
The name used in the checklist modules are identical to that used in the remainder of the CSDB for the production of other aircrew information. Abbreviations, as used in other parts of the CSDB, can be used as necessary.
- 2.2.4.15    **Warnings, cautions and notes**  
Warnings, cautions and notes can be used in checklist format if necessary.
- 2.2.4.16    **Limitations**  
The following limitations can be incorporated within checklists:
- Airframe limitations
  - Engine limitations
  - Approved fuels and oils
  - System limitations
- 2.2.4.17    **Operating data**  
Any operating data presented must be from a validated source.

## Chapter 5.2.3

## 1 General

### 1.1 Purpose

Land/Sea Product crew/operator descriptive information data modules are prepared and codified, where appropriate, using the rules contained here.

### 1.2 Scope

It the rules for the preparation of information needed to provide crew/operator with the necessary degree of understanding of the Land/Sea Product.

Unnecessary theory and superfluous engineering detail, which are not of direct concern to the crew/operator as defined by the project or the organization, must be excluded. Inclusion of information that is a duplication of descriptions or any other material contained in other documents (Land/Sea Product publications, regulations or official publications) must be avoided. Performance information must be included.

This information set is divided into two groups:

- General information
- Description

#### 1.2.1 General information

The information must contain the general information (eg, general description, technical data, etc) of the Land/Sea Product.

#### 1.2.2 Land/Sea Product description for the Crew/Operator

The following three different description types can be used as defined by the project or the organization:

- Functional description (predominant descriptions of functions) of the Land/Sea Product.
- Physical breakdown orientated description (descriptions of each part of a physical breakdown) of the Land/Sea Product.
- External equipment description (descriptions of components or equipment which are outside of the defined project, for example ammunition, but for which the crew/operator must be provided information) of the Land/Sea Product.

#### Business rule decision point BRDP-S1-00459 - Description types for Land/Sea Products for the crew/operators:

- Decide on the description types to be used: functional, physical breakdown, or external equipment.

## 1.3 Standards and definitions

### 1.3.1 Standards

The following chapters are applicable when using this chapter:

- [Chap 3.4](#) - Zoning and access
- [Chap 3.6](#) - Security and data restrictions
- [Chap 3.7](#) - Quality assurance
- [Chap 3.9.1](#) - General writing rules

Applicable to: All

S1000D-A-05-02-0301-00A-040A-A

Chap 5.2.3.1

- [Chap 3.9.2](#) - Illustration rules and multimedia
- [Chap 3.9.3](#) - Warnings, cautions and notes

For the purposes of explanation, data module codes are shown in both 17 character and 37 character lengths. The project or the organization must establish their own data module coding strategy, using a code length that suits the project's needs.

### 1.3.2 Writing style

Where data modules for Product descriptions are used in common for Land/Sea crew/operator and maintainer information, they must be written in the style, scope and depth appropriate to Land/Sea crew/operator data modules.

### 1.3.3 References

Reference to any other documents inside this information set must be used in a structured way. To avoid repetition of information, related subject matter must be adequately referenced. Such references in a data module to other modules must be made by reference to the data module code and title and to other technical publications by reference to their identifier.

### 1.3.4 Definitions

The definitions as stated in [Chap 9.2](#) must be used as appropriate.

## 2 Crew/Operator descriptive information content

### 2.1 Introduction

The introduction data module contains explanation of the purpose, scope, structure, special format and use of the technical content of this information set. They also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-00-00-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-A00-00-0000-NNAAA-018Y-A (37 characters)

The information code variant is used to distinguish between the different information sets.

### 2.2 Land/Sea Product - General

#### 2.2.1 General description

General description must contain an overview of the whole Product with the following topics:

- Illustration and or pictures of the Land/Sea Product
- Purpose of the Land/Sea Product
- General description of construction and use of the Land/Sea Product

Data modules must be coded:

YY-Y-15-00-00-YYA-043A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-00-0000-YYAAA-043A-A (37 characters)

#### 2.2.2 Technical data

Technical data include all necessary information about the Land/Sea Product and its components, (eg, weights and measures, performance data, limits (when they are in a descriptive manner: view-areas of the different crew-members/operators under use of optical components)).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-033A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-033A-A (37 characters)

### 2.2.3 Operation areas and devices

The description of operation areas covers all different kind of structures where the Land/Sea Product is divided into functional or tactical purpose groups. Furthermore a summary of all used devices or components must be added for the above defined groups.

Data modules must be coded:

YY-Y-15-00-00-YYA-055A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-00-0000-YYAAA-055A-A (37 characters)

## 2.3 Land/Sea Product description

### 2.3.1 Technical description (functional breakdown orientated)

The functional breakdown orientated description of the Land/Sea Product covers all topics, appropriate for the Land/Sea crew/operator to realize the combine or function of more than one device or component. The goal must put the Land/Sea crew/operator in the position to understand the functionalities of the Land/Sea Product. The information must also be usable for training purposes.

Data modules must be coded:

YY-Y-15-05-YY-YYY-043A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-05-YYYY-YYYYY-043A-A (37 characters)

### 2.3.2 Technical description (physical breakdown orientated)

The components of the Product (if the information is necessary and on the level for the Land/Sea crew/operator) must have a description about the construction and its function in data modules as follows:

- Each control of the Product must be described and its location established.
- In some cases (especially automatic systems) it is advisable to explain the internal mechanization of the Product, so that the Land/Sea crew/operator can fully appreciate what can be expected of the Product. Where appropriate, software and its effects on the Product must be described.
- All dedicated indications and warning devices, which are part of the Product, must be described.

Illustrations must be included to illustrate all indications and controls. All types of illustrations permitted by [Chap 3.9.2](#) can be used.

References between technical description data modules must be used if necessary (show dependency).

The information must also be usable for training purposes.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-044A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-044A-A (37 characters)

### 2.3.3 Technical description (independent equipment)

All equipment not covered by the model identification definition but nevertheless used at the Land/Sea Product (eg, ammunition), describe the construction and its function on crew/operator level.

Data modules must be coded:

YY-Y-15-06-00-YYY-XXXA-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-06-0000-YYYYY-XXXA-A (37 characters)

Where "XXX", in the information code, is either 033 or 043

### 2.3.4 Content and references

The different kind of descriptions are connected by references, as shown in [Fig 1](#), to extend the information content and usability for the Land/Sea crew/operator. The functional breakdown orientated description gives the Land/Sea crew/operator an overview, the physical breakdown orientated description and details of the individual component.

ICN-AE-A-050203-A-U8025-00001-A-001-01

*Fig 1 Data and reference model descriptive information*

The physical breakdown allows an implicit connection between all other information on the same breakdown.

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for crew/operator operation information.

### 1.2 Scope

It covers the rules for the preparation of information needed to provide land/sea crew with the operation of the land/sea Product.

This information set is divided into seven groups:

- General information
- Operation
- Operating data manual
- Operating under special conditions
- Emergency procedures
- Transportation
- Equipment stowing

### 1.3 Standards and definitions

#### 1.3.1 Standards

The following chapters are applicable when using this chapter:

- [Chap 3.9.1](#) - General writing rules
- [Chap 3.9.2](#) - Illustration rules and multimedia
- [Chap 3.9.3](#) - Warnings, cautions and notes
- [Chap 3.4](#) - Zoning and access
- [Chap 3.6](#) - Security and data restrictions
- [Chap 3.7](#) - Quality assurance

For the purposes of explanation, data module codes are shown in both 17 character and 37 character lengths. The project or the organization must establish their own data module coding strategy, using a code length that suits the project or organization needs.

#### 1.3.2 Writing style

Where data modules for Product operation are used in common for land/sea crew/operator and maintainer information, they must be written in the style, scope and depth appropriate to land/sea crew/operator data modules.

#### 1.3.3 References

Reference to any other documents inside this information set must be used in a structured way. To avoid repetition of information, related subject matter must be adequately referenced so that the reader does not overlook important supplementary information. Such references in a data module to other modules must be made by reference to the data module code and title.

## 1.3.4

**Definitions**

The definitions as stated in [Chap 9.2](#) must be used as appropriate.

## 2

**Crew/Operator operation information**

## 2.1

**Introduction**

The introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of this information set. They could also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-15-00-00-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-00-0000-NNAAA-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed.

The information code variant is used to distinguish between the different information sets.

## 2.2

**Land/Sea Product operation - General**

The information must contain the general information (eg, general introduction into operation, conditions, performance limits) of the land/sea Product.

Data modules must be coded:

YY-Y-15-30-YY-YYY-043A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-30-YY-YYYYY-043A-A (37 characters)

## 2.3

**Land/Sea Product operation**

## 2.3.1

**Operation (physical breakdown orientated)**

The operation data modules must include all descriptions necessary to perform the operation of Product to put into operation, to operate during use or to turn off the defined Product. The operation description must be created as a step by step structure.

It must also include all preliminary requirements as a description or as a reference to the related data modules.

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data modules.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-**XXX**A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYYY-YYYYY-**XXX**A-A (37 characters)

Where "XXX", in the information code, is IC 111, IC112, IC 121, IC 131, IC 141 or IC 151.

## 2.3.2

**Operation (functional breakdown orientated)**

The operation data modules must include all descriptions necessary to perform the operation of components (functional groups) to put into operation, to operate during use or to turn off the

defined components (functional groups). The operation description must be created as a step by step structure.

All dependencies between the single Product inside the defined component (functional group) must as far as the crew needs be explained or taken into consideration for the content of the data modules.

It must also include all preliminary requirements as a description or as a reference to the related data modules.

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data modules.

Data modules must be coded:

YY-Y-15-3Y-YY-YYY-XXXA-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-3Y-YYYY-YYYYY-XXXA-A (37 characters)

Where

- "3Y", in the sub-/subsystem code, is 31 thru 38
- "XXX", in the information code, is IC 111, IC 112, IC 121, IC 131, IC 141 or IC 151

### 2.3.3 Land/Sea Product operating data

These data modules must contain all data for active service that are not described in the topic land/sea Product operation.

These could be information of Product parameters in case of battle not for training use or other operation instruction only applicable under battle conditions.

Data modules must be coded:

YY-Y-15-2Y-YY-YYY-XXXA-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-2Y-YYYY-YYYYY-XXXA-A (37 characters)

Where "XXX", in the information code, is IC 111, IC 112, IC 121, IC 131, IC 141 or IC 151.

## 2.4 Operating under special conditions

### 2.4.1 Heat conditions

These data modules must contain all relevant additional operation instructions to realize the whole functionality of the land/sea Product under higher temperature.

Data modules must be coded:

YY-Y-15-51-YY-YYY-YYYA-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y15-51-YYYY-YYYYY-YYYA-A (37 characters)

### 2.4.2 Cold conditions

These data modules must contain all relevant additional operation instructions to realize the whole functionality of the land/sea Product under lower temperature.

Data modules must be coded:

YY-Y-15-51-YY-YYY-YYYB-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-51-YYYY-YYYYY-YYYB-A (37 characters)

#### 2.4.3 Dust conditions

These data modules must contain all relevant additional operation instructions to realize the whole functionality of the land/sea Product used in areas by an abnormal influence of dust.

An example could be the shorter period of cleaning or changing of filters, etc.

Data modules must be coded:

YY-Y-15-51-YY-YYY-YYYC-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-51-YYYY-YYYYY-YYYC-A (37 characters)

#### 2.4.4 Recovery or tow away

These data modules must contain the detail instructions for the

- preparation and preliminary requirements of the land/sea Product for the recovery under consideration of the safety instructions
- performing of the recovery and/or the afterwards tow away of the land/sea Product under consideration of the safety instructions

Only land/sea Product specific instructions must be created. Standard practices, or other general information about recovery or tow away, which are defined in other general publications must not be included. Only references must be included.

Data modules must be coded:

YY-Y-15-52-YY-YYY-YYYA-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-52-YYYY-YYYYY-YYYA-A (37 characters)

#### 2.4.5 Crossing of stretch water

These data modules must contain the detail instructions for the

- preparation and preliminary requirements of the land/sea Product for the crossing of stretch water under consideration of the safety instructions
- performing of the crossing of stretch water and the afterwards close up procedures of the land/sea Product under consideration of the safety instructions

Only land/sea Product specific instructions must be created. Standard practices, or other general information about crossing of stretch water, which are defined in other general publications must not be included. Only references must be included.

Data modules must be coded:

YY-Y-15-53-YY-YYY-YYYA-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-53-YYYY-YYYYY-YYYA-A (37 characters)

#### 2.4.6 Nuclear, biological, chemical (NBC) conditions

These data modules must contain the detail instructions for the

- preparation and performing of preliminary requirements for the land/sea Product under NBC conditions
- using of the land/sea Product under NBC conditions

Only land/sea Product specific instructions must be created. Standard practices, or other general information under NBC conditions, which are defined in other general publications must not be included. Only references must be included.

Data modules must be coded:

YY-Y-15-54-YY-YYY-YYYA-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-54-YYYY-YYYYY-YYYA-A (37 characters)

#### 2.4.7 In case of fire at the Land/Sea Product

These data modules must contain all instructions to extinguish or to suppress fire at the land/sea Product.

Data modules must be coded:

YY-Y-15-55-YY-YYY-YYYA-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-55-YYYY-YYYYY-YYYA-A (37 characters)

#### 2.4.8 Make unserviceable or destruction of the Land/Sea Product

These data modules must contain all instructions to destroy the land/sea Product systematically in case of

- the crew/operator has been ordered to perform the make unserviceable or destruction
- the tactical situation requires the make unserviceable or destruction

The instructions could be defined in different levels of make unserviceable or destruction.

Data modules must be coded:

YY-Y-15-59-YY-YYY-YYYA-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-59-YYYY-YYYYY-YYYA-A (37 characters)

### 2.5 Emergency procedures

These data modules must cover all information to

- use emergency exits if necessary
- operate the faulty land/sea Product under reduced readiness to work

Data modules must be coded:

YY-Y-15-40-YY-YYY-141A-A (17 characters)

or

YY-Y-15-40-YY-YYY-145A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-40-YYYY-YYYYYY-141A-A (37 characters)

or

YYYYYYYYYYYYYYY-YYYY-Y15-40-YYYY-YYYYYY-145A-A (37 characters)

## 2.6 Transportation

These data modules must describe all procedures to prepare and carry out the transportation of land/sea Product. Standard practices must only be included unless they are not described in other general publications.

It must also include all necessary safety instructions (as descriptions or as references).

The different types of transportation data modules must be coded:

- Transport by train - YY-Y-15-39-1Y-YYY-XXXA-A
  - Transport by ship - YY-Y-15-39-2Y-YYY-XXXA-A
  - Transport by plane - YY-Y-15-39-3Y-YYY-XXXA-A
  - Transport on road (eg, low-loader) - YY-Y-15-39-4Y-YYY-XXXA-ATransport defined by project - YY-Y-15-39-YY-YYY-XXXA-A
- thru
- Transport by train - YYYYYYYYYYYYYY-YYYY-Y15-39-1Y00-YYYYYY-XXXA-A
  - Transport by ship - YYYYYYYYYYYYYY-YYYY-Y15-39-2Y00-YYYYYY-XXXA-A
  - Transport by plane - YYYYYYYYYYYYYY-YYYY-Y15-39-3Y00-YYYYYY-XXXA-A
  - Transport by road - YYYYYYYYYYYYYY-YYYY-Y15-39-4Y00-YYYYYY-XXXA-A
  - Transport defined by project - YYYYYYYYYYYYYY-YYYY-Y15-39-YY00-YYYYYY-XXXA-A

Where:

- "YY", in the unit or assembly code, is = **5Y**, **6Y**, ..., for transport defined by project
- "XXX", in the information code, is IC 111, IC 112, IC 121, IC 131, IC 141 or IC 151

## 2.7 Equipment stowing

These data modules must include all necessary information for

- give the crew/operator an overview of the stowing locations
- what equipment in which number has to be stowed in the defined locations

Data modules must be coded:

YY-Y-15-04-YY-YYY-056A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y15-04-YYYY-YYYYYY-056A-A (37 characters)

## Chapter 5.2.3.3

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for land/sea crew/operator sequential operation list information.

### 1.2 Scope

It covers the rules for the preparation of information needed to provide land/sea crew/operator with the sequential operation of the land/sea Product and its subsystems in checklist form.

This information set is divided into four groups:

- General information
- Operation (sequential)
- Operating under special conditions (sequential)
- Transportation (sequential)

### 1.3 Standards and definitions

#### 1.3.1 Standards

The following chapters are applicable when using this chapter:

- [Chap 3.9.1](#) - General writing rules
- [Chap 3.9.2](#) - Illustration rules and multimedia
- [Chap 3.9.3](#) - Warnings, cautions and notes
- [Chap 3.4](#) - Zoning and access
- [Chap 3.6](#) - Security and data restrictions
- [Chap 3.7](#) - Quality assurance

For the purposes of explanation, data module codes are shown in both 17 character and 37 character lengths. The project or the organization must establish their own data module coding strategy, using a code length that suits the project or organization needs.

#### 1.3.2 References

Reference to any other documents inside this information set must be used in a structured way. To avoid repetition of information, related subject matter must be adequately referenced so that the reader does not overlook important supplementary information. Such references in a data module to other modules must be made by reference to the data module code and title.

#### 1.3.3 Definitions

The definitions as stated in [Chap 9.2](#) must be used as appropriate.

## 2 Crew/Operator sequential operation information

### 2.1 Introduction

The introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of this information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-15-36-00-00A-018A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-36-0000-00AAA-018A-A (37 characters)

### 2.1.1 Land/Sea Product sequential operation - General

The information must contain the general information (like general introduction into sequential operation lists, conditions, performance limits, etc) of the land/sea Product.

Data modules containing a description attributed to crew are coded:

YY-Y-15-36-YY-YYY-043Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-36-YYYY-YYYYY-043Y-A (37 characters)

### 2.1.2 Land/Sea Product sequential operation list

This data module must provide a sequential listing of the tasks. The data modules must be constructed using the inspectionDefinition branch of the schedules Schema. The attribute `taskSeqNumber` of the element `<taskItem>` must be used to capture the sequential number of the task. This list must also provide links to the listed tasks.

Data modules must be coded:

YY-Y-05-SS-00-NNY-000Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A05-SS-0000-NNYYY-000Y-A (37 characters)

Where:

- SS = 45 for a sequence of scheduled tasks
- SS = 55 for a sequence of unscheduled tasks
- SS = 65 for a sequence of "acceptance" tasks (for example hand over)
- NN defaults to "00" but if there was a sequence of sequenced tasks then NN must be set to the parent sequence

## 2.2 Land/Sea Product operation (sequential)

### 2.2.1 Preliminary requirements

The Preliminary Requirements for sequential operation data modules must include all necessary information to prepare the sequential operation of the land/sea Product to put into operation, to operate during use or to turn off the defined land/sea Product. The sequential operation description must be created as a step by step structure in checklist form.

It must include all preliminary requirements as a description or as a reference to the related data modules.

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data module.

Data modules must be coded:

YY-Y-15-36-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-36-YYYY-YYYYY-YYYY-A (37 characters)

**2.2.2 Put into operation**

The sequential put into operation data modules must include all necessary information to perform sequential put into operation activities of the Product. The sequential put into operation description must be created as a step by step structure in checklist form.

Data modules must be coded:

YY-Y-15-37-YY-YYY-125Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-37-YYYY-YYYYY-125Y-A (37 characters)

**2.2.3 Operation during use**

The sequential operation during use data modules must include all necessary information to perform sequential operation of the Product. The sequential operation description must be created as a step by step structure in checklist form.

Data modules must be coded:

YY-A-15-37-YY-YYY-135Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-37-YYYY-YYYYY-135Y-A (37 characters)

**2.2.4 Emergency operation**

The sequential emergency operation data modules must include all necessary information to perform sequential emergency operation of the Product. The sequential emergency operation description must be created as a step by step structure in checklist form.

Data modules must be coded:

YY-Y-15-37-YY-YYY-145Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-37-YYYY-YYYYY-145Y-A (37 characters)

**2.2.5 Operation to turn off the defined Product**

The sequential operation to turn off the defined land/sea Product data modules must include all necessary information to perform sequential operation to turn off the defined Product. The sequential operation to turn off the defined land/sea Product description must be created as a step by step structure in checklist form.

Data modules must be coded:

YY-Y-15-37-YY-YYY-155Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-37-YYYY-YYYYY-155Y-A (37 characters)

**2.2.6 Close up operation**

The sequential close up operation procedures data module must include all necessary information to finalize the operation after use of the defined systems or subsystems. The sequential close up operation description must be created as a step by step structure in checklist form.

Data modules must be coded:

YY-Y-15-38-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-38-YYYY-YYYYY-YYYY-A (37 characters)

## 2.2.7 **Operating data**

The sequential operating data manual data modules must include all necessary information of active service that is not described in the topic land/sea Product operation. The sequential operating data manual description must be created as a step by step structure in checklist form.

Data modules must be coded:

YY-Y-15-2Y-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-2Y-YYYY-YYYYY-YYYY-A (37 characters)

The values for information code are 125, 135, 145, or 155 as appropriate.

## 2.3 **Operating under special conditions (sequential)**

### 2.3.1 **Heat, cold or dust conditions**

These data modules must contain all relevant additional sequential operation instructions to realize the whole functionality of the land/sea Product under higher or lower temperature or under dust conditions.

Data modules must be coded:

YY-Y-15-51-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-51-YYYY-YYYYY-YYYY-A (37 characters)

The values for information code are 125, 135, 145, or 155 as appropriate.

### 2.3.2 **Recovery and towing**

These data modules must contain all relevant additional sequential operation instructions to realize the necessary task for recovery and/or towing of the land/sea Product.

Data modules must be coded:

YY-Y-15-52-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-52-YYYY-YYYYY-YYYY-A (37 characters)

The values for information code are 125, 135, 145, or 155 as appropriate.

### 2.3.3 **Crossing of stretch water**

These data modules must contain all relevant additional sequential operation instructions to realize the whole functionality of the land/sea Product before, during and after the tactical operation, crossing of stretch water.

Data modules must be coded:

YY-Y-15-53-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-53-YYYY-YYYYY-YYYY-A (37 characters)

The values for information code are 125, 135, 145, or 155 as appropriate.

#### 2.3.4 **Nuclear, biological, chemical (NBC) conditions**

These data modules must contain all relevant additional sequential operation instructions to realize the whole functionality of the land/sea Product before, during and after operation under NBC conditions.

Data modules must be coded:

YY-Y-15-54-YY-YYY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-54-YYYY-YYYYY-YYYY-A (37 characters)

The values for information code are 125, 135, 145, or 155 as appropriate.

#### 2.3.5 **Transportation**

These data modules must describe all sequential procedures to prepare and carry out the transportation of land/sea Product.

- Transport by train - data modules must be coded: YY-Y-15-39-1Y-YYY-YYYY-A
- Transport by ship - data modules must be coded: YY-Y-15-39-2Y-YYY-YYYY-A
- Transport by plain - data modules must be coded: YY-Y-15-39-3Y-YYY-YYYY-A
- Transport on road - data modules must be coded: YY-Y-15-39-4Y-YYY-YYYY-A
- Transport defined by project - data modules must be coded: YY-Y-15-39-YY-YYY-YYYY-A

For project specific transport, definitions of the unit or assembly "YY" must be "5Y"

- Transport by train - YYYYYYYYYYYYYY-YYYY-A15-39-1Y00-YYYYY-YYYY-A
- Transport by ship - YYYYYYYYYYYYYY-YYYY-A15-39-2Y00-YYYYY-YYYY-A
- Transport by plain - YYYYYYYYYYYYYY-YYYY-A15-39-3Y00-YYYYY-YYYY-A
- Transport on road - YYYYYYYYYYYYYY-YYYY-A15-39-4Y00-YYYYY-YYYY-A
- Project specific - YYYYYYYYYYYYYY-YYYY-A15-39-YY00-YYYYY-YYYY-A

For project specific transport, definitions of the unit or assembly "YY00" must be "5Y00".

The values for information code are 125, 135, 145, or 155 as appropriate.

## Chapter 5.2.3.4

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for land/sea crew/operator fault detection and resolution information.

### 1.2 Scope

It covers the rules for the preparation of information needed to provide a land/sea crew/operator with fault detection and either the resolution of the detected faults or the further activities to solve the technical problems of the land/sea Product.

This information set is divided into three groups

- General information
- Functional test (crew/operator level)
- Fault detection and resolution

### 1.3 Standards and definitions

#### 1.3.1 Standards

The following chapters are applicable when using this chapter.

- [Chap 3.9.1](#) - General writing rules
- [Chap 3.9.2](#) - Illustration rules and multimedia
- [Chap 3.9.3](#) - Warnings, cautions and notes
- [Chap 3.4](#) - Zoning and access
- [Chap 3.6](#) - Security and data restrictions
- [Chap 3.7](#) - Quality assurance

For the purposes of explanation, data module codes are shown in both 17 character and 37 character lengths. The project or the organization must establish their own data module coding strategy, using a code length that suits the project or organization needs.

#### 1.3.2 References

Reference to any other documents inside this information set must be used in a structured way. To avoid repetition of information, related subject matter must be adequately referenced, so that the reader does not overlook important supplementary information. Such references in a data module to other modules must be made by reference to the data module code and title.

#### 1.3.3 Definitions

The definitions as stated in [Chap 9.2](#) must be used as appropriate.

## 2 Crew/Operator fault detection, isolation and resolution information

### 2.1 Introduction

The introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of this information set. They must also contain any information of a general nature which is not detailed in any specific data modules.

Data modules must be coded:

YY-Y-15-34-00-00A-018A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-34-0000-00AAA-018A-A (37 characters)

## 2.2 Land/Sea system crew/operator fault detection and resolution - General

The information must contain the general information (such as general introduction into land/sea crew/operator fault detection and resolution, etc) of the land/sea Product.

Data modules must be coded:

YY-Y-15-34-YY-YYA-010A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-34-YYYY-YYAAA-010A-A (37 characters)

## 2.3 Functional test (Crew/Operator level)

### 2.3.1 Functional tests (manual)

The functional test data modules must include all necessary information to prepare and perform the manual functional test of the Product by the crew/operators. It must include all necessary preliminary requirements as a description or as a reference to the related data modules. Furthermore the step-by-step description of the functional tests and if necessary the close up procedures must be included.

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data modules.

Data modules containing manual functional tests for physical breakdown orientated topics must be coded:

YY-Y-YY-YY-YY-YYA-321A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-AYY-YY-YYYY-YYAAA-321A-A (37 characters)

Data modules containing manual functional tests for functional breakdown orientated topics must be coded:

YY-Y-15-35-YY-YYA-321A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-35-YYYY-YYAAA-321A-A (37 characters)

### 2.3.2 Functional tests with built in test equipment

The functional test data modules must include all necessary information to prepare and perform the automatic or semi-automatic functional test using Built In Test Equipment (BITE) of the Product by the crew/operators. It must include all necessary preliminary requirements as a description or as a reference to the related data modules. Furthermore the step by step description of the functional tests and, if necessary, the close up procedures must be included.

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data modules.

Data modules containing automatic or semi-automatic functional tests for physical breakdown orientated topics must be coded:

YY-Y-YY-YY-YY-YYA-322A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-AYY-YY-YYYY-YYAAA-322A-A (37 characters)

Data modules containing automatic or semi-automatic functional tests for functional breakdown orientated topics must be coded:

YY-Y-15-35-YY-YYA-322A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-35-YYYY-YYAAA-322A-A (37 characters)

## **2.4 Fault detection and resolution (Crew/Operator level)**

### **2.4.1 Fault codes, symptoms and fault tracing for detection of faulty Land/Sea Product**

The fault code, symptoms and fault tracing data modules must include all necessary information to allow the detection of faults from the Product by the crew/operators. It is the basis for the follow on fault detection process and it defines an entry point to the fault detection. It must include if necessary the preliminary requirements as a description or as a reference to the related data modules. Furthermore the step by step description of the handling of the fault codes or symptoms and if necessary the close up procedures must be included.

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data modules.

Data modules must be coded:

YY-Y-15-41-YY-YYA-410A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-41-YYYY-YYAAA-410A-A (37 characters)

### **2.4.2 Fault detection and resolution - Description**

The Fault detection and resolution description data modules must include all necessary information to allow the detection of faults from the Product by the crew/operators. The descriptions could be in form of flowcharts or similar constructs with:

- descriptions of the actions inclusive the necessary preliminary requirements
- questions, if necessary with limits
- answers, probably as a selection list for the crew/operator
- measures to resolve the fault, also references to higher level of maintenance if this is not to clarify by the crew/operator (as a description or as a reference to the related data modules)

Safety conditions and instructions must be included inside the data modules or inserted as a reference to the related data modules.

Data modules must be coded:

YY-Y-15-42-YY-YYA-420A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-A15-42-YYYY-YYAAA-420A-A (37 characters)

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for International National and Regulatory Scheduled Check (INRSC) information.

### 1.2 Scope

It covers the rules for the preparation of information needed to provide land approval personnel with descriptions about international national and regulatory scheduled check in checklist form of the land/sea Product.

- General Information
- Safety instructions
- Preliminary requirements and preparation of work
- Check of systems and subsystems
- Checks according law rules
- Operation tests

### 1.3 Standards, references and definitions

#### 1.3.1 Standards

The following chapters are applicable when using this chapter.

- [Chap 3.9.1](#) - General writing rules
- [Chap 3.9.2](#) - Illustration rules and multimedia
- [Chap 3.9.3](#) - Warnings, cautions and notes
- [Chap 3.4](#) - Zoning and access
- [Chap 3.6](#) - Security and data restrictions
- [Chap 3.7](#) - Quality assurance

For the purposes of explanation, data module codes are shown in both 17 character and 37 character lengths. The project or the organization must establish their own data module coding strategy, using a code length that suits the project or organization needs.

#### 1.3.2 References

Reference to any other documents inside this information set must be used in a structured way. To avoid repetition of information, related subject matter should be adequately referenced so that the reader does not overlook important supplementary information. Such references in a data module to other modules must be made by reference to the data module code and title.

#### 1.3.3 Definitions

The definitions as stated in [Chap 9.2](#) must be used as appropriate.

## 2 International, national and regulatory scheduled check information

### 2.1 Introduction

The introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of this information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules containing an introduction must be coded:

YY-Y-19-00-00-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-A19-00-0000-NNA-018Y-A (37 characters)

Where "NN" in the disassembly code is a sequential number starting from "00" if more than one data module is needed.

The information code variant is used to distinguish between the different information sets.

## 2.2 Land/Sea Product international, national and regulatory scheduled check - General

The information must contain the general information about land/sea Product international, national and regulatory scheduled check of the land/sea Product. It must cover general descriptions of use for INRSC work.

Data modules containing general information about international, national and regulatory check must be coded:

YY-Y-19-1Y-YY-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y19-1Y-YYYY-NNAAA-018Y-A (37 characters)

## 2.3 Safety instructions

The information must contain the common safety instructions necessary to perform the INRSC information for land/sea Product.

Data modules containing common safety instructions must be coded:

YY-Y-19-2Y-YY-NNA-012A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y19-2Y-YYYY-NNAAA-012A-A (37 characters)

## 2.4 Preliminary requirements and preparation of work

The information must contain the common preliminary requirements to perform the INRSC information for land/sea Product.

Data modules containing common preliminary requirements must be coded:

YY-Y-19-3Y-YY-YYY-300Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y19-3Y-YYYY-YYYYY-300Y-A (37 characters)

## 2.5 Check of systems and subsystems

The information must contain the information for INRSC information land/sea Product. It must include necessary specific preliminary requirements and all safety instructions.

The INRSC could cover the checks for the following:

- establish the technical state of the land/sea Product
- establish the combat-readiness and the necessary measures to maintain the land/sea Product

Data modules containing checks of systems and subsystems must be coded:

YY-Y-19-4Y-YY-YYY-3YYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y19-4Y-YYYY-YYYYY-3YYY-A (37 characters)

## 2.6 Checks according law rules

The information according law rules must contain the checks for land/sea Product. It must include necessary specific preliminary requirements and all safety instructions.

The checks according law rules could cover the following:

- the keeping of law rules for the land/sea Product
- the mandatory checks and the belonging certification of the demand for technical status

Data modules containing checks according law rules must be coded:

YY-Y-19-5Y-YY-YYY-3YYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y19-5Y-YYYY-YYYYY-3YYY-A (37 characters)

## 2.7 Operation tests

The information according operation tests must include practical test and checks for the safe operation of land/sea Product. It must include necessary specific preliminary requirements and all safety instructions.

Data modules containing operation tests must be coded:

YY-Y-19-6Y-YY-YYY-3YYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y19-6Y-YYYY-YYYYY-3YYY-A (37 characters)

<a href="#">Chap 5.3.3</a>	Publications - Land/Sea specific publications

#### **1 General**

This chapter provides rules for the preparation and coding of publications, and contains also generic requirements for the Product publications.

The required publications must be decided by the project.

This chapter contains:

- Common requirements, refer to [Chap 5.3.1](#)
- Requirements for air specific publications, refer to [Chap 5.3.2](#)
- Requirements for land/sea specific publications, refer to [Chap 5.3.3](#)

#### **2 Purpose**

The purpose of this chapter is to define the rules for the preparation and coding of publications. It also contains the generic requirements for the Product publications.

<a href="#">Chap 5.2.1.3.5</a>	Maintenance information - Storage
<a href="#">Chap 5.3.1.1</a>	Common requirements - Front matter
<a href="#">Chap 5.3.1.2</a>	Common requirements - Technical content
<a href="#">Chap 5.3.1.3</a>	Common requirements - Illustrated parts data

#### 1 General

The following common requirements are contained in the chapters referenced:

- List of applicable publications. Refer to [Chap 5.3.1.1](#)
- Front matter. Refer to [Chap 5.3.1.1](#)
- Technical content. Refer to [Chap 5.3.1.2](#)
- Illustrated parts data: Refer to [Chap 5.3.1.3](#)

#### 2 Scope

General information related to one publication (eg, front matter, introduction), must be coded:

YY-Y-YY-YY-00-**NNY**-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-0000-**NNYYY**-YYYY-Z (37 characters)

Where:

- "**NN**" in the disassembly code is a sequential number starting from "00" if more than one data module is needed.
- "**YYY**" in the information code is the type of information.

---

The third element of the SNS is always 00 or 0000, except for non-chapterized IPD (refer to [Chap 5.3.1.3](#)).

**Note**

Some information sets have predefined values for population of the first and second element of the SNS. These values must be used also for the equivalent publications. For example front matter data modules for storage information must have the SNS 10-30-00 or Y10-30-0000. Refer to [Chap 5.2.1.3.5](#).

## 1 General

This chapter gives the rules for selection of front matter information to be included in the publications. The front matter information gives the status of a publication or volume and an overview of the contents. It also provides general data related to a publication or volume to support the user in finding information and to keep control of the content.

For explanation purposes, data module codes are shown in both 17 character and 37 character lengths.

## 2 Front matter

### 2.1 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

### 2.2 General

The content of the front matter depends on the publication media and the content of the publication (if illustrations are included, if symbols, terms and abbreviations must be explained, etc).

Front matter information can be captured and represented by using different Schemas. Front matter data modules can use the descriptive Schema (refer to [Chap 3.9.5.2.2](#)) except ACT, CCT and PCT which have their own Schemas.

The front matter Schema minimizes manual authoring and in most cases supports auto-generation of the front matter data modules. Refer to [Chap 3.9.5.2.16](#).

#### Note

Some front matter can be auto-generated and some must be authored.

#### Business rule decision point BRDP-S1-00426 - Schema to be used for front matter data modules:

- Decide which Schemas to be used to capture the different front matter data module types.

[Chap 3.9.4](#) gives the basic rules and guidance for front matter information. [Chap 3.9.5.2.16](#) describes the Front Matter (FM) Schema. [Chap 3.9.5.3](#) details the content of the Product Cross-reference Table (PCT), the Conditions Cross-reference Table (CCT) and the Applicability Cross-reference Table (ACT).

Refer to [Chap 6.2.3.1](#) for presentation examples of front matter for page-oriented publications.

Front matter in publications or volumes thereof can include the data modules given in [Table 2](#) and [Table 3](#). [Chap 3.9.4](#) states the rules for mandatory and optional use of front matter data modules.

The order of appearance is given in [Table 2](#) and [Table 3](#). If a copyright data module is part of the front matter information this data module is presented immediately after the Title page.

#### Note

Transmittal letters, a data module that describes the content of an exchange package, are presented after any copyright data module.

[Table 2](#) and [Table 3](#) give the mandatory and optional front matter data modules to be included in a publication.

#### Business rule decision point BRDP-S1-00460 - Front matter to be included in page-oriented publications and IETP, respectively:

- Decide which front matter is to be included (mandatory or optional) in each of the page-oriented publications and in the IETP. The decisions must be based on the rules given in [Chap 3.9.4](#).

#### Business rule decision point BRDP-S1-00461 - Front matter information codes:

- Decide which front matter information codes to use, the basic (eg, IC 00R) or the alternative (eg, IC 002).

### 2.3 Data module coding

The basic coding of front matter data modules is shown in [Table 2](#) and [Table 3](#).

**Note**

Some information sets have predefined values for population of the first and the second element of the SNS. These values must be used also for the equivalent publications. For example, front matter data modules for storage information (refer to [Chap 5.2.1.3.5](#)) must have the SNS 10-30-00 or Y10-30-0000.

**Note**

Non-chapterized IPD front matter data modules use the third element of the SNS as a part of the unique identifier. Refer to [Chap 5.3.1.3](#).

In [Table 2](#) and [Table 3](#), "NN" in the disassembly code is a sequential number starting from "00" if more than one data module is needed.

The information code variant must be used to differentiate front matter data modules with the same SNS and information code.

*Table 2 Front matter (17 character example)*

#### **1 General**

##### **1.1 Purpose**

This chapter contains the rules for the preparation coding, where appropriate, and compilation of data modules for the technical content of publications.

##### **1.2 Scope**

It covers the rules for the preparation and compilation of information to enable skilled personnel to access and handle the information in an efficient way in order to perform the tasks of the respective publication scope.

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions. For the purposes of explanation, data module codes are shown in both 17 character and 37 character lengths.

## 2 Technical content

The technical content must consist of an introduction followed by the technical information belonging to that publication.

### 2.1 Introduction

The introduction data module must contain explanation of the purpose, scope, structure, special format and use of the technical content of the publication. They must also contain any necessary information of a nature which is not detailed in any of the specific data modules.

The following information must be provided or referenced:

- the purpose and scope of the publication and its subsets and if required with additional information about system/equipment effectively
- the nature and structure of the publication and its subsets
- references to general information contained in the information sets which were integrated in the publication (eg, zoning and access information)
- information about publishing authorization / certification / copy rights
- definition of used warnings, cautions and notes. Refer to [Chap 3.9.3](#).
- explanation of the used change marks and highlights. Refer to [Chap 3.9.5.2.1.1](#).
- information about updating and commenting. Refer to [Chap 3.5](#), [Chap 4.9.3](#) and [Chap 4.6](#).
- description of headings of tables if this is not contained in general information of information sets which were integrated in the publication (eg, tables of the List of Applicable Publications (LOAP)). Refer to [Chap 5.3.1.1](#).
- other general information which is not contained in the data modules of the technical information of the publication

The data modules must be coded:

YY-Y-YY-YY-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-0000-**NN**AAA-018Y-A (37 characters)

Where "NN" in the disassembly code is a sequential number starting from "00" if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

### 2.2 Technical information

These data modules must include all information sets or parts of information set, legacy data and other data compiled for the specific publication as decided by the project or organization.

## Chapter 5.3.1.3

## 1 General

### 1.1 Purpose

Preparation and coding, where appropriate, of Illustrated Parts Data (IPD) information data modules must follow the rules contained here. Rules for preparation of digital and paper deliverables are included as well as rules for creation of data modules from a S2000M provisioning database.

The contents are based on the provisioning process given in the S2000M but can also be used for non-S2000M projects.

### 1.2 Scope

It covers the rules for the publication of spare parts information. These rules are in line with S2000M.

[Para 2](#) gives the build-up and content of an IPD Publication (IPDP), page-oriented and/or interactive, which follows the common rules given in this specification. An IPD publication produced in accordance with [Para 2](#) will be an integrated information set in a total technical publication package.

The specific functions of the IPD are:

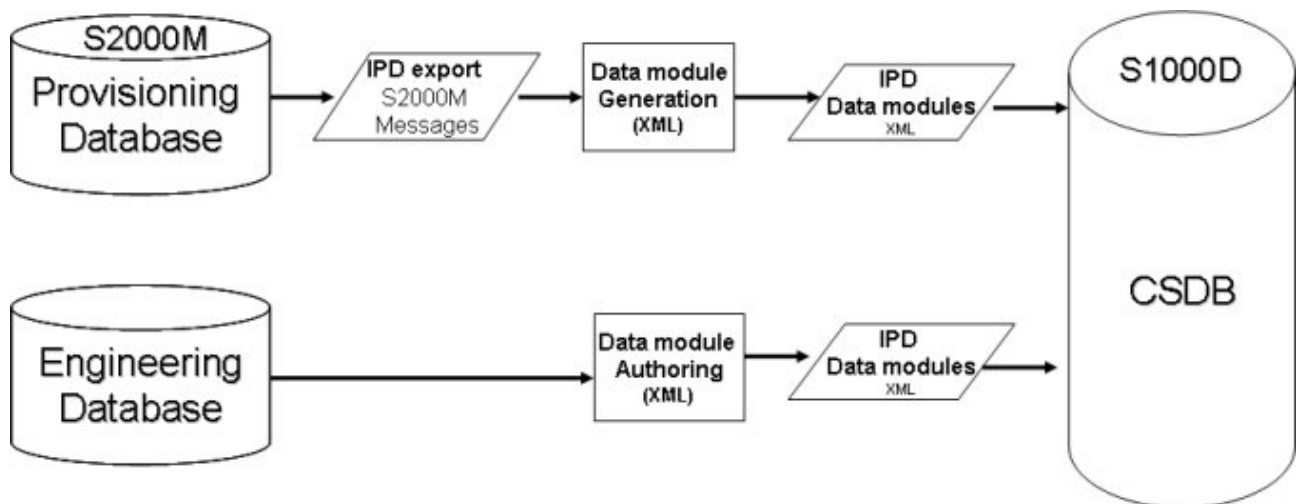

- identification of spare parts
- identification of physical relationship of parts
- identification of the method of supply

The spare parts information in the form of data modules can be prepared from:

- a S2000M provisioning database
- engineering data for non-S2000M projects

The principles for preparing IPD information is shown in [Fig 1](#).

ICN-S1000D-A-050303-A-F6117-00001-A-001-01

Fig 1 Preparation of the IPD data modules

By project decision, the IPD can be produced as a stand-alone publication and hence has its own publication module. For non-complex equipment (hydraulic pump, Ultra High Frequency (UHF) transmitter, etc), as the number of data modules often is low, these IPD data modules can be provided as (eg, part of the equipment maintenance publication).

**Business rule decision point BRDP-S1-00462 – IPD as a standalone publication:**

- Decide if the IPD must be produced as a stand-alone publication or the IPD data modules included in another publication (eg, an equipment maintenance publication including IPD).

IPD information must be prepared in the language specified by the customer. Customers' national security rules are to be considered. Refer to [Chap 3.6](#).

## 1.3

### Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate.

- **IPD figure:** An IPD data module. The data module includes data and illustrations, one or more, relative to a system, subsystem or sub-subsystem or an assembly.
- **IPD figure number:** The running number of IPD figures (data modules) within the same Model Identification and SNS code. The IPD figure number is derived from the Catalogue sequence number (CSN).
- **IPD figure number variant:** The variant number of IPD figures. The IPD figure number variant is derived from the CSN.

## 2

### IPD Content

#### 2.1

#### General

The complete set of IPD data modules is specified in [Para 2.2](#) and [Para 2.3](#).

An IPD information set can be either chapterized or non-chapterized:

- A chapterized IPD information set contains data modules which have data module codes with the basic SNS, SNS, as given in [Chap 8](#). These information sets are created either from a S2000M provisioning database or from engineering databases.
- A non-chapterized IPD information set contains only data modules which have data module codes with a specific structure in the SNS "positions". Refer to [Para 2.3.2.2](#). Non-chapterized IPD information sets are only created from a S2000M provisioning databases.

## Note

Front matter (refer to [Para 2.2](#)) and introductory data modules (refer to [Para 2.3.3](#)) must use the information code variant to give a unique data module code in the CSDB.

## 2.2 Front matter

For content of front matter refer to [Chap 3.9.4](#).

For coding of front matter to a chapterized IPD refer to [Chap 5.3.1](#) and [Chap 5.3.1.1](#).

Front matter data modules for non-chapterized IPD must be coded:

YY-Y-ZR-YY-YY-NNY-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-ZZR-YY-YYYY-NNYYYY-YYYY-Z (37 characters)

Where:

- "ZR-YY-YY" or "ZZR-YY-YYYY". Refer to [Para 2.3.2.2](#).
- "NN", in the disassembly code, is a sequential number starting from "01", if more than one data module is needed.

## 2.3 Technical content

### 2.3.1 General requirements

The IPD publication must contain the following information types:

- Introduction
- IPD data modules
- Cross-reference index. Refer to [Para 2.3.5](#).

### 2.3.2 Data module coding

To assist in the codification of data modules, the following rules must be used. For system difference code, information code variant and item location code, the rules are given in [Chap 4.3.2](#), [Chap 4.3.7](#) and [Chap 4.3.8](#) respectively.

Data modules for **chapterized IPD** must be coded:

YY-Y-YY-YY-YY-NNY-XXXA-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-NNYYYY-XXXA-Z (37 characters)

Data modules for **non-chapterized IPD** must be coded:

YY-Y-ZR-YY-YY-NNY-XXXA-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-ZZR-YY-YYYY-NNYYYY-XXXA-Z (37 characters)

Where:

- "YY-YY-YY"/"ZR-YY-YY" or "YYY-YY-YYYY"/"ZZR-YY-YYYY", in the SNS code, as given in [Para 2.3.2.1](#) (chapterized IPDP) and [Para 2.3.2.2](#) (non-chapterized IPDP)
- "NN", in the disassembly code, is a sequential number starting from "01", if more than one data module is needed for the same SNS. An alpha character in the first position is allowed.

- When the data module is generated from a S2000M provisioning database this is the IPD figure number. IPD figure number is equivalent to figure number S2000M and is a part of the Catalogue sequence number (CSN).
- "Y" or "YYY", in the disassembly code variant, gives the variants of the data modules, starting with "A" or "AAA" for the initial variant
  - When the data module is generated from a S2000M provisioning database this is the IPD figure number variant. IPD figure number variant is equivalent to Figure Number Variant in S2000M and is a part of the CSN. The IPD figure number variant starts with the figure "0" for the initial data module with a given SNS-number. When there is a need to produce variants (modified items) or to "insert" new data modules, the disassembly code variant is used the standard way now starting with "A" for the first variant.
- "XXX", the information code, is:
  - 941 = IPD
  - 942 = IPD cross-reference index

#### 2.3.2.1 Parts data module coding for chapterized IPDP "YY-YY-YY" or "YYY-YY-YYYY" must be the SNS of the described system or equipment

Examples:

SNS code 29-10-00 = Main hydraulic

- A1-A-29-10-00-010-941A-D (parts data module, IPD figure number = 1, IPD figure number variant = 0 = initial data module within 29-10-00)
- A1-A-29-10-00-01A-941A-D (parts data module, IPD figure number = 1, IPD figure number variant = A = new data module)
- A1-A-29-10-00-00A-942A-D (IPD cross-reference index)

#### 2.3.2.2 Parts data module coding for non-chapterized IPDP "ZR-YY-YY" or "ZZR-YY-YYYY" is built up as follows:

- "Z" or "ZZ" identifies that the data module is non-chapterized
- "R" identifies the responsible partner company code used as a status element in the identification and status section. Refer to [Chap 3.9.5.1](#).
- "YY-YY" or "YY-YYYY" is a unique identifier:
  - When the data module is generated from a S2000M provisioning database this must be the last four digits of the initial provisioning project number "YY-YY" or "YY-YY00".
  - For non-S2000M projects the unique identifier must be defined by the project (eg, to identify a component).

Examples:

- A1-A-ZD-00-35-010-941A-D (parts data module, IPD figure number = 1, IPD figure number variant = 0 = initial data module within ZD-00-35)
- A1-A-ZD-00-35-02A-941A-D (parts data module, IPD figure number = 2, IPD figure number variant = A = new data module)
- A1-A-ZD-00-35-00A-942A-D (IPD cross-reference index)

#### 2.3.2.3 Data module code - Catalog sequence number The attributes in the CSN are also used to build up the IPD data module code. The data module code attributes and the corresponding CSN attributes are given in [Table 2](#).

Table 2 Data module code and CSN attributes

Data module code attribute	Content derived from the attributes of the element <catalogSeqNumberRef>	
	Chapterized IPD	Non-chapterized IPD
Model identification code - attribute modelIdentCode	Content of attribute modelIdentCode	Content of attribute modelIdentCode
System difference code - attribute systemDiffCode	Content of attribute systemDiffCode	Content of attribute systemDiffCode
System code - attribute systemCode	Content of attribute systemCode	The value "00" (and the attribute systemCode must not be used)
Subsystem code - attribute subSystemCode	Content of attribute subSystemCode	The value "0" (and the attribute subSystemCode must not be used)
Sub-subsystem code - attribute subSubSystemCode	Content of attribute subSubSystemCode	The value "0" (and the attribute subsubSystemCode must not be used)
Unit or assembly - attribute assyCode	Content of attribute assyCode	The value "00" (and the attribute assyCode must not be used)
Disassembly code - attribute disassyCode	Content of attribute figureNumber (which must always be 2 digits)	Content of attribute figureNumber (which must always be 2 digits)
Disassembly code variant - attribute disassyCodeVariant	Content of attribute figureNumberVariant, or "0" if the attribute is not present (ie, there is no figure variant)	Content of attribute figureNumberVariant, or "0" if the attribute is not present (ie, there is no figure variant)
Information code - attribute infoCode	The value "941" which indicates an IPD data module	The value "941" which indicates an IPD data module
Information code variant - attribute infoCodeVariant	The value "A"	The value "A"
Item location code - attribute itemLocationCode	Content of attribute itemLocationCode. Typically this is the value "D"	Content of attribute itemLocationCode. Typically this is the value "D"

### 2.3.3 Introduction

#### 2.3.3.1 General

The introduction data modules must contain explanations of the purpose, scope, structure, special format and use of the technical content of the IPD publication. They must also contain a list of incorporated modifications and any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

Applicable to: All

S1000D-A-05-03-0103-00A-040A-A

Chap 5.3.1.3

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-NNAAA-018Y-Z (37 characters)

- "YY-YY-YY" or "YYY-YY-YYYY", the introduction is relative to the whole publication, so it must be allocated according to the data module code actually used for the technical content. Refer to [Para 2.3.2](#).
- "NN", the disassembly code, is a sequential number starting from "00", if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

Examples:

- Chapterized IPD:
  - Aircraft: A1-A-00-00-00-00A-018A-A or SUPERAIRCRAFT1-AAAA-A00-00-0000-00AAA-018A-A
  - Engine: A1-A-00-72-00-00A-018A-A or BASICENGINE007-AAAA-A00-72-0000-00AAA-018A-A
- Non-chapterized IPD:
  - A1-A-ZD-00-35-00A-018A-A

#### 2.3.3.2 List of incorporated modifications in IPDP

A list of incorporated modification in the introduction to each IPDP will be produced from the change record incorporated in the provisioning database.

To enable the IPDP user to determine the precise relationship of components, the IPDP is to record every configuration standard likely to be encountered. In the IPDP text, the configuration changes/modifications will be identified against line items through data elements which include:

- Interchangeability (Interchangeability codes will be set for the preceding (old) and succeeding (new) line entries)
- Usable on code Equipment
- Usable on code Assembly
- Applicability
- Model version

The change authority will be also shown for all newly introduced items (eg, Modification XXXX).

Some customers can require that, during the production of an IPDP, the contractor omit configuration standards that are superseded by modifications fully embodied in their fleets.

#### 2.3.4 IPD modules

The items relative to an assembly are organized in IPD figures and supported with the appropriate illustration. In cases where the content of an IPD figure is complex, the illustration will be spread over several illustration sheets (eg, Fig 1 Hydraulic pump (Sheet 1 of 2), Fig 1 Hydraulic pump (Sheet 2 of 2)) in accordance with the following:

- Each illustration sheet has its own ICN.
- Each IPD figure must be defined as one parts data module.
- Each parts data module must include all IPD data related to one IPD figure.

## 2.3.4.1 Parts data elements

[Table 3](#) gives all mandatory and optional parts data elements independently of their use in page oriented or electronic IPDP. Detailed information on each element is presented in the S2000M data dictionary. Conditional data elements as defined in S2000M are also marked optional.

**Note**

The three-character acronyms give the text element identifier specified in S2000M.

*Table 3 Parts data elements*

Text element identifier	Data element name	Mandatory / Optional	Remarks
ASP	Attaching, storage or shipping part	O	
CAN	Change authority number	O	
CMK	Calibration marker	O	
CSN	Catalog sequence number	M	Position 7 thru 13 gives the Fig/Fig variant/Item/Item variant
CTL	Category 1 container location	O	
DFL	Description for location	O	
DFP	Description for part	M	
EFY	Effectivity	O	
FTC	Fitment code	O	
ICN	Information control number	O	
ICY	Interchangeability	O	
ILS	Integrated logistics support number	O	
IND	Indenture	M	
IPP	Initial provisioning project number	M	
IPS	Initial provisioning project number subject	M	
ISN	Item sequence number	M	
LGE	Language code	M	
MFC	CAGE code of manufacturer	M	
MFM	Select or manufacture from range	O	
MOI	Model identification code	M	
MOV	Model version	O	
NIL	Not illustrated	O	
NSN	NATO stock number	O	Composite data element composed of NSC and NIN
NSC	NATO supply class	M	

Applicable to: All

S1000D-A-05-03-0103-00A-040A-A

Chap 5.3.1.3

Text element identifier	Data element name	Mandatory / Optional	Remarks
NIN	NATO item identification number	O	
PNR	Part number	M	
PSC	Physical security pilferage code	O	
QNA	Quantity per next higher assembly	M	
QUI	Quantity per unit of issue	O	
RFD	Reference designator	O	
RFS	Reason for selection	O	
RTX	Refer to	O	
SID	Subject identification	M	Composite data element composed of MFC and PNR
SMF	Select or manufacture from identifier	O	
SMR	Source maintenance recoverability	M	
SPC	Spare parts classification	O	
SRV	Service	M	
STR	Special storage	O	
UCA	Usable on code assembly	O	
UCE	Usable on code equipment	O	
UOI	Unit of issue	O	
UOM	Unit of measure	O	

#### 2.3.4.2 Page-oriented parts data modules

The illustration must always start on a left-hand page followed by text, the detail parts list, on the right-hand page. Where either the illustration or text outnumbers the other, the additional illustrations and text must continue on both left-hand and right-hand pages.

The front page (Page 1) gives the title of the data module and if applicable the part number of the assembly or equipment. A location illustration or an illustration of the assembly or equipment can follow.

The detail parts list contains the following elements. Refer to [Table 4](#):

- 1 Fig (M): The figure number and variant must appear on the first line on each text page. No other details are to appear on the same line. Where an item is listed but not illustrated on the accompanying illustration, this must be marked with a dash in this column and on the same line as the item number. Part of CSN.
- 2 Item (M): The item number and variants are a part of the Catalogue sequence number (CSN). Zeros in the item number must be suppressed.
- 3 Units per assembly/Unit of issue (O/O): The number of units required for the next higher assembly (QNA) and the code for standard unit/ quantity delivered to the customer (UOI).

Applicable to: All

**S1000D-A-05-03-0103-00A-040A-A**

**Chap 5.3.1.3**

- 4 CAGE (O): Identifies the supplier or design authority by its CAGE code (MFC).
- 5 Part number/NATO stock number (M/O): The part number of the item. Part numbers (PNR) exceeding the space available must be split arbitrarily with the overflow on the second line. NATO stock numbers (NSN) must be located on the line immediately below the part number and be indented two spaces from the left.
- 6 Description (M/O): The description column must contain the mandatory DFP together with the optional Description For Location (DFL). Additionally, supplementary information which relates to the part and its location can also appear. The layout of the description field is as follows:
  - Indentation: The spacing must be one bullet per indent given by the indenture code (IND).
  - Continuation lines of description must be to the same indent as the first line of the description.
  - Item spacing: Words can be hyphenated when passing from one line to the next, however, an item must not be divided by page breaks. A reasonable space between items to aid legibility.
  - Attaching parts: Attaching parts must be distinguished by the replacement of the indentation bullets with asterisks.
  - The width of the description column must be approximately 50 mm.
  - The description column is also used to convey additional information to the IPD user, such as
    - Refer to (RTX)
    - Category 1 container location (CTL)
    - Select or manufacture from identifier (SMF)
    - Select or manufacture from range (MFM)
  - The additional information is to appear in the description block at the same indent level as the item to which it refers.

For detailed information refer to [Chap 6.2.3.5](#).

- 7 \* Usable on code assy • Model Version (MV)/Effect(\*O●O/O): Usable on code assembly (UCA) must be preceded with an asterisk and appear on the same line as the part number. Model version (MOV) and Applicability must appear on the line immediately below the Usable on code assembly. When an item is common to the entire customer's range of air vehicle, engine or equipment, in all Model versions, then they must be left blank. If different ranges and/or Model versions are applicable then these must be shown in multiple consecutive lines in this column. The MV/Applicability must be preceded by a bullet.
- 8 ICY (O): Interchangeability (ICY).

*Table 4 Detail parts list - Example*

Fig (1)	Item (2)	Units per assembly /Unit of issue (3)	CAGE (4)	Part No. NATO stock No. (5)	Description (6)	* Usable on code assy • MV/Effect (7)	ICY (8)

	9				• Generator	*B	
	10				• Connector		
	11				• Bracket	*A	
	11				• Bracket	*B	

2.3.4.3 Interactive parts data modules  
Each IETP parts data module must include all parts data and illustrations related to one IPD figure. The mandatory and optional elements are given in [Para 2.3.4.1](#).

### 2.3.5 Cross-reference index

The following search keys must be used:

Table 5 Search keys in cross-reference index

Text element identifier	Data element name Search key	Search key code (SKC)	Mandatory/ Optional
PNR	Part number	P	M
NSN	NATO stock number	N	O
RFD	Reference designator	R	O
ILS	Integrated logistics support number	I	O

Each IPD page oriented publication requires a cross-reference index ordered in alphanumeric sequence.

The following elements can be presented as given in [Table 6](#):

**Note**

By project decision some of the optional data can be excluded.

- 1 SKC (M): Search key code from [Table 5](#).
- 2 Search key (M): The part number (PNR), NATO stock number (NSN), reference designator (RFD) and the integrated logistics support number (ILS)
- 3 Part number (M)
- 4 CAGE (O): CAGE (MFC)
- 5 NATO stock number (O): must not be repeated if it also is the search key
- 6 SNS (M)
- 7 Fig - Item (M)

*Table 6 Cross-reference index - Example*

<b>S K C (1)</b>	<b>Search key (2)</b>	<b>Part No. (3)</b>	<b>CAGE (4)</b>	<b>NATO stock No. (5)</b>	<b>SNS (6)</b>	<b>Fig- Item (7)</b>
....	....					
R	+XF2	960-78923	F6198	5995-14- 278-3448	36-10- 20	04A- 010
P	1322 3-355/C7-244- A5	1322 3-355/C7-244-A5601- 001	D1081	1680-12- 909-9595	24-10- 05	03 - 025
N	1680-12-909-9595	1322 3-355/C7-244-A5601- 001	D1081		24-10- 05	03 - 025
N	5995-14-278-3448	960-78923	F6198		36-10- 20	04A- 010
....	....					
....	....					

For interactive IPDP, a cross-reference index capability must be implemented in the form of viewer search functionality using the search keys as given in [Table 5](#). In this case it is unnecessary to generate cross-reference index data modules.

## 1 General

### 1.1 Purpose

Specific guidance for the preparation of a Component Maintenance Publication (CMP) is given.

### 1.2 Scope

The CMP provides a range of procedures that will enable an experienced technician who is unfamiliar with the component to restore it to a serviceable condition.

### 1.3 Standards

The standards given here are applicable with no exceptions.

## 1.4 Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate.

**Basic part:** A part that cannot be further disassembled without destruction of its function.

**Overhaul:** A mandatory set of maintenance activities that are performed to restore the component to a condition as close to its originally manufactured condition. These activities are performed without regard to the initial condition of the component. This includes systematic disassembly, cleaning, inspection, maintenance and assembly. This effort includes the replacement or repair of all subassemblies or parts exhibiting any level of wear or less than original performance. It can include significant inspections, examinations, test and checks to ensure no latent faults exist. Pass/Fail criteria for inspections, examinations, test and checks are based on the manufacturing criteria for the component. The resultant component meets the same functional and time/cycle time requirements as a new component.

**End item:** For purposes of this chapter the term "end item" refers to the top level component, or set of components, covered by the CMP unless otherwise stated. Disassembly principles are discussed in [Chap 3.8](#).

## 1.5 Requirements

### 1.5.1 Information set

The CMP is based on the information set described in [Chap 5.2.1.9](#). Other information codes and schemas can be used as directed by the project or the organization.

### 1.5.2 Publication module

The CMP is organized into three or four main sections with subordinate topics as described in [Para 1.6](#). The publication module Schema is used to provide the required organization and structure.

#### 1.5.2.1 Publication module entries, sections and topics

A publication module entry at first level will be created for each section of the CMP in the order described in [Para 1.6](#). When a topic is to be included in any section it will be created as a child publication module entry at second level under the applicable section.

[Chap 3.9.6.1](#) provides values of attribute `pmEntryType` for this purpose.

### 1.5.3 Coverage

The CMP coverage can apply to a single component or to a collection of variants of the basic component. Typically this is based on a single common primary part number. It is acceptable to include components with different root part numbers only when such components are very similar.

In most cases the end item will be comprised of components that are assemblies that have constituent subassemblies and parts. In those cases where the CMP end item is itself a singular part or collection of like singular parts, certain data modules are not required. Refer to [Para 1.6](#).

#### Note

A CMP which supports a singular part or collection of like singular parts is the functional equivalent of what was termed an "Abbreviated CMM" in some legacy systems (eg, civil aviation). Because of the modular nature and flexibility of S1000D there is no need to describe a unique publication to support this type of end item.

The CMP is to provide descriptions, procedures and processes to return the unit to a serviceable or other condition defined by its part number and source engineering data. Applicability references are to this end item definition.

When CMP end item variants result in differing procedures, these differences must be documented and clearly identified.

Applicability references to the used-on installation are prohibited unless mandated by project or organization decision.

#### 1.5.4 **Maintenance environment**

The CMP descriptions, procedures and processes are to support component maintenance in the shop or depot maintenance environment.

#### 1.5.5 **Level of detail**

The CMP and IPD descriptions, procedures and processes are to provide coverage to the "basic part" level unless the project or organization decides otherwise.

#### 1.5.6 **On-condition vs scheduled maintenance**

The CMP descriptions, procedures and processes are to support on-condition maintenance. Scheduled maintenance intervals including inspections and checks for in-service units are expressly forbidden unless required for regulatory compliance or required by project or organization decision. Refer to [Para 2.3.2.1](#).

Storage life limits and required maintenance intervals for units in storage can be included. Refer to [Para 2.3.2.9](#).

#### 1.5.7 **Outside references and standard practices**

To the extent possible, the CMP is to provide self-supporting procedures and processes. References to standard practices publications, other CMP, and generally available industry standards and process documents can be included. References to discrete, manufacturer unique, documentation are prohibited.

Standard industry practices such as procedures for magna-fluxing, riveting, plating, terminal swaging, or dye penetrant inspection need not be covered when applicable industry reference is readily available. The CMP documents only the specific requirements necessary to apply the standard to the CMP activity.

#### 1.5.8 **Task sets**

To satisfy certain maintenance requirements it can be useful to organize discrete maintenance information and procedures into ordered task sets to achieve a specific end condition. Two possible uses for a task set are:

- "Return-To-Service" (RTS). This task set is to define the specific minimum set of procedures to be performed and criteria to be met to certify that the component can be safely returned to service. The purpose is to distinguish this specific set of modules from other provided maintenance procedures and to avoid performing those procedures simply because they are provided in the CMP.
- "Overhaul". This task set is to define the specific set of procedures to be performed and criteria to be met to certify that the component has been overhauled. Typically this would restore the unit to a higher standard than that required for RTS. The purpose is to distinguish this specific set of modules from other provided maintenance procedures.

#### **Business rule decision point BRDP-S1-00464 - Use of task sets in the CMP:**

- Decide whether to use task sets in the CMP.

#### 1.5.9 **Granularity**

Data modules are normally to be limited to a single specific description, procedure or process. In some cases it can be acceptable to include multiple, related, simple descriptions or procedures in one data module.

For instance, multiple cleaning procedures might be included in one data module when the procedures are simple and there is no potential re-use of the included discrete procedures.

Likewise, a description of the unit's function can be provided as one, or more than one, data module depending on the complexity of the unit and any potential re-use of the descriptions.

#### 1.5.10 Listing equipment, materials, and consumables

List the equipment required and materials to be used. Whenever possible, specify equipment, materials, and consumables normally considered "standard" in a typical shop appropriate for the technology of the component.

These items must be selected based on the specific CMP usage. Do not simply list those items used at the manufacturer facility. Likewise, parameters listed for required equipment must be based solely on the requirements of the CMP procedures.

Each list of tools, equipment, materials and consumables must include a note to allow the use of equivalent substitutes. Except that equivalent substitutes are not allowed for those materials and consumables that become a part of the defined component configuration.

#### 1.5.11 Verification and validation

Procedures, processes and fault isolation procedures must be verified as required by [Chap 3.7](#).

#### 1.5.12 Records

If a record of accomplishment is required, include a sample of the required form and instructions for its use. This information can be included in either the applicable data module or the CMP introduction if the record covers more than one data module.

#### 1.5.13 No data required for a particular topic

[Para 1.6](#) describes the required set of data modules to be included in a CMP by topic. When there is no information to be provided under a certain topic, the project must decide whether to provide a data module that states that the topic is not required or this information is contained in the introduction or description data module. When these data modules are to be provided, the information code must be the one for the topic that isn't required (eg, if removal and installation is not required, then the information code 520, 720 or 921 must be used). These will be descriptive data modules that must contain a title that reflects the information name and a paragraph containing the words "Not applicable" or "Xxxx is not required."

#### Business rule decision point BRDP-S1-00465 - Use of placeholder data modules in the CMP:

- Decide whether "placeholder" data modules are required for those topics where data is not required or necessary.

#### 1.5.14 Service bulletin accomplishment instruction

The CMP provides information and procedures to maintain components in accordance with their approved configuration, either original or properly altered. The CMP must not contain Service bulletin accomplishment instructions or any other instruction or procedure to alter or change the configuration of any component.

### 1.6 Content

#### 1.6.1 Assemblies

When the CMP end items are assemblies and subassemblies, the CMP will include data modules which address the following topics in the following order:

- Front matter and introduction
  - Title page
  - Configuration
  - Copyright statements
  - Administrative and legal statements
  - Safety statement

- List of effective data modules
- Change record
- Highlights
- List of abbreviations
- List of terms
- List of symbols
- Technical standard record
- Table of contents
- List of illustrations
- List of tables
- List of applicable specifications and documentation
- List of suppliers
- List of support equipment
- List of supplies
- List of spares
- Introduction
- Functional and technical descriptions
  - Description of function
  - Technical description
  - Diagrams and schematics
- Maintenance and servicing
  - Maintenance planning
  - Removal and installation
  - Task sets
  - Servicing
  - Examination, test, checks, and fault isolation
  - Disassemble
  - Repair
  - Assemble
  - Storage
- IPD
  - Introduction
  - Numerical index
  - Equipment designator index
  - Details parts data

When no information is to be provided for a topic, refer to the rules given in [Para 1.5.13](#).

The IPD can be provided as a separate publication. Refer to [Para 2.3](#).

### 1.6.2 Basic parts

When the CMP end items are themselves basic parts, the CMP will include data modules which address the following topics in the following order:

- Front matter and introduction
  - Title page
  - Configuration
  - Copyright statements
  - Administrative and legal statements
  - Safety statement

- List of effective data modules
  - Change record
  - Highlights
  - List of abbreviations
  - List of terms
  - List of symbols
  - Technical standard record
  - Table of contents
  - List of illustrations
  - List of tables
  - List of applicable specifications and documentation
  - List of suppliers
  - List of support equipment
  - List of supplies
  - Introduction
- Functional and technical descriptions
    - Description of function
    - Technical description
    - Diagrams and schematics
  - Maintenance and servicing
    - Maintenance planning
    - Removal and installation
    - Task sets
    - Servicing
    - Examination, test, checks, and fault isolation
    - Repair
    - Storage

When no information is to be provided for a topic, refer to the rules given in [Para 1.5.13](#).

There is no IPD information for a basic part.

## 2 Content

### 2.1 General

The complete set CMP data modules is described in [Para 2.2](#) and [Para 2.3](#). The data modules are divided into Front matter and introduction, Technical content, and Illustrated parts data (IPD). Refer to [Para 1.6](#) to determine which modules must be included.

### 2.2 Front matter and introduction

#### 2.2.1 Front matter

A CMP must include a set of front matter data modules. Refer to [Table 2](#). Except as provided for in this chapter, or as defined in project or organization requirements, front matter content for a CMP must be generally in accordance with [Chap 3.9.4](#) and [Chap 5.3.1.1](#) and [Chap 3.9.5.2.16](#).

#### Note

The front matter data modules can use the descriptive Schema, except for ACT, CCT and PCT, or the front matter Schema.

Refer to [Chap 6.2.3.1](#) for rules and examples of the layout of front matter in page-oriented CMP. Refer to [Chap 6.3.1](#) for the layout of IETP.

Table 2 - Front matter content

Title	Include in page-oriented	Include in IETP
Title page	(M)	No

Introduction	(M)	(M)

(M) – Mandatory

(O) – Optional (Project decision)

#### Business rule decision point BRDP-S1-00466 - Front matter to be used in the CMP:

- Decide what front matter data modules to be used and their content.

#### 2.2.1.1 Title page

The title page for a CMP must contain the following information:

- Company masthead
- Company CAGE code
- Publication type ("COMPONENT MAINTENANCE PUBLICATION")
- Any data restriction information that applies to the entire publication, such as:
  - export control statement(s)
  - copyright legend/indicator
- Publication module code
- Publication issue number
- Title page data module code (if authored)
- SNS of the CMP
- Issue date

The title page must also contain the following for each product included in the CMP:

- Name of the component
- Product number (eg, part number/model/series/type)

The title page can also contain the following optional information:

- Component manufacturer's CAGE code (if different from the company CAGE code)
- Company's address, phone and fax
- Associated product identification numbers
- Component logo

#### 2.2.2 List of Effective Data Modules (LOEDM)

The LOEDM lists all data modules in the publication in lexical order by data module code. The purpose of the LOEDM is to provide a mechanism to verify that all content is present in a publication and is current. It is not intended to aid readers in finding content. That is the purpose of the table of contents. It is recommended that this information be generated rather than authored.

#### 2.2.3 Change Record (CR)

The CR is provided in the page-oriented publication only. It presents the revision history of the CMP.

#### 2.2.4 Highlights

The highlights provide the user with a quick and simple list of changes that can affect maintenance.

For each data module removed or added, the highlights lists the data module code, the data module title, whether the data module was removed, revised or added, and the reason for the change.

Provide clear, concise descriptions of changes to technical information or valuable instructions in a data module. Some examples of recommended phrases are:

- "... corrected assembly procedure ..."
- "... WARNING added to test procedure ..."
- "... wiring diagram added ..."
- "... torque values increased ..."
- "... special tool procedure added ..."
- "... welding repair added ..."

Minor text changes, such as movement of text, typographical errors and changes to punctuation must not be included in the highlights unless they alter provided procedures or affect safety.

Special caution must be exercised to ensure that information affecting components still in-service is not removed.

#### **2.2.5 Access illustrations**

The access illustrations are included in the IETP only and are optional. These are illustrations used to navigate to data modules in the IETP. The format of these illustrations is a project or organization decision.

#### **2.2.6 List of Abbreviations (LOA)**

The LOA must be authored generally in accordance with [Chap 3.9.4](#) and [Chap 5.2.1.18](#) except that it must include all abbreviations used in the CMP.

#### **2.2.7 List of Terms (LOT)**

The LOT must be authored generally in accordance with [Chap 3.9.4](#) and [Chap 5.2.1.18](#) except that it must include all terms used in the CMP.

#### **2.2.8 List of Symbols (LOS)**

The LOS must be authored generally in accordance with [Chap 3.9.4](#) and [Chap 5.2.1.18](#) except that it must include all symbols used in the CMP.

#### **2.2.9 Technical Standard Record (TSR)**

The TSR lists all incorporated Service bulletins applicable to the component and indicates if the Service bulletin has been incorporated or if it had no effect. The update frequency of Service bulletins can vary by project. Service bulletins are listed in order of Service bulletin number. For each Service bulletin list the following:

- Service bulletin number
- Service bulletin title
- Service bulletin revision number
- Service bulletin date
- Issue number when incorporated or the words "No effect"

#### **Business rule decision point BRDP-S1-00468 – Incorporating Service bulletins into the CMP:**

- Decide on the updating frequency for incorporating Service bulletins into the CMP.

#### **2.2.10 Table of Contents (TOC)**

The purpose of the TOC is to contain adequate information to permit the reader to quickly and accurately locate the data modules sought. Though similar to the LOEDM, the TOC differs from the LOEDM in purpose and therefore, in presentation and content. It is recommended that this data module be generated.

The TOC contains an entry for each listed introduction and technical content data module in the CMP. The front matter data modules are not included in the TOC.

Data modules listed in the TOC are presented in order of appearance in the CMP as described in [Para 1.6](#).

The TOC data module entries list the data module code and the data module title (<techname> - <infoname>).

Because each data module in a CMP starts on page one, page numbering is not useful and is therefore not required.

- 2.2.11 List of Illustrations and List of Tables (LOI, LOTBL)**  
The LOI and LOTBL list all the figures and tables in the CMP. These lists will show the illustration/table number and title.
- 2.2.12 List of Applicable Specifications and Documentation (LOASD)**  
The LOASD must be authored generally in accordance with [Chap 3.9.4](#), [Chap 5.3.1.1](#) and [Chap 5.2.1.18](#). It must include a reference to the Issue of S1000D to which the CMP and data modules were produced.
- 2.2.13 List of Suppliers (LOSUP)**  
The LOSUP contains all of the enterprise identification and information for all enterprises mentioned in the CMP.
- 2.2.14 List of Support Equipment (LOSE)**  
The LOSE provides a consolidated listing of all support equipment used throughout the CMP. Refer to [Chap 3.9.4](#).
- 2.2.15 List of Supplies (LOSU)**  
The LOSU provides a consolidated summary listing of all support equipment used throughout the CMP. Refer to [Chap 3.9.4](#).
- Do not include any item of supply that is listed in the IPD as part of the configured end item component.
- 2.2.16 List of Spares (LOSP)**  
The LOSP contains all spare parts for the CMP end item. A LOSP can be included in the CMP when the IPD information is in a separate publication. Do not include a LOSP in the CMP when the IPD is included in the CMP. All spare parts for the CMP end item must be included in the IPD. Refer to [Chap 5.3.1.3](#).
- Discrete spare parts lists for procedures, processes, etc, must still be provided as required by the applicable Schema for that data module.
- 2.2.17 Product Cross-reference Table (PCT)**  
Including this data module is optional. Refer to [Para 2.2.1](#).
- 2.2.18 Conditions Cross-reference Table (CCT)**  
Including this data module is optional. Refer to [Para 2.2.1](#).
- 2.2.19 Applicability Cross-reference Table (ACT)**  
Including this data module is optional. Refer to [Para 2.2.1](#).
- 2.2.20 Introduction**  
The introduction data module must provide a brief statement explaining the organization, content, method for using the CMP. Include information covering the purpose, scope and revision service for the publication. The introduction can also contain the following:
- Advisement on observing the publication instructions
  - Explanation of the publication arrangement and format
  - Documentation of the process verification. Refer to [Para 1.5.11](#).
  - Explanation of data module code numbering
  - Explanation of callouts and cross-references
- The introduction data module must be the last front matter data module in the publication.
- 2.3 Technical content**  
The technical content of the CMP is divided into three logical sections:

- Functional and technical descriptions
- Maintenance and servicing
- Illustrated parts data

Each section contains the applicable data modules. These data modules are to be presented in the order listed in this [Para 2.3](#).

Refer to [Chap 5.2.1.9](#) for requirements for the content and coding of these data modules.

### 2.3.1 Functional and technical descriptions

This section provides descriptive information in sufficient detail to enable the technician to perform the required procedures in the shop. The following information must always be provided:

- Description of function (M)
- Technical description (M)
- The following information must always be provided if applicable to the components:
  - Electrical and electronic data
  - Software functional description
  - Diagrams and schematics

These constitute the technical content of the publication. In a page-oriented publication, these data modules appear in the order listed and appear after the front matter data modules.

The following paragraphs give the publication requirements for this information.

### 2.3.2 Maintenance and servicing

These data modules provide the actual procedures and constitute the procedural content of the publication. In a page-oriented publication, these data modules appear in the order listed and appear after the front matter data modules.

#### 2.3.2.1 Maintenance planning

The CMP is intended to provide on-condition maintenance instructions. Specific maintenance schedules must be avoided unless required for regulatory compliance.

In some instances, the project or the organization can decide to include maintenance planning information in the CMP.

#### **Business rule decision point BRDP-S1-00470 - Inclusion of maintenance planning information in the CMP:**

- Decide whether to include maintenance planning information in the CMP.

#### 2.3.2.2 Removal and installation

The CMP is intended to provide shop level information to maintain and repair an end item that has already been removed from its installed location. The CMP procedures restore the unit to a condition suitable for re-installation wherever the component can be used.

Typically, the CMP must not include instructions for removing or installing the covered unit from its installed location. In some instances, the project or the organization can decide to include this information in the CMP.

#### **Business rule decision point BRDP-S1-00471 - Inclusion of removal and installation information in the CMP:**

- Decide whether to include removal and installation information in the CMP.

#### 2.3.2.3 Task sets

Any required task sets are to be included in this section. Refer to [Para 1.5.8](#).

#### 2.3.2.4 Servicing

These data modules provide instructions for routine servicing of the component in the shop.

Instructions can include the following:

- Cleaning
- Inspection
- Remove and restore fluids and filters
- Lubrication
- Procedures to read, interpret, clear and reset or restore component memory
- Shop load component software

Typically, these procedures do not include significant disassembly or assembly requirements.

When component memory is used for recording faults, including Built-In Test (BIT), Built-In Test Equipment (BITE), refer to [Para 2.3.2.5](#) for guidance.

Include adjustment procedures to be performed on the fully assembled component. Adjustment procedures to be accomplished on a partially assembled component are to be included in the assembly procedures.

The software loading procedures to be provided in this section are for installing software in the completely assembled component.

Adjustment and software installation to be accomplished on a partially assembled component are to be described in the assembly procedures. Refer to [Para 2.3.2.7](#).

Cleaning procedures include procedures for surface finish removal and repair or replacement including markings.

#### 2.3.2.5 Examination, test, check and fault isolation

This section must provide the examination, test and check procedures required to determine the condition of a component, guide maintenance and repair activities and determine if the unit can be returned to service. In some instances, fault isolation procedures can also be required to fully determine the defective subassembly or part.

The procedures must be arranged in such a manner that they will progressively isolate and identify any faults in each assembly, subassembly or parts to the level of detail required. Refer to [Para 1.5.5](#).

A detailed Return-To-Service (RTS) test or tests must be provided. When the RTS testing requires multiple complex tests and /or additional procedures and criteria a task set must be used to collect and organize this information. Refer to [Para 1.5.8](#).

Requirements to execute all procedures, in order, must be avoided in lengthy procedural sequences and lengthy procedures if possible. Lengthy sequences or procedures must provide discrete entry points to allow performing specific segments as necessary.

Procedures must be written according to parameters to be checked to repair the component and return it to service rather than according to manufacturing acceptance criteria or support equipment features.

When the order of performing the procedures is important, that order must be clearly explained.

All data required to perform the procedure must be contained within the procedure to avoid the necessity of referencing other areas of the publication. Set-up data including set-up diagrams for each procedure must be provided as well as any supporting diagrams necessary to perform the procedure. Refer to [Para 2.3.1](#) for schematics and other component technical diagrams.

Projects or organizations can require including specific manufacturer's test and other test support data and its format (eg, test specifications, test source code).

**Business rule decision point BRDP-S1-00472 - Inclusion of test support data in the CMP:**

- Decide whether to include manufacturer's test support data and, if so, decide the format of the data.

Each procedure must contain instructions for corrective action in the event the component fails to pass that procedure. This can be a maintenance procedure or reference to additional examination, test, check or fault isolation procedure.

When the component design includes Built-In Test (BIT), Built-in Test Equipment (BITE), or Non-Volatile Memory (NVM) that records component faults, the following procedures and information must be provided:

- procedures to operate the BIT/BITE in the shop environment
- procedures to access and read the NVM
- procedures and information to translate the BIT/BITE/NVM codes and messages into human-readable form
- procedural or fault isolation modules as necessary to isolate malfunctions reported/recorded by the BIT/BITE/NVM

The BIT/BITE/NVM procedures and information will appear first in this section. Procedures to clear or reset the BIT/BITE/NVM memory must be provided in this section or in servicing. Refer to [Para 2.3.2.4](#).

2.3.2.6 Disassembly

This section must provide instructions and procedures to completely disassemble the component in the shop environment. Procedures to disconnect and remove the component from its installed location are addressed in [Para 2.3.2.2](#).

These procedures do not normally require opening permanent joints such as those that are riveted, soldered or welded where no useful purpose will be gained by such. When the design of the component clearly provides for opening these joints for normal replacement of defective parts then the procedures must be included.

Include a NOTE at the beginning of this section that disassembly must only be performed to the extent necessary to determine the condition of the component and/or perform the required maintenance such as replacement of a defective subassembly or part.

Provide step-by-step instructions in a logical sequence starting with a fully assembled component and sequentially progress to the level of detail required by the project or the organization. Refer to [Para 1.5.5](#). In those instances where a specific sequence must be followed include a CAUTION to support the mandatory sequence.

Subassemblies and parts addressed must be identified by an IPD Catalog Sequence Number (CSN). Do not make statements such as "Disassemble in order of IPD CSN".

When appropriate, include instructions or references to perform required examinations, test and checks at the required step in the disassembly procedure. Refer to [Para 2.3.2.5](#).

The user must be instructed to make notes of such items as shim and spacer locations and wiring routing for reference during re-assembly. When necessary, provide instructions to record necessary data at required steps in the disassembly procedure (eg, clearance, tolerance, shim thicknesses). If permanent records are required, refer to [Para 1.5.12](#).

Provide procedures for using any applicable tools and equipment if not self-explanatory or that need additional instruction for these procedures.

In the case of extensive or complicated disassembly procedures, provide graphics including exploded views and supplemental illustrations to support the written procedures. A disassembly sequence chart can be included. The chart must reflect a disassembly sequence such that a specific part can be accessed with minimum disturbance to other serviceable parts in the component.

#### 2.3.2.7 Assembly

This section must provide instructions and procedures to completely assemble the component in the shop environment. Procedures to install and connect the component in its installed location are addressed in [Para 2.3.2.2](#).

Provide step-by-step instructions in a logical sequence starting with the lowest level of subassembly or part detail (refer to [Para 1.5.5](#)) and proceeding to the fully assembled component. In those instances where a specific sequence must be followed include a CAUTION to support the mandatory sequence.

Do not make statements such as "assemble in reverse order of disassembly".

Subassemblies and parts addressed must be identified by an IPD Catalog Sequence Number (CSN). Do not make statements such as "assemble in order of IPD CSN".

When appropriate, include instructions or references to perform required examinations, test and checks at the required step in the assembly procedure. Refer to [Para 2.3.2.5](#) for guidance.

When necessary provide instructions to record necessary data at required steps in the disassembly procedure (eg, clearance, tolerance, shim thicknesses).

Provide procedures for using any applicable tools and equipment if not self-explanatory or that need additional instruction for these procedures.

In the case of extensive or complicated assembly procedures, provide graphics including exploded views and supplemental illustrations to support the written procedures. An assembly sequence chart can be included.

#### 2.3.2.8 Repair

This section must provide instructions and procedures to restore a worn or damaged component to an approved serviceable configuration and condition that is different from its original. Repairs employ processes and procedures other than those for replacing assemblies, subassemblies and components in accordance with [Para 2.3.2.6](#) and [Para 2.3.2.7](#). Refer to [Chap 5.2.1.9](#) for a more detailed discussion.

#### 2.3.2.9 Storage

This section must provide instructions and procedures for storing the component, maintaining the component while in storage, and for removing the component from storage. Refer to [Chap 5.2.1.9](#).

#### 2.3.2.10 Illustrated Parts Data (IPD)

This section must provide illustrated parts data for those components that have replaceable subassemblies and parts. Information must be provided to the level of detail required for the CMP. Refer to [Para 1.5.5](#).

Refer to [Chap 5.2.1.9](#) and [Chap 3.9.5.2.7](#) for additional information.

## Chapter 5.3.2

### *Publications - Air specific publications*

<a href="#">Chap 5.3.2.1</a>	Air specific publications - Aircrew information
<a href="#">Chap 5.3.2.2</a>	Air specific publications - Cross servicing guide

#### **1 General**

This chapter provides general and specific rules for the preparation of publications for air systems.

#### **2 Scope**

The required publications must be decided by the project or the organization. A checklist of possible publications is given here:

- List of applicable publications
  - Aircrew information
    - Flight manual
    - Aircraft operation
    - Performance data
    - Checklists
    - Quick reference manual
  - Air vehicle mass and balance
  - Maintenance
    - Air vehicle maintenance
    - Air vehicle description
    - Maintenance procedures

- Checklists
- Job cards
- Air vehicle fault isolation
- Air vehicle schematic diagrams
- Air vehicle wiring data
- Air vehicle maintenance planning
- Maintenance requirements
  - Checklists
  - Job cards
  - Engine standard practices
  - Engine maintenance
  - Power plant build-up
  - Equipment maintenance
  - Airborne equipment
  - Engine accessories
  - Ground support equipment
  - Training equipment
- Loading
  - Air vehicle cargo loading
  - Air vehicle weapon loading
  - Air vehicle stores loading
- Air vehicle cross servicing
- Air vehicle role change
- Air vehicle structure repair
- Air vehicle non-destructive testing
- Air vehicle corrosion control
- IPD
- Air vehicle battle damage repair
- Air vehicle recovery
- Air vehicle storage
- Illustrated tools and equipment
- Common information and data
  - Standard practices structure
  - Standard practices systems
  - Standard practices electric/electronic
  - Regulatory information
- Material data
  - Material data sheets
  - List of consumable materials
  - Time change items (TCI) data
- Service bulletins / Service information

The definition of the content of the publications should be based on the requirements of the corresponding information sets. Refer to [Chap 5.2](#).

Subsequently some specific requirements to publications are contained in:

- Aircrew information. Refer to [Chap 5.3.2.1](#).
- Cross servicing guide. Refer to [Chap 5.3.2.2](#).

## Chapter 5.3.2.1

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 5.2.2.7</a>	Air specific information sets - Aircrew information

#### **1 General**

By project or organization decision Aircrew information can be split in the following publications:

- General description (GD)
- Flight manual (FM)
- Operating data manual (ODM)
- Flight crew checklist

#### **2 Aircrew information**

##### **2.1 General description**

The GD must contain the description (functioning) of the air system and its systems and equipment. Refer to [Chap 5.2.2.7](#).

##### **2.2 Flight manual**

The FM must contain all specific information necessary for aircrew to perform the air system's missions. Refer to [Chap 5.2.2.7](#).

##### **2.3 Operating data manual**

The ODM must contain performance data used by the operator for flight planning purposes. Refer to [Chap 5.2.2.7](#).

---

**2.4 Flight crew checklist**

The flight crew checklist must contain a compilation of all drills for normal operation of the air vehicle, for air system and system malfunctions, for emergency procedures and for special operations. Refer to [Chap 5.2.2.7](#).

**Note**

Supplementary information, such as operating data, can be included if essential to aircrew.

## Chapter 5.3.2.2

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 5.2.2.3</a>	Air specific information sets - Cross servicing information

## 1 General

An Air vehicle Cross-Servicing Guide (ACSG) must enable services to be performed on air vehicle by an organization other than to which the air vehicle is assigned, according to an established operational air vehicle cross-servicing requirement, and for which there can be a charge.

## 2 Cross-servicing guide

The breakdown of the air vehicle cross-servicing guide must be as follows:

### 2.1 Section I - Leading particulars

- How to use section I
- General description and operation of the air vehicle
- Safety chart(s)
- Danger areas
- Walkways
- Dimensions and weight data
- Access and inspection openings diagrams

Applicable to: All

**S1000D-A-05-03-0202-00A-040A-A**

**Chap 5.3.2.2**

- Interior arrangements of compartments
- Radio and radar equipment essential for flight
- Armament installation

## **2.2 Section II - Air system handling, launching and recovery**

- How to use section II
- List of handling equipment requirements
- Performance parameters for launching and recovery of air vehicles
- Handling safety chart
- Air vehicle overturn danger chart
- Methods of grounding
- Towing and winching
- Deck securing and picketing (mooring)
- Nose, wing, fin and rotor blade folding and unfolding
- Gust locking procedures
- Safety devices and protective covers
- Emergency access and crew evacuation
- Fire fighting
- Slings and hoisting
- Jacking

## **2.3 Section III - Replenishment, servicing points, engine starting and cooling**

- How to use section III
- Servicing and drain points
- List of consumable materials
- Types of replenishment connections for charging main systems
- Capacity of systems and methods of replenishment or charging
- Lubricating charts and symbols
- External hydraulic power application
- External electrical power application
- External pneumatic power application
- Engine starting
- External air conditioning requirements
- Drag chutes

## **2.4 Section IV - Inspection and servicing procedures**

- How to use section IV
- Access and inspection procedures
- Inspection

## **2.5 Section V - Main systems**

- How to use section V
- Main systems

## **2.6 Section VI - Armament**

- How to use section VI
- Non-nuclear munitions

## **2.7 Section VII - Locally-manufactured items**

- How to use section VII
- Locally-manufactured items

---

**2.8 Glossary****2.9 Index**

The index must list the subject matter of the air vehicle cross servicing guide in alphabetical order and must immediately follow the glossary and will therefore be the last element of the publication.

For further details refer to [Chap 5.2.2.3](#).

## Chapter 5.3.3

### ***Publications - Land/Sea specific publications***

#### **Table of contents**

	Page
Publications - Land/Sea specific publications .....	1

### ***References***

*Table 1 References*

Chap No./Document No.	Title
None	

#### **1 General**

This chapter provides rules for the preparation of publications for land/sea Products. The required publications must be decided by the project or organization.

#### **2 Land/sea specific publications**

##### **2.1 Checklist**

A checklist of possible publications is as shown below:

- List of applicable publications
- User reference guide or Operator's handbook
  - Crew/operator information - Description
  - Crew/operator information - Operation
  - Crew/operator information - Sequential operation
  - Crew/operator information - Fault detection, isolation and resolution
  - Crew/operator information - National checks
  - Crew/operator information - Maintenance
- Mass and Balance
- Maintenance
  - Description
  - Maintenance procedures
  - Check lists
  - Work cards

- Fault detection, isolation and resolution
- Schematic diagrams
- Wiring data
- Cross servicing
- Structure repair
- Non-destructive testing
- Corrosion control
- IPD
- Illustrated tools and equipment
- Battle damage repair
- Maintenance planning
  - Maintenance requirements
  - Check lists
  - Work cards
- Loading and storage
  - Cargo loading
  - Weapon loading
  - Stores loading
  - Storage
- Operation
  - Operation
  - Role change
  - Recovery
- Material data
  - Material data sheets
  - List of consumables/expendables
- Service bulletins

## 2.2 User reference guide

When producing the User reference guide or Operator's handbook, the selection of data modules will be based on the skill level, which can be set to an appropriate level that indicates that the crew/operator is also a maintainer.

## Chapter 6

### *Information presentation and use*

#### Table of contents

Chapter	Data module title	Data module code	Applic

<a href="#">Chap 6.3</a>	Information presentation/use - Interactive electronic technical publications
<a href="#">Chap 6.4</a>	Information presentation/use - Functionality

## **1 General**

This chapter contains the guidance and rules on the presentation and use of information. The two distribution mainstreams are:

- page-oriented presentation on paper or screen
- interactive electronic presentation on screen of pre-packed IETPs

The chapter also includes a comprehensive functionality matrix for evaluation of or specifying output functionality.

## **2 Content**

### **2.1 Page-oriented publications**

[Chap 6.2](#) gives the rules for the S1000D standard page-oriented presentation of publications. The chapter includes the typographical information needed to set up any type of output production environment, either using traditional production methods by word processors or using XML editors. Rules and examples of front matter, descriptions, procedures, etc, are given.

### **2.2 Interactive Electronic Technical Publications (IETPs)**

[Chap 6.3](#) gives the basic rules for presentation of Interactive Electronic Technical Publications (IETPs). Guidance for further interactivity is also given.

Applicable to: All

**S1000D-A-06-01-0000-00A-040A-A**

**Chap 6.1**

---

## 2.3 Output functionality

[Chap 6.4](#) gives the details for output functionality that is facilitated by producing information in accordance with S1000D.

## Chapter 6.2

<a href="#">Chap 6.2.1</a>	Page-oriented publications - Page layout, paper publications, headers and footers
<a href="#">Chap 6.2.2</a>	Page-oriented publications - Typography and layout elements
<a href="#">Chap 6.2.3</a>	Page-oriented publications - Layout rules and examples

## 1 General

A page-oriented publication is built up of front matter and several documents, all stored as data modules in the CSDB. The detailed specifications for the information set content and the arrangement of the documents to make a publication from the information set are given in [Chap 5](#).

The layout in page-oriented presentations is based on the paper paradigm, which gives the possibility to present the formatted data modules on paper or on screen. Thus the page layout is composed to suit A4 and A5 (European) and A-size and 5 inch by 8 inch (US) paper sizes. For oversize pages (foldouts) A3 and B-size respectively are used. For other project specific page sizes the presentation must follow the layout given herein, in an equivalent way. Small page sizes (eg, pocket-sized manuals) can necessitate the use of smaller than typical type size.

The paper publication is the printed output from the data modules and the screen presentation is the displayed output from the data modules.

---

**Business rule decision point BRDP-S1-00473 - Use of the S1000D standard page-oriented presentation chapters:**

- Decide whether to use the S1000D standard page-oriented presentation given in [Chap 6.2.2](#) and [Chap 6.2.3](#) or to use any other rules for presentation to meet specific project or organization requirements. The business rules must specify all the requirements needed to contract the desired presentation.

## **2 Page-oriented publications**

### **2.1 Page layout, paper publications, headers and footers**

[Chap 6.2.1](#) gives the detailed rules for the page layout of standard and oversize pages. Rules for headers and footers are detailed together with basic rules for paper publications.

### **2.2 Typography and layout elements**

[Chap 6.2.2](#) gives the detailed typographic rules for all layout elements used to present the XML information in the data modules to the S1000D standard page-oriented presentation.

This chapter provides the basic rules for producing formatted output using for example, XML stylesheets (written in the Extensible Stylesheet Language) or cascading stylesheets.

### **2.3 Layout examples**

[Chap 6.2.3](#) gives detailed rules and examples of S1000D standard presentations of front matter, descriptive, procedural, etc, data modules using the layout elements given in [Chap 6.2.2](#).

## References

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.9.2.1</a>	Illustration rules and multimedia - Illustrations, General
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 6.2.2</a>	Page-oriented publications - Typography and layout elements

## 1 General

This chapter gives the S1000D standard page-oriented presentation page layout rules (type and image widths and heights, margins, etc) for European A4, A3 and A5 pages, and North American (ANSI) A-size, ANSI B-size and index card pages presented on paper or on screen. The typography for headers and footers is also given.

The layout examples provided are for right-hand pages. For left-hand pages (when double-sided printing) mirror images of the right-hand examples provided can be used. The page image area stays the same.

When other page sizes are used, a similar and consistent presentation layout must be used.

The typography for all other presentation elements is given in [Chap 6.2.2](#).

**Business rule decision point BRDP-S1-00474 - Use of mirrored headers and footers:**

- Decide whether to use mirrored headers and footers.

## 2 Page layout

### 2.1 General

The page layout is composed to suit A4 (European 210 mm x 297 mm) and ANSI A-size (North American 8 ½ inch x 11 inch) including foldout pages in A3 (European 420 mm x 297 mm) and ANSI B-size (North American 17 inch x 11 inch) respectively. A smaller size publication is allowed using A5 (European 148,5 mm x 210 mm) or Index card (North American 5 inch x 8 inch).

The examples of text pages in A4, A5, ANSI A-size, and index card publications give the default presentation as single column pages.

Double column text is allowed by project decision. No mix of single and double column presentation in the same data module is allowed.

A3L (L = Landscape) and ANSI B-size publications are normally used for page-oriented wiring data and schematic diagram publications. For details on foldout pages refer to [Para 2.6.1](#), [Para 2.6.2](#) and [Para 2.4.1.4](#).

#### Note

Projects can decide on other page sizes. However, using other page and paper sizes can affect the presentation and authoring, and thus the reuse of the data modules in other projects or by other customers.

#### Note

The A4 layout given in [Fig 1](#) is suitable for both A4 and ANSI A-size pages. By using this layout the composed pages can be printed globally without defining "local" paper sizes.

**Note**

Text pages in A3L/ANSI B-size publications can be A4/ANSI A-size pages or A3L/ANSI B-size pages built up by two A4/ANSI A-size text page images.

All text must be presented with a sans serif type (eg, Helvetica, Univers, Swiss, Arial).

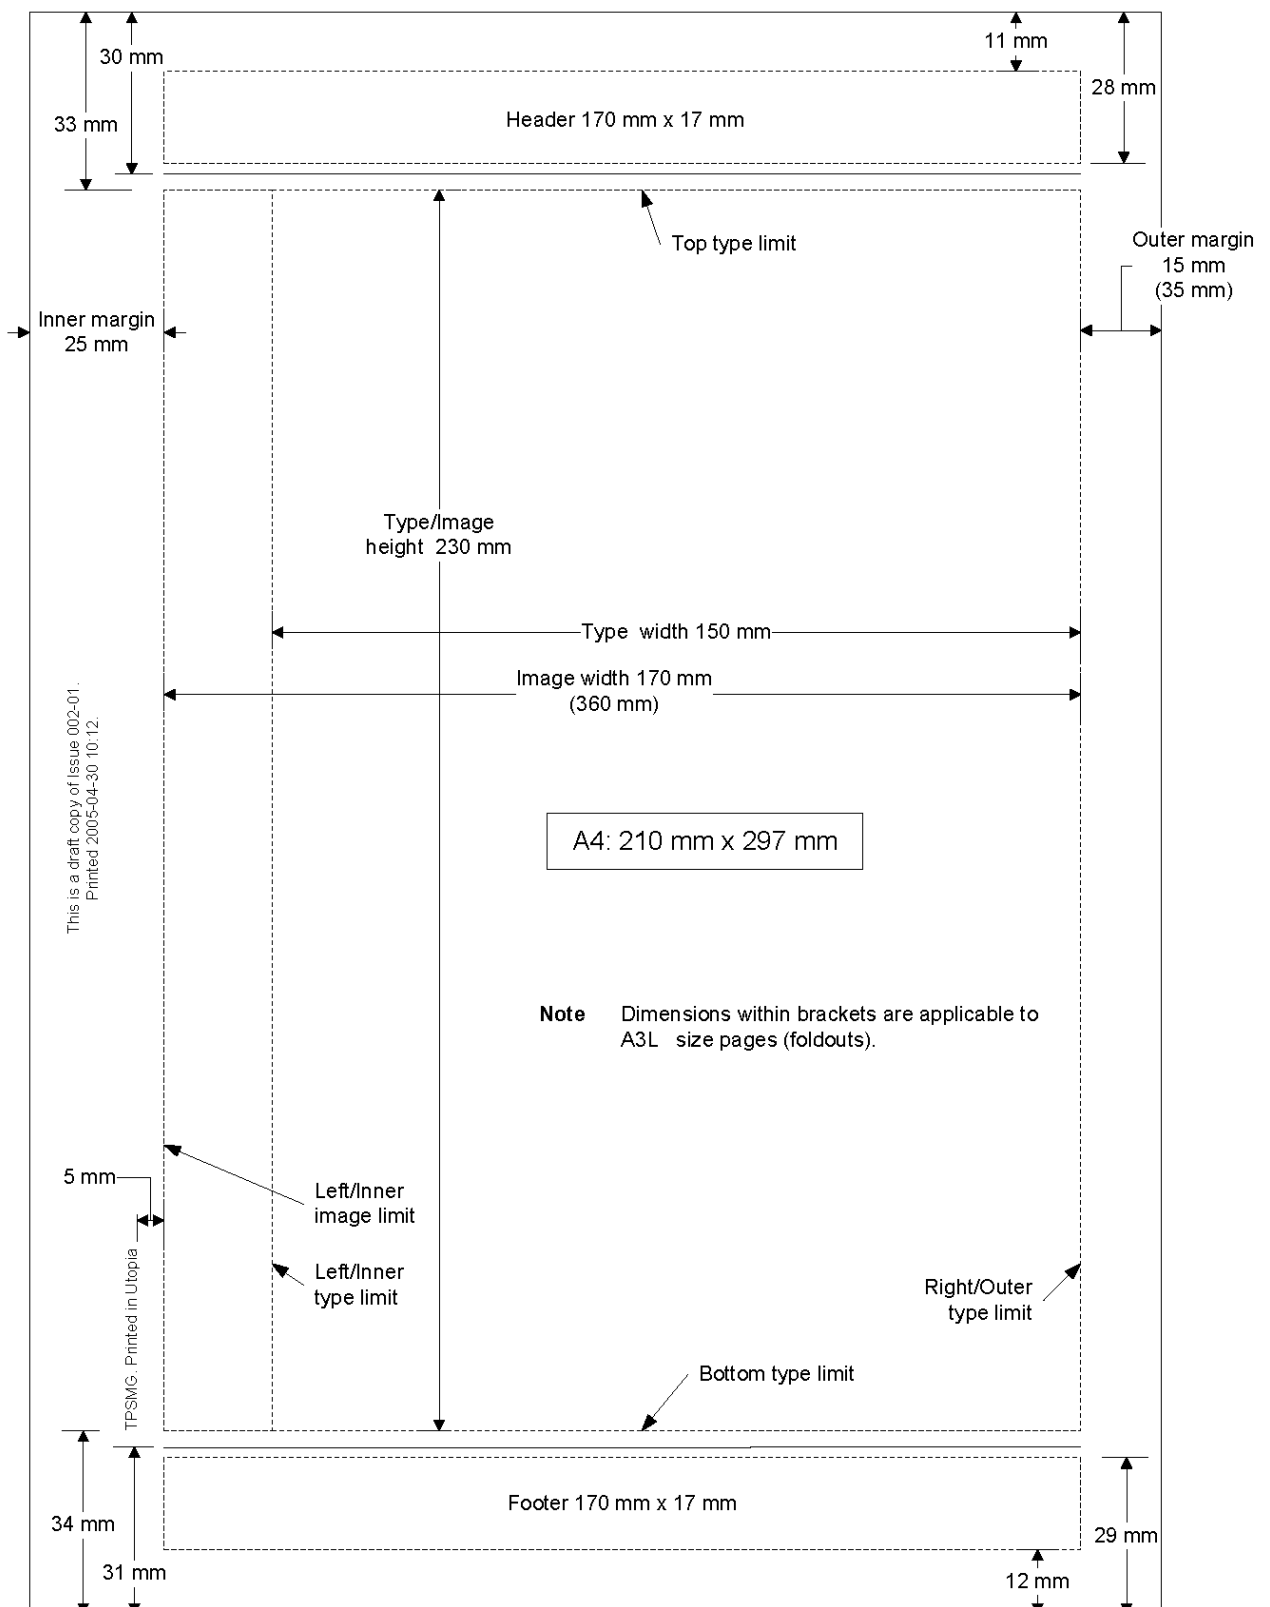

Layout sheet for A4 and A3L is shown in [Fig 1](#) and the layout sheet for A5 is shown in [Fig 2](#). Layout sheet for ANSI A- and ANSI B-size is shown in [Fig 3](#) and the layout sheet for Index cards is shown in [Fig 4](#). These sheets show margins, header and footer areas, type limits and the page image area. Location of header and footer on oversize pages is shown in [Fig 5](#).

**Business rule decision point BRDP-S1-00475 - Page size:**

- Decide which page size to be used (including sizes when foldouts are allowed) per publication.

**Business rule decision point BRDP-S1-00476 - Presentation of foldouts in page-oriented publications:**

- Decide where (eg, interspersed or at the end of the publication) the foldouts must be located in page-oriented publications.

*Fig 5 Header and footer on oversize pages*

## 2.2 Inwork markings

When a data module in the stage of "inwork" is presented as a paper copy or PDF file, it is recommended to present its issue number and the time of printing on each page.

The issue number and its "inwork" number, derived from the attribute values in the element `<issueInfo issueNumber="002" inWork="01">`, separated by a hyphen to be presented in 8 pt, centered in the inner margin. Refer to [Fig 1](#), [Fig 2](#), [Fig 3](#), [Fig 4](#) and [Fig 5](#).

Example: "This is a draft copy of Issue 002-01. Printed 2004-02-29 10:12."

### **Business rule decision point BRDP-S1-00477 - Presentation of inwork markings:**

- Decide whether to present the inwork markings. The details must be documented.

## 2.3 Produced by - Printed in

Responsible for producing the page-oriented output can, by project decision, be given on each page.

The producer's name is presented in 6 pt in the margin. Refer to [Fig 1](#), [Fig 2](#), [Fig 3](#), [Fig 4](#) and [Fig 5](#) for detailed location.

Example of "Produced by": Saab (AB)

When printed on paper for distribution, a notification on in which country the page has been printed, can be added after producer's name.

Example of "Produced by. Printed in": Saab AB. Printed in Sweden

### **Business rule decision point BRDP-S1-00478 - Presentation of "Produced by" - "Printed in":**

- Decide whether to present the responsible producer of the page-oriented output and/or where the publication was printed.

## 2.4 Header and footer

The header and footer must provide a discrete identification of the page. Applicability annotation and security marking can also be included. Manufacturer's, project's or sponsor's logotype can be included in the header.

The header and footer are separated from the page image area by a black line of 1 pt width across the full image width.

Layout and typography for header and footer is shown in [Fig 6](#) (A4 and A3) and [Fig 7](#) (ANSI A- and B-size), [Fig 8](#) (A5) and [Fig 9](#) (Index card).

For left-hand pages use mirror images of the right-hand examples provided.

Font sizes given in this [Para 2.4](#) are given for A4, A3, ANSI A- and B-size pages. [Table 2](#), [Fig 8](#) and [Fig 9](#) give the font sizes for A5 and Index card pages.

### 2.4.1 Page identification

The page identification comprises the publication module code, the data module code, the issue date and the page number. When the publication uses applicability annotations this must be included in the page identification. Refer to [Para 2.4.1.5](#).

#### 2.4.1.1 Publication module code

The publication module code for the complete publication must be located in the header. The publication module code is, per S1000D standard page-oriented presentation rules, positioned in the top outside corner and presented in 11 pt bold, aligned to the outer type limit. The value is derived from `<pmc>` or `<pme>` in the publication module.

##### **Business rule decision point BRDP-S1-00479 - Presentation of publication module code:**

- Decide whether to use the S1000D standard page-oriented presentation rules for the publication module code or to create project or organization specific rules for its positioning and style within the header.

#### 2.4.1.2 Document identifier

The document identifier, which is equal to the data module code, must be located in the footer. The data module code is, per S1000D standard page-oriented presentation rules, positioned in the top outside corner of the footer and is presented in 11 pt bold, aligned to the outer type limit.

##### **Business rule decision point BRDP-S1-00480 - Presentation of data module code:**

- Decide whether to use the S1000D standard page-oriented presentation rules for the data module code or to create project or organization specific rules for its positioning and style within the footer.

#### 2.4.1.3 Issue date

The issue date must be located in the bottom of the footer. The issue date precedes, per S1000D standard page-oriented presentation rules, the page number by two spaces and must be presented in 11 pt bold. In the markup, it is represented in the element `<issueDate>` as described in [Chap 3.9.5.1](#).

Example: 2003-05-31

##### **Business rule decision point BRDP-S1-00481 - Presentation of issue date:**

- Decide whether to use S1000D standard page-oriented presentation rules for the issue date or to create project or organization specific rules for its positioning in the bottom of the footer.

## 2.4.1.4

## Page number

Each printed page must have a page number. The page number must be located in the footer. The page number is, per S1000D standard page-oriented presentation rules, positioned in the bottom outside corner of the footer preceded by "Page". The page number including "Page" must be presented in 11 pt bold, aligned to the outer type limit.

An A4, A5, ANSI A-size or Index card without any information within a document must have a header and footer and thus a page number, except for the last page in the document, which must have no header or footer. There is no need for marking a blank page within a document with "Intentionally left blank". A blank last page must not be marked.

Oversize pages (foldouts) are normally printed on one (right-hand) side only and placed at the end of the document. When foldouts are placed at the end of the document, page numbers must follow on from the standard size pages without regard to the blank backing pages. Where foldouts are interspersed within the document, they must be numbered only on the printed sides indicating that no pages are missing.

**Recommendation:** Double number the foldout pages to keep the right-hand pages throughout the publication with an odd page number (eg, 11/12, 13/14), when interspersed and printed on one (right-hand) side only.

**Business rule decision point BRDP-S1-00482 - Presentation of page number:**

- Decide whether to use the S1000D standard page-oriented presentation rules for the page number or to create project or organization specific rules for its positioning in the footer.

**Business rule decision point BRDP-S1-00483 - Page numbering of foldout pages:**

- Decide whether to use double numbering of pages when printed on one (right-hand) side only (eg, 11/12, 13/14).

## 2.4.1.5

## Applicability annotation block

For customized page-oriented publications an applicability annotation block is presented in the inside margin of the footer on each page. The applicability must be expressed, by project decision, with serial number of the Product, with an "Applicability" code or with a human-readable expression. When a code is used, the publication must contain an explanation of the code employed in the publication.

If a publication uses applicability annotation blocks all footers must contain the text "Applicable to:" as a default heading in the applicability annotation block followed by serial numbers, codes or a human-readable expression. When the applicability includes all instances of the Product, the code "All" must be used.

The applicability annotation, code or human-readable expression in the footer is derived from the element <applic> in the Identification and status section giving the overall applicability for the data module.

The applicability annotation block, including the default heading "Applicable to:" is located in the top inside corner of the footer and must be presented in 10 pt lowercase aligned to the inner image width.

**Business rule decision point BRDP-S1-00484 - Presentation of applicability annotation:**

- Decide whether to use the S1000D standard page-oriented presentation rules for the applicability annotation or to create project or organization specific rules for the presentation.

### 2.4.2 Security marking

Each page in a publication must have a security marking except, by project decision, for unclassified publications. The marking must correspond to the highest classified information within the data module.

The classification markings must be located in both the header and the footer. The text must be presented in 11 pt bold, uppercase, and centered at top and the bottom of the page. In the markup, it is represented in the element `<security>` as the projects meaning of the value of the attribute `securityClassification` as described in [Chap 3.9.5.1](#).

As an alternative the project can decide to present the commercial classification (value of attribute `commercialClassification`) and/or the national caveat (value of attribute `caveat`) in the header and/or footer. The project can also decide to present the security markings in sentence case (instead of in uppercase) and to exclude the presentation of security markings for unclassified publications.

The binder and the title page must be marked according to the highest classified information in the publication or volume thereof. The title page can also include other classification information represented in the element `<derivativeClassification>`. For each derivative classification action, this information would be identified by date of the action, source material used for the derivation, contact person and the action type (eg, classified, declassified, downgraded and/or upgraded). Refer to [Chap 6.2.3.1](#).

#### **Business rule decision point BRDP-S1-00485 - Presentation of security markings:**

- Decide whether to present the security markings in sentence case instead of in uppercase.

#### **Business rule decision point BRDP-S1-00486 - Presentation of commercial classification and/or caveat as security markings:**

- Decide whether to use the commercial classification (value of attribute `commercialClassification`) and/or national caveat (value of attribute `caveat`) as an alternative to the security classification (value of the attribute `securityClassification`).

#### **Business rule decision point BRDP-S1-00568 - Presentation of derivative classification markings:**

- Decide whether to use and when to use the derivative classification (value of the `<classificationAction>` elements within the `<classificationActionGroup>` defined by the IDREF in the attribute `derivativeClassificationRefId`).

#### **Business rule decision point BRDP-S1-00487 - Exclude presentation of security markings for unclassified publications:**

- Decide whether to exclude the presentation of security markings for unclassified publications.

### 2.4.3 Safety classification

Each page in a data module with the attribute `safetyLabel` in the element `<productSafety>` set to "alert" must have "Alert" presented in the header.

The classification must be presented in 11 pt bold aligned to the bottom outer type limit. Refer to [Fig 6](#) and [Fig 7](#).

**Business rule decision point BRDP-S1-00488 - Presentation of safety classification**

- Decide whether to use the S1000D standard page-oriented presentation rules for the safety classification (attribute `safetyLabel` of the element `<productSafety>`) or to create project or organization specific rules for the presentation.

**2.4.4 Logotype**

Each page in a publication or each page in discrete data modules can have by project decision a logotype (manufacturer's, project's or sponsor's) located in the top outside corner of the header. The maximum height is limited by the height of the header. The element `<logo>` in element `<dmStatus>` contains the reference to the logotype.

**Business rule decision point BRDP-S1-00489 - Presentation of the element `<logo>`:**

- Decide whether to present any of the logotypes given in the element `<logo>` and how this element is presented (eg, size, color).

**2.4.5 End of data module**

The last printed page in a data module must be identified by a statement indicating the end of the data module. This statement must be either the static phrase "**End of data module**" or the dynamic phrase comprised of the words "**End of**" followed by the data module title. Projects must determine which phrase will be published.

**Recommendation:** It is recommended that the end of data module statement be written in 11 pt bold, placed in the footer.

**Note**

The end of data module statement is not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for generating pages.

**Business rule decision point BRDP-S1-00490 - Presentation of "End of data module" statement:**

- Decide on the text that will be used to identify the end of a data module, either "End of data module" or "End of" followed by the data module title.

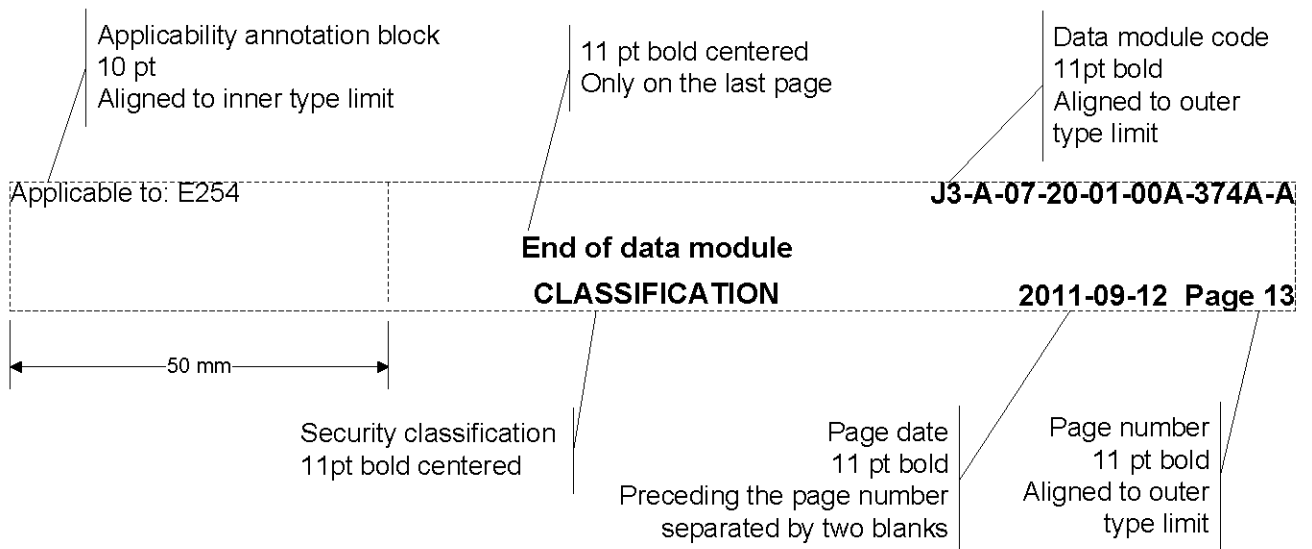

**Business rule decision point BRDP-S1-00491 - Placement of the end of data module statement:**

- Decide whether to present the "End of" statement in the footer or in the body of the page.

**Page header** 170 mm x 17 mm

## 2.4.6

### Elements in header and footer

The following table gives the elements creating the document header and footer.

Table 2 Elements in header and footer

Element	Character image A4, A3, ANSI A- and ANSI B-size	A5 and Index cards	Derived from
Publication code	11 pt bold	10 pt bold	<pmCode>
Data module code	11 pt bold	10 pt bold	<dmCode>

Applicable to: All

S1000D-A-0-02-0100-00A-040A-A

Chap 6.2.1

Element	Character image A4, A3, ANSI A- and ANSI B-size	A5 and Index cards	Derived from
Page date	11 pt bold	10 pt bold	<issueDate>
Page number	11 pt bold	10 pt bold	Generated by the page make-up system
Applicability annotation block	10 pt	9 pt	The interpretation of the element <applic>
Security marking	10 pt	9 pt	The interpretation of the attribute securityClassification in the element <security>
Safety classification	11 pt bold	10 pt	The interpretation of the attribute safetyLabel in the element <productSafety>
Logotype			<logo>
Inwork markings	8 pt	8 pt	<issueInfo>

## 2.5 Double column text

For pages produced with double column text, the columns must be equally split over the page image width with a gutter approximately six millimeters (¼ inch) wide between the columns.

The illustration size and orientation rules specified in [Chap 3.9.2.1](#) apply to double column text pages.

Tables can be placed within a column or be spread across the full page image width.

Titles must not cross over the full page image width, except for centerheads (refer to [Chap 6.2.2](#)), full width figures, and full width tables.

Text must be presented for the reader in the way that the text flows from top to bottom "thru" any page image wide illustration or table. Centerheads, because of their default placement centered across a full page, are allowed to "break" the flow. Care must be taken when determining layout and placement so that the users are not confused by an illustration that is interspersed with text.

### Business rule decision point BRDP-S1-00492 - Use of double column text:

- Decide whether to use double column text, and under what circumstances. Typography for double column page layout must be documented.

## 2.6 Paper publications

### 2.6.1

#### Paper and printing

It is recommended to use white paper with good strength characteristics and of sufficient weight and substance to eliminate show-thru when printed on both sides.

Standard paper sizes used in publications are listed in [Table 3](#).

**Note**

Projects can specify other paper sizes.

*Table 3 Standard paper sizes*

Binder size	Paper size		Note
	Standard size	Optional oversize pages (foldouts). To be avoided.	
A5	A5	A4L	L = Landscape. Refer to <a href="#">Para 2.6.2</a> .
5" by 8"	5" by 8"		Index card size
A4	A4	A3L	
A-size	A-size	B-size	ANSI sizes
A3L	A3L	-	

The standard size paper given in [Table 3](#) is normally printed on both sides and the optional oversize papers on one side only.

**Business rule decision point BRDP-S1-00493 - Double sided printing of foldout pages:**

- Decide whether to use double sided printing on foldout pages.

**Note**

A3L paper in A3L binders are normally printed on both sides.

A form of printing must be used which results in a black image suitable for reproduction (eg, by xerography). The quality of the printed characters, lines, etc, must be uniform within the page, from page to page, and from page revision to page revision.

**2.6.2**
**Folding**

Oversize pages in a publication must be folded to present the header and the footer.

**Recommendation:** Place oversize pages at the end of the document.

## 1 General

This chapter gives the rules for S1000D standard page-oriented presentation of the technical content in page-oriented publications.

These rules also apply when using double column layout. Refer to [Chap 6.2.1](#).

As given in [Chap 6.2](#), the project or the organization must decide whether to accept S1000D standard page-oriented presentation given in this chapter or to use any other rules for presentation to meet specific project requirements. These project specific business rules must specify the information needed to contract the desired presentation.

### Note

Paragraph, step numbers, prefixes like "Para", "Table" in cross-references and "WARNING", "Note", etc, are not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation. Refer to additional notes in the paragraphs below.

## 2 Typography and layout elements

### 2.1 Fonts and leading

The type font for all text elements must be of sans serif type (eg, Arial, Helvetica).

The leading between the lines for all text elements is depending of the font size. Refer to [Para 2.4](#) and [Para 2.5](#).

### Note

Leading is the "vertical space" between the layout elements (text paragraphs, table title lines, headings, etc).

If there is an extra leading after a component and an extra leading before the following component, the resulting leading is the highest value of the two. If the leadings are the same the resulting leading between the elements is the sum of the two. Refer to [Fig 4](#).

### 2.2 Live matter

Text and headings (excluding centerheads, refer to [Para 2.3.2.1](#)) must be left justified and ragged right.

### 2.3 Titles - Headings

#### 2.3.1 General

In the following, "headings" are used for the different levels of titles in the data modules.

In descriptive data modules, titles must be included for the element `<table>` and the element `<figure>`. If used in the element `<levelledPara>`, titles must be presented on levels one thru level five.

#### Note

Presentation of the titles for paragraphs on level six thru level eight are not given. The use of these elements is discouraged and their use and presentation are project decisions.

In procedural, crew and fault data modules, titles must be included for the element the `<table>` and the element `<figure>`. Titles can also, by project decision, be presented for the element `<proceduralStep>` and the element `<crewDrillStep>`.

#### Business rule decision point BRDP-S1-00494 - Presentation of the procedural step titles from the element `<proceduralStep>`:

- Decide whether to present the titles for the element `<proceduralStep>` and to which level.

#### Business rule decision point BRDP-S1-00495 - Presentation of the crew drill step titles from the element `<crewDrillStep>`:

- Decide whether to present the titles for the element `<crewDrillStep>` and to which level.

#### Note

Presentation of the titles for steps on level six thru level eight are not given. The use of these elements is discouraged and their use and presentation are project decisions.

#### Business rule decision point BRDP-S1-00496 - Presentation of the document title:

- Decide whether to present the document title as a Centerhead No. 1 and a Centerhead No. 2 or as a Centerhead No. 1 only (including both element `<techName>` and element `<infoName>`).

Presentation of the element `<levelledPara>` is given in [Para 2.4](#).

Presentation of the element `<proceduralStep>` and the element `<crewDrillStep>` is given in [Para 2.5](#).

Presentation of list titles is given in [Para 2.6](#).

Presentation of table titles is given in [Para 2.8](#).

Presentation of figure titles is given in [Para 2.9](#).

### 2.3.2 Typography and use

The typography and use of headings is presented in [Table 2](#). Leadings to adjacent elements are presented in [Table 3](#).

Table 2 Order and typography of headings

Order	Layout element	Point size/Leading	Typestyle	Live matter	Numbered
1	Centerhead No. 1	14/16 pt	Bold	Centered	No
2	Centerhead No. 2	14/16 pt	Bold, italic	Centered	No
3	Sidehead 0	14/16 pt	Bold	Left justified	No
4	Sidehead 1	14/16 pt	Bold	Left justified	Yes
5	Sidehead 2	12/14 pt	Bold	Left justified	Yes

Order	Layout element	Point size/Leading	Typestyle	Live matter	Numbered
6	Sidehead 3	10/11 pt	Bold	Left justified	Yes
7	Sidehead 4	10/11 pt	Roman	Left justified	Yes
8	Sidehead 5	10/11 pt	Italic	Left justified	Yes

*Table 3 Leadings to adjacent headings and text paragraphs*

Order	Layout element	Leading to next lower level of heading <sup>1</sup>	Leading to a follow-on text paragraph <sup>1</sup>	Leading text paragraph to the heading <sup>1</sup>	Leading table footer end line to the heading <sup>1</sup>
1	Centerhead No. 1	28 pt/10 mm	17 pt/6 mm	27 pt	35 pt
2	Centerhead No. 2	28 pt/10 mm	17 pt/6 mm	27 pt	35 pt
3	Sidehead 0	28 tp/10 mm	17 pt/6 mm	27 pt	35 pt
4	Sidehead 1	14 pt	15 pt	27 pt	35 pt
5	Sidehead 2	11 pt	12 pt	25 pt	34 pt
6	Sidehead 3	11 pt	11 pt	23 pt	32 pt
7	Sidehead 4	11 pt	11 pt	23 pt	32 pt
8	Sidehead 5	-	11 pt	19 pt	28 pt

<sup>1</sup> The leadings given are the leadings between the baselines of the components

Headings must always be kept with the next element. Thus headings must not be placed at the bottom of a page.

### 2.3.2.1

#### Centerheads

Two centerheads are available, a Centerhead No. 1 and, if required, a Centerhead No. 2.

The Centerhead No. 1, which is used only once in a document, presents together with a Centerhead No. 2 the title of the document.

Centerhead No. 1 is derived from the element <techName> and Centerhead No. 2 from the optional element <infoName>.

By project decision, the document title, including both element <techName> and element <infoName> can be presented as a Centerhead No. 1. In this case the two elements must be separated by a hyphen [-] surrounded by spaces [ ].

Centerhead No. 2 is also used for "fixed text strings" (default headings), such as "References", "Preliminary requirements", "Description", "Procedure".

#### Note

These centerheads are not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation of titles and the "fixed text strings".

2.3.2.2 Sidehead 0  
Sidehead 0 must be used for the following three introductory lists in a document:

- 1 Table of contents
- 2 List of figures
- 3 List of tables

**Note**

These three sideheads and their related lists are not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for these introductory lists.

An extra leading of 12 pt is added before the first heading (Centerhead No. 2 thru Sidehead 4) after the last of the three introductory lists, giving a total of 24 pt before.

Sidehead 0 must also be also used in procedural and specialized information data modules to present default headings (eg, "Required conditions", "Required persons" in the preliminary requirements of a procedure). These sideheads are fixed text strings and auto-generated by the editing system when data modules are written in an XML editor.

The default headings for each data module type are given in [Chap 6.2.3](#).

2.3.2.2.1 *Table of contents*

The mandatory table of contents must include the document title and all sideheads 1, 2 and 3. The word "Page" written in 10 pt roman, aligning the right type limit, must follow on the same line as the sidehead. In the table the number of the sideheads, the sideheads themselves and the page numbers must be written in 10/11 pt roman. The entries in the table, starting with the number, must align the left type limit. The text of the sideheads (the title) must be indented 14 mm from the left type limit. The page numbers must align the right type limit. A dotted leader must appear between the end of the sideheads and the page numbers.

An extra leading of 2 pt must be added before all Sidehead 1 in the table of contents.

By project decision, the maximum number of sidehead levels to be presented in the table of contents must be agreed. The number can vary between data module types and publications.

**Business rule decision point BRDP-S1-00497 - Number of sidehead levels to be presented in the Table of contents:**

- Decide whether to present more than three sidehead levels in the table of contents. The allowed number of sidehead levels must be stated in the business rules.

2.3.2.2.2 *List of tables*

The optional list of tables must include all table titles in the document. The presentation rules given for table of contents apply.

By project decision, the prefix "Table" can be added before the table number.

**Business rule decision point BRDP-S1-00498 - Presentation of List of tables:**

- Decide whether to present the List of tables.

**Business rule decision point BRDP-S1-00499 - Present the prefix "Table" in the List of tables:**

- Decide whether to present the prefix "Table" before the table number in the List of tables.

2.3.2.2.3 *List of figures*

The optional list of figures must include all figure titles in the document. The presentation rules given for table of contents apply.

By project decision, the prefix "Fig" can be added before the figure number.

**Business rule decision point BRDP-S1-00500 - Presentation of List of figures:**

- Decide whether to present the List of figures.

**Business rule decision point BRDP-S1-00501 - Present the prefix "Fig" in the List of figures:**

- Decide whether to present the prefix "Fig" before the figure number in the List of figures.

2.3.2.3

**Sidehead 1 thru 5**

Sidehead 1 thru Sidehead 5 are used for presentation of the titles for paragraphs of text and steps. Sidehead 1 is used for level 1, Sidehead 2 for level 2, etc. The use of Sidehead 1 thru 5, refer to [Para 2.3.2](#) for typography.

**Business rule decision point BRDP-S1-00502 - Presentation (layout) of titles:**

- Decide whether to use the S1000D standard presentation rules for titles (Sidehead 1 thru Sidehead 5 or if used thru Sidehead 8) or to create project or organization specific rules such as type size, leading and justification.

**Business rule decision point BRDP-S1-00503 - Presentation of the leveled para titles from the element [<levelledPara>](#) on level six thru eight:**

- Decide whether to present the titles for the element [<levelledPara>](#) on level six thru eight.

2.3.2.4

**Numbering of sideheads**

All sideheads 1 thru 5 must be numbered with Arabic numerals separated with a period [.]. There must be no period [.] after the last digit of the number.

The number must all use the same type-size and type styles as the sidehead itself. The number must align with the left limit of the page image area. The title itself must be aligned with the left type limit.

An alternative method for labeling procedural steps is to use a mix of Arabic numerals and alphabetic labels.

**Business rule decision point BRDP-S1-00504 - Use of the alternative method for labeling procedural steps at presentation:**

- Decide whether to use the preferred or the alternative method for labeling procedural steps.

**2.4**

**Paragraphs of text**

One or more paragraphs of text (element [<para>](#)) can follow Sidehead 1 thru 4. Normally, only one paragraph of text runs on from Sidehead 5.

Type style size and spacing must be in accordance with best commercial practices for technical publications. It is recommended that paragraphs of text are presented in 10/11 pt font. However, by project decision, other typefaces can be used for specific implementations (ie, pocket-sized manuals). Ragged (unjustified) right-hand edge is recommended.

**Business rule decision point BRDP-S1-00505 - Presentation of paragraphs of text:**

- Decide whether to use the recommended presentation rules for type size, spacing and justification.

The leading between two text paragraphs (base line to base line from the last line of a paragraph to the first line of the following paragraph) must be 20 pt (equal to an extra 8 pt leading after each text paragraph).

A paragraph must not be divided due to a page-break in the way that only one single line is placed on top of the following page. At least two lines must in this case go on to the following page.

## 2.5 Step

When used with titles the rules for sideheads apply. Refer to [Para 2.3](#).

When used without titles, the step number and the text from the element `<para>` must be presented in 10/11 pt roman. The preferred method is for the number to align at the left limit of the page image area and the text itself to align at the left type limit.

An alternative method, when used without titles, is for the labels and the text to be indented hierarchically with the left type limit.

The rules for paragraphs of text apply. Refer to [Para 2.4](#).

For the presentations of warnings, cautions and notes within a step, refer to [Para 2.10](#).

Example, refer to [Chap 6.2.3.3](#).

### **Business rule decision point BRDP-S1-00506 - Presentation of hierarchical indented steps, when used without titles in procedural steps:**

- Decide whether to use hierarchical indented steps, when used without titles.

## 2.6 Lists

### 2.6.1 General

Lists consist of two main parts, a title and the list items. The title is optional.

The list title line must be aligned to the left type limit and presented in 10/11 pt. Bold must be used for titles for random lists and sequential lists. Italic must be used for definition lists and legends.

The normal leading from a preceding headline, paragraph, list item, figure title line, table footer (closing line), last line in a warning, caution or note, etc, to the list title line must be used. The leading between the title line and the first list item must be 14 pt (equal to an extra 4 pt leading added after the title).

The basic value for list item leading is 10/11 pt. The values of the extra leadings between and after list items are given in the following paragraphs.

#### **Note**

The prefixes are not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation.

### 2.6.2 Random lists - Unordered lists and simple lists

#### 2.6.2.1 General

Simple lists are recognized by the value "pf01" of attribute `listItemPrefix`.

Unordered lists are the default lists recognized by the value "pf02" of attribute `listItemPrefix`. There are three levels of unordered lists, all indented with a multiple of 7 mm. Refer to default BREX rule BREX-S1-00178.

The prefixes must be consistently used and presented throughout each data module.

**Recommendation:** To improve readability, use and present the same set of prefixes throughout the project.

**Business rule decision point BRDP-S1-00507 - Prefixes to be used for random lists at presentation:**

- Decide whether to use a consistent set of prefixes for random list throughout the project.

#### 2.6.2.2 Prefix, indents and leading in unordered lists

The following rules apply to the presentation of unordered lists (the default prefix value "pf02" is used):

- Unordered list items at level 1, start with an en-dash [–] as the prefix aligning the left type limit. The text must be indented 7 mm.
- The list items within unordered lists on all three levels must be separated by normal leading, 11 pt, giving no extra leading between the same levels of unordered list items.
- An extra leading of 8 pt must be added after the last list item on each of the three levels.
  - Subunordered (level 2) list items start with a bullet [•] as the prefix indented 7 mm from the left type limit.
  - The text must be indented 7 mm further (14 mm from left type limit).
    - Sub-subunordered (level 3) list items starts with en-dash [–] as the prefix indented 14 mm from the left type limit. The text must be indented 7 mm further (21 mm from left type limit).
    - Each list item, on any level, can consist of one or more paragraphs.

The paragraphs within a list item must be separated by an extra leading of 8 pt. This applies on all levels.

An extra leading of 8 pt must be added after the last paragraph in a list item.

#### 2.6.2.3 Prefix, indents and leading in simple lists

Simple lists are presented just like an unordered list at level 1, but without any prefix.

### 2.6.3 Sequential lists - Ordered lists

#### 2.6.3.1 General

There are two levels of ordered lists, both indented with a multiple of 7 mm.

Only one ordered list must be placed under a sidehead. One subordered list can follow each ordered list item.

Ordered lists must not be used to provide procedural step information.

#### 2.6.3.2 Indents and leading in ordered lists

The following rules apply to the presentation of ordered lists:

- 1 Ordered lists must be numbered with Arabic numerals. The number, starting with "1", must align the left type limit.
- 2 The text must be indented 7 mm.
- 3 The additional leading after each list item on both levels must be the same as for text paragraphs, 8 pt.
- 4 There must be no period [.] after the last digit of the number.
  - 4.1 Subordered lists must be numbered. The number must start with the number of the preceding item followed by a number starting with "1". The numbers must be separated by a period [.]

4.2 The number in subordered lists must be indented 7 mm from the left type limit. The text must be indented 7 mm further (14 mm from left type limit). The text indent can be extended in steps of 7 mm as necessary, for example if one of the numbers is wider than the character 9 (eg, 6.12, 12.6, 10.10). The indentation must be consistent within each ordered or subordered list.

Each list item, on any level, can consist of one or more paragraphs and must be separated by an extra leading of 8 pt.

5 Ordered lists can include subunordered (level 2) and sub-subunordered lists.

- Subunordered (level 2) list items can be included in ordered lists.
- The presentation rules from [Para 2.6.2](#) must be used.
  - Sub-subunordered (level 3) list items can also be included in ordered and subordered lists.
  - Each subunordered and sub-subunordered list can consist of one or more paragraphs. The rules for leadings are given in [Para 2.6.2.2](#).

## 2.6.4 Definition lists and legends

There is only one level to a definition list and to a legend.

The definition list and the legend must be aligned to the left type limit and be presented in 10/11 pt.

### 2.6.4.1 Indents and leading in definition lists

The presentation of a definition list is the same as for an informal table (refer to [Para 2.8.2](#)) with the following differences:

- no leading before the first row
- a leading of 8 pt between rows and paragraph within a row

#### Note

Column titles are allowed as in informal tables.

Two columns must be used for presentation of the term (element `<listItemTerm>`) and its definition (element `<listItemDefinition>`). The definition can consist of more than one paragraph.

If a title is used (eg, "Definition of terms:" in the example below) and the definition list continues on the next page, the title must be repeated followed by two spaces and the default heading "(Continued)" on the top of the continuation page.

The first column with the term has a width of 50 mm and the second column with the definition has a width of 100 mm.

If `<definitionListHeader>` is used to specify column titles, the column titles must be presented in 10 pt bold and underlined.

Layout example 1 - Title without column titles:

*Definition of terms:*

Structural damage, category 1 Damage on load bearing items that can be tolerated or cannot be repaired or replaced in BDR conditions.

This damage is less than the specified limit and has no effect on the ability of the Product to complete at least one mission. Tolerated damage requires only clean-out or stop drilling of cracks.

*Definition of terms:*

Structural damage, category 2 Damage on load bearing items that must be repaired or replaced when damage exceeds the specified limit.

Substitute material A material which has less ultimate tensile strength than the original but which can be used for the BDR of an item by adapting it.

Layout example 2 - No list title with column titles:

<b><u>Name</u></b>	<b><u>Description</u></b>
Nomenclature	Name of the part
Part number	Number assigned to the part

#### 2.6.4.2 Prefix, indents and leading in legends

The presentation of a legend is the same as for an informal table (refer to [Para 2.8.2](#)) with the following differences:

- mandatory use of a title (default heading)
- no leading before the first row
- having a leading of 4 pt between rows

Four columns must be used for presentation of a legend. The item numbers (element `<listItemTerm>`) are given in column 1 and 3 and the corresponding definition (element `<listItemDefinition>`) in column 2 and 4.

The columns with item number (column 1 and 3) are aligned to left type limit. The width of the item number column is 7 mm.

The column giving the definition has a width of 68 mm.

The default heading, "*Legend to Fig X:*", must be presented in front of the legend.

When a full-page legend is split on two or more pages, the item numbers (and their definition) must be presented in consecutive order on the first page and then continue on the following page. Refer to [Fig 1](#).

If the legend continues on the next page, the default heading must be repeated followed by two spaces and the text (*Continued*) on the top of the continuation page.

**Note**

The default heading is not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation of legends.

Refer to [Fig 1](#) for layout example.

Legend to Fig 3:

1	Bracket assembly	16	Nut
2	Screw	17	Bar, small
3	Washer	18	Bar, big

Legend to Fig 3: (Continued)

4	Bar, even bigger	19	Screw
5	Screw	20	Nut
6	Washer	21	Washer
...		...	
15	Support assy	29	Clamp

ICN-S3627-S1000D0496-001-01

Fig 1 Legend split over two pages

## 2.7 Footnotes

### 2.7.1 General

Footnotes used in regular text (inline footnotes) and in tables (table footnotes) are marked up the same way (refer to [Chap 3.9.5.2.1](#)) but presented different.

The recommended way of presenting the footnote markers is as superscripted numbers. Thus the examples below are based on that recommendation.

Projects have to decide if numbers must be superscripted or presented in parenthesis following the item.

#### Business rule decision point BRDP-S1-00508 - Presentation of footnote numbers:

- Decide whether to present the footnote markers as superscripted numbers (default) or as numbers presented within parenthesis.

### 2.7.2 Inline footnotes

Inline footnotes must be numbered (when the recommended superscripted numbers are used) in numerical order within the complete data module. If the same footnote is referenced several times within the data module, the same number must be used.

The publishing systems must present inline footnotes at the bottom of the page, or by project decision, at the end of the complete data module.

Example<sup>1</sup>, refer to the bottom of this page.

<sup>1</sup> This is a footnote. It must be presented in 8/9 pt.

---

**Business rule decision point BRDP-S1-00509 - Presentation of inline footnotes:**

- Decide whether to present the inline footnotes at the bottom of the page (default) or at the end of the data module.

**2.7.3 Table footnotes**

Table footnotes must be numbered (when the recommended superscripted numbers are used) in numerical order within each table. If the same footnote is referenced several times the same number must be used.

The publishing system must present table footnotes at the bottom of the complete table. The table footer must not be split due to page break. At least one row of the table must follow the table footer to the next page.

By project decision, if the table breaks to a new page, the publishing system can present the relevant footnotes at the bottom of the table before the page break. The table closing line must only appear after the complete table footer.

Refer to [Para 2.8.1](#) for font size and leading.

Refer to [Para 2.8.1](#) for examples.

**Business rule decision point BRDP-S1-00510 - Presentation of table footnotes:**

- Decide whether to present the footnotes on the relevant page, if the table is split over several pages. Refer to [Fig 2](#) and [Fig 3](#).

**2.7.4 Interactive presentation**

Rules for presentation of footnotes in IETPs are presented in [Chap 6.3.1](#).

**2.8 Tables**
**2.8.1 Formal tables**

There are two standard widths of tables, image width (attribute `pgwide` is not "0") and type (column) width (attribute `pgwide` value "0" or not specified). All tables must be presented in portrait. The text in cells of portrait tables is parallel to the text in the page header and footer.

A formal table consists of four parts, the **table title line**, the **table head**, the **table rows** and the **table footer**.

The **table title line** must be centered above the table head and be written in 10/11 pt italic. An extra leading of 12 pt must be added before the table title line and 2 pt after. The prefix "Table" followed by the number of the table, starting from "1" within each data module, must be separated from the title itself by two spaces.

The **table head** starts with a horizontal line, followed by the column headings written in 10/11 pt bold. An additional leading of 4 pt must be added before and after the table heading text.

The table title and table head must not be split due to a page break. Nor must a table be split with only one row on the first page.

Column references can be used to facilitate cross-reference between the text and the table columns. These numerical references must be written within brackets. Example, refer to [Table 4](#).

The table head ends with a horizontal line.

If a table continues on the next page, the closing horizontal line must be omitted on the incomplete table. The table title line followed by two spaces and the default heading (*Continued*) and the table head must appear at the top of the continuation page.

The **table rows** entries (from element `<tbody>`) must be written in 10/11 pt. An additional leading of 4 pt must be added before and after each row (giving 8 pt leading between the entries or 19 pt baseline to baseline).

Lengthy tables must have a reasonable space between the table rows to aid legibility. The practice of every fifth - sixth line having extra leading is preferred. For example, the extra leading can be entered by the application adding an extra 4 pt after, for example, every fifth row.

The **table footer** starts with a horizontal line followed by any text entry or footnotes in 8/9 pt. The footnote content is indented 7 mm. An additional leading of 2 pt is added before and after each footnote. The table footer ends with a horizontal closing line.

If there are no text entries or footnotes in the table footer, only the horizontal line must be presented.

All horizontal lines must be 1/2 pt.

After the table footer, an additional leading giving the subsequent element a total leading from table closing line to its base line of:

- 28 pt - text paragraphs or a list items
- 32 pt - table title lines
- 28 thru 35 pt for headings. Refer to [Table 3](#).

Refer to [Chap 3.9.5.2.1.10](#) for markup example of [Table 4](#) below.

#### Note

Vertical lines (rules) in tables must be avoided.

#### Business rule decision point BRDP-S1-00511 - Presentation of vertical lines in formal tables:

- Decide whether to, in exceptional cases, allow presentation of vertical lines in formal table.

#### Note

The rendering of the table must be based on the elements and attributes in the XML files.

The author must apply elements and attributes as defined in [Chap 3.9.5.2.1.6](#) in order to achieve the layout described in this chapter.

Layout example:

*Table 4 Example of a column width table with footnotes*

Col 1 heading (1)	Col 2 heading (2)	Col 3 heading (3)
Row 1 entry 1 has a footnote <sup>1</sup>	Row 1 entry 2	Row 1 entry 3
Row 2 entry 1 continues on a second line	Row 2 entry 2	Row 2 entry 3 <sup>2</sup>
Row 3 entry 1 also has a footnote <sup>2</sup>	Row 3 entry 2	Row 3 entry 3
<div> <div>1 This is a footnote for entry 1</div> <div>2 This is another footnote which is used twice</div> </div>		

[Fig 2](#) shows [Table 4](#) with all footnotes at the end of the complete table.

[Fig 3](#) shows the equivalent table with the relevant footnotes on each page.

Table 3 Example of an image width table with footnotes - Split over two pages

Col 1 heading	Col 2 heading	Col 3 heading
Row 1 entry 1 has a footnote <sup>1</sup>	Row 1 entry 2	Row 1 entry 3
Row 2 entry 1 continues on a second line	Row 2 entry 2	Row 2 entry 3 <sup>2</sup>

Table 3 Example of an image width table with footnotes - Split over two pages (Continued)

Col 1 heading	Col 2 heading	Col 3 heading
Row 3 entry 1 also has a footnote <sup>2</sup>	Row 3 entry 2	Row 3 entry 3
1 This is a footnote for entry 1		
2 This is another footnote which is used twice

Fig 3 Table split over two pages, footnotes on the relevant page

## 2.8.2 Informal tables

An informal table is a table without regular table title line (no "Table X") and without any table header and table footer.

Applicable to: All

S1000D-A-06-02-0200-00A-040A-A

Chap 6.2.2

The table title follows the rules for titles in lists. Refer to [Para 2.6.1](#).

The table row rules in [Para 2.8.1](#) apply with the following differences:

- no extra leading before the first row in the table
- the additional leading after the table footer is measured from baseline to baseline

Example:

*The Top-8 colors:*

- 1 Shocking pink
- 2 Lavender-blue
- 3 Rust-brown
- 4 Bluish-black
- 5 Vivid red
- 6 Pastel green
- 7 Dirty yellow
- 8 Dark black

### 2.8.3 Tabular data modules

Data modules presenting the majority of the information in tabular format only, can have deviations from the rules for formal tables.

#### 2.8.3.1 Front matter data modules

List of effective pages, IC 00R, List of effective data modules, IC 00S, Change record data modules, IC 00T, Highlight data modules, IC 00U, and table of contents, IC 009, have no table title lines in front of the listed data modules or list of reason for change. Refer to [Chap 6.2.3.1](#).

#### 2.8.3.2 IPD modules

IPD modules, IC 941, and IPD cross reference index, IC 942, have the table header starting lines omitted (and tie the table header direct to the page header line). No table title lines are used. Refer to [Chap 6.2.3.5](#).

## 2.9 Figures

### 2.9.1 Formal figures

As the publications and documents are produced from data modules the placement of the figure is given from the data module. Normally no manual attempt to move the figure to another page, due to an automatic page break, must be done.

The illustration sizes are given in [Chap 3.9.2](#).

A figure consists of two parts, an **illustration sheet** (or sheets) and a **figure title line** for each illustration sheet.

The normal leading from a preceding headline, paragraph, list item, table footer (closing line), figure title line, last line in a warning, caution or note, etc, to the illustration top limit must be used, for example, 8 pt after a text paragraph or figure title line.

The **illustration sheet** is placed within a predefined illustration reproduction area. The dimensions are given in [Chap 3.9.2](#). No extra leading must be added before or after the illustration reproduction area.

The **figure title line** must be centered on the first line following the illustration bottom limit. The title must be written in 10/11 pt italic, lowercase. An extra 8 pt leading must be added after the figure title line. The abbreviation "*Fig*" followed by the number of the figure, starting from "1" within each data module, must be separated from the title itself by two spaces.

When an illustration requires several illustration sheets, (*Sheet X of Y*) must be added after the title. The default presentation mode is to use the same figure number for all illustration sheets.

As an alternative, by project decision, an individual figure number can be appended to each illustration sheet, for example:

- Fig 7.1 Computer (Sheet 1 of 2) and Fig 7.2 Computer (Sheet 2 of 2)
- Fig 2 Pump (ACDC) (Sheet 1 of 2) and Fig 3 Pump ACDC (Sheet 2 of 2)

Refer to [Chap 3.9.2](#) for the handling of multi sheet figures.

**Business rule decision point BRDP-S1-00512 - Use of the alternative individual numbering of multi sheet illustrations at presentation:**

- Decide whether to use one of the alternative methods for individual numbering of multi sheet illustrations. The chosen method must be used throughout the project.

The ICN can be presented in 10 pt, right justified on the first line below the illustration reproduction area. Refer to BRDP-S1-00569.

**Note**

The ICN for symbols (Refer to [Para 2.9.3](#)) and other data must not be presented.

**Business rule decision point BRDP-S1-00569 - Presentation of ICN:**

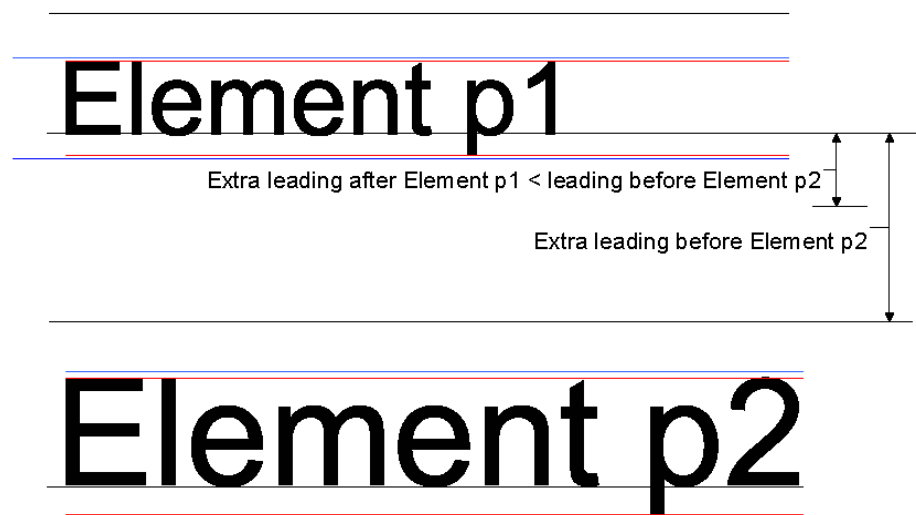

- Decide whether to present the ICN (content of attribute `infoEntityIdent`) for each illustration.

## 2.9.2 Examples of illustration sizes

When the extra leading after an element is equal to the leading before the following element the resulting leading will be the sum of the two.

When the extra leading after an element is greater than the leading before the following element the resulting leading will be the greatest leading.

ICN-S3627-S1000D0396-001-01

Fig 4 Flexi height illustration 170 mm x 210 mm showing extra leading after and before an element

illustration

ICN-S3627-S1000D0387-001-01

*Fig 6 Full page illustration 170 mm x 222 mm*

### 2.9.3

#### Symbols

Symbols are illustrations presented without a figure reference line and an ICN. The symbols can be presented inline with regular text. If the symbol is taller than the current font, the leading must be adjusted to fit the height of the symbols. The symbols are normally aligned to the baseline, but can be centered between text lines if preferred.

Examples - Aligned to the baseline:

A warning can include the general warning symbol. The general warning symbol  can be

omitted or substituted with other, to the warning, relevant symbols, for example

"Click the acknowledge button , when the caution pop-up has been read and understood."

Refer to examples in [Para 2.10.2.2](#).

## 2.10

### Warnings, cautions and notes

#### 2.10.1

##### General

The use of warnings, cautions and notes are given in [Chap 3.9.3](#).

There are two variants of presenting warnings and cautions:

- Symbolic - symbolic frame, with or without color
- Textual - text based without color and frames

The symbolic variant is mainly aimed, but not limited, for screen display as it can include colored frames.

The textual variant is the basic variant mainly aimed for page-oriented paper presentation.

Both variants can include symbols. Refer to [Para 2.9.3](#).

Presentation of applicability in connection with warnings and cautions, refer to [Chap 6.2.3.3](#).

#### 2.10.2

##### Warnings

##### 2.10.2.1

##### Warnings - Textual

The default heading WARNING must be presented in 12/14 pt bold, uppercase underlined, centered on the width of the warning itself. The normal leading from a preceding headline, paragraph, list item, table footer (closing line), figure title line, last line in a warning, caution or note, etc, to the illustration top limit must be used. Add for example 8 pt after a text paragraph or figure title line. An extra leading of 8 pt must be added after the warning default heading.

The warning must be presented in 10/11 pt bold, lowercase. The extra leading after paragraphs and list items in a warning must be the same as for "ordinary" paragraphs and list items.

The default heading WARNING, symbols, if any, and the warning itself must not be split due to a page-break.

A warning is effective throughout the whole operational or procedural data module if it is applied in the element `<description>` before the first element `<levelledPara>` or in the element `<safetyRqmts>` in the element `<preliminaryRqmts>`.

A warning is the first information given in the step of a procedure.

The S1000D standard page-oriented presentation of warnings is to locate them inside a step/para on the first "empty" text line in the step after the step number and the title if any.

Presentation of the warning before the step/para number is allowed by project decision.

No mix of the two presentation methods is allowed.

#### Business rule decision point BRDP-S1-00513 - Presentation of warnings and cautions:

- Decide whether to use the alternative rule to present the warnings before the step/para number.

##### Note

Projects must be aware of potential hazards when allowing step numbers to follow the warning and ensure that there is a clear connection in the presentation between the warning and the associated steps.

A warning is effective to the step/para and all its substeps/subparas.

A warning must not be located between paragraphs.

A warning must be located and presented in the same way for all steps.

A warning can begin with symbols, element `<symbol>`. These graphics are intended to be standardized symbols. Symbols must be presented immediately after the default heading WARNING.

A warning can include:

- attention random lists, element `<attentionRandomList>` (one level only)
- initial symbols

The list item prefix must be a bullet.

##### Note

The attribute `listItemPrefix` in element `<attentionRandomList>` is given the value "pf07" by the author or the authoring application. Refer to [Chap 3.9.3](#).

#### Business rule decision point BRDP-S1-00514 - Presentation of symbols in warnings and cautions:

- Decide whether to present symbols in warnings and cautions. The symbols must be standardized and documented.

Below follows the different presentations variants of warnings:

##### 2.10.2.1.1 A warning without symbols

### **WARNING**

**When you do Step 3, make sure that the tire is fully deflated before you remove the tire.**

**The removal of the tire with the tire inflated is dangerous.**

##### 2.10.2.1.2 A warning with symbols, several paragraphs and a random list

### **WARNING**

**When you do Step 3, make sure that the tire is fully deflated before you remove the tire.**

**The removal of the tire with the tire inflated is dangerous.**

- **Attention random list items allowed**
- **Attention random list items allowed**

### 2.10.2.1.3 A warning in a procedure without titles

The example below shows a warning in a procedure without a step title.

5.2.4

#### **WARNING**

**When you do Step 3, make sure that the tire is fully deflated before you remove the tire.**

**The removal of the tire with the tire inflated is dangerous.**

ICN-S3627-S1000D0793-001-01

*Fig 7 Warning in a procedure without titles - Example*

### 2.10.2.2 Warnings - Symbolic

The layout text elements, including leadings, are the same as for the textual warnings with the following differences:

- The default heading WARNING must not be underlined
- The warning text being centered in a symbolic warning
- An extra leading of 8 pt after the frame

The difference is in the "symbolic" frame.

The symbol  can be omitted or substituted with other relevant symbols. Refer to [Para 2.10.2.1.2](#).

Fig 5 in [Chap 6.3.1](#) shows a warning with an acknowledge button , which is used in interactive publications only.

#### **Business rule decision point BRDP-S1-00515 - Use of symbolic presentation of warnings and cautions:**

- Decide whether to use symbolic presentations of warnings and cautions.

### 2.10.3 Cautions

Follows the same rules as warnings given in [Para 2.10.2.1](#) and [Para 2.10.2.2](#) with the following differences:

- The default heading CAUTION must not be underlined
- Cautions are preceded by any warnings

#### 2.10.4

##### Notes

Notes given in the beginning of a procedural step must be preceded by any warning and cautions.

The default heading Note, or Note X if more than one, must be presented in 10/11 pt bold, lowercase. The normal leading from a preceding headline, paragraph, list item, table footer (closing line), figure title line, last line in a warning, caution or note, etc, to the illustration top limit is used. Add for example 8 pt after a text paragraph or figure title line. No extra leading must be added after the default heading.

The word Note must align the left type limit when it refers to a paragraph and be indented to align the text of the list item to which it pertains. The note itself must be indented 7 mm from the left limit of the word Note and is presented in 10/11 pt, lowercase, on the following line. An extra leading of 8 pt must be added after the note.

The word **Note** or **Note X** and the note itself must not be split due to a page break.

Projects can decide on the use of numbered notes must be consistent throughout the data module starting with Note 1 for the first note in the data module.

**Business rule decision point BRDP-S1-00516 - Use of numbered notes within a data module at presentation:**

- Decide whether to use numbered notes within a data module.

A note can consist of one or more paragraphs. The paragraphs within a note must be separated by an additional leading of 8 pt. This applies on all levels.

The following shows the presentation of the four levels of notes:

##### Note

This note refers to a paragraph or a step.

This is a second paragraph to the note.

- Below follows a note to an ordered or unordered list item.

##### Note

This note refers to an ordered or unordered list.

- Below follows a note to a subordered or subunordered list item.

##### Note

This note refers to a subordered or subunordered list.

- And finally, below follows two numbered notes to a sub-subunordered list item. They are numbered just to show how it is presented. Normally use of numbered notes must be consistently done throughout the data module.

### Note 1

This note refers to a sub-subunordered list.

### Note 2

This is the second note to the sub-subunordered list.

A note can also include **one** unordered/random lists and **one** ordered/sequential list. The latter can in turn include **one** level of unordered/random list. The layout rules for the list items (indents, leading and presentation in 10/11 pt) apply. Refer to [Para 2.6](#).

The list item prefix must be a dash when an unordered/random list is presented in a note.

### Note

The dash is derived from the attribute `listItemPrefix` in element `<attentionRandomList>` as it is given the value "pf03" by the author or the authoring application. Refer to [Chap 3.9.5.2.1.3](#).

The following shows the presentation of lists in notes:

### Note

This note refers to a paragraph or a step.

This is a second paragraph to the note.

- This is the first item in an unordered list (element `<attentionRandomListItem>`) within the note. It is used for all items.
- This is the second item in an unordered list within the note. This list item includes more than one paragraph.

This is the second paragraph (element `<attentionListItemPara>`) in the unordered list item. The same rules as for list paragraphs apply: The paragraphs within a list item must be separated by an extra leading of 8 pt.

- This is the last unordered list item in this note. An extra leading of 8 pt must be added after the last paragraph in a list item.

This is the third paragraph in the note. The note can also include **one** level only of an unordered list.

- 1 This is the first ordered/sequential list item (element `<attentionSequentialListItem>`) within the note. The ordered/sequential list items can include one or more paragraphs.

The ordered/sequential lists items within a note can include **one** level only of unordered list items.

- This is the first unordered list item (element `<attentionRandomListItem>`) within the ordered/sequential list.

This is the second paragraph in the unordered list within the ordered/sequential list.

- The same rules as for list rules apply.

- 2 This is the last item (an ordered/sequential list item) in the note. Only one ordered/sequential list is allowed in a note.

## 2.11 Mathematical expressions

To Be Determined (TBD).

## 2.12 Highlighted text

To highlight (emphasize) a word, an expression or a sentence bold must be used as the default value. The presentation is driven by the value of the attribute `emphasisType` (eg, "`em01`").

## 2.13 Change marks

### 2.13.1 General

Change marks show the changes from the previous issue delivered to the customer.

#### Business rule decision point BRDP-S1-00517 - Display of change marks:

- Decide whether to display change marks.

Changes given the attribute `changeMark` is "`1`" can be identified with a change bar in the form of a vertical black line, 2 to 4 pt wide, to the left of the left type limit adjacent to the changed lines, or in the case of tabular data, against the row that contains the change.

#### Note

The vertical black line to the left is the default value. Any other visual representation is by project decision.

#### Business rule decision point BRDP-S1-00518 - Presentation of change marks:

- Decide whether to use an alternative visual presentation as change marker.

Changes to tables, figures and individual sheet of a multi-sheet figure, including their titles, are marked at the table and figure title line respectively. Projects can decide to mark individual table rows. If individual rows are change marked the table title line must not be change marked if the title is not changed.

#### Business rule decision point BRDP-S1-00519 - Presentation of change marking of individual table rows:

- Decide whether to present change marks for individual table rows.

When a table or a figure is part of a change marked element, the change mark for the complete element must be displayed if the display of change marks is a project requirement.

Table of contents, List of figures and List of tables in data modules must not be change marked.

Title pages, List of effective pages, List of effective data modules, Change records, Highlight pages and table of contents pages must not be change marked.

Examples of coding are given in [Chap 3.9.5.2.1.1](#).

## 2.14 Controlled content

The presentation of controlled content is decided by the project.

#### Business rule decision point BRDP-S1-00570 - Presentation of controlled content:

- Decide how to present controlled content using the attributes `authorityName` and `authorityDocument`.

## 2.15 References

References to data modules and technical publications are presented in lexical order, with data modules first, in the beginning of a data module under the default heading "References" and as inline references in the text.

When the reference is a link to the target it must be presented underlined and in blue.

### 2.15.1 The references table in data modules

Descriptive, procedural, fault information, maintenance planning, etc, data modules include a standardized reference table immediately following the introductory lists: Table of contents, List of tables or List of figures. The references table is presented under the default heading References (Centerhead No. 2) as [Table 1](#) with the table title "References".

The table presents the data module code, the publication module code or a non-S1000D publication code together with the corresponding title, as given by the element `<refs>`, for all in the data module referenced publications and data modules. Publications not having a code are presented by the title only. This means:

- The data module reference is derived from the element `<dmRef>` which gives the data module code from the element `<dmCode>` contained in the element `<dmRefIdent>`.

For projects that include the issue number (in element `<issueInfo>` contained in element `<dmRefIdent>`) in the data module reference, this will be displayed after the data module code and be preceded by the word "Issue".

For projects that include the title of the data module (in element `<dmTitle>` contained in element `<dmRefAddressItems>`) in the data module reference, the data module title will be displayed in the second column.

#### Note

It is recommended to include the data module titles.

- The publication module reference is derived from the element `<pmRef>` which gives the publication code from the element `<pmCode>` contained in element `<pmRefIdent>` together with the element `<pmTitle>` contained in element `<pmRefAddressItems>`.

For projects that include the issue date (in element `<issueDate>` contained in element `<pmRefAddressItems>`) in the publication module reference, this will be presented after the publication identifier.

- A non-S1000D publication reference is derived from the element `<externalPubRef>` using the element `<externalPubCode>` and/or the element `<externalPubTitle>` contained in element `<externalPubRefIdent>`.

No other elements and attributes on the element `<refs>`, than those given above, have any effect on the formatted output for page-oriented presentation.

The absence of external references within a data module will be presented with "None" in the reference table. Refer to [Fig 8](#).

- The alternate title of publication modules (element `<shortPmTitle>`) and non-S1000D publications (element `<shortExternalPubTitle>`) must be presented in bold and underlined on a new line to differ from the presentation of the full title. Refer to [Fig 9](#).

Detailed rules for specific data module types are given in [Chap 6.2.3](#).

Refer to [Fig 8](#) for examples of a table with and without references.

#### Business rule decision point BRDP-S1-00520 - Presentation of data module titles in the reference table:

- Decide whether to present the data module title in the reference table ("Table 1 References").

**Business rule decision point BRDP-S1-00521 - Presentation of publication module/non-S1000D publication titles in the reference table:**

- Decide whether to present the title (element `<pmTitle>/<externalPubTitle>`) or the short title (element `<shortPmTitle>/<shortExternalPubTitle>`), or both, in the reference table ("*Table 1 References*").

**Business rule decision point BRDP-S1-00522 - Order of presentation of references in the reference table:**

- Decide in which order the referenced document is presented in the reference table ("*Table 1 References*"): In order of appearance, alphabetical order, data modules before publications, etc.

## References

Fig 9 Presentation of references under the default heading "References" when using alternate title - Example

### 2.15.2 Inline references

The presentation of references to data modules are done by presentation of the data module code derived from the element `<dmRefIdent>`. The content of the element `<dmTitle>` is not presented.

The presentation of references to publication modules are done by presentation of the publication module code derived from the element `<pmRefAddressIdent>`. The content of the element `<pmTitle>` or the element `<shortPmTitle>` is not presented.

The presentation of non-S1000D references is derived from the element `<externalPubCode>`, the element `<externalPubTitle>` or the element `<shortExternalPubTitle>`.

**Business rule decision point BRDP-S1-00523 - Inline presentation of non-S1000D publication titles:**

- Decide whether to present the external publication code (element `<externalPubCode>`), the title (element `<externalPubTitle>`) or the short title (element `<shortExternalPubTitle>`) as the inline reference.

### 2.16 Cross-references

Cross-references to elements within the current data module typically display a generated prefix. Cross-references to paragraphs, steps, figures, sheets, hotspots, multimedia, multimedia objects and tables must be preceded with the prefixes "Para", "Step", "Fig", "Fig, Sheet", "Fig [ ]", "Fig", "Fig, Object" and "Table", respectively when presented. The prefix must include the number of the target (eg, the paragraph, step or figure number). These cross-references can be followed by a title by project decision.

When the cross-reference is a link to a target, it must be presented underlined and in blue.

The table below shows the presentation of the link related to the target type independent of the "trigger" is the target element or the attribute `internalRefTargetType`.

Refer to [Chap 3.9.5.2.1.2](#) for further information on how and when to present titles as an addition to the generated prefix/text in cross-references.

Table 5 Presentation of attribute *internalRefTargetType*

Cross-reference to	Corresponding attribute <b>internal Ref TargetType value</b>	Output example with generated prefix/text	Comments

<workLocation>	"irtt14"	<a href="#">Nose cowl</a>	The text content of the element <workArea> <sup>3</sup>
<sbmaterialSet> <sbSupportEquipSet> <sbIndividualSupportEquip> <sbExternalSupportEquipSet> <sbSupplySet> <sbIndividualSupply> <sbExternalSupplySet> <sbSpareSet> <sbIndividualSpare> <sbExternalSpareSet> <sbRemovedSpareSet> <sbIndividualRemovedSpareSet>	"irtt15"	<a href="#">Emergency kit</a>	Text content of the child element <shortName> <sup>2, 3</sup>
<accessPointRef>	"irtt16"	<a href="#">Access panel 131CW</a>	The text content of the child element <name> -- "Access" + space + the interpretation of the value of attribute accessPointType Value + space + attribute accessPoint Number <sup>6</sup>

- 1 + space + the content of the element <title> if the project has decided to present titles.
- 2 or the content of the element <name> if there is no content in the element <shortName>.
- 3 When the element <internalRef> is populated, **only** the textual content of this element is presented.
- 4 This is valid for the "basic" method (the same figure number for all sheets), refer to [Chap 3.9.2.2](#). When any of the alternate methods are used (individual numbers on the figures): "Fig" + space + target figure number.
- 5 When no content is available in the element <shortName> or the element <name>.
- 6 When no content is available in the element <name>.

**Note**

Any space before and after the element `<internalRef>` must be inserted by the author of the data module, not added by the stylesheet. This is to ensure correct spacing for any surrounding punctuation.

**Business rule decision point BRDP-S1-00097 - Presentation of the target titles in cross-references:**

- Decide whether to present the target titles given in the element `<title>`.

**Note**

Presentation of the titles depends on the presentation system and its settings.

**Business rule decision point BRDP-S1-00524 - Presentation of the name of spares, supplies and support equipment:**

- Decide whether to present the name (element `<name>`) or the abbreviated alternate name (element `<shortName>`), as the cross-reference in the text.

**2.17****2.17.1****Applicability****Placement of applicability statements in context**

The human readable applicability statements must be presented in the proper context as it is critical for the user to clearly understand the validity of the statement.

The basic presentation rules are:

- An applicability statement must be presented whenever the applicability is changed.
- The S1000D standard page-oriented presentation of the applicability statement is to locate it inside a step or paragraph aligning the left type limit
  - on the first text line in the step or paragraph after the step or paragraph number and the title if any
  - on the same line as the step or paragraph number if there is no title
  - presented in 10/11 pt bold aligning the left type limit

An alternative method is to present the applicability statement before the step or paragraph number to which it applies, is allowed by project decision.

- presented in 10/11 pt bold aligning the left limit of the page image area
- Applicability that pertains to parent elements is also applicable to all of its child elements.

**Note**

This is built in into the XML Schemas.

**Business rule decision point BRDP-S1-00525 - Use of the alternative method for presentation of applicability statements:**

- Decide whether to use the preferred or the alternative method for presentation of applicability statements.

Rules for applicability markings on individual paragraphs and list items, on notes, on figures and on rows in tables will be included in a future issue of the specification.

Presentation of applicability in connection with warning, cautions and the tables in preliminary requirements, refer to [Chap 6.2.3.3](#).

## 2.17.2 Examples

The following examples are derived from the same XML instance which for simplicity only uses the element `<proceduralStep>`. For an example where the element `<proceduralStepAlts>` is used, refer to [Chap 6.2.3.3](#).

If there is no applicability set for the element the applicability is inherited from the parent element or from the overall applicability of the data module.

**Recommendation:** Avoid setting (duplicate) applicability to child elements if these elements have the same applicability as the parent element. Avoiding or minimizing duplication eases updating of the data modules and minimize conflicts at presentation.

The applicability given in brackets is presented to support the understanding and reading of the examples. The overall data module applicability in the examples is set to Serial Number (SN) 1-100.

The mark-up for this example is given in [Chap 3.9.5.3](#).

### Example 1 - The S1000D standard page-oriented presentation of applicability statements:

This example follows rules for the S1000D standard page-oriented presentation of applicability statements.

- |         |  |  |
|---------|--|--|
| 1       | <b>Applicable to: 1-50</b><br>This step called A is applicable to SN: 1-50   | <i>(applic set to SN: 1-50)</i>                                |
| 1.1     | This step called B is applicable to SN: 1-50                                 | <i>(no applic set - inherited from Step 1)</i>                 |
| 1.1.1   | <b>Applicable to: 1-10</b><br>This step called C is applicable to SN: 1-10   | <i>(applic set to SN: 1-10)</i>                                |
| 1.1.2   | <b>Applicable to: 11-20</b><br>This step called D is applicable to SN: 11-20 | <i>(applic set to SN: 11-20)</i>                               |
| 1.1.2.1 | This step called E is applicable to SN: 11-20                                | <i>(no applic set - inherited from Step 1.1.2)</i>             |
| 1.1.2.2 | This step called F is applicable to SN: 11-20                                | <i>(no applic set - inherited from Step 1.1.2)</i>             |
| 1.1.2.3 | This step called G is applicable to SN: 11-20                                | <i>(no applic set - inherited from Step 1.1.2)</i>             |
| 1.1.2.4 | This step called H is applicable to SN: 11-20                                | <i>(no applic set - inherited from Step 1.1.2)</i>             |
| 1.1.2.5 | This step called I is applicable to SN: 11-20                                | <i>(no applic set - inherited from Step 1.1.2)</i>             |
| 1.2     | <b>Applicable to: 1-50</b><br>This step called J is applicable to SN: 1-50   | <i>(no applic set - inherited from Step 1)</i>                 |
| 2       | <b>Applicable to: 1-100</b><br>This step called K is applicable to SN: 1-100 | <i>(no applic set - inherited from the data module applic)</i> |
| 2.1     | This step called L is applicable to SN: 1-100                                | <i>(no applic set - inherited from Step 2)</i>                 |
| 2.1.1   | <b>Applicable to: 1-10</b><br>This step called M is applicable to SN: 1-10   | <i>(applic set to SN: 1-10)</i>                                |
| 2.1.2   | <b>Applicable to: 11-20</b><br>This step called N is applicable to SN: 11-20 | <i>(applic set to SN: 11-20)</i>                               |

Applicable to: All

**S1000D-A-06-02-0200-00A-040A-A**

**Chap 6.2.2**

- 
- 2.1.2.1 This step called P is applicable to SN: 11-20 *(no applic set - inherited from Step 2.1.2)*
  - 2.1.2.2 This step called Q is applicable to SN: 11-20 *(no applic set - inherited from Step 2.1.2)*
  - 2.1.3 **Applicable to: 21-100**  
This step called R is applicable to SN: 21-100 *(applic set to SN: 21-100)*
  - 2.2 **Applicable to: 1-100**  
This step called S is applicable to SN: 1-100 *(no applic set - inherited from Step 2)*
  - 3 This step called T is applicable to SN: 1-100 *(no applic set - inherited from the data module applic)*

### Example 2 - Alternative presentation of applicability statements:

Equal to Example 1, but using the alternative presentation: Applicability statement presented before the step.

#### Applicable to: 1-50

- 1 This step called A is applicable to SN: 1-50 (*applic set to SN: 1-50*)
- 1.1 This step called B is applicable to SN: 1-50 (*no applic set - inherited*)

#### Applicable to: 1-10

- 1.1.1 This step called C is applicable to SN: 1-10 (*applic set to SN: 1-10*)

#### Applicable to: 11-20

- 1.1.2 This step called D is applicable to SN: 11-20 (*applic set to SN: 11-20*)
- 1.1.2.1 This step called E is applicable to SN: 11-20 (*no applic set - inherited*)
- 1.1.2.2 This step called F is applicable to SN: 11-20 (*no applic set - inherited*)
- 1.1.2.3 This step called G is applicable to SN: 11-20 (*no applic set - inherited*)
- 1.1.2.4 This step called H is applicable to SN: 11-20 (*no applic set - inherited*)
- 1.1.2.5 This step called I is applicable to SN: 11-20 (*no applic set - inherited*)

#### Applicable to: 1-50

- 1.2 This step called J is applicable to SN: 1-50 (*no applic set - inherited*)

#### Applicable to: 1-100

- 2 This step called K is applicable to SN: 1-100 (*no applic set - inherited from the data module applic*)
- 2.1 This step called L is applicable to SN: 1-100 (*no applic set - inherited from Step 2*)

#### Applicable to: 1-10

- 2.1.1 This step called M is applicable to SN: 1-10 (*applic set to SN: 1-10*)

#### Applicable to: 11-20

- 2.1.2 This step called N is applicable to SN: 11-20 (*applic set to SN: 11-20*)
- 2.1.2.1 This step called P is applicable to SN: 11-20 (*no applic set - inherited*)
- 2.1.2.2 This step called Q is applicable to SN: 11-20 (*no applic set - inherited*)

#### Applicable to: 21-100

- 2.1.3 This step called R is applicable to SN: 21-100 (*applic set to SN: 21-100*)

#### Applicable to: 1-100

- 2.2 This step called S is applicable to SN: 1-100 (*no applic set - inherited from Step 2*)
- 3 This step called T is applicable to SN: 1-100 (*no applic set - inherited from the data module applic*)

### 2.17.3 Default heading and style

The S1000D standard page-oriented presentation of the applicability is preceded by the default heading "**Applicable to:**" presented in 10/11 pt bold. If required, to highlight the default heading and applicability statement blue must be used (eg, **Applicable to: SN 1-100**).

To group and separate serial numbers, service bulletins and conditions commas [,], logical expressions ("and", "or") and full stops [.] must be used.

#### Examples:

Serial number, individual and ranges separated by commas, for example:

- "SN: 5-12", " SN: 001-100, 103", " SN: 001-199, 201-220, 222"

Service bulletins and modifications, for example:

- Post SB A350-A-25-10-0001A-00A-930A-C\_002 and Pre SB-A350-A-25-10-0004-00A-930A-C\_001
- Post SB-A350-A-25-10-0001-00A-930A-C\_002. Post SB-A350-A-32-10-0014-00A-930A-A\_001 and Pre SB-A350-A-25-10-0004-00A-930A-B\_001.

Conditions, for example:

- Dessert operations
- SN: 101-120, Dessert conditions

Mixed, for example:

- SN: 001-050 and Post SB-A350-A-25-10-0001-00A-930A-C\_002
- SN: 001-050 and Post SB-A350-A-25-10-0001-00A-930A-C\_002. SN: 051-100.

#### Note

The full stop after "\_002", in the second example, separates the two applicability statements for " SN: 001-050" and " SN: 051-100".

#### Business rule decision point BRDP-S1-00526 - Decide on highlighting the applicability default heading and statement at presentation:

- Decide whether to highlight (blue and bold) the default heading and applicability statement at presentation.

## 1 General

This chapter gives the rules for and examples of S1000D standard page-oriented presentation of data modules using the layout elements given in [Chap 6.2.2](#). It is used to build for example, XML Style Sheets (written in the XML Style Sheet Language). If a traditional authoring environment is used, it is used as the input for setting up the authoring application.

Rules and examples are given for:

- [Chap 6.2.3.1](#) Layout - Layout rules and examples - Front matter data modules
- [Chap 6.2.3.2](#) Layout rules and examples - Descriptive data modules
- [Chap 6.2.3.3](#) Layout rules and examples - Procedural data modules

## 1 General

This chapter gives the rules for and examples of S1000D standard page-oriented presentations of the below listed front matter data modules.

### Note

In the examples the security classification is in lowercase "by project decision".

The rules and examples in this chapter include:

- Title page - (TITLE) - IC 001
- List of effective pages - List of Effective Pages (LOEP) - IC 00R (or IC 002)
- List of effective data modules - List Of Effective Data Module (LOEDM) - IC 00S (or IC 002)
- Change record - Change Record (CR) - IC 00T (or IC 003)
- Highlights - (HIGH) - IC 00U (or IC 003)
- Technical standard record - Technical Standard Record (TSR) - IC 008
- Table of contents - Table Of Contents (TOC) - IC 009

In a future issue, rules and examples for the following cross-reference tables will be included:

- Product cross-reference table - Product Cross-reference Table (PCT) - IC 00P
- Conditions cross-reference table - Conditions Cross-reference Table - (CCT) - IC 00Q
- Applicability cross-reference table- Applicability Cross-reference Table (ACT) - IC 00W

Examples of the following front matter lists are given in [Chap 5.2.1.18](#):

- List of abbreviations - List of Abbreviations (LOA) - IC 005
- List of terms - List of Terms (LOT) - IC 006
- List of symbols - List of Symbols (LOS) - IC 007

- List of applicable specifications and documentation - List of Applicable Specifications and Documentation (LOASD) - IC 00V

The following front matter data modules, for a given publication, can be auto generated with the publication module as base. The publication module and all data modules being included in the publication, contain all necessary data:

- Title page - TITLE
- List of effective pages - LOEP
- List of effective data modules - LOEDM
- Highlights - HIGH
- Table of contents - TOC

If properly marked up in the data modules the following front matter data modules can be auto generated based on the use of the element `<acronym>`:

- List of abbreviations - LOA
- List of terms - LOT

Change record, Technical standard record, List of symbols and List of applicable specifications and documentation must be authored using the Descriptive Schema.

Markup examples of front matter data modules are given in [Chap 3.9.5.2.16.1](#). They are provided as a download package (filename of the package), which contains XML, PDF representations of the XML and PDF presentation examples of each front matter data module. The package can be downloaded from [www.s1000d.org](http://www.s1000d.org).

## 2 Rules and examples

### 2.1 General

The front matter data modules must use the basic layout and rules given in [Chap 6.2.1](#) and [Chap 6.2.2](#) with the following significant rules:

#### Note

The date in the footer is derived from the front matter data module element `<issueDate>` given in the element `<identAndStatusSection>`. Rules for data module issue dates are given in [Chap 3.9.5.1](#).

- Only element `<infoName>` must be presented as the title. Thus the element `<infoName>` takes the place (Centerhead No. 1) of the element `<techName>` in the layout.
- The tables given for each front matter type must be used. Refer to, for example, [Table 3](#) and [Table 4](#). The project has to decide on the first and second column table header titles. For example:
  - **Document title** can be used instead of **Title** in column 1
  - **Document identifier** can be used for Column 2 (when the table also can include non-S1000D publications (`<externalPubRef>`))
  - **Data module code** or **Publication module code** (when the table only includes data modules or publication modules)
- The standard introductory and explanatory text paragraphs (element `<reducedPara>`) are presented after the title and in front of the tables. These standardized paragraphs and lists are given below for each of the front matter types.

When using the Front matter Schema:

- the issue number and issue date (the elements `<issueInfo>` and `<issueDate>`) to be included in the standard introductory text are derived from the

corresponding elements in the relevant child element (eg, <frontMatterList>) of the element <frontMatter>. The inclusion is done during the creation of the data module which means that the content of the element <reducedPara> is complete and ready for presentation.

When using the Descriptive Schema:

- the issue number and issue date (the elements <issueInfo> and <issueDate>) included in the standard introductory text are derived from the element <identAndStatusSection> of the source publication module.
- Table of contents, List of tables or List of figures of the front matter itself must not be presented
- The Reference table must not be presented
- No table title lines are used, except for Highlights

[Table 2](#) gives the front matter, the corresponding Schema to be used and a reference to where the details are given.

#### Note

(M) and (O) is used to indicate whether the content/value of the element/attribute must be presented (M) or is optional (O).

[Chap 3.9.4](#) gives an overview and the basic rules for front matter data modules and [Chap 5.3.1.1](#) gives the rules for the data module coding.

## 2.2 Title page

The Title page rules below are based on the use of the Front matter Schema. The same presentation applies when the Descriptive Schema is used.

The information is derived from the element `<frontMatterTitlePage>`.

Each of the information objects must be presented left justified to the left image limit.

The layout rules are given in the list below and in [Fig 1](#) and [Fig 2](#).

The first line of each of the following object starts on fixed distances from the top of the page.

- 1 Product/Project (optional). The content from the elements `<productIntroName>` and/or `<productAndModel>`.
- 2 Publication/Volume title (mandatory). Content derived from the elements `<pmTitle>` and `<shortPMTitle>`.
- 3 Publication module code (mandatory). Content derived from the element `<pmCode>`.
- 4 Issue information (mandatory). Content derived from the element `<issueInfo>` (`<issueNumber>` in the element `<frontMatterTitlePage>`). The issue date given in the element `<issueDate>` (in the element `<frontMatterTitlePage>`) can be a complement to the issue number. The date is typically the same as in the footer of the Title page data module (element `<issueDate>` in the element `<identAndStatusSection>`).

The following information objects must be presented at the lower part of the Title page, starting with manufacturer's information from the very bottom. These objects expand as necessary.

- 5 Product illustration (optional). The illustration of the product derived from the element `<productIllustration>`. The height of the product illustration must be agreed.
- 6 Restriction information (optional). Content derived from the element `<restrictionInfo>`, expands upwards from the Publisher block ([item 7](#)). When the height expands available space, the information continues at the top of the following page.

The content of any populated child element is presented in the following order:

- Copyright
- Policy statement
- Data conditions

The content is presented in 8/9 pt roman, all left justified.

### Note

Any text to be presented in, for example bold, must be coded with the corresponding value of the attribute `emphasisType`.

- 7 Publishing authority (mandatory). The publisher is presented under the fixed title "Publisher:" by its name from the element `<enterpriseName>` in the element `<responsiblepartnerCompany>`.

The name is given below the title "Publisher:" in 8/9 pt roman.

The publisher's logotype (optional). The logotype is derived is derived from the element `<symbol>` in the element `<publishersLogo>`. As there can be more than one logotype, the first given is used, if not otherwise stated in the business rules for the element. Refer to [Chap 3.9.5.2.16](#).

The logotype is presented left justified below the title "Publisher:" with the publisher's name indented accordingly.

- 8 Manufacturer's information (optional). The information is presented under the fixed title "Manufacturer:". Typically only the following elements are used: `<enterpriseName>` and `<businessUnitName>` giving the manufacturers name and the business unit name, and the element `<businessUnitAddress>` giving the address.

The name and address are given below the title "Manufacturer:" in 8/9 pt roman.

Manufacturer's logotype (optional). The logotype is commonly presented and is derived from the element `<symbol>` in the element `<enterpriseLogo>`. As there can be more than one logotype, the first given is used if not otherwise stated in the business rules for the element. Refer to [Chap 3.9.5.2.16](#).

The logotype is presented left justified below the title "Manufacturer:" with the manufacturer's name and address indented accordingly.

- 9 The optional barcode derived from the element `<barcode>`. As there can be more than one bar code, the first given is used, if not otherwise stated in the business rules for the element. Refer to [Chap 3.9.5.2.16](#).

The following information objects are presented from the top of the page.

- 10 Restriction instructions (optional). Content derived from the element `<restrictionInstructions>` starts to fill the page from the top.

#### Note

Any overflow from Restriction information (copyright, etc) ([item 6](#)) will continue on top of the page before the Restriction instructions.

The content of any populated child element is presented in the following order:

- Data distribution
- Export control
- Data handling
- Data destruction
- Data disclosure
- Supersedure

The content is presented in 8/9 pt roman, all left justified.

#### Note

Any text to be presented in, for example bold, must be coded with the corresponding value of the attribute `emphasisType`.

- 1011 Miscellaneous information - Front matter information (optional). The information is derived from the element `<frontMatterInfo>`. Each front matter information type is presented with its title (`<title>` or the value of the attribute `frontMatterInfoType`) followed by a colon and the content of the element `<reducedPara>` starting on a new line.

**Note**

The content given in the element `<title>` takes precedence over the interpretation of the value of the attribute `frontMatterInfoType`.

Each of the entries is presented left justified in 8/9 pt roman proceeded by a title in 8/9 pt bold.

**Note**

The title must be coded with value `"em01"` on the attribute `emphasisType`.

Security classification (mandatory). The security classification of the publication is presented in the header and footer.

**Note**

The security classification presented on the Title page must use the element `<security>` given in the element `<frontMatterTitlePage>`.

The title page can also include other classification information represented in the element `<derivativeClassification>`. For each derivative classification action, this information is identified by date of the action, source material used for the derivation, contact person, and the action type (eg, classified, declassified, downgraded, upgraded).

**Business rule decision point BRDP-S1-00527 - Elements and attributes to be presented on the Title page:**

- Decide which elements and attributes to be presented on the Title page.

**Note**

The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in [Chap 3.9.4](#) and [Chap 3.9.5.2.16](#).

**Business rule decision point BRDP-S1-00528 - Size of the product illustration on the Title page:**

- Decide on the height of the product illustration on the Title page, if used.

## 2.3 Table of contents

A Table of contents could be presented as a non-hierarchical (the content just listed in the order of appearance in the publication) or as a hierarchical (grouping the entries by adding titles).

### Business rule decision point BRDP-S1-00529 - Elements and attributes to be presented on the Table of contents page:

- Decide which elements and attributes to be presented on the Table of contents page.

#### Note

The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in [Chap 3.9.4](#) and [Chap 3.9.5.2.16](#).

### Business rule decision point BRDP-S1-00571 - Number of levels in Table of contents:

- Decide on the number of levels to be presented in Table of contents.

## 2.3.1 Introductory paragraph

The introductory paragraph for S1000D standard page-oriented presentation is:

"The listed documents are included in issue XXX, dated YYYY-MM-DD, of this publication."

The paragraph is derived from the element `<reducedPara>` in the element `<frontMatterTableOfContent>`.

#### Note

The issue number and the date are included in the reduced paragraph during the production of the Table of contents data module.

## 2.3.2 Table of contents list entries

### 2.3.2.1 Table of contents - non-hierarchical

The Table of contents list, containing all entries, follows after the introductory paragraph. Each entry in the table is derived from an element `<tocEntry>`. The details are given in [Table 3](#).

The project has to decide on the first and second column table header titles. For example:

- **Document title** can be used instead of **Title** in column 1
- **Document identifier** can be used for Column 2 (when the table also can include non-S1000D publications (`<externalPubRef>`))
- **Data module code or Publication module code** (when the table only includes data modules or publication modules)

Table 3 Table of contents entry details

#### Note

The TOC must not include the Title page, LOEDM, LOEP, Change Record (CR) or TOC itself.

An example of a non-hierarchical Table of contents page is presented in [Fig 3](#) which also includes the standard introductory and explanatory text paragraph.

#### Note

The issue information in this example is given by the issue date.

#### 2.3.2.2

##### Table of contents - hierarchical

The hierarchical Table of contents list contains, besides listing the entries as given in [Para 2.3.2.1](#), titles for one or more groups of entries. The titles are derived from the element <title> in the elements <tocList> and <tocEntry>.

Several hierarchical levels can be presented in bold, indented or not.

An example of a hierarchical Table of contents page is presented in [Fig 4](#) which also includes the standard introductory and explanatory text paragraph.

#### Note

The issue information in this example is given by the issue number. The last entry is a non-S1000D publication and only has the issue information in the form of a date, which then is presented.

## 2.4 List of effective pages

When a publication includes other S1000D publications and/or non-S1000D publications, these are listed in their entirety. Refer to [Table 4](#) for details.

### Business rule decision point BRDP-S1-00530 - Elements and attributes to be presented on the List of effective pages:

- Decide which elements and attributes to be presented on the List of effective pages.

#### Note

The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in [Chap 3.9.4](#) and [Chap 3.9.5.2.16](#).

### 2.4.1 Introductory paragraph

The introductory paragraph for S1000D standard page-oriented presentation is:

“This publication includes the following pages after insertion of issue XXX, dated YYYY-MM-DD.

C = Changed page

N = New page”

The content is derived from the element `<reducedPara>` in the element `<frontMatterList>`.

#### Note

The issue number and the date are included in the reduced paragraph during the production of the List of effective pages data module.

### 2.4.2 List of effective pages list entries

The List of effective page list, containing all entries, follows after the introductory paragraph. Each entry in the table, representing a page in a data module or an entire publication or non-S1000D publication, is derived from an element `<frontMatterSubList>`. The details are given in [Table 4](#).

#### Note

A title (element `<title>`) and informative text (element `<reducedPara>`) can be included in the table to group entries.

Table 4 List of effective pages entry details

Data module code	Page (O)	<sup>0</sup> (M)	Issue date Issue No. <sup>2</sup>	Applicable to
<code>&lt;frontMatterDmEntry&gt;/&lt;dmRef&gt;</code> :				
<code>&lt;dmCode&gt;</code> (M) (and <code>&lt;identExtension&gt;</code> (O) if extended data module code is used)	<sup>3</sup>	<sup>4</sup>	<code>&lt;issue Date&gt;</code> (and/or attribute issue Number)	attribute <code>applicRefId</code> (O) <sup>5</sup>
X4-A-00-00-00-00A-001A-A	1	C	2016-09-01	All

EFC-ZL123-ABC23-00	-		2011-04-21	
1 This column gives the interpretation of the value of the attribute <code>issueType</code> . Refer to <a href="#">Para 2.4.3</a> for the interpretation of the values. 2 <b>Issue date</b> and/or <b>Issue No.</b> 3 The page number derived from the element <numberOfPages>. 4 The presented issue type value is the same for all pages in a data module. 5 <b>Recommendation:</b> It is recommended to use/present the element <displayText> when the Table of contents data module is intended for page-oriented presentation. 6 As publicationns or non-S1000D publications are stored in their entirety as one entry in the LOEP, no individual pages will be presented. Use a hyphen [-] or the total number of pages if the project has decided to use the element <footnoteRemarks> to store the total number of pages. 7 The presented issue type value is the same as for the complete publication or non-S1000D publication.				

An example of a List of effective pages is presented in [Fig 5](#) which also includes the standard introductory and explanatory text paragraph.

#### Note

The issue information in this example is given by the issue date.

### 2.4.3 Presentation of attribute `issueType` values

The following values are presented:

N = New page/data module and C = Changed page/data module on LOEP and LOEDM.

R = Remove data module and I = Insert data module to be presented on a HIGH with updating instructions.

Table 5 Attribute *issueType* values vs presented values in HIGH and LOEP/LOEDM

## 2.5 List of effective data modules

**Business rule decision point BRDP-S1-00531 - Elements and attributes to be presented on the List of effective data modules:**

- Decide which elements and attributes to be presented on the List of effective data modules.

### Note

The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in [Chap 3.9.4](#) and [Chap 3.9.5.2.16](#).

### 2.5.1 Introductory paragraph

The introductory paragraph for S1000D standard page-oriented presentation is:

“The listed documents are included in issue XXX, dated YYYY-MM-DD, of this publication.

C = Changed data module

N = New data module”

The content is derived from the element `<reducedPara>` in the element `<frontMatterList>`.

### 2.5.2 List of effective data module list entries

The List of effective data module list, containing all entries, follows after the introductory paragraph. Each entry in the table is derived from an element `<frontMatterSubList>`. The details are given in [Table 6](#).

### Note

A title (element `<title>`) and informative text (element `<reducedPara>`) can be included in the table to group entries.

Table 6 List of effective data module entry details

Title	Data module code Publication module code	<sup>0</sup> Issue date (M) Issue No. <sup>2</sup>	No. of pages	Applicable to

Short introduction to the life of a steamroller nerd	ISBN 978-3-16-148410-0	Initial issue	218	

1 This column gives the interpretation of the value of the attribute `issueType`. Refer to [Para 2.4.3](#) for the interpretation of the values.

2 **Issue date** and/or **Issue No.**

3 The number of pages is derived from the element `<numberOfPages>`.

4 **Recommendation:** It is recommended to use/present the element `<displayText>` when the Table of contents data module is intended for page-oriented presentation. This simplifies the complexity of the functionality of the page-layout application.

5 The total number of pages if the project has decided to use the element `<footnoteRemarks>` to store the total number of pages.

Number of pages is only given when used for page-oriented distribution.

An example of a List of effective data modules is presented in [Fig 6](#) which also includes the standard introductory and explanatory text paragraph.

### Note

The issue information in this example is given by the issue date.

## 2.7 Highlights

The issue number of the publication is presented as a Centerhead No. 2. Refer to [Chap 6.2.2](#). The issue number (the elements `<issueInfo>`) is derived from the element `<frontMatterList>`.

There are two types of Highlights

- Highlights listing new or changed data modules with the reason for update.  
The attribute `frontMatterType` has the value "fm03".
- A variant of a highlight data module, "Highlights with updating instructions", for paper publications. This variant includes instructions for the updating of the publication in addition to the list of highlights. Refer to [Para 2.7.3](#).

The attribute `frontMatterType` has the value "fm04".

### Business rule decision point BRDP-S1-00532 - Elements and attributes to be presented on the Highlights data modules:

- Decide which elements and attributes to be presented on the Highlights data modules.

#### Note

The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in [Chap 3.9.4](#) and [Chap 3.9.5.2.16](#).

### 2.7.1 Introductory paragraph

The introductory paragraph for S1000D standard page-oriented presentation is:

"The listed changes are introduced in issue XXX, dated YYYY-MM-DD, of this publication."

The content is derived from the element `<reducedPara>` in the element `<frontMatterList>`.

### 2.7.2 Highlights list entries

The Highlights data module list, containing all entries, follows after the introductory paragraph. The table content is derived from the first appearance of the element `<frontMatterSubList>` in the data module. This element contains all the entries. The details are given in [Table 7](#).

Table 7 Highlights data module entry details

Data module	Reason for update
<code>&lt;frontMatterDmEntry&gt;</code> / <code>&lt;dmRef&gt;</code> :	
<code>&lt;dmCode&gt;</code> (M) (and <code>&lt;identExtension&gt;</code> (O) if extended data module code is used)	<code>&lt;simpleRefPara&gt;</code> or <code>&lt;simplePara&gt;</code> in <code>&lt;reasonForUpdate&gt;</code>
X4-A-00-00-01A-021A-A	Copyright and data restrictions introduced

### 2.7.3 Highlights with updating instructions

This variant of the Highlights data module have an additional Updating instruction following the Highlights list given in [Para 2.7.2](#).

The instruction consists of three parts:

- the title
- the updating instruction
- the listing of data modules to be removed and inserted

#### 2.7.3.1

The title

The updating instruction starts with the default heading "Updating instruction" presented as a Centerhead No. 1. Refer to [Chap 6.2.2](#).

The content is derived from the element `<title>` in the second appearance of the element `<frontMatterSubList>` in the data module.

#### 2.7.3.2

The updating instruction

The instruction itself is as follows:

"Remove or insert data modules as listed in [Table 1](#).

I = Insert data module

R = Remove data module"

The content is derived from the element `<reducedPara>` in the second appearance of the element `<frontMatterSubList>` in the data module.

#### 2.7.3.3

The listing of data modules to be removed and inserted

The table content is derived from the second appearance of the element

`<frontMatterSubList>` in the data module. This element contains all the entries. The details are given in [Table 8](#).

#### Note

The Highlights data module with updating instructions has been populated with data based on the following rules:

- All data modules having a value given for the attribute `issueType` must have an entry (`<frontMatterDmEntry>`).
- The order to follow structure of the publication (= TOC).
- All entries with attribute `issueType` = "[revised](#)"/"[changed](#)"/"[status](#)" (data modules to be inserted) must be preceded by an entry with attribute `issueType` = "[deleted](#)" of the revised/changed/status data module (data modules to be removed).
- The elements `<dmCode>`, `<dmTitle>` and `<numberOfPages>`, and depending on project decision, the element `<issueDate>` or the element `<issueInfo>` are populated. The attribute `applicRefId` is optional.

Refer to [Chap 3.9.5.2.16](#).

The remove-insert listing starts with the default table title line:

"*Table 1 Data modules to be removed or inserted*"

*Table 8 Remove insert list entry details*

Data module	Title	<sup>0</sup> (M)	Issue date Issue No. <sup>2</sup>	No. of pages <sup>3</sup>	Applicable to
<code>&lt;frontMatterDmEntry&gt;</code> <code>/&lt;dmRef&gt;</code> :					
<code>&lt;dmCode&gt;</code> (M) (and <code>&lt;identExtension&gt;</code> (O) if extended data module code is used)	<code>&lt;dmTitle&gt;</code> (M) <sup>4</sup>		<code>&lt;issue Date&gt;</code> (or attribute issueN umber )		attribute applic RefId (O) <sup>5</sup>
X4-A-00-00-00-00A-001A-A	Title page	R	2011-11-01	1	All
		I	2012-12-24	1	All
X4-A-00-00-00-01A-021A-A	Copyright	I	2012-12-24	1	All
X4-A-00-00-00-02A-040A-A	Steamroller - Description	R	2008-07-01	6	Mk2

1 This column gives the interpretation of the value of the attribute `issueType`. Refer to [Para 2.4.3](#) for the interpretation of the values.

2 **Issue date** or **Issue No.**

3 The number of pages is derived from the element `<numberOfPages>`.

4 The presented title is expected to be the title of the current (updated) data module when it is substituted.

5 **Recommendation:** It is recommended to use/present the element `<displayText>` when the Table of contents data module is intended for page-oriented presentation.

An example of a Highlight page is presented in [Fig 8](#).

A variant of a highlight data module is an "extended" highlight data module for paper publications which includes the procedure for updating of the publication. Refer to [Fig 9](#).

The examples include the standard introductory and explanatory text paragraphs.

## Note

The issue information in this example is given by the issue date.

#### 1 General

This chapter gives the rules for S1000D standard page-oriented presentation of descriptive data modules using the layout elements given in [Chap 6.2.2](#). If a traditional authoring environment is used, it can be used as the input for setting up the authoring application.

The following two data modules exemplify the S1000D standard presentation of descriptive data modules:

- Bicycle - Description of how it is made. S1000DBIKE-AAA-D00-00-00-0000-041A-A at issue 010. This data module belongs to the publication Description and operation with the publication module code S1000DBIKE-TPSMG-DO000-00.
- Bicycle - Description of function. S1000DBIKE-AAA-D00-00-00-0000-042A-A at issue 009. This data module belongs to the publication Description and operation with the publication module code S1000DBIKE-TPSMG-DO000-00.

## 2 Presentation

The descriptions use the tagging from the descriptive Schema.

The presentation of a description is built up of:

- 1 Data module title (M)
- 2 Table of contents (M), List of figures (O) and List of tables (O)
- 3 References (M)
- 4 Description (M)

The header and footer information follows the rules given in [Chap 6.2.1](#).

### 2.1 Title

The title of the description is derived from the element `<techname>` and the element `<infoname>` and is presented following the rules for centerheads as given in [Chap 6.2.2](#).

### 2.2 Table of contents, List of figures and List of tables

The introductory lists **Table of contents**, **List of figures** and **List of tables** are presented following the rules as given in [Chap 6.2.2](#).

### 2.3 References

The default heading **References** is presented as a centerhead following the last of the introductory tables.

The table presents the data module code, the publication module code, the technical publication reference or any other publication code together with the corresponding title, as given by the element `<refs>`, for all in the data module referenced publications and data modules. Publications not having a code are presented by the title only.

If there are no references, "None" is presented in the first column.

For details see [Chap 6.2.2](#).

This table has the title "Table 1 References".

### 2.4 Description

The default heading **Description** is presented as a centerhead following the table of references.

Hereafter follows the presentation of the content, of the descriptive data module.

### Description

#### 1 Physical description of a bicycle

A bicycle (refer to [Fig 1](#)) is a frame and a number of movable components with mechanical parts that are completely open. There are no covers or sheet metal panels that prevent access to the mechanical parts. Thus, you can disassemble the different components of a bicycle (refer to [Fig 1 \(0\)](#)) to do:

- an inspection
- a maintenance task
- a repair task

### Description

#### 1 Functional description of a bicycle

Below is a list of the different bicycle components and a functional description of them.

Frame	The frame is the skeleton of the bicycle. Refer to <a href="#">S1000DBIKE-AAA-DA3-00-00-00AA-041A-A</a> for a functional description of the frame system.
-------	---

Applicable to: Mountain bicycle  
and (Mountain storm Mk1 or

Fig 4 Descriptive data module IC 042 Page 1 - Layout example

UNCLASSIFIED

S1000DBIKE-TPSMGDO001-00

Wheel	The wheel is the point of contact between the bicycle and the road for the bicycle to have movement. Refer to <a href="#">S1000DBIKE-AAA-DA0-00-00AA-041A-A</a> for a functional description of the wheel.
Spokes	The spokes are thick wires with tension applied that connect the hub to the rim. You can adjust the tension with the nipple on the rim side.
Hub	The hub attaches to the center of the wheel where the axle and the bearings are.
Metal rim	The metal rim is a metal ring that has a U-shaped cross section to hold the spokes on the inner side and the tire on the outer side.
Seat	The seat, which is also known as the "saddle", is used as the support platform for the person to sit on the bicycle.
Seat post	The seat post is used as a support post for the seat and to change the height of the seat for the rider.
Handle bar	The handle bar is a horizontal bar with handles on each end. The handle bar is a steering mechanism that the rider uses to change the direction of the bicycle. The brake levers are also on the handle bar. Refer to <a href="#">S1000DBIKE-AAA-DA2-20-00-00AA-720A-A</a> for information on how to install the handle bar. Refer to <a href="#">S1000DBIKE-AAADA2-20-00-00AA-520A-A</a> for information on removing the handlebar.
Handle bar stem	The handle bar stem (the stem) attaches the handle bar to the steering tube. Refer to <a href="#">S1000DBIKE-AAA-DA2-10-00-00AA-720A-A</a> for information on how to install a stem. Refer to <a href="#">S1000DBIKE-AAA-DA2-10-00-00AA-520A-A</a> for information on how to remove the stem.
Brake levers	When you operate the brake lever, the brake pads move against the wheel to decrease the speed. The brake lever on the left side operates the front brake. The brake lever on the right side operates the rear brake.
Brakes	When you operate the brakes, the brake pad moves against the wheel to decrease the speed of the bicycle. Refer to <a href="#">S1000DBIKE-AAA-DA1-00-00-00AA-041A-A</a> for a description of the braking system.
Shifters	The shifters are the mechanisms that you use to change the gears on the bicycle. There are 7 different types of shifters that have been developed over the years, but they all have the same functionality. When you operate the shifters, they pull the control cable to move the derailleur towards a larger diameter chain ring. The shifters can also loosen the cable to let the derailleur move towards a smaller diameter chain ring. Refer to <a href="#">S1000DBIKE-AAA-DA5-30-00-00AA-041A-A</a> for a functional description of the shifters.
Crank	The crank moves the power to the chain rings when the pedals operate.

Applicable to: Mountain bicycle  
and (Mountain storm Mk1 or  
Brook trekker Mk9)

S1000DBIKE-AAA-D00-00-00-00AA-042A-A

UNCLASSIFIED

Chap 6.2.3.2

UNCLASSIFIED

S1000DBIKE-TPSMGDO001-00

Pedals	The pedals move the force of movement from the feet to the cranks.
Chain	The chain moves the power from the chain rings to the cogs on the freewheel. Refer to <a href="#">S1000DBIKE-AAA-DA4-10-00-00AA-251B-A</a> for the procedure on how to clean the chain.
Gears	<p>The gears have different mechanisms that function together to change the speed of the bicycle. These mechanisms include:</p> <ul style="list-style-type: none"> <li>– the sprockets</li> <li>– the chain</li> <li>– the derailleur</li> </ul> <p>Refer to <a href="#">S1000DBIKE-AAA-DA5-00-00-00AA-041A-A</a> for a functional description of the gear system.</p>
Chain rings	The chain rings (also known as the "chain wheel") pull on the chain when the cranks turn
Derailleur	<p>A derailleur moves the chain from one sprocket to another to change the gears. There are two different types of derailleur, the front and the rear. The highest ratio (highest gear) is when the chain is on the largest sprocket on the front and the smallest at the rear. To get the lowest gear, the smallest sprocket is at the front and the largest at the rear. Refer to <a href="#">S1000DBIKE-AAA-DA5-10-00-00AA-041A-A</a> for a functional description of the derailleur system.</p>

## 1 General

This chapter gives the rules for S1000D standard page-oriented presentation of procedural data modules using the layout elements given in [Chap 6.2.2](#). If a traditional authoring environment is used, it can be used as the input for setting up the authoring application.

The three data modules below exemplify the S1000D standard presentation of procedural data modules.

- Chain - Oil. S1000DBIKE-AAA-DA4-10-00-0000-241A-A at issue 009. This data module use titles for the steps and is presented without indented steps. Refer to [Para 3.1](#).

The data module is changed with reason for update:

- Main procedure restructured

- Bicycle - Other procedure to clean. The following data modules do not use titles for the steps and are presented with indented steps.

- S1000DBIKE-AAA-D00-00-00-00AA-258A-A at issue 009.
- S1000DBIKE-AAA-D00-00-00-00AA-258B-A at issue 002. This data module is technically the same as "-258A" but uses the alternates concept ([Chap 4.13.3](#)) for the step "Wash the bike".

The data module is changed with reason for update:

- Detergent B replaced by Detergent C

All data modules belong to the Bicycle Maintenance Publication (BMP) with the publication module code S1000DBIKE-TPSMG-BMP01-00.

### Note

The applicability is presented by using the content of the element `<displaytext>`.

### Business rule decision point BRDP-S1-00572 - Presentation of data module code extension in references and tables:

- Decide whether and when to present the DME in references and tables.

### Business rule decision point BRDP-S1-00573 - Presentation of issue number of the data module or the technical publication in references and tables:

- Decide whether and when to present the issue number of the data module or the technical publication in references and tables.

## 2 Presentation

The procedures use the tagging from the procedural Schema.

The presentation of a procedural data module is built up of:

- 1 Data module title (M)
- 2 Table of contents (M), List of figures (O) and List of tables (O)
- 3 References (M)
- 4 Common information (O)
- 5 Preliminary requirements (M) including safety conditions
- 6 Procedure (M)

## 7 Requirements after job completion (M)

For Component maintenance publications special rules apply. Refer to [Chap 6.2.3.6](#).

For Service bulletin special rules apply. Refer to [Chap 6.2.3.7](#).

The header and footer information must follow the rules given in [Chap 6.2.1](#).

## 2.1 Data module title

The title of the procedure is derived from the element <techname> and the element <infoname> is presented following the rules for centerheads as given in [Chap 6.2.2](#).

## 2.2 Table of contents, List of figures and List of tables

The introductory lists **Table of contents**, **List of figures** and **List of tables** are presented following the rules as given in [Chap 6.2.2](#).

### Note

List of figures and List of tables are presented depending on the business rules decisions.

## 2.3 References

The default heading **References** is presented as a Centerhead following the last of the introductory tables.

The table presents the data module code, the publication module code, the technical publication reference or any other publication code together with the corresponding title, as given by the element <refs>, for all in the data module referenced publications and data modules. Publications not having a code are presented by the title only.

If there are no references, "None" is presented in the first column.

For details, refer to [Chap 6.2.2](#).

This table has the title "Table 1 References".

## 2.4 Common information

The default heading **Common information** is presented as a Centerhead following the table of references. The common information, derived from element <commonInfo>, is presented following the layout rules given in [Chap 6.2.2](#).

## 2.5 Preliminary requirements

The default heading **Preliminary requirements** is presented as a Centerhead following the optional Common information or the table of References. For detailed explanation of Preliminary requirements and Requirements after job completion, refer to [Chap 3.9.5.2.1.9](#).

The preliminary requirements consist of:

- 1 Production management data (O). Refer to [Para 2.5.1](#).
- 2 Required conditions (M) including circuit breakers (O). Refer to [Para 2.5.2](#).
- 3 Required persons (O). Refer to [Para 2.5.3](#).
- 4 Required technical information (O). Refer to [Para 2.5.4](#).
- 5 Support equipment (M). Refer to [Para 2.5.5](#).
- 6 Consumables, materials and expendables (M). Refer to [Para 2.5.6](#).
- 7 Spares (M). Refer to [Para 2.5.7](#).

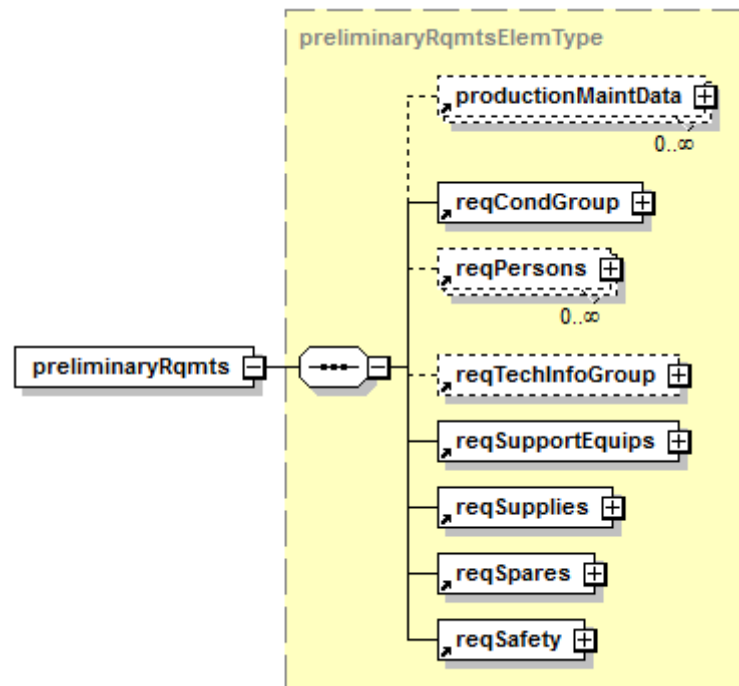

8 Safety conditions (M). Refer to [Para 2.5.9](#).

Item 1 above is presented only when the element `<productionMaintData>` is used and its presentation is decided by the project.

Item 2 - 7 above are standardized full width tables. They are, when used, presented in the order given above numbered starting from 2 (*Table 2 Required conditions*) and they are always presented including their default heading (Sidehead 0) and table title.

Immediately after these tables follows the general safety condition valid for the data module listed under the default heading **Safety conditions**, presented as a Sidehead 0.

ICN-S3627-S1000D0701-001-01

Fig 1 Element `<preliminaryRqmts>`

## 2.5.1 Production management data

The production management data, derived from element `<productionMaintData>`, can be presented in a standardized tabular form (informal table). Refer to [Fig 2](#). The default heading **Production management data**, presented as a Sidehead 0, precedes the informal table, divided into three parts:

- Threshold interval
- Work area location
- Maintenance task duration

**Business rule decision point BRDP-S1-00574 - Presentation of Production management data:**

- Decide whether to present Production management data.

### 2.5.1.1 Threshold interval - Element `<thresholdInterval>`

The threshold or threshold interval values followed by a space and the interpretation of the value of the attribute `thresholdUnitOfMeasure` are presented in the informal table.

The threshold intervals are preceded by the default heading **Threshold interval**, which is only presented in the left column on the first row. Refer to [Fig 2](#) for presentation.

#### 2.5.1.2 Work area location - Element <[workAreaLocationGroup](#)>

The work area locations are presented divided in three parts:

- Zone
- Access point
- Work location

When there is no zone, access point or work location given, no default heading Zone, Access point or Work location is presented. Refer to [Fig 3](#) for presentation.

### Production management data

Threshold interval 55 to 60 days

#### Work area location

Zone	120	The completely dark cell The Cell MIKE-A-00-00-0000-00A-055A-A
------	-----	--

Access points	824 825 515CLF	Door Door Panel
---------------	----------------------	-----------------------

Work location	80VU	Electrical panel
---------------	------	------------------

#### Maintenance task duration

Preliminary requirements	0,5 h
Procedure	3,0 h
Requirements after job completion	1,5 h

ICN-S3627-S1000D0702-001-01

*Fig 2 Presentation of Production maintenance data*

#### 2.5.1.2.1 Element <[zoneRef](#)>

Each zone is presented in one row. The zone number given by the attribute `zonenumber` is presented followed by any name, short name or reference to a data module or technical publication. The zones are preceded by the default heading **Zone**, which is only presented in the left column on the first row.

#### 2.5.1.2.2 Element <[accessPointRef](#)>

Each access point is presented in one row. The access point given by attribute `accessPointNumber` followed by the interpretation of the value of the attribute `accessPointTypeValue` is presented. The access points are preceded by the default heading **Access points**, which is only presented in the left column on the first row.

#### 2.5.1.2.3 Element <[workLocation](#)>

Each work location is presented in one row. The information presented depends on which of the five elements (branches) is used. Refer to [Fig 3](#). The work locations are preceded by the default heading **Work location**, which is only presented in the left column on the first row.

### Work area location

<b>Zone</b>	<u>zoneNumber</u>	<u>&lt;Name&gt;</u> <u>&lt;shortName&gt;</u> <u>&lt;refs&gt;</u>

Fig 3 Work area location - Entry details

#### 2.5.1.2.4 Examples of Work area location

##### Example 1 - Work on a panel

- Zone is 120 named "The completely dark cell" or shorter "The cell". A location diagram can be found in the data module MIKE-A-00-00-0000-00A-055A-A.
- Access points are Door 824, Door 825 and Panel 515CLF
- Work location is Electrical panel 80VU on which the work has to be done

Applicable to: All

<workLocation>
<functionalItemRef functionalItemNumber="10VT"/>
</workLocation>
```

```
</workAreaLocationGroup>
</productionMaintData>
```

Presentation Example 2:

#### Work area location

<b>Zone</b>	120	
<b>Access points</b>	824	Door
	80VU	Electrical panel
<b>Work location</b>	10VT	Functional item number

#### Example 3 - Zone, access and precise location

From a Service bulletin modifying an ACARS System (Functional Item Number 1RB and 2RB) as given in [dmStatus](#).

- Zone is 120
- Access points are Avionics door 825, and Partition panels 131CW and 131DW
- Work location is Electrical panel 80VU (an access panel on which the work has to be done to change the 1RB functional item)

Markup Example 3:

```
<productionMaintData>
<workAreaLocationGroup>
<zoneRef zoneNumber="210"/>
<accessPointRef accessPointNumber="815"
accessPointTypeValue="accpn101"/>
<accessPointRef accessPointNumber="131CW"
accessPointTypeValue="accpn102"/>
<accessPointRef accessPointNumber="131DW"
accessPointTypeValue="accpn102"/>
<workLocation>
<accessPointRef accessPointNumber="80VU"
accessPointTypeValue="accpn103"/>
</workLocation>
</workAreaLocationGroup>
</productionMaintData>
```

Presentation Example 3:

#### Work area location

<b>Zone</b>	210	
<b>Access points</b>	815	Door
	131CW	Panel
	131DW	Panel
<b>Work location</b>	80VU	Electrical panel

#### Example 4 - Several work locations (several elements [workAreaLoactionGroup](#))

Removal of parts in 3 different zones with 3 different work areas

First zone

- Zone is 210

- Access point is Door 831
- Work location is Station (199 cm), Waterline (170 cm), Buttock line (57 cm)

#### Second zone

- Zone are Zone 250 and Zone 260
- Work location is From Frame 62 to Frame 63

#### Third zone

- Zone is 210
- Work location is Pilot seat

#### Markup Example 4:

```
<productionMaintData>
<workAreaLocationGroup>
<zoneRef zoneNumber="210"/>
<accessPointRef accessPointNumber="831"
accessPointTypeValue="accpnl01"/>
<workLocation>
<installationLocation installationLocationType="instloctyp03"
unitOfMeasure="cm">199</installationLocation>
<installationLocation installationLocationType="instloctyp04"
unitOfMeasure="cm">170</installationLocation>
<installationLocation installationLocationType="instloctyp05"
unitOfMeasure="cm">57</installationLocation>
</workLocation>
</workAreaLocationGroup>
<workAreaLocationGroup>
<zoneRef zoneNumber="250"/><zoneRef zoneNumber="260"/>

<workArea>Pilot seat</workArea>
</workLocation>
</workAreaLocationGroup>
</productionMaintData>
```

#### Presentation Example 4:

##### Work area location 1

<b>Zone</b>	210	
<b>Access points</b>	831	Door
<b>Work location</b>	Station = 199 cm Water line = 170 cm Buttock line = 57 cm	

### Work area location 2

**Zone** 250  
260

**Work location** From Frame 62 to Frame 63

### Work area location 3

**Zone** 210

**Work location** Pilot seat

#### 2.5.1.3 Maintenance task duration - Element <taskDuration>

The maintenance task duration, derived from element <taskDuration>, is presented in the informal table. The three entries, Preliminary requirements, Procedure and Requirements after job completion are preceded by the default heading **Maintenance task duration**.

The value of the attributes is presented followed by a space and the value of the attribute `unitOfMeasure` (h = hour or d = day).

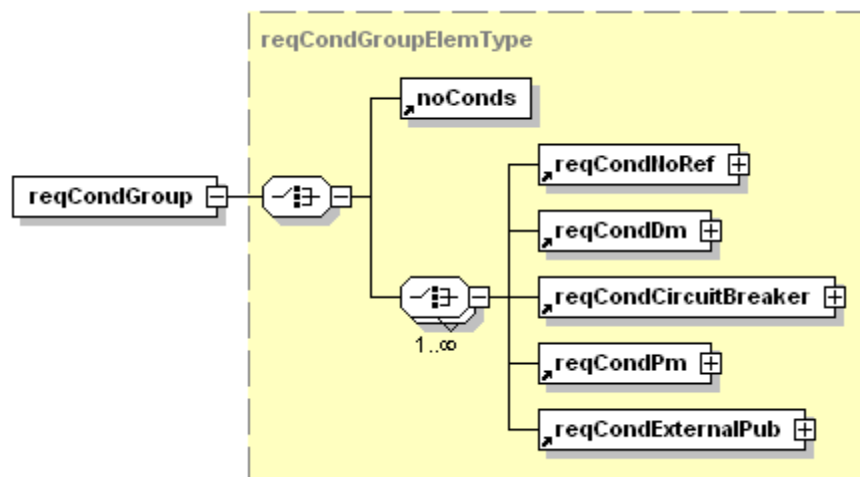

Refer to [Fig 2](#) for presentation.

#### 2.5.2 Required conditions

The required conditions, derived from element <reqCondGroup>, are presented in a standardized table. Refer to [Fig 7](#). The default heading **Required conditions** presented as a Sidehead 0 precedes the table.

##### Note

The corresponding markup is given in [Chap 3.9.5.2.1.9](#).

ICN-S3627-S1000D0444-001-01

Fig 4 Element <reqCondGroup>

#### 2.5.2.1 No conditions - Element <noConds>

If the element <noConds> is used, "None" is presented in the column Action/Condition. Refer to [Fig 5](#).

#### 2.5.2.2 Conditions without references - Element <reqCondNoRef>

When the required condition does not reference a data module or technical publication, the textual content, the action or the condition, from the element <reqCond> is presented in the

column Action/Condition. The column Data module/Technical publication is left empty. Refer to Fig 5.

## Required conditions

Fig 5 Required conditions - Entry details, element `<reqCondCircuitBreaker>` not populated

- 2.5.2.3 Required data modules - Element `<reqCondDm>`  
The textual content from the element `<reqCond>` is presented in the column Action/Condition.
- The data module code or extended data module code from element `<dmRef>` is presented in the column Data module/Technical publication followed by any issue number, title or issue date. Refer to [Fig 5](#).
- 2.5.2.4 Circuit breaker conditions - Element `<reqCondCircuitBreaker>`  
The textual content from the element `<reqCond>` is presented in the column Actions/Conditions. The following rows within the same instance of element `<reqCondCircuitBreaker>` are split into five columns with the first column indented. Each row presents the content of an element `<circuitBreakerDescr>`:
- **Access point** gives the interpreted value of the attribute `accessPointTypeValue` followed by the value of the attribute `accessPointNumber` from element `<accessPointRef>`
  - **CB Name** gives the element `<name>` from the element `<circuitBreakerDescr>` or the element `<shortName>` from the element `<circuitBreakerRef>`
  - **CB** gives the value of the attribute `circuitBreakerNumber` from element `<circuitBreakerRef>`
  - **Location** gives the textual content from the element `<circuitBreakerLocation>`
  - **Remark** gives the textual content from the element `<simplePara>` in the element `<footnoteRemark>` or the footnote marker in the element `<footnoteRef>` (normally a number, refer to [Chap 3.9.5.2.1.10](#)). The footnote itself at the bottom of the table gives the content from the element `<para>` from the element `<footnote>`. For details, refer to [Para 2.5.5.6](#).
- For details on presentation of footnotes, refer to [Chap 6.2.3](#).
- Note**  
The second table title row (Access point, CB Name, etc) is only presented if there are one or more element `<reqCondCircuitBreaker>` instances.
- In the case of having the attribute `circuitBreakerAction` value set to "open"/"open-order" or "close"/"close-order", "- Open" and "- Close", respectively is presented left justified in the corresponding row.
- Refer to [Fig 6](#) for content details.
- Note**  
It is assumed that the circuit breaker conditions are marked up in the order of presentation (order to be performed).
- Each group or groups of circuit breaker actions/conditions is enclosed by horizontal lines at top and bottom. Refer to [Fig 7](#).
- 2.5.2.5 Required publications - Element `<reqCondPm>`  
The textual content from the element `<reqCond>` is presented in the column Action/Condition.
- The publication module code or extended publication module code from the element `<pmRef>` is presented in the column Data module/Technical publication followed by any issue number, title, short title or issue date. Refer to [Fig 5](#).

2.5.2.6 Required non-S1000D publications and documents - Element `<reqCondExternalPub>`  
The textual content from the element `<reqCond>` is presented in the column Action/Condition.

The external publication code and or title from the element `<externalPubRef>` is presented in the column Data module/Technical publication followed by any issue number, short title or issue date. Refer to [Fig 5](#).

## Required conditions

1 The location of the circuit breaker depends on the aircraft configuration

2 If the circuit breaker is modified by SB-A350-A-25-10-0001-00A-930A-C

- A circuitBreakerAction not used or given the attribute value "verif-open" in the element <circuitBreakerDescrGroup> or <circuitBreakerDescrSubGroup>
- B circuitBreakerAction not used or given the attribute value "verif-close" in the element <circuitBreakerDescrGroup> or <circuitBreakerDescrSubGroup>
- C circuitBreakerAction given the attribute value "open" in the element <circuitBreakerDescrGroup> or <circuitBreakerDescrSubGroup>
- D circuitBreakerAction given the attribute value "close" in the element <circuitBreakerDescrGroup> or <circuitBreakerDescrSubGroup>
- E circuitBreakerAction given the attribute value "open-order" in the element <circuitBreakerDescrGroup> or <circuitBreakerDescrSubGroup>
- F circuitBreakerAction given the attribute value "close-order" in the element <circuitBreakerDescrGroup> or <circuitBreakerDescrSubGroup>

ICN-S3627-S1000D0706-001-01

Fig 7 Presentation of the standard table "Required conditions" - Example

Applicable to: All

S1000D-A-06-02-0303-00A-040A-A

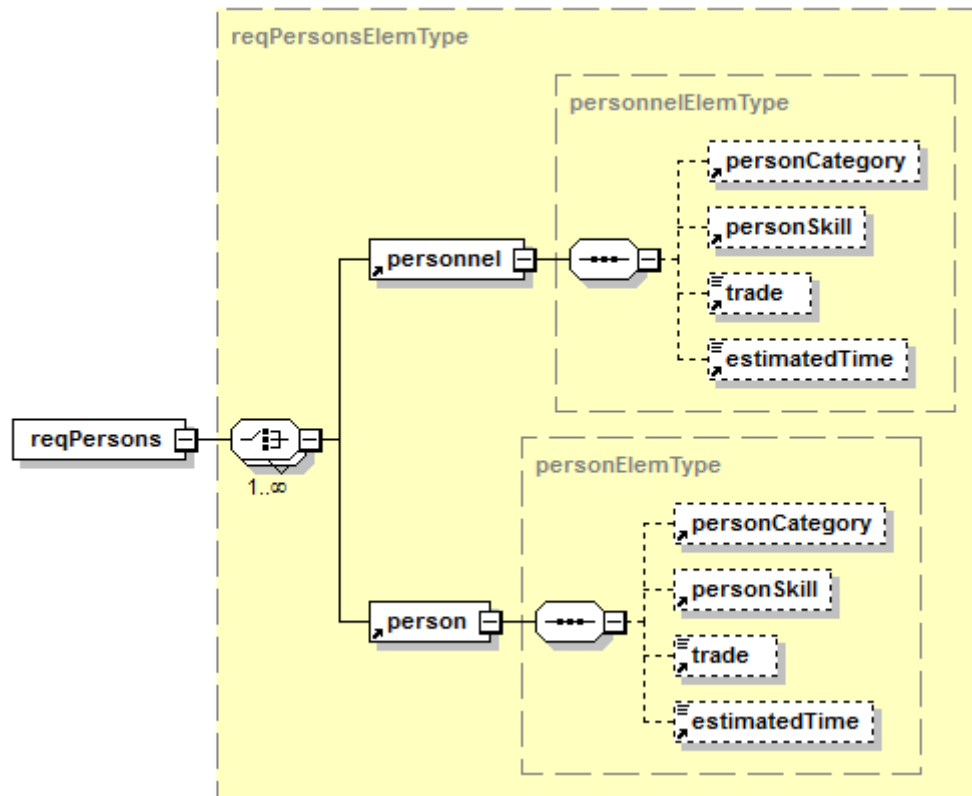

Chap 6.2.3.3

### 2.5.3 Required persons

The required persons, derived from element `<reqPersons>`, are presented in a standardized table. Refer to [Fig 9](#).

The default heading **Required persons** is presented as a Sidehead 0 precedes the table.

Each `<reqPerson>` gives a new table (header and rows but no extra table title line). Refer to [Para 2.5.3.7](#).

ICN-S3627-S1000D0707-001-01

Fig 8 Element `<reqPersons>`

#### 2.5.3.1 Personnel by category - Element `<personnel>`

The value of the attribute `numRequired` in the element `<personnel>` is presented in the column Person. If the number of personnel (attribute `numRequired`) of a specific category, skill level or trade is not defined, or the value is set to "0" in the element `<personnel>`, the absence of a specified quantity generates at presentation the words "As required" in the column Person. If the attribute `numRequired` is used, then the number required will be presented.

#### 2.5.3.2 Personnel by individual - Element `<person>`

The value of the attribute `man` in the element `<person>` is presented in the column Person preceded by "Man" and a space.

#### 2.5.3.3 Category - Element `<personCategory>`

The value of the attribute `personCategoryCode` in the element `<personCategory>` is presented in the column Category.

- 2.5.3.4 Skill level - Element `<personSkill>`  
The value of the attribute `skillLevelCode` in the element `<personSkill>` is presented in the column Skill level.
- 2.5.3.5 Trade/Trade code - Element `<trade>`  
The textual content in the element `<trade>` is presented in the column Trade/Trade code.
- 2.5.3.6 Estimated time - Element `<estimatedTime>`  
The textual content in the element `<estimatedTime>` is presented in the column Estimated time preceded by a space and the value of the attribute `unitOfMeasure`.
- 2.5.3.7 Required persons - Applicability  
When applicability is used (attribute `applicRefid` in the element `<reqPersons>`) a new subtable is created preceded by its applicability statement. Refer to [Fig 25](#).

#### Note

The sidehead Required persons and the table title line is only presented once.

### Required persons

Table 3 Required persons

Person	Category	Skill level	Trade/Trade code	Estimated time
Man + blank + value of man <sup>1/</sup>	Value of personCategoryCode	The interpretation of the value of skillLevelCode	<code>&lt;trade&gt;</code>	<code>&lt;estimatedTime&gt;</code> + space + value of unitOfMeasure
Value of numRequired <sup>2</sup>	-"	-"	-"	-"
1 From branch <code>&lt;person&gt;</code>				
2 From branch <code>&lt;personnel&gt;</code>				

Example: The presentation of the markup example given in Chap 3.9.5.2.1.9.

### Required persons

Table 3 Required persons

Person	Category	Skill level	Trade/Trade code	Estimated time
Man <sup>1</sup> A	Electrician	Basic	AF901	1,5 h
Man B	PE	Intermediate	AF903	2,5 h
As required <sup>2</sup>	Mechanic	Basic	AF999	1 h
1 <sup>3</sup>	SPRVR	Advanced	AF092	
1 The use of element <code>&lt;person&gt;</code> generates at presentation the word "Man" before the value of attribute man.				
2 If the number of personnel of a specific category, skill level or trade is not defined or the value is set to "0" in the element <code>&lt;personnel&gt;</code> , the absence of a specified quantity generates at presentation the words "As required".				
3 If the attribute numRequired is used, then the number required will be presented.				

ICN-S3627-S1000D0708-001-01

Fig 9 Entry details and presentation of the standard table "Required persons"

## 2.5.4 Required technical information

The list of required technical information, derived from element `<reqTechInfoGroup>`, is presented in a standardized table.

[Fig 10](#) shows which elements and attributes to be presented and how to present them.

The default heading **Required technical information** presented as a Sidehead 0 precedes the table.

### 2.5.4.1 Required technical information - Applicability

When applicability is used (attribute `applicRefid` in the element `<dmRef>`, `<pmRef>`, `<externalPubRef>`) each entry is preceded by its applicability statement. Refer to [Fig 10](#).

## Required technical information

Table 4 Required technical information

Document No.	Title	Category
<code>&lt;dmCode&gt;</code> or <code>&lt;dmCode&gt;</code> + space + "Issno" + space + value of <code>issueNumber</code>	<code>&lt;dmTitle&gt;</code>	The interpretation of the value of attribute <code>reqTech Info Category</code>
<code>&lt;pmCode&gt;</code> or <code>&lt;pmCode&gt;</code> + space + "Issno" + space + value of <code>issueDate</code>	<code>&lt;pmTitle&gt;</code>	..
<code>&lt;externalPubCode&gt;</code> or <code>&lt;externalPubCode&gt;</code> + space + "Issno" + space + value of <code>externalPubIssue</code>	<code>&lt;externalPubTitle&gt;</code>	..

ICN-S3627-S1000D0709-001-01

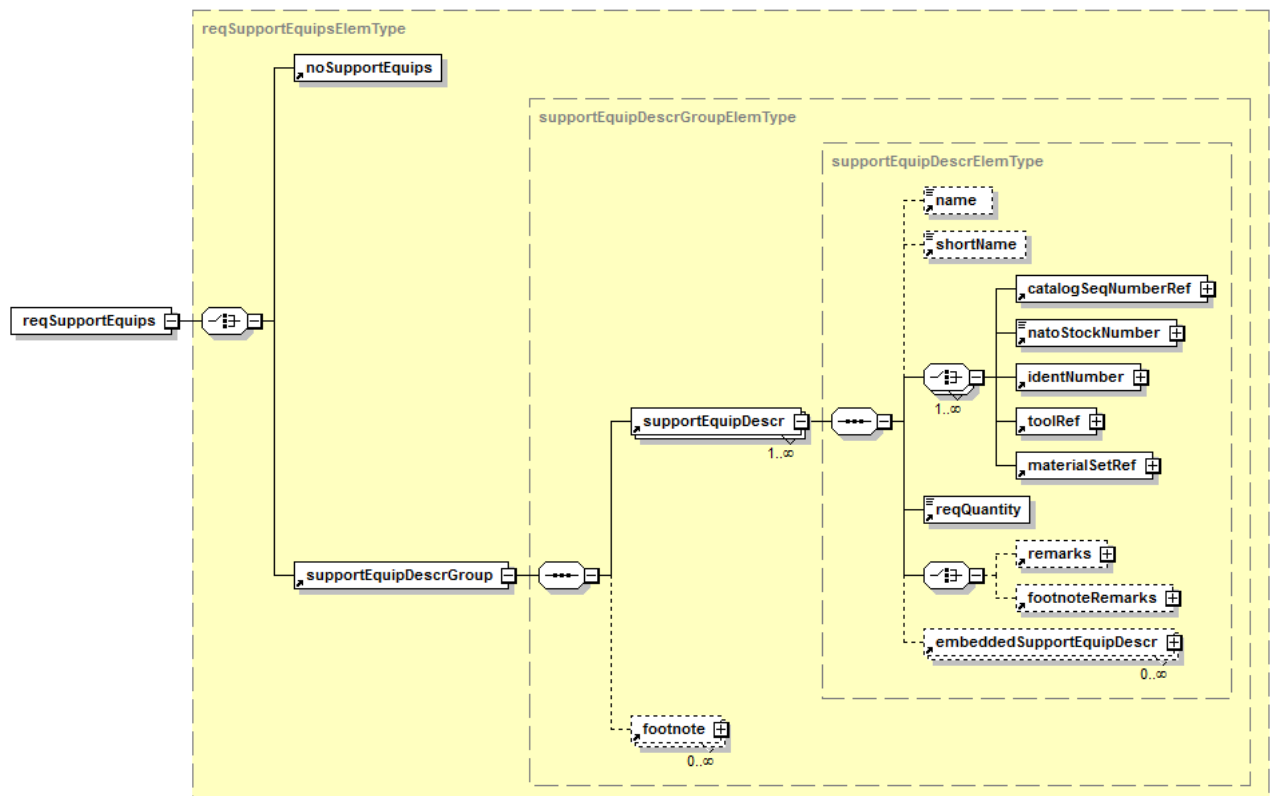

Fig 10 Entry details and presentation of the standard table "Required technical information"

### 2.5.5 Required support equipment

The list of support equipment, derived from element `<reqSupportEquips>`, is presented in a standardized table. Refer to [Fig 13](#), which shows the markup examples given in [Chap 3.9.5.2.1.9](#).

[Fig 12](#) and [Fig 12](#) shows which elements and attributes to be presented and how to present them.

The default heading **Support equipment** presented as a Sidehead 0 precedes the table.

ICN-S3627-S1000D0710-001-01

Fig 11 Element `<reqSupportEquips>`

#### 2.5.5.1 Element `<noSupportEquips>`

If the element `<noSupportEquips>` is used, "None" is presented in the column Name.

#### 2.5.5.2 Name/Alternate name

Element `<name>` and element `<shortName>`. The textual content in the elements `<name>` (Name) and `<shortName>` (Alternate name) are presented in the column Name/Alternate name.

#### Business rule decision point BRDP-S1-00575 - Presentation of Name and Alternate name:

- Decide whether to present only Name or both Name and Alternate name in the list of support equipment.

When an Alternate name is used, this is the name that is presented in the data module when referred to by its attribute `internalRefId`.

Alternate name is presented in

- black and underlined in the list
- blue and underlined in the narrative text of the data module (as it is a link to the entry in the list)

Examples are given in [Fig 13](#) and [Fig 15](#).

### 2.5.5.3 Identification/Reference

The identification of the support equipment is derived from one or more of the following elements:

- Catalog Sequence Number - CSN. Refer to [Para 2.5.5.3.1](#).
- NATO Stock Number - NSN. Refer to [Para 2.5.5.3.2](#).
- Identification number. Refer to [Para 0](#).
- Tool reference. Refer to [Para 2.5.5.3.4](#).
- Material set reference. Refer to [Para 2.5.5.3.5](#).

#### 2.5.5.3.1 *Catalog Sequence Number - CSN*

Element `<catalogSeqNumberRef>`. The value of the attributes, preceded by "CSN" and a space are presented. For details about CSN, refer to [Chap 3.9.5.2.7](#).

The CSN reference must be presented as follows:

- the abbreviation "CSN"
- `systemCode`
- `subSystemCode` and `subSubSystemCode`
- `assyCode`

with the attributes separated by hyphens [-] followed by

- `figureNumber` and `figureNumberVariant` preceded by "Fig "
- `itemVariant` preceded by "Item "

Examples of CSN presentation:

- CSN 12-34-56 Fig 08A Item 023A
- CSN 12-34-56 Fig 78 Item 123A (there is no value for attribute `figureNumberVariant`)
- CSN 12-34-56 Fig 78A Item 123 (there is no value for attribute `itemVariant`)

#### 2.5.5.3.2 *NATO Stock Number - NSN*

Element `<natoStockNumber>`. The content of the values of the attributes `natoSupplyClass`, `natoCodificationBureau`, and `natoIdentificationNumberCore`, separated by hyphens or the content of the element `<fullNatoStockNumber>` is presented. In either case preceded by "NSN" and a space. For details about NSN, refer to [Chap 3.9.5.2.7](#).

The NSN reference is presented in four groups all separated with hyphens [-]:

- the abbreviation "NSN"
- 1234-12-123-4567 where
  - the first group is equivalent to attribute `natoSupplyClass`
  - the second group equivalent to attribute `natoCodificationBureau`

- and the third and fourth groups are derived from attribute `natoIdentificationNumberCore` wherein a hyphen is inserted between the third and fourth number

or

- the abbreviation "NSN"
- the content of the element `<fullNatoStockNumber>`

Example of NSN presentation

- NSN 4920-99-123-4567

#### 2.5.5.3.3 Identification number

Element `<identNumber>`. The content of the elements `<manufacturerCode>` and `<partNumber>` are presented separated by slashes [/]. The expression is preceded by "Part No." and a space.

The element `<serialNumberValue>`, if any, is presented on a new line in the Remarks column, preceded by "Serial No." and a space.

#### 2.5.5.3.4 Tool reference

Element `<toolRef>`. The Name and the Alternate name derived from either the elements `<name>`/`<shortName>` in the element `<supportEquipDescr>` as given in [Para 2.5.5.2](#) or from the elements `<descrForPart>`/`<shortName>` in the element `<toolRepository>` in the Tools CIR are presented.

The content of the element `<limitedPartNumber>` is presented preceded by "Part No." and a space. Alternatively, the NATO stock number (refer to [Para 2.5.5.3.2](#) for the three alternatives) is presented preceded by "NSN" and a space. Both element contents are derived from the element `<toolRepository>` in the Tools CIR.

#### 2.5.5.3.5 Material set reference

Element `<materialSetRef>`. The values of the attribute `materialSetIdent` and `materialSetIssue` are presented separated with a hyphen [-].

#### Note

If any introductory text, like "Set", is needed to name the material set identifier this must be entered as text in the attribute `materialSetIdent`.

Any accompanied reference to a service bulletin data module is derived from the element `<dmRef>` and presented as the first information in the Remark column.

Any support equipment included in the material set given in the element `<embeddedSupportEquipDescr>` is presented on a table row of its own, following the rules for presentation of the elements `<catalogSeqNumberRef>`, `<natoStockNumber>`, `<identNumber>` and `<toolRef>`. Each entry (row) starts with a hyphen [-] and a blank before the name of the support equipment.

#### 2.5.5.3.6 References to data modules, publications and non-S1000D publications or documents

Element `<refs>`. Any reference to a data module, publication and non-S1000D publication or document is presented in the Remarks column following the rules given in [Fig 5](#).

#### 2.5.5.4 Quantity

Element `<reqQuantity>`. The textual content in the element `<reqQuantity>` followed by space and the value of the attribute `unitOfMeasure`, is presented in the column Quantity.

- 2.5.5.5 Remark  
Element `<remarks>`. The textual content of `<simplePara>` in the element `<remarks>` is presented in the column Remark.
- 2.5.5.6 Footnote  
Element `<footnoteRemarks>`. Content from the element `<simplePara>` is presented in the Remarks column on a new line.
- Each element `<footnoteRef>` creates a table footnote marker as a superscripted number starting from 1 in each table. The marker is presented in the column Remarks. When several elements `<footnoteRef>` are given, the markers are presented on the same line separated by a comma and a space. The table footnote content derived from the element `<footnote>` in the element `<supportEquipDescrGroup>` is presented at the bottom of the complete table, following the rules given in [Chap 6.2.2](#).
- 2.5.5.7 Required support equipment - Applicability  
When applicability is used (attribute `applicRefId` in the element `<supportEquipmentDescr>`) each entry is preceded by its applicability statement. Refer to [Fig 10](#) (Required technical information) and [Fig 26](#) (Support equipment).

Table 5 Support equipment

Name/Alternate name	Identification/Reference	Quantity	Remark
<sup>1</sup> None			
<sup>2</sup> <name> or <name> <shortName> <sup>4</sup>	"CSN" + space + the CSN reference <sup>3</sup>	<req Quant ity> + space + the interpret ation of the value of attribute unit OfMea sure	<simplePara> from <remarks> or <simplePara> from <footnote Remarks> and/or the footnote marker generated from footnoteMark in <footnote>. <sup>5</sup> and/or <refs> <sup>6</sup>

#### 2.5.6 Required supplies - Consumables, materials and expendables

The list of consumables, materials and expendables, derived from element `<reqSupplies>`, is presented in a standardized table. Refer to [Fig 14](#).

The default heading **Consumables, materials and expendables** presented as a Sidehead 0 precedes the table.

The same rules as for support equipment are valid to derive and present the table. Refer to [Para 2.5.4](#).

Example: The presentation of the markup examples given in [Chap 3.9.5.2.1.9](#). Refer to [Fig 14](#).

## Consumables, materials and expendables

## Safety conditions

### WARNING

Do not get [Detergent agent](#) into your eyes. If it gets into your eyes, wash them immediately in clean warm water.

### **Procedure**

- 1 Remove the grease from the [Freewheel assembly](#) with the [Degreasing agent](#) as shown in [Fig 2](#). Use a brush to remove the grease from these parts:

...

ICN-S3627-S1000D0716-001-01

Fig 15 Use of the element <[shortName](#)> - Example

### 2.5.7 Required spares

The list of spares, derived from the element `<reqSpares>`, is presented in a standardized table. Refer to [Fig 16](#).

The default heading **Spares** presented as a Sidehead 0 precedes the table.

The same rules as for support equipment are valid to derive and present the table. Refer to [Para 2.5.4](#).

Example: The presentation of the markup examples given in [Chap 3.9.5.2.1.9](#). Refer to [Fig 16](#).

Two spares:

#### Spares

Fig 16 Content of the standard table "Spares" - Example

### 2.5.8 Presentation of values of the attribute `materialUsage`

Example of use and presentation of the attribute `materialUsage` (Discarded, Retained, Modified from, Referenced, Material set and Modified to).

#### Note

The color codes match the example of the standard table "Spares" given in [Fig 17](#).

- **"mu01" Discarded:** Gives, for spares, "Discarded" in the Remarks column. Only used in the context of Service bulletins.

Applicable to: All

S1000D-A-06-02-0303-00A-040A-A

Chap 6.2.3.3

- **"mu02" Retained**: Gives "Retained" in the Remarks column for spares and supplies. Only used in the context of Service bulletins
- **"mu03" - Modified from**: Gives, for spares, "Modified from" + blank + identifier (<catalogSeqNumberRef>, <natoStockNumber>, <identNumber> or or <partRef>) following the rules given in [Chap 3.9.5.2.1.9](#). A reference to Service bulletin or Service bulletin material information data module can be presented in the Remarks column after the identifier.
- **"mu04" - Referenced**. Used for indicating a referenced spare. Does not affect the presentation.

#### Note

The element <reqQuantity> is populated with a hyphen [-] which is presented in the Quantity column.

- **"mu05" - Material set**: Used for indicating support equipment, supplies or spares being part of a material set (kit). Does not affect the presentation.

#### Note

The element <embeddedSupportEquipDescr> is the trigger for the presentation as given in [Para 2.5.5.3.5](#) and [Fig 12](#).

- **"mu06" - Modified to**: Gives, for spares, "Modified from" + blank + identifier (<catalogSeqNumberRef>, <natoStockNumber>, <identNumber> or <partRef>) following the rules given in [Chap 3.9.5.2.1.9](#). A reference to Service bulletin or Service bulletin material information data module can be presented in the Remarks column after the identifier.

An example of a Spares table is given in [Fig 17](#).

- Material set 1234 consisting of two spares
- Part A is an "ordinary" part needed from store.
- Part B: A part needed from store (1 EA) which will be modified to a Part B.
- Part B1: Part B after modification.
- Part C: A part already on the Product marked with "-" in the Quantity column.
- Part C1: Part C after modification.
- Part D: The part is discarded (leftovers) when the procedure is fulfilled.
- Part F: A removed part (on the Product when work started) but is retained for future use.

## Spares

Table 7 Spares

ICN- S3627-S1000D0717-001-01

Fig 17 Content of a standard table "Spares" when the attribute *materialUsage* is used - Example

### 2.5.9 Safety conditions

The information is derived from the element `<safetyRqmts>` in the element `<reqSafety>`. The presentation of the warnings, cautions and notes follows the rules given in [Chap 6.2.2](#).

The default heading **Safety conditions** is presented as a Sidehead 0 following the table of spares. Refer to [Fig 15](#).

If the element `<noSafety>` is used, "None" is presented as a text paragraph.

#### 2.5.9.1 Safety conditions - Applicability

When applicability is used (attribute `applicRefId` in the element `<warningAndCautionPara>`) each warning and caution is preceded by its applicability statement. Refer to [Fig 26](#).

## 2.6 Procedure

The default heading **Procedure** is presented as a Centerhead following the safety conditions. Hereafter follows the presentation of the Content of the procedural data module.

The presentation of the elements follows the layout rules given in [Chap 6.2.2](#).

There are two basic methods of presenting procedural data modules:

- Steps without indentations (preferred method)
- Steps with indentations

Steps having a title (by project decision, refer to BRDP-S1-00506) always present these as Sidehead 1 through Sidehead 5.

---

**2.7 Requirements after job completion**

The default heading **Requirements after job completion** follows after the core procedure and is presented as a Centerhead. The default heading **Required conditions** follows and is then presented as a Sidehead 0.

The required conditions, derived from element `<closeRqmts>` which is equal to `<reqCondGroup>`, is presented in a standardized table equal to Required conditions in Preliminary requirements. Refer to [Para 2](#).

**3 Examples****3.1 Example 1**

This example shows a procedure (S1000DBIKE-AAA-DA4-10-00-00AA-241A-A\_009-00) using titles for the steps. It is presented without indented steps.

### Procedure

- 1 Clean the bicycle with water to remove all dirt. Refer to [Fig 1](#).

ICN-C0419-S1000D0359-001-01

*Fig 1 Cleaning the bike*

- 2 Use a [Stiff bristle brush](#) to get access to areas that are not easy to clean. These are the shift levers, the knobby tires, and the brakes.
- 3 Clean the caked grime from the chain and the sprockets with a screwdriver that has a small blade.
- 4 Remove the grease from the freewheel assembly with the [Degreasing agent](#) as shown in [Fig 2](#).  
Use a brush to remove the grease from these parts:
  - sprockets
  - guide and tension wheels of the derailleur
  - chain ring teeth

Fig 3 Brake lever pivots

## 2 Lubricate the chain

- 2.1 Make sure the chain is clean and dry.
- 2.2 Put the [Floor covering](#) on the floor below the chain.
- 2.3 **Applicability: Dry conditions**  
Apply the [Dry lube](#) to each roller of the chain (refer to [Fig 4](#)) but only apply a small quantity.
- 2.4 **Applicability: Wet conditions**  
Apply the [Wet lube](#) to each roller of the chain (refer to [Fig 4](#)) but only apply a small quantity.
- 2.5 Hold the nozzle of the container above the front of the chain ring and slowly turn the cranks rearwards.
- 2.6

### CAUTION

Do not get lubrication oil into the brake system. Oil in the break system can affect the efficiency of the bake system. Do not get oil onto the floor where it can easily get transferred onto the brake system.

Let the lubricant soak into chain before you clean the unwanted lubricant from the chain.

Fig 4 Lubricate the chain

### 3 Check lubricated parts

- 3.1 Do a check of the rear wheel rim and clean the unwanted lubricant if necessary.
- 3.2 Do a check of the chain to make sure that each link is lubricated. If there are links that do not move easily or have become frozen, lubricate the chain again (refer to [Step 2](#)).
- 3.3 Do a check of the remaining lubricated parts and clean the unwanted lubricant with a [Clean dry cloth](#).

### WARNING

Do not get Detergent A into your eyes. If it gets into your eyes, wash them immediately in clean warm water.

Applicable to: Mountain bicycle Brook trekker Mk9

### WARNING

Do not get Detergent C into your eyes. If it gets into your eyes, wash them immediately in clean warm water.

### CAUTION

Do not use a Water hose that has high pressure. A water hose that has high pressure can cause some parts to become loose or full of water.

### CAUTION

Do not point the hose directly at the hub or at the bottom bracket bearings. This can cause damage to the parts.

Applicable to: Mountain bicycle Brook trekker Mk9

### CAUTION

Apply Detergent C in accordance with the instruction on the container. The substance may cause damage to the Bike paint if it is not applied correctly.

#### **1 General**

This chapter gives the rules for S1000D standard page-oriented presentation of fault information data modules using the layout elements given in [Chap 6.2.2](#). It is used to build for example, XML stylesheets in an XML environment. If a traditional authoring environment is used, it must be used as the input for setting up the authoring application.

#### **2 Rules and examples**

The rules and guidelines for the standard presentation of fault information data modules will be included in a future issue of this publication.

##### **Note**

In general, the presentation rules given in Issue 3.0 still apply.

Page-oriented publications - Typography and layout elements

[Chap 6.2.3.2](#)

Layout rules and examples - Descriptive data modules

[Chap 6.2.3.3](#)

Layout rules and examples - Procedural data modules

## 1 General

The rules for S1000D standard page-oriented presentation of service bulletin data modules are based on the layout elements given in [Chap 6.2.2](#). They are used to build for example, XML Style Sheets in an XML environment.

## 2 Rules and examples

### 2.1 General

The service bulletin data modules must can use the layout given in [Chap 6.2.1](#) and [Chap 6.2.2](#) with the following significant rules:

- Display of the element `<productSafety>` and the attribute `safetyLabel`. Refer to [Para 2.2](#).
- Display of service bulletin descriptive main topics. Refer to [Para 2.4](#).
- Display of service bulletin Material information main topic. Refer to [Para 2.5](#).
- Display of service bulletin Accomplishment instructions main topic. Refer to [Para 2.6](#).

### 2.2 Product safety and safety label

The textual content of the element `<productSafety>` (in the element `<identAndSatusSection>`) must be presented under the caption "Product safety" which comes before "Safety conditions". If there is no content in the element the caption is suppressed.

Each page in an alert service bulletin data module must have its classification presented in the header. The classification is derived from the attribute `safetyLabel` when the value is "Alert".

The service bulletin classification "Alert" must be located in the header and be presented in 11 pt bold aligned to the bottom outer type limit. Refer to [Fig 1](#) and [Chap 6.2.1](#).

Page header 170 mm x 17 mm

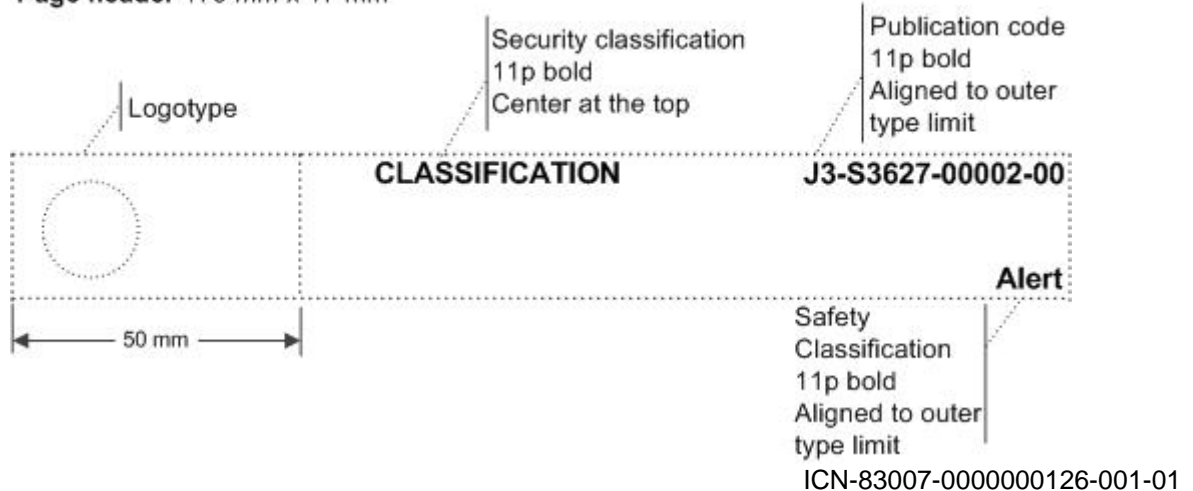

Fig 1 Display of safetyClassification Alert

## 2.3 Service bulletin management information main topic

The service bulletin management information main topic is a data management section, and is designed to be processed by IT tools. Data in this section are not intended to be displayed as is but referenced from relevant topics of the service bulletin.

## 2.4 Service bulletin descriptive main topics

In the service bulletin data module four main topics have a descriptive model:

- Revision information
- Summary
- Planning information
- Additional information

Refer to [Chap 6.2.3.2](#) for their display rules.

## 2.5 Service bulletin material information main topic

There are several business rules decision points to decide which elements and attributes to populate in the structure of the service bulletin Material information main topic. Refer to [Chap 3.9.5.2.15.2](#). Each project or organization must choose a display standard relevant to their decisions about which elements and attributes they are going to populate.

Below are examples of display guidance for one such display standard relevant to a particular set of business rules decisions.

### Note:

The layout sample given in the following paragraphs contains data extracted from the SB bike sample. The proposed layout is based on the order the data are stored in the SB data module. This layout is given as guidance and does not prevent any project or organization from providing a more sophisticated one matching its business requirements.

### 2.5.1 Example of Material set list display Applic 002:

Table 2 Material set list

Material category	Material name and reference	Quantity	Remark
Support equipment set	"BSK-TLST-200" (mat-0001)	1	
Supply	(mat-0002)		
Spare set	"SPA-1000-1" (mat-0003)	1	
Removed spare set	(mat-0005)		
Modified spare	(mat-0007)		

### Applic 003:

Table 3 Material set list

Material category	Material name and reference	Quantity	Remark
Support equipment set	"BSK-TLST-200" (mat-0001)	1	
Supply	(mat-0002)		
Spare	"FK-TEL1002" (mat-0004)	1	
Removed spare set	(mat-0006)		
Modified spare	(mat-0007)		

## 2.5.2 Example of Support equipment list display

Chap No./Document No.	Title
<a href="#">Chap 6.3.1</a>	IETP - Output specification
<a href="#">Chap 6.4</a>	Information presentation and use - Functionality
<a href="#">Chap 7.4</a>	Information processing - Generation of publications

#### **1 General**

An IETP is built up of front matter and several documents all stored as data modules in the CSDB. The detailed specifications for the generation of IETP are given in [Chap 7.4](#).

- [Chap 6.3.1](#) provides rules and guidance for look and feel, and printed output from an IETP. It is not meant to be a design document.
- [Chap 6.4](#) is to be used in conjunction with this chapter to give guidance on functionality.

#### **2 IETP presentation flexibility**

Since [Chap 6.3.1](#) is not meant to be a design document, the use of the rules and guidance therein are a project decision. If this guidance is not to be used, then an alternate output specification must be defined by the project.

##### **Business rule decision point BRDP-S1-00533 - Use of rules and guidance for IETP:**

- Decide whether to use the rules and guidance for look and feel, and printed output from an IETP detailed in [Chap 6.3.1](#) or an alternate output specification.

## 1 General

This chapter gives guidance for look and feel and printed output from an IETP. Where specific guidance for elements is not provided in this chapter, the guidance in [Chap 6.2.2](#) must be applied as closely as possible.

Each project is to decide which elements of this chapter are to be mandated or be developed for the Product and end user requirements. The functionality matrix in [Chap 6.4.1](#) is to be used in conjunction with this chapter to build the project requirement.

## 2 Layout and styles

### 2.1 Screen sizes

Proper planning for the size and resolutions of various devices up front in the planning stages is important as the presentation technology is always undergoing change (eg, terminals, desktops, laptops, personal digital assistance devices).

### 2.2 Stylesheets

Stylesheets are necessary to transform the XML data modules into a format that is capable of being interpreted and presented in an IETP.

### 2.3 Screen layout

The screen can have an outer shell, title bar and an inner shell as described in this section. Refer to [Fig 1](#).

#### 2.3.1 Outer shell

The outer shell is the application/browser window and is the portion of the screen that surrounds the title bar and inner shell.

ICN-AE-A-060301-A-USPM1-00001-A-001-01

*Fig 1 Application screen layout*

#### 2.3.2 Title bar

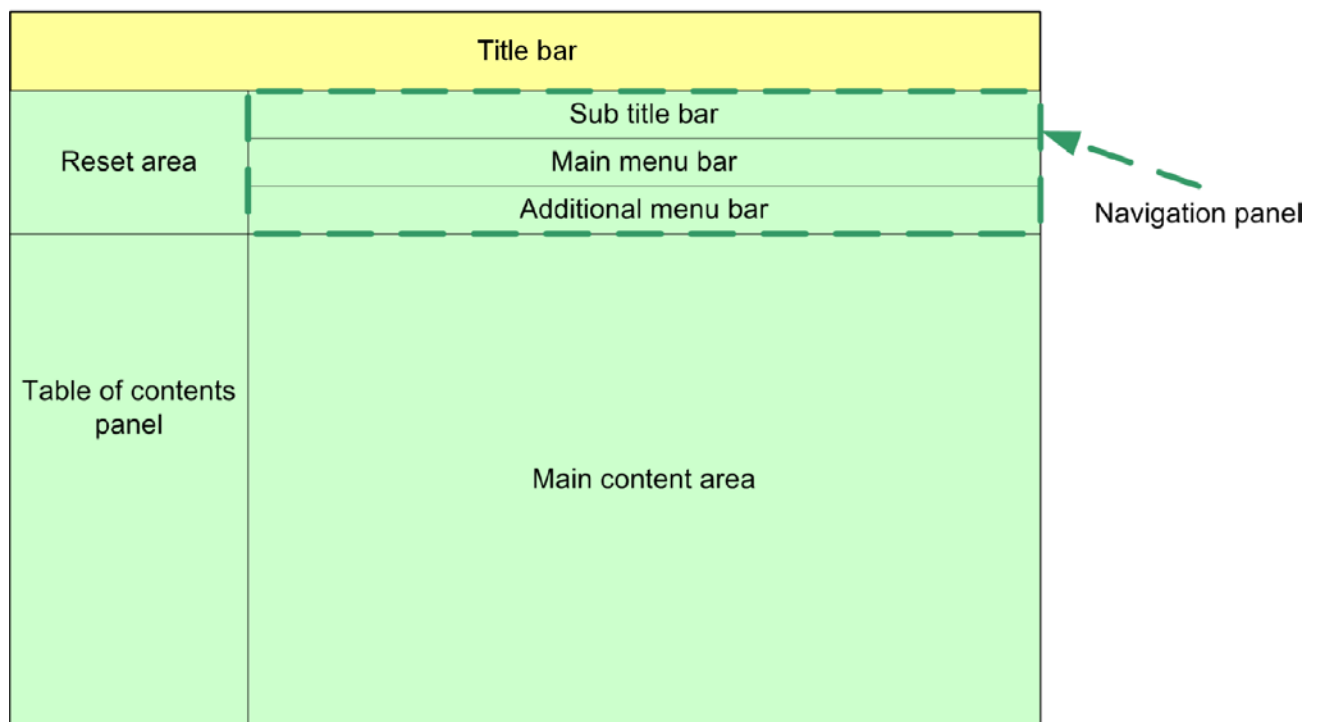

A horizontal title bar must appear at the top of the outer shell. The title bar can include the name of the application and can also include security classification markings, the data module code and the title of the data module currently being viewed.

#### 2.3.3 Inner shell

The inner shell is the portion of the IETP that provides the primary display area.

##### 2.3.3.1 Inner shell layout

The inner shell must contain, as a minimum, the Table of contents panel, Navigation panel and the Main content area as illustrated in [Fig 2](#). Optionally it can include a Reset area.

ICN-AE-A-060301-A-USPM1-00002-A-001-01

Fig 2 Inner shell components

#### 2.3.4 Table of contents panel

The table of contents panel, located to the left of the main content area, is where the navigation interactions must appear. Refer to [Fig 2](#). This panel can include:

- A table or list of all key entry points (eg, publication and data modules) must be made available for user access. This can be provided by a hierarchical breakdown of:
  - the publication set to publications
  - the publications to data modules by, for example, the SNS structure
- The Highlights data modules must be included here to give the user information about the status and reason for change of the updated publications and data modules.
- Other navigation, for example:
  - list of tables
  - list of figures

These can be implemented by graphical interfaces.

This panel must be resizable and can be toggled on and off.

#### 2.3.5 Reset area

The reset area allows a user to return the IETP view back to its default settings. The reset area also provides a special mechanism for navigation and preferences. Items in this area are provided using a function menu. For example, the reset area can provide a menu allowing the user to navigate the IETP in different ways, such as, by part number, list of graphics, revision summary, etc. The reset area can be toggled on and off but must always be accessible. If toggled off, the reset area must be easy to find by the user. This could be achieved via an icon such as a compass rose or by a right click menu. Clicking on this area can provide a function menu.

The reset area also provides a means for selecting your preferences. The reset area menu could include selections allowing the user to toggle screen areas on and off. An example of a screen area that can be toggled on and off, is the additional information bar. It is recommended that a menu item be grayed out if the user is not permitted to toggle that particular screen area off.

## 2.4 Navigation panel

The navigation panel is comprised of multiple bars in the following sequence:

- 1 Sub title bar (optional)
- 2 Main menu bar (mandatory)
- 3 Additional information bar (optional)

The navigation panel can appear either above or below the main content area. The position of the navigation panel must, as far as possible, remain consistent throughout the application.

### 2.4.1 Subtitle bar

The subtitle bar can be used for additional information, from the identification and status sections such as modification state or classification, when it has not been presented in the title bar.

### 2.4.2 Main menu bar

The main menu bar consists of a basic set of functions. If required by the project, these functions (or any combination of them) can be mandated. There are three ways to present the standard functions:

- text based - the function is given a text label
- graphic based - the function is represented by an icon
- text and graphic - a combination of an icon and text is used

The main menu bar can contain the functions as illustrated in [Fig 3](#).

ICN-AE-A-060301-A-USPM1-00003-A-001-01

*Fig 3 Navigation panel - Example*

When used, icons must be developed to be representative of the function that they perform. Their meaning must be apparent with little confusion in the mind of the user. Icons are not mandated because the end user and operating environment have to be considered before deciding upon the final set. These relate to the basic functions previously described in this chapter with some additional icons for further expansion of the application.

Cascading menus can appear as a child of a function when selected. In a drop-down menu, this appears next to the function selected. There can be several levels of cascading menus.

Functions that are not active during any rendering must be presented as disabled. The bar must remain accessible.

---

**Business rule decision point BRDP-S1-00534 - Main menu bar functions in the IETP viewer:**

- Decide which, if any, of the basic set of main menu bar functions to mandate.

- 2.4.2.1 Previous  
This navigates the user through the data in a sequential manner backward.
- 2.4.2.2 Next  
This navigates the user through the data in a sequential manner forward.
- 2.4.2.3 Table of contents  
A function that toggles the Table of contents panel on and off. Refer to [Para 2.3.4](#).
- 2.4.2.4 History  
A navigational function that displays previously viewed data in a sequential manner (eg, data module visited).
- 2.4.2.5 Search  
A function that displays a search dialog box.
- 2.4.2.6 Print  
A function that allows data to be printed (eg, by use of a print dialog box). By decision, if information is classified the print function can be disabled and the print button grayed out.

**Business rule decision point BRDP-S1-00535 - Printing of classified data**

- Decide whether to allow the printing of classified data. If not allowed, the print function must be disabled when classified data is presented in the IETP viewer.

- 2.4.2.7 Feedback  
A function that allows feedback to be gained from the user either on an individual data module, publication or a complete publication set. This can be done by, for example, use of the Comment Schema. Refer to [Chap 4.6](#).
- 2.4.2.8 Exit  
A function that allows exit from the IETP, where appropriate, the following modes can be available:
- complete - exits the application
  - suspend - suspends the session for the user
- 2.4.2.9 Help  
A function that displays a help file. The help can contain viewer usage information.
- 2.4.2.10 IDSTATUS  
A function that shows part or the whole of the identification and status section of the data module or publication.

**2.4.3 Additional information bar**

The additional information bar can be used if additional functions are required (eg, ordering of spares). It is presented below the main menu bar and must include the functionality to be toggled on and off.

---

**Business rule decision point BRDP-S1-00536 - Additional information bar in the IETP viewer:**

- Decide on the use of an additional information bar. If used, it must be decided which information to be available in the additional information bar.

**2.4.4 Main content area**

The main content area contains the technical content, text and graphics of the IETP, this area must not be divided into more than three panes.

**2.4.5 Screen "stacking"**

Screen "stacking", that is the use of multiple windows, must be avoided to aid end user clarity.

**2.5 Style and format****2.5.1 General**

Unless otherwise stated in this chapter, style and format must conform to the general principles defined in [Chap 6.2](#).

**2.5.2 Use of colors**

Consideration must be given for capabilities of intended display devices. It is recommended to design for the least capable display device (8-bit, monochrome devices, etc). The use of color must be controlled by human factors studies or usability testing. The operational environment and equipment in use must dictate some rules regarding the colors used. There can be operational considerations such as night ops, red-light conditions and where color has special meaning. Any colors that are used must comply with the rules in [Chap 3.9.2](#).

The recommended color scheme for standard text display must be black on a white background.

**2.5.3 Typefaces****2.5.3.1 Standard typefaces**

When deciding upon typeface and size, consideration must be given to the information detailed in [Chap 6.2.2](#). The use of font size must be adequate for the user to be able to read the technical content. Attention must be paid to the display device and working environment.

**2.6 Dialog box**

A dialog box is used to obtain information from the user and provide feedback to the user. When possible, it must appear in the screen center. The dialog box appearance must be consistent throughout the IETP.

A dialog box can contain controls. A user interacts with the dialog box through named controls. Typical controls are:

- Text input box
- Push button
- Checkbox
- Radio button
- Selection box

Controls can have tool tips. Tool tips display further information about the purpose of the control. A tool tip appears when the user hovers over the control with the mouse pointer. Refer to [Fig 4](#) for an example dialog box which contains various named controls types and a tool tip.

ICN-AE-A-060301-0-A-USPM1-00004-A-001-01

Fig 4 Dialog box - Example

### 2.6.1 Text input box

A text input box allows the end user the ability to provide information to the application in the form of free text and/or numerical values.

Wherever possible, the data input field prompt must be placed on the same line as the data entry area. Formatting for prompts must be distinctive. Prompts must be placed in close proximity to their respective data entry area.

When required, an acceptable value criteria must be provided through the element `<validate>` expression on the element `<userEntry>` expression. The acceptable values specified by the `<validate>` expression must be displayed in close proximity to the text input box, such as appended to the prompt or directly below the text input box. As a minimum, if the user enters a value outside of the acceptable values criteria `<validate>` expression, a message must be displayed to the user identifying the acceptable values. Upon acknowledging the message, the text input box must be displayed to give the user another chance to enter a valid value.

### 2.6.2 Push button

The push button executes a function. Examples of push buttons are "OK", "Calculator" (executes a calculator program), "Figure" (displays associated graphic), and "IDSTATUS" shows identification and status information. A dialog box has five pre-defined push button functions and must be displayed in the following order centered along the dialog box bottom:

- Submit (mandatory)
- Cancel/Abort (mandatory)
- Reset (optional)
- Help (optional)
- Generic (optional)

- 2.6.2.1 **Submit**  
The submit push button is used to submit the data in the dialog box to the IETP, closes the dialog box, and performs the next action. Submit push buttons can have several different text labels. Examples of submit push buttons are:
- "OK" - the user enters the prompted data before submitting to the logic engine
  - "Search" - the user enters search criteria before submitting to the search engine
  - "Comment" - the user enters comments on the dialog box before submitting to the comments service
- 2.6.2.2 **Cancel**  
The cancel push button is used to void information entered, to void executing the function, or to close the dialog box, and return control to the prescribed action as identified for the function.
- 2.6.2.3 **Reset**  
The reset push button, when activated, is used to reset controls on the dialog box to their default values. An example of a reset push button is to "Clear" the contents of a search dialog box ready for a new search.
- 2.6.2.4 **Help**  
The help push button, when activated, is used to provide further information about the dialog box.
- 2.6.2.5 **Generic**  
A generic push button, when activated, executes a defined function. A generic push button must not close the dialog box or display along the dialog box bottom. An example of a generic push button is to execute a calculator to help compute an answer for the dialog box.
- 2.6.3 Checkboxes**  
Checkboxes provide "On/Off" toggle switches. A switch is "On" when the box is checked. It is possible to have none or several checkboxes with the same control name thus allowing users to select several values for the same property. An example of a checkbox function in an IETP is selecting applicability values for an applicability filter.
- 2.6.4 Radio buttons**  
Radio buttons are similar to checkboxes except that where a group of radio buttons exist, only one of the options can be selected. At all times, exactly one radio button in a group is set to "Checked".  
  
Radio buttons can be used to implement a Yes-No dialog box. Two radio buttons are labeled with "Yes" and "No" respectively, and a submit button (eg, "Submit" or "OK") is used to submit the response to the IETP.
- 2.6.5 Selection boxes**  
Selection boxes are used when the user is required to select a value from a scrollable list box. Selection boxes can be set so that a user can pick only various options.
- 2.7 Lists**  
Lists must conform to the general requirements as identified in [Chap 6.2](#) with the exception when those specific measurements for indentation and spacing cannot apply.
- 2.8 Steps**  
**2.8.1 Procedural steps**  
It is preferred that procedural steps and their corresponding illustrations be presented together. When this is not feasible or it affects the user's perception of the screen layout (such as a scrolling screen or "cluttering" when using a small screen) the illustration or inline an icon can

be placed inline to allow the display of the illustration. Steps must be presented such that the order cannot be misunderstood.

Screen stacking (eg, several open windows) to present multiple steps is not permitted.

## 2.8.2 **Keep with next**

Procedural, fault isolation, and crew steps with the attribute `keepWithNext` set to "1" are presented with the next sibling step (if one exists) and therefore, all children of the step for which the attribute is set are kept together as well (if possible). Refer to [Chap 3.9.5.2.3](#), [Chap 3.9.5.2.4](#), and [Chap 3.9.5.2.6](#).

## 2.9 **Tables**

Tables can appear within the body (inline) of the IETP or in their own separate window (pop-up). When pop-up tables are used an icon must identify the table. The icon serves as a push button to open up a table pane.

Table titles must conform to the guidance provided in [Chap 6.2.2](#).

Typefaces must be the same as the rest of the data module. Presentation of tables must follow the principles given in [Chap 6.2.2](#).

### 2.9.1 **Headers and footers**

The header must always be visible so that it does not scroll away while rows are scrolled. Where appropriate the footer can remain visible so that it does not scroll away while rows are scrolled.

#### 2.9.1.1

Table footnotes

Table footnotes marker, presented either in superscripted format (superscripted numbers are recommended, refer to [Chap 3.9.5.2.1.6](#)), in parentheses following the item, or by any other means, must have a link to the related footnote presented in the table footer or display a pop-up when the mouse "hovers" over the footnote marker in the table cell.

The basic rules for table footnotes given in [Chap 3.9.5.2.1.6](#) apply.

### 2.9.2 **Background**

It is preferred that the background be white. Where the table is long, it can be acceptable to change the background colors of alternate rows to aid readability.

### 2.9.3 **Links to table cells**

Only the referencing text within a table cell must be hyperlinked. Do not link the entire cell. Reference to a table cell or row must scroll directly to the referenced cell or row. This type of reference is not presented in a printed output.

## 2.10 **Hyperlinks**

### 2.10.1 **Hyperlink presentation**

Standard web practices must be followed to indicate the presence of hyperlinks. Blue underlined text must be used to indicate unvisited links and purple underlined text must be used to indicate visited links.

### 2.10.2 **Graphic links (hotspots)**

The following are the four acceptable modes of visual indication of hotspots in graphics:

- persistent visual indication that an area is hot
- cursor changes shape or color when cursor is over the hotspot area
- object changes shape or color when cursor is over the hotspot area
- pop-up appears while cursor is over the hotspot area (eg, IPD callout expands)

## 2.11 Warnings and cautions

Warnings and cautions must be presented inline either by the complete warning or caution or by an icon. When icons are used the warning or caution must pop-up when the icon is pushed.

The presentation of warnings and cautions must conform to the general requirements as identified in [Chap 6.2](#). Warnings and cautions and any associated icons must be displayed prominently in the main content area. They must be treated with particular formatting requirements to ensure the user's attention. Examples of a warning and a caution are given in [Fig 5](#) and [Fig 6](#) together with their respective icons.

### Note

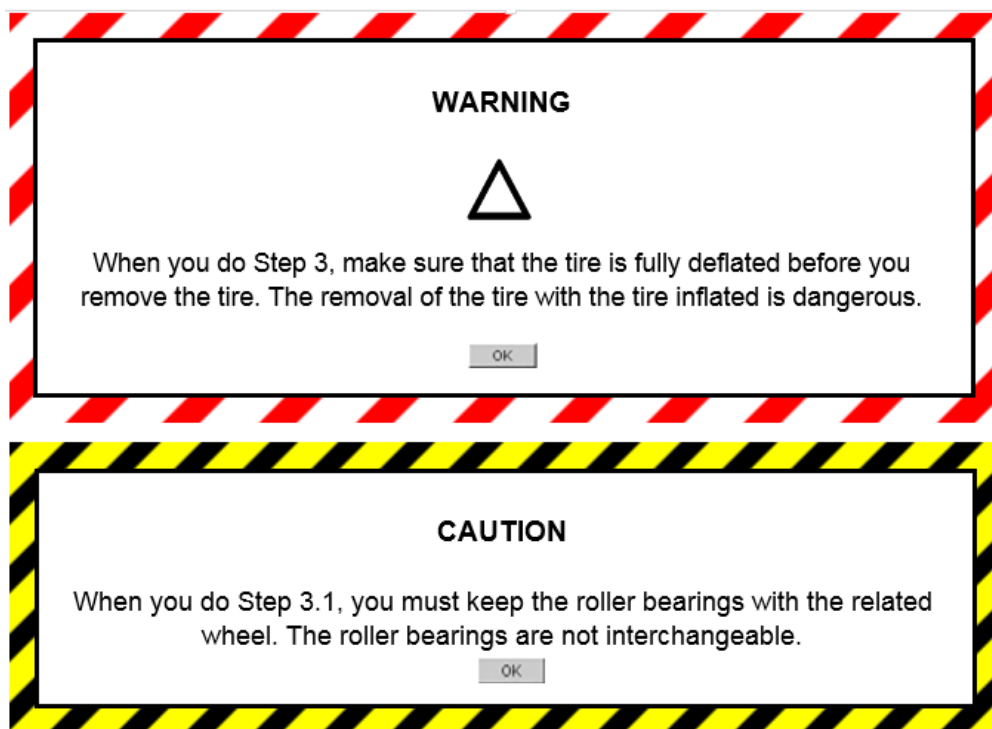

Projects must ensure commonality of presentation utilized.

The warning and caution, and associated symbols, or icons must be visible to the user whenever the warning or caution is applicable to the information (procedure, etc) is viewed.

Any warnings or cautions that are applicable to the complete data module (ie, included and presented in safety conditions within preliminary requirements) must be displayed when a data module is opened. Refer to [Chap 3.9.3](#).

### 2.11.1 Pop-up warnings and cautions

Pop-up warnings and cautions must appear in the center of the user viewing area, to alert the user of a specific condition. A system can display all applicable pop-ups as stacked window frames. The user must be able to again see the pop-up after they are acknowledged by clicking on an applicable icon.

ICN-AE-A-060301-A-USPM1-00005-A-001-01

*Fig 5 A Warning and a caution with acknowledge buttons - Example*

For systems which allow minimized appearance of pop-up warnings and cautions (as opposed to those that are inline), an on-screen indication appears and displays an appropriate icon, refer to [Fig 6](#).

ICN-AE-A-060301- A-USPM1-00006-A-001-01

*Fig 6 Warning and caution icons - Example*

### 2.11.2 Safety icons and symbols

Hazardous material icons are optional. General rules for colors and shapes, reference must be made to [Chap 3.9.2](#). The meaning of the hazardous material icon can pop-up by "hovering" the mouse over the icon.

### 2.12 Change markings

If change markings are presented for onscreen display, the change markings must clearly identify the changed content. A link to the highlights data module can be made available and the reason for change can be displayed as a tool tip when the cursor hovers over the changed content.

The IETP can have a function to show or hide changed content.

Changed content is best displayed in the IETP by use of a different color or highlight the changed information.

Refer to [Chap 3.9.5.2.1.1](#) for additional information about change marking.

### 2.13 Acronyms and abbreviations

Any acronyms and abbreviations that are in the displayed data module can have a function that displays the meaning as a tool tip when the cursor hovers over the acronym or abbreviation.

### 2.14 Illustrations - Figures

Illustrations can appear within the body (inline) of the IETP or in their own separate window (pop-up). When pop-up illustrations are used an icon must identify the "hidden" illustration. The icon serves as a push button to open up an illustration pane.

Illustrations can be displayed using as much screen space as is available. The IETP presentation system must provide the user with the ability to view graphic objects with pan, zoom, expand, and magnify.

Figure titles must conform to the guidance provided in [Chap 6.2.2](#).

If required, hovering over an area of a graphic can provide some means of descriptive data. For example, if used in an IPD graphic the information displayed can be that which is contained in the element `<descrForPart>` or in a wiring data graphic it can be some information related to the cable.

Right-mouse clicking can optionally display a menu of options to include related remove/replace/repair procedures, part ordering, training, etc.

### 2.15 Printed output from IETP

#### 2.15.1 General

The IETP application is designed for the purpose of displaying data electronically. It must be discouraged for use as a publishing engine. However, if there is the requirement to print any data the following guidelines must be adhered to.

Consideration could be given to the printed output of partial data modules. This would require that any applicable caveats be printed. The function to provide a complete publication output is strongly discouraged.

When printing a data module from the IETP application, a header and footer must be printed on all pages that are output. The following information can be displayed on them:

- the data module code and its issue date
- the date and time of printing
- the security classification
- a caveat to state the information is only applicable at the time of printing and is not subjected to amendment action and that it must be "destroyed after use"
- the page number, starting with "Page 1"
- the words "End of data module" on the last page

#### 2.15.2 **Printing process data module elements**

Printing a process data module is a particularly challenging task due to the programmatic nature of the data. The goal is to present the process data module "program" in a human readable form such that a maintainer can interpret the precondition, preset, postset, alt, if, and loop constructs sufficiently to correctly guide him through the maintenance flow.

## 1 General

This chapter provides an explanation of the functionality matrix and defines standard terminology associated with its use.

## 2 Background and use of the functionality matrix

The matrix is intended to be used by acquisition professionals as an aid to define requirements for a project or organization. The matrix provides a standard format for documenting the functional needs of a technical data project. It provides also standard definitions for each functionality, so that companies and customers can clearly state their needs and capabilities.

The matrix includes functionalities both within and beyond the capabilities of the Schema. Certain functionalities listed are typically capabilities of viewers or data delivery mechanisms and are not explicitly described elsewhere in the standard. Cross references are provided in those instances when functionality is a capability of the standard.

[Chap 6.4.2](#) contains a matrix intended to indicate possible capabilities for various types of technical data implementations. The matrix is to be used by a project and company to help identify project and organization requirements. The matrix includes functionalities both within and beyond the capabilities of the Schema.

An MS Excel™ version of the matrix that can be used by project teams to capture requirements is available at [www.s1000d.org](http://www.s1000d.org).

### 2.1 Functionality categories

The matrix is divided into the following categories based on functionality type.

#### 2.1.1 Functionality

The functionality column lists possible technical publications functionalities. The following summarizes the functional categories at a high level.

##### 2.1.1.1 Access

These are the functionalities that allow or restrict users to view specific data.

##### 2.1.1.2 Annotation

These are the functionalities that have to do with the user's ability to add notations or other marks associated with the data. Bookmarks are a type of annotation.

##### 2.1.1.3 Delivery and distribution

Delivery is the method of moving tech data from a contracted company to the contracted client and distribution is the method of moving tech data from an initial point to all the end users of the tech data. Selection of the desired media and method will drive costs; however, the most significant consideration is the readiness of the infrastructure at the user level for whatever method is chosen.

##### 2.1.1.4 Diagnostics and prognostics

Diagnostics include procedures for identification of a fault that lead to a corrective action or maintenance procedure. Diagnostics span from basic standalone troubleshooting procedures to integration with the product and other maintenance systems. Prognostics include the capability to predict system degradation or failure based on maintenance and operational data input and real time monitoring. Diagnostics/prognostics can be a significant benefit in reducing maintenance times and total ownership costs; however, they can also be a sizable cost driver in publications development.

Applicable to: All

S1000D-A-06-04-0100-00A-040A-A

Chap 6.4.1

- 2.1.1.5 External processes  
The digital environment has the potential to provide greater functionality by interacting with external processes to retrieve and transmit information.
- 2.1.1.6 Graphics  
Various levels of graphics display, interactivity and navigation can be implemented. Examples of these functionalities include.
- Point and click on a locator graphic for the purpose of navigating to graphic details
  - Links to textual or tabular information
  - Highlighting specific connections in a circuit
  - System simulation expressed graphically
- The more complex graphical functionalities often come at a premium for both cost and system hardware/software requirements.
- 2.1.1.7 Linking  
Basic linking functionality is defined as essentially link access or connections to the data within the publication such as from the table of contents to the applicable section. Additional linkage such as cross-references can require some additional effort to maintain. Linking to data items externally can also be accomplished. These links can be to resources such as material handling information or for integration with other related information.
- 2.1.1.8 Navigation and tracking  
Different navigation methods enable linear and non-linear access thru the data. Features such as "next" and "previous", search and the use of bookmarks are considered to be relatively fundamental and consistent with most Web-based data presentation techniques. Higher complexity navigation techniques include dialog driven interaction, voice activated commands and various filtering techniques. Examples of filtering characteristics are model number, identification number (eg, tail number), modification performed and user qualifications.
- Tracking provides the ability to allow recording and subsequent retrieval of electronic publications activity, as in an audit log.
- 2.1.1.9 Printing  
Some publications by their nature are intended for use in an electronic environment, with print functionality limited primarily to task oriented and screen print output. By defining a hard copy output that more closely resembles a paper technical publication, the resulting costs and complexity rise.
- 2.1.1.10 Special content  
The inclusion of additional data types such as audio, motion video, and animations are accommodated relatively easily by most presentation systems; however, content generation often cost more. Performance issues can also occur, which can have further cost implications.
- 2.1.1.11 Updates  
There are a number of different update methodologies that affect life cycle costs and include revisions, changes, and urgent changes (Rapid Action Changes (RACs), etc). These can include change markings or other change indications. Updates include any data delivery after the initial delivery.
- 2.1.1.12 User operation mode  
These functionalities have to do with infrastructure and a user's ability to connect with the source of the data.
- Business rule decision point BRDP-S1-00537 - Use of the functionality matrix:**
- Decide whether to use the functionality matrix. If used, fill in the functionality matrix. Refer to [Chap 6.4.2](#).

## 2.2 References

Wherever possible references are made in the functionality definitions to indicate related material located elsewhere in S1000D. When a reference is not possible, a notation is made to indicate that the functionality is viewer, infrastructure, or external software functionality that is not enabled as a direct application of S1000D.

## 2.3 Matrix columns

The horizontal axis contains the column headings: Functionality, Complexity - Page, Complexity - IETP, Requirement, All data sets, and a list of the S1000D information sets. Refer to [Chap 5.2](#).

### 2.3.1 Complexity

There are two columns that indicate a relative measure of difficulty and probable higher cost associated with a particular functionality (the higher the complexity factor, the more difficult implementation and a more probable higher cost). In many cases the complexity level is different depending upon a page-oriented or IETP implementation. Separate columns are provided that indicate the complexities in these two implementations. The absence of a complexity factor indicates that the functionality is generally not available or desirable.

Page-oriented publications are presented in a linear or document oriented manner. The data author largely predefines the sequence of the data presentation. Page oriented publications can be designed for traditional printing or for electronic display. Electronically displayed page oriented publications are sometimes called Electronic Technical Publications (ETP).

IETP data is displayed in a non-linear fashion. There are high levels of interactivity between the data and the user. The sequence of presentation is dictated by inputs by the user or external sources and events. IETP implementations typically require the use of the process data module and a logic engine.

The complexity factors provided are intended to provide relative complexities (and relative costs) for implementing various functionalities. The complexity factors range between one and five, with one being the least complex, to implement and five being the most complex.

### 2.3.2 Requirement

The requirement column is to be used by the project team to indicate the need for a specific functionality. If desired, the acquisition agent can also use the requirement column (in the spreadsheet version of the matrix) to capture and coordinate notes reflecting the importance of the functionality to the project (must have, nice to have, do not want, etc) prior to making final requirements decisions. The spreadsheet version of the matrix provides a useable format for this purpose.

### 2.3.3 All information sets

The All information sets column is used to identify those functionalities that typically apply universally across all information sets. These functionalities are identified with an "A." These are in contrast to functionalities that can be applied to specific identified information sets. Refer to [Chap 5.2](#).

### 2.3.4 Information sets

The remaining columns represent the information sets described in [Chap 5.2](#). These columns are to be used by the project team to indicate, which data sets should include the specified functionality. The information sets provided in the matrix are consistent with those described in [Chap 5.2](#), a project or organization can modify the matrix to match the information sets used in their actual project or organization.

#### **Business rule decision point BRDP-S1-00538 - Modification of the functionality matrix due to selection of information sets:**

- Decide on which modifications are needed in the functionality matrix due to the selection of information sets. Refer to BRDP-S1-00004.

### 2.3.5 Front matter

Front matter is the information traditionally displayed in the front of paper publications. Refer to [Chap 3.9.4](#), [Chap 5.3.1.2](#), [Chap 6.2.3.1](#), [Chap 8.4.1](#), [Chap 8.4.2](#) and [Chap 8.5](#). It can include the title information, "A" page or change information, verification status, export control notice, warning, safety summary, title page, list of pages or data modules, change records or highlights, access illustration, list of abbreviations, list of terms, list of symbols, technical standards records, table of contents, general data, function (of an IETP/Publication), general warnings cautions and related safety data, numeric indexes, alphabetic and alphanumeric indexes, list of special materials, list of dangerous materials, list of related data, introduction, supplier lists, configuration, copyright, etc. The complexity, practicality and desirability of front matter content vary greatly depending on the data acquired.

## 2.4 Functionality definitions

The following tables provide descriptions of each of the functionalities identified in the matrix as well as some considerations to be made and the range of capabilities that can be addressed therein. These tables provide identification of the category, title of the functionality, a definition of the functionality and in many cases, an example.

### 2.4.1 Functionality definitions - Access

#### 2.4.1.1 Login

This is the capability to identify a user for tracking, authorization or other purposes. This is an IETP viewer functionality. This functionality requires the inclusion of the Exit functionality.

Consideration must be given to determine if specific profiles, user IDs, roles and permissions will be required to permit usage. A password for log on is not necessary. It should be kept in mind, that if there is a higher-level infrastructure controlling access, it should be the controlling authority. Data access based on the training and skill of the maintainer can require that the system link into the maintainer's training records. In a standalone mode, the amount of data required on the standalone device is considerable and complex. Consideration must be given to the maintenance of this data in multiple locations.

#### 2.4.1.2 Suspend and restart

This is the capability to suspend a session and provide the user with the ability to restart at the point of suspense. This functionality requires the inclusion of the Login functionality. This capability extends beyond a user session and retains session data. This is an IETP viewer functionality.

During the performance of a maintenance session, a part is removed. The replacement part is not available in supply. The session is suspended and subsequently restarted after the part becomes available.

#### 2.4.1.3 Exit

Function to close the session. This is an IETP viewer functionality.

If suspend is used, the current state tables and position are maintained, otherwise all information concerning state tables and position is cleared.

### 2.4.2 Functionality definitions - Annotation

#### 2.4.2.1 Action Complete Indicator (checkbox)

The functionality used to indicate the completion of an action. Refer to [Chap 3.9.5.2.10](#) and [Chap 6.3.1](#). This functionality is normally associated with, but not limited to use with, checklists. Other methods can be used (eg, "sign off"). The data entered via the action complete indicator can be retained for state table or audit trail purposes depending on project and organization requirements.

#### 2.4.2.2 Global data annotation

This functionality allows the entry, storage and display of globally applicable supplemental data. This is an IETP viewer functionality.

Globally accessible annotations should be limited in scope and required to be approved by the end user's QA process and be made available to the development contractor. Globally accessible annotation is a quality maintenance supplement indicating the new type of lubricant to use. Some users of data on CD-ROM might use these global data annotations to provide updates to data by quickly revising the CD-ROM to contain the "sticky" notes.

#### 2.4.2.3 Local data annotation

This functionality allows the entry, storage and display of locally applicable supplemental data. This is an IETP viewer functionality.

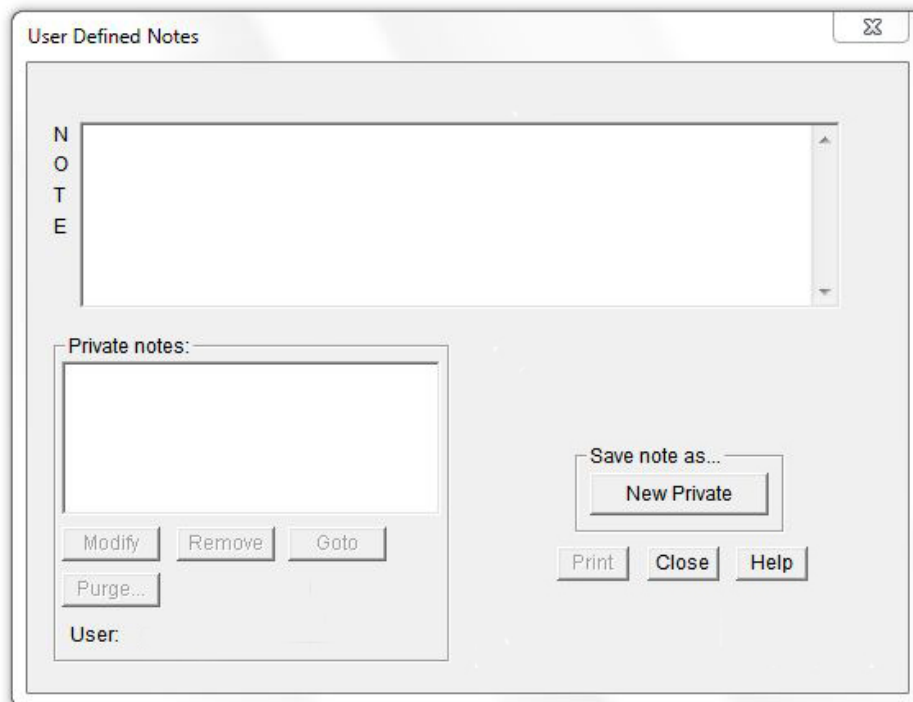

These annotations should be limited in scope and follow local approval process.

Example - The maintainer can be required to use additional filtering in a desert environment.

#### 2.4.2.4 Personal annotation

This capability allows an individual user to add supplemental information to the data. This is an IETP viewer functionality. This functionality requires the inclusion of the Login functionality.

Personal annotation can be added or deleted at the end user's discretion and it is suggested that it is not retained at the end of the user session. It is not the intent that the personal annotation persists.

ICN-AE-A-060401-0-07GB6-00001-A-002-01

*Fig 1 Personal annotations*

Example - "Noticed that the radome latch was bent on left side, remember to complete appropriate forms to notify radar shop."

#### 2.4.2.5 Redlining text

Capability provided during the publication development and verification process to annotate text using markings for deletions and insertions. The capability exists to save and attribute redline markups. These are saved for feedback only for the improvement of the publication. This is an IETP viewer functionality.

#### 2.4.2.6 Redlining graphics

This is a capability to annotate graphics using an overlay freehand-type drawing facility. It can be used to report errors during the publication development and verification process. The capability exists to save and attribute redline markups. These are saved for feedback only for the improvement of the publication. This is an IETP viewer functionality.

ICN-AE-A-060401-0-07GB6-00002-A-002-01

Fig 2 Redlining graphics

#### 2.4.3 Functionality definitions - Delivery and distribution

##### 2.4.3.1 Printed publication

A paper publication compiled from data modules. Refer to [Chap 4.9.1](#).

##### 2.4.3.2 Physical media

The capability to deliver and/or distribute data on hard media such as CD-ROM, DVD, hard drive. This is an infrastructure functionality.

Such physical distribution methods typically entail issuance of a complete database thus replacing the data in use. This replacement constitutes a block change update and is generally performed on a periodic basis.

##### 2.4.3.3 Network distribution

Distribution via the Internet (connections to the World Wide Web (www))/Intranet (internal to one network) and consists of direct transfer from one computing system to another. This is an infrastructure functionality.

Delivery could be via secure FTP, (HTTP) or other transfer protocols. Bandwidth, security and operational deployment considerations should be addressed. This could enable near real-time updates. Refer to [Para 2.4.11](#)

#### 2.4.4 Functionality definitions - Diagnostics and prognostics

##### 2.4.4.1 Diagnostics - User determined entry to data

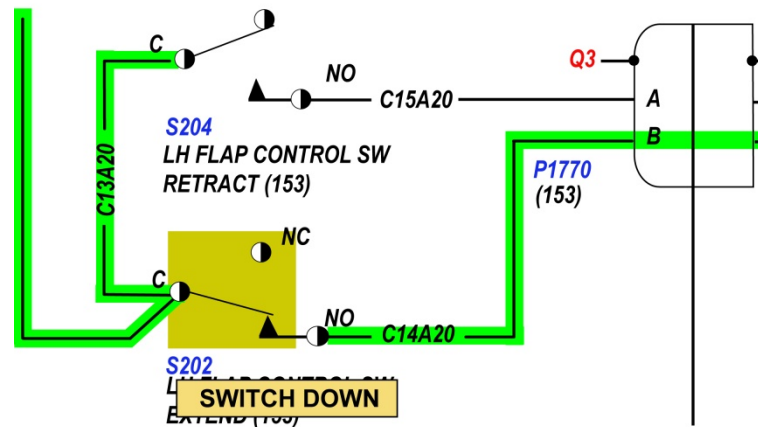

Tasking for troubleshooting procedures is provided thru primarily textual references. "If statements" provide alternatives in a narrative form. This makes use of a predefined fault tree. The user determines starting point for maintenance action. Refer to [Chap 3.9.5.2.4](#) and [Chap 5.2.1.3.2](#), [Chap 5.2.3.4](#) and [Chap 7.7](#).

- 2.4.4.2 Diagnostics - Software driven entry to data  
The appropriate maintenance action starting point is software determined thru use of an inference or logic engine. The user is provided with the appropriate starting point for fault isolation. Various inputs from personnel and system and multiple fault codes are analyzed. The analysis will determine if a relationship exists between these fault codes and information with the appropriate action as a result. This is an external software functionality. Refer to [Chap 3.9.5.2.4](#), [Chap 5.2.1.3.2](#), [Chap 5.2.3.4](#) and [Chap 7.7](#).
- 2.4.4.3 Dynamic diagnostics  
This is diagnostic capabilities that use onboard monitoring devices (eg, Built-In Test (BIT)) and/or support/test equipment to provide enhanced capability for fault detection and isolation. Dynamic diagnostics direct fault isolation and troubleshooting based on results returned from the product rather than inputs received from the maintainer. With this type of diagnostics, there are no predefined paths in the troubleshooting data and the paths are generally model-based. This is an external software functionality. Refer to [Chap 3.9.5.2.4](#), [Chap 5.2.1.3.2](#), [Chap 5.2.3.4](#) and [Chap 7.7](#).
- 2.4.4.4 Wire/Fluid system tracing  
This is the capability to select wires, fluid, pneumatic or (HVAC) line in a diagram or schematic and have continuity highlighted thru the circuit or schematic. Refer to [Chap 3.9.5.2.9](#) and [Chap 5.2.1.4](#).

ICN-AE-A-060401-0-07GB6-00003-A-002-01

Fig 3 Wire tracing, switch up

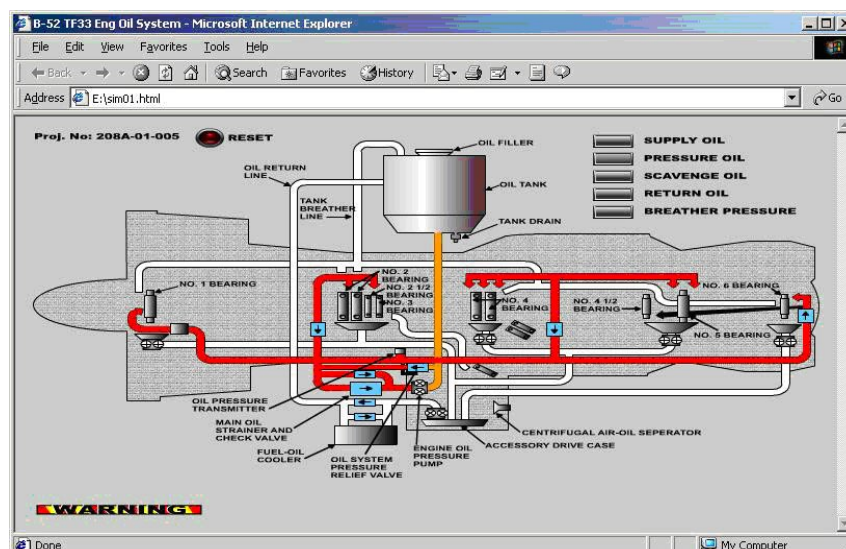

ICN-AE-A-060401-0-07GB6-00004-A-002-01

Fig 4 Wire tracing, switch down

#### 2.4.4.5

#### System simulation

This functionality includes the capability to represent the behavior or characteristics of the system function/malfunction to determine or reenact the problem. System simulation allows the user to introduce stimulus (such as pressure, valve positions, temperatures, voltages, sensor inputs, switch positions) and present the results in a manner that models the system behaviors. These capabilities can be used to model hydraulic, fuel, pneumatic and other systems. This is an external software functionality.

ICN-AE-A-060401-0-07GB6-00005-A-002-01

Fig 5 System simulation

- 2.4.4.6 Prognostics  
Prognostics are the prediction of component degradation or impending failure, which will allow maintenance personnel to replace components based on their actual condition. The goal is autonomic logistics, which uses electronic information collected from the Product system to determine, plan and perform preventive maintenance. This is an external software functionality. This functionality requires the inclusion of the retrieval, transmittal and maintenance data collection functionalities.
- 2.4.5 Functionality definitions - External processes**
- 2.4.5.1 Parts ordering  
This functionality enables parts ordering from within the IETP presentation and is integrated with the supply system. This is an external software functionality. This functionality requires inclusion of the transmittal functionality.
- This functionality would not circumvent the supply system
- 2.4.5.2 Deficiency / improvement report transmittal  
It provides a method for users to transmit errors and recommended changes to the data and/or equipment. This is an external software functionality. Refer to [Chap 4.6](#). This functionality requires inclusion of the transmittal functionality.
- The complexity of this will be determined by the level of integration with the deficiency reporting system and the type of reporting structure:
- Paper trail reporting
  - Electronic reporting
- 2.4.5.3 Maintenance data collection  
This functionality provides for the capability to capture and transmit configuration change data (ie, removed and installed part number information), tasks authorized, tasks performed, results of that work, other observed problem, etc. This is an external software functionality. This functionality requires inclusion of the Transmittal functionality.
- This update can feed an external data repository or maintenance application. The state table or audit trail can be used to accumulate information for maintenance data collection.
- 2.4.5.4 Operator debriefing  
An interface with a system or the product itself, to identify and report observed behaviors of the product. This is an external software functionality. This functionality requires inclusion of the Transmittal functionality.
- The actual debriefing activity can be carried out by a human operator or the product itself.
- 2.4.5.5 Resource scheduling  
Interface with a system designed to assign tasks, personnel and items related to maintenance of the Product. Refer to [Chap 3.9.5.2.5](#), [Chap 3.9.5.2.6](#) and [Chap 5.2.1.6](#). This is an external software functionality. Refer to [Chap 3.9.1](#), [Chap 3.9.5.2.5](#), [Chap 5.2.1.6](#), [Chap 7.3.1.2](#) and [Chap 7.3.1.4](#). This functionality requires inclusion of the transmittal and retrieval functionalities.
- Resource scheduling can be coordinated among multiple human or software systems. These systems act against a set of constraints to minimize conflicts. Automatic resource scheduling is characteristic of a complex autonomic logistics system.
- Example - An engine maintainer's planned maintenance activity can be modified from "test and repair" to "remove and replace" based on reliability data, mission availability requirements and spares availability data from a ship within range.

- 2.4.5.6 Knowledge management  
This is an interface with a system that models an organization's knowledge assets and environment to enhance its ability to deliver on its mission. This is an external software functionality. This functionality requires inclusion of the transmittal and retrieval functionalities.
- Knowledge management provides for information tracking, access and synthesis in coordination with organizational culture, values and guidance. Additionally, a knowledge management system can indicate changes to maintenance actions based on given conditions and lessons learned. For example: A particular system failure can be caused by one of three things, usually it is caused by an electrical failure. However, industry conditions, a clogged air filter is the most likely cause of failure. A knowledge management system will adjust the order of procedures accordingly, so that the air filter is checked first in a dusty environment.
- Example - The technical maintenance data gathered thru audit logs can suggest that a restructuring of the logistics footprint is needed to maximize efficiency.
- 2.4.5.7 Other external applications  
The other external applications functionality is provided so that customers can indicate specific external applications that are required as part of the IETP or data functionality. This is an external software functionality. Refer to [Chap 7.3.1.1](#), [Chap 7.4.1.2](#), [Chap 7.6.1](#) and [Chap 7.7.1](#).
- 2.4.6 Functionality definitions - Graphics functionality**
- 2.4.6.1 Pan, zoom, expand, rotate, magnify  
Controls are provided to perform pan, zoom, expand, rotate and magnify on graphic components. This is an IETP viewer function. Additional functionality can include spyglass view, text search, graphics and window resizing. Refer to [Chap 6.3.1](#) and [Chap 7.3.2](#).
- Consideration should be given to the quality or limitations of the source data.

ICN-AE-A-060401-0-07GB6-00006-A-002-01

*Fig 6 Pan, zoom, expand, rotate, magnify*

- Example - This depicts icons that might be used for the identified function. Refer to [Chap 6.3](#).
- 2.4.6.2 Assembly/Disassembly  
Graphical figures that can be used to allow virtual assembly, disassembly, removal and installation of parts of the system. These can be implemented thru linked drawings or thru manipulation of modeled vector graphics. Refer to [Chap 3.8](#).

ICN-AE-A-060401-0-07GB6-00007-A-002-01

Fig 7 Assembly/Disassembly

#### 2.4.6.3

##### Locator graphics

Locator graphics show where a component is located relative to other components. Refer to [Chap 5.2.2.5](#).

ICN-AE-A-060401-0-07GB6-00008-A-002-01

Fig 8 Locator graphic

#### 2.4.6.4

##### 3D modeling

This is a modeling of the system using 3D, solid object graphical figures. Refer to [Chap 3.9.2.5](#).

3D models can allow virtual assembly, disassembly, removal and installation of parts of the system using animation, simulation and/or virtual reality concepts. Levels of capability can

include fly thru (navigation thru a 3D model) type viewing. The degree of simulation, animation and virtual reality concepts can dramatically affect cost.

## **2.4.7 Functionality definitions - Linking**

### **2.4.7.1 External references**

External references are links to data outside the current data module or view. Refer to [Chap 3.9.5.2.1.2](#), [Chap 7.4.1.1](#), [Chap 7.4.1.2](#) and [Chap 7.7.4](#).

This includes links to supporting technical data that is helpful to the user, but not part of the traditional technical publication. Refer to [Chap 3.9.5.2.1.2](#), [Chap 7.4.1.1](#), [Chap 7.4.1.2](#), [Chap 7.6.1](#) and [Chap 7.7.4](#). Examples include general publications, part and process publications, commodity books, commercial publications, reference material, training data, engineering drawings.

Consideration must be given for bidirectional links. A bi-directional link returns the user to the original referenced link after completing the action or procedure.

For example, a link from a data module to a publication module containing a related procedure is an external link. It should be noted that references to some data can require network connectivity.

### **2.4.7.2 Internal references**

Internal references are links to another place in the same data module or view. Refer to [Chap 3.9.5.2.1.2](#), [Chap 7.4.1.1](#), [Chap 7.4.1.2](#) and [Chap 7.7.4](#).

Examples - Links to figures and tables.

### **2.4.7.3 Hot reference**

This is the capability to display additional content such as acronyms, tool tips, etc. Refer to [Chap 3.9.5.2.1.2](#), [Chap 5.2.1.4](#) and [Chap 6.3.1](#).

Example - A "mouse over" of the acronym IETP would generate popup text box with "IETP"

### **2.4.7.4 Link to separate parts data**

Linkage from a maintenance task or narrative can be provided to a separate parts display (illustrated parts breakdown/catalog) in the current or separate window. Refer to [Chap 3.9.5.3](#), [Chap 3.9.5.2.1.2](#), [Chap 3.9.5.2.7](#) and [Chap 7.7.4](#).

This external link type links the user to a specific point within the parts data.

### **2.4.7.5 Table of contents, lists of figures, tables and photos**

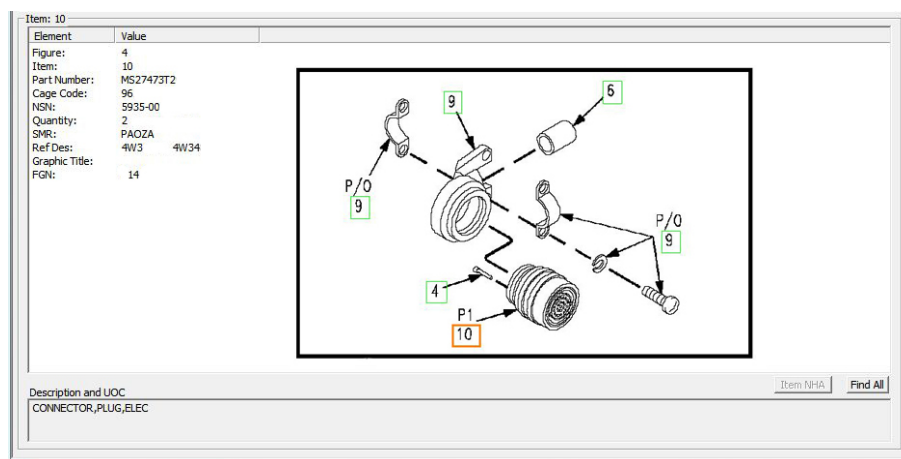

A categorized items list with links to the corresponding data within the technical publication.

### **2.4.7.6 Hot spotting**

Graphics with links to other relevant information. Refer to [Chap 3.9.2](#), [Chap 3.9.5.2.1.8](#), [Chap 7.3.2](#) and [Chap 7.4.1.1](#).

Links can be to related text such as procedural information, IPD data; or to related graphics such as breakdown illustrations showing greater detail, next higher assembly, etc.

Example - The figure below shows a hot reference from a graphic to related text.

ICN-AE-A-060401-0-07GB6-00010-A-002-01

Fig 9 Hot spotting

## 2.4.8 Functionality definitions - Navigation and tracking

### 2.4.8.1 Next and previous

"Next" is a navigational function that, when invoked, displays the subsequent data. "Previous" is a navigational function that, when invoked, displays the preceding data. This is an IETP viewer functionality.

"Next" can be a re-navigation of previously viewed data with no impact on state information (browse); or a progression to the next data in sequence. "Previous" can be a re-navigation of previously viewed data with no impact on state information (browse); or a reversal of steps where state table information is modified accordingly. "Next" and "previous" will normally not be implemented independent of each other. These functionalities, particularly when implemented without the process data module using a state table, are sometimes referred to as "forward" or "back".

### 2.4.8.2 Return (Chronological)

This is a navigational function that allows a user to get back to the link source from the link destination. This is an IETP viewer functionality.

This functionality could be implemented in such a way to allow a user to navigate back to the start of one of several branches or sub-branches.

### 2.4.8.3 History of traversed links

A navigational feature that tracks and lists each location (link) a user sees along the navigational path thru an IETP. This is an IETP viewer functionality.

In many cases, the user has the ability to bring the list up and use each location (link) in the history list, as a link back to a point in the path. It provides the user a way to move forward and backward along previously traversed links and a quick way to return to a home document. This feature is useful when flipping back and forth between several data types or components of the unit under maintenance.

Example - The user opens the IETP to the front matter

- (A). Follows the link to the section on the landing gear
- (B). Follows a reference link to an adjustment procedure
- (C). The history of traversed links will be discretely listed as C, B, A.

- 2.4.8.4 User creation of bookmarks  
This is a navigational feature that allows the user to flag certain locations for later access. It allows the user to build their own index of links to specific locations in the data. This is an IETP viewer functionality.

Associated advanced features include login-specific bookmarks, so different people using the same presentation device have their own unique set of bookmarks. This is a digital means of implementing the dog-eared page or the paperclip used in paper publications.

Example - The maintenance crewmember that generally does the preventative maintenance checks and services might have the bookmarks to those tasks. Since that crewmember might also do the rotor tension adjustment, he would also have a bookmark to that task.

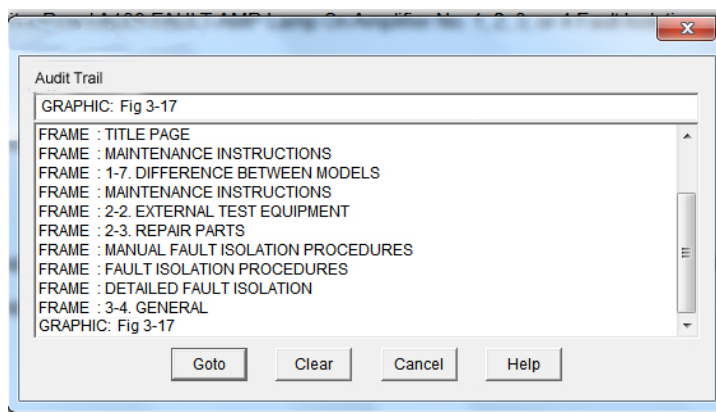

- 2.4.8.5 System/subsystem navigation  
This is a navigational feature allowing the user to follow a top-down path thru the system breakdown structure. The user follows a physical or functional breakdown to the next lower assembly and then to the next lower assembly from that. This is an IETP viewer functionality.

Example - A helicopter mechanic might begin the navigation of an IETP at the helicopter level. Next step would be to go down to the airframe. From the airframe, the mechanic might pick the cockpit. Next subsystem might be the Pilots seat and the final topic might be the forward/rearward adjustment.

- 2.4.8.6 Restore initial navigation view  
This is a function that returns all navigational and other frames to their initial view. This is an IETP viewer functionality.

In some IETP implementations, a user will have the capability to hide navigation or other frames of the display. The restore initial navigation view functionality returns all hidden frames to their default positions. The ability to initiate the restore initial navigation view function should always be available to the user.

- 2.4.8.7 Audit trail  
This functionality provides the capability to capture all user and IETP interaction including dialog interaction entries. This is an IETP viewer functionality.

ICN-AE-A-060401-0-07GB6-00011-A-002-01

Fig 10 Audit trail #1

- 2.4.8.8 Graphical navigation  
This is a navigation of the data thru graphical representation of the product and its components. (The use of hot spotting is a prerequisite). Refer to [Chap 3.9.2](#).  
This can be a type of system/subsystem navigation.

Example - From a graphical overview of the aircraft, the user selects a wing. A graphical overview of the wing is presented. The user then selects the flaps. A graphical overview of the flaps is presented. The user selects the actuator. Information on the actuator is presented.

#### 2.4.8.9 Dialog-driven interaction

A navigational feature used with the process data module that allows the user to directly feed information to the IETP environment. The IETP would cue the user to input specific data. The feature implies that at some point the IETP would then respond to the information entered.

Refer to [Chap 3.9.5.2.10](#), [Chap 6.3.1](#) and [Chap 7](#).

Example - During a troubleshooting procedure, the IETP would open a dialog box that states "Enter the voltage reading at TP 5". If the user types in 5 (a nominal value), the IETP jumps to the next step in the procedure. Alternately, if the user enters 0 (a fault level reading for a short) the IETP might jump to a remove and replace procedure.

#### 2.4.8.10 Voice-activated commands

A feature that enables the user to navigate thru the IETP by predetermined voice commands. This is an IETP viewer functionality.

The complexity of this feature depends upon the extent of voice tagging in the IETP and the quality of the voice recognition software.

#### 2.4.8.11 Search - Full text

This is a navigational feature that allows the user to search an IETP for any words or phrases. This feature does not depend upon the predefinition of key words. This is an IETP viewer functionality.

Example - In searching for "IFF" the user can find "IFF", "difference", "TIFF", etc, depending on the search criteria.

#### 2.4.8.12 Search - User defined Boolean

A search feature that permits the logical association of terms by use of the Boolean operators (such as AND, OR, etc) to narrow the results of the search. This is an IETP viewer functionality.

User defined Boolean search functionality is a possible extension of a full text search.

#### 2.4.8.13 Search - Across multiple databases/files

A search feature that allows the user to look for words or phrases in more than one database. This is an IETP viewer functionality.

#### 2.4.8.14 Search - Context

A feature that allows the user to search for words or phrases within predefined subsets of an IETP or data sources. This is an IETP viewer functionality.

It can be necessary to identify the predefined subsets by use of markup.

Search

☐ Word Highlighting

ICN-AE-A-060401-0-07GB6-00013-A-002-01

Fig 11 Search

#### 2.4.8.15 Search - Key word

A navigational feature that allows the user to search an IETP for occurrences of a specific word. System specific "key words" are predefined with links to their location in the data. This is an IETP viewer functionality.

A key word search provides benefits similar to an index in a paper document. It can also use other search functionalities such as Boolean, search across multiple data bases, etc.

Example - A user might search for the term "IFF". The Key word search would locate each pre-identified occurrence of the term in the data. This will find all occurrences of IFF that have been predefined as a key word, but will not find all occurrences of the letters IFF.

#### 2.4.8.16 Filter content per applicability

Remove or de-emphasize content in the display based on information about the product of interest to the user."

The user has provided input that they are working on a particular aircraft ("serial number 001") with certain conditions present ("POST Service Bulletin 23- 1100"). Only content relevant to aircraft "001" with SB 23-100 implemented is displayed to the user. Alternatively content not relevant is de-emphasized in some manner (for example, is shown in a lighter colored text)."

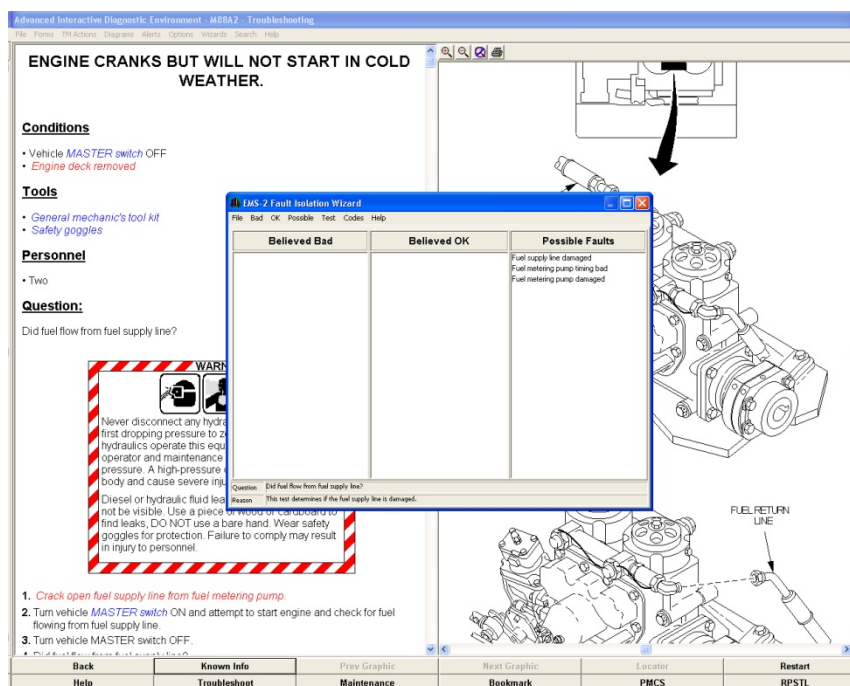

#### 2.4.8.17 Simultaneous display of multiple content objects

A functionality that establishes a relationship between content objects (text, tables, graphics, etc) requiring simultaneous display. Refer to [Chap 6.3.1](#).

The text and its associated supporting graphic must be displayed concurrently to provide complete information to the user.

#### 2.4.8.18 Tear off window

This is the capability to capture an existing pane/screen image and then allow the user to navigate forward, while retaining the captured image for later reference. This is an IETP viewer functionality.

ICN-AE-A-060401-0-07GB6-00014-A-001-01

Fig 12 Tear off window

## 2.4.9 Functionality definitions - Printing

### 2.4.9.1 Print screen

This is the capability to print only the screen currently being viewed. This is an IETP viewer functionality.

Beyond the printed technical data, considerations should be given to time/date stamps, destruction notices, destruction dates, destruction requirements, security and derivative classification markings, associated warnings and cautions, etc.

### 2.4.9.2 Data module specific printing

This is the capability to print a single data module in its entirety. Refer to [Chap 6.2.1](#) and [Chap 6.3.1](#). This is an IETP viewer functionality.

Beyond the printed technical data, considerations should be given to time/date stamps, classified security and derivative classification marks, destruction notices, destruction dates and destruction requirements. Print linked data.

### 2.4.9.3 Print linked data

This capability to print any linked data on a given task/location. Refer to [Chap 6.2.1](#) and [Chap 6.3.1](#). This should be limited to one level of linking. Traversing lower than one layer greatly increases the complexity. Beyond the printed technical data, considerations should be given to time/date stamps, persistent warnings and cautions, classified security and derivative classification marks, destruction notices, destruction dates and destruction requirements.

### 2.4.9.4 Fully formatted/ book version

This is the capability to print a complete publication (Publication) from individual data modules. This implies the capability to produce the output in compliance with a predefined format for printed publications Refer to [Chap 4.9.1](#) and [Chap 6.3.1](#).

Beyond the printed technical data, considerations should be given to time/date stamps, classified security and derivative classification marks, destruction notices, destruction dates and destruction requirements. When the document exists as an IETP, in addition to the cost incurred, this will sub-optimize both the IETP and the printed technical publication.

Applicable to: All

S1000D-A-06-04-0100-00A-040A-A

Chap 6.4.1

---

**2.4.10 Functionality definitions - Special content****2.4.10.1 Acknowledgement of warnings and cautions**

This is the capability of the user to acknowledge warnings, cautions and notes in the technical data. Refer to [Chap 3.9.3](#), [Chap 6.2.2](#) and [Chap 6.3.1](#).

Warnings and cautions must be readily identified and can require specific operator acknowledgment prior to proceeding with the presented data.

**2.4.10.2 Emergency procedures**

A functionality that will call up and display all emergency procedures associated with a system, subsystem or sub-subsystem. Refer to [Chap 5.2.1.9](#), [Chap 5.2.1.10](#), [Chap 5.2.1.12](#), [Chap 5.2.2.7](#) and [Chap 5.2.3.2](#).

**2.4.10.3 Photos**

This is the capability to include photographic images in the technical data. Refer to [Chap 3.9.2](#), [Chap 4.4](#), [Chap 4.8](#) and [Chap 7.3.2](#).

Photos can be included to show a specific visual representation of actual systems. Presentation standards (such as resolution, the use of color, file size and file format) must be addressed as well as content and context of the photo.

**2.4.10.4 Audio**

This is the capability to provide sound within the technical data. Refer to [Chap 3.9.2.4](#), [Chap 4.8](#), [Chap 7.3.3](#) and [Chap 7.5.1](#).

Examples - operator warnings and cautions, presentation clips or complete audio representation of the data. Presentation standards must be addressed as well as content, duration and context of the audio. Consideration must be given to the anticipated environment to determine the usability of audio.

**2.4.10.5 Motion video**

This is the capability to provide video within the technical data. Refer to [Chap 3.9.2.4](#), [Chap 4.8](#), [Chap 7.3.3](#) and [Chap 7.5.1](#).

Motion video should be used as a supplement to the procedural text. Presentation standards must be addressed as well as content, duration and context of the video.

**2.4.10.6 Animation**

This is the capability to provide animated graphics within the technical data. Refer to [Chap 3.9.2.4](#), [Chap 4.8](#), [Chap 7.3.3](#) and [Chap 7.5.1](#).

Animation should be used as a supplement to the procedural text. Animation can be included to show a variety of system functions from theory of operation (hydraulic flow) to maintenance procedures (how to access a specific part). Presentation standards must be addressed as well as content, duration and context of the animation.

**2.4.10.7 Content sensitive help (Technical data help)**

Help information based on the data being presented or the tasks being performed. Refer to [Chap 3.9.1](#), [Chap 6.3.1](#) and [Chap 9.2](#).

Examples - Lists of acronyms, lists of abbreviations and definitions of acronyms and abbreviations. The type of help pertains to the particular subject matter of the data, such as the specific product. Content sensitive help can be delivered thru pop-ups, dedicated help screens or pull down menus.

**2.4.10.8 Context sensitive help (viewer help)**

Help information for the IETP operation including the features and functions of the IETP viewer. This is an IETP viewer functionality.

Example - In many systems, right-clicking via the mouse or hovering the cursor over a particular graphic or menu item will cause a "tool tip" to pop up, providing help or a description for the specified feature.

## Software, Training, and Contact Information

It was originally developed to eliminate the need for paper technical manuals in the field and accuracy for updates, reduces print costs, and enhances search and retrieval.

### Table of Contents Navigating

How to navigate through

The left and right arrow keys on the keyboard can be used OR the green arrows on the table of contents (TOC) window pane located on the left side of the display screen. Once the TOC Pane is enabled, click a topic of interest.

ICN-AE-A-060401-0-07GB6-00015-A-002-01

Fig 13 Context sensitive help

#### 2.4.10.9 User training

This is the capability to integrate or link maintenance and/or operational training data with the IETP. This is both a data and IETP viewer functionality.

User training complexity can range from online access during IETP run time by linking to a CBT database to run complete training lessons.

Access of the data can be thru a link to an external module or integrated with the IETP. Advanced capabilities can be to monitor usage and training access for the purpose of tracking user competency. Specific training courseware and or actions are not necessarily part of the data.

#### 2.4.11 Functionality definitions - Updates

##### 2.4.11.1 Passive change indications and markings

This is the capability to identify changes in the technical data thru a list of changes only and not thru visible marks within the actual technical data. Refer to [Chap 5.3.1.2](#), [Chap 8.4.1](#), [Chap 8.4.2](#) and [Chap 8.5](#).

Examples - List of Changes, Highlights Page or summary of changed data. Display and tracking of change information can drive costs.

##### 2.4.11.2 Active change indications and markings

This is the capability to discretely identify and visibly mark each change in the data. Refer to [Chap 3.9.5.2.1.1](#), [Chap 6.2.2](#) and [Chap 6.2.3](#).

Complexity can be affected by the methods of display, change identification and when they are removed or suppressed. The IETP can also include passive change markings. Display and tracking of change information can drive costs.

##### 2.4.11.3 Full change

The capability to provide a complete replacement of the data previously distributed. Refer to [Chap 3.9.5.2.1.1](#).

A full change can contain detailed change markings (or a change summary).

- 2.4.11.4 Block cycle and urgent changes  
The capability to provide regularly scheduled updates to the technical data. Changes from all sources are consolidated and issued at regularly scheduled intervals. Urgent changes are interim updates between scheduled block cycle updates. Refer to [Chap 3.9.5.2.1.1](#).
- If block cycle updates are contracted, a company is responsible for providing both regularly scheduled updates to the data as well as urgent off-cycle updates as needed.
- 2.4.11.5 Near real time updates  
The capability to quickly provide data updates to users rather than depending on a predetermined schedule. Refer to [Chap 3.9.5.2.1.1](#), [Chap 6.2.2](#) and [Chap 6.2.3](#). This functionality requires the inclusion of the Network distribution and Network connectivity functionalities.
- 2.4.12 Functionality definitions - User operation mode**
- 2.4.12.1 Web browser viewable  
This is technical data that can primarily be viewed thru a COTS Web browser. This is an infrastructure functionality.
- The functionality selected in this matrix will determine the level of complexity and cost of implementing a Web browser viewable application. This can be accomplished directly thru the Web browser (eg, Internet Explorer™) or thru helper applications (eg, Adobe Acrobat™) or plug-ins (eg, IsoView™). Consideration will be required for a specific Web browser. Different implementations include remote access to a Web server, opening static HTML pages locally and Web server emulation on the client viewer.
- 2.4.12.2 Stand-alone mode  
This is the capability to access the IETP via the hard drive on the stand alone device after uploading data from a network or thru a transfer media such as CD-ROM or DVD.
- Consideration should be given for the update capabilities of this operating method. When in stand-alone mode, full update capability entails the update of the complete data after uploading from a network or thru a transfer media such as CD-ROM or DVD. This method provides the lowest cost impact. When in stand-alone mode, a partial update capability entails the update of only the changed data from the previous release after uploading from a network or thru a transfer media such as CD-ROM or DVD.
- 2.4.12.3 Network connectivity  
This is the capability to access to the IETP via a network infrastructure. The data can be downloaded to or viewed on the client device. The data changes are installed on the host server and updates are transmitted via the network. This is infrastructure functionality.
- Data changes are/can be incorporated as complete or partial updates.
- Business rule decision point BRDP-S1-00539 - Selection of functionality using the functionality matrix:**
- Decide on which functionality is required in the technical publications.

## Chapter 6.4.2

### **Functionality - Functionality matrix**

<b>Chap No./Document No.</b>	<b>Title</b>
<a href="#">Chap 6.4.1</a>	Functionality - Background and explanation

#### **1 General**

The functionality matrix is found in [Table 2](#) and described in [Chap 6.4.1](#).

#### **2 The functionality matrix**

The functionality matrix is found in [Table 2](#). Use of the functionality matrix is described in [Chap 6.4.1](#).

Table 2 Functionality matrix

Functionality	Complexity – Page	Complexity – (IET)P	Requirement	All information sets	Front matter	Crew / operator	Description and annotation	Maintenance procedures	Fault Isolation	Non-destructive testing	Corrosion control	Storage	Wiring data	IPD	Maintenance planning	Mass and balance	Recovery	Equipment	Weapon loading	Cargo loading	Stores loading	Role change	BDAR	Illustr 'd tool & support	Service bulletins	Material data	Common info. & data	Training	Applicability

## 1 General

### 1.1 Scope

The chapter gives general information, directives and advice in four main aspects:

- creation and maintenance of CSDB objects

Applicable to: All

S1000D-A-07-01-0000-00A-040A-A

Chap 7.1

- generation of publications
- interchange of information
- technical requirements for display systems

Although some basic guidelines are provided regarding the principle characteristics of systems that support the specification, it is not suggested how such a system should be implemented, nor are any specific tools suggested for such an implementation.

## 1.2 Purpose

The purpose of this chapter is to describe and explain the technical aspects of the information processing. This chapter provides information that is sufficient for understanding and implementing the technical concepts of S1000D. However, additional resources and examples are available at [www.s1000d.org](http://www.s1000d.org).

## 2 Content

### 2.1 Related standards

The standards specific to information processing are listed in [Chap 2.2](#).

### 2.2 Basic concepts

An overview of the basic concepts of the S1000D technical solutions is given in [Chap 7.2](#). This can be used as an introduction to the features that constitute the technical backbone of the specification.

### 2.3 CSDB objects

Relevant information on the technical implications of creation and maintenance of the content of a CSDB is given in [Chap 7.3](#).

The chapter contains a useful introduction to and overview of the XML Schemas. It covers:

- descriptions of the Schemas
- definition of S1000D profiles for raster and vector graphics and technical methods for implementing graphical hotspots

### 2.4 Generation of publications

Information on the generation of publications from a CSDB is given in [Chap 7.4](#).

From a technical point of view, the chapter covers:

- descriptions of publication related Schemas
- production of page-oriented publications
- compilation of IETP including linking mechanism specifics
- inclusion of legacy information

### 2.5 Information interchange

Details on the interchange of S1000D based information are given in [Chap 7.5](#).

From a technical point of view, the chapter covers:

- interchange supporting resources (eg, Schema)
- methods and specifics on the interchange of data modules and compiled publications

### 2.6 Software requirements

The requirements for software, in support of the process data module and resource resolution, are given in [Chap 7.6](#). It covers the requirements for basic functional properties of the software, (eg, the logic engine), which is needed to execute and display process data modules.

---

**2.7 Guidance and examples**

In support of implementation and use of an S1000D environment, guidance and examples are given in [Chap 7.7](#).

**2.8 Schema availability**

Electronic copies of the Schemas for all XML CSDB objects are available for download from the S1000D web site at [www.s1000d.org](http://www.s1000d.org). In addition, online HyperText Markup Language (HTML) documentation of the Schemas and a set of sample instances can be downloaded from the S1000D web site.

**2.9 Applicability**

The technical aspects of evaluating applicability annotations together with guidance on the generation of applicability display text are given in [Chap 7.8](#).

## Chapter 7.2

Chap No./Document No.	Title
<a href="#">Chap 7.6.2</a>	Software requirements - Resource resolution service
<a href="#">Chap 7.7</a>	Information processing - Guidance and examples

## 1 General

The purpose of this chapter is to give an overview of some characteristics and technical requirements concerning information processing.

A characteristic of S1000D is that it outlines an open systems approach to the production of technical publications. The specification does not take into account any particular tool or other proprietary solution. It is important to recognize that system and tool independence (eg, in addressing) is a necessity for interoperability across distributed S1000D implementations.

## 2 Concepts

### 2.1 Use of XML

The XML Schema package, provided by S1000D, covers the factual information (contained in data modules) produced within and for the Product. It also contains the documentation process related information, such as data dispatch notes included in transfer packages.

The Schema package is provided as a set of self-standing schemas, each representing a certain type of object, such as a procedural or fault isolation data module. These schemas are referable by their URL and available for invocation online by produced data modules as specified in [Chap 7.3.1.3](#). With the exceptions of XLink, Resource description framework and Dublin core fragments (refer to [Chap 7.3](#)), each of the schemas declare all components (elements and attributes) that are used in the schema.

For maintainability reasons, the schema package is maintained in a highly modularized form where each part defines objects of a certain type (eg, "complexType" Schema objects), and where each Schema fragment is focused on its specific characteristics and substructures. The application Schema, representing specific types of data modules (eg, descriptive, procedural) are then composed by invocation of a suitable selection of the parts. This variant of the Schema package is usually referred to as the "modularized XML Schema package" (as opposed to the published "flattened Schema package") and is the master for maintenance and development of the S1000D technical base. Even though the modularized Schema package is not supposed to be referenced by factual CSDB objects it is made available for download on [www.s1000d.org](http://www.s1000d.org). The incentive to make this variant of the package available is that it fs potentially be used efficiently when S1000D is being implemented. There are not supposed to exist any produced data modules, or other objects, that refer to the modularized schemas as their underlying structure.

A detailed method of compiling publications, based on XML, is given in [Chap 7.4](#).

#### Note

As of issue 4.0 of the specification support for Document Type Definition (DTD) is dropped.

### 2.2 Graphics and multimedia

Exchange of graphics and multimedia across information systems infrastructure (eg, platforms, tools, systems) has always been an area of considerable difficulty. This also applies to S1000D, since it, by definition, adopts an open system approach.

Information about the use of graphics, multimedia, supported graphics and multimedia formats and interchange of graphics and multimedia can be found in [Chap 3.9.2](#), [Chap 4.8](#), [Chap 7.3.2](#) and [Chap 7.3.3](#).

## 2.3 Referencing and linking

The S1000D Schemas provide specific constructs for expressing cross-references within and references between data modules, including references to, from and within graphics and multimedia elements. In addition, there are supported methods of referencing other information such as legacy publications.

The reference constructs enable a strict and formal method of referring from one place in a publication package to another, and to enable automated resolution of these references into hyperlinks. Refer to [Chap 3.9.5.2.1.2](#).

The reference constructs are based on open standards. However, their main aim is to provide sufficient information to resolve them into hyperlinks, regardless of the technique used. This allows for the use of the S1000D's own "linking language" as described in [Chap 7.4.1](#) and [Chap 7.4.2](#).

Linking mechanisms and resource resolution in a web environment are further described in [Chap 7.6.2](#).

## 2.4 Processes

The specification also includes a method for preparing data in the form of processes. These processes order the sequence of data modules and/or steps within the process, where the traversal thru that sequence can be influenced by user interaction and/or environment conditions (typically equipment status). This sequencing is represented by process data modules, which provide the means to increase the interactivity of IETP, including the possible integration of the information with the Product.

The process concept also introduces the use of a logic engine. This, and its relation to the process data module, is given in [Chap 4.11](#).

More detailed information about the process data module and logic engine can be found in [Chap 3.9.5.2.10](#), [Chap 6.3.1](#), [Chap 7.6.1](#) and [Chap 7.7](#).

## 2.5 Tailoring the application of Schemas

S1000D compliant projects must use the Schemas as supplied. However, a project or an organization can configure the use of various attribute values within the Schemas as described in [Chap 7.3](#) and [Chap 3.9.6](#), as interpreted in their business rules.

## 1 General

### 1.1 Purpose

The purpose of this chapter is to describe and explain the technical aspects of creation and maintenance of CSDB objects. It concentrates on providing information about the underlying XML technology for generating and maintaining data modules.

### 1.2 Scope

Besides the description of the XML Schema structure for data modules, this chapter also contains information and guidance on the preparation of graphics and their definition within data module text for hyper-linking and navigation through graphical hotspots, as well as providing guidance on the selection and use of multimedia.

It covers the following:

- a description of the XML Schemas for data modules. Refer to [Chap 7.3.1](#)
- a description of the technical methods for implementing graphical hotspots. Refer to [Chap 7.3.2](#) and [Chap 3.9.5.2.1.8.](#)
- a description of the technical methods for implementing multimedia. Refer to [Chap 7.3.3](#)

**Note**

XML Schemas for other CSDB objects such as publication modules, data management lists, comments and data dispatch notes are described in corresponding chapters. Refer to [Chap 7.4](#) and [Chap 7.5](#).

<a href="#">Chap 7.3.1.4</a>	Schema - Backwards compatibility

#### 1      General

Technical background on the S1000D Schemas for all CSDB objects is provided here.

#### 2      XML Schemas

The rules and guidance for XML Schemas are given in the following chapters:

- [Chap 7.3.1.1](#) provides a summary of Schema changes
- [Chap 7.3.1.3](#) provides the information how to invoke the corresponding Schema for the different types of CSDB objects
- [Chap 7.3.1.4](#) provides a summary of backward incompatibilities with the Schemas between this issue and Issue 4.0.1

The Schemas can be referenced on the S1000D web site at [www.s1000d.org](http://www.s1000d.org) by use of the respective URL shown in [Chap 7.3.1.3](#). In addition, electronic copies of the Schemas are available for download from the web site at [www.s1000d.org](http://www.s1000d.org). In production, when accessing a Schema by the web is impossible or inconvenient, local copies of the Schema can be used. If so, conformant Schema invocation statements can be achieved if the OASIS XML catalog feature is implemented.

Chap No./Document No.	Title
S1000D	International specification for technical publications using a common source database - Issue 4.1

## 1 General

### 1.1 Purpose

The purpose of this chapter is to provide technical background on S1000D data module XML Schema development.

### 1.2 Scope

Only the changes to the S1000D XML Schema brought about by the Change Proposal Forms (CPF) approved for this issue are recorded in this chapter. Details of changes to previous issues are recorded in Issue 4.1 of this specification.

## 2 Summary of changes

The changes to the XML Schema for data modules for Issue 4.2 are:

- 2009-077MTDTT - Introduction of applicability on inspections and on thresholds
  - Added the optional attribute `applicRefId` to the elements `<inspectionDefinition>` and `<threshold>`.
- 2009-078MTDTT - Sampling attributes
  - Added the new optional attributes `samplingValue`, `samplingUnit` and `samplingRatio` to the element `<sampling>`.
- 2009-079MTDTT - Optional `limitRangeFrom`

- Changed the element `<limitRange>` to require at least one child (either `<limitRangeFrom>` or `<limitRangeTo>`).
- 2009-080MTDTT – Multiple Refs on trigger
  - Added the new optional attribute `occurrenceTrigger` to the element `<trigger>`.
- 2009-101US - Definition of attribute on `<externalApplication>`
  - Changed the definition of the attribute `application` of the element `<externalApplication>` from an entity to a string.
- 2009-123IGBRTT - BR severity levels
  - Added the new configurable optional attribute `defaultBrSeverityLevel` to the element `<brex>`.
  - Added the new configurable optional attribute `brSeverityLevel` to the elements `<snsRules>`, `<structureObjectRule>`, `<notationRule>` and `<nonContextRule>`.
- 2009-133IGBRTT - BR - markup
  - Introduced a new schema for the Business Rules document data module type: `brDoc` Schema, whose main element is the new element `<brDoc>`.
- 2009-134IGBRTT - BR identification
  - Added the new optional and repeatable element `<brDecisionRef>` to the elements `<snsRules>`, `<structureObjectRule>`, `<notationRule>` and `<nonContextRule>`.
- 2010-012SE - Add `<name>` and `<shortName>` in `<zoneSpec>`
  - Added the element `<shortName>` to the element `<accessPointRef>`.
- 2010-019S1 - `<enterpriseRef>`
  - Added the optional and repeatable element `<businessUnit>` to the element `<enterpriseRef>`.
- 2010-034US - Add a security attribute to `<dmTitle>` elements `<techName>` and `<infoName>`
  - Added the group of attributes `securityAttGroup` to the elements `<techName>` and `<infoName>`.
- 2012-015AA - CIR FIN - FLS properties
  - Added the optional elements `<softwareClassification>` and `<softwareCustomizationStatus>` to the element `<functionalItemSpec>`, containing the new configurable mandatory attributes `softwareClassificationValue` and `softwareCustomizationStatusValue`.
- 2012-016AA - CIR FIN - Grounding type

- Added the new optional element `<groundingType>` to the element `<functionalItem>`.
- 2012-020US - Data Restrictions - Derivative Classifications
  - Added the new optional element `<derivativeClassification>` to the elements `<dmStatus>` and `<frontMatterTitlePage>`.
  - Added the new optional attribute `derivativeClassificationRefId` to the group of attributes `securityAttGroup` and to the element `<security>` (several hundred impacted elements).
  - Replaced the existing security attributes by the full group of attributes `securityAttGroup` on the elements `<maintAllocationGroup>`, `<groupNumber>`, `<toolsList>` and `<remarksList>`, therefore implicitly adding the attribute `caveat` to these elements.
  - Other impacts covered under CPF 2009-133IGBRTT.
- 2012-024AA - Specific sourcing
  - Added the new optional and repeatable element `<sourcingType>` to the element `<procurementData>`, containing the new configurable mandatory attribute `sourcingTypeValue`.
- 2012-025EPWG - Make FM title page product illustration multiple
  - Changed the element `<graphic>` to multiple in the element `<productIllustration>`.
- 2013-025US - Fault Isolation enhancements
  - Added the new optional and repeatable element `<actionAlts>` to the elements `<isolationStep>` and `<isolationProcedureEnd>`.
  - Added the optional attribute `applicRefId` to the element `<action>`.
  - Added the attributes `changeType`, `changeMark` and `reasonForUpdateRefIds` to the elements `<isolationStepQuestion>`, `<yesAnswer>`, `<noAnswer>` and `<choice>`.
  - Added the optional elements `<subScript>` and `<superScript>` to the elements `<isolationStepQuestion>` and `<choice>`.
- 2013-026GB - Addition of references to Reason for Update
  - Added the new optional and repeatable element `<simpleRefPara>` to the element `<reasonForUpdate>`.
- 2013-027NN - Empty CSN element after applicability filtering
  - Added the optional attribute `applicRefId` to the element `<catalogSeqNumber>`.
- 2013-028CMPTT - Add two identification attributes to the `<pm>` schema
  - Added a new optional attribute `pmType` to the element `<pm>`.
- 2013-037AA - Wire installation traceability
  - Added the new optional element `<changeAuthorityDataGroup>` to the element `<wireInfo>`.

- 2013-041AA - Revision marking consistency
  - Added the optional attributes `changeType`, `changeMark` and `reasonForUpdateRefIds` to the elements `<quantity>`, `<threshold>`, `<internalRef>`, `<footnoteRef>`, `<inlineSignificantData>`, `<taskDuration>`, `<workArea>`, `<installationLocation>`, `<reqCond>`, `<shortName>`, `<sbProcurementInfo>`, `<noInfo>`, `<descr>`, `<isolationStepQuestion>`, `<choice>`, `<changeAuthorityData>`, `<genericPartData>`, `<assign>` and `<condIncorporation>`.
- 2013-042AA - Add `id` attribute to Service Bulletin material information sub-section
  - Added the optional attributes `id`, `changeType`, `changeMark` and `reasonForUpdateRefIds` to the elements `<sbMaterialSetList>`, `<sbSupportEquipsList>`, `<sbSuppliesList>`, `<sbSparesList>` and `<sbRemovedSparesList>`.
- 2013-044AA – IPD - Operation restriction messages
  - Added the new configurable optional attribute `operationType` to the element `<restrictedOperationNote>`.
- 2013-047LSHTT - Support for SCORM runtime files in S1000D
  - The file notations.xml has been extended by notation declarations for CSS, FLA, JS and ZIP.
- 2013-052LSHTT - Learning chapter text deficiencies
  - Changed the element `<title>` to optional in the element `<lcAudience>`.
- 2013-053LSHTT - Support metadata information related to multimedia resources in S1000D
  - Introduced a new schema for an ICN metadata file, which has the main element `<icnMetadataFile>`
- 2013-054DE - Optional title on `<dmNode>`
  - Added the optional element `<title>` in the element `<dmNode>`.
- 2014-011EPWG - IPD Figure variant number - Bug Fix
  - Changed the definition of the attribute `figureNumber` of the elements `<catalogSeqNumber>`, `<catalogSeqNumberRef>` and `<categoryOneContainerLocation>` to allow one alpha or numerical in the first position.

#### Note

CPF 2013-047LSHTT did not affect data module Schemas directly.

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.2</a>	Data modules - Content section

#### **1 General**

This chapter describes the modular Schema for data modules and gives background information on its development and maintenance procedures.

#### **2 Modular structure**

##### **2.1 Background**

##### **2.1.1 Application of XML**

S1000D requires a unified and neutral way of describing technical information for the Product in any project. This chapter details the S1000D application of XML, a method for describing the structure of a technical document regardless of the final publishing process. XML is system and platform independent data format, thus enabling interchange of technical information across software applications.

The S1000D Schemas for data modules consist of entities which are specific to a type of data module as specified in [Chap 3.9.5.2](#). This modular design of the Schemas allows for incremental update when new types of data modules are required.

To provide a versatile support to system/tool implementers, S1000D contains definitions of the object structures (data modules, etc) in several formats. Thus, apart from the modular Schema, which is the master, all structures are also provided in the flat Schema.

## 2.1.2 Development objectives

The S1000D Schemas for data modules have been developed with the following objectives:

- modular form. The master Schemas have a modular form that provides a very good basis for simple and safe maintenance of the Schemas.
- compliance with standards. The prime structure of the Schemas reflects the S1000D specification. The Schemas comply with W3C recommendations.
- versatile implementation formats. The modular master Schemas enable simple automatic generation of the data module structures in flat Schemas.
- backward compatibility. To ensure as far as possible backward compatibility between subsequent versions and the initial Schemas.

## 2.1.3 Development phases

### 2.1.3.1 Analysis

Schema development involved the analysis of S1000D requirements, the generation of XML content models and the evaluation of the most effective way of modularization. Structure charts produced from the analysis of different data module types were included in this phase.

### 2.1.3.2 Testing

Schema testing is undertaken at two levels:

- component testing of the individual Schema modules
- integrated testing of the complete Schema

During construction and update, the Schemas are parsed to ensure compliance with the W3C recommendations. To ensure a wide usability of the Schemas, this activity is carried out on a number of different available parsers. The testing includes integration of graphics and multimedia objects with the XML coded text.

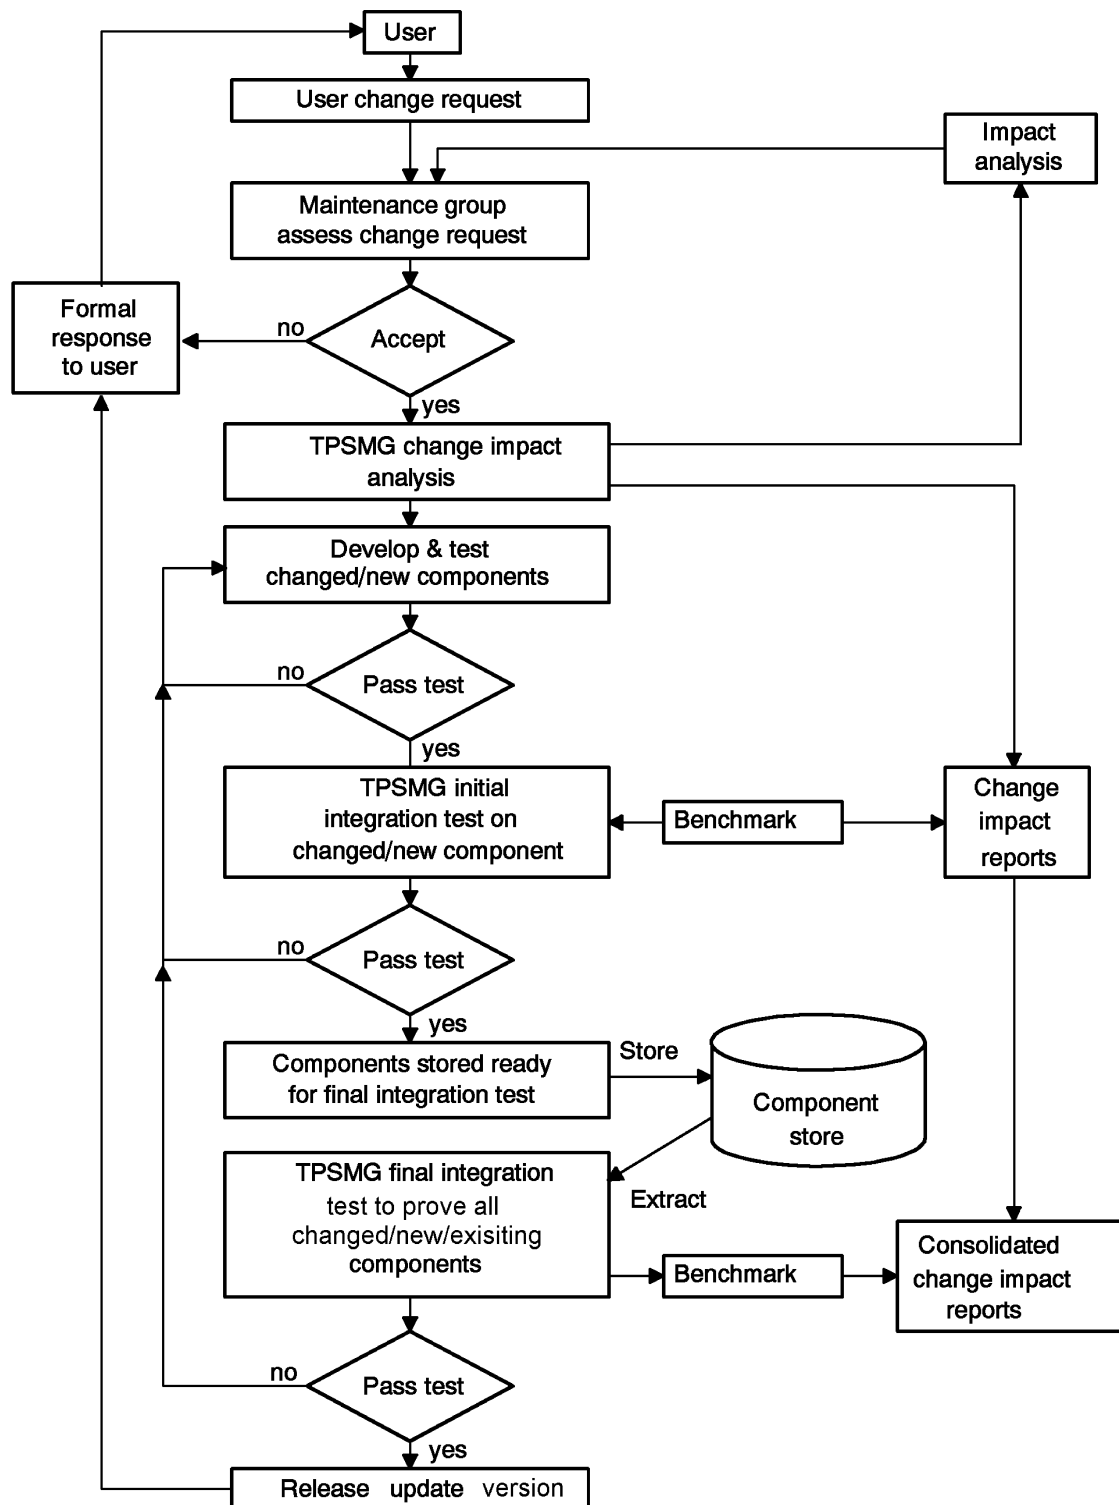

### 2.1.3.3 Review and approval

Before release of a specific version reflecting the requirements of the corresponding S1000D issue and change, the Schemas are reviewed by the Electronic Publications Working Group (EPWG) and approved by the Steering Committee.

## 2.1.4 Life cycle management

To achieve the necessary control during subsequent maintenance of the Schemas a life cycle management procedure is applied. Strict version control of releases is maintained.

[Fig 1](#) shows the development and life cycle upgrade plan.

ICN-S1000D-A-07030102-G-S3627-00058-A-03-1

Fig 1 Schema development and life cycle upgrade plan

---

**2.1.5 Ownership and usage**

The S1000D Schemas are in the public domain; however, they remain the property of the S1000D issuing authorities. There are no additional charges or royalties required. In the event that users change the Schemas, then it is not allowed to use the name or reference S1000D Schemas for the results.

**2.2 Overview of modular structure**

This section gives an overview of the structural breakdown of the Schemas for data modules.

**2.2.1 Theory of operation**

The modular Schema structure is controlled by incorporating the different Schema modules as required. The paths through the Schema are given by references to and inclusion of the corresponding Schema modules. As applicable redefinitions of reused schema objects are made.

There is one main entry for each type of data module structure. The main entry for Schemas is given in each data module XML instance by attribute `xsi:noNamespaceSchemaLocation` of the root element `<dmodule>`.

Each "main" entity:

- redefines as needed the definition of objects that are reused
- includes the various components (complexTypes)
- declares the root element `<dmodule>`

## 1 General

### 1.1 Purpose

Technical information on S1000D XML Schema invocation is provided below.

### 1.2 Scope

How to invoke the appropriate XML Schemas that specify the structures of the various types of CSDB objects is described here.

For each type of CSDB object it is shown how to call the corresponding XML Schema.

For XML instances to be validated against the corresponding XML Schema, the main entry point to the XML Schema must be given as the content of attribute `xsi:noNamespaceSchemaLocation` in Uniform Resource Locator (URL) form. Examples are given below.

## 2 Applicability Cross-reference Table (ACT) information

None	

## **1 General**

### **1.1 Scope**

The scope of this chapter is limited to summarizing the backward incompatibilities since Issue 4.1 of the XML Schema for data modules.

### **1.2 Purpose**

This chapter provides details of the character and degree of changes that are included between Issue 4.1 and this issue. It also provides guidance when assessing the impact of converting an existing CSDB from Issue 4.1 to this issue and can be used as one source of information, among many others, when selecting the issue of the specification that is most suitable for a project to adopt.

### **1.3 Previous backward compatibilities**

Details of the backwards compatibilities between previous issues of the XML data module Schema are in Issue 4.1 of S1000D.

---

## **2        Numbering releases of the specification**

### **2.1       Major**

A major backward incompatibility is one where some degree of human intervention is required to convert data from one issue of the specification to another.

### **2.2       Minor**

A minor backward incompatibility is one where automated processes can be used to convert data from one issue of the specification to another with less human intervention.

Beginning with Issue 4.0, major releases are always backward incompatible. Major releases of S1000D can contain both major and minor incompatibilities whereas minor releases only contain minor incompatibilities.

All major releases are given an issue number that is incremented in the first position. For example, a major issue after Issue 4.6 is numbered Issue 5.0.

The issue number of a minor release is increased in the second position. For example, the first minor release after Issue 5.0 is numbered 5.1.

### **2.3       Patches**

Patches are indicated by addition of a letter in the third position of the issue number; for example Issue 4.1.A.

## **3        Backward compatibility description of Issue 4.2**

The Issue 4.2 is fully backward compatible with Issue 4.1. There are neither major nor minor backward incompatibilities.

## Chapter 7.3.1.5

<a href="#">Chap 4.10</a>	Information management - Business rules exchange

## **1 General**

### **1.1 Purpose**

The purpose of this chapter is to provide number of attributes with values and interpretations that can be adjusted to the needs of the project or the organization.

S1000D also provides a means for the tailoring of these attributes in a controlled manner. This is permissible for such attributes that are not crucial for the function of the specification.

#### **Note**

All tailoring must be made in such a way that maximizes interoperability.

## **2 Configuration of attributes**

[Chap 3.9.6](#) provides a listing of the attributes concerned, including their defined values sets.

### **2.1 Tailoring method**

To each configurable attribute, S1000D allocates a set of values. For a subset of these values there is an S1000D interpretation of each value. In addition, for each attribute there are a number of specific values open to interpretation by the project or the organization.

Tailoring can be of these kinds:

- reduction of the set of attribute values defined in the Schemas, in order to match the project or the organization needs
- introduction of interpretations for project available values (51-99)
- translation of interpretations of S1000D reserved values to other languages (eg, for styling purposes)

It is imperative that tailoring (ie, sub-setting) of attribute values does not violate project or organization requirements. Furthermore, the agreed interpretations must be communicated within the project or the organization to enable all parties concerned to take the proper measures to handle the values/interpretations (eg, in viewers).

### 2.1.1 S1000D configurable attributes

The attribute value sets available for tailoring are described in [Chap 3.9.6](#). Each attribute contains assigned values by S1000D which must not be changed and a set of values available for project or organization specific definition.

### 2.1.2 Project BREX file

Project specific use of allowable attribute values are to be reflected in a project specific BREX data module. Refer to [Chap 4.10](#).

#### Note

If, for some reason, a project BREX data module is not employed, then information of how attributes are used, like information about tailoring in general, must be communicated by some other means.

The sets of attribute values defined in [Chap 3.9.6](#) and in the default BREX data module must not be extended by further values.

## 1 General

This chapter contains information and guidance on the preparation of graphics for hyper-linking and navigation through graphical hotspots. It defines in particular the S1000D profiles for Tagged Image File Format (TIFF) raster graphics and CGM vector graphics, and describes the technical methods for implementing graphical hotspots.

The concept of graphical hotspots is based on the World Wide Web Consortium (W3C) WebCGM profile which utilizes standard CGM version 4 Application Structures (APS) of ISO/IEC 8632:1999 for grouping graphical primitives into addressable objects.

A graphics object can be accompanied by metadata provided in a separate ICN metadata file. For details on its use, refer to [Chap 3.9.2.7](#).

## 2 Graphic requirements

The basic S1000D principle for graphics is that they must contain only graphical information. Apart from identifiers such as callout/item numbers or generic names, all other non-graphical information associated with the building blocks of a graphic or the graphic itself must be stored and maintained externally in the XML environment. This basic principle also applies to legends and other textual information such as notes and annotations.

Embedded non-graphical information inhibits the reuse of graphics in different contexts and requires the use of a graphics editor tool to maintain them. An example for reuse is to provide the same illustration in electronic parts catalogs for different natural languages.

For illustrations containing or made up of raster images, CGM is the recommended S1000D format for interchange.

### 2.1 CGM versions

ISO/IEC 8632 defines four metafile versions. Every metafile declares its version with the METAFILE VERSION element in the metafile descriptor. All versions are nested and upwardly compatible. A valid version 1 metafile is automatically a valid version 2, 3, and version 4 metafile, and so on. This means for example that a metafile version 1 can be enriched by only version 4 elements for using it in intelligent graphics applications.

#### 2.1.1 Metafile version 1

Version 1 provides a basic drawing and picture interchange capability. It is relatively simple, and is suited to simple and common graphical tasks. Nevertheless, this basic drawing set also

embraces more sophisticated graphical primitives than just polylines, polygons, or graphical text: Rectangles, circles, ellipses and arcs are also permitted in version 1 metafiles.

### **2.1.2 Metafile version 2**

Version 2 metafiles allow all version 1 elements, and add graphical segment capabilities. Notable additions are: segmentation and the closed figure primitive.

#### **Note**

Segmentation is prohibited in the profile.

### **2.1.3 Metafile version 3**

Version 3 metafiles permit version 1 and 2 elements, and add the capability to represent compressed tiled images, define external symbol libraries, and provide greater control of drawing aspects. Beside compound regions and paths, higher-level primitives such as hyperbolic and parabolic arcs, non-uniform B-splines, and polybeziers were introduced. The support of these higher-level primitives is essential when transforming 3D Computer Aided Design (CAD) data to 2D CGM. Version 3 provides a significant increase in CGM's capability.

### **2.1.4 Metafile version 4**

Version 4 metafiles allow all previous version elements, and add application-structuring extensions. These capabilities are critical for the use of CGM in intelligent graphics applications.

## **2.2 Terminology**

### **2.2.1 Application profile**

An Application Profile (AP) is a set of specifications (beyond that in ISO/IEC 8632) appropriate to a particular environment. Profiles are used as a method for defining subsets of ISO/IEC 8632 by identifying the CGM elements, parameters, options, and implementation requirements necessary for the effective and unambiguous use of the standard.

### **2.2.2 Application structure**

An Application Structure (APS) is a sequence of metafile elements delimited by the BEGIN APPLICATION STRUCTURE and END APPLICATION STRUCTURE elements, containing one or more optional APPLICATION STRUCTURE ATTRIBUTE elements and containing one mandatory BEGIN APPLICATION STRUCTURE BODY element. APS are used to group CGM elements for retrieval, hyperlinking, and other specific application-dependent operations.

An APS is uniquely identified within a metafile by the value of the ID parameter associated with its BEGIN APPLICATION STRUCTURE element.

#### **Note**

APS with different ID parameter values can be nested to any level.

### **2.2.3 CGM element**

A CGM element is a functional item that can be used to construct a picture or convey information.

### **2.2.4 CGM generator**

The process or equipment that produces the CGM is called a CGM generator.

### **2.2.5 CGM interpreter**

The process or equipment that reads the CGM and interprets the contents is called a CGM interpreter.

### **2.2.6 Graphical hotspot**

A graphical hotspot is a graphical object that participates in a link.

**2.2.7 Graphical object**

A graphical object is an addressable logical unit within a picture grouping graphical primitives and/or graphical objects. These groups are realized as standard CGM version 4 APS and allow a hierarchical structure to be imposed on a picture or to create collections of graphical objects.

**2.2.8 Graphical primitive**

A graphical primitive is a basic drawing element that defines the geometry and its presentation. Examples are:

- simple generic drawing primitives such as polylines, polygons, and sets of these
- specialized primitives such as rectangles, circles, ellipses, circular and elliptical arcs
- graphical text primitives such as restricted text and append text
- curves such as hyperbolic and parabolic arcs, non-uniform B-splines, and polybeziers
- embedded raster elements such as cell and tile arrays in uncompressed or compressed (CCITT4, Joint Photographic Experts Group (JPEG) or PNG) format.

Graphical primitives have rendering details and/or properties associated with them such as line attributes (type, width, color, etc), fill attributes (color, hatch style, pattern, etc) or text attributes (color, path, alignment, font, etc), where appropriate.

**2.2.9 Metafile**

A metafile is a mechanism for the storage and transfer of graphical data and control information in a device-independent manner. A metafile consists of one or more pictures, which in turn are composed of graphical primitives and their associated attributes.

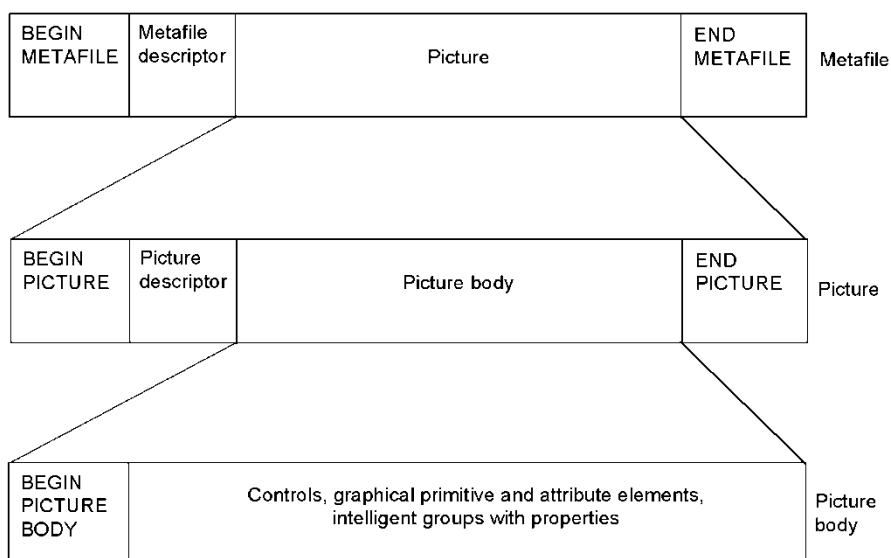

**2.3 S1000D CGM profile****2.3.1 General**

The S1000D CGM profile is defined as a cascading profile from the W3C Recommendation: [REC-webcgm21-20100301](https://www.w3.org/TR/REC-webcgm21-20100301). WebCGM 2.1 is a full profile based on the ISO model profile as defined in ISO/IEC 8632:1999.

The presentation of the cascading profile maintains the table numbering from the ISO model profile, but only presents table entries where the S1000D profile differs from WebCGM. References in the functionality column of the profile usually relate to sections in the CGM standard.

**2.3.2 CGM structure**

[Fig 1](#) shows the structure of an S1000D CGM that consists always of one and only one picture. The picture itself contains CGM version 1, 2 or 3 graphic elements as well as version 4 application structures.

ICN-C0419-S1000D0095-001-01

- 2.3.3.3 Application structure elements
- [Table 4](#) gives information about the application structure elements which are profiled for S1000D.

*Table 4 Application structure elements*

Functionality	Specifications - S1000D profile	Specifications - WebCGM profile
T.24.1	Same as WebCGM profile: No	Same as ISO model profile: No
APPLICATION STRUCTURE ATTRIBUTE	<p>Element is: Required No, Permitted Yes, Prohibited No</p> <p>Define the set of structure elements for use within application structures, and attach complete syntactic and semantic description:</p>	<p>Element is: Required No, Permitted Yes, Prohibited No</p> <p>Define the set of structure elements for use within application structures, and attach complete syntactic and semantic description:</p>

Functionality	Specifications - S1000D profile	Specifications - WebCGM profile
	<p><b>The set of attributes allowed on application structure type "grobjct" is listed in <a href="#">Para 2.3.3.4</a> of this chapter.</b></p> <p>Other: None.</p>	<p>The set of attributes allowed is listed in section 3.2.2, which includes complete syntactic and semantic definitions, as well as permissibility according to application structure type.</p> <p>Other: None.</p>

- 2.3.3.4      Application structure attributes  
As opposed to WebCGM, only one APS type named "grobjct" is permitted in an S1000D version 4 CGM. The APS type is realized as a parameter of the BEGIN APPLICATION STRUCTURE element.
- In accordance with S1000D requirements, the essential navigation information to reside within a graphic is the unique identifiers of graphical objects and their names. An identifier is realized as a parameter of the BEGIN APPLICATION STRUCTURE element itself and serves as the unique address of a graphical object within a single CGM.
- All other non-graphical information about graphical objects (metadata) must be, in general, be kept outside of the metafile. This approach guarantees that graphics remain neutral and can be more easily adapted to a new target environment if required.
- Hence, only a subset of APS attributes defined in WebCGM is applicable to S1000D. From the WebCGM set of optional APS attributes, only `name`, `region` and `viewcontext` are permitted. Other WebCGM APS attributes such as `linkuri` and `screen tip` are realized in a different manner outside of the graphical environment (ie, in the XML data modules) and will be mapped to the APS attributes at runtime through the XML Companion File (XCF).
- 2.3.3.5      APS attribute `name`  
The meaning of attribute `name` is to associate a generic name with an APS of type "grobjct". Unlike the APS ID parameter, the value of the attribute `name` need not be unique within a metafile. The object can optionally be addressed by this value in circumstances where all instances of the object should be brought into view at once.
- An example would be to highlight all occurrences of a specific callout/item number in an illustration.
- 2.3.3.6      APS attribute `region`  
The meaning of attribute `region` is to associate a spatial region for picking purposes with an APS of type "grobjct". Simple regions of type rectangle, ellipse, closed polygon and closed continuous polybezier can be defined. The APS attribute `region` can occur at a maximum of once in an APS, however complex regions, which comprise a collection of simple regions, can be built allowing the definition of disjointed subregions, regions with holes, etc.
- If no region is defined, an implied region is assumed by the extents of the graphical primitives contained in the APS body.
- Note**  
If a region is defined, the set of primitives making up the graphical object need not be enclosed by an APS. In this case, the given spatial region can geometrically identify the object. A practical example would be to define overlay regions to serve as hotspot areas for embedded raster images.

---

#### 2.3.3.7 APS attribute `viewcontext`

The attribute `viewcontext` provides specification to viewers of the initial view of an object when the viewer has been directed to navigate to the graphical object. In essence, this attribute allows a rectangular viewport for fitting the object and its graphical surroundings into the viewer's display to be defined. This can also include a zoom operation.

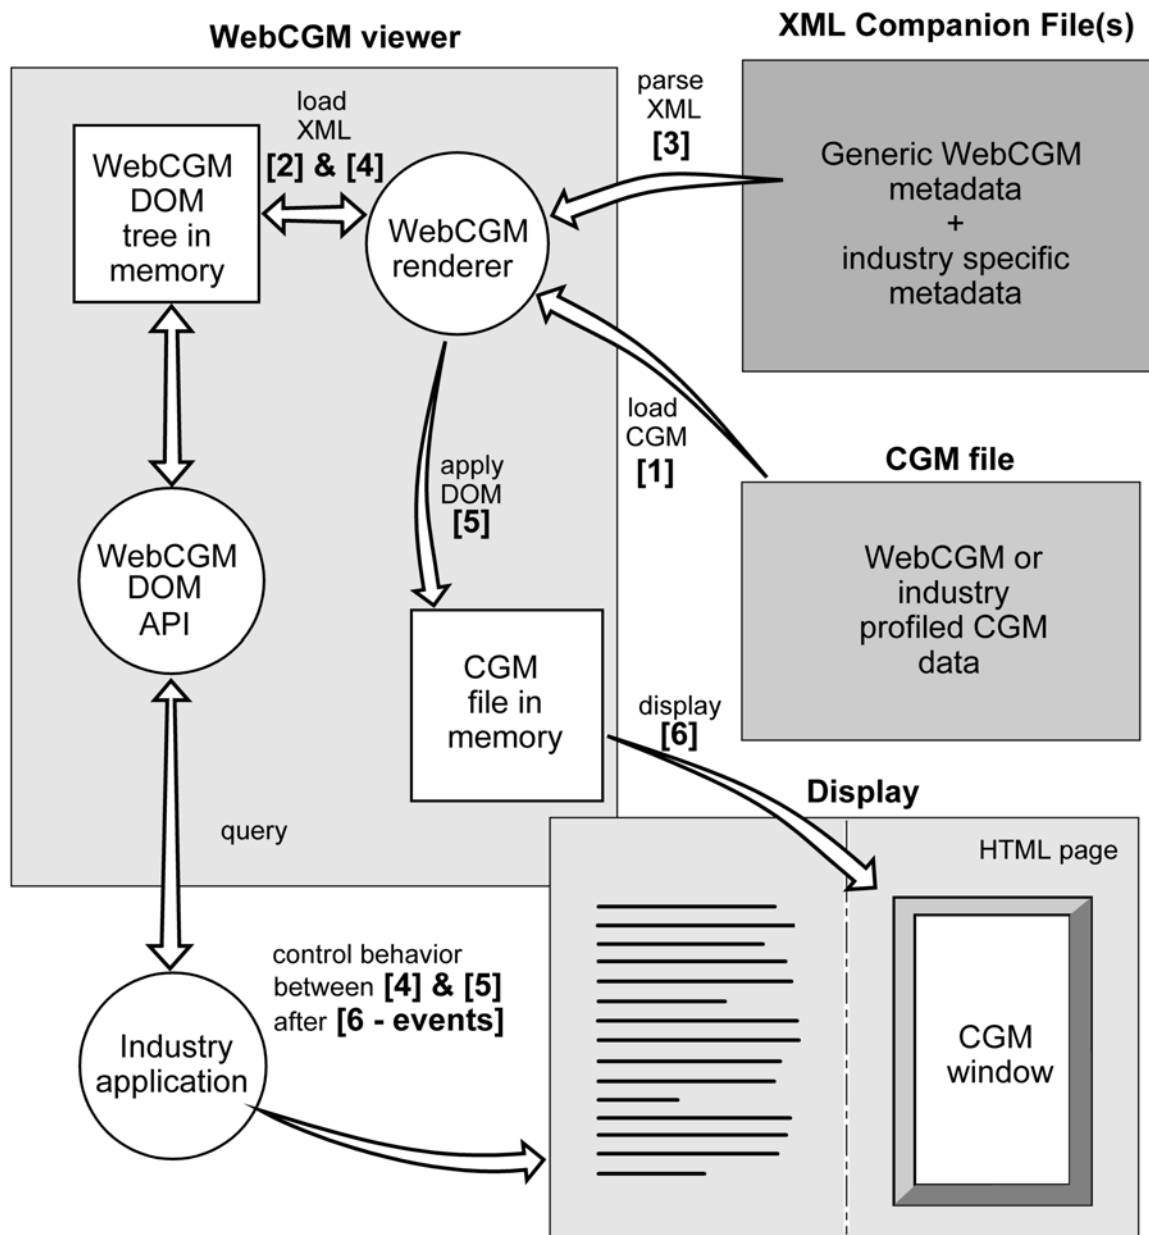

If attribute `viewcontext` is not given, but attribute `region` is there, the rectangular viewport is the rectangle enclosing the given region.

If neither attribute `viewcontext` nor attribute `region` are given, the rectangular viewport is the bounding box of the graphical primitives of the object.

The viewer moves the addressed graphical object into view and indicates visually that the region or the graphical primitives of the object is the target of the link. The manner in which the viewer creates the new display and highlights the graphical object is viewer dependent.

#### 2.3.4 WebCGM 2.1 architecture

[Fig 2](#) illustrates the interaction between a WebCGM viewer, external metadata, and a user application in general.

ICN-C0419-S1000D0192-001-01

Fig 2 WebCGM 2.1 viewing process

The process involves [1] the WebCGM viewer interpreting the CGM file, [2] loading the file into a Document Object Model (DOM) tree in memory, [3] parsing external WebCGM metadata, along with S1000D specific metadata, and [4] adding that metadata to the DOM tree.

At this point an external application has an opportunity to apply additional style and behavior attributes to the DOM via an ECMAScript binding. The WebCGM viewer then [5] applies the DOM to the CGM in memory and [6] sends the rendered image to the viewing window.

At this point the external application can control style attributes of the rendered illustration and the behavior of the WebCGM viewer.

#### 2.3.4.1 WebCGM 2.1 XCF

WebCGM 2.1 includes an external companion file that enables control of the behavior of the WebCGM viewer through an XML DOM interface. The XML Schema associated with this external file is extensible to include industry specific metadata.

The content model described in [Chap 3.9.5.2.1.8](#) does not support the XCF directly. It is generated at the point of use. The S1000D companion file content is based on the context dependent information given by the S1000D element `<graphic>` and the S1000D element `<hotspot>`.

If the S1000D element `<hotspot>` is present in the content model of element `<graphic>`, an XCF must be generated to apply the information given in element `<hotspot>`. During the dynamic generation of the XCF instance, the decision to transform the element `<hotspot>` is based on its applicability. This means that applicability filtering must be applied when the XCF instance is generated.

#### 2.3.4.2 Creating the S1000D XCF

The S1000D XCF content is made up of five major structures.

##### 2.3.4.2.1 The webcgm structure

The first structure of an S1000D XCF is the webcgm structure. The element `<webcgm>` is the document level element in the Schema. The content is derived from the S1000D element `<graphic>`. [Table 5](#) represents the mapping.

Table 5 XCF mapping of element `<graphic>`

S1000D element <code>&lt;graphic&gt;</code>	XCF element <code>&lt;webcgm&gt;</code>
Attribute <code>infoEntityIdent</code>	Attribute <code>id</code>
System identifier associated with the entity given in attribute <code>infoEntityIdent</code>	Attribute <code>filename</code>

The following attributes of the XCF element `<webcgm>` can be used by an external application to override the properties given in the CGM at rendering time:

- `background-color` (O), the background color
- `pictureVisibility` (O), the visibility of the picture that can have one of the following values:
  - `"on"`
  - `"off"`

The style attributes given in the group `stylePropertiesAttGroup` of the XCF Schema can also be used for dynamic rendering.

For further details refer to the WebCGM 2.1 specification.

##### 2.3.4.2.2 The grobject structure

The second structure of an S1000D XCF is the grobject structure. The content here is derived from the S1000D element `<hotspot>`. [Table 6](#) represents the mapping.

Table 6 XCF mapping of element *<hotspot>*

S1000D element <i>&lt;hotspot&gt;</i>	XCF element <i>&lt;grobjct&gt;</i>
Attribute applicationStructureIdent	Attribute apsid
Attribute hotspotTitle	Attribute screentip
Values of attribute visibility	Values of attribute visibility
– "visible"	– "on"
– "hidden"	– "off"

The following attributes of the XCF element *<grobjct>* can in addition be used by an external application to override the properties of graphical objects given in the CGM at rendering time:

- interactivity (O), the interactive behavior of the graphical object. The attribute can have one of the following values:
  - "off"
  - "inherit"
  - "on"
- the style attributes given in the group stylePropertiesAttGroup of the XCF Schema. Refer to [Para 2.3.4.2.1](#).

#### 2.3.4.2.3 The linkuri content

The third structure of an S1000D XCF is the linkuri content.

The S1000D element *<internalRef>*, the S1000D element *<dmRef>* and the S1000D element *<catalogSeqNumberRef>* of the S1000D element *<hotspot>* are mapped to the XCF element *<linkuri>*. The required XCF attribute uri is derived from the attributes associated with the S1000D element *<internalRef>*, the S1000D element *<dmRef>* and the S1000D element *<catalogSeqNumberRef>*. [Table 7](#), [Table 8](#), and [Table 9](#) represent these mappings.

Table 7 XCF mapping of element *<internalRef>*

S1000D element <i>&lt;internalRef&gt;</i>	XCF element <i>&lt;linkuri&gt;</i>
Attribute internalRefId or attribute referredFragment or attribute xlink:href	Attribute uri
Attribute xlink:show and/or attribute xlink:actuate	Attribute behavior
Attribute targetTitle or attribute xlink:hotspotTitle	Attribute desc

Table 8 XCF mapping of element *<dmRef>*

S1000D element <i>&lt;dmRef&gt;</i>	XCF element <i>&lt;linkuri&gt;</i>
Attribute referredFragment or attribute xlink:href	Attribute uri

S1000D element <dmRef>	XCF element <linkuri>
Attribute xlink:show and/or attribute xlink:actuate	Attribute behavior
Element <dmTitle> or attribute xlink:hotspotTitle	Attribute desc

Table 9 XCF mapping of element <catalogSeqNumberRef> (implicit linking)

S1000D element <catalogSeqNumberRef>	XCF element <linkuri>
For chapterized IPD: The attributes modelIdentCode, systemDiffCode, systemCode, subSystemCode, subSubSystem, assyCode, figureNumber, figureNumberVariant, itemLocationCode, item and itemVariant or for non-chapterized IPD: The attributes initialProvisioningProjectNumber, responsiblePartnerCompanyCode, figureNumber, figureNumberVariant, itemLocationCode, item and itemVariant or for both chapterized and non-chapterized IPD if a reference to a specific ISN is needed: The attribute itemSeqNumberValue or the attribute xlink:href	Attribute uri
Attribute xlink:show and/or attribute xlink:actuate	Attribute behavior
Attribute xlink:hotspotTitle	Attribute desc

#### Note

In this context, the values of attribute xlink:show are restricted to "new" or "replace" and the value of attribute xlink:actuate is restricted to "onload".  
The existence of the attribute xlink:show overrides any attribute xlink:actuate that can be present.

#### 2.3.4.2.4 The bindById and bindByName structures

The other two structures of an S1000D XCF are bindById and bindByName. The child element <bindById> of element <webcgm> is equivalent to the child element <grobjct> of element <webcgm>. The child element <bindByName> of element <webcgm> attaches the external metadata to any grobjct(s) in the CGM that have the same attribute name.

The content of bindById is mapped exactly the same way as the content of grobjct.

The content of bindByName is mapped the same way as the content of grobjct apart from the attribute apstargetname. The XCF attribute apstargetname of the XCF element <bindByName> is derived from the S1000D attribute applicationStructureName of the S1000D element <hotspot>.

## 2.4 S1000D TIFF profile

### 2.4.1 General

Binary raster graphics interchanged in the TIFF must utilize the CCITT Group 4 compression algorithm. Colored raster graphics interchanged in TIFF must utilize the loss-less Lempel-Ziv-Welch (LZW) compression method as defined in the Adobe TIFF 6.0 specification.

S1000D prohibits multiple images in a single TIFF file. The acceptable resolutions (pixel density) are 300, 400, 600, and 1200 pixels per inch (ppi) with a minimum resolution of 300 ppi.

### 2.4.2 Profile details

The S1000D application profile for TIFF files is defined as a delta-profile based on the Adobe TIFF 6.0 specification. It is detailed in the following, but gives only information where it differs from the TIFF specification.

#### 2.4.2.1 Image file header

The offset in bytes of the first and only Image File Directory (IFD) must be 8 from the beginning of the TIFF file.

#### 2.4.2.2 Tag names and values

[Table 10](#) lists the TIFF tags with their names and values which are profiled for S1000D.

*Table 10 S1000D profile of TIFF tags*

Tag name	Tag value	Specifications - S1000D profile
NewSubfileType	254	permitted - value must be 0
SubfileType	255	prohibited
BitsPerSample	258	required - values must be 1, 4 or 8 (triple 8 for RGB)
Compression	259	required - value must be 4 (bi-level: Group 4 fax) or 5 (color: LZW)
PhotometricInterpretation	262	required - value must be 0, 1, 2 or 3
FillOrder	266	permitted - value must be 1
DocumentName	269	prohibited
ImageDescription	270	required - value must be the S1000D ICN in the form "ICN-icn", where "ICN-" is a static prefix and "icn" denotes the core ICN as defined in <a href="#">Chap 4.4</a> .
Orientation	274	required - values must be 1 or 4
SamplesPerPixel	277	required - values must be 1 or 3 (3 for RGB only)
MinSampleValue	280	prohibited
MaxSampleValue	281	prohibited
XResolution	282	required - values must be 300, 400, 600 or 1200
YResolution	283	required - values must be 300, 400, 600 or 1200
PlanarConfiguration	284	permitted - value must be 1
PageName	285	prohibited
XPosition	286	prohibited

Applicable to: All

**S1000D-A-07-03-0200-00A-040A-A**

**Chap 7.3.2**

<b>Tag name</b>	<b>Tag value</b>	<b>Specifications - S1000D profile</b>
YPosition	287	prohibited
FreeOffsets	288	prohibited
FreeByteCounts	289	prohibited
GrayResponseUnit	290	prohibited
GrayResponseCurve	291	prohibited
T4Options	292	prohibited
T6Options	293	required for compression = 4, otherwise prohibited
ResolutionUnit	296	required - value must be 2
PageNumber	297	prohibited
TransferFunction	301	prohibited
ExtraSamples	338	prohibited

## 1 General

Information and guidance on the use of multimedia and definition of recommended minimum standards is addressed. Multimedia is intended to be used as an enhancement to the verified data within a data module, not instead of that data and as such must be verified alongside the data it supports. The element `<multimediaAlts>` is used to provide the capability to group several alternate solutions of multimedia. For further information on the use of alternates, refer to [Chap 4.13.2](#). Further guidance on the authoring of multimedia can be found in [Chap 3.9.2](#), [Chap 3.9.5.2.1.7](#), and [Chap 3.9.5.2.1.8](#).

A graphics object can be accompanied by metadata provided in a separate ICN metadata file. For details on its use, refer to [Chap 3.9.2.7](#).

## 2 Multimedia

### 2.1 Abbreviations and units of measure used in the chapter

General abbreviations and units of measure are given in [Chap 9.2](#). Abbreviations and units of measure that are specific to this chapter are:

- Digital Video (DV)
- Digital Versatile Disk (DVD)
- Family of color spaces used in video systems (YCbCr), where Y is the luma component, and Cb and Cr are the blue and red chroma components
- Motion Pictures Expert Group (MPEG2), which is the standard for generic coding of moving pictures and associated audio information

### 2.2 Project guidance

When selecting multimedia for use within a project consideration must be given to the role in which it will operate. Display background, use of colors and presentation methods must be considered along with the different working conditions in which the multimedia will be used. Hardware must be chosen on its ability to deliver the project's chosen multimedia types and a project needs to be aware that additional hardware such as headphones and amplifiers can be required. The project or the organization must also address verification, change management and production methods, as well as file naming conventions, file structure and hierarchy for multimedia production outside the CSDB.

Other items to consider are the user interface, whether the multimedia will be displayed at full screen size or at a predetermined size, and the use of PDF for printing functionalities in support of media elements. It is recommended that a project consider capture rates and file sizes as these affect the quality and loading times. A balance between quality and file size must be achieved. The project or organization must therefore look at utilizing multimedia authoring/production tools that aid and utilize efficient compression on streaming technologies.

A project is responsible for selecting its own multimedia types, although it is recommended to avoid the use of proprietary formats. These formats can be costly to license and maintain, which can hinder interchangeability. The use free and open codecs and specifications is recommended, where open specification means:

- any project can read or write data from/to a file created according to the specification
- the specification contains details on the behavior of objects in a file created according to the specification
- the specification is owned/used by multiple vendors/companies
- no cost is associated with implementing the specification

A list of multimedia types with notations included in the schemas is given in [Table 3](#), [Table 5](#), [Table 6](#), and [Table 7](#). The list is not definitive and a project is free to add its own notations. The more complex multimedia will often come at a premium for both cost and hardware/software requirements.

## 2.3 Multimedia

**Description:** The element `<multimedia>` contains the multimedia content. It is the parent of the element `<multimediaObjects>`, which contains the multimedia objects and the element `<parameter>`. The element `<parameter>` contains the attribute for passing parameter values to and from objects within the multimedia scene. The element `<multimedia>` and the element `<multimediaObjects>` are described in [Chap 3.9.5.2.1.7](#). The element `<parameter>` is described in [Chap 3.9.5.2.1.8](#).

## 2.4 Types of multimedia

### 2.4.1 Audio

Audio can be a sound track, audible effect or a pure narrative heard to warn, support, or clarify a procedure or diagnosis steps and actions. All of these audio elements can be embedded or linked externally with displayed media. Presentation standards must be addressed as well as content, duration and context of the audio. Consideration must be given to the anticipated environment to determine the usability of audio.

Examples include operator alerts, presentation clips, or complete audio representation of the data. [Table 2](#) details the recommended minimum rates for audio. A list of audio types with notations included in the schemas is given in [Table 3](#).

The following list shows the recommended use of audio:

- natural sounds to clarify the result of actions
- audio that will enhance video, adding information required in performing the displayed actions
- user controlled audio narration from verified technical information to enhance user understanding
- aural warnings and audible alarms heard on the flight deck or procedural queue to an action

*Table 2 Audio - Recommended minimum rates*

Type	Minimum capture	Low bandwidth output maximum	Low bandwidth output minimum	Broad bandwidth minimum	Minimum output
Master	48 kHz 16 bit	-	-	-	44 kHz 16 bit
Effects	48 kHz 16 bit	-	16 kbps	64 kbps	96 kbps
Voice	48 kHz 16 bit	44 kbps	8,5 kbps	64 kbps	96 kbps
Sound tracks	48 kHz 16 bit	-	32 kbps	96 kbps	128 kbps

*Table 3 Audio types*

Encoding	File extension type
Audio AIFF Format sound	AIF, AIFC and CDDA
Audio MIDI	MID, MIDI and RMI
Audio Playlist	PLS

Encoding	File extension type
CD Audio	CDA
Microsoft RIFF chunk for Waveform Data	WAV
MIDI	KAR and SMF
MP3 format sound	M3U, M3URL, MP3 and SWA
Sun Audio	AU and SND
ULAW	ULW
Windows Media Audio	WMA

#### 2.4.2

##### Video

The term video in this case means real life or synthetic moving images of equipment actions, procedural steps or a captured live event. These clips can include audio narration or a sound track. Video can be linked with other media objects. Video is used primarily to show a unique procedure. Presentation standards must be addressed as well as content, duration and context of the video. [Table 4](#) details the recommended minimum rates for video. A list of video types with notations included in the schemas is given in [Table 5](#).

The following list shows the recommended use of video:

- real images to clarify a complex or rarely required maintenance procedure
- demonstrations
- embedded training
- presentations

Table 4 Video - Recommended minimum rates

Type	Minimum capture Digital Video (DV)	Minimum capture DV frames per second	Minimum capture DV chroma sampling	Recording media minimum compression	Minimum output
Color space	YCbCr <sup>1</sup>	-	-	-	-
Data rate	25 Mbps	-	-	-	-
Resolution PAL/ SECAM	720 px x 576 px	25 fps	4:2:0	5:1	-
Resolution NTSC	720 px x 420 px	29,70 fps	4:1:1	5:1	-
Low bandwidth	320 px x 240 px (Output)	-	-	-	80 kbps minimum <sup>2</sup>
Broad bandwidth	640 px x 480 px (Output)	-	-	-	256 kbps maximum
Profile@level	-	-	-	-	MP@ML <sup>3</sup>

<sup>1</sup> Device: YCbCr – Based on IEC 61834 standard for helical scan digital recording methods

Type	Minimum capture Digital Video (DV)	Minimum capture DV frames per second	Minimum capture DV chroma sampling	Recording media minimum compression	Minimum output
2	Acceptable, but not recommended				
3	MPEG-2 Profiles at Main Level (720 x 480 pixels at 30 Hz max frame rate or 720 x 576 pixels at 25 Hz max frame rate, 4:2:0 sampling (DVD: 9,8 Mbps))				

Table 5 Video types

Encoding	File extension type
Autodesk Animator FLIC Format FLI	FLI
Digital Video	DIF and DV
Macromedia Flash	FLA
Microsoft RIFF chunk for Audio/Visual Interleaved Data	AVI
Motion Picture Experts Group video	MP2, MP2V, MP4, MPE, MPEG, MPEG-1, MPEG-2, MPG, MLV, and MPG4
Multimedia and Hypermedia Experts Group	MHEG
Real Audio-Video	RA, RAM, RM and RMJ,
SMI Video	SMI
SML Video	SML
Streaming Movie	RTS, RTSP and SDP
VFW Video	VFW
Video RGB	RGB
Video X-FLV	FLV
Video X-MS-ASF	ASF
Video/Quicktime	MOV, QT, QTR and QTX
Windows Media	ASR and ASX
Windows Media audio/video	WM, WMP, WMV and WMX

### 2.4.3 Three dimensional models

The term 3D model refers to the use of 3D objects to present technical information.

Examples of use are virtual assembly/disassembly, removal and installation of parts using animation, simulation and/or virtual reality concepts. Levels of capability can include fly thru type viewing (navigation thru a 3D scene). The degree of simulation, animation and virtual reality modeling concepts can dramatically affect cost. A list of 3D types with notations included in the schemas is given in [Table 6](#).

Table 6 3D types

Encoding	File extension type
ASME/ANSI Y14.26M-1987 Initial Graphics Exchange Specification	IGES
CATIA 3D models	CATDRAWING, CATPART, CATPRODUCT, CGR, CT and MODEL
Dassault Systems 3DXML	DS-3DXML
JT 3D models	UGS
Lattice 3D models	XV0, XV2, XV and XVL
Pro Engineer 3D models	ASM, DRW, ED, EDZ, FRM and PRT
RightHemisphere 3D models	RH
SolidWorks 3D models	SLDASM, SLDDRW and SLDPRT
STEP AP203 3D models	STEP
Universal 3D models	U3D
VND 3D models	DWF
VRML 3D models	WRL
Web3D 3D models	W3D
X3D 3D models	X3D
X-Director 3D models	DCR
DS 3D-VIA	SMG, SMGXML, SMGGEOM

#### 2.4.4

##### Miscellaneous types

Several multimedia types such as the Synchronized Multimedia Integration Language (SMIL) and PDF do not fall into the audio, video or 3D type classification. These miscellaneous types are listed in [Table 7](#).

Table 7 Miscellaneous types

Encoding	File extension type
Cascading Style Sheet	CSS
Microsoft Word	DOC
Movie Authoring File	FLA
Java script	JS
Microsoft Access	MDB
Microsoft Project	MPP

<a href="#">Chap 7.4.2</a>	Generation of publications - Publication module and SCORM Content Package Schema
<a href="#">Chap 7.4.3</a>	Generation of publications - Inclusion of legacy information

#### 1      **General**

The purpose of this chapter is to describe the technical aspects of the generation of publications. The content of this chapter together with the necessary additional resources, available through [www.s1000d.org](http://www.s1000d.org), is sufficient for understanding the concept of generating an S1000D IETP.

#### 2      **Generation of publications**

General information and guidance on the IETP concept and on the supporting publication module are given in the following chapters.

- [Chap 7.4.1](#) provides the general principles of IETP generation
  - [Chap 7.4.1.1](#) provides information for IETP generation process
  - [Chap 7.4.1.2](#) provides information for IETP resource resolution with the uniform resource names concept
- [Chap 7.4.2](#) provides a description of the publication module XML
- [Chap 7.4.3](#) provides a description of the inclusion of legacy information in the IETP concept

---

Although some guidelines are provided regarding the principle characteristics of systems that support the specification, it is not suggesting how such a system should be implemented, nor are any specific tools suggested for such an implementation.

<a href="#">Chap 7.4.1.1</a>	IETP - Generation process
<a href="#">Chap 7.4.1.2</a>	IETP - Resource resolution

## 1 General

### 1.1 Purpose

A wide variety of operational environments are envisioned for accessing and displaying IETP. These include:

- web or Local/Wide area network (LAN/WAN)
- temporarily disconnected
- stand-alone

Moreover, interoperability between IETP is becoming a firm requirement for many projects.

In addition to these operational requirements, S1000D acknowledges the fact that technical improvements and new possibilities are becoming available with Internet/Intranet technology. These improvements are accompanied by commercial off the shelf software, which might be used for implementing IETP.

The main objective of this chapter is to describe XML-oriented IETP and its definition through the use of the publication module concept.

In addition, as a by-product, this chapter describes the possibility to map S1000D concepts to web concepts. However, the IETP end user form (eg what it looks like on-screen) is out of the scope of this chapter.

## 2 IETP

General information on the IETP concept are given in the following chapters.

- [Chap 7.4.1.1](#) provides information for IETP generation process
- [Chap 7.4.1.2](#) provides information for IETP resource resolution with the Uniform Resource Name (URN) concept

### 2.1 Web concepts and S1000D concepts

#### 2.1.1 Resources

A fundamental concept of the World Wide Web is a resource. A resource can be anything that can be accessed through an identifier. The resource identifier can be considered the resource name or the resource location. For web based applications resource identifiers are described by the Uniform Resource Identifier (URI) syntax. Both Uniform Resource Locators (URL) and URN are considered URI.

These names are persistent for a project if they are never re-assigned during Product life cycle. This means the name will never change even when the resource content is changed. Any reference to a resource using its name as the identity will stay valid forever.

In S1000D, all information objects such as data modules, publication modules, illustrations and multimedia objects are considered resources. The data module code, publication module code, catalogue sequence number and ICN are the resource identifiers that are each described by specific name syntax and format.

#### 2.1.2 Metadata

A challenge for web-oriented documents is the ability to retrieve a specific resource amongst an ever increasing number of resources. A solution to this is to associate metadata to a resource.

Metadata describe additional aspects of the resource beyond its identifier such as the title, author, creation date, etc. The Resource Description Framework (RDF) and Dublin Core (DC) are methods of describing resources. A resource resolver allows the discovery of resource identifiers through the use of metadata queries.

In S1000D, all data module metadata are contained in the identification and status section.

### 2.2 IETP and publication modules

The IETP concept is supported in S1000D through the use of publication modules.

This concept is defined by using material derived from:

- Internet Engineering Task Force (IETF) URI specifications for naming and locating resources to be linked
- World Wide Web Consortium (W3C) XML Pointer Language (XPointer) specification, which specifies a language to be used as the basis for defining a fragment identifier in any URI reference that locates a resource
- W3C XML Linking Language (XLink) specification, which allows elements to be inserted into XML instances in order to create and describe links between resources
- RDF and disassembly code initiatives for encoding metadata

A publication module is structured in a similar way to data modules with an identification and status section followed by a content section. The content section contains references to data modules, legacy technical publications or other publication modules in the required sequence and structure of the publication delivery.

---

Publication modules are described in detail in [Chap 4.9.1](#).

Chap No./Document No.	Title
<a href="#">Chap 7.4.1.1.1</a>	Generation process - XML-based links
<a href="#">Chap 7.4.1.1.2</a>	Generation process - Metadata
<a href="#">Chap 7.4.1.1.3</a>	Generation process - Transformation for IETP

## 1 General

The purpose of this chapter is to describe the technical aspects of the IETP generation. The content of this chapter together with the necessary additional resources, available through [www.s1000d.org](http://www.s1000d.org), is sufficient to understand the concept of generating an S1000D IETP.

## 2 IETP generation process

[Fig 1](#) represents the IETP generation process.

ICN-S1000D-A-07040101-0-RAYCC-00005-A-02-1

Fig 1 IETP generation process

## 2.1 CSDB source data

Authored data modules and publication modules reside in the CSDB and exist in XML form. This is the repository where the source data for IETP is maintained.

## 2.2 IETP neutral repository

The IETP neutral repository contains all data modules and publication modules in XML form. This information is generated from the CSDB and acts as a standard representation to be used for display transformation. This allows an IETP to consist of data from different CSDB implementations. The neutral data is generated and not authored. It can be generated "on the fly" from the CSDB through an automated process. The translation involves the inclusion of auto-generated XLinks and metadata. Refer to [Chap 7.4.1.1.1](#) and [Chap 7.4.1.1.2](#).

The form of the repository is not specified. It can be a file storage system, web server, database, or other virtual representation.

## 2.3 IETP display transformation

To render a data module for display to an end-user the IETP process transforms the data in the XML neutral repository into a viewable "end-user" form. This transformation process applies stylesheets to the XML data and transforms the XLink references into the required form of hyperlinks (eg, HTML). Refer to [Chap 7.4.1.1.3](#).

## 2.4 IETP namespaces

### 2.4.1 General

XML namespaces are designed to resolve naming conflicts in XML instances that contain elements and attributes from different XML Schemas. This is accomplished by associating namespaces, identified by Uniform Resource Identifier (URI) references, with names of elements and attributes.

These names appear as qualified names, ie, they contain a single colon which separates the name into a namespace prefix and a local part. The prefix, which is mapped to a URI reference,

denotes a namespace. The combination of the globally managed URI namespace and the instance's own namespace allow the names of elements and attributes to be universally unique.

There is no default XML namespace. If elements or attributes are not specifically declared to belong to an XML namespace, then they are not in any namespace.

#### 2.4.2 Declaration of namespaces

An XML namespace is declared by using an attribute named either `xmlns` or having `xmlns:` as a prefix followed by an XML name specifying the namespace in question. The first form of the attribute `xmlns` declares that the specified namespace is the default XML namespace, whereas the second form defines the namespace prefix to be used on elements and attributes in the XML instance.

The value of the attribute `xmlns` is the namespace name in the form of a URI reference.

An XML namespace can be declared on any element in an XML document. The namespace is in scope for that element (and its attributes) and all its descendants (and their attributes) unless it is overridden or undeclared. Namespace declaration attributes can also be provided as default attributes with fixed values in an XML Schema.

To override a namespace prefix, simply another XML namespace has to be declared with the same prefix. To override the current default XML namespace, another XML namespace has to be declared as the default. A namespace prefix cannot be "undeclared". It remains in scope until the end of the element on which it was declared unless it is overridden. To "undeclare" the current default XML namespace, a default namespace with an empty (zero-length) URI has to be declared.

##### Note

XML namespaces do not apply to entity names, notation names, or processing instruction targets. In consequence, these names must not contain colons for conformity reasons.

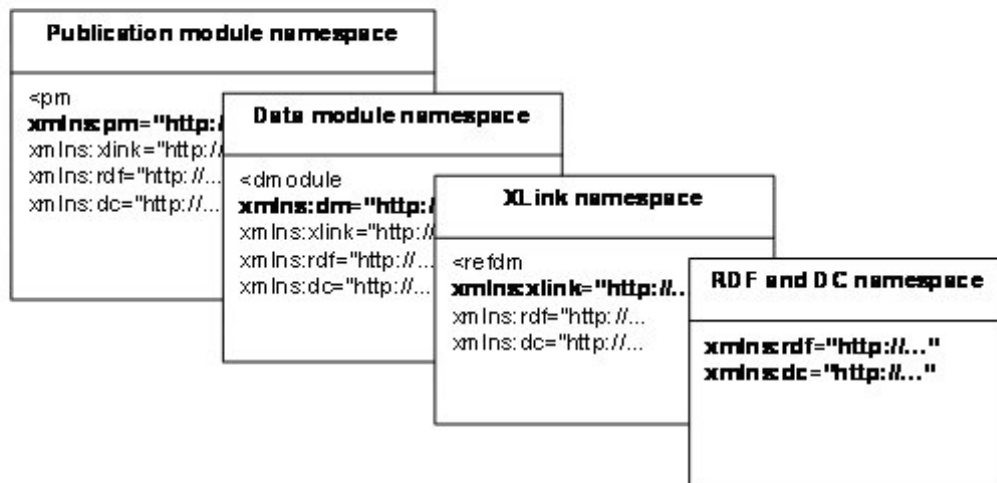

XML namespaces identified to be useful for IETP include:

- optional Resource Description Framework (RDF) (namespace prefix: `rdf`) and Dublin Core (namespace prefix: `dc`) namespaces for data module and publication module metadata
- XLink (namespace prefix: `xlink`) language namespace for XLink elements and attributes
- data module (namespace prefix: `dm`) and publication module (namespace prefix: `pm`) namespaces for corresponding elements and attributes

##### Note

The data module namespace is the default namespace for IETP.

[Fig 2](#) gives an overview of these IETP XML namespaces and shows their relationships.

ICN-S1000D-A-07040101-0-I9005-00006-A-01-1

Fig 2 IETP XML namespaces

The URI references used as the namespace names in an IETP environment are summarized in [Table 2](#).

Table 2 IETP XML namespace definitions

Namespace prefix	URI reference
pm	<a href="http://www.s1000d.org/pm">http://www.s1000d.org/pm</a>
dm	<a href="http://www.s1000d.org/dm">http://www.s1000d.org/dm</a>
xlink	<a href="http://www.w3.org/1999/xlink">http://www.w3.org/1999/xlink</a>
rdf	<a href="http://www.w3.org/1999/02/22-rdf-syntax-ns#">http://www.w3.org/1999/02/22-rdf-syntax-ns#</a>
dc	<a href="http://purl.org/dc/elements/1.1/">http://purl.org/dc/elements/1.1/</a>

Applications wishing to make use of XML namespace-aware processing, for instances conforming to this specification must ensure that the namespace names are resolved to the above URI references.

<a href="#">Chap 4.15.2</a>	Learning information - Coding SCORM content package module

#### 1 General

The purpose of this chapter is to describe the technical aspects of building links based on XML. The content of this chapter together with the necessary additional resources, available through [www.s1000d.org](http://www.s1000d.org), is sufficient for understanding the concept of generating an S1000D IETP.

#### 2 Linking elements

S1000D linking elements are restricted to outbound links. These are links that point from within a data module to or into remote resources or sub-resources. For consistency, all links within a data module, which can be expressed by XML ID/IDREF mechanisms, should also be transformed to XLink linking elements.

---

## 3 Basic elements

### 3.1 XLink attribute list

Elements which are used in links are already marked up as elements in data modules, (eg, element `<dmRef>` and element `<catalogSeqNumberRef>`). Link semantics (behavior, type, role, etc) are completed by adding attributes to these elements.

### 3.2 Resource and sub-resource

In S1000D, all information objects such as data modules, publication modules, SCORM content package modules, parts information, illustrations and multimedia objects are considered resources. The data module code, ICN, publication module code and CSN are the resource identifiers that are each described by specific name syntax and format identified in [Chap 3.9.5.2.7](#), [Chap 4.3](#), [Chap 4.4](#), [Chap 4.9.2](#) and [Chap 4.15.2](#) respectively. The resource identifier data module extension is described in [Chap 4.12](#) and [Chap 3.9.5.1](#).

### 3.3 Links

It is recommended to use simple links as far as possible, but extended links can be useful for multiple remote ending resources. For example this can be a link to all data modules dependant on language and/or issue number.

In HTML, a link is defined using the element `<A>`. However, just as XML is more flexible concerning tags, which describe elements, it is more flexible concerning tags that refer to external resources. In XML almost any element can be defined as a link.

Elements that assert the existence of a link are called linking elements; these are all XML elements having an attribute `xlink:type` with value "[simple](#)" or value "[extended](#)".

## **1 General**

The purpose of this chapter is to describe the technical aspects of the IETP generation metadata. The content of this chapter, together with the necessary additional resources available through [www.s1000d.org](http://www.s1000d.org), is sufficient to understand the concept of generating an S1000D IETP.

## **2 Metadata**

### **2.1 General**

Metadata describe, through a set of attributes or elements, additional aspects of the resource beyond its identifier. Catalog records for library material with elements such as author, title, date of publication, etc, are a common example of metadata.

The association of standardized metadata with networked information objects substantially improves resource discovery, use and management capabilities by enabling field-based searches, permitting indexing of non-textual objects, and allowing access to the surrogate content that is distinct from access to the content of the resource itself.

Although all data specified within S1000D is machine-readable, this data is currently not always machine-understandable, for example where are the data modules about landing gear removal issued during last year?, is there an online French translation available for this data module?

This goal can be reached by using a precise and formal metadata definition.

### **2.2 Resource description framework**

Resource Description Framework (RDF) is a framework for metadata providing interoperability between applications that exchange machine-understandable information on the web. RDF emphasizes facilities to enable automated processing of web resources and, as such, provides the basic building blocks for supporting the semantic web.

In general, RDF provides the basis for generic tools for authoring, manipulating, and searching machine-understandable data on the web thereby promoting the transformation of the web into a machine-processable repository of information.

### **2.3 Dublin core**

Dublin core metadata is specifically intended to support resource discovery. The elements represent a broad, interdisciplinary consensus about the core set of elements that are useful to support resource discovery.

"Simple Dublin core" or "unqualified Dublin core" is Dublin core metadata that uses no qualifiers. The elements are expressed as attribute value pairs without any qualifiers such as encoding schemes, enumerated lists of values, or other processing clues.

"Qualified Dublin core" employs additional qualifiers to further refine the meaning of a resource. One use for such qualifiers is to indicate if a metadata value is a compound or structured value, rather than just a string. For example, a "date" is a Dublin core element that has the option of being further specified to identify it as a particular kind of date (date last modified, date published, etc).

### **2.4 Relationship between RDF and Dublin core**

RDF and Dublin core are distinct specifications. Neither requires the other, but their co-evolution makes them natural complements in the metadata architecture for the web.

XML provides the syntax for encoding assertions in RDF, and hence in RDF-encoded Dublin core metadata.

## 2.5 Dublin core elements

Dublin core builds on RDF by defining 15 named properties, the Dublin core metadata set of elements, which are considered to be sufficient for resource discovery.

S1000D metadata, contained in the identification and status section of data modules, publication modules or SCORM content package modules, are mapped to the Dublin core set of elements. Any RDF/Dublin core aware application is then able to understand these mapped elements.

The following paragraphs list the 11 Dublin core elements used by S1000D together with their definitions, followed by a summary in [Table 2](#).

### 2.5.1 Title

**Definition:** A name given to the resource. Typically, a title will be a name by which the resource is formally known.

S1000D maps the data module, publication module title or SCORM content package module title to this Dublin core element, ie, for data modules the content of element `<techName>` and, if given, element `<infoName>` separated from `<techName>` by a space-surrounded hyphen as indicated below, for publication modules the content of element `<pmTitle>`, and for or SCORM content package modules the content of element `<scormContentPackageTitle>`.

Mapping:

`<dc:title>` = `<techName>` - `<infoName>` (for data modules)

or

`<dc:title>` = `<pmTitle>` (for publication modules)

or

`<dc:title>` = `<scormContentPackageTitle>` (for SCORM content package modules)

### 2.5.2 Creator

**Definition:** An entity primarily responsible for making the content of the resource. Examples of a creator include a person, an organization, or a service. Typically, the name of a creator is used to indicate the entity.

S1000D maps the content of element `<originator>` to this Dublin core element for data modules and the element `<responsiblePartnerCompany>` for publication modules and SCORM content package modules.

Mapping:

`<dc:creator>` = `<originator>` (for data modules)

or

`<dc:creator>` = `<responsiblePartnerCompany>` (for publication modules and SCORM content package modules)

### 2.5.3 Subject and keywords

**Definition:** The topic of the content of the resource. Typically, a subject will be expressed as keywords, key phrases or classification codes that describe a topic of the resource. Recommended best practice is to select a value from a controlled vocabulary or formal classification scheme.

S1000D maps the data module title or the publication module title or the SCORM content package module title to this Dublin core element.

Mapping:

`<dc:subject> = <techName> - <infoName>` (for data modules)

or

`<dc:subject> = <pmTitle>` (for publication modules)

or

`<dc:subject> = <scormContentPackageTitle>` (for SCORM content package modules)

#### 2.5.4 Publisher

**Definition:** An entity responsible for making the resource available. Examples of a publisher include a person, an organization, or a service. Typically, the name of a publisher is used to indicate the entity.

S1000D maps the content of element `<responsiblePartnerCompany>` (ie, the value of attribute `enterpriseCode` if given, otherwise the content of element `<enterpriseName>`) for data modules, the attribute `pmIssuer` for publication modules, and the attribute `scormContentPackageIssuer` for SCORM content package modules to this Dublin core element.

Mapping:

`<dc:publisher> = <responsiblePartnerCompany>` (for data modules)

or

`<dc:publisher> = pmIssuer` (for publication modules)

or

`<dc:publisher> = scormContentPackageIssuer` (for SCORM content package modules)

#### 2.5.5 Contributor

**Definition:** An entity responsible for making contributions to the content of the resource. Examples of a contributor include a person, an organization, or a service. Typically, the name of a contributor is used to indicate the entity.

S1000D maps the originator to this Dublin core element, ie, the value of attribute `enterpriseCode` if given, otherwise the content of element `<enterpriseName>`).

Mapping:

`<dc:contributor> = <originator>` (only for data modules and publication modules)

#### 2.5.6 Date

**Definition:** A date associated with an event in the life cycle of the resource. Typically, `<dc:date>` will be associated with the creation or availability of the resource. Recommended best practice for encoding the date value is defined in a profile of International Standards Organization (ISO) 8601 and follows the YYYY-MM-DD format.

S1000D maps the data module or publication module or SCORM content package module issue date to this Dublin core element, (ie values of attribute year, attribute month and attribute day of element `<issueDate>`, separated by hyphens as indicated below).

Mapping:

`<dc:date>` = values of attributes year-month-day of element `<issueDate>`

## 2.5.7

### Resource type

**Definition:** The nature or genre of the content of the resource. Element `<dc:type>` includes terms describing general categories, functions, genres, or aggregation levels for content. Recommended best practice is to select a value from a controlled vocabulary (eg, the recommended list of Dublin core types). To describe the physical or digital manifestation of the resource, use the element `<dc:format>`.

S1000D assigns the fixed value "text" to this Dublin core element.

Mapping:

`<dc:type>` = fixed value "text"

## 2.5.8

### Format

**Definition:** The physical or digital manifestation of the resource. Typically, element `<dc:format>` includes the media type or dimensions of the resource. Element `<dc:format>` can be used to determine the software, hardware or other equipment needed to display or operate the resource. Examples of dimensions include size and duration. Recommended best practice is to select a value from a controlled vocabulary (eg, the list of Internet media types defining computer media formats).

S1000D assigns the fixed value "text/xml" to this Dublin core element.

Mapping:

`<dc:format>` = fixed value "text/xml"

## 2.5.9

### Resource identifier

**Definition:** An unambiguous reference to the resource within a given context. Recommended best practice is to identify the resource by means of a string or number conforming to a formal identification system. Example formal identification systems include the URI (including the Uniform Resource Locator (URL)), the Digital Object Identifier (DOI) and the International Standard Book Number (ISBN).

S1000D maps the content of the attributes of element `<dmCode>`, of element `<pmCode>` or of element `<scormContentPackageCode>` to this Dublin core element, separated by hyphens as given in [Chap 4.3](#), [Chap 4.9.2](#) and [Chap 4.15.2](#) respectively. When used, the content of the extension element `<identExtension>`, as described in [Chap 4.12](#), is included in the mapping to the Resource identifier. In addition, the attribute `issueNumber` of element `<issueInfo>` must be added, separated from the data module code, the publication module code or the SCORM content package module code by an underscore. The attribute `inWork` must be added and separated by a hyphen.

Mapping:

`<dc:identifier>` = `<dmCode>`\_issueNumber-inWork (for data modules)

or

`<dc:identifier> =  
extensionProducer_extensionCode_<dmCode>_issueNumber-inWork  
(for data modules)`

or

`<dc:identifier> =  
extensionProducer_extensionCode_<pmCode>_issueNumber-inWork  
(for publication modules)`

or

`<dc:identifier> =  
extensionProducer_extensionCode_<scormContentPackageCode>_i  
ssueNumber-inWork (for SCORM content package modules)`

### 2.5.10 Language

**Definition:** A language of the intellectual content of the resource. Recommended best practice for the content of element `<dc:language>` is defined by RFC 1766 (refer to [Chap 3.9.5.1](#) regarding acceptable language codes), optionally followed by the country code in uppercase (taken from the ISO 3166 standard). For example, "en" for English, "fr" for French, "de" for German, or "en-GB" for English used in Great Britain.

S1000D maps the data module or publication module or SCORM content package module language to this Dublin core element, ie, the values of attribute `languageIsoCode` and attribute `countryIsoCode` of mandatory element `<language>`, separated by a hyphen as indicated below.

Mapping:

`<dc:language> = attributes languageIsoCode-countryIsoCode of element  
<language>`

### 2.5.11 Rights management

**Definition:** Information about rights held in and over the resource. Typically, the element `<dc:rights>` will contain a rights management statement for the resource, or reference a service providing such information. Rights information often encompasses Intellectual Property Rights (in process review), copyright, and various property rights. If the element `<dc:rights>` is absent, no assumptions can be made about the status of these and other rights with respect to the resource.

S1000D maps the data module or publication module or SCORM content package module security classification to this Dublin core element, ie, the values of attribute `securityClassification`, optional attribute `commercialClassification` and optional attribute `caveat` of element `<security>`, and the derivative classification information, if applicable.

Mapping:

`<dc:rights> = attributes  
securityClassification_commercialClassification_caveat_  
of element <security> followed by an optionally repeatable  
actionIdentType_year_month_day of elements  
<classificationAction> or <valueAfterAction> of element  
<derivativeClassification> (this mapping reflects the use of all attributes)`

or

<dc:rights> = attributes  
securityClassification\_commercialClassification\_\_ of element  
<security> followed by an optionally repeatable  
actionIdentType\_year\_month\_day of elements  
<classificationAction> or <valueAfterAction> of element  
<derivativeClassification> (this mapping reflects the use of all attributes except  
the attribute caveat)

or

<dc:rights> = attributes securityClassification\_\_caveat\_ of element  
<security> followed by an optionally repeatable  
actionIdentType\_year\_month\_day of elements  
<classificationAction> or <valueAfterAction> of element  
<derivativeClassification> (this mapping reflects the use of all attributes except  
the attribute commercialClassification)

or

<dc:rights> = attributes  
securityClassification\_commercialClassification\_caveat of  
element <security> (this mapping reflects the use of all attributes except the attribute  
actionIdentType\_year\_month\_day)

or

<dc:rights> = attributes  
securityClassification\_commercialClassification of element  
<security> (this mapping reflects the use of all attributes except the attributes caveat  
and actionIdentType\_year\_month\_day)

or

<dc:rights> = attributes securityClassification\_\_caveat of element  
<security> (this mapping reflects the use of all attributes except the attributes  
commercialClassification and actionIdentType\_year\_month\_day)

or

<dc:rights> = attribute securityClassification of element <security>  
(this mapping reflects only the use of the attribute securityClassification)

## 2.5.12

### Source

**Definition:** A related resource from which the described resource is derived. Typically the  
element <dc:source> will contain the derivative source for the described resource. If the  
element <dc:source> is absent, no assumptions can be made about the status of derived  
content.

S1000D maps the data module or publication module derivative classification source to the  
Dublin core element, ie, the value of element <derivativeSource>.

Mapping:

<dc:source> = <derivativeSource> of element  
<derivativeClassification>

## 2.6 Metadata mapping

[Table 2](#) summarizes the mapping of S1000D elements and attributes to the Dublin core elements. It is not possible to achieve a one to one relationship as some:

- S1000D metadata elements are not within the Dublin core scope (eg, element <qualityAssurance>)
- Dublin core elements have no exact counterpart in S1000D (eg, element <dc:rights>)
- S1000D metadata elements have to be merged (eg, <techName> - <infoName>)

Table 2 Metadata mapping

Dublin core elements	Data module elements and/or attributes	Publication module/ SCORM content package module elements and/or attributes
<dc:creator>	<originator>	<responsiblePartnerCompany>
<dc:title>	<techName> - <infoName>	<pmTitle> <scormContentPackageTitle>
<dc:subject>	<techName> - <infoName>	<pmTitle> <scormContentPackageTitle>
<dc:publisher>	<responsiblePartnerCompany>	pmIssuer scormContentPackageIssuer
<dc:contributor>	<originator>	<originator>
<dc:date>	year-month-day	year-month-day
<dc:type>	"text"	"text"
<dc:format>	"text/xml"	"text/xml"
<dc:identifier>	<dmCode>_issueNumber- inWork  or extensionProducer_ extensionCode_ <dmCode>_ issueNumber-inWork	<pmCode>_issueNumber- inWork  or extensionProducer_ extensionCode_<pmCode>_ issueNumber-inWork <scormContentPackageCode>_ issueNumber-inWork  or extensionProducer_ extensionCode_ <scormContentPackageCode>_ issueNumber-inWork
<dc:language>	languageIsoCode- countryIsoCode	languageIsoCode- countryIsoCode

## 2.7 RDF/Dublin core example

The following example demonstrates the mapping of S1000D data module elements and/or attributes to Dublin core metadata elements within an RDF container expressed in XML:

```
<?xml version="1.0"?>
<!DOCTYPE dmodule
[
<!ENTITY % ISOEntities PUBLIC "ISO 8879-1986//ENTITIES ISO Character
Entities 20030531//EN//XML" "http://www.s1000d.org/S1000D_4-
2/ent/ISOEntities">
%ISOEntities;
]>
```

```
<dmodule xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

## 1 General

The technical aspects of the transformation for IETP generation are described below. The content of this chapter together with the necessary additional resources, available through [www.s1000d.org](http://www.s1000d.org), is sufficient to understand the concept of generating an S1000D IETP.

## 2 Transformation

The transformation of data modules for IETP includes as a minimum:

- the automatic generation of identifiers for elements which will be used in hyperlinks and for which identifiers have not yet been authored into the data modules. In XML terminology these identifiers will serve as the addresses of ending resources. An example would be to amend the element `<catalogSeqNumber>` by an attribute `id` for referencing this CSN. In the S1000D Schema all these attributes are named `id`, which facilitates addressing the corresponding XML elements by name using the fragment identifier `"#xpointer(//*[id='id-value'])"`. Therefore, it is strongly recommended that this common practice also for identifiers, which are automatically generated (ie, name them

id), is used. Furthermore, the automatic generation process must obey the validity constraint of unique identifiers, otherwise only the first occurrence of an XML element in question can be retrieved.

- the generation of `xlink:` attributes for elements which serve both as starting resources and linking elements
- the optional, but recommended, generation of a standard RDF/Dublin core metadata section by mapping data module and publication module identification and status section to corresponding Dublin core elements. Refer to [Chap 7.4.1.1.2](#).
- the transformation from XML to HTML for the IETP (eg, by using XSLT), if the viewer cannot interpret eXtensible Stylesheet Language (XSL) stylesheets or process native XLink attributes directly

## 2.1 Generation of identifiers

Identifiers are only useful for ending resources, and if they can be defined properly through a semantic rule, in order to allow safe access to them.

The recommended naming conventions for identifier values for automatic generation are, for example, as follows:

- `<figure id="fignnn">`, where "nnn" is a sequential number denoting the sequence of the figure within a data module, starting with "001".
- In case of multi-sheet figures:  
`<graphic id="fignnn-gramm" infoEntityIdent="ICN-icn">`, where "fignnn" is the identifier value of the parent element `<figure>` and "mm" denotes the sequential number of this illustration sheet within a multi-sheet figure.
- `<catalogSeqNumber id="csn-csn">` when you are referring to a complete CSN or `<itemSeqNumber id="csn-csnisn">`, where "csnisn" are the related CSN and ISN values within an IPD data module when you are referring to a specific ISN.
- `<term id="fignnn-trmmmm">`, if element `<term>` is a child of element `<legend>` of element `<figure>`, where value "fignnn" is the identifier value of the parent element `<figure>` and "mm" is a unique sequential number of this term within the figure legend.
- Within the instance, each of these generated identifier values must be unique and must not conflict with already existing identifiers.
  - For chapterized CSN, the unique identifier can be built up from the attributes `systemCode`, `subSystemCode`, `subSubSystemCode`, `assyCode`, `figureNumber`, `figureNumberVariant`, `item`, and `itemVariant` of the element `<catalogSeqNumber>` and the attribute `itemSeqNumberValue` of the element `<itemSeqNumber>`
  - For non-chapterized CSN, the identifier can be built up from the attributes `figureNumber`, `figureNumberVariant`, `item` and `itemVariant` of the element `<catalogSeqNumber>`.

### Note

Attribute `figureNumberVariant` is optional and when not provided, use a "0". If the optional attribute `itemVariant` is not provided, omit it in the generated identifier.

The recommended naming convention for identifier values is as follows:

- 1 Use the first three characters of the element name.
- 2 Add a sequential (control) number (eventually preceded by a single hyphen), which is unique within the data module.

Examples:

```
<figure id="fig001">
```

```
<graphic id="fig002-gra02" infoEntityId="ICN-S1000D-A-004002-G-
S7282-00151-A-01-1">
```

```
<symbol id="sym123" infoEntityId="ICN-S1000D-A-316200-0-F0214-
00352-A-01-1">
```

```
<listItemTerm id="fig001-trm03">
```

Example for a CSN within a chapterized IPD data module, represented by

```
<catalogSeqNumber systemCode="53" subSystemCode="2"
subSubSystemCode="5" assyCode="10" figureNumber="02" item="007">:
```

```
<catalogSeqNumber id="csn-53-25-10-020-007">
```

Example for an ISN within a chapterized IPD data module, represented by

```
<itemSeqNumber itemSeqNumberValue="00A"> where the CSN is represented by
<catalogSeqNumber systemCode="53" subSystemCode="2"
subSubSystemCode="5" assyCode="10" figureNumber="01" item="008">:
```

```
<itemSeqNumber id="csn-53-25-10-010-008-00A">
```

Example for a CSN within a non-chapterized IPD data module, represented by

```
<catalogSeqNumber figureNumber="01" item="008">
```

and an ISN, represented by <itemSeqNumber itemSeqNumberValue="00A">:

```
<catalogSeqNumber id="csn-010-008-00A">
```

## 2.2 Graphics and graphical hotspots

Graphical hotspots are defined in S1000D XML data modules by child elements [hotspot](#) of the element [graphic](#).

Example of an XML Schema fragment:

```
<xs:element name="graphic">
  <xs:complexType>
    <xs:sequence>
      <xs:element ref="hotspot" minOccurs="0" maxOccurs="unbounded"/>
      <xs:element ref="reasonForAmendment" minOccurs="0"
maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="infoEntityId" type="xs:ENTITY" use="required"/>
    <xs:attribute name="applicRefId" type="xs:IDREF"/>
    <xs:attribute name="id" type="xs:ID"/>
    <xs:attribute name="reproductionWidth" type="xs:string"/>
    <xs:attribute name="reproductionHeight" type="xs:string"/>
    <xs:attribute name="reproductionScale" type="xs:string"/>
    <xs:attribute name="changeMark" type="xs:nonNegativeInteger"/>
    <xs:attribute name="reasonForUpdateRefIds" type="xs:IDREFS"/>
    <xs:attribute name="authorityName" type="xs:string"/>
    <xs:attribute name="authorityDocument" type="xs:string"/>
    <xs:attribute name="securityClassification"
type="securityClassificationAttType"/>
    <xs:attribute name="commercialClassification"
type="commercialClassificationAttType"/>
    <xs:attribute name="caveat" type="caveatAttType"/>
    <xs:attribute ref="xlink:type" fixed="simple"/>
  </xs:complexType>
</xs:element>
```

```
<xs:attribute ref="xlink:href"/>
<xs:attribute ref="xlink:title"/>
<xs:attribute ref="xlink:show"/>
<xs:attribute ref="xlink:actuate"/>
</xs:complexType>
</xs:element>
```

#### Note

As it only makes sense to activate graphical hotspots by referencing them through the element `<internalRef>`, there is no need to declare the element `<hotspot>` as a linking element.

There is a special case for the element `<symbol>`, which can appear at the lowest level (eg, in paragraphs, lists and tables). The default viewer behavior is to present it without the need for user interaction, and to embed it in the flow of text.

Refer to [Chap 7.7.4](#) for an XLink instance example concerning the element `<symbol>`.

Other markup examples for the element `<figure>` and the element `<graphic>` are given in the paragraphs below.

### 2.2.1

#### Single-sheet figure

Markup example for a single illustration sheet figure in an XML data module instance fragment with minimum required information:

```
<figure id="fig001">
<title>Removal of solenoid valve, Pump No. 1</title>
<graphic infoEntityIdent="ICN-1B-B-291101-M-C0419-00571-A-01-1">
</graphic>
</figure>
```

Markup example of a single illustration sheet figure in XML form with XLink attributes, assuming that the graphic file name appears as value of the attribute `xlink:href`, has been retrieved from the system identifier given in the corresponding graphic entity definition at the beginning of the data module (generated attributes are shown in bold):

```
<figure id="fig001">
<title>Removal of solenoid valve, Pump No. 1</title>
<graphic xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:href="URN:S1000D:ICN-1B-B-291101-M-C0419-00571-A-01-1"
xlink:title="Removal of solenoid valve, Pump No. 1"
infoEntityIdent="ICN-1B-B-291101-M-C0419-00571-A-01-1">
</graphic>
</figure>
```

#### Note

Although not required, it is recommended that the element `<graphic>` be amended using the attribute `xlink:title`, which contains the figure title in accordance with [REC-xlink11-20100506](#). The value of attribute `xlink:title` can be used as a screen tip in the viewer application.

Depending on end user viewing requirements, the attributes `xlink:show` and `xlink:actuate` can appear in addition on the element `<graphic>`. They can take the value `"embed"` and the value `"onLoad"`, respectively, in cases where the graphic is to be displayed in the flow of text.

Another possibility for viewing behavior is to show only an icon in the flow of text (`xlink:actuate="onRequest"`) and display the full graphic on user request either embedded in the same window (`xlink:show="embed"`) or in a newly created window (`xlink:show="new"`).

### 2.2.2 Multi-sheet figure with two illustration sheets

Markup example of a multi-sheet figure with two illustration sheets in an XML data module instance fragment with minimum required information:

```
<figure id="fig002">
<title>Identification of components on complex circuit board
</title>
<graphic id="fig002-gra01"
infoEntityId="ICN-S1000D-A-004002-G-S7282-00150-A-01-1">
</graphic>
<graphic id="fig002-gra02"
infoEntityId="ICN-S1000D-A-004002-G-S7282-00151-A-01-1">
</graphic>
</figure>
```

Markup example of a multi-sheet figure with two illustration sheets in XML form with XLink attributes (generated XLink attributes are shown in bold):

```
<figure id="fig002">
<title>Identification of components on complex circuit board
</title>
<graphic xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:href="URN:S1000D:ICN-S1000D-A-004002-G-S2782-00150-A-01-1"
xlink:title="Identification of components on complex
circuit board (Sheet 1 of 2)"
id="fig002-gra01"
infoEntityId="ICN-S1000D-A-004002-G-S7282-00150-A-01-1">
</graphic>
<graphic xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:href="URN:S1000D:ICN-S1000D-A-004002-G-S2782-00151-A-01-1"
xlink:title="Identification of components on complex
circuit board (Sheet 2 of 2)"
id="fig002-gra02"
infoEntityId="ICN-S1000D-A-004002-G-S7282-00151-A-01-1">
</graphic>
</figure>
```

## 2.3 Links

Links include as a minimum the generation of XLink attributes on the elements `<dmRef>`, `<internalRef>`, `<pmRef>`, `<externalPubRef>` and `<catalogSeqNumberRef>`. For more information on XML-based links, refer to [Chap 7.4.1.1.1](#).

Markup example of an XML instance fragment for the element `<pmRef>`:

```
<pmRef xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:title="S1000D Publication Module - The first"
```

```

xlink:href="URN:S1000D:PMC-S1000D-F6117-00001-00">
  <pmRefIdent>
    <pmCode modelIdentCode="S1000D" pmIssuer="F6117"
    pmNumber="00001" pmVolume="00"/>
    <language languageIsoCode="sx" countryIsoCode="US"/>
    <issueInfo issueNumber="001" inWork="00"/>
  </pmRefIdent>
  <pmRefAddressItems>
    <pmTitle>S1000D publication module - The first</pmTitle>
    <issueDate year="2003" month="07" day="18"/>
  </pmRefAddressItems>
</pmRef>

```

The following examples demonstrate the extension of a data module instance fragment with XLink attributes for the element `<dmRef>`.

Markup example of a data module instance fragment with minimum required information:

```

<dmRef>
  <dmRefIdent>
    <dmCode modelIdentCode="S1000D" systemDiffCode="A"
    systemCode="07" subSystemCode="0" subSubSystemCode="4"
    assyCode="0101" disassyCode="00" disassyCodeVariant="A"
    infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
  </dmRefIdent>
</dmRef>

```

Markup example with generated XLink attributes shown in bold:

```

<dmRef xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:href="URN:S1000D:DMC-S1000D-A-07-04-0101-00A-040A-A">
  <dmRefIdent>
    <dmCode modelIdentCode="S1000D" systemDiffCode="A"
    systemCode="07" subSystemCode="0" subSubSystemCode="4"
    assyCode="0101" disassyCode="00" disassyCodeVariant="A"
    infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
  </dmRefIdent>
</dmRef>

```

Markup example of a data module instance fragment with optional issue number and optional data module title:

```

<dmRef>
  <dmRefIdent>
    <dmCode modelIdentCode="S1000D" systemDiffCode="A"
    systemCode="07" subSystemCode="0" subSubSystemCode="4"
    assyCode="0101" disassyCode="00" disassyCodeVariant="A"
    infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
    <issueInfo issueNumber="002" inWork="00" issueType="changed"/>
  </dmRefIdent>
  <dmRefAddressItems>
    <dmTitle>
      <techname>IETP</techname>
      <infoName>Generation process</infoName>
    </dmTitle>
  </dmRefAddressItems>
</dmRef>

```

```
</dmRefAddressItems>
</dmRef>
```

Markup example with generated XLink attributes shown in bold:

```
<dmRef xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:title="IETP - Generation process"
xlink:href="URN:S1000D:DMC-S1000D-A-07-04-0101-00A-040A-A">
  <dmRefIdent>
    <dmCode modelIdentCode="S1000D" systemDiffCode="A"
      systemCode="07" subSystemCode="0" subSubSystemCode="4"
      assyCode="0101" disassyCode="00" disassyCodeVariant="A"
      infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
    <issueInfo issueNumber="002" inWork="00" issueType="changed"/>
  </dmRefIdent>
  <dmRefAddressItems>
    <dmTitle>
      <techname>IETP</techname>
      <infoName>Generation process</infoName>
    </dmTitle>
  </dmRefAddressItems>
</dmRef>
```

Markup example of a data module instance fragment when the extended code is applied:

```
<dmRef>
  <dmRefIdent>
    <identExtension extensionProducer="SF518"
      extensionCode="USER001"/>
    <dmCode modelIdentCode="S1000D" systemDiffCode="A"
      systemCode="07" subSystemCode="0" subSubSystemCode="4"
      assyCode="0101" disassyCode="00" disassyCodeVariant="A"
      infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
  </dmRefIdent>
</dmRef>
```

Markup example with generated XLink attributes shown in bold:

```
<dmRef xmlns:xlink="http://www.w3.org/1999/xlink"
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:href="URN:S1000D:DME-SF518-USER001-S1000D-A-07-04-0101-00A-040A-A">
  <dmRefIdent>
    <identExtension extensionProducer="SF518"
      extensionCode="USER001"/>
    <dmCode modelIdentCode="S1000D" systemDiffCode="A"
      systemCode="07" subSystemCode="0" subSubSystemCode="4"
      assyCode="0101" disassyCode="00" disassyCodeVariant="A"
      infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
  </dmRefIdent>
</dmRef>
```

**Note**

Depending on the end user viewing requirements, the attribute `xlink:show` can take the value "new" instead of the value "replace".

#### **1 General**

With the emergence of the Web the use of Uniform Resource Locators (URL) has provided a method to access resources located anywhere in the world. Unfortunately, the URL establishes resource links directly to a location, usually residing on a web server, but once the resource is moved to another location all users of the link must re-author their side of the link or the link is broken. Additionally, to establish a link using a URL the location of the resource must be known beforehand. To overcome these limitations there is a need to establish a location independent method of linking.

In a shared environment this situation becomes even more difficult as users of a resource must be notified of changes to the location of a resource to maintain a valid link. Use of relative URLs minimizes some of these issues, but this would imply that every resource exists in the same

fixed file structure. Relative URLs also cause issues for resources that do not exist in actual physical locations or file structures but are located in a database server or other virtual representation. Finally, relative URLs lack metadata capability and do not address communication between applications.

Within the S1000D concept, IETPs are expected to interact with one another, and interoperability between IETPs is becoming a firm requirement. Although an IETP can manage its own resources, interaction between IETPs can be difficult, especially if different enterprise's IETP applications need to communicate. Having a location independent resource system will facilitate this communication by masking the internal resource structure of the various IETP applications and allowing resource access thru named requests instead of location requests.

The main objective of this chapter is to describe a method of resource resolution that will be location independent using Uniform Resource Names (URN), XLink, and promote resource description using metadata attributes.

## **2 Resource resolution**

### **2.1 Resource resolution concepts**

#### **2.1.1 Resources**

A fundamental concept of the World Wide Web is a resource. A resource can be anything that can be accessed thru an identifier. The resource identifier can be considered the resource name or the resource location. For web based applications resource identifiers are described by the Uniform Resource Identifier (URI) syntax. Both URL and URN are considered URIs.

#### **2.1.2 Resource resolvers**

Resource resolution involves determining the physical resource location from a resource identifier. A resource resolver accepts a resource identifier and provides access to the resource location. Using URLs, a web server provides access to the resource directly. Using URNs, an intermediate server provides indirect access to resources by providing access to a URL, which can then be used to access the resource directly.

#### **2.1.3 Location independence**

The use of location independence allows the physical location of a resource to change while the identifier of the resource remains constant. If a resource is resolved indirectly using a resource resolver the link location only needs to be maintained in the resolver. Resource resolvers will accept a resource identifier and return the resolved resource location. Once the location change is updated in the resource resolver, all users of the resource thru the resolver can continue to access the resource without modifying their own internal links. If the identifier is made persistent then any reference to the resource using the identifier will remain valid as long as the resource resolver remains updated with the current resource location.

#### **2.1.4 Uniform resource names**

Since URLs contain embedded location information they cannot be made location independent. The best method to achieve resource location independence is to use the URI described as a Uniform Resource Name. The URN identifies a resource by name only and contains no location information. To use a URN as a link, the link location must be resolved to a URL thru an intermediate resource resolution process.

#### **2.1.5 XLinks**

An XLink provides a powerful linking mechanism for XML documents. For the purpose of location independence all XLink references used in this specification should use the URN form of URI.

#### **2.1.6 Metadata**

Another important aspect of resources is metadata. Metadata describes additional aspects of the resource beyond its identifier, such as the title, author, creation date, etc. The Resource

Description Framework (RDF) and Dublin Core (DC) are methods of describing resources. A resource resolver allows discovery of resource identifiers thru the use of metadata queries.

## 2.2 Use of URNs for resource resolution

To provide location independence in the XML neutral repository all links should be expressed in URN format. The IETP application will process the URN links and transform them into URL links for the rendered "end user form". The use of URNs will standardize data access across IETP repositories allows for XML neutral repositories to be shared between IETP applications.

### 2.2.1 URN format

The URN format is described by the following:

URN:NID:NSS

Where:

URN = Required URN Prefix

NID = Namespace Identifier

NSS = Namespace Specific String

### 2.2.2 S1000D URN namespace identifiers

In S1000D, all information objects such as data modules, publication modules, and illustrations are considered resources. The Data Module Code (DMC), Data Module code Extended (DME), Publication Module Code (PMC), Publication Module code Extended (PME), SCORM content package Module Code (SMC), SCORM content package Module code Extended (SME), CSN, ICN, ICN metadata file code (IMF), COMment code (COM), Data Dispatch Note code (DDN), Data Management List code (DML), data UPdate File (UPF) and data UPdate file Extended (UPE) are the resource identifiers that are each described by a specific name syntax and format identified elsewhere in this specification. Since DMC, DME, PMC, PME, SMC, SME, CSN, ICN, IMF, COM, DDN, DML, UPF and UPE codes have global name uniqueness and are controlled under the authority of the S1000D each can be considered an S1000D subnamespace.

### 2.2.3 S1000D URN namespace registration

S1000D has a registered namespace identifier to reserve a range of names for specification use. The namespace identifier "S1000D" is reserved as illustrated by the following string:

URN:S1000D:{NSS as DMC, DME, PMC, PME, SMC, SME, CSN, ICN, IMF, COM, DDN, DML, UPF, UPE encodings}

### 2.2.4 S1000D URN namespace specific strings

The namespace specific string for URNs defined by this specification will be divided into three components: subnamespace prefix, subnamespace code, and namespace extension suffix.

#### 2.2.4.1 S1000D URN subnamespace prefix

Within S1000D, the namespace specific string is divided into subnamespaces for each of the encodings defined by this specification thru the use of a prefix at the start of the string. The following are identified subnamespaces:

- the "URN:S1000D:DMC" subnamespace must contain all DMCs
- the "URN:S1000D:DME" subnamespace must contain all DMCs with extensions
- the "URN:S1000D:PMC" subnamespace must contain all PMCs
- the "URN:S1000D:PME" subnamespace must contain all PMEs
- the "URN:S1000D:SMC" subnamespace must contain all SMCs
- the "URN:S1000D:SME" subnamespace must contain all SMEs
- the "URN:S1000D:CSN" subnamespace must contain all CSNs
- the "URN:S1000D:ICN" subnamespace must contain all ICNs

- the "URN:S1000D:IMF" subnamespace must contain all IMFs
- the "URN:S1000D:COM" subnamespace must contain all COMs
- the "URN:S1000D:DDN" subnamespace must contain all DDNs
- the "URN:S1000D:DML" subnamespace must contain all DMLs
- the "URN:S1000D:UPF" subnamespace must contain all UPFs
- the "URN:S1000D:UPE" subnamespace must contain all UPEs

#### 2.2.4.2 S1000D URN subnamespace codes

The subnamespacecode follows the subnamespace prefix. The subnamespace prefix will be separated from the subnamespace code using the "-" (ASCII 45) character.

URN:S1000D:DMC-{Code in DMC syntax}

URN:S1000D:DME-{Code in DME syntax}

URN:S1000D:PMC-{Code in PMC syntax}

URN:S1000D:PME-{Code in PME syntax}

URN:S1000D:SMC-{Code in SMC syntax}

URN:S1000D:SME-{Code in SME syntax}

URN:S1000D:CSN-{Code in CSN syntax}

URN:S1000D:ICN-{Code in ICN syntax}

URN:S1000D:IMF-{Code in IMF syntax}

URN:S1000D:COM-{Code in COM syntax}

URN:S1000D:DDN-{Code in DDN syntax}

URN:S1000D:DML-{Code in DML syntax}

URN:S1000D:UPF-{Code in UPF syntax}

URN:S1000D:UPE-{Code in UPE syntax}

#### 2.2.4.3 S1000D URN subnamespace extension suffix

In addition, the code syntax must be extended within the namespace to include qualifiers that further identify the item. Each qualifier is separated from the subnamespace code by an underscore, (ie, the "\_" (ASCII 95) character and appended after the subnamespace code). A qualifier begins with a qualifier identifier separated from the qualifier data using the "-" (ASCII 45) character.

The following qualifiers are required:

The issue of the data is identified using the "I" qualifier by appending the string "\_I-{ISSUE}" to issue number where "{ISSUE}" is the issue number.

The INWORK status of the data is identified using the "W" qualifier by appending the string "\_W-{INWORK}" to the code where "{INWORK}" is the inwork number.

The encoded language of the data is identified using the "L" qualifier by appending the string "\_L-{LANG}" where "{LANG}" is the language code.

The encoded country of the data further qualifies the language using the "C" qualifier by appending the string "\_C-{COUNTRY}" to the code where "{COUNTRY}" is the country code.

### 2.2.5 URN examples

URN for the DMC "S1000D-A-07-05-0000-00A-000A-A":

URN: S1000D:DMC-S1000D-A-07-05-0000-00A-000A-A\_I-001\_W-00\_L-SX\_C-US

URN for the DMC "S1000D-A-07-05-0000-00A-000A-A" specifying the first issue in English:

URN: S1000D:DMC-S1000D-A-07-05-0000-00A-000A-A\_I-001\_W-00\_L-EN\_C-US

URN for the training DMC "S1000D-A-07-05-0000-00A-000A-A-T80E" specifying the first issue in English:

URN: S1000D:DMC-S1000D-A-07-05-0000-00A-000A-A-T80E\_I-001\_W-00\_L-EN\_C-US

URN for an instance of the DMC "S1000D-A-07-05-0000-00A-000A-A" applying the extension "SF518-ABC00231", and also specifying the first issue in English:

URN: S1000D:DME-SF518-ABC00231-S1000D-A-07-05-0000-00A-000A-A\_I-001\_W-00\_L-EN\_C-US

### 2.2.6 URN security considerations

There are no additional security considerations other than those normally associated with the use and resolution of URI in general. Most implementations of resolution services will likely be web services. Therefore security considerations in this case will be the same well known issues related to accessing and protecting information over the internet.

## 2.3 IETP URN to URL translation

Since current browsers do not have the capability to resolve URNs and XLinks directly, each IETP application will need to resolve link information during the transformation to the end user form to be displayed in the browser. The process to resolve URN information depends on the IETP implementation.

To convert a URN to a file name a simple method is to parse the namespace specific string of the URN and append the appropriate file extension and possibly a static directory structure to get a relative or static URL. More advanced applications could use a database to lookup the URL for a specific URN and possibly even store the data module within the database.

To achieve a common resolution interface, IETP applications must implement the URN resolution server interface proposed in this specification by providing an external interface to the internal IETP data repository, thereby allowing external applications to access the information. Using this interface for internal URN resolution is also recommended to simplify link resolution.

## Chapter 7.4.2

<a href="#">Chap 7.4.2.1</a>	Publication module Schema - Issue summary
<a href="#">Chap 7.4.2.2</a>	SCORM content package module Schema - Issue summary

#### **1 General**

##### **1.1 Purpose**

The purpose of this chapter is to provide technical background on S1000D publication module and SCORM content package.

##### **1.2 Scope**

The publication module defines the content and the structure of a publication. It contains references to data modules, other publication modules, data modules with front matter and access illustrations, gives corresponding titles and specifies how these are structured within the publication instance.

The SCORM content package defines the content and the structure of a SCO. It contains references to data modules, other SCORM content packages, data modules with front matter and access illustrations, gives corresponding titles and specifies how these are structured within the SCO instance.

## 2 Publication module and SCORM content package Schemas

The rules and guidance for publication module and SCORM content package are given in the following chapters:

- [Chap 4.9](#): provides a detailed description of the concept and structure of the publication module
- [Chap 4.15](#) provides a detailed description of the concept and structure of the SCORM content package

Electronic copies of the XML Schema for publication modules and SCORM content package are available for download from the S1000D web site at [www.s1000d.org](http://www.s1000d.org). System identifiers shown in examples point to these reference copies at:

[http://www.s1000d.org/S1000D\\_4-1/...](http://www.s1000d.org/S1000D_4-1/...)

From S1000D Issue 4.0 onwards, Standard Generalized Markup Language (SGML) and XML Document Type Definition (DTD) are no longer supported.

General information on the Publication module and SCORM content package concept are given in the following chapters:

- [Chap 7.4.2.1](#) provides information for publication module Schema.
- [Chap 7.4.2.2](#) provides information for SCORM content package module Schema.

### 2.1 Publication module and SCORM content package structure

#### 2.1.1 Formats

The structure of a publication module and SCORM content package is based on addressable items and has no reference to pages.

The publication module and SCORM content package instance must be a valid XML instance. This means that the publication module and SCORM content package instance must conform to either a publication module or SCORM content package XML schema.

Data modules and publication modules and SCORM content package can reside as XML instances within the CSDB. It is strongly advised to check that data modules, publication or SCORM content package modules in XML format are valid XML instances before they enter into the IETP building process, to ensure S1000D conformity and, thus, interoperability.

#### 2.1.2 Schema structure

This paragraph outlines the representation of the hierarchical (tree) structure of the S1000D publication module and SCORM content package.

The publication module and SCORM content package structure is divided into three parts:

- An optional XML RDF/DC metadata section (element [<rdf:Description>](#)) (available only for the XML format)
- A mandatory publication module identification and status section (element [<identAndStatusSection>](#)) derived from the data module identification and status section
- A mandatory publication module and SCORM content package content section (element [<content>](#)) which includes only references to data modules, publication modules or external publications (ie for legacy interoperability)

## **1 General**

### **1.1 Purpose**

Technical background on Schema issues related to the publication module, which have been formally released for productive use, is given below.

### **1.2 Scope**

Only the changes to the S1000D XML Schema brought about by the Change Proposal Forms (CPF) approved for this issue are recorded here. Details of changes to previous issues are recorded in Issue 4.1 of this specification.

#### **Note**

From Issue 4.0 of S1000D, the corresponding XML Schemas are named Issue instead of Version.

## **2 Summary of changes**

Summary of changes for Issue 4.2 of the XML Schema for publication module:

- 2010-012SE - Harmonization of name instantiation between Common information repository (CIR) zones and CIR access points:
  - Added the element <shortName> to the element <accessPointRef>

- 2010-034US - Addition of security attributes to elements <techName> and <infoName>:
  - Added the attributes group securityAttGroup to the elements <techName> and <infoName>
- 2012-020US - Derivative classifications:
  - Added the new optional element <derivativeClassification> to the element <pmStatus>. The element <derivativeClassification> introduces the elements <classificationActionGroup>, <classificationAction>, <valueAfterAction>, <derivativeSource>, <businessUnit> and 23 other descendants.
  - Added the new optional attribute derivativeClassificationRefId to the attributes group securityAttGroup and to the element <security>
- 2013-026GB - Addition of references to Reason for update:
  - Added the new optional and repeatable element <simpleRefPara> to the element <reasonForUpdate>
- 2013-028CMPTT - Addition of a type to publication module information:
  - Added the new project configurable optional attribute pmType to the element <pm>
- 2013-041AA - Revision marking consistency:
  - Added the optional attributes changeType, changeMark and reasonForUpdateRefIds to the elements <quantity>, <internalRef>, <footnoteRef>, <inlineSignificantData> and <shortName>

## 1 General

Operation and maintenance of a Product in a certain user environment quite frequently call for additional information apart from the Product specific publications. Typically, such information concerns general matters or local circumstances, and can include local safety regulations, support equipment or commercial off the shelf documentation, etc. This kind of information, not complying with S1000D as far as structure and/or format are concerned, is herein called legacy information/data.

S1000D appreciates the need for legacy information. Therefore, to facilitate compilation of complete packages of information to meet the comprehensive requirements of specific user groups, S1000D provides the means to include legacy data in publications.

## 2 Inclusion techniques

### 2.1 Encapsulation in data modules

One way of including legacy data in an S1000D publication is to reference the data from within a data module. The technique for this is based on the use of the element `<externalPubRef>`. Refer to [Chap 3.9.5.2.1.2](#).

The element `<externalPubCode>`, contained in element `<externalPubRefIdent>`, is used to store the identification of the legacy publication concerned. In addition, good practice is to use the attribute `pubCodingScheme` of element `<externalPubRefIdent>` to reflect the type of identification that is applied.

**Business rule decision point BRDP-S1-00540 - Population of the element `<externalPubCode>`:**

- Decide the preferred syntax to identify legacy data by a publication code.

**Business rule decision point BRDP-S1-00541 - Use of the attribute `pubCodingScheme`:**

- Decide whether to use the attribute `pubCodingScheme`. If used, decide on the set of allowed coding schemes and the syntax of those schemes.

S1000D does not impose or suggest any specific coding of legacy publications or any particular method for identifying such a coding system. That is a project or an organization decision.

The encapsulating data module must be a valid data module, including the required `<identAndStatusSection>` section, and a minor structure to encompass the reference element. In consequence, the data module must also be assigned a valid data module code.

**Note**

The format of an encapsulated legacy object must be one of the allowed data formats that apply to illustrations, etc. Normally it would be a PDF file.

## 2.2 Reference by publication modules

As an alternative to encapsulating legacy data in a data module, the data can be included by a reference within a publication module. In this case, the element `<externalPubRef>`, contained in element `<pmEntry>`, is used to refer to the legacy publication. Refer to [Chap 7.4.2](#).

Markup of this reference is similar to that described in [Para 2.1](#). The element `<externalPubCode>`, contained in element `<externalPubRefIdent>`, is used to give the identification of the legacy publication concerned as text. Also in this case, it is good practice to let the attribute `pubCodingScheme` of element `<externalPubRefIdent>` reflect the type of identification that is applied. The business rule decision points given in [Para 2.1](#) are also applicable here.

This alternative method can also be used to include "S1000D legacy" data (ie, publications produced to a previous issue of this specification). However, the preferred method to include such data is to regenerate the publications to meet the current standards.

**Note**

To include legacy publications in an IETP, the software applied must be able to read and present the legacy information.

## 2.3 Transformation for display

To enable viewing of legacy data in an IETP, it is necessary to resolve the references made in either a data module or a publication module and transform these to a format complying with the viewer used.

**Business rule decision point BRDP-S1-00542 - Method to include legacy information in an IETP:**

- Decide whether to include legacy information by encapsulating it in data modules or by referencing it as external publications using the publication module.

---

**Business rule decision point BRDP-S1-00543 - IETP reference format:**

- Decide the syntax and semantics of the links established to reference legacy data.

Since the preconditions are not fully controlled by S1000D, the specification does not elaborate on transformation of the references for viewing and navigation purposes. This is left to the project or the organization. Nevertheless, it is recommended to apply the principles and methods for IETP link management as described in [Chap 7.4.1.1](#) and [Chap 7.7.4](#).

## 1 General

### 1.1 Purpose

The purpose of this chapter is to provide technical background on S1000D data interchange rules and procedures.

### 1.2 Scope

In addition to providing details of the file based transfer method for information interchange, this chapter also contains descriptions of interchange related Schemas.

## 2 Information interchange

The rules and guidance for information interchange are given in the following chapters:

- [Chap 7.5.1](#) provides a detailed description of the file based transfer method including file naming conventions
- [Chap 7.5.2](#) provides a descriptions of interchange related Schemas
- [Chap 7.5.3](#) provides a mapping of S1000D elements and attributes to RDF/DC metadata

PDF Reference	Adobe Portable Document Format

## 1 General

The purpose of this chapter is to describe the file based transfer method to be used for S1000D compatible electronic information interchange.

## 2 File based transfer method

The file based transfer method imposes a file naming convention to allow simple CSDB data import checks to be performed without the need to investigate values inside data files.

### 2.1 File based transfer package structure

An S1000D file based transfer package consists of one data dispatch note text file, marked up with XML, and at least one file out of the data categories given in [Chap 4.8](#).

The files can be transferred in any order, but it is recommended that the data dispatch note is the first data file in the sequence for serial media. A directory structure will not be used.

Appropriate data compression techniques (eg, ZIP, GZIP, TAR or X/Open (UNIX) compress) can be applied to the data file set as a whole before transfer. This reduces transfer package sizes and transfer times but has to be mutually agreed upon between sender and receiver for each individual project.

#### Business rule decision point BRDP-S1-00544 - Use of data compression techniques:

- Decide whether to use compression techniques on files being transferred and which techniques to be used.

### 2.2 File types

[Table 2](#) summarizes the permitted data formats for S1000D compatible information interchange, where filename examples are shown according to the mandatory filename format with hyphens and, if applicable, underscores.

The file types for graphics and multimedia are particularly important because of a potential financial impact. Refer to [Chap 3.9.2.7](#).

Table 2 Permitted interchange data formats and corresponding filename examples

Data format	Filename example
CALS Raster (CCITT Gr 4)	ICN-1B-A-270000-M-C0419-00002-A-002-03.CG4
CGM	ICN-A1-A-532510-D-F6117-00001-A-001-01.CGM
Graphics Interchange Format (GIF)	ICN-E2-A-721060-R-K0378-00066-A-001-01.GIF
Joint Photographic Experts Group (JPEG)	ICN-1B-B-291101-M-C0419-00571-B-001-01.JPG
PDF	ICN-S1000D-A-07050100-0-I9005-00002-A-003-01.PDF
Portable Network Graphics (PNG)	ICN-S1000D-A-004005-0-I9005-00001-A-001-01.PNG
Tagged Image File Format (TIFF)	ICN-E2-A-723200-R-K0378-00003-A-003-02.TIF
XML	PMC-S1000D-I9005-1000D-00_001-02_SX-US.XML
Multimedia formats	ICN-S1000D-A-005004-0-E8010-00001-A-001-01.XXX where XXX is the filename extension of the multimedia type used

## 2.3 File naming conventions

The transfer files are named according to the following generic structure:

**TYPE-CONTROLNUMBER.FORMAT**, where:

- **TYPE** can have the following values:
  - "DDN" for data dispatch notes
  - "DMC" for data module text
  - "DME" for data module text, extended identification
  - "ICN" for illustrations and multimedia objects
  - "IMF" for illustrations and multimedia object metadata files
  - "DML" for data management lists
  - "PMC" for publication modules
  - "SMC" for SCORM content package modules
  - "PME" for publication modules, extended identification
  - "SME" for SCORM content package modules, extended identification
  - "COM" for comment forms
  - "UPF" for data update files
  - "PE" for data update files, extended identification
- **CONTROLNUMBER** is the unique identifier of the data file written with hyphens and underscores depending on the type of data as given below.
- **FORMAT** can have the following values:
  - "XML", denoting text marked up with XML in accordance with the corresponding Schema
  - "CGM", denoting 2D Computer Graphics Metafile (CGM) graphics in accordance with the S1000D CGM profile given in [Chap 7.3.2](#)
  - "CG4", denoting binary Continuous Acquisition and Life-cycle Support (CALS) raster type 1 (untiled) graphics encoded in CCITT/4 in accordance with MIL-PRF-28002C

- **"TIF"**, denoting Tagged Image File Format (TIFF) binary raster graphics encoded in CCITT/4 in accordance with the S1000D TIFF profile given in [Chap 7.3.2](#), or LZW encoded colored raster graphics in accordance with the Adobe TIFF 6.0 specification
- **"JPG"**, denoting Joint Photographic Expert Group (JPEG) raster graphics encoded in accordance with ISO/IEC 10918
- **"PNG"**, denoting Portable Network Graphics (PNG) raster images encoded in accordance with ISO/IEC 15948
- **"GIF"**, denoting Graphic Interchange Format (GIF) raster images encoded in accordance with the CompuServe GIF 89a specification
- **"PDF"**, denoting documents encoded in accordance with the Adobe PDF Reference
- **"XXX"**, (where XXX is the filename extension) denoting the specific encoding for the multimedia type used. Refer to [Chap 7.3.3](#).

The filenames are built of three characters followed by a hyphen, followed by the appropriate unique identifier including hyphens, followed by a period, followed by the three character filename extension. All filenames must be in uppercase.

The CONTROLNUMBER consists of the following sequence:

- data identifier, written with hyphens
- underscore
- issue number (content of attribute `issueNumber` of element `<issueInfo>`)
- hyphen
- inwork number (content of attribute `inWork` of element `<issueInfo>`)

For data types **"DDN"** (data dispatch notes) and **"ICN"** (illustrations and multimedia objects), the CONTROLNUMBER consists only of the data identifier.

For data modules, publication modules, SCORM content package modules and comment forms, the CONTROLNUMBER is further extended by the following sequence:

- underscore
- language code (content of attribute `languageIsoCode` of element `<language>`)
- hyphen
- country code (content of attribute `countryIsoCode` of element `<language>`)

The element `<language>` and the attributes `countryIsoCode` and `languageIsoCode` must be used.

Details on the breakdown of control numbers and more examples of filenames for the different data categories are given in the following paragraphs.

### 2.3.1 Data dispatch note

CONTROLNUMBER is the data dispatch note identifier in the form:

MI-SSSSS-RRRRR-XXXX-NNNNN, where:

- MI = model identification code
- SSSSS = Commercial And Government Entity (CAGE) code of the sender
- RRRRR = CAGE code of the receiver
- XXXX = year (eg, 1999, 2001)
- NNNNN = unique sequential decimal data dispatch note number per year depending on the model identification code, the sender, the receiver and the year, starting with value "00001" every new year

Filename example of the third dispatch from EADS-M to BAES in 2001:

- DDN-S1000D-C0419-K0999-2001-00003.XML

Filename example of the second dispatch from MoD UK to ASD in 2003:

- DDN-S1000DBIKE-U8025-I9005-2003-00002.XML

Filename example of the first dispatch from EADS-M to MoD UK in 2004:

- DDN-S1000DBIKE-C0419-U8025-2004-00001.XML

The data dispatch note defines the sender, the receiver and the content of the dispatch. A data delivery list (DDL) is optionally included in the data dispatch note which lists all filenames of the dispatched data together with their control numbers and issue numbers as additional options.

The element `<deliveryListItem>` specifies one dispatched object in the transfer package. The element `<dispatchFileName>` must contain the complete dispatch filename including TYPE and FORMAT, separated by hyphens and underscores as appropriate.

The element `<entityControlNumber>` must contain only the CONTROLNUMBER without TYPE and FORMAT (ie, without any prefix or postfix) separated by hyphens as appropriate.

Markup examples:

```
<deliveryListItem>
<dispatchFileName>DMC-1B-A-31-16-00-00A-040A-A_003-00_SX-US.XML
</dispatchFileName>
<entityControlNumber>1B-A-31-16-00-00A-040A-A_003-00_SX-US
</entityControlNumber>
</deliveryListItem>

<deliveryListItem>
<dispatchFileName>PMC-1B-D9460-00001-00_002-00_EN-US.XML
</dispatchFileName>
<entityControlNumber>1B-D9460-00001-00_002-00_EN-US
</entityControlNumber>
</deliveryListItem>

<deliveryListItem>
<dispatchFileName>ICN-A1-A-532510-D-F6117-00001-A-001-01.CGM
</dispatchFileName>
<entityControlNumber>A1-A-532510-D-F6117-00001-A-001-01
</entityControlNumber>
</deliveryListItem>

<deliveryListItem>
<dispatchFileName>COM-AJ-I9034-2006-00365-R_SX-US.XML
</dispatchFileName>
<entityControlNumber>AJ-I9034-2006-00365-R_SX-US
</entityControlNumber>
</deliveryListItem>

<deliveryListItem>
<dispatchFileName>ICN-S1000D-A-005004-0-E8010-00001-A-001-01.AVI
</dispatchFileName>
<entityControlNumber>S1000D-A-005004-0-E8010-00001-A-001-01
</entityControlNumber>
</deliveryListItem>
```

### 2.3.2 Data module text

CONTROLNUMBER is the data module code with hyphens between the different parts of the code (refer to [Chap 4.3](#)), followed by the sequence:

- underscore
- three digit data module issue number
- hyphen
- two digit inwork number

The CONTROLNUMBER is extended by \_LL-CC, where:

- LL = language code
- CC = country code

Filename examples:

- DMC-1B-A-31-16-00-00A-040A-A\_003-00\_SX-US.XML
- DMC-S1000DBIKE-AAA-DA5-20-00-0000-251C-A\_001-01\_SX-US.XML

### 2.3.3 Data module text, extended identification

CONTROLNUMBER is the data module code with hyphens between the different parts of the code (refer to [Chap 4.3](#)), preceded by the content of the attributes `extensionProducer` and `extensionCode` of the element `<identExtension>` in the element `<dmIdent>`, also separated by hyphens.

Filename examples:

- DME-SF518-ABC00231-1B-A-31-16-00-00A-040A-A\_003-00\_EN-US.XML
- DME-SF518-USER001-S1000DBIKE-AAA-DA5-20-00-0000-251C-A\_001-01\_EN-US.XML

### 2.3.4 Illustrations and multimedia objects

CONTROLNUMBER is the ICN (without the "ICN-" prefix) written with hyphens between the different parts of the code.

Filename examples:

- ICN-A1-A-535210-D-F6117-00001-A-001-01.CGM
- ICN-S3627-S1000D00494-001-01.CG4
- ICN-K0378-D1B00003-003-02.TIF
- ICN-B2-A-746210-E-G9216-00001-A-001-01.MPG
- ICN-2C-A-390000-M-F0518-00003-A-002-03.AVI
- ICN-F3-A-123400-K-R0863-00005-A-003-02.MP3

#### Note

This CONTROLNUMBER format must also be used along with the prefix "ICN-" in graphic/multimedia entity definitions and for the values of attribute `infoEntityIdent` of the elements `<graphic>`, `<symbol>` and `<multimediaObject>`.

A variety of computer media are available and in widespread use for the interchange of technical information. The most appropriate medium, or combination of media, must be agreed upon at the project or the enterprise level. Whichever interchange medium is selected, file naming, file types and file structure must be implemented as described above.

#### Note

The term "interchange media" includes situations where the parties involved agree on providing the information in a shared web or distributed file system environment.

### 2.3.5

#### Data management list

CONTROLNUMBER is the data management list identifier in the form:

MI-SSSSS-T-XXXX-NNNNN\_III-WW, where:

- MI = model identification code
- SSSSS = CAGE code of the sender
- T = type of list. Possible values are:
  - "S" for CSDB status lists
  - "P" for partial data management requirement lists
  - "C" for complete data management requirement lists
- XXXX = year (eg, 2012)
- NNNNN = unique sequential decimal data management list number per year depending on the model identification code, the sender, the list type and the year, starting with value "00001" every new year
- III = issue number
- WW = inwork number

Filename examples:

- DML-S1000D-C0419-S-1999-00003\_001-00.XML
- DML-S1000D-C0419-P-2000-00002\_001-00.XML
- DML-S1000D-C0419-C-2002-00001\_001-00.XML
- DML-S1000D-I9005-C-2003-00001\_002-00.XML
- DML-S1000DBIKE-U8025-S-2004-00001\_000-01.XML

The functionality and content of data management lists is described in [Chap 4.5](#).

### 2.3.6

#### Publication module and SCORM content package module

CONTROLNUMBER is the publication module and the SCORM content package module identifiers in the form:

MI-YYYYY-XXXXX-NN\_III-WW, where:

- MI = model identification code
- YYYYY = CAGE code of the issuing authority
- XXXXX = unique alphanumeric identification of the publication module or the SCORM content package module depending on the model identification code and the issuing authority
- NN = volume number of the publication, the default value "00" means there are no volumes (ie, single volume publication)
- III = issue number
- WW = inwork number

The CONTROLNUMBER is extended by \_LL-CC, where:

- LL = language code
- CC = country code

Filename examples:

- PMC-E2-K0378-00001-00\_001-00\_EN-GB.XML
- PMC-1B-D9460-00001-00\_002-00\_EN-GB.XML
- PMC-S1000D-I9005-1000D-00\_000-02\_SX-US.XML
- SMC-E2-K0378-00001-00\_001-00\_EN-GB.XML
- SMC-1B-D9460-00001-00\_002-00\_EN-GB.XML

- SMC-S1000D-I9005-1000D-00\_000-02\_EN-GB.XML

The functionality and the content of publication modules and SCORM content package modules are described in [Chap 4.9](#) and [Chap 4.15](#), respectively.

### 2.3.7 Publication module, extended identification

CONTROLNUMBER is the publication module code with hyphens between the different parts of the code (refer to [Para 2.3.6](#)), preceded by the content of the attributes `extensionProducer` and `extensionCode` of the element `<identExtension>` in the element `<pmIdent>`, also separated by hyphens.

### 2.3.8 SCORM content package module, extended identification

CONTROLNUMBER is the SCORM module code with hyphens between the different parts of the code (refer to [Para 2.3.6](#)), preceded by the content of the attributes `extensionProducer` and `extensionCode` of the element `<identExtension>` in the element `<scormContentPackageIdent>`, also separated by hyphens.

### 2.3.9 Comment

CONTROLNUMBER is the comment identifier in the form:

MI-YYYYYY-XXXX-NNNNN-T, where:

- MI = model identification code
- YYYYYY = CAGE code of the authority, which raised the query/comment originally
- XXXX = year (eg, 2005)
- NNNNN = unique sequential decimal comment number per year depending on the model identification code, the originator of the query/comment and the year, starting with the value "00001" every new year
- T = type of comment form. Possible values are:
  - "Q", the query (originally raised comment)
  - "I", the interim response
  - "R", the final response

The CONTROLNUMBER is extended by `_LL` or `_LL-CC`, where:

- LL = language code
- CC = country code

Filename examples:

- COM-E2-K0378-2002-00001-Q\_EN\_GB.XML
- COM-E2-K0378-2002-00001-I\_SX\_US.XML
- COM-JA-H2433-2002-00058-Q\_EN\_US.XML
- COM-JA-H2433-2002-00058-R\_SX\_US.XML

The functionality and content of comment forms is described in [Chap 4.6](#).

#### 2.3.9.1 Attachments to comments

CONTROLNUMBER is the comment identifier amended by the sequential number (MM) of the attachment to this comment in the form:

MI-YYYYYY-XXXX-NNNNN-T-MM, where:

- MM = unique sequential decimal number of the attachment starting with the value "01"

The data format of the attachment is not restricted to the permitted interchange formats given in [Para 2.2](#). The allowed extensions must be defined by the project or the enterprise. Refer to [Para 2.3](#).

Filename examples:

- COM-AJ-I9034-2006-00365-Q-01\_EN\_US.PDF
- COM-AJ-I9034-2006-00365-I-01\_SX\_US.ZIP

### 2.3.10 Data update file

CONTROLNUMBER is the data update file code with hyphens between the different parts of the code (refer to [Chap 4.13.2.2](#)), followed by the sequence:

- underscore
- three digit data module issue number
- hyphen
- two digit inwork number

The CONTROLNUMBER is extended by \_LL-CC, where:

- LL = language code
- CC = country code

Filename examples:

- UPF-1B-A-31-16-00-00A-040A-A\_003-00\_SX-US.XML
- UPF-S1000DBIKE-AAA-DA5-20-00-0000-251C-A\_001-01\_SX-US.XML

### 2.3.11 Data update file, extended identification

CONTROLNUMBER is the data update file code with hyphens between the different parts of the code (refer to [Chap 4.13.2.2](#)), preceded by the content of the attributes `extensionProducer` and `extensionCode` of the element `<identExtension>` in the element `<updateIdent>`, also separated by hyphens.

Filename examples:

- UPE-SF518-ABC00231-1B-A-31-16-00-00A-040A-A\_003-00\_EN\_US.XML
- UPE-SF518-USER001-S1000DBIKE-AAA-DA5-20-00-0000-251C-A\_001-01\_EN-US.XML

### 2.3.12 Illustrations and multimedia metadata files

CONTROLNUMBER is derived from the ICN concerned, written as described in [Para 2.3.4](#), followed by metadata file issue numbering:

- ICN (without the "ICN-" prefix)
- underscore
- three digit metadata file issue number
- hyphen
- two digit metadata file inwork number

The illustration and multimedia metafile is described in [Chap 3.9.2.7](#).

Filename examples:

- IMF-A1-A-535210-D-F6117-00001-A-001-01\_001-00.XML
- IMF-S3627-S1000D00494-001-01\_001-02.XML
- IMF-K0378-D1B00003-003-02\_002-00.XML
- IMF-B2-A-746210-E-G9216-00001-A-001-01\_001-03.XML
- IMF-2C-A-390000-M-F0518-00003-A-002-03\_003-00.XML
- IMF-F3-A-123400-K-R0863-00005-A-003-02\_001-01.XML

#### 1 General

The purpose of this chapter is to provide a description of the interchange Schemas.

#### 2 Interchange Schemas

The rules and guidance for information interchange Schemas are given in the following chapters.

- [Chap 7.5.2.1](#) provides a version summary of Schemas for data dispatch notes, data management lists and comment forms

Electronic copies of the Schemas for data dispatch notes, data management lists, and comment forms are available for download from the S1000D web site at [www.s1000d.org](http://www.s1000d.org).

## 1 General

The purpose of this chapter is to identify all S1000D interchange related Schema issues, which have been formally released. For each issue there is a summary of the reasons for change from previous releases. Details of the changes are recorded in the appropriate sections.

From S1000D Issue 4.0 and onwards, Standard Generalized Markup Language (SGML) and XML Document Type Definition (DTD) are no longer supported.

#### **Note**

From Issue 4.0 of the specification the corresponding XML Schema are named Issue instead of Version.

## 2 Issue summary

### 2.1 Data dispatch note

#### 2.1.1 List of XML Schema issues for data dispatch notes

[Table 2](#) lists all XML Schema issues for data dispatch notes together with their corresponding S1000D issue.

*Table 2 List of S1000D XML Schema issues for data dispatch notes*

S1000D	XML Schema	Release date
Issue 2.0	Version 2.0	2003-05-31
Issue 2.1	Version 2.1	2004-02-29
Issue 2.2	Version 2.2	2005-05-01
Issue 2.3	Version 2.3	2007-02-28
Issue 3.0	Version 3.0	2007-07-31
Issue 4.0	Issue 4.0	2008-08-01
Issue 4.1	Issue 4.1	2012-07-31

#### 2.1.2 Update summary

##### 2.1.2.1 Version 2.0

This was the first formal version of a Schema for data dispatch notes, released to coincide with Issue 2 of the specification. This Schema version just reflects the SGML/XML DTD.

##### 2.1.2.2 Version 2.1

Summary of changes for Version 2.1 of the S1000D Schema for data dispatch notes:

- CPF 2003-13DE: Element [<issno>](#) removed from content model of element [<ddn>](#) (refer to [ddnSchema.xsd](#) and [ddn.xsd](#)). Attribute [issno](#) and attribute [inwork](#) removed from pattern of element [<dc:Identifier>](#). Refer to [dc\\_ddn.xsd](#).

##### 2.1.2.3 Version 2.2

Summary of changes for Version 2.2 of the S1000D Schema for data dispatch:

- CPF 2004-21GB: List of values on attribute change within attribute group "INSDEL" amended by value ["modify"](#). Refer to [dmaddr2.xsd](#).
- CPF 2004-22GB: Element [<copyright>](#) redefined to contain only running text or simple paragraph element [<p>](#) (refer to [datarest2.xsd](#)). Inclusion of file [datarest.xsd](#) replaced by [datarest2.xsd](#) for data restrictions on CSDB objects other than data modules. Refer to [ddnSchema.xsd](#).
- CPF 2004-24GB: Simple type ["MNTLVLS"](#) introduced for the definition of generic maintenance levels. Refer to [project.cfg](#).
- CPF 2004-49DE: Pattern on element [<seqnum>](#) redefined to contain always a 5-digit positive integer for a uniform definition of sequential numbers in data dispatch note, data module list and COMMENT starting with 00001. Refer to [seqnum.xsd](#).
- Bug fixes:
  - Content model of element [<remarks>](#) changed to allow optional repeatable sub element [<p>](#). Refer to [listcode.xsd](#).
  - Pattern definitions on attribute [issno](#) and attribute [inwork](#) of element [<issno>](#) corrected. Refer to [dmaddr2.xsd](#).

- Pattern definitions on attribute year, attribute month and attribute day of element `<issdate>` corrected. Refer to dmaddr2.xsd.
- TPSMG request: Introduce attributeGroup "bodyatt" on element `<p>`. Refer to listcode.xsd.
- TPSMG request: Introduce entity %bodyatt; on element `<p>`. Refer to listcode.xsd.
- Consistency:
  - Type of all elements which contain only Parsed Character Data and which have no attributes has been redefined to type="xs:string".

#### 2.1.2.4 Version 2.3

Summary of changes for Version 2.3 of the Schema for data dispatch notes:

- CPF 2005-65SE: Dublin Core element names changed to all lowercase.

#### 2.1.2.5 Version 3.0

There were no changes compared to the data dispatch note Schema Version 2.3.

#### 2.1.2.6 Issue 4.0

Summary of changes for Issue 4.0 of the Schema for data dispatch:

- CPF 2004-051DE:
  - Elements `<ddnAddress>` and `<ddnIdent>` have been introduced in order to contain the data dispatch note code (old element `<ddnc>`).
  - Content model of element `<dmRef>` (old element `<refdm>`) changed from (identExtension?, dmCode, dmTitle?, issueInfo?, issueDate?, language?) to (identExtension?, dmCode, language?, issueInfo?, issueDate?, dmTitle?).
- CPF 2006-044US: the attribute `inWork` of element `<issueInfo>` is now required (old element `<issno>`).
- CPF 2006-046SE:
  - Sequence of repeated sibling elements has been wrapped in its own element in order to enhance clarity in the schemas. The structure of the element `<deliveryList>` has changed.
  - A wrapper element has been added to make structure more easily understood
    - `<deliveryListItem>` in `<deliveryList>`
  - Mixed content has been eliminated in the `<remarks>` element.
- CPF 2007-098SE:
  - The top structure and the identification of the CSDB objects have been harmonized, which affects all of data module, publication module, data module list, data dispatch note and Comment.

#### 2.1.2.7 Issue 4.1

Summary of changes for Issue 4.1 of the Schema for data dispatch:

- CPF\_2009-098US:
  - Element `<brexDmRef>` has been introduced to the element `<ddnStatus>` in order to allow the BREX data module reference.

## 2.2 Data management list

### 2.2.1 List of XML Schema issues for data management lists

[Table 3](#) lists all XML Schema issues for data management lists with their corresponding S1000D issue.

#### Note

From Issue 4.1 of the specification the data module list was renamed to data management list.

*Table 3 List of S1000D XML Schema issues for data management lists*

S1000D Issue	XML Schema Issue No.	Release date
Issue 2.0	Version 2.0	2003-05-31
Issue 2.2	Version 2.2	2005-05-01
Issue 2.3	Version 2.3	2007-02-28
Issue 3.0	Version 3.0	2007-07-31
Issue 4.0	Issue 4.0	2008-08-01
Issue 4.1	Issue 4.1	2012-07-31

## 2.2.2 Update summary

### 2.2.2.1 Version 2.0

This was the first formal version of a Schema for data management lists, released to coincide with Issue 2 of the specification. This Schema version just reflects the SGML/XML DTD.

### 2.2.2.2 Version 2.2

Summary of changes for Version 2.2 of the S1000D Schema for data management lists:

- CPF 2004-21GB: List of values on attribute change within attribute group "INSDEL" amended by value "modify". Refer to dmaddr2.xsd.
- CPF 2004-22GB: Element <copyright> redefined to contain only running text or simple paragraph element <p> (see datarest2.xsd). Inclusion of file datarest.xsd replaced by datarest2.xsd for data restrictions on CSDB objects other than data modules. Refer to dmlSchema.xsd.
- CPF 2004-24GB: Simple type "MNTLVLS" introduced for the definition of generic maintenance levels. Refer to project.cfg.
- CPF 2004-49DE: Pattern on element <seqnum> redefined to contain always a 5-digit positive integer for a uniform definition of sequential numbers in data dispatch note, data module list and COMMENT starting with 00001. Refer to seqnum.xsd.
- Bug fixes:
  - Content model of element <remarks> changed to allow optional repeatable sub element <p>. Refer to listcode.xsd.
  - Pattern definitions on attribute issno and attribute inwork of element <issno> corrected. Refer to dmaddr2.xsd.
  - Pattern definitions on attribute year, attribute month and attribute day of element <issdate> corrected. Refer to dmaddr2.xsd.
- TPSMG request: Introduce attributeGroup "bodyatt" on element <p>. Refer to listcode.xsd.
- TPSMG request: Introduce entity %bodyatt; on element <p>. Refer to listcode.xsd.

- Consistency:
  - Type of all elements which contain only Parsed Character Data and which have no attributes has been redefined to type="xs:string".

#### 2.2.2.3 Version 2.3

Summary of changes for Version 2.3 of the S1000D Schema for data management lists:

- CPF 2004-64SE: Addition of element `<dmcextension>` to the `<addresdm>` content model.
- CPF 2005-65SE: Dublin Core element names changed to all lowercase.

#### 2.2.2.4 Version 3.0

There were no changes compared to the data management list Schema Version 2.3.

#### 2.2.2.5 Issue 4.0

Summary of changes for Issue 4.0 of the Schema for data management lists:

- CPF 2004-051DE:
  - Elements `<dmlAddress>` and `<dmlIdent>` have been introduced in order to contain the data module list code (old element `<dmlc>`).
  - Content model of element `<dmRef>` (old element `<refdm>`) changed from (identExtension?, dmCode, dmTitle?, issueInfo?, issueDate?, language?) to (identExtension?, dmCode, language?, issueInfo?, issueDate?, dmTitle?).
- CPF 2006-044US: the attribute `inWork` of element `<issueInfo>` is now required (old element `<issno>`).
- CPF 2006-046SE: Mixed content has been eliminated in the `<remarks>` element.
- CPF 2007-098SE:
  - The top structure and the identification of the CSDB objects have been harmonized, which affects all of data module, publication module, data module list, data dispatch note and Comment.

#### 2.2.2.6 Issue 4.1

Summary of changes for Issue 4.1 of the Schema for data dispatch notes:

- CPF\_2009-098US:
  - Element `<brexDmRef>` has been introduced to the element `<dmlStatus>` in order to allow the BREX data module reference.
- CPF\_2005-008GB (CPF\_2007-015SE)
  - Change name of element `<dmEntry>` to `<dmlEntry>`
  - Add `<pmRef>` to `<dmlEntry>`

## 2.3 Comment

### 2.3.1 List of XML Schema issues for comment forms

[Table 4](#) lists all XML Schema issues for comment forms together with their corresponding S1000D issue.

Table 4 List of S1000D XML Schema issues for comment forms

S1000D Issue	XML Schema Issue No.	Release date
Issue 2.0	Version 2.0	2003-05-31
Issue 2-1	Version 2.1	2004-02-29
Issue 2.2	Version 2.2	2005-05-01
Issue 2.3	Version 2.3	2007-02-28
Issue 3.0	Version 3.0	2007-07-31
Issue 4.0	Issue 4.0	2008-08-01
Issue 4.1	Issue 4.1	2012-07-31

## 2.3.2 Update summary

### 2.3.2.1 Version 2.0

This was the first formal version of a Schema for comment forms, released to coincide with Issue 2 of the specification. This Schema version just reflects the SGML/XML DTD.

### 2.3.2.2 Version 2.1

Summary of changes for Version 2.1 of the S1000D Schema for comment forms:

- CPF 2004-09DE: Element `<ccode>` removed from content model of element `<refcattach>`. Refer to commentSchema.xsd and comment.xsd.

### 2.3.2.3 Version 2.2

Summary of changes for Version 2.2 of the S1000D Schema for comment:

- CPF 2004-21GB: List of values on attribute `change` within attribute group "INSDEL" amended by value "modify". Refer to dmaddr2.xsd.
- CPF 2004-22GB: Element `<copyright>` redefined to contain only running text or simple paragraph element `<p>`. Refer to datarest2.xsd. Inclusion of file datarest.xsd replaced by datarest2.xsd for data restrictions on CSDB objects other than data modules. Refer to commentSchema.xsd.
- CPF 2004-24GB: Simple type "MNTLVLS" introduced for the definition of generic maintenance levels. Refer to project.cfg.
- CPF 2004-49DE: Inclusion of seqnum\_comment.xsd replaced by seqnum.xsd to contain always a 5-digit positive integer for a uniform definition of sequential numbers in data dispatch note, data module list and COMMENT starting with 00001. Refer to commentSchema.xsd.
- CPF 2004-63DE: Optional sub element `<language>` introduced on element `<cstatus>`. Refer to comment.xsd.
- CPF 2005-06SE: Publication module number `<pmnumber>` within publication module code `<pmc>` became alphanumeric. Refer to pmc.xsd.
- Bug fixes:
  - Content model of element `<remarks>` changed to allow optional repeatable sub element `<p>`. Refer to listcode.xsd.
  - Pattern definitions on attribute `issno` and attribute `inwork` of element `<issno>` corrected. Refer to dmaddr2.xsd.
  - Pattern definitions on attribute `year`, attribute `month` and attribute `day` of element `<issdate>` corrected. Refer to dmaddr2.xsd.
  - Definition of empty element `<cnorefs>` corrected. Refer to comment.xsd.

- TPSMG request: Introduce attributeGroup "bodyatt" on element `<p>`. Refer to listcode.xsd.
- Consistency:
  - Type of all elements which contain only Parsed Character Data and which have no attributes has been redefined to `type="xs:string"`.

#### 2.3.2.4 Version 2.3

Summary of changes for Version 2.3 of the S1000D Schema for comment forms:

- CPF 2004-64SE: Addition of element `<dmcextension>` to the `<crefdm>` content model in element `<crefdms>`.
- CPF 2005-02FR: Transition to XML Schema from SGML DTD master.
- CPF 2005-65SE: Dublin Core element names changed to all lowercase.

#### 2.3.2.5 Version 3.0

There were no changes compared to the comment Schema Version 2.3.

#### 2.3.2.6 Issue 4.0

Summary of changes for Issue 4.0 of the Schema for comment forms:

- CPF 2004-051DE:
  - Elements `<commentAddress>` and `<commentIdent>` have been introduced in order to contain the data module list code (old element `<commentc>`).
  - Content model of element `<dmRef>` (old element `<refdm>`) changed from (identExtension?, dmCode, dmTitle?, issueInfo?, issueDate?, language?) to (identExtension?, dmCode, language?, issueInfo?, issueDate?, dmTitle?).
- CPF 2006-044US: the attribute `inWork` of element `<issueInfo>` is now required (old element `<issno>`).
- CPF 2006-046SE: Mixed content has been eliminated in the `<remarks>` element.
- CPF 2007-098SE:
  - The top structure and the identification of the CSDB objects have been harmonized, which affects all of data module, publication module, data module list, data dispatch note and Comment.

#### 2.3.2.7 Issue 4.1

Summary of changes for Issue 4.1 of the Schema for comment forms:

- CPF\_2009-098US:
  - Element `<brexDmRef>` has been introduced to the element `<commentStatus>` in order to allow the BREX data module reference.

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 7.4.1.1.2</a>	Generation process - Metadata

## 1 General

The mapping of S1000D elements and attributes to the Resource Description Framework (RDF) / Dublin core metadata element `<rdf:Description>` for data dispatch notes, data management lists and comments is specified below.

## 2 RDF/Dublin core metadata mapping

### 2.1 Introduction

The inclusion of RDF/Dublin core metadata is a project decision. If required, it is to be done automatically during the publishing process. Manual inclusion of this metadata is strongly discouraged.

The mapping follows in principle the one given for data modules, publication modules and SCORM content package modules in [Chap 7.4.1.1.2](#) with the exceptions detailed below.

## 2.2 RDF/Dublin core metadata mapping for data dispatch notes

[Table 2](#) summarizes the mapping of the elements and attributes to the Dublin core metadata of the element `<rdf:Description>` for data dispatch notes. Exceptions to the principles given for data modules and publication modules in [Chap 7.4.1.1.2](#) are:

- The elements `<dc:title>` and `<dc:subject>` contain the fixed value "Data Dispatch Note".
- The element `<dc:identifier>` contains the data dispatch note identification code, ie, the values of attributes `modelIdentCode`, `senderIdent`, `receiverIdent`, `yearOfDataIssue` and `seqNumber` of element `<ddnCode>`, separated by hyphens.
- The value of attribute `senderIdent` of element `<ddnCode>` is mapped to the element `<dc:publisher>`.
- The elements `<dc:creator>`, `<dc:contributor>`, `<dc:language>` and `<dc:source>` are not used for mapping.

Table 2 Metadata mapping for data dispatch note

Dublin core elements	Data dispatch note elements and/or attributes
<code>&lt;dc:title&gt;</code>	"Data Dispatch Note"
<code>&lt;dc:subject&gt;</code>	"Data Dispatch Note"
<code>&lt;dc:publisher&gt;</code>	<code>senderIdent</code>
<code>&lt;dc:date&gt;</code>	<code>year-month-day</code>
<code>&lt;dc:type&gt;</code>	"text"
<code>&lt;dc:format&gt;</code>	"text/xml"
<code>&lt;dc:identifier&gt;</code>	<code>modelIdentCode-senderIdent-receiverIdent-yearOfDataIssue-seqNumber</code>
<code>&lt;dc:rights&gt;</code>	<code>securityClassification_commercialClassification_caveat</code>
	or
	<code>securityClassification_commercialClassification</code>
	or
	<code>securityClassification__caveat</code>
	or
	<code>securityClassification</code>

## 2.3 RDF/Dublin core metadata mapping for data management list

[Table 3](#) summarizes the mapping of S1000D elements and attributes to the Dublin core metadata of the element `<rdf:Description>` for data management lists. Exceptions to the principles given for data modules and publication modules in [Chap 7.4.1.1.2](#) are:

- The elements `<dc:title>` and `<dc:subject>` contain the fixed value "Data Management List"
- The element `<dc:identifier>` contains the data management list code, ie, the values of attributes `modelIdentCode`, `senderIdent`, `dmlType`,

yearOfDataIssue and seqNumber of element `<dmlCode>`, separated by hyphens, followed by an underscore and the attributes issueNumber and inWork of element `<issueInfo>`, separated by a hyphen.

- The value of attribute senderIdent of element `<dmlCode>` is mapped to the element `<dc:publisher>`.
- The elements `<dc:creator>`, `<dc:contributor>`, `<dc:language>` and `<dc:source>` are not used for mapping.

Table 3 Metadata mapping for data management list

Dublin core elements	Data management list elements and/or attributes
<code>&lt;dc:title&gt;</code>	"Data Management List"
<code>&lt;dc:subject&gt;</code>	"Data Management List"
<code>&lt;dc:publisher&gt;</code>	senderIdent
<code>&lt;dc:date&gt;</code>	year-month-day
<code>&lt;dc:type&gt;</code>	"text"
<code>&lt;dc:format&gt;</code>	"text/xml"
<code>&lt;dc:identifier&gt;</code>	modelIdentCode-senderIdent-dmlType-yearOfDataIssue-seqNumber_issueNumber-inWork
<code>&lt;dc:rights&gt;</code>	securityClassification_commercialClassification_caveat or securityClassification_commercialClassification or securityClassification__caveat or securityClassification

## 2.4 RDF/Dublin core metadata mapping for comments

[Table 4](#) summarizes the mapping of the elements and attributes to the Dublin core metadata of the element `<rdf:Description>` for comments. Exceptions to the principles given for data modules and publication modules in [Chap 7.4.1.1.2](#) are:

- The element `<commentTitle>` is mapped to the element `<dc:title>` and to the element `<dc:subject>`.
- The element `<dc:identifier>` contains the comment code, ie, the values of attributes modelIdentCode, senderIdent, yearOfDataIssue, seqNumber and commentType of element `<commentCode>`, separated by hyphens.
- The value of attribute senderIdent of element `<commentCode>` is mapped to the element `<dc:publisher>`.
- The values of attributes languageIsoCode and countryIsoCode of element `<language>` are mapped to the element `<dc:language>`, separated by a hyphen.

- The elements `<dc:creator>`, `<dc:contributor>` and `<dc:source>` are not used for mapping.

*Table 4 Metadata mapping for comments*

Dublin core elements	Comment elements and/or attributes
<code>&lt;dc:title&gt;</code>	<code>&lt;commentTitle&gt;</code>
<code>&lt;dc:subject&gt;</code>	<code>&lt;commentTitle&gt;</code>
<code>&lt;dc:publisher&gt;</code>	<code>senderIdent</code>
<code>&lt;dc:date&gt;</code>	<code>year-month-day</code>
<code>&lt;dc:type&gt;</code>	<code>"text"</code>
<code>&lt;dc:format&gt;</code>	<code>"text/xml"</code>
<code>&lt;dc:identifier&gt;</code>	<code>modelIdentCode-senderIdent-yearOfDataIssue- seqNumber-commentType</code>
<code>&lt;dc:language&gt;</code>	<code>languageIsoCode-countryIsoCode</code>
<code>&lt;dc:rights&gt;</code>	<code>securityClassification_commercialClassification_ caveat</code>  <code>or</code> <code>securityClassification_commercialClassification</code>  <code>or</code> <code>securityClassification__caveat</code>  <code>or</code> <code>securityClassification</code>

### 3 Examples

#### 3.1 RDF/Dublin core metadata for data dispatch notes

The following example demonstrates the mapping of the data dispatch note elements and/or attributes to DC metadata elements within an RDF container expressed in XML:

```
<?xml version="1.0"?>
<ddn xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.s1000d.org/S1000D_4-
2/xml_schema_flat/ddn.xsd"
xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
xmlns:dc="http://www.purl.org/dc/elements/1.1/">
<rdf:Description>
<dc:title>Data Dispatch Note</dc:title>
<dc:subject>Data Dispatch Note</dc:subject>
<dc:publisher>C0419</dc:publisher>
<dc:date>1999-03-08</dc:date>
<dc:type>text</dc:type>
<dc:format>text/xml</dc:format>
<dc:identifier>URN:S1000D:DDN-AE-C0419-K0999-1999-00002
</dc:identifier>
<dc:rights>01</dc:rights>
</rdf:Description>
```

```
...
</ddn>
```

### 3.2 RDF/Dublin core metadata for data management lists

The following example demonstrates the mapping of the data management list elements and/or attributes to Dublin core metadata elements within an RDF container expressed in XML:

```
<?xml version="1.0" encoding="UTF-8"?>
<dml xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.s1000d.org/S1000D_4-
2/xml_schema_flat/dml.xsd"
xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
xmlns:dc="http://www.purl.org/dc/elements/1.1/"
xmlns:xlink="http://www.w3.org/1999/xlink">
<rdf:Description>
<dc:title>Data Management List</dc:title>
<dc:subject>Data Management List</dc:subject>
<dc:publisher>A0019</dc:publisher>
<dc:date>1999-04-01</dc:date>
<dc:type>text</dc:type>
<dc:format>text/xml</dc:format>
<dc:identifier>URN:S1000D:DML-1B-A0019-P-1999-00003_003-00
</dc:identifier>
<dc:language>sx-US</dc:language>
<dc:rights>01</dc:rights>
</rdf:Description>
...
</dml>
```

### 3.3 RDF/Dublin core metadata for comments

The following example demonstrates the mapping of the comment elements and/or attributes to Dublin core metadata elements within an RDF container expressed in XML:

```
<?xml version="1.0"?>
<comment xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.s1000d.org/S1000D_4-
2/xml_schema_flat/comment.xsd"
xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
xmlns:dc="http://www.purl.org/dc/elements/1.1/"
xmlns:xlink="http://www.w3.org/1999/xlink">
<rdf:Description>
<dc:title>Window, LH Front - Installation (Job Completion)
</dc:title>

Chap No./Document No.	Title
SCORM_2004_4ED_v1_1_CAM_20090814	SCORM 2004, 4th Edition, Version 1.1: Content Aggregation Model (CAM)

## 1 General

There is a mapping between certain of the identification and status section elements and attributes, and the Learning Objects Metadata (LOM) child elements of element <lom> in the SCORM content package module.

### 1.1 Scope

The elements of the LOM Schema are used to provide metadata about the learning event defined in the SCORM content package.

### 1.2 Purpose

The LOM is used in the Content Aggregation Model (CAM) in SCORM to provide:

- search and discovery capability of learning objects across systems
- the learner with information about the content organization (course, lesson, module, etc)
- information at runtime to help in the decision of what content model component to deliver to the learner

For these reasons, the LOM has been added to the SCORM content package module Schema. There is some overlap between metadata captured in the identification and status section of the SCORM content package module and the LOM, but the LOM allows for additional metadata, specific for training that the SCORM content package module does not address.

Applicable to: All

S1000D-A-07-05-0400-00A-040A-A

Chap 7.5.4

## 2 LOM metadata

### 2.1 Metadata mapping

[Table 2](#) summarizes the mapping of elements and attributes to the LOM element <lom> for the SCORM content package module.

*Table 2 Metadata for the LOM in the SCORM content package module*

LOM elements	Identification and status section elements and attributes
lom/general/identifier	DMC, PMC, ICN, SMC or SME
lom/general/title	<dmTitle> or <pmTitle>
lom/lifecycle/version	<issueInfo issueNumber>
lom/lifecycle/contribute/date	<dmStatus issueDate>
lom/general/language	<language>
lom/annotation/entity	<responsiblePartnerCompany>
lom/annotation/entity	<originator>
lom/general/coverage	<applic>
lom/general/coverage	<systemBreakdownCode>
lom/general/coverage	<functionalItemCode>
lom/annotation/description	<reasonForUpdate>
lom/annotation/description	<remarks>
lom/technical/format	<scormContentPackageMedia scormContentPackageMediaType>

### 2.2 Other LOM metadata

The LOM is a SCORM requirement, therefore a full description of the LOM can be found at

<http://www.adlnet.gov/capabilities/scorm/scorm-2004-4th#tab-resources>

The LOM is described in detail in the CAM. Refer to [Table 1](#).

## 3 Examples

The following example demonstrates the mapping of the Identification and status section elements and attributes to the LOM metadata elements included in the SCORM content package module Schema containers expressed in XML:

```
<lom>

<a href="#">Chap 7.6.2</a>	Software requirements - Resource resolution service

#### **1 General**

Information processing software requirements are necessary to achieve consistency of software behavior so that the data modules will behave the same on any software implementation. This will ensure the common behavior and functionality that is required of all software implementations.

#### **2 Software requirements**

[Chap 7.6.1](#) defines requirements for the software components that implement the process data module logic engine. [Chap 7.6.2](#) defines the requirements for the Uniform Resource Name (URN) / Uniform Resource Identifier (URI) resolution engine.

Any software implementation must adhere to the requirements defined herein.

<a href="#">Chap 7.6.1.6</a>	Process data module requirements - External application interface
<a href="#">Chap 7.6.1.7</a>	Process data module requirements - Error handling

## 1 General

There are detailed software requirements for the logic engine component of S1000D. The logic engine is required to interpret the navigation instructions contained within the process data module and pass the result for display. Additionally, in order to maintain standardized data modules that are interoperable (shared amongst projects and within different presentation tools), any implementation of a logic engine must conform to the requirements detailed within this chapter.

For an overview of the S1000D process data module, refer to [Chap 4.11](#).

For a successful implementation of the process data module, two elements are required:

- **Logic engine**, the runtime software component of the S1000D display package that interprets and executes a process data module
- **State table**, the collection of variables declared within a process data module and the value currently assigned to each variable

## 2 Requirements

The logic engine is capable of interpreting process data modules and acting upon the data contained within. Although the process data module is an XML document, the data represents the information that is to be executed in a defined order with specific rules as detailed in this chapter.

The logic engine must sequentially interpret the markup contained within the process data module. Certain elements contain information to be displayed to the user in the form of a data module reference, a step, or a dialog. Other elements contain instructions that control the behavior and navigation through the process data module content as defined in this chapter.

The logic engine must determine the unit of information to be displayed (depending on the state table values) and will wait for user input. The current position within the process data module must be retained and the current state of local variables and global properties will be maintained. The "Next" and "Previous" functions will cause the logic engine to continue interpreting at the saved position.

These requirements are explained in more detail in the following chapters:

- Process data module requirements - Navigation. Refer to [Chap 7.6.1.1](#).
- Process data module requirements - Variables and global properties. Refer to [Chap 7.6.1.2](#).
- Process data module requirements - Variable and global property management. Refer to [Chap 7.6.1.3](#).
- Process data module requirements - Expression evaluation. Refer to [Chap 7.6.1.4](#).
- Process data module requirements - Dialogs. Refer to [Chap 7.6.1.5](#).
- Process data module requirements - External application interface. Refer to [Chap 7.6.1.6](#).
- Process data module requirements - Error handling. Refer to [Chap 7.6.1.7](#).

## 1 Navigation functions

The navigation functions provide the interface to step through procedural sequences defined in the process data module. Functions are provided to move to the next and previous nodes in the process data module. The element `<dmNode>` defines the set of data that should be interpreted by the logic engine and displayed to the user.

### Note

In this paragraph, the phrase "passes applicability evaluation" means that either:

no applicability exists, or

applicability exists with an element `<assert>` or an element `<evaluate>` and the evaluation in accordance with [Chap 7.8](#) returns a "true" result, or

applicability exists with an element `<expression>` and the evaluation of the expression in accordance with [Para 2.2.1](#) returns a "true" result

## 1.1 Main navigation functions

### 1.1.1 Next

The "Next" function instructs the logic engine to proceed with interpreting the process data module from the current position. The logic engine must proceed until one of the following conditions occurs (user input or navigation function is required or no more data):

- an element `<dmNode>` with a child element `<dmRef>` is executed and passes applicability evaluation in which case the data module referenced is displayed to the user
- an element `<dmNode>` with one or more child element `<proceduralStep>` and an optional last element `<dialog>` is executed and at least one proceduralStep or the dialog passes applicability evaluation in which case the proceduralStep(s) and/or dialog that pass applicability evaluation are displayed to the user
- an element `<dmNode>` with one or more child element `<proceduralStepAlts>` is executed and at least one `<proceduralStep>` child of the `<proceduralStepAlts>` passes applicability evaluation in which case the first proceduralStep that passes applicability evaluation in sequence order is displayed to the user
- an element `<dmNode>` with a child element `<dialog>` is executed and passes applicability evaluation in which case the dialog is displayed to the user
- an element `<dmNode>` with a child element `<externalApplication>` is executed
- the end of the outermost process data module is reached in which case a message is displayed to the user indicating that the end of the procedure has been reached

### 1.1.2 Previous

The "Previous" function instructs the logic engine to logically reverse through actions taken beginning at the current location until a node with displayable content is encountered. When navigating to a previous node, the logic engine must restore the state table to the condition that it was when it first encountered the node being returned to. Restoring the state table includes any variables that were assigned a new value through the following: element `<dialog>`, element `<variablePreSet>`, element `<variablePostSet>`, element `<variableDeclarations>`, element `<assertion>`, or element `<externalApplication>`. This allows the user to change his input, which could change the forward logical path.

When executing a previous node, the entire node must be evaluated in the same manner as going forward. All child elements must be evaluated including presets and applicability.

The logic engine must proceed backwards until one of the following conditions occurs (user input or navigation function is required or no more data):

- an element `<dmNode>` with a child element `<dmRef>` is executed and passes applicability evaluation in which case the data module referenced is displayed to the user
- an element `<dmNode>` with one or more child element `<proceduralStep>` and an optional last element `<dialog>` is executed and at least one proceduralStep or the dialog passes applicability evaluation in which case the proceduralStep(s) and/or dialog that pass applicability evaluation are displayed to the user
- an element `<dmNode>` with one or more child element `<proceduralStepAlts>` is executed and at least one `<proceduralStep>` child of the `<proceduralStepAlts>` passes applicability evaluation in which case the first proceduralStep that passes applicability evaluation in sequence order is displayed to the user
- an element `<dmNode>` with a child element `<dialog>` is executed and passes applicability evaluation in which case the dialog is displayed to the user including the input originally entered by the user
- an element `<dmNode>` with a child element `<externalApplication>` is executed
- the beginning of the outermost process data module is reached in which case a message is displayed to the user indicating that the start of the procedure has been reached

If an element `<dmLoop>` is encountered when reversing then the processing path depends upon the forward path and number of iterations taken through the loop. If the user continues to perform the previous function, the logic engine must process the same number of iterations in reverse as was processed in the forward path.

## 1.2 Dialog navigation functions

When a dialog is displayed, either as the sole content of a `<dmNode>` or as an optional sibling of `<proceduralStep>` in `<dmNode>`, the dialog will assume responsibility for the viewer navigation function. Next and Previous navigation controls that can be present on the viewer navigation panel or equivalent will be disabled.

### 1.2.1 Submit function dialog response

The submit function dialog response instructs the logic engine to process the user input, either fill-in input data or a menu selection, then perform the Next navigation function. Refer to [Para 1.1.1](#).

### 1.2.2 Cancel function dialog response

The cancel function dialog response instructs the logic engine to remove the dialog display, discard any user input and perform the "Previous" navigation function. Refer to [Para 1.1.2](#).

#### Note

The cancel function is the method to perform a previous navigation function from a dialog.

### 1.2.3 Reset function dialog response

The reset function dialog response instructs the logic engine to revert the dialog data fields to the original values (eg, default settings) and remain in the dialog.

## 2 Data navigation processing classes

Several of the process data module elements are processed in an identical manner. These data module elements are grouped into classes; wrapper, node, node sequence, node alternative, if node, and loop node.

## 2.1 Wrapper class

Implemented by: element `<process>`

The wrapper class provides the outermost content tag for a data module that supports the interactive constructs. The order of processing is as follows:

- element `<variableDeclarations>` - All element `<variable>` within an element `<variableDeclarations>` are created.
- element `<variablePreSet>` - Variables and global properties may be assigned a value upon entering a process data module.
- element `<variablePostSet>` - Variables and global properties may be assigned a value upon exiting a process data module.
- content - The content is usually an element of the sequence class.

## 2.2 Node class

Implemented by: element `<dmNode>`

The node class is the main building block within a process data module. The order of processing is as follows:

- attribute `applicRefId` - The applicability reference is resolved and the element `<applic>` is evaluated. If it evaluates to "true" the element `<dmNode>` is processed. Within the element `<applic>`, the element `<expression>`, if provided, must evaluate to "true" to continue processing the element `<dmNode>`.
- element `<variablePreSet>` - Before processing any content, element `<variablePreSet>` assignments are made.
- content - Processing can suspend here if there is displayable data to present to the user. Processing remains suspended until the user selects the "Next" or "Previous" function.
- element `<variablePostSet>` - Before moving on in the process data module, element `<variablePostSet>` assignments are made.

### 2.2.1 Attribute `applicRefId`

The node class element can contain an attribute `applicRefId` that identifies the element's applicability. The referenced element `<applic>` can contain element `<displayText>`, and an element `<assert>`, element `<evaluate>` or element `<expression>`.

The element `<displayText>` is used for display to the user. The element `<assert>` and the element `<evaluate>` must be processed in accordance with [Chap 7.8](#).

The element `<expression>` must be evaluated against current variable or global property values using the expression evaluation rules specified in [Chap 7.6.1.4](#). If the element `<expression>` evaluates to "true", the logic engine must proceed with processing this node. If the element `<expression>` is given and evaluates to "false", then the remainder of the node is skipped and processing continues with the next node.

If no element `<expression>`, `<assert>` or `<evaluate>` is given then the logic engine must assume "true" and proceed with processing this node.

### 2.2.2 Element `<variablePreSet>`

The node class element can contain a list of element `<variablePreSet>` that assigns values to variables and global properties. Each element `<variablePreSet>` contains an element `<assertion>` which will modify the value of a variable or global property as specified in [Chap 7.6.1.2](#).

### 2.2.3 Content

For element `<dmRef>`, the logic engine must cause the referenced data module to be accessed and processed accordingly. If the referenced data module is another process data module, then the process data module must be executed by the logic engine. If the referenced data module is not a process data module, then the referenced data module must be sent to the display software to be rendered to the user.

For element `<proceduralStep>`, the logic engine must process all step content including the hierarchical substep structure, build a display package, and send the display package to the display software to be rendered to the user. The element `<proceduralStep>` content is modified from the procedural data module with the addition of element `<variableRef>` or `<globalPropertyRef>` within element `<para>`. Upon encountering element `<variableRef>` or `<globalPropertyRef>`, the logic engine must obtain the value associated with the referenced variable and embed that value into the para to be displayed to the user.

For element `<dialog>`, the logic engine must process the dialog content, build a display package, and send the display package to the display software to be rendered to the user.

For element `<externalApplication>`, the logic engine must process all external application content including parameters to send and expected results. Depending upon implementation, the logic engine must interface with the external application directly or send the interface information to the display software to perform the interface with the external application.

### 2.2.4 Postset

The node class element can contain a list of element `<variablePostSet>` that assigns values to variables or global properties. Each element `<variablePostSet>` contains an element `<assertion>` which will modify the value of a variable or global property as specified in [Chap 7.6.1.2](#).

## 2.3 Sequence class

Implemented by: element `<dmSeq>`  
element `<dmThenSeq>`  
element `<dmElseSeq>`

The sequence provides the mechanism to specify sequences of nodes, if nodes, loop nodes, and node alternates that create the procedure flow. The sequence simply contains a list of nodes that are processed in the order that they appear. A sequence cannot directly contain another sequence.

## 2.4 Alternate class

Implemented by:

- the element `<dmNodeAlts>`
- the element `<proceduralStepAlts>`
- the element `<dialogAlts>`
- the element `<messageAlts>`
- the element `<dmSeqAlts>`

The node alternate provides the mechanism to group a list of alternative nodes. The grouping is to define that the nodes apply to different contextual situations. Where two or more nodes exist within a node alternate grouping, the nodes must be of the same type. For instance: an element `<proceduralStepAlts>` can only contain one or more element

<proceduralStep>. Each node must contain the attribute applicRefId. Not every contextual situation has to be covered by the nodes within a node alternate.

The element <applic> must be evaluated on each alternative node in order using the rules specified in [Chap 7.6.1.4](#). The first node where the element <applic> evaluates to "true" (if any) will continue to be processed and the remaining nodes will be skipped. Nodes where the element <applic> evaluates to "false" are not to be processed. If no node passes applicability testing, then the node alternate is skipped and processing continues after the node alternate.

## 2.5 If node class

Implemented by:

- the element <dmIf>

The If node provides a simple if-then-else branching mechanism. The logic engine is to evaluate the element <expression> using the expression evaluation rules specified in [Chap 7.6.1.4](#). If the element <expression> evaluates to "true", the then branch (element <dmThenSeq>) is processed according to the node sequence rules specified in [Para 2.3](#). If the expression evaluates to "false", the else branch (element <dmElseSeq>), if present, is processed according to the node sequence rules.

## 2.6 Loop node class

Implemented by: element <dmLoop>

The loop node provides a looping mechanism, similar to a traditional programming language loop. The loop node supports an initial element <variablePreSet> for variable or global property assignment, an element <expression> to loop on while "true", an element <dmSeq> to process on each loop iteration, and an element <assertion> for variable or global property reassignment at the end of a loop iteration prior to evaluating the element <expression> for the next iteration.

### 2.6.1 Preset

The element <variablePreSet>, if present, is always processed. Each element <variablePreSet> contains an element <variableRef> or <globalPropertyRef> to be assigned and an element <expression>. The logic engine must evaluate the element <expression> using the expression evaluation rules specified in [Chap 7.6.1.4](#) and assign the result to the referenced variable or global property.

### 2.6.2 Expression

The element <expression> is evaluated using the expression evaluation rules specified in [Chap 7.6.1.4](#). If the element <expression> evaluates to anything other than "true" the loop is terminated.

### 2.6.3 Node sequence

The element <dmSeq> is processed according to the node sequence rules listed previously.

### 2.6.4 Assertion

The element <assertion>, if present, is processed. Each element <assertion> contains an element <variableRef> or <globalPropertyRef> to be assigned and an element <expression>. The logic engine must evaluate the element <expression> using the expression evaluation rules specified in [Chap 7.6.1.4](#) and assign the result to the referenced variable or global property.

**2.6.5****Looping**

The logic engine jumps up to the expression step of this process and continues looping until the element <expression> evaluates to anything other than "true".

## 1 Variables and Global Properties

Variables and global properties hold state values and are used within expressions to context filter, branch, loop, pass parameters, and display state information to the user. Variables are

local in scope. Local variables are created as elements `<variable>` in process data modules and are only visible to the process data module in which they were created. Global properties are defined as either elements `<productAttribute>` in the ACT or elements `<cond>` in the CCT and are visible to all data modules in the IETP. Local variables are referenced by element `<variableRef>` while global properties are referenced by element `<globalPropertyRef>`. These elements have an "OR" relationship within variable referencing structures such as element `<expression>`.

## 2 Local Variables

### 2.1 Variable identification

Local variables are identified by the attribute `variableName`. Variable names are case insensitive, unique within a single data module and must not exceed a length of 64 characters. The first character in a variable name must be a letter, [A-Z] or [a-z]. Subsequent characters can be any of the following: [A-Z], [a-z], [0-9], underscore [`_`], or blank space []. The last character cannot be a blank space. The logic engine must ignore any leading or trailing white space.

### 2.2 The `variableDescr` and `productConfigurationFlag` attributes

The attribute `productConfigurationFlag` provides a flag indicating whether this local variable represents a product configuration item and the attribute `variableDescr` provides a human readable description of the variable. Using attribute `variableDescr` and attribute `productConfigurationFlag` and values from the state table, a display can optionally be presented to the user which conveys the current state of the logic engine state table. By filtering on the attribute `productConfigurationFlag`, the display can be limited to items pertaining to product configuration. This can be helpful to verify that the state table configuration matches the actual product configuration. This flag was introduced into the specification when all variables were declared in a process data module and were global. However, it could be useful in the case where global variable values are assigned to local variables in order to manipulate them in a procedure without affecting the global variable values.

### 2.3 The `valueType` attribute

The logic engine is required to support the data types Boolean, integer, real, string and set for local variables.

#### 2.3.1 Boolean

A Boolean variable is allowed to have the values `"true"` or `"false"`.

#### 2.3.2 Integer

An integer variable must support, at a minimum, a 32 bits signed long integer, providing a range of -2.147.483.648 to 2.147.483.647.

#### 2.3.3 Real

A real variable must support, at a minimum, a 32 bits (4 bytes) real number. It must support the IEEE standard of 1-bit sign, 8 bits exponent, and 23 bits mantissa, which gives a minimum precision of 6 significant digits and a minimum exponent range of -38 to 38. A range of approximately 3,4E-38 to 3,4E+38 should be supported.

#### 2.3.4 String

A string variable must support, at a minimum, a Unicode string up to 64 characters long.

#### 2.3.5 Set

A set variable is allowed to contain a collection of like values: integer, real, or string. A set variable is also allowed to have value `"noValue"`. A particular value can be a member of a set only once.

## 2.4 The valuePrecision attribute

For local variables with a valueType of real, the attribute valuePrecision is used to specify the number of digits after the decimal point that is relevant. The nth decimal position specified by valuePrecision is rounded up when the nth + 1 digit is greater than or equal to 5 and truncated when the nth + 1 digit is less than 5.

The attribute valuePrecision is used only for formatting the display and should not be confused with the number of significant digits capable of being represented by a real number within a computer.

## 2.5 The scope attribute

The element <variable> attribute scope defaults to "local", as only local variables are defined within a process data module. Local variables must be available to only the data module in which they are created and no longer exist once that data module is exited. Refer to [Para 1](#).

## 2.6 Dialog

The optional element <dialog> provides a method to obtain the value of a local variable from the user at runtime when that variable is not defined in the state table. The dialog should assign a value to the variable, although this is not enforced in the Schema and would be difficult to validate. Refer to [Chap 7.6.1.5](#).

## 2.7 Initialize

The optional element <initialize> provides the initial value to assign to a local variable at the time of creation in the state table. Refer to variable and global property management in [Chap 7.6.1.3](#).

# 3 Global Properties

Global properties are created in the ACT and CCT data modules as elements <productAttribute> and <cond>. Refer to [Chap 4.14.1](#) and [Chap 4.14.2](#). Discussed below are elements <productAttribute> and <cond> attributes relevant to the process data module.

## 3.1 Global property identification

Global properties are uniquely identified by the combination of a product attribute identifier or condition identifier and the global property type which indicates whether the property was declared as a product attribute or a condition.

A product attribute identifier is declared in the ACT data module in element <productAttribute> with the attribute id. A condition identifier is declared in the CCT in element <cond> with the attribute id. The global property type indicates whether the property was declared as a product attribute or a condition.

Both global property types are referenced by their property type (product attribute or condition) and their attribute id.

## 3.2 Value typing

Product attribute global properties are typed by the element <productAttribute> attribute valueDataType.

Condition global properties are typed by reference by element <cond> attribute condTypeRefId.

The local variable base types are supported in both cases except for type "set". Refer to [Para 2.3](#).

### 3.3 Scope

No scope is specified for global properties. They are assumed global.

### 3.4 Dialogs

Element [<productAttribute>](#) child element [<prompt>](#) or [<displayName>](#) from the ACT data module can be used to generate a dialog question in order to obtain the value of a product attribute global property. If a menu type dialog is required, the element [<productAttribute>](#) child element [<enumeration>](#) attribute `enumerationLabel` can be used to generate a menu of choices for the global property value.

Element [<cond>](#) child element [<prompt>](#) from the CCT data module can be used to generate a dialog question in order to obtain the value of a condition global property. If a menu type dialog is required, the element [<condType>](#) child element [<enumeration>](#) attribute `enumerationLabel` can be used to generate a menu of choices for the global property value.

Dialogs supporting global properties may also be authored in a process data module using the element [<dialog>](#). Refer to [Chap 7.6.1.5](#).

### 3.5 Initialization

Global properties can be initialized in the PCT. If they are not, the value of `"noValue"` should be assigned to the global property to indicate it has no value. Refer to [Chap 7.6.1.3](#).

## Chapter 7.6.1.3

## 1 Variable and global property management

The logic engine is required to maintain the process data module state table containing all declared local variables and global properties during execution.

The state table must provide access to local variables by name. Global properties are referenced by their property type (condition or product attribute) and id. The currently assigned value, the description, and the data type must be retained and made accessible by the variable name or global property reference as defined above. A configuration flag and precision must also be retained for local variables.

## 2 Local variables

### 2.1 Variable declarations

All local variables are required to be defined within an element `<variableDeclarations>` and must be unique within a process data module.

Local variables must be added according to the following rules:

- If the element `<variable>` contains an element `<initialize>`, the initialization element `<expression>` is to be evaluated using the expression evaluation rules specified in [Chap 7.6.1.4](#) and the result must be assigned to the variable in the state table.
- If the element `<variable>` does not contain an element `<initialize>`, the value of "noValue" must be assigned to the variable in the state table.

### 2.2 Assigning a value to a local variable

An element `<assertion>` causes the logic engine to assign the value of a variable. The element `<assertion>` contains an element `<variableRef>` and an element `<expression>`. These can be considered the left-hand and right-hand portions of an assignment statement (eg, variable = expression).

The `variableName` attribute provided in the element `<variableRef>` is used to find the variable. The element `<expression>` is to be evaluated using the expression evaluation rules specified in [Chap 7.6.1.4](#). The value of the variable is then assigned the result of the expression.

If the variable does not exist in the state table, an error message must be generated. Refer to error handling in [Chap 7.6.1.7](#).

If the variable exists in the state table, but the data type of the variable and the data type of the expression result do not match, an error message must be generated. Refer to error handling in [Chap 7.6.1.7](#).

### 2.3 Accessing the value of a local variable

Accessing the value of a variable is done during run-time processing by the logic engine. The logic engine uses the name of the variable provided in the element `<variableRef>` to retrieve the value of the variable.

If a variable has the value of "noValue" and an element `<dialog>` is included in the element `<variable>` declaration, the dialog must be presented to the user according to the dialog rules specified in [Chap 7.6.1.5](#). The user's response is to be assigned to the variable. If the variable has the value of "noValue" and an element `<dialog>` is not included in the element `<variable>` declaration, an error message is to be generated. If the variable does not exist in the state table, an error message must be generated. Refer to error handling at [Chap 7.6.1.7](#).

## 3 Global properties

### 3.1 Global property definition

Global variables are defined in the ACT and CCT as discussed in [Chap 7.6.1.2](#).

New global properties must be added to the state table according to the following rules:

- If the element `<productAttribute>` or element `<cond>` is initialized in the PCT with the element `<assign>`, then the assign attribute `applicPropertyValue` value must be assigned to the global property in the state table.

- If the element `<productAttribute>` or element `<cond>` is not initialized, the value of "noValue" must be assigned to the global property in the state table.

### 3.2 Assigning values to global properties

An element `<assertion>` causes the logic engine to assign the value of a global property. The element `<assertion>` contains an element `<globalPropertyRef>` and an element `<expression>`. These can be considered the left-hand and right-hand portions of an assignment statement (eg, variable = expression).

The `applicPropertyIdent` and `applicPropertyType` attributes provided in the element `<globalPropertyRef>` are used to find the global property. The element `<expression>` is to be evaluated using the expression evaluation rules specified in [Chap 7.6.1.4](#). The value of the variable or global property is then assigned the result of the expression.

If the global property does not exist in the state table, an error message must be generated. Refer to error handling in [Chap 7.6.1.7](#).

If the global property exists in the state table, but the data type of the global property and the data type of the expression result do not match, an error message must be generated. Refer to error handling in [Chap 7.6.1.7](#).

### 3.3 Accessing the value of a global property

Accessing the value of a global property is done during run-time processing by the logic engine. The logic engine uses the `applicPropertyIdent` and `applicPropertyType` attributes provided in the element `<globalPropertyRef>` to retrieve the value of the variable.

If a global property has the value of "noValue" and the element `<prompt>` and optional element `<enumeration>` attribute `enumerationLabel` were provided in the ACT or CCT `productAttribute` or `cond` definition, a dialog should be generated and presented to the user according to the dialog rules specified in [Chap 7.6.1.5](#). The user's response is to be assigned to the global property. If the global property has the value of "noValue" and no prompts or enumeration labels were provided in the ACT/CCT `productAttribute` or `cond` definitions, an error message is to be generated. If the global property does not exist in the state table, an error message must be generated. Refer to error handling at [Chap 7.6.1.7](#).

## 1 Expression evaluation

The cornerstone of the process data module is the capability to branch, loop, and filter data. It is the expression evaluation that makes this possible. Expressions are defined in the content of the element `<expression>` and a rich set of operations are supported for the different data types.

A set of sample expressions are provided in [Chap 7.7.1](#).

## 2 Supported operations

The expression element contains one of four forms: an operation between two expressions, a function on a single expression, a variable or global property value, or a static value. Expression evaluations returning imaginary numbers, positive infinity or negative infinity are not supported, refer to error handling in [Chap 7.6.1.7](#).

### 2.1 Operations between two expressions

The following tables ([Table 2](#) thru [Table 5](#)) list the operations required to be supported.

Operations between two expressions are always in the form of

`<expression><"operation"><expression>`. The operation, the forms that the operation can take, the return value data type and a description are listed in the following tables. The form column defines the return value type for the expression on each side of the operator.

The binary operations are divided into four groups depending upon the type of the operands (the type of the expression on either side of the operation): Boolean operations, number operations (for integer and real operands), set operations and string operations. Within each group, several operations are possible.

When one side of an operation contains an expression that contains a value, data type errors will be caught by comparing the type of value with the data type of the operation they are contained within. For instance: the operation `<booleanOperator booleanOperation="and">` will fail if one side of the operation has the value element `<stringValue>Yes</stringValue>`.

Table 2 Boolean Operations

Value of attribute booleanOperation	Form	Return Value	Description
"and"	Boolean "and" Boolean	Boolean	"true" if both Booleans are "true", "false" otherwise.
"equal"	Boolean "equal" Boolean	Boolean	"true" if the values are the same or "false" if they are different.
"exclusiveOr"	Boolean "exclusiveOr" Boolean	Boolean	"true" if one and only one Boolean is "true", "false" otherwise.
"notEqual"	Boolean "notEqual" Boolean	Boolean	"true" if the values are different or "false" if they are the same.

Value of attribute booleanOperation	Form	Return Value	Description
"or"	Boolean "or" Boolean	Boolean	"true" if either Boolean is "true", "false" otherwise.

Table 3 Number Operations

Value of attribute numberOperation	Form	Return Value	Description
"divide"	Integer "divide" Integer	Real	Return the value of the first number divided by the second number.
	Integer "divide" Real	Real	
	Real "divide" Integer	Real	
	Real "divide" Real	Real	
"equal"	Integer "equal" Integer	Boolean	"true" if the values are the same or "false" if they are different.
	Real "equal" Real	Boolean	
"exponent"	Integer "exponent" Integer	Integer or Real	Return the value of the first number raised to the power of the second number. The return value is a real unless the first number is an integer and the second number is a positive integer.
	Integer "exponent" Real	Real	
	Real "exponent" Integer	Real	
	Real "exponent" Real	Real	
"greaterThan"	Integer "greaterThan" Integer	Boolean	"true" if the first number is greater than the second number, "false" otherwise.
	Integer "greaterThan" Real	Boolean	
	Real "greaterThan" Integer	Boolean	
	Real "greaterThan" Real	Boolean	

Value of attribute numberOperation	Form	Return Value	Description
"greaterThanOrEqual"	Integer "greaterThanOrEqual" Integer	Boolean	"true" if the first number is greater than or equal to the second number, "false" otherwise.
	Integer "greaterThanOrEqual" Real	Boolean	
	Real "greaterThanOrEqual" Integer	Boolean	
	Real "greaterThanOrEqual" Real	Boolean	
"integerDivide"	Integer "integerDivide" Integer	Integer	Return the value of the first number divided by the second number, truncated to an integer.
	Integer "integerDivide" Real	Integer	
	Real "integerDivide" Integer	Integer	
	Real "integerDivide" Real	Integer	
"lessThan"	Integer "lessThan" Integer	Boolean	"true" if the first number is less than the second number, "false" otherwise.
	Integer "lessThan" Real	Boolean	
	Real "lessThan" Integer	Boolean	
	Real "lessThan" Real	Boolean	
"lessThanOrEqual"	Integer "lessThanOrEqual" Integer	Boolean	"true" if the first number is less than or equal to the second number, "false" otherwise.
	Integer "lessThanOrEqual" Real	Boolean	
	Real "lessThanOrEqual" Integer	Boolean	
	Real "lessThanOrEqual" Real	Boolean	
"minus"	Integer "minus" Integer	Integer	Return the value of the first number minus the second number.
	Integer "minus" Real	Real	
	Real "minus" Integer	Real	
	Real "minus" Real	Real	

Value of attribute numberOperation	Form	Return Value	Description
"modulus"	Integer "modulus" Integer	Integer	Return the integer remainder after the first number is integer-divided by the second number.
"notEqual"	Integer "notEqual" Integer	Boolean	"true" if the values are different or "false" if they are the same.
	Real "notEqual" Real	Boolean	
"plus"	Integer "plus" Integer	Integer	Return the value of the first number plus the second number.
	Integer "plus" Real	Real	
	Real "plus" Integer	Real	
	Real "plus" Real	Real	
"times"	Integer "times" Integer	Integer	Return the value of the first number multiplied by the second number.
	Integer "times" Real	Real	
	Real "times" Integer	Real	
	Real "times" Real	Real	

Table 4 Set Operations

Value of attribute setOperation	Form	Return Value	Description
"add"	Set "add" Value	Set	Make a new set containing all members of the old set plus Value.
"disjoint"	Set "disjoint" Set	Boolean	"true" if the intersection of the two sets is empty, "false" otherwise.
"equal"	Set "equal" Set	Boolean	"true" if the values in the set are the same or "false" if they are different.

Value of attribute setOperation	Form	Return Value	Description
"intersection"	Set "intersection" Set	Set	Make a new set that contains only values that are members of both sets in the expression.
"member"	Value "member" Set	Boolean	"true" if Value is contained in the set, "false" otherwise.
"notEqual"	Set "notEqual" Set	Boolean	"true" if the values of the set are different or "false" if they are the same.
"remove"	Set "remove" Value	Set	Make a new set containing all members of the old set minus Value.
"setDifference"	Set "setDifference" Set	Set	Make a new set which is the difference of the two sets.
"subset"	Set "subset" Set	Boolean	"true" if all elements of the first set are contained in the second, "false" otherwise.
"union"	Set "union" Set	Set	Make a new set containing members of both sets in the expression. Members contained in both sets will be contained in the new set only once.

Table 5 String Operations

Value of attribute stringOperation	Form	Return Value	Description
"concatenate"	String "concatenate" String	String	Make a new string which is equal to the first string with the second string concatenated

Applicable to: All

S1000D-A-07-06-0104-00A-040A-A

Chap 7.6.1.4

Value of attribute stringOperation	Form	Return Value	Description
"contains"	String "contains" String	Boolean	to the end of it. "true" if the first string occurs anywhere within the second string, "false" otherwise.
"equal"	String "equal" String	Boolean	"true" if the values are the same or "false" if they are different.
"greaterThan"	String "greaterThan" String	Boolean	"true" if the first string is greater than the second string, "false" otherwise.
"greaterThanOrEqualTo"	String "greaterThanOrEqualTo" String	Boolean	"true" if the first string is greater than or equal to the second string, "false" otherwise.
"lessThan"	String "lessThan" String	Boolean	"true" if the first string is less than the second string, "false" otherwise.
"lessThanOrEqualTo"	String "lessThanOrEqualTo" String	Boolean	"true" if the first string is less than or equal to the second string, "false" otherwise.

Value of attribute stringOperation	Form	Return Value	Description
"notEqual"	String "notEqual" String	Boolean	"true" if the values are different or "false" if they are the same.

## 2.2 Functions on a single expression

The following tables (Table 6 thru Table 10) list the functions required to be supported.

Functions on a single expression are always in the form of <"function"><expression>. The function result and the return value data type must be returned. The function, the forms that the function can take, the return value data type and a description are listed.

The functions are divided into five groups depending upon the type of the operand: Boolean functions, number functions, set functions, string functions, and a substring function. Within each group, several operations are possible.

When a function contains an expression that contains a value, data type errors will be caught by comparing the type of value with the data type of the operation they are contained within. For example, the operation <numberFunction numberAction="float"> will fail if the operation has the value element <stringValue>Yes</stringValue>.

Table 6 Boolean Functions

Value of attribute booleanAction	Form	Return Value	Description
"defined"	"defined" <variableRef>	Boolean	"true" if variable exists in state table and does not have a "noValue" value.
"not"	"not" Boolean	Boolean	"true" if operand is "false". "false" if operand is "true".

Table 7 Number Functions

Value of attribute numberAction	Form	Return Value	Description
"commonLogarithm"	"commonLogarithm" Integer	Real	Return the common logarithm (log) of the number
	"commonLogarithm" Real	Real	
"cosecant"	"cosecant" Integer	Real	Return the cosecant (csc or cosec) of the number
	"cosecant" Real	Real	
"cosine"	"cosine" Integer	Real	

Value of attribute numberAction	Form	Return Value	Description
	"cosine" Real	Real	Return the cosine (cos) of the number
"cotangent"	"cotangent" Integer	Real	Return the cotangent (cot) of the number
	"cotangent" Integer	Real	Return the cotangent (cot) of the number
"exponential"	"exponential" Integer	Real	Return the exponential (exp) of the number.
	"exponential" Real	Real	Return the exponential (exp) of the number.
"factorial"	"factorial" Integer	Integer	Return the product of multiplying all integers up to and including the given positive integer.
"float"	"float" Integer	Real	Return the number converted to a real.
	"float" Real	Real	Return the number converted to a real.
"hyperbolicCosecant"	"hyperbolicCosecant" Integer	Real	Return the hyperbolic cosecant (csch) of the number
	"hyperbolicCosecant" Real	Real	Return the hyperbolic cosecant (csch) of the number
"hyperbolicCosine"	"hyperbolicCosine" Integer	Real	Return the hyperbolic cosine (cosh) of the number
	"hyperbolicCosine" Real	Real	Return the hyperbolic cosine (cosh) of the number
"hyperbolicCotangent"	"hyperbolicCotangent" Integer	Real	Return the hyperbolic cotangent (coth) of the number
	"hyperbolicCotangent" Real	Real	Return the hyperbolic cotangent (coth) of the number
"hyperbolicSecant"	"hyperbolicSecant" Integer	Real	Return the hyperbolic secant (sech) of the number
	"hyperbolicSecant" Real	Real	Return the hyperbolic secant (sech) of the number
"hyperbolicSine"	"hyperbolicSine" Integer	Real	Return the hyperbolic sine (sinh) of the number
	"hyperbolicSine" Real	Real	Return the hyperbolic sine (sinh) of the number
"hyperbolicTangent"	"hyperbolicTangent" Integer	Real	Return the hyperbolic tangent (tanh) of the number
	"hyperbolicTangent" Real	Real	Return the hyperbolic tangent (tanh) of the number

Value of attribute numberAction	Form	Return Value	Description
"inverseCosine"	"inverseCosine" Integer	Real	Return the inverse cosine (arccos or cos-1) of the number.
	"inverseCosine" Real	Real	
"inverseCosecant"	"inverseCosecant" Integer	Real	Return the inverse cosecant (arccsc or csc-1) of the number.
	"inverseCosecant" Real	Real	
"inverseCotangent"	"inverseCotangent" Integer	Real	Return the inverse cotangent (arccot or cot-1) of the number.
	"inverseCotangent" Real	Real	
"inverseSine"	"inverseSine" Integer	Real	Return the inverse sine (arcsin) of the number.
	"inverseSine" Real	Real	
"inverseSecant"	"inverseSecant" Integer	Real	Return the inverse secant (arcsec or sec-1) of the number.
	"inverseSecant" Real	Real	
"inverseTangent"	"inverseTangent" Integer	Real	Return the inverse tangent (arctan or tan-1) of the number.
	"inverseTangent" Real	Real	
"naturalLogarithm"	"naturalLogarithm" Integer	Real	Return the natural logarithm (ln) of the number
	"naturalLogarithm" Real	Real	
"negative"	"negative" Integer	Integer	Return the negative value of the number.
	"negative" Real	Real	
"secant"	"secant" Integer	Real	Return the secant (sec) of a number
	"secant" Real	Real	
"sine"	"sine" Integer	Real	Return the sine (sin) of a number
	"sine" Real	Real	
"squareRoot"	"squareRoot" Integer	Integer or Real	Return the square root (sqrt) of a number
	"squareRoot" Real	Real	
"tangent"	"tangent" Integer	Real	Return the tangent (tan or tg) of a number
	"tangent" Real	Real	

Applicable to: All

S1000D-A-07-06-0104-00A-040A-A

Chap 7.6.1.4

Value of attribute numberAction	Form	Return Value	Description
"truncate"	"truncate" Real	Integer	Return the real number truncated to an integer.

Table 8 Set Functions

Value of attribute setAction	Form	Return Value	Description
"empty"	"empty" Set	Boolean	"true" if the set is empty, "false" otherwise.
"sizeOf"	"sizeOf" Set	Integer	Number of characters in the set

Table 9 Unary String Functions

Value of attribute stringAction	Form	Return Value	Description
"empty"	"empty" String	Boolean	"true" if the string is empty, "false" otherwise.
"sizeOf"	"sizeOf" String	Integer	Number of characters in the string

Table 10 Unary Substring Functions

Form	Return Value	Description
<pre>&lt;subStringFunction&gt; &lt;subStringPosition&gt; &lt;/subStringFunction&gt; String</pre>	String	<p>The subStringFunction will return a substring depending on the values provided in one or two element <code>&lt;subStringPosition&gt;</code> and element <code>&lt;subStringLength&gt;</code>.</p> <p>The subStringPosition specifies the position in the string by the following rules:</p> <p>A positive subStringPosition means an index position counted from the beginning of the string. A negative subStringPosition is counted from the end. A one means the start and a zero means the end of the string.</p> <p>A single subStringPosition will return a single character string.</p> <p>A positive subStringLength means the length towards the string end. A negative subStringPosition means the length towards the string start. A zero means the returned string is from the</p>

Applicable to: All

S1000D-A-07-06-0104-00A-040A-A

Chap 7.6.1.4

Form	Return Value	Description
<pre> &lt;subStringFunction&gt;   &lt;subStringPosition&gt;   &lt;subStringPosition&gt; &lt;/subStringFunction&gt; String </pre>	String	<p>subStringPosition to string end. A subStringLength greater than remainder of the string means the returned string is from the subStringPosition to string end (positive) or to string start (negative).</p> <p>Two subStringPositions specify the starting position and ending position of the substring to be returned.</p> <p>NOTE: The starting position can occur after the ending position. For example, a starting position of 10 and ending position of 3 will return the range between 3 and 10.</p>
<pre> &lt;subStringFunction&gt;   &lt;subStringPosition&gt;   &lt;subStringLength&gt; &lt;/subStringFunction&gt; String </pre>	String	<p>A subStringPosition and subStringLength specify the starting position and length, respectively, of the substring to be returned.</p>

## 2.3 Variable and global property references

If the expression contains an element [<variableRef>](#) or [<globalPropertyRef>](#), the value of the expression is obtained by looking up the current value of the variable or global property in the state table. Refer to variable and global property management - accessing the value of a variable or global property in [Chap 7.6.1.3](#) for the rules governing state table retrieval.

## 2.4 Values

Values within an expression represent a constant. The data type of the value is indicated by the name of the element. For value elements that contain character data (element [<stringValue>](#), element [<integerValue>](#) and element [<realValue>](#)), the character data must match the data type. Data content that does not match the data type must be flagged as an error. Refer to error handling in [Chap 7.6.1.7](#).

## 2.5 Operations by data type

The following is provided as a quick reference to the operations supported per data type.

Operations that operate on Boolean data types are:

- ["and"](#)
- ["defined"](#)
- ["equal"](#)
- ["exclusiveOr"](#)
- ["notEqual"](#)
- ["not"](#)
- ["or"](#)

Operations that operate on integer data types are:

- ["commonLogarithm"](#)
- ["cosecant"](#)

- "cosine"
- "cotangent"
- "divide"
- "equal"
- "exponent"
- "exponential"
- "factorial"
- "float"
- "greaterThan"
- "greaterThanOrEqualTo"
- "hyperbolicCosecant"
- "hyperbolicCosine"
- "hyperbolicCotangent"
- "hyperbolicSecant"
- "hyperbolicSine"
- "hyperbolicTangent"
- "integerDivide"
- "inverseCosine"
- "inverseCosecant"
- "inverseCotangent"
- "inverseSine"
- "inverseSecant"
- "inverseTangent"
- "lessThan"
- "lessThanOrEqualTo"
- "minus"
- "modulus"
- "naturalLogarithm"
- "notEqual"
- "negative"
- "plus"
- "secant"
- "sine"
- "squareRoot"
- "tangent"
- "times"

Operations that operate on real data types are:

- "commonLogarithm"
- "cosecant"
- "cosine"
- "cotangent"
- "divide"
- "equal"
- "exponent"
- "exponential"
- "float"
- "greaterThanOrEqualTo"

- "greaterThan"
- "hyperbolicCosecant"
- "hyperbolicCosine"
- "hyperbolicCotangent"
- "hyperbolicSecant"
- "hyperbolicSine"
- "hyperbolicTangent"
- "integerDivide"
- "inverseCosine"
- "inverseCosecant"
- "inverseCotangent"
- "inverseSine"
- "inverseSecant"
- "inverseTangent"
- "lessThanOrEqual"
- "lessThan"
- "minus"
- "naturalLogarithm"
- "notEqual"
- "negative"
- "plus"
- "secant"
- "sine"
- "squareRoot"
- "tangent"
- "times"
- "truncate"

Operations that operate on string data types are:

- "concatenate"
- "contains"
- "empty"
- "equal"
- "greaterThan"
- "greaterThanOrEqual"
- "lessThan"
- "lessThanOrEqual"
- "notEqual"
- "sizeof"
- <subStringFunction>

Operations that operate on set data types are:

- "add"
- "disjoint"
- "empty"
- "equal"
- "intersection"
- "member"

- "notEqual"
- "remove"
- "setDifference"
- "sizeOf"
- "subset"
- "union"

### 3 Failed evaluations

An expression that cannot be evaluated must be considered a fatal error. The logic engine must immediately stop executing the process data module and present an error message to the user. Refer to error handling in [Chap 7.6.1.7](#).

### 4 Error conditions

The following error conditions must be trapped and handled according to error handling in [Chap 7.6.1.7](#):

- Division by zero
- Calculating the nth root of a negative integer or negative real
- Calculating the factorial of a negative integer
- Fixed value content does not match the data type implied by the value element (element <stringValue>, element <integerValue>, element <realValue>)
- Operation between two expressions with incorrect data type operand(s)
- Function on a single expression with incorrect data type operand
- Expression cannot be evaluated

## 1 Dialogs

Dialogs provide interactivity between the user and the state local variables and global properties used in the process data module. Dialogs provide the capability of prompting the user to input a typed response via a fill-in dialog or select from a set of choices via a menu dialog.

### 1.1 Dialog state variable management

Any state variable or global property references (element `<variableRef>` or `<globalPropertyRef>`) used in the element `<dialog>` is replicated to a temporary state table when the dialog is executed. Dialog state variables and global properties are managed separately to maintain the asserted values during the dialog, not to the system state table. All dialog expressions (element `<applic>`, element `<enabledState>`, element `<validate>`, and element `<assertion>`) are evaluated using the dialog state table.

#### 1.1.1 System state table modification

When a dialog navigation function (submit, cancel, or reset) is selected, an event is performed to the system state table. The following navigation functions perform the following system state table event.

- submit - The system state table is updated with the dialog state values
- cancel - The system state values are unchanged
- reset - The dialog state values are reverted to the current system state values

## 1.2 Applicability dialog component elements

The dialog and dialog component elements (element `<dialog>`, element `<userEntry>`, element `<menu>`, element `<menuChoice>`, element `<pushButton>`, and element `<message>`) are based on the node template and can contain applicability elements that are to be processed by the rules defined in the data navigation classes in [Chap 7.6.1.1](#), above. It does not contain the element `<variablePreSet>` or the element `<variablePostSet>` from the node template.

## 1.3 Enable / disable dialog component elements

Each dialog component element (element `<userEntry>`, element `<menu>`, element `<pushButton>`, and element `<menuChoice>`) can contain the element `<enabledState>`. The logic engine must evaluate each element `<enabledState>` expression after each fill-in is completed or menu choice is selected and asserted. When evaluating the enable/disable expression the dialog state values are used. When the evaluated expression is "false", the associated data entry information is disabled (not available) and visibly dimmed or grayed out. When the dialog is submitted, any asserted state variables or global properties, in a disabled data entry, are reverted to the original values.

# 2 Fill-in dialogs

A dialog element `<userEntry>` is constructed with an element `<prompt>` which contains the question to be presented to the user, an element `<variableRef>` or `<globalPropertyRef>` which will receive the user's response, an optional element `<default>` which defines the default value, and an optional element `<validate>` which defines a criteria for the input. The fill-in can contain the element `<pushButton>` specifying an action push button next to the data entry field.

The attribute `mandatory` identifies whether the user must input text before the submit function.

A fill-in dialog is presented with the prompt and an area to enter input.

## 2.1 Default data entry

When a default expression or value is provided, the input area is to be pre-filled with the text. The logic engine determines the default entry by evaluating the element `<default>` expression, if present. If no element `<default>` exists, the logic engine will not provide pre-filled text.

## 2.2 Validate data entry

The logic engine is to validate user input either as characters are entered or when the user has completed entry and wants to continue. The validation rules are enforced by getting the data type of the variable or global property to receive the user's response and validating that all characters are valid for that data type. For an integer data type, an optional leading minus sign [-] and numeric characters [0-9] are valid. For a real data type, an optional leading minus sign [-], numeric characters [0-9], and one dot [.] or one comma [,] are valid, scientific notation is not currently supported. For a string data type, any ASCII characters are valid. Processing must not continue until a valid input is entered or the user cancels the dialog.

Fill-in dialogs that contain an element `<validate>` are to validate that the user input returns a value `"true"` against the validation expression. If the user enters a value that fails the validation check, a warning is to be presented that includes the acceptable criteria (as specified in the attribute `errorMessage`). Processing must not continue until an acceptable criterion is entered or the user cancels the dialog. Once an acceptable input value is received, it is assigned to the variable or global property in the dialog state table.

### 3 Menu dialogs

A dialog element `<menu>` is constructed with an element `<prompt>` that contains the question to be presented to the user and one or more elements `<menuChoice>` that the user can select from. The element `<prompt>` has an attribute `textDisplayPosition`, which gives the position of the prompt. It has values `"top"`, `"bottom"`, `"left"` and `"right"`.

A menu dialog is presented with the prompt and the list of choices to select from.

- The attribute `choiceSelection` identifies whether the user is limited to selecting a single choice or can select multiple choices. For value of `"single"`, the preferred method of display is a list of radio boxes. For value of `"multiple"`, the preferred method of display is a list of check boxes.
- The attribute `mandatory` identifies whether the user must select a choice(s).
- The attribute `choiceType` identifies the preferred layout as either item or scrollable list. For value of `"select"`, the preferred method of display is either a list of radio or check boxes, depending on attribute `choiceSelection`. An alternative method of display for a large number of choices is a scrolling list. For value of `"pulldown"`, the preferred method of display is a scrolling list.
- The attribute `menuChoiceFlow` identifies the preferred layout as either in horizontal or vertical direction.

Each element `<menuChoice>` contains the element `<prompt>` for the choice, either element `<assertion>` specifying the operation to perform if the choice is selected or element `<noAssertions>` if no operation is to be performed. Each choice can contain element `<externalApplication>` specifying upon selection to execute the application, element `<dialog>` specifying upon selection to launch a secondary dialog, or element `<pushButton>` specifying an action push button next to the menu choice answer.

The attribute `menuChoiceDefaultFlag` on the element `<menuChoice>` determines if the choice is initially displayed as pre-selected. For value of `"1"`, the choice is pre-selected. For value of `"0"`, the choice is not pre-selected. If more than one choice of a single choice menu dialog (`<menu choiceSelection="single">`) has the attribute `menuChoiceDefaultFlag` value of `"1"`, then only the first choice with the attribute `menuChoiceDefaultFlag` value of `"1"` must be displayed pre-selected.

The element `<externalApplication>` or element `<dialog>` is executed by the logic engine after the menu choice is selected.

The element `<pushButton>` is displayed next to the menu choice and is executed after the push button is selected, not when the menu choice is selected.

Each element `<menuChoice>` must contain one or more elements `<assertion>` or the element `<noAssertions>` specifying the action to perform when the choice is selected. For choices with element `<assertion>`, the logic engine must perform all of the assertions

---

assigning values to variables and global properties in the dialog state table. For choices with an element `<noAssertions>`, the logic engine must not perform any assertion actions.

## 4 Push button dialogs

The logic engine launches the external application, using the element `<externalApplication>` or secondary dialog, using the element `<dialog>`, after the push button is selected.

## **1 External application interface**

The logic engine/IETP combination must provide the capability to interface with applications external to the IETP. Examples of external applications are diagnostic tools, which can run tests that return results; and additional technical data viewers, such as an interactive wiring viewer, which typically would not return results. The external application interface is intended to support interfaces with any type of application.

The requirements for the external application interface apply to the combination of logic engine and IETP. Specific projects will have to allocate the requirements between the logic engine and the IETP. Different projects or organizations can allocate the requirements differently. No specific implementation guidance is provided here.

## 1.1 External application

The element `<externalApplication>` defines an interface to an external application. The mandatory attribute `application` defines the "service" being requested. The attribute `application` refers to an ENTITY, which provides further information about the service being requested. The logic engine/IETP uses this information to identify the actual application to invoke through some sort of mapping (such as XSL). The attribute provides the flexibility to use the best-suited external application to perform the request. The implementation of mapping an external application request to an actual application is not specified.

## 1.2 Description

The element `<paraBasic>` provides a description of the interface. This description can aid the author and can be used to provide a display to the user if there is a delay involved, such as waiting for results in an interface to a diagnostic program which performs on-product testing.

## 2 Send parameters

The element `<send>` identifies parameters to send to the external application. Each element `<send>` can specify either a value or a name/value pair. Each send parameter value must be specified as a static value using the element `<stringValue>` or as a variable or global property value using the element `<variableRef>` or `<globalPropertyRef>`. S1000D does not specify the communication protocol used between the logic engine/IETP and the application being called. The logic engine/IETP is required to format the send parameters to be compatible with the application being called.

## 3 Receive parameters

Some applications will return results that the process data module author can then use to further guide navigation through the process data module. This is accomplished by identifying variables or global properties in the state table to receive return values from the external application. The element `<receiveValue>`, element `<receiveByName>`, and element `<receiveByPosition>` are used to specify what return data to assign to which variables or global properties in the state table. The three methods are mutually exclusive and cannot be mixed.

Each of the three methods specify an element `<variableRef>` or `<globalPropertyRef>` indicating which variable or global property to update with the value returned by the external application. The logic engine/IETP must accept the return value(s) from the external application and update the referenced variable or global property's value.

### 3.1 Receive

The receive method assigns each result from the external process in the order received to the variable or global property in the state table specified in the element `<receiveValue>` in the order of the markup. This requires that an element `<receiveValue>` is provided for each expected return value. It also requires that the elements `<receiveValue>` are authored in the order expected from the external application results.

### 3.2 Receive by name

The receive by name method is used when the external application returns results with a name / value pair, such as with an XML message. The element `<receiveByName>` must include an element `<returnedValueName>` with the name to associate in the result from the external application and an element `<variableRef>` or `<globalPropertyRef>` specifying the variable or global property in the state table to update. The receive by name method does not require that all returned results are assigned.

### 3.3 Receive by position

The receive by position method is used when only some of the results are needed to be stored in the state table. The element `<receiveByPosition>` must include an element `<returnedValuePosition>` with the position of the return result from the external application (starting at 1) and an element `<variableRef>` or `<globalPropertyRef>` specifying the variable or global property in the state table to update. The receive by position method does not require that all returned results are assigned.

## 4 Processing requirements

### 4.1 General

The logic engine/IETP must provide a mapping to associate an actual application to invoke with the element `<externalApplication>` attribute `application`.

The logic engine/IETP must invoke the appropriate external application including parameters in the format required by the external application.

If the external application cannot be successfully invoked, an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

### 4.2 Send parameters

The logic engine/IETP must process the element `<send>` to build a list of parameters to send to the external application. If the element `<variableRef>` or `<globalPropertyRef>` is included, the value associated with the variable or global property referenced is sent. If the value cannot be obtained, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

### 4.3 Wait, no wait, and cancel

If no element `<receiveValue>`, element `<receiveByName>`, or element `<receiveByPosition>` is provided, after invoking the external application the logic engine/IETP must continue processing the process data module and must not wait for a return result from the external application.

If any element `<receiveValue>`, element `<receiveByName>`, or element `<receiveByPosition>` is provided, after invoking the external application the logic engine/IETP must suspend processing the data module and presents the user with an indication that the IETP is in a wait state. A cancel operation must be provided to the user.

If the logic engine/IETP is suspended waiting for an external process to return and the user invokes the cancel function, the logic engine/IETP must resume by performing the previous operation (refer to [Chap 7.6.1.1](#)) and ignore any results that can eventually be returned by the external application.

If the logic engine/IETP is suspended waiting for an external process to return and the external process returns, the logic engine/IETP must process the return results as defined in the following paragraphs and if successful continue processing the process data module.

### 4.4 Receive

If the receive method is used, the logic engine/IETP must assign each return result in the order received to each element `<receiveValue>` in the order in the markup. The value of the state table variable or global property must be updated with the associated return value.

If the external application returns a value with a data type that does not match the value-type of the variable or global property specified by the element `<variableRef>` or `<globalPropertyRef>`, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

If the number of return values does not match the number of element `<receiveValue>`, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

#### 4.5 Receive by name

If the receive by name method is used, the logic engine/IETP must match the name specified in element `<returnedValueName>` with the name in a name/value pair returned from the external application. The value of the variable or global property specified by the element `<variableRef>` or `<globalPropertyRef>` must be updated with the associated return value.

If a name match cannot be made, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

If the external application returns a value with a data type that does not match the value-type of the variable or global property specified by the element `<variableRef>` or `<globalPropertyRef>`, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

#### 4.6 Receive by position

If the receive by position method is used, the logic engine/IETP must assign the value of the nth return result as specified by element `<returnedValuePosition>` to the variable or global property specified by the element `<variableRef>` or `<globalPropertyRef>`. If a position match cannot be made, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

If the external application returns a value with a data type that does not match the value-type of the variable or global property specified by the element `<variableRef>` or `<globalPropertyRef>`, then an error message must be presented to the user. Refer to error handling in [Chap 7.6.1.7](#).

## 1 Error handling

Due to the programmatic nature of the process data module, there exists the possibility of runtime errors occurring. Upon detection of an error, the logic engine error processing must record detailed error information that is sufficient to reconstruct the errors in order to pinpoint the problem. An error or warning message must be presented to the user identifying the problem and the next action that will occur.

The format of the messages and reports are not specified. At a minimum, the following error conditions and actions must be trapped and reported by the logic engine.

Table 2 Error Conditions

Error	Message	Action
Node-Alts with one or more nodes that do not contain the attribute <code>applicRefId</code>	Warning	System must process the first Node that evaluates to "true" (a Node without an applic is considered "true")
A variable declaration contains a data type different from an existing variable of the same name	Fatal	Fatal error, processing cannot continue
A variableRef or globalPropertyRef references a variable or global property that is	Fatal	Fatal error, processing cannot continue

Applicable to: All

S1000D-A-07-06-0107-00A-040A-A

Chap 7.6.1.7

Error	Message	Action
not in the state table, was never declared		
An assertion variable or global property data type and expression result data type do not match	Fatal	Fatal error, processing cannot continue
Division by zero, applies to elements <divide>, <idivide> and <modulus>	Fatal	Fatal error, processing cannot continue, infinity not supported
Calculating the nth root of a negative integer or negative real	Fatal	Fatal error, processing cannot continue, imaginary numbers not supported
Calculating the factorial of a negative integer	Fatal	Fatal error, processing cannot continue
Fixed value content does not match the data type implied by the value element (element <stringValue>, element <integerValue>, element <realValue>)	Fatal	Fatal error, processing cannot continue
Operation between two expressions with incorrect data type operand(s)	Fatal	Fatal error, processing cannot continue
Function on a single expression with incorrect data type operand	Fatal	Fatal error, processing cannot continue
Calculating the common logarithm or natural logarithm of a negative number	Fatal	Fatal error, processing cannot continue, imaginary numbers and infinity not supported
Calculating the common logarithm or natural logarithm of 0 is negative infinity ( $-\infty$ )	Warning	Result will be set to the largest negative number supported by the system and processing will continue
Calculating the cosecant or cotangent of zero or any multiple of pi ( $\pi$ ) is infinity ( $\infty$ )	Warning	Result will be set to the largest positive number supported by the system and processing will continue
Calculating the hyperbolic cosecant or hyperbolic cotangent of zero	Fatal	Fatal error, processing cannot continue
Calculating the inverse cosecant, inverse secant or inverse cotangent of 0 is infinity ( $\infty$ )	Warning	Result will be set to the largest positive number supported by the system and processing will continue
Calculating the inverse cosine or inverse sine of a number greater than 1 or less than -1.	Fatal	Fatal error, processing cannot continue

Error	Message	Action
Calculating the secant or tangent of $\pi/2$ or any integer multiple, such as $3\pi/2$ , $5\pi/2$ or $-3\pi/2$ is infinity ( $\infty$ )	Warning	Result will be set to the largest positive number supported by the system and processing will continue
Calculating the square root of a negative number produces an imaginary number	Fatal	Fatal error, processing cannot continue, imaginary numbers not supported
Expression can not be evaluated	Fatal	Fatal error, processing cannot continue
External application cannot be invoked - no return data expected	Warning	Processing will continue
External application cannot be invoked - return data is expected	Fatal	Fatal error, processing cannot continue
External application send cannot obtain the value of a variableRef or globalPropertyRef	Fatal	Fatal error, processing cannot continue
External application return value type mismatched with receiving parameter variable or global property type	Fatal	Fatal error, processing cannot continue
External application receive method - number of return values and number of receive parameters mismatch	Fatal	Fatal error, processing cannot continue
External application receive by name method - cannot match return value name with the receive parameter name	Fatal	Fatal error, processing cannot continue
External application receive by position method cannot match return value position	Fatal	Fatal error, processing cannot continue

## 2 User interface

The User Interface and printing requirements are specified in [Chap 6.3](#).

Chap No./Document No.	Title
IETF RFC 2483	URI Resolution Services
IETF RFC 3986	Uniform Resource Identifiers (URI): Generic Syntax

## 1 General

To allow the use of Uniform Resource Names (URN) within IETP applications it is necessary to construct a URN resolution service. The primary function of a resolution service is to resolve a Uniform Resource Locator (URL) location from a URN name. How each project implements a resolution service is up the project or the organization. The following guidelines must be followed when implementing the resolution service:

- All solutions are constrained by Internet Engineering Task Force (IETF) Request for Comments (RFC) 2396, Uniform Resource Identifier (URI) Syntax. Since this proposal concerns URNs, the suggested URN format must conform to the current IETF proposals or superseding documents.
- All solutions must be possible to implement using existing technologies. Since web browsers and web servers do not support URN resolution, the solution must be able to function with the existing browsers that are not URN capable.
- No solution must require a specific method of resolving URNs. Since there are many methods of defining a URN resolution server there is no need to constrain implementers to a specific methodology.
- All solutions must be web capable. Since the internet is foreseen to be the primary medium for IETP publications, solutions must have a particular emphasis on using web-based technologies.

To allow interoperability between IETP applications this specification proposes a standard interface describing a URN resolution service. Resolution services implemented using the proposed interface must be able to communicate with each other regardless of specific implementation details. Considering the above guidelines, a compatible interface can be described as meeting IETF guidelines, be able to be implemented by enterprises using existing tools they are familiar with, capable of working with any URN resolution service implementations, and focused on the use of web technologies.

## 2 Resource resolution

### 2.1 Proposed resource resolution interface

The following is a proposal to allow interoperability for IETP implementations using URN syntax for referencing. A basic interface would be a concrete implementation of IETF RFC 2483 using Hypertext Transfer Protocol (HTTP) as a transfer protocol and XML as communication medium. The interface is a web service or services implementing the service functions of RFC 2483. The interface can be used to implement a resolution service for any IETP application.

The resource resolution interface consists of two subfunctions, resource resolution and resource description. Resource resolution responds by redirecting to the resource. Resource description will provide more information about the resource in an XML document.

A standard HTTP query string provides access to this service. The service will be a URL with the following syntax:

`http://urn.server.com/urnServiceName?urnQueryString`

Where:

- *urn.server.com* = The Domain Name System (DNS) name or Internet Protocol (IP) of the URN resolution server
- *urnService* = The name and location of the URN resolution service within the server
- *urnQueryString* = The HTTP query string used to access or request information about a resource

#### 2.1.1 Resource queries

The resource resolution interface must accept queries using an HTTP query string. Query parameters will be the metadata characteristics specified as name/value pair. The resolution services attempt to resolve resources having the specified characteristics. The parameters in [Table 2](#) are service keywords that resolution services must accept:

Table 2 Resolution service keywords

Parameter	Description
<code>urn</code>	Requests the service to return information describing a resource identified by the passed URN.
<code>url</code>	Requests the service to return information describing a resource identified by the passed URL.
<code>multiple</code>	Requests the service to return multiple information sets describing the resource, if possible.
<code>allurcs</code>	Requests the service to return all known characteristics about the requested resource.

### 2.1.2 Parameter handling

The HTTP query string is considered the resource request. If the resolution service was a relational database the `urn` and `url` parameters could be considered the primary keys of a resource. The `multiple` parameter allows the service to describe the resource in multiple formats, if possible. The `allurcs` is a shorthand method to request that all metadata characteristics be described. The resolution service can also contain other metadata characteristics and any other parameter will be considered a query on these characteristics. There is no specified set of metadata characteristics defined, but implementations must consider the use of the Dublin core as a standard metadata set.

If the request contains parameters without values, or parameters with and without values, the request is considered a query for the values of resource characteristics matching the names of the parameters without values, returned as an XML document. If the request contains only parameters with values the request is consider a query for the resource stream and the resource data is returned as a response. To promote interoperability the requests parameter names must be considered as case insensitive and values that are considered dates must be in International Standards Organization (ISO) format. A service must be able to handle resource characteristic queries even if the service does not support the characteristic. A query on an unsupported characteristic will return a "not found" error message.

### 2.1.3 Multiple resource formats

A URN could be described by multiple URLs, for example a URN available in multiple formats, such as different languages. When a URN is linked to multiple URLs, the service identifies one as the default format and that resource will be returned when the resource is requested by URN only. The definition of the default resource must be identified in the business rules of the service or application. If a URN is describing multiple URLs each match must have at least one metadata characteristic vary between differing formats.

A URL could also be described by multiple URNs, for example if the URN is available in multiple formats one URN could generically describe all resource formats and another URN could describe the specific format.

The query results will be the resource itself or an XML document describing the resource characteristics. A Resource Description Unit (RDU) will describe the resource characteristics of a particular resource or resource format. Result sets can contain multiple RDUs and messages from the resolution service.

## 2.2 Resource resolution interface definition

The interface can support the following functions as defined by RFC 2483. For interface simplicity, a single service handles the various functions. The particular function to be

invoked is based on the structure and occurrence of the HTTP query parameters sent to the resolution service.

- N2R/L2R: URN/URL to resource resolution.
- N2C/L2C: URN/URL to characteristic resolution.
- N2L/L2N: URN to URL resolution.
- NEN/LEL: URN/URL equivalence.

### 2.2.1 URN/URL to resource (N2R/L2R)

This function will resolve a URN or a URL to a resource. This is the most basic service of the interface, allowing a link containing the URN to return the resource data. The service accepts a URN as a query parameter and returns the resource data. The service returns Error 004 "unknown resource" message if the resource is unknown to the service or redirect to the resource as an HTTP response. If the resource can be returned in more than one format, such as different languages, the service provides the one it considers a default or the resource most specifically identified by the additional parameters.

**Query Format:** The reserved query parameter `urn` and the parameter value is the URN string. N2R resolution occurs if only the `urn` parameter is found or only other parameters with values are found. If the service is passed a parameter with no value and the parameter name can be interpreted as a URN then the resource to resolve will be the resource specified by the parameter name. L2R performs the same function but accepts a URL as the `url` parameter. Examples that return the resource identified in English if possible are:

`http://urn.server.com/urnService?urn=URN:NID:NSS&lang=EN`

or

`http://urn.server.com/urnService?URN:NID:NSS&lang=EN`

### 2.2.2 URN to characteristic (N2C/L2C)

This function resolves a URN to one or more resource characteristics. The service accepts a URN as a query parameter and returns an XML document describing the requested characteristics. The service returns each specified characteristic or an error message as an XML document. The Error 301 "unsupported characteristic" indicates that the characteristic is not found. If there are unsupported characteristics the service returns the supported characteristics and the error messages in a single document.

**Query Format:** The N2C query accepts the `urn` parameter of the N2R query and another single parameter without a value. The name of the other parameters without values are the names of the characteristics to return. Additional parameters with values will further filter the query. The `allurcs` parameter requests the service to return all characteristics of the identified resource. Characteristics for multiple formats will be returned in multiple resource description units using the `multiple` parameter. L2C performs the same function but accepts a URL as the `url` parameter. An example that resolves the value of the author characteristic of the English language resource is:

`http://urn.server.com/urnService?urn=URN:NID:NSS&author&lang=EN`

An example that resolves the value of the all characteristics of the identified resource is:

`http://urn.server.com/urnService?urn=URN:NID:NSS&allurcs`

### 2.2.3 URN to URL/URL to URN (N2L/L2N)

This function resolves a URN or to a URL. The service accepts a URN or a URL as a query parameter and returns an XML document containing the URL characteristic. If the resource can be returned in more than one format the service will provide the one it

considers default or the resource most identified by the additional parameters. The error message 004 "unknown resource" indicates that the URL is not found.

**Query Format:** The N2L query accepts the `urn` parameter of the N2R query and a valueless `url` reserved parameter is used to activate this service. The service will return the URL or an error message as an XML document. This function is a special form of N2C where the reserved `url` parameter is to be recognized by all services. If the resource exists in multiple formats the `multiple` parameter requests the service to return multiple resource description units describing each format, otherwise information concerning the default format is returned. L2N accepts a URL as the reserved `url` parameter and returns the URN using a valueless `urn` parameter. An example that returns the URL of the identified resource in English:

`http://urn.server.com/urnService?urn=URN:NID:NSS&url&lang=EN`

#### 2.2.4 URI equivalence (NEN/LEL)

This function determines if multiple URNs are equivalent, basically if the multiple URNs point to the same resource location or if the multiple URLs describe the same URN. Examples could be where a URN has multiple formats each with their own URL or if there are two URNs that identify the same URL. This service accepts two URNs and returns an XML document describing their equivalence relationship. The Errors 501 or 502 will be returned indicating the equivalence relationship. An example that returns the URLs identified by the specified URI is:

`http://urn.server.com/urnService?urn=URN:NID:NSS1& urn=URN:NID:NSS2`

#### 2.2.5 General query format (QRY)

This function provides the same functionality as N2C, L2C, N2L, or L2N. The query format is the same as the matching function but does not take the reserved `urn` or `url` parameter. Basically the function will return information for all resources that match the query instead of matching against a specific URN. As this function can return many matches, services could limit the results to a specific number of matches. The messages 301 or 302 are returned as appropriate. An example that returns the titles of all the resources in English format is:

`http://urn.server.com/urnService?title&lang=EN`

#### 2.2.6 Advanced query services

Advanced query services could be implemented in a Resource Description Service (RDS) that allows the submission of complex queries and perform searches using more than name/value pairs.

### 2.3 Resource description

When the service returns resource characteristics the data returned will be an XML document. The function that returns this document is the RDS. This document will return one or more Resource Description Units (RDU) containing the requested resource characteristics. Multiple RDUs can be returned, one for each resource or resource format queried. The document can also contain a messaging structure to allow applications using the service to intelligently respond to errors or to provide additional information.

#### 2.3.1 Resource description units

RDUs are defined using the Resource Description Framework (RDF) to describe the specified resource. An RDU can be considered the resource metadata set described by a particular metadata schema. The default resource description schema used by this specification is the Dublin core element set defining the standard set of Uniform Resource Characteristics (URC). The RDU contains the resource identifier and can contain one or more URCs that identify particular resource metadata elements, such as the document title. A URC consists of the name of the URC element and the specific value of the URC as data

contained within that element. Additionally URC can describe their own RDU schema if different from the primary RDU and provide URC creation, ownership, modification, and expiry information for URC management between resolution servers. All services at a minimum must support URC characteristics for URN and URL information to allow link resolution.

### 2.3.2 Resource description framework

The result set RDU is described by a document containing a single `rdf:RDF` element and multiple `rdf:Description` elements defined by the RDF.

As defined by this specification the `rdf:Description` element can contain multiple `urc` elements identifying resource metadata elements with simple name/value pairs. The resource description must be returned in the `rdf:Description` element and for the purposes of this specification must contain both an `rds:urn` attribute specifying the resource URN and an `rdf:about` attribute identifying the resource URL. Every tag that is a first level child of the `rdf:Description` element is considered an URC and with the name of the tag as the URC name and the contents of the tag describing the URC value. The namespace of the URC element must describe the specific RDF schema used. This allows advanced resource description structures, therefore applications must not assume any particular structure within the `rdf:Description` element and process only RDF schemas that they recognize and ignore all other schemas. This implies that the query results document must be processed as well-formed, but not valid, for applications that do not recognize RDF schemas. All RDUs will contain at a minimum an empty `rdf:Description` element with the `rdf:about` and `rds:urn` elements as required by this specification. It is suggested that resource resolvers maintain URC metadata defined by the Dublin core. An example of an RDF structure describing a specified resource is:

```
<rdf:RDF>
<rdf:Description urn="URN:S1000D:DMC-AE-A-00-40-50-50A-000A-
A" about="http://www.examples.org/DMC/AE-A-00-40-50-50A-000A-
A.xml">
<!-- URCS describing the resource -->
</rdf:Description>
</rdf:RDF>
```

### 2.3.3 Uniform resource characteristics

The URC defines a simple metadata structure in the form of a name/value pair. The URC name is the name of the metadata element and the URC value is the data within that metadata element, for a particular resource. Documents will return the name of the URC as the name of the XML tag and the URC value as the text string or subobject contained within that tag. To perform resolution queries the `query` parameters can be matched against data within the resolution resolver. This simple structure fits well with HTTP queries, which are also described by name/value pairs. The URC must fit most metadata identification needs. More advanced resource description could use RDF schemas. It is suggested URC names are processed as case insensitive without including the namespace prefix. The following example illustrates a URC with the name of "title" and a value of "Example Resource Title" using the Dublin core resource schema.

```
<dc:title>Example Resource Title</dc:title>
```

#### 2.3.3.1 URC extended attributes

A URC element can be extended by the resource service to provide additional information about the returned resource characteristics. The following are specified URC extension attributes.

- `rds:name` - The name of the URC as a string. If this attribute is provided the value will override the name implied by the element name.

- `rds:type` - Datatype for the URC. If this attribute is specified the value will describe the datatype of the URC value. Valid types are constrained by the XML Schema datatypes. If this attribute is not specified the URC value will be assume to be of type `"xs:string"`.
- `rds:schema` - This attribute will be a string indicating the resource schema describing the URC.
- `rds:created` - This attribute value will indicate the creation date of the URC.
- `rds:modified` - This attribute value will indicate the modification date of the URC.
- `rds:expiry` - This attribute value will indicate the expiry date of the URC.
- `rds:owner` - This attribute value will be a string indicating the owner of the URC.

### 2.3.4 Messaging

The resolution service can provide additional information to the requester using messages in the response. The message will consist of a text string describing the message and identify the message number and type. Certain messages should be reserved by the interface such as "Not Found", "Invalid Query", etc. Message numbers must be assigned using the following numbering scheme:

- 000-299 Reserved for RDS errors
- 300-599 Reserved for RDS warnings
- 500-799 Reserved for RDS information
- 800-999 Reserved for future use
- >999 RDS implementation specific messages

Table 3 RDS service messages

Number	Message	Description
001	General Failure.	RDS service had an internal error and could not continue.
002	Method <code>&lt;%TYPE%&gt;</code> not supported.	RDS service does not support the query type used. %TYPE% parameter values are (N2R,L2R,N2C,L2C,N2L,L2N,N2N).
004	Resource <code>&lt;%NAME%&gt;</code> is unknown.	Requested resource is unknown to the RDS service. %NAME% is the URN or URL of the resource.
005	Resource <code>&lt;%NAME%&gt;</code> does not exist.	Response if the resolution service is handling HTTP 404 message. %NAME% is the URN or URL of the resource.
301	Query contained unsupported metadata characteristic, <code>&lt;%URC_NAME%&gt;</code>	The query contained a characteristic that was not supported by the RDS service. %URC_NAME% parameter value will be the name of the unsupported characteristic.
302	No Matches	This message indicates that the query returned no results.
501	Resource <code>&lt;%NAME1%&gt;</code> is equivalent to resource <code>&lt;%NAME2%&gt;</code> .	Message in response to NEN/LEL indicating that the passed URIs are equivalent. %NAME1% is the URN or URL of the first resource and %NAME2% is the URN or URL of the second resource.
502	Resource <code>&lt;%NAME1%&gt;</code> is not equivalent to resource <code>&lt;%NAME2%&gt;</code> .	Message in response to NEN/LEL indicating that the passed URIs are not equivalent. %NAME1% is the URN or URL of the first resource and %NAME2% is the URN or URL of the second resource.

---

**Note**

Text within the '<' and '>' characters will be replaced by a value from the RDS server.

**End of data module**

Chap No./Document No.	Title
<a href="#">Chap 7.6.1.3</a>	Process data module requirements - Variable and global property management

## 1 General

The purpose of this chapter is to provide technical examples of logic engine processing on various process data module structures. It presents process data module markup samples and details how a logic engine is expected to process the samples.

## 2 Guidance and examples

### 2.1 State management

The following examples will illustrate the assignment of state within the logic engine. As the nodes within the process data module are evaluated, certain elements such as element `<variableDeclarations>`, element `<variablePreSet>`, element `<variablePostSet>` and element `<dialog>` will request the logic engine to modify the state information.

#### 2.1.1 Variable declarations

All local variables used in a process data module must be declared using element `<variableDeclarations>`. Each variable must be identified and referenced by a uniquely defined name. Global properties are declared in the ACT and CCT and initialized in the PCT. Refer to [Chap 7.6.1.3](#).

Table 2 Local Variable declaration example

Line	Markup
1	<code>&lt;variableDeclarations&gt;</code>
2	<code>&lt;variable variableName="OnStand" valueType="boolean"&gt;</code>

Line	Markup
3	<dialog submitCaption="ok01" cancelCaption="ca01">
4	...
5	</dialog>
6	</variable>
7	<variable variableName="BicyclePartnum" valueType="string">
8	<initialize>
9	<expression><stringValue>MC-168119</stringValue></expression>
10	</initialize>
11	</variable>
12	</variableDeclarations>

Table 3 Global declaration example

Line	Markup
1	<condTypeList>
2	<condType id="conditionType" valueDataType="string">
3	<name>equipment condition</name>
4	<descr>condition of equipment</descr>
5	<enumeration applicPropertyValues="fullyFunctional" enumerationLabel="Fully Functional"/>
6	<enumeration applicPropertyValues="partiallyFunctional" enumerationLabel="Partially Functional"/>
7	<enumeration applicPropertyValues="notFunctional" enumerationLabel="Not Functional"/>
8	</condType>
9	</condTypeList>
10	<condList>
11	<cond condTypeRefId="conditionType" id="bikeCondition">
12	<name>bike condition</name>
13	<descr>condition of bike</descr>
14	<prompt> <paraBasic> What is the state of the bike?</paraBasic>
15	</prompt>
16	</cond>
17	</condList>

Variable declaration processing:

In [Table 2](#) two local variables are declared: OnStand and BicyclePartnum. Each element **<variable>** informs the logic engine to allocate a variable in the state information. The variable named OnStand (line 2) is allocated as a Boolean type and the value of the

variable is set to "noValue" since there is no initialization code. If the variable is accessed as "noValue" the associated dialog (line 3-5) will be displayed to assign a value to the variable. The second variable named BicyclePartnum (lines 7-12) is allocated as a string type and is initialized to the value "MC-168119". Variable BicyclePartnum is not provided a dialog in this example. While a dialog is optional content of variable, the logic engine has no way of querying for a variable's value on its own without an associated dialog.

In [Table 3](#) a Global Boolean Variable bikeCondition is declared in the CCT. Lines 1-9 define the Condition type within the Condition Type List. Lines 10-17 define the Condition within the Condition List. Initialization of this variable would take place in the PCT. If there were no initialization specified, a dialog would be generated from the optional prompt declaration in the CCT when a value for the variable was required. In this example, the viewer would display a dialog with prompt "What is the state of the bike?" and answer choices "Fully Functional", "Partially Functional", and "Not Functional".

### 2.1.2 Expression evaluation

Expressions are evaluated by the logic engine and are used to perform dynamic state assignment and determine conditional processing. An expression can be any combination of subexpressions.

### 2.1.3 Value expressions

Value expressions are simple functions that return a constant value.

*Table 4 Value expression example*

Line	Markup
1	<expression>
2	<stringValue>MC-168119</stringValue>
3	</expression>

Value expression processing:

The above fragment will be processed by extracting the string constant and returning the constant value as a string.

### 2.1.4 Variable expressions

Variable expressions are functions that retrieve the value of a variable from the state table and return the value of the variable as the appropriate data type.

*Table 5 Variable expression example*

Line	Markup
1	<expression>
2	<variableRef variableName="BicyclePartnum"/>
3	</expression>

Variable expression processing:

To process the above fragment, the logic engine will look up the value of the previously defined variable named BicyclePartnum (line 2) in the state table and return the value of that variable as the result of the expression.

### 2.1.5 Unary expressions

Unary expressions are functions that operate on a single expression and return a value.

Table 6 Unary expression example

Line	Markup
1	<expression>
2	<booleanFunction booleanAction="defined"/>
3	<expression>
4	<variableRef variableName="BicyclePartnum"/>
5	</expression>
6	</expression>

Unary expression processing:

The above fragment illustrates use of the element `<booleanFunction>` operator (line 2). The logic engine evaluates the inner expression (lines 3-5) by checking for the existence of the previously defined variable named `BicyclePartnum` (line 4) in the state information. If the inner expression returns a value that is not `"noValue"`, then the outer expression returns the Boolean value `"true"`, otherwise the outer expression returns the Boolean value `"false"`.

### 2.1.6 Binary expressions

Binary expressions are functions that take two parameters and return a value.

Table 7 Binary expression example

Line	Markup
1	<expression>
2	<expression>
3	<variableRef variableName="BicyclePartnum"/>
4	</expression>
5	<numberOperator numberOperation="equal"/>
6	<expression>
7	<stringValue>MC-168119</stringValue>
8	</expression>
9	</expression>

Binary expression processing:

The above fragment illustrates use of the element `<numberOperator>` operator (line 5). The logic engine evaluates the first inner expression (lines 2-4) and returns the value of the previously defined variable named `BicyclePartnum`. Then the logic engine will evaluate the second inner expression (lines 6-8) returning the string value `"MC-168119"`. Finally, the outer expression will be evaluated using the element `<numberOperator numberOperation="equal">` operator to compare the previously determined values of the inner expressions. In this case, the value of the variable `BicyclePartnum` will be compared to the string `"MC-168119"`. The Boolean value `"true"` is returned if the

expression values are equal, the Boolean value "false" is returned if the expression values are not equal.

### 2.1.7 Assert expressions

Assert expressions use the applicability element <assert> structure within an expression to evaluate the current value of a global variable.

Table 8 Assert expression example

Line	Markup
1	<expression>
2	<assert applicPropertyIdent="bikeCondition" applicPropertyType="condition" applicPropertyValues="fullyFunctional"/>
3	</expression>

Assert expression processing:

The above fragment shows how one can include applicability <assert> structure within an expression. The <assert> returns either "true", in the case that the current value of the bikeCondition global condition variable is "fullyFunctional", or returns "false" to the expression if the current value of the variable is one of the other allowed values. If the variable value is not set, a dialog will be displayed to the end user to get input.

### 2.1.8 Combined expressions

Expressions can be combined to form more complex expressions. The level of complexity is theoretically infinite, but can be limited by software constraints.

Table 9 Combined expression example

Line	Markup
1	<expression>
2	<expression>
3	<booleanFunction booleanAction="defined"/>
4	<expression>
5	<variableRef variableName="BicyclePartnum"/>
6	</expression>
7	</expression>
8	<booleanOperator booleanOperation="and"/>
9	<expression>
10	<expression>
11	<variableRef variableName="OnStand"/>
12	</expression>
13	<booleanOperator booleanOperation="equal"/>
14	<expression>
15	<booleanValue><trueValue/></booleanValue>
16	</expression>
17	</expression>

Line	Markup
18	</expression>

Combined expression processing:

The above fragment will be processed by having the logic engine check for the existence of the previously defined variable named BicyclePartnum (lines 2-7). The result of this evaluation will be ANDed (line 8) with the result of comparing the variable OnStand to the Boolean value "true" (lines 9-17) and then will be ANDed again with the result of the final <assert>.

## 2.2 Applicability presets and postsets

### 2.2.1 Applicability

The element <applic>, referenced by use of the attribute applicRefId, provides an expression which determines whether the rest of the content of the current node is to be processed. When used within the element <applic>, the element <expression> must evaluate to a Boolean result.

Table 10 Applicability example

Line	Markup
1	<referencedApplicGroup>
2	<applic id="appl-001">
3	<expression>
4	<expression>
5	<variableRef variableName="OnStand"/>
6	</expression>
7	<booleanOperator booleanOperation="equal"/>
8	<expression>
9	<booleanValue><trueValue/></booleanValue>
10	</expression>
11	</expression>
12	</applic>
13	</referencedApplicGroup>
	...
14	<variableDeclarations>
15	<variable variableName="OnStand" valueType="boolean"/>
16	</variableDeclarations>
	...
17	<dmNode applicRefId="appl-001">
18	<dmRef>...</dmRef>
19	</dmNode>

Applicability processing:

The element `<dmNode>` (line 17) in the above fragment is processed by the logic engine by first following the applicability statement reference, attribute `applicRefId`, and evaluating the expression (lines 2-12) which returns a Boolean value depending upon the value of the variable `OnStand` in the state table. If the expression evaluates to the Boolean value `"true"`, then the node, which includes element `<dmRef>`, is displayed and presented to the user. If the expression evaluates to the Boolean value `"false"`, then the element `<dmRef>` is skipped and processing continues after the current element `<dmNode>`.

### 2.2.2 Preset

An element `<variablePreSet>` will instruct the logic engine to modify the value of a variable in the state table before processing any node content. Preset is also available as a child of element `<process>` in addition to elements `<dmNode>` and `<dmLoop>`.

Table 11 Preset example

Line	Markup
1	<code>&lt;variableDeclarations&gt;</code>
2	<code>&lt;variable variableName="OnStand" valueType="boolean"/&gt;</code>
	<code>...</code>
3	<code>&lt;/variableDeclarations&gt;</code>
	<code>...</code>
4	<code>&lt;dmNode&gt;&lt;!--Secure bike to stand--&gt;</code>
5	<code>&lt;variablePreSet&gt;</code>
6	<code>&lt;assertion&gt;</code>
7	<code>&lt;variableRef variableName="OnStand"/&gt;</code>
8	<code>&lt;expression&gt;</code>
9	<code>&lt;booleanValue&gt;&lt;falseValue/&gt;&lt;/booleanValue&gt;</code>
10	<code>&lt;/expression&gt;</code>
11	<code>&lt;/assertion&gt;</code>
12	<code>&lt;/variablePreSet&gt;</code>
13	<code>&lt;dmRef&gt;...&lt;/dmRef&gt;</code>
14	<code>&lt;/dmNode&gt;</code>

Preset processing:

In the above fragment the element `<variablePreSet>` (lines 5-12) contains a child element `<assertion>` that informs the logic engine to modify the state table by assigning the Boolean value `"false"` to the variable `OnStand`. After the state table is updated, the data module identified by the element `<dmRef>` (line 13) is displayed and presented to the user and processing is halted until the user activates the "Next" function.

### 2.2.3 Postset

An element `<variablePostSet>` will instruct the logic engine to modify the value of a variable in the state table after the node content is processed. Postset is also available as a child of element `<process>` in addition to element `<dmNode>`.

Table 12 Postset example

Line	Markup
1	<variableDeclarations>
2	<variable variableName="OnStand" valueType="boolean"/>
	...
3	</variableDeclarations>
	...
4	<dmNode><!--Remove bike from maintenance stand-->
5	<dmRef>...</dmRef>
6	<variablePostSet>
7	<assertion>
8	<variableRef variableName="OnStand"/>
9	<expression>
10	<booleanValue><falseValue/></booleanValue>
11	</expression>
12	</assertion>
13	</variablePostSet>
14	</dmNode>

Postset processing:

In the above fragment, the data module referenced by the element [<dmRef>](#) (line 5) will be displayed and processing will halt until the "Next" function is activated. After the user activates the "Next" function the element [<variablePostSet>](#) (lines 6-13) is processed with the child element [<assertion>](#) informing the logic engine to modify the state information by assigning the Boolean value "false" to the variable OnStand.

## 2.3 Step content

The process data module can include step content. The step content is grouped within the element [<dmNode>](#). This grouping defines a screen of information to be presented to the user.

### 2.3.1 Step content grouping

The step content collected within an element [<dmNode>](#) is to be displayed as a screen of information to the user. This example illustrates two screens of information.

Table 13 Step content grouping example

Line	Markup
1	<dmNode>
2	<proceduralStep><para>This is the first screen of data</para></proceduralStep>
3	<proceduralStep><para>This step has substeps</para>
4	<proceduralStep><para>First screen, first substep</para></proceduralStep>
5	<proceduralStep><para>First screen, second substep</para></proceduralStep>

Line	Markup
6	</proceduralStep>
7	</dmNode>
8	<dmNode>
9	<proceduralStep><para>This is the second screen of data</para> </proceduralStep>
10	<proceduralStep><para>This step has substeps</para>
11	<proceduralStep><para>Second screen. first substep</para> </proceduralStep>
12	<proceduralStep><para>Second screen, second substep</para> </proceduralStep>
13	</proceduralStep>
14	</dmNode>

#### Step content grouping processing:

In the above fragment, the logic engine would process the first dmNode (lines 1-7) and build a package for IETP display. Expected output can look like:

- 1 This is the first screen of data
- 2 This step has substeps
  - 2.1 First screen, first substep
  - 2.2 First screen, second substep

When the user has read the information and wishes to proceed, he would activate the "Next" function. The logic engine would then process the second dmNode (lines 8-14) and build a package for IETP display. Expected output can look like:

- 1 This is the second screen of data
- 2 This step has substeps
  - 2.1 Second screen, first substep
  - 2.2 Second screen, second substep

### 2.3.2 Embedded variable references

In this example, the user is presented with the value from a state table variable. This example represents display of a voltage reading. The example shows the voltage reading being set with an assertion, which might have been obtained using an external application interface to a piece of automated test equipment.

Table 14 Embedded variable reference example

Line	Markup
1	<variableDeclarations>
2	<variable variableName="Voltage" valueType="real"/>
3	</variableDeclarations>
4	...
5	<assertion>

Line	Markup
6	<code>&lt;variableRef variableName="Voltage"/&gt;</code>
7	<code>&lt;expression&gt;&lt;realValue&gt;12.8&lt;/realValue&gt;&lt;/expression&gt;</code>
8	<code>&lt;/assertion&gt;</code>
9	<code>...</code>
10	<code>&lt;dmNode&gt;</code>
11	<code>&lt;proceduralStep&gt;</code>
12	<code>&lt;para&gt;</code>
13	<code>Voltage is &lt;variableRef variableName="Voltage"/&gt; volts.</code>
14	<code>&lt;/para&gt;</code>
15	<code>&lt;/proceduralStep&gt;</code>
16	<code>&lt;/dmNode&gt;</code>

Embedded variable reference processing:

In the above fragment the logic engine will create a variable named `Voltage` in the state table (line 2) and will assign the value of `"12.8"` to it (lines 5-8). When processing the `dmNode` (lines 10-16), the logic engine will retrieve the value of the embedded attribute `variableRef` (line 13), from the state table, and embed the value directly inline with the text. The `dmNode` display package will then be displayed. The output would be expected to be displayed similar to the following:

1 Voltage is 12.8 volts.

If the variable `Voltage` had been defined as a global variable, the reference markup would change from:

`<variableRef variableName="Voltage"/>`

to:

`<globalPropertyRef applicPropertyIdent="Voltage" applicPropertyType="condition"/>` in lines 6 and 13.

## 2.4 Dialogs

A dialog will apply state after the user has completed the dialog by activating the "OK" function.

The examples below utilize local variables. Dialogs can be authored for values of global variables by replacing element `<variableRef>` with element `<globalPropertyRef>` in the markup lines 10, 24, and 30.

### 2.4.1 Fill-in dialog

A fill-in dialog requests the logic engine to present a dialog to the user containing an input box where the user can enter data.

Table 15 Fill-in example

Line	Markup
1	<code>&lt;variableDeclarations&gt;</code>
2	<code>&lt;variable variableName="TirePressureFront" valueType="real"/&gt;</code>
	<code>...</code>

Applicable to: All

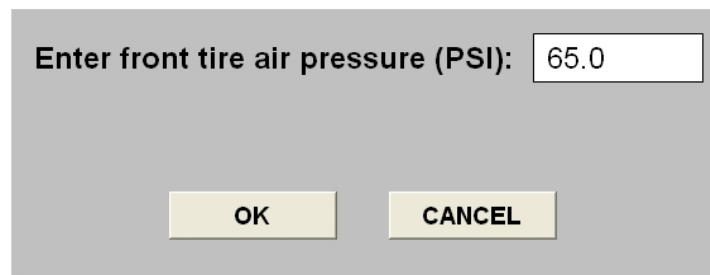

S1000D-A-07-07-0100-00A-040A-A

Chap 7.7.1

Line	Markup
3	</variableDeclarations>
	...
4	<dmNode><!--Air pressure dialog-->
5	<dialog submitCaption="ok01" cancelCaption="ca01">
6	<userEntry mandatory="1" dataEntryFieldLength="8">
7	<prompt>
8	<paraBasic>Enter front tire air pressure (PSI):</paraBasic>
9	</prompt>
10	<variableRef variableName="TirePressureFront"/>
11	<default>
12	<expression>
13	<realValue>65.0</realValue>
14	</expression>
15	</default>
16	<validate errorMessage="Tire pressure must be between 0.0 and 90.0 PSI">
17	<expression>
18	<expression>
19	<expression>
20	<realValue>0.0</realValue>
21	</expression>
22	<numberOperator numberOperation="lessThanOrEqual"/>
23	<expression>
24	<variableRef variableName="TirePressureFront"/>
25	</expression>
26	</expression>
27	<booleanOperator booleanOperation="and"/>
28	<expression>
29	<expression>
30	<variableRef variableName="TirePressureFront"/>
31	</expression>
32	<numberOperator numberOperation="lessThanOrEqual"/>
33	<expression>
34	<realValue>90.0</realValue>
35	</expression>
36	</expression>
37	</expression>
38	</validate>
39	</userEntry>
40	</dialog>
41	</dmNode>

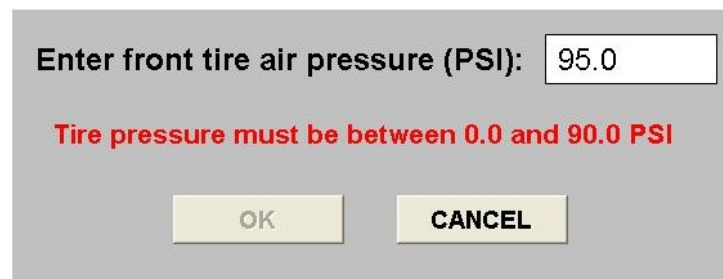

Fill-in processing:

In the above fragment the element `<dialog>` will instruct the logic engine to display a dialog containing an input box pre-filled with the value "65,0" (lines 11-15) which prompts the user with the message "Enter front tire air pressure (PSI):" (lines 7-9). Refer to [Fig 1](#) for tire pressure dialog fill-in example. Processing will halt until the user activates the "OK" function. If the user enters a value outside of the range 0,0 to 90,0 (lines 16-38) an error message informs the user of the acceptable range. Refer to [Fig 2](#) for error message dialog fill-in example. When the user activates the "OK" function with an acceptable value the logic engine will modify the state table by assigning the data entered by the user to the variable identified in the element `<variableRef>` (line 10), in this case the variable named `TirePressureFront`.

ICN-AE-A-070701-A-99994-00001-A-01-1

Fig 1 Example tire pressure dialog fill-in

ICN-AE-A-070701-A-99994-00002-A-01-1

Fig 2 Example error message dialog fill-in

## 2.4.2 Menu dialog

A menu dialog requests the logic engine to present a dialog to the user containing one or more choices for the user to select. When the user selects a choice, the logic engine will perform the assertion(s) associated with the selected choice. The attribute `choiceSelection` determines whether the user is allowed to select single or multiple choices.

The examples below show dialogs for local variables. Dialogs for global variables may be authored also by replacing the element `<variableRef>` with the element `<globalPropertyRef>` in lines 11 and 20.

Table 16 Menu example

Line	Markup
1	<code>&lt;variableDeclarations&gt;</code>
2	<code>&lt;variable variableName="BicyclePartnum" valueType="string"/&gt;</code>
	<code>...</code>
3	<code>&lt;/variableDeclarations&gt;</code>

Applicable to: All

S1000D-A-07-07-0100-00A-040A-A

Chap 7.7.1

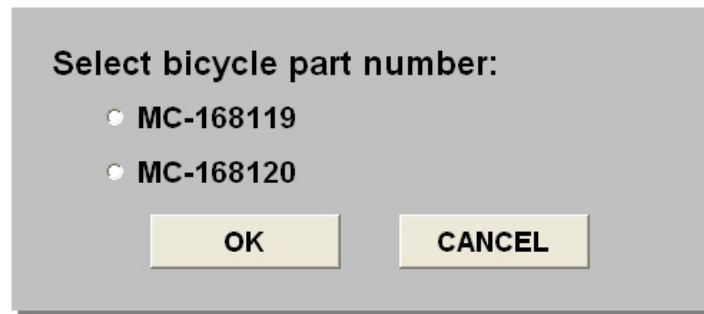

Line	Markup
	...
4	<dmNode><!--Part number dialog-->
5	<dialog submitCaption="ok01" cancelCaption="ca01">
6	<menu choiceSelection="single" choiceType="select" menuChoiceFlow="list" mandatory="1">
7	<prompt><paraBasic>Select bicycle part number:</paraBasic></prompt>
8	<menuChoice menuChoiceDefaultFlag="0">
9	<prompt><paraBasic>MC-168119</paraBasic></prompt>
10	<assertion>
11	<variableRef variableName="BicyclePartnum"/>
12	<expression>
13	<stringValue>MC-168119</stringValue>
14	</expression>
15	</assertion>
16	</menuChoice>
17	<menuChoice>
18	<prompt><paraBasic>MC-168120</paraBasic></prompt>
19	<assertion>
20	<variableRef variableName="BicyclePartnum"/>
21	<expression>
22	<stringValue>MC-168120</stringValue>
23	</expression>
24	</assertion>
25	</menuChoice>
26	</menu>
27	</dialog>
28	</dmNode>

#### Menu processing:

In the above fragment, the element `<dialog>` will instruct the logic engine to display a dialog containing a user prompt "Select bicycle part number:" (line 7) and provide choices of "MC-168119" (line 9) and "MC-168120" (line 18). Refer to [Fig 3](#) for dialog menu example.

Processing will halt until the user selects one of the choices and activates the "OK" function. When the user activates the "OK" function, the logic engine will modify the state information by processing the element `<assertion>` of the selected choice (lines 10-15 or lines 19-24) and performing the appropriate modification to the state table.

ICN-AE-A-070701-A-99994-00003-A-01-1

Fig 3 Example part number dialog menu

## 2.5 External application interface

The external application interface provides a method for the logic engine/IETP to interface with programs external to the IETP. Abilities include sending parameters to the external application, either static values or state table variable values, and receiving data from the external application, which update variables in the state table. External application data may be passed using either local variables or global properties. The following examples use local variables. To pass or receive global properties replace element `<variableRef>` with element `<globalPropertyRef>`.

This set of examples is built on an imaginary tool for displaying and isolating wiring defects. The tool accepts parameters, consisting of a reference designator and pin, to designate the wiring circuit to display and returns a status and a defective wire number.

### 2.5.1 Send parameters

Parameters to send to the external application can be specified in two ways as detailed below.

#### 2.5.1.1 Static parameters with name pair

Start the wiring isolation tool with a set reference designator and pin, do not process any results.

Table 17 Send parameters with name pair example

Line	Markup
1	<code>&lt;!ENTITY WireTool SYSTEM "file://Wired/Wired.exe" NDATA exe&gt;</code>
	<code>...</code>
2	<code>&lt;dmNode&gt;</code>
3	<code>&lt;externalApplication application="WireTool"&gt;</code>
4	<code>&lt;paraBasic&gt;Isolate Wiring Defect&lt;/paraBasic&gt;</code>
5	<code>&lt;send&gt;</code>
6	<code>&lt;sendName&gt;RefDes&lt;/sendName&gt;</code>
7	<code>&lt;stringValue&gt;52P-H004&lt;/stringValue&gt;</code>
8	<code>&lt;/send&gt;</code>
9	<code>&lt;send&gt;</code>
10	<code>&lt;sendName&gt;Pin&lt;/sendName&gt;</code>
11	<code>&lt;stringValue&gt;4&lt;/stringValue&gt;</code>
12	<code>&lt;/send&gt;</code>
13	<code>&lt;/externalApplication&gt;</code>

Line	Markup
14	</dmNode>

Static parameters with name pair processing:

In the above example, the logic engine/IETP would invoke the wiring tool with two parameters. The format of the invocation is not specified and will depend on the actual implementation, but a typical executable invocation can look like:

Wired.exe - RefDes 52P-H004 - Pin 4

Another typical invocation can include Hypertext Markup Language (HTML):

<http://wired&RefDes=52P-H004&Pin=4>

Yet another invocation can include XML bundled in a SOAP message:

```
<env:Envelope xmlns:env="http://www.w3.org/2003/05/soap-envelope">
<env:Header>...</env:Header>
<env:Body>
<p:refdes>52P-H004</p:refdes>
<p:pin>4</p:pin>
</env:Body>
</env:Envelope>
```

Since there are no receive parameters, the logic engine continues processing past the external application invocation (line 14) in this data module node, then waits until the "NEXT" function is selected before proceeding.

#### 2.5.1.2

Variable parameters with name pair

Start the wiring isolation tool with a reference designator and pin values obtained from state table variables, do not process any results.

*Table 18 Variable parameters with name pair example*

Line	Markup
1	<!ENTITY WireTool SYSTEM "file://Wired/Wired.exe" NDATA exe>
	...
2	<variableDeclarations>
3	<variable variableName="MyRefDes" valueType="string"/>
4	<variable variableName="MyPin" valueType="integer"/>
5	</variableDeclarations>
	...
6	<dmNode>
7	<variablePreSet>
8	<assertion>
9	<variableRef variableName="MyRefDes"/>
10	<expression><stringValue>52P-H004</stringValue></expression>
11	</assertion>
12	</variablePreSet>
13	<variablePreSet>
14	<assertion>

Applicable to: All

**S1000D-A-07-07-0100-00A-040A-A**

**Chap 7.7.1**

Line	Markup
15	<variableRef variableName="MyPin"/>
16	<expression><integerValue>4</integerValue></expression>
17	</assertion>
18	</variablePreSet>
19	<externalApplication application="WireTool">
20	<paraBasic>Isolate Wiring Defect</paraBasic>
21	<send>
22	<sendName>RefDes</sendName>
23	<variableRef variableName="MyRefDes"/>
24	</send>
25	<send>
26	<sendName>Pin</sendName>
27	<variableRef variableName="MyPin"/>
28	</send>
29	</externalApplication>
30	</dmNode>

Variable parameters with name pair processing:

In the above example as with the previous example, the logic engine/IETP would invoke the wiring tool with two parameters. In this case, on lines 2-5 the author has defined two variables to hold the RefDes and Pin values to be sent as parameters. The values of the variables can be assigned in many ways, but for the example two presets on lines 7-18 set the values in the state information.

On lines 19-29, the external application interface markup defines the two parameters and indicates that the parameter values should be obtained from the state table variables. The format of the invocation is not specified and will depend on the actual implementation, but a typical executable invocation can look the same as the previous example:

Wired.exe -RefDes 52P-H004 -Pin 4

Since there are no receive parameters, the logic engine continues processing past the external application invocation (line 30) in this data module node. Processing waits until the "NEXT" function is selected before proceeding.

- 2.5.1.3 Parameters without name pair  
Start the wiring isolation tool with a set reference designator and pin, do not process any results.

Table 19 Parameters without name pair example

Line	Markup
1	<!ENTITY WireTool SYSTEM "file://Wired/Wired.exe" NDATA exe>
	...
2	<dmNode>
3	<variablePreSet>
4	<assertion>

Line	Markup
5	<variableRef variableName="MyPin"/>
6	<expression><integerValue>4</integerValue></expression>
7	</assertion>
8	</variablePreSet>
9	<externalApplication application="WireTool">
10	<paraBasic>Isolate Wiring Defect</paraBasic>
11	<send>
12	<stringValue>52P-H004</stringValue>
13	</send>
14	<send>
15	<variableRef variableName="MyPin"/>
16	</send>
17	</externalApplication>
18	</dmNode>

Parameters without name pair processing:

The external application does not require send variable name, since it only process the variables in the order received.

In the above example, the logic engine/IETP would invoke the wiring tool with two parameters in the order received. The format of the invocation is not specified and will depend on the actual implementation, but a typical executable invocation can look like:

Wired.exe 52P-H004 4

Since there are no receive parameters, the logic engine continues processing past the external application invocation (line 18) in this data module node. Processing waits until the "NEXT" function is selected before proceeding.

## 2.5.2 Return values

Return values can be specified in three different formats as detailed below. For the return values examples, the example of a wiring tool will continue to be used, but in these cases, the wiring tool has the capability for the user to select the defective wire number found during isolation. The wiring tool will report the status, defective wire number A1000A26, and bundle 20201.

For these examples, the wiring tool returns the following XML message:

```
<wireToolResults>
<status>Isolated</status>
<wireNumber>A1000A26</wireNumber>
<bundle>20201</bundle>
</wireToolResults>
```

### 2.5.2.1 Return values "Receive by Order" method

In this method all return results must be accounted for in the same order as the return results.

Table 20 Return values "Receive by Order" example

Line	Markup
1	<!ENTITY WireTool SYSTEM "file:///Wired/Wired.exe" NDATA exe>
	...
2	<variableDeclarations>
3	<variable variableName="RtnStatus" valueType="string"/>
4	<variable variableName="RtnWireno" valueType="string"/>
5	<variable variableName="RtnBundle" valueType="string"/>
6	</variableDeclarations>
	...
7	<dmNode>
8	<externalApplication application="WireTool">
9	<paraBasic>Isolate Wiring Defect</paraBasic>
10	<send>
11	<sendName>RefDes</sendName>
12	<stringValue>52P-H004</stringValue>
13	</send>
14	<send>
15	<sendName>Pin</sendName>
16	<stringValue>4</stringValue>
17	</send>
18	<receiveValue>
19	<variableRef variableName="RtnStatus"/>
20	</receiveValue>
21	<receiveValue>
22	<variableRef variableName="RtnWireno"/>
23	</receiveValue>
24	<receiveValue>
25	<variableRef variableName="RtnBundle"/>
26	</receiveValue>
27	</externalApplication>
28	</dmNode>

"Receive by Order" method processing:

Using the "Receive by Order" method on lines 18-26, the logic engine will take the values received from the external application in the order received and assign them to the variables referenced within the receive markup.

In this example, after the WireTool returns, the state information variables would be updated to the following values:

RtnStatus = "Isolated"

RtnWireno = "A1000A26"

RtnBundle = "20201"

- 2.5.2.2 Return values "Receive by Position" method  
In this method, return results are accounted for by position, not all results have to be accounted for. This example only saves the wireNumber and bundle return values. The status return value is not used.

Table 21 Return values "Receive by Position" example

Line	Markup
1	<!ENTITY WireTool SYSTEM "file://Wired/Wired.exe" NDATA exe>
	...
2	<variableDeclarations>
3	<variable variableName="RtnWireno" valueType="string"/>
4	<variable variableName="RtnBundle" valueType="string"/>
5	</variableDeclarations>
	...
6	<dmNode>
7	<externalApplication application="WireTool">
8	<paraBasic>Isolate Wiring Defect</paraBasic>
9	<send>
10	<sendName>RefDes</sendName>
11	<stringValue>52P-H004</stringValue>
12	</send>
13	<send>
14	<sendName>Pin</sendName>
15	<stringValue>4</stringValue>
16	</send>
17	<receiveByPosition>
18	<returnedValuePosition>3</returnedValuePosition>
19	<variableRef variableName="RtnBundle"/>
20	</receiveByPosition>
21	<receiveByPosition>
22	<returnedValuePosition>2</returnedValuePosition>
23	<variableRef variableName="RtnWireno"/>
24	</receiveByPosition>
25	</externalApplication>
26	</dmNode>

"Receive by Position" method processing:

Using the "Receive by Position" method, the logic engine will take the values received from the external application in the order received and assign them to the variables referenced within the "Receive by Position" markup, lines 17-24, as indicate by the position indicated in element [<returnedValuePosition>](#). Note in this example that only two of the three return values are saved and the two that are saved are listed in the markup in reverse order, as they

are received from the external application. The return value in the first position is not referenced in the markup; therefore, it is not processed or saved in the state table.

In this example, after the WireTool returns, the state table variables would be updated to the following values:

RtnWireno = "A1000A26"

RtnBundle = "20201"

### 2.5.2.3 Return values "Receive by Name" method

In this method, return results are accounted for by name, not all results have to be accounted for. This example only saves the wireNumber and bundle return values. The status return value is not used.

*Table 22 Return values "Receive by Name" example*

Line	Markup
1	<!ENTITY WireTool SYSTEM "file://Wired/Wired.exe" NDATA exe>
	...
2	<variableDeclarations>
3	<variable variableName="RtnWireno" valueType="string"/>
4	<variable variableName="RtnBundle" valueType="string"/>
5	</variableDeclarations>
	...
6	<dmNode>
7	<externalApplication application="WireTool">
8	<paraBasic>Isolate Wiring Defect</paraBasic>
9	<send>
10	<sendName>RefDes</sendName>
11	<stringValue>52P-H004</stringValue>
12	</send>
13	<send>
14	<sendName>Pin</sendName>
15	<stringValue>4</stringValue>
16	</send>
17	<receiveByName>
18	<returnValueName>bundle</returnValueName>
19	<variableRef variableName="RtnBundle"/>
20	</receiveByName>
21	<receiveByName>
22	<returnValueName>wireNumber</returnValueName>
23	<variableRef variableName="RtnWireno"/>
24	</receiveByName>
25	</externalApplication>
26	</dmNode>

"Receive by Name" method processing:

In order to use the "Receive by Name" method, the external application must provide a return consisting of name/value pairs which the logic engine can use to match names with values.

Using the "Receive by Name" method, the logic engine will take the name/value pairs received from the external application and assign them to the variables referenced within the "Receive by Name" markup, lines 17-24, as indicated by the name indicated in element `<returnedValueName>`. Note in this example that only two of the three return values are saved and the two that are saved are listed in the markup in reverse order, as they are received from the external application.

In this example, after the WireTool returns, the state table variables would be updated to the following values:

RtnWireno = "A1000A26"

RtnBundle = "20201"

### 2.5.3 External application cancel operation

This sample is included to illustrate how data can be structured in a way to provide fault tolerance when using the external application interface. In this example, assume that we are testing a piece of equipment where the test can be run both automated and manually. The automated method has the possibility of an error condition where the expected return value is never returned. The logic engine/IETP will, by default, wait forever for the return value.

Table 23 Return values "Receive by Name" example

11	<code>&lt;assertion&gt;</code>
12	<code>&lt;variableRef variableName="TestType"/&gt;</code>
13	<code>&lt;expression&gt;&lt;stringValue&gt;Auto&lt;/stringValue&gt;&lt;/expression&gt;</code>
14	<code>&lt;/assertion&gt;</code>
15	<code>&lt;/menuChoice&gt;</code>
16	<code>&lt;menuChoice&gt;&lt;prompt&gt;&lt;paraBasic&gt;Manual&lt;/paraBasic&gt;&lt;/prompt&gt;</code>
17	<code>&lt;assertion&gt;</code>
18	<code>&lt;variableRef variableName="TestType"/&gt;</code>
19	<code>&lt;expression&gt;&lt;stringValue&gt;Manual&lt;/stringValue&gt;&lt;/expression&gt;</code>

Line	Markup
20	</assertion>
21	</menuChoice>
22	</menu>
23	</dialog>
24	</dmNode>
25	<dmIf>
26	<expression>
27	<expression><variableRef variableName="TestType"/> </expression>
28	<stringOperator stringOperation="equal"/>
29	<expression><stringValue>Auto</stringValue></expression>
30	</expression>
31	<dmThenSeq>
32	<dmNode>
33	<externalApplication application="AutoTest">...</externalApplication>
34	</dmNode>
35	</dmThenSeq>
36	<dmElseSeq>
37	<dmNode>
38	<proceduralStep>
39	<para>Steps for taking manual reading</para>
40	</proceduralStep>
41	</dmNode>
42	</dmElseSeq>
43	</dmIf>

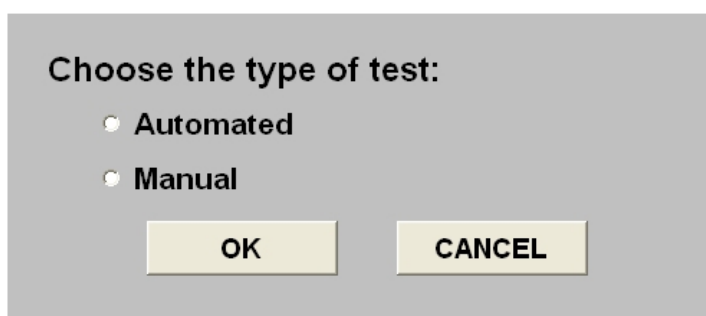

External application "Cancel" operation processing:

In this scenario, the user is first presented with a dialog (lines 7-23) to choose either the automated test or manual test. Refer to [Fig 4](#). If the user selects automated the state table variable TestType is updated with the value "Auto".

Next, the If statement (line 25) expression (lines 26-30) is evaluated and the then branch (lines 31-35) is executed and the external application is invoked.

Assuming the external application has an error and does not return a result, the user would perform the cancel function.

The logic engine would perform a previous function and back up to the dialog (lines 7-23) again asking the user to choose either the automated test or manual test. At this point, the user can choose to attempt the automated test again, or proceed to bypass it with the manual test. The logic engine would reevaluate the If statement (line 25) and process the appropriate then or else leg of the data.

#### 1 General

The purpose of this chapter is to provide technical examples of the process data module nodes to illustrate the usage of interactivity. It contains examples which demonstrate basic functionality. The examples are not intended to express the full system capabilities.

#### 2 Process data module node guidance and examples

##### 2.1 Data module node

The element `<dmNode>` represents a reference to another data module, a dialog or a sequence.

Table 2 Node example

Line	Markup
	<code>&lt;dmNode&gt;&lt;!--Inspect bicycle--&gt;</code>
	<code>&lt;dmRef&gt;</code>
	<code>...</code>
	<code>&lt;/dmRef&gt;</code>
	<code>&lt;/dmNode&gt;</code>

Node processing:

In the above example the logic engine will display the reference data module indicated by the element `<dmRef>` and processing will halt until the user selects the "Next" function.

## 2.2 Data module node alternates

The element `<dmNodeAlts>` represents a collection of data module nodes where only one node in the collection is displayed based on node preconditions.

Table 3 Node alternates example

Line	Markup

16.	<code>&lt;variable name="BicyclePartnum" valueType="string"/&gt;</code>
17.	<code>...</code>
18.	<code>&lt;/variableDeclarations&gt;</code>

Line	Markup
19.	...
20.	<dmNodeAlts><!--Adjust brakes-->
21.	<dmNode applicRefId="appl-001"><!--Adjust side-pull brakes-->
22.	<dmRef>
23.	...
24.	</dmRef>
25.	</dmNode>
26.	<dmNode><!--Adjust center-pull brakes-->
27.	<dmRef>
28.	...
29.	</dmRef>
30.	</dmNode>
31.	</dmNodeAlts>

Node alternates processing:

The logic engine will begin examining each child element `<dmNode>` in sequence and evaluate each element `<applic>`. The logic engine will continue examining each element `<dmNode>` in sequence until an element `<applic><expression>` construct is found that evaluates to the Boolean value "true". The first element `<dmNode>` containing an element `<applic>` that evaluates to the Boolean value "true", or the first element `<dmNode>` without an element `<applic>`, will have its content displayed.

In the above example, if the value of the variable named "BicyclePartnum" equals "MC-168119" (lines 2-12) then the associated element `<dmRef>` made by attribute `applicRefId` (line 21) is displayed and processing is halted. Otherwise, the element `<dmRef>` of the second node (line 26) is displayed since it does not contain the attribute `applicRefId`. This data module node (lines 25-29) could be considered similar to the default case in a programmatic switch type construct.

#### Note

If none of applicability referenced by attribute `applicRefId` evaluates to the Boolean value "true" processing continues after the element `<dmNodeAlts>`.

## 2.3 Data module node sequence

The element `<dmSeq>` represents a collection of data module nodes that are processed sequentially. The logic engine will process each node in sequential order until the end of the sequence is reached.

Table 4 Node sequence example

Line	Markup
1.	<referencedApplicGroup>
2.	<applic id="appl-001">
3.	<expression>
4.	<expression>
5.	<variableRef variableName="TirePressure"/>
6.	</expression>
7.	<numberOperator numberOperation="lessThan"/>
8.	<expression>
9.	<realValue>60,0</realValue>
10.	</expression>
11.	</expression>
12.	</applic>
13.	</referencedApplicGroup>
14.	...
15.	<variableDeclarations>
16.	<variable variableName="TirePressure" valueType="real"/>
17.	...</variableDeclarations>
18.	<dmSeq><!--Monthly periodic maintenance-->
19.	<dmNode><!--Visually inspect-->
20.	<dmRef>
21.	...
22.	</dmRef>
23.	</dmNode>
24.	<dmNode><!--Check tire pressure-->
25.	<dialog>
26.	...
27.	</dialog>
28.	</dmNode>
29.	<dmNode applicRefId="appl-001"><!--Inflate tires-->
30.	<dmRef>...</dmRef>
31.	</dmNode>
32.	<dmNode><!--Lubricate chain-->

Line	Markup
33.	<dmRef>
34.	...
35.	</dmRef>
36.	</dmNode>
37.	<dmNode><!--Clean bicycle-->
38.	<dmRef>
39.	...
40.	</dmRef>
41.	</dmNode>
42.	</dmSeq>

Node sequence processing:

The logic engine will evaluate each child element `<dmNode>` in sequence and display the content as appropriate. The first node content, "Visual inspection", (lines 19-23) will be displayed and processing will halt until the user activates the "Next" function. The next function continues processing to the second node, "Check tire pressure" (lines 24-28), and a dialog is displayed with processing again halting for user input. This dialog is assumed to set the variable named "TirePressure". When the user activates the dialog "OK" function the "Inflate tires" node (lines 29-31) is processed, the attribute `applicRefId` is resolved and the applicability statement element `<applic><expression>` (lines 2-12) is evaluated. If the "TirePressure" variable is less than the real value of "60,0" then the associated element `<dmRef>` (line 30) is displayed and processing is halted, otherwise processing continues. The "Lubricate chain" (lines 32-36) and "Clean bicycle" (lines 37-41) nodes are then displayed with processing halting as appropriate until the user activates the "Next" function. Processing will then continue past the element `<dmSeq>` node.

## 2.4 Data module node if

The element `<dmIf>` will instruct the logic engine to branch processing between "then" or "else" branches, behaving as a programmatic "if" construct.

Table 5 Node if example

Line	Markup
1.	<variableDeclarations>
2.	<variable name="BicyclePartnum" valueType="string"/>
3.	...
4.	</variableDeclarations>
5.	...
6.	<dmIf><!--Remove/replace brakes-->
7.	<expression>

Line	Markup
8.	<expression>
9.	<variableRef variableName="BicyclePartnum"/>
10.	</expression>
11.	<stringOperator stringOperation="equal"/>
12.	<expression>
13.	<stringValue>MC-168119</stringValue>
14.	</expression>
15.	</expression>
16.	<dmThenSeq><!--Replace side-pull brakes-->
17.	<dmNode><!--Remove side-pull brakes-->
18.	<dmRef>
19.	...
20.	</dmRef>
21.	</dmNode>
22.	<dmNode><!--Repair side-pull brakes-->
23.	<dmRef>
24.	...
25.	</dmRef>
26.	</dmNode>
27.	<dmNode><!--Install side-pull brakes-->
28.	<dmRef>
29.	...
30.	</dmRef>
31.	</dmNode>
32.	</dmThenSeq>
33.	<dmElseSeq><!--Replace center-pull brakes-->
34.	<dmNode><!--Remove center-pull brakes-->
35.	<dmRef>
36.	...
37.	</dmRef>
38.	</dmNode>
39.	<dmNode><!--Repair center-pull brakes-->

Line	Markup
40.	<dmRef>
41.	...
42.	</dmRef>
43.	</dmNode>
44.	<dmNode><!--Install center-Pull Brakes-->
45.	<dmRef>
46.	...
47.	</dmRef>
48.	</dmNode>
49.	</dmElseSeq>
50.	</dmIf>

Node if processing:

In the above example the logic engine will evaluate the child element `<expression>` (lines 7-15). If the element `<expression>` construct evaluates to the Boolean value "true" each node in the element `<dmThenSeq>` (lines 16-32) will be processed in sequential order. If the element `<expression>` construct evaluates to the Boolean value "false" the nodes in the element `<dmElseSeq>` (lines 33-49) will be evaluated in sequential order. If the element `<dmElseSeq>` does not exist, then processing will continue beyond the element `<dmIf>`.

## 2.5 Data module node loop

The element `<dmLoop>` will iterate a sequence of data module nodes as long as condition is met. The logic engine will examine the child expression and if it evaluates to the Boolean value "true" the child nodes will be processed in sequence. When the end of the sequence is reached the logic engine will reexamine the expression and reiterate the sequence if the expression continues to evaluate to the Boolean value "true". Otherwise processing will continue beyond the element `<dmLoop>`. Node loops can also contain assertions at the end of the loop node sequence to increment or otherwise assign variable values to modify the condition after each pass of the loop. The post assertions are not illustrated in this example.

Table 6 Node loop example

13.	</expression>
14.	<numberOperator numberOperation="greaterThan"/>
15.	<expression>
16.	<stringValue>20,0</stringValue>
17.	</expression>
18.	</expression>
19.	<dmSeq>
20.	<dmNode><!--Adjust chain-->
21.	<dmRef>
22.	...
23.	</dmRef>
24.	</dmNode>
25.	<dmNode><!--Measure chain play-->
26.	<dialog>
27.	...
28.	</dialog>
29.	</dmNode>
30.	</dmSeq>
31.	</dmLoop>

Node loop processing:

This example illustrates a loop where the chain is adjusted then measured repeatedly until the chain play is less than 20 mm.

The "ChainPlay" variable (lines 2-6) is initialized to 100,0 when added to the state information. Processing of the element `<dmLoop>` begins by evaluating the element `<expression>` (lines 10-18) which checks if the "ChainPlay" variable (initialized to 100,0) is greater than 20,0, returning the Boolean value "true". The element `<dmSeq>` (lines 19-30) is then processed. The "Adjust chain" node (lines 20-24) is displayed and processing will halt until the user activates the "Next" function. The next function continues processing to the second

node, "Measure chain play" (lines 25-29), and a dialog is displayed with processing again halting for user input. This dialog is assumed to set the variable named "ChainPlay". When the user activates the dialog "OK" function the bottom of the loop is hit and processing returns to the element `<expression>` (lines 10-18). This continues until the expression evaluates to the Boolean value "false".

## 2.6 Data module node sequence alternates

The element `<dmSeqAlts>` represents a collection of data module sequences where only one sequence in the collection is displayed based on sequence preconditions.

Table 7 Node sequence alternates example

Line	Markup
1.	<code>&lt;referencedApplicGroup&gt;</code>
2.	<code>&lt;applic id="appl-001"&gt;</code>
3.	<code>&lt;assert applicPropertyIdent="BicyclePartnum"</code> <code>applicPropertyType="prodattr"</code> <code>applicPropertyValues="MC-168119"/&gt;</code>
4.	<code>&lt;/applic&gt;</code>
5.	<code>&lt;applic id="appl-002"&gt;</code>
6.	<code>&lt;assert applicPropertyIdent="BicyclePartnum"</code> <code>applicPropertyType="prodattr"</code> <code>applicPropertyValues="MC-168234"/&gt;</code>
7.	<code>&lt;/applic&gt;</code>
8.	<code>&lt;/referencedApplicGroup&gt;...</code>
9.	<code>&lt;process&gt;</code>
10.	<code>&lt;variableDeclarations&gt;</code>
11.	<code>&lt;variable name="BrakesOK" valueType="boolean"/&gt;</code>
12.	<code>...</code>
13.	<code>&lt;/variableDeclarations&gt;</code>
14.	<code>...</code>
15.	<code>&lt;dmSeq&gt;</code>
16.	<code>&lt;dmNode&gt;</code>
17.	<code>&lt;dialog&gt;</code>
18.	<code>&lt;menu choiceType="select" mandatory="1"</code> <code>menuChoiceFlow="list"&gt;</code>
19.	<code>&lt;prompt&gt;&lt;paraBasic&gt;Do the brakes work?</code> <code>&lt;/paraBasic&gt;&lt;/prompt&gt;</code>
20.	<code>&lt;menuChoice&gt;</code>
21.	<code>&lt;prompt&gt;&lt;paraBasic&gt;Yes&lt;/paraBasic&gt;&lt;/prompt&gt;</code>
22.	<code>&lt;assertion&gt;</code>

Line	Markup
23.	<variableRef variableName="BrakesOK"/>
24.	<expression> <booleanValue><trueValue/></booleanValue> </expression>
25.	</assertion>
26.	</menuChoice>
27.	<menuChoice>
28.	<prompt><paraBasic>No</paraBasic></prompt>
29.	<assertion>
30.	<variableRef variableName="BrakesOK"/>
31.	<expression> <booleanValue><falseValue/></booleanValue> </expression>
32.	</assertion>
33.	</menuChoice>
34.	</menu>
35.	</dialog>
36.	</dmNode>
37.	<dmIf>
38.	<expression> <variableRef variableName="BrakesOK"/> </expression>
39.	<dmThenSeq> <!-- Brakes OK check next component -->
40.	<dmRef>
41.	...
42.	</dmRef>
43.	</dmThenSeq>
44.	<dmElseSeq> <!-- Brakes faulty -->
45.	<dmSeqAlts>
46.	<dmSeq applicRefId="appl-001"> <!-- Brake repairs for bicycle part number "MC-168119" --> ... </dmSeq>
47.	<dmSeq applicRefId="appl-002"> <!-- Brake repairs for bicycle part number "MC-168234" --> ... </dmSeq>
48.	</dmSeqAlts>

Line	Markup
49.	</dmElseSeq>
50.	</dmIf>
51.	</dmSeq>

Node sequence alternates processing:

The logic engine will begin examining each child element `<dmSeqAlts>` in sequence and evaluate each element `<applic>`. The logic engine will continue examining each element `<dmSeqAlts>` in sequence until an element `<applic><assert>` construct is found that evaluates to the Boolean value "true". The first element `<dmSeqAlts>` containing an element `<applic>` that evaluates to the Boolean value "true" will have its content displayed.

In the above example, the applicability values are identified (lines 1-8) then the user is asked in the dialog if the brakes are working (lines 17-35). If the brakes are OK, then the user is referenced to the next data module to check other bicycle components (lines 39-43). If the brakes are faulty, then if the product configuration is "BicyclePartnum" equals "MC-168119" then the first `<dmSeqAlts>` is selected and displayed (line 46). However, if the product configuration is "BicyclePartnum" equals "MC-168234" then the second `<dmSeqAlts>` is selected and displayed (line 47).

#### Note

If none of applicability referenced by attribute `applicRefId` evaluates to the Boolean value "true" processing continues after the element `<dmSeqAlts>`.

## 1 General

The purpose of this chapter is to provide guidance and examples of resource resolution. It contains examples of resource resolution.

## 2 Guidance and examples

### 2.1 Sample resource resolution dataset

The following is a sample dataset to use in the example queries. In this example, three metadata characteristics are defined:

- title
- issue
- language

As a default, the resource service in this example will first resolve the resource with the highest issue and then resolve the English format if a resource conflict exists. Implementations can use other methods of resolving resource conflicts.

Table 2 Resource resolution dataset

URN	URL	Title	Issue-Inwork	Language-Country
URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A	www.s1000d.org/DMC-YY-A-53-25-10-02A-999A-A_I-001_W-00_L-EN_C-US.XML	Example instance	001-00	EN-US
URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A	www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A_I-002_W-01_L-EN_C-GB.XML	English instance Issue 2	002-01	EN-GB

## 2.2 Query to redirect to a resource

The following query will redirect to the resource:

```
URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A
```

```
http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A
```

Redirects to the URL:

```
http://www.s1000d.org/DMC-YY-A-53-25-10-02A-999A-A_I-001_W-00_L-EN_C-US.XML
```

## 2.3 Query to resolve a resource characteristic

The following query will return the "Issue" characteristic of the resource:

```
URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A
```

```
http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A&Issue
```

The following XML instance will be returned:

```
<rds:RDS>
<rdf:RDF>
```

```
<rdf:Description
rdf:about="www.s1000d.org/DMC-YY-A-53-25-10-02A-999A-A.XML"
rds:urn="URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A">
<issueInfo issueNumber="001" inWork="00"/>
<language languageIsoCode="en" countryIsoCode="US"/>
</rdf:Description>
</rdf:RDF>
</rds:RDS>
```

## 2.4 Query for resources with multiple formats

The following query will redirect to the resource:

URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A

which exists in multiple formats. The resource indicated as the default will be returned.

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A>

Redirects to the URL:

[http://www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A\\_I-002\\_W-01\\_L-EN\\_C-GB.XML](http://www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A_I-002_W-01_L-EN_C-GB.XML)

## 2.5 Query to resolve a resource with multiple formats by characteristic

The following query will redirect to the resource:

URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A

which exists in multiple formats. The resource service is requested to return the second issue in French.

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A&Issue=002&Work=01&Language=FR&Country=FR>

Redirects to the URL:

[http://www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A\\_I-002\\_W-01\\_L-FR\\_C-FR.XML](http://www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A_I-002_W-01_L-FR_C-FR.XML)

## 2.6 Query to resolve a conflicted resource

The following query will return the "Title" characteristic for the default format of the resource:

URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A

Since a conflict exists with multiple documents returned for the query, the resolution rules for the example resource resolution service will determine what resource description will be returned. In this example, the defined rules dictate that the highest issue of the resource in English or the resource that best matches those criteria will be returned. Within the dataset, the document "Simplified Technical English instance Issue 2" meets the conflict criteria.

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A&Title>

The following XML instance will be returned:

```
<rds:RDS>
<rdf:RDF>
<rdf:Description
rdf:about="www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A_I-002_L-EN.XML"
```

```
rds:urn="URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A">
<title>Simplified Technical English instance Issue 2</title>
<issueInfo issueNumber="002" inWork="00"/>
<language languageIsoCode="sx" countryIsoCode="US"/>
</rdf:Description>
</rdf:RDF>
</rds:RDS>
```

## 2.7

### Query to return results describing multiple formats

The following query will return the "Title" characteristic for all formats of the resource:

URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A&multiple&Title>

The following XML instance will be returned:

```
<rds:RDS>
<rdf:RDF>
<rdf:Description
rdf:about="www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A_I-002_W-00_L-
SX_C-US.XML"
rds:urn="URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A">

rds:urn="URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A">
<title>French instance Issue 2</title>
<issueInfo issueNumber="002" inWork="01"/>
<language languageIsoCode="fr" countryIsoCode="FR"/>
</rdf:Description>
</rdf:RDF>
<rdf:RDF>
<rdf:Description
rdf:about="www.s1000d.org/DMC-YY-A-53-25-10-02A-520A-A_I-001_W-01_L-
FR_C-FR.XML"
rds:urn="URN:S1000D:DMC-YY-A-53-25-10-02A-520A-A">
<title>French instance Issue 1</title>
<issueInfo issueNumber="001" inWork="01"/>
<language languageIsoCode="fr" countryIsoCode="FR"/>
</rdf:Description>
```

```
</rdf:RDF>
</rds:RDS>
```

## 2.8 Query to resolve all characteristics of a resource

The following query will return all characteristics of the resource:

URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A&allurcs>

The following XML instance will be returned:

```
<rds:RDS>
<rdf:RDF>
<rdf:Description
rdf:about="http://www.s1000d.org/DMC-YY-A-53-25-10-02A-999A-A_I-001_W-
00_L-EN_C-US.XML"
rds:urn="URN:S1000D:DMC-YY-A-53-25-10-02A-999A-A">
<title>Example instance 1</title>
<issueInfo issueNumber="001" inWork="00"/>
<language languageIsoCode="en" countryIsoCode="US"/>
</rdf:Description>
</rdf:RDF>
</rds:RDS>
```

## 2.9 Query to resolve the URL of a resource

The following query will return the URL of the resource:

URN:S1000D:ICN-1B-B-311501-B-K0999-00352-A-001-01

The attribute `rdf:about` within the element `<rdf:Description>` will contain the resource location. Notice that the URL and the URN are always returned for any resource description.

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:ICN-1B-B-311501-B-K0999-00352-A-001-01&url>

The following XML instance will be returned:

```
<rds:RDS>
<rdf:RDF>
<rdf:Description
rdf:about="http://www.s1000d.org/ICN-1B-B-311501-B-K0999-00352-A-001-
01.CGM"
rds:urn="URN:S1000D:ICN-1B-B-311501-B-K0999-00352-A-001-01">
</rdf:Description>
</rdf:RDF>
</rds:RDS>
```

## 2.10 Query that returns an error message

The following query requests an unknown instance:

URN:S1000D:DMC-YY-A-53-25-10-02A-720A-A

<http://www.s1000d.org/resolution/resolveUrn?urn=URN:S1000D:DMC-YY-A-53-25-10-02A-720A-A&allurcs>

---

The following XML instance will be returned:

```
<rds:RDS>
<rds:Message number="004" type="E">The resource URN:S1000D:DMC-YY-A-
53-25-10-02A-720A-A is unknown.</rds:Message>
</rds:RDS>
```

### References

Table 1 References

Chap No./Document No.	Title
<a href="#">REC-xlink11-20100506</a>	W3C Recommendation: XML Linking Language (XLink) Version 1.1

## 1 General

This chapter gives guidance and examples for the use of the XLink attributes within the various reference structures.

Linkage within an IETP is specified using XLink attributes within the XML repository. Links must use the URN of the resource referenced, and can be created automatically from the content of the elements `<dmRef>`, `<pmRef>`, `<externalPubRef>`, `<catalogSeqNumberRef>`, `<graphic>`, `<multimediaObject>`, `<symbol>` and `<internalRef>`.

The XLink attributes are as follows:

- `xlink:type` (O), the link type, if an XLink link is established. This attribute can have the following values:
  - `"simple"` - a simple link
  - `"extended"` - an extended, possibly multi-source, link
- `xlink:href` (O), the link address (the URN of the requested resource), if an XLink link is established.

- `xlink:title` (O), the link title, if an XLink link is established.
- `xlink:show` (O), the link appearance, if an XLink link is established. This attribute can have the following values:
  - `"new"` - opens a new window to display the information
  - `"replace"` - replaces the current window with the displayed information
  - `"embed"` - embeds the information inline
  - `"other"` - defined by user
  - `"none"` - does not display the information
- `xlink:actuate` (O), the link behavior, if an XLink link is established. This attribute can have the following values:
  - `"onLoad"` - displays the information when the page loads
  - `"onRequest"` - displays the information on user click

## 2 Guidance and examples

The attribute `xlink:type` has the value `"simple"` and the attribute `xlink:href` contains the URN of the requested resource. All examples are provided for illustration purposes only.

### 2.1 DMC reference

The data module link URN must be created from the content of the element `<dmCode>`.

```
<dmRef
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:title="IETP resource resolution"
xlink:href="URN:S1000D:DMC-S1000D-A-07-07-0400-00A-040A-A">
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="07" subSystemCode="0" subSubSystemCode="7"
assyCode="0400" disassyCode="00" disassyCodeVariant="A"
infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>IETP resource resolution</techName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
```

Example data module code display transformation to the HyperText Markup Language (HTML):

```
<a href="DMC-S1000D-A-07-07-0400-00A-040A-A.XML">
AE-A-07-07-0400-00A-040A-A</a>
```

### 2.2 PMC reference

The publication module link URN must be created from the content of the element `<pmCode>`.

```
<pmRef
xlink:type="simple"
xlink:actuate="onRequest"
```

```
xlink:show="replace"
xlink:title="Example publication module"
xlink:href="URN:S1000D:PMC-S1000D-I9005-01000-00">
<pmRefIdent>
<pmCode modelIdentCode="S1000D" pmIssuer="I9005"
pmNumber="01000" pmVolume="00"/>
</pmRefIdent>
</pmRef>
```

Example publication module code display transformation to HTML:

```
<a href="PMC-S1000D-I9005-01000-00.XML">
PMC-S1000D-I9005-01000-00</a>
```

## 2.3 CSN reference

The link URN built from an implicit catalog sequence number must contain the values of the attributes `modelIdentCode`, `systemDiffCode`, `systemCode`, `subSystemCode`, `subSubSystemCode`, `assyCode`, `figureNumber`, `figureNumberVariant`, `item`, `itemVariant`, `itemLocationCode` of the element `<catalogSeqNumberRef>` and attribute `itemSeqNumberValue` of the element `<itemSeqNumber>`. If attributes values for `modelIdentCode` and `systemDiffCode` are not present, they will be derived from the data module code of the containing data module. If attribute value for `itemLocationCode` is not present, the value "D" is implied. The catalog sequence number is given after the # starting with "csn" and with dashes between its parts. If there is no figure number variant, add a "0".

Reference to an item (72-32-00 Fig 01A, Item 100A) in a chapterized catalog:

```
<catalogSeqNumberRef
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="new"
xlink:title="Part: ABCD"
xlink:href="URN:S1000D:DMC-AE-A-72-32-00-01A-941A-D#csn-72-32-
00-01A-100A"
modelIdentCode="AE" systemDiffCode="A" systemCode="72"
subSystemCode="3" subSubSystemCode="2" assyCode="00"
figureNumber="01" figureNumberVariant="A" itemLocationCode="D"
item="100" itemVariant="A"/>
```

Example CSN display transformation to HTML:

```
<a href="JavaScript:openwindow('AE-A-72-32-00-01A-941A-D#csn-72-
32-00-01A-100A')">csn-72-32-00-01A-100A</a>
```

Reference to an item (72-32-00 Fig 02, Item 600) in a chapterized catalog:

```
<catalogSeqNumberRef
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="new"
xlink:title="Part: ABCD"
xlink:href="URN:S1000D:DMC-AE-A-72-32-00-020-941A-D.XML#csn-72-
32-00-020-600"
systemCode="72" subSystemCode="3" subSubSystemCode="2"
```

```
assyCode="00" figureNumber="02" figureNumberVariant="0"
itemLocationCode="D" item="600"/>
```

Example CSN display transformation to HTML:

```
<a href="JavaScript:openwindow('AE-A-72-32-00-01A-941A-D#csn-72-
32-00-020-600')">csn-72-32-00-020-600</a>
```

Reference to an item (72-32-00 Fig 02, Item 600, ISN 00A) in a chapterized catalog:

```
<catalogSeqNumberRef
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="new"
xlink:title="Part: ABCD"
xlink:href="URN:S1000D:DMC-AE-A-72-32-00-020-941A-D.XML#csn-72-
32-00-020-600-00A"
systemCode="72" subSystemCode="3" subSubSystemCode="2"
assyCode="00" figureNumber="02" item="600"
itemSeqNumberValue="00A"/>
```

Example CSN display transformation to HTML:

```
<a href="JavaScript:openwindow('AE-A-72-32-00-01A-941A-D#csn-72-
32-00-020-600-00A')">csn-72-32-00-020-600-00A</a>
```

Reference to an item (IPPN K0378730E, Fig 01, Item 300) in a non-chapterized catalog:

```
<catalogSeqNumberRef figureNumber="01" item="300"
initialProvisioningProjectNumber="K0378730E"
responsiblePartnerCompanyCode="R"
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="new"
xlink:title="Part: ABCD"
xlink:href="URN:S1000D:AE-A-ZR-73-0E-010-941A-D#csn-010-300"/>
```

Example CSN display transformation to HTML:

```
<a href="JavaScript:openwindow('AE-A-ZR-73-0E-010-941A-D#csn-
010-300')">csn-010-300</a>
```

The CSN reference link URN built from an explicit element `<dmRef>` (contained in the element `<catalogSeqNumberRef>`) is marked up like any other reference to a data module. The reference can target the referred item/fragment in the IPD data module, where the attribute `id` of the item entry has for example the value `"csn-53-25-10-010-001"`.

```
<catalogSeqNumberRef
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="new"
xlink:title="Part: ABCD"
xlink:href="URN:S1000D:DMC-YY-A-53-25-10-010-941A-D#csn-53-25-
10-010-001"
figureNumber="01" item="001" >
<refs>
<dmRef referredFragment="csn-53-25-10-010-001">
```

```
<dmRefIdent>
<dmCode modelIdentCode="YY" systemDiffCode="A" systemCode="53"
subSystemCode="2" subSubSystemCode="5" assyCode="10"
disassyCode="01" disassyCodeVariant="0" infoCode="941"
infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</refs>
</catalogSeqNumberRef>
```

Example CSN display transformation to HTML:

```
<a href="JavaScript:openwindow('YY-A-53-25-10-010-941A-
D.XML#csn-53-25-10-010-001')">csn-53-25-10-010-001</a>
```

#### Note

In the examples above it is assumed that the value "ABCD" of attribute `xlink:title` is derived based on the sub-structure of element `<catalogSeqNumberRef>`

## 2.4 Graphic reference

The graphic link URN must be derived from the attribute `infoEntityIdent` of the element `<graphic>`.

```
<figure id="fig001">
<title>LH multifunction head down display</title>
<graphic
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="new"
xlink:href="URN:S1000D:ICN-1B-B-311501-B-K0999-00352-A-001-01"
infoEntityIdent="ICN-1B-B-311501-B-K0999-00352-A-001-01"/>
</figure>
```

Example ICN display transformation to HTML:

```
<a href="ICN-1B-B-311501-B-K0999-00352-A-001-01.CGM"
target="_blank">ICN-1B-B-311501-B-K0999-00352-A-001-01</a>
```

## 2.5 Symbol reference

The symbol link URN must be derived from the attribute `infoEntityIdent` of element `<symbol>`.

```
<symbol
xlink:type="simple"
xlink:actuate="onLoad"
xlink:show="embed"
xlink:href="URN:S1000D:ICN-AE-A-316200-0-F0214-00352-A-001-01"
infoEntityIdent="ICN-AE-A-316200-0-F0214-00352-A-001-01"/>
```

Example ICN display transformation to HTML:

```

```

## 2.6 External reference with a target

The data module link URN must be created from the content of the element `<dmCode>` and the target identifier within the referenced data module.

In the following example, the link points to a figure with `id="fig-0001"` in another external data module.

```
<dmRef referredFragment=
"URN:S1000D:DMC-S1000D-A-06-02-0301-00A-040A-A#fig-0001"
xlink:type="simple"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:href=
"URN:S1000D:DMC-S1000D-A-06-02-0301-00A-040A-A#fig-0001">
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="06" subSystemCode="0" subSubSystemCode="2"
assyCode="0301" disassyCode="00" disassyCodeVariant="A"
infoCode="040" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Layout rules and examples</techName>
<infoName>Front matter data modules</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
```

Example data module code display transformation to HTML:

```
<a href=
"DMC-AE-A-06-02-0301-00A-040A-A.XML#fig-0001">
Layout rules and examples - Front matter data modules</a>
```

## 2.7 Internal reference

Internal references are defined by the attributes `internalRefId` and `internalRefTargetType` of the element `<internalRef>`.

In the following example, the link points to a figure with `id="fig-0001"` in the same data module.

```
<internalRef internalRefId="fig-0001"
internalRefTargetType="irtt01"
xlink:actuate="onRequest"
xlink:show="replace"
xlink:href="#fig-0001">
</internalRef>
```

Example reference display transformation to HTML:

```
<a href="#fig-0001"></a>
```

<a href="#">Chap 3.9.5.2.1.2</a>	Common constructs - Referencing
<a href="#">Chap 3.9.5.2.17</a>	Content section - SCO content data module
REC-xpath20-20101214	W3C Recommendation: XML Path Language (XPath) 2.0 (Second Edition)

#### 1 General

The element `<dmSegmentRef>` is used within, and restricted to, the SCO content data module to address data portions inside a data module of interest for reuse in learning context. Refer to [Chap 3.9.5.2.17](#).

#### 2 XPath identified data module segments

The basic structure of the element `<dmSegmentRef>` is the same as that of element `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#). As opposed to the element `<dmRef>`, however, the element `<dmSegmentRef>` does not require that the target portions (substructures) in the referenced data modules are identified by use of ID attributes. Instead, the element `<dmSegmentRef>` uses an XPath expression to address the target portion(s) of interest. The path must be given in accordance with the XML Path Language (XPath) specification. Refer to [REC-xpath20-20101214](#).

The element `<dmSegmentRef>` is used to reference specific portions of information in another data module, allowing for the inclusion of data module parts (eg, paragraphs or figures) in a learning object. The location is entered in the attribute `targetPath` of element `<dmSegmentRef>`.

### 3 Examples

**Chap 7.8**

Chap No./Document No.	Title
<a href="#">Chap 6.2.3.3</a>	Layout rules and examples - Procedural data modules
<b>1</b>	<b>General</b> <p>There are a number of technical details associated with processing applicability annotations and the generation of human-readable display text from computable applicability annotations.</p> <p>Refer to <a href="#">Chap 4.14</a> and its subchapters for an overview of applicability. It is recommended that these chapters and the concepts therein have been read before.</p>
<b>2</b>	<b>Content</b>
<b>2.1</b>	<b>Supported data types</b> <p>Each product attribute and condition is given a data type when it is declared in the Applicability Cross-reference Table (ACT) data module or the Conditions Cross-reference Table (CCT) data module, respectively. Any values given in an applicability annotation element <code>&lt;assert&gt;</code> in the attribute <code>applicPropertyValue</code> must conform to the data type of the product attribute or condition being tested. The default data type is string unless specifically declared in the ACT data module or CCT data module.</p> <p>The supported data types and allowable values are detailed below.</p>
<b>2.1.1</b>	<b>Boolean</b> <p>A Boolean variable is allowed to have the values <code>"true"</code> or <code>"false"</code>.</p>
<b>2.1.2</b>	<b>Integer</b> <p>An integer variable must support, at a minimum, a 32 bits signed long integer.</p>
<b>2.1.3</b>	<b>Real</b> <p>A real variable must support, at a minimum, a 32 bits (4 bytes) real number. It must support the IEEE standard of 1 bit sign, 8 bits exponent, and 23 bits mantissa which gives a minimum precision of 6 significant digits and a minimum exponent range of -38 to 38.</p>
<b>2.1.4</b>	<b>String</b> <p>A string variable must support, at a minimum, a Unicode string up to 64 characters long.</p>
<b>2.2</b>	<b>Evaluation of applicability annotations</b> <p>The applicability model provides a framework which can facilitate a computer system to understand and process applicability annotations. The result of that processing will either be the Boolean value of true, meaning that the associated technical data is appropriate for the current situation, or the Boolean value of false, meaning that the associated technical data is not appropriate for the current situation.</p> <p>Computer systems must follow the processing rules defined in this chapter to ensure that technical data is interchangeable between computer systems. The processing rules will ensure that different computer systems arrive at the same result given the same input.</p>
<b>2.2.1</b>	<b>Evaluation of assert annotations</b> <p>The element <code>&lt;assert&gt;</code> defines a single test. The result of the test will be a Boolean value of true or false.</p>
<b>2.2.1.1</b>	<b>Components of an assert annotation</b> <p>Assert annotations can take on two forms: computable and textual.</p>

#### 2.2.1.1.1 *Computable assert annotation*

The computable assert annotation contains the following computable components which are used during evaluation:

- The attribute `applicPropertyIdent` containing the identifier of a product attribute or condition to test, this is the same attribute used in the Products Cross-reference Table (PCT) data module element `<assign>` and provides a reference to either:
  - the element `<productAttribute>` attribute `id` from the Applicability Cross-reference Table (ACT) data module
 or
  - the element `<cond>` attribute `id` from the Conditions Cross-reference Table (CCT) data module
- The attribute `applicPropertyValues` containing the values and ranges to test against

#### 2.2.1.1.2 *Textual assert annotation*

The textual assert annotation contains no computable components.

#### 2.2.1.2 Evaluation rules

If any of the following rules fail, the result is a Boolean value of true causing the associated technical data to be considered appropriate for display. If technical data cannot be absolutely determined to be inappropriate, then it must be considered appropriate.

- 1 The applicability annotation must be of the computable form.
- 2 There must be a PCT data module identifying product instances.
- 3 A specific product instance from the PCT must be identified.
- 4 The identified product instance in the PCT data module must have an element `<assign>` with the attribute `applicPropertyIdent` value matching the applicability annotation element `<assert>` and attribute `applicPropertyIdent` value.
- 5 The value of the attribute `applicPropertyValue` from the identified element `<assign>` in the PCT data module is tested against the values and ranges in the assert annotation attribute `applicPropertyValues`.

If an assert annotation value does not conform to the data type of the product attribute or condition being tested, the result is the Boolean value of true. This condition is an error which must be checked for and corrected before data delivery.

If the product instance value matches an assert annotation value or falls within an assert annotation range, the result is the Boolean value of true.

If the product instance value does not match an assert annotation value and does not fall within an assert annotation range, the result is the Boolean value of false.

#### 2.2.1.3 Examples

Refer to [Para 3.2.1](#).

### 2.2.2 Evaluation of evaluate annotations

The element `<evaluate>` groups several tests together and provides the logical operation to perform between the results of the individual tests. The result of the logical operation will be a Boolean value of true or false.

- 2.2.2.1 Components of an evaluate annotation  
The evaluate annotation contains the following computable components which are used during evaluation:
- The attribute `andOr` containing the operation to perform
  - Content consisting of any combination of the element `<assert>` and the element `<evaluate>`, each providing a Boolean value result of true or false of their own
- 2.2.2.2 Evaluation rules
- 1 For the attribute `andOr` value of `"and"`:
    - If all child element results are the Boolean value of true, then this evaluation results in the Boolean value of true.
    - If any child element result is the Boolean value of false, then this evaluation results in the Boolean value of false.
  - 2 For the attribute `andOr` value of `"or"`:
    - If any child element result is the Boolean value of true, then this evaluation results in the Boolean value of true.
    - If all child element results are the Boolean value of false, then this evaluation results in the Boolean value of false.
- 2.2.2.3 Examples  
Refer to [Para 3.2.2](#).

## 2.3 Generation of display text

The guidance provided in this paragraph is a suggestion for the default format for generating display text.

The generated human-readable applicability annotation can be used to populate the element `<displayText>` within the applicability annotation (element `<applic>` within data modules). Viewers can also generate an human-readable applicability annotation at display time if no information is available in element `<displayText>`.

### Business rule decision point BRDP-S1-00547 - Format of generated display text:

- Decide on the format for generating the displayed applicability annotation from the computable applicability annotation that will best fulfill industry and/or customer display requirements.

Auto-generated applicability statements may not be completely consistent between processors. In determining whether to populate the element `<displayText>` a project must weigh this fact with the cost of maintaining the authored element `<displayText>` and with the possibility that the authored element `<displayText>` may not match the actual applicability assertion.

### 2.3.1 Conversion of assert annotations

An assert annotation is used to perform a single test. The assert annotation can be a textual annotation that is already in human-readable form, or it can be a test of a single product attribute or condition against a set of values and ranges.

#### 2.3.1.1 Conversion to readable form

A single assert annotation can be converted to readable form by presenting the element `<displayName>` from the declaration in the ACT or CCT data module, or alternately the

element [<name>](#) if display name is not available, followed by a colon, a space and the allowable value or values. If the assert annotation is textual, only the content is used.

#### Note

Do not enter spaces and colons as they has to be auto-generated by the presentation system.

2.3.1.2 Examples  
Refer to [Para 3.3.1](#).

### 2.3.2 Conversion of evaluate annotations

An evaluate annotation is used to group several annotations together and assign a logical operation between the grouped annotations. The operation can be either a logical "and" operation or a logical "or" operation.

2.3.2.1 Conversion of a logical "and" annotation to human-readable form  
An evaluate annotation performing a logical "and" operation can be converted to human-readable form by displaying each of the contained elements separated by spaces [ ], the word "and" and space [ and ] [... and ...]. If the contained element is another occurrence of the element [<evaluate>](#) performing a logical "or" operation, then parentheses must be placed around the displayed contents of the contained evaluate annotation [... and (... or ...)].

#### Note

Spaces and parenthesis has to be auto-generated by the presentation system and must not be entered by the author.

2.3.2.2 Conversion of a logical "or" annotation to human-readable form  
An evaluate annotation performing a logical "or" operation can be converted to human-readable form by displaying each of the contained elements separated by spaces [ ], the word "or" and a space [ or ], [... or ...]. If the contained element is another occurrence of the element [<evaluate>](#) performing a logical "and" operation, then parentheses must be placed around the displayed contents of the contained evaluate annotation [... or (... and ...)].

#### Note

Spaces and parenthesis has to be auto-generated by the presentation system and must not be entered by the author.

2.3.2.3 Examples  
Refer to [Para 3.3.2](#).

### 2.3.3 Use of display class

2.3.3.1 Concept  
In order to facilitate a more sophisticated display text generation, the attribute `applicDisplayClass` can be used to provide a hint to the software application performing the generation of the human-readable form of specific formatting that is applied to the applicability annotation. The use of the attribute `applicDisplayClass`, the allowable values and the meaning of those values are to be previously defined as business rules. Refer to [Chap 3.9.5.3](#).

2.3.3.2 Example  
Refer to [Para 3.3.3](#).

### 2.3.4 Determining when to "show" applicability statements

Care has to be taken when deciding to "hide" applicability statements from the end user. A data module can contain applicability statements utilizing product or condition attributes for which the viewer has not obtained values from the end user. In this case, it is important that the applicability statements be visible in order for the end user to determine the applicability.

Applicability operates hierarchically. This means that if applicability is assigned to an element then all of the children of that element have the same or further restricted applicability. However, applicability is read linearly. When reading information that contains applicability, the displayed applicability is in effect until another applicability statement is encountered.

When a procedure or descriptive information is read in document order (top to bottom), an indication is needed whenever the applicability of the content changes.

- The data module applicability must always be displayed.
- Whenever the applicability changes in the sequence of the current rendered view, it must be displayed.

Rules for presentation applicability statements are given in [Chap 6.2.2](#) and examples of procedures presenting applicability can be found in [Chap 6.2.3.3](#).

## 2.4 Obtaining applicability values at IETP run time

### 2.4.1 Auto-generated dialogs

The ACT data module is used to declare all product attributes that can affect applicability of data. The ACT data module serves as the central point of reference for applicability definitions. Similarly, the CCT data module is used to declare any type of conditions that can affect applicability of data.

The constructs of these two data modules are sufficient to generate simple dialogs to obtain values from an end-user.

The element `<productAttribute>` is used to declare a single attribute of the Product, such as "serial number" or "model". The attribute `valuePattern` and subelements `<displayName>` and the element `<enumeration>` can be used to auto-generate a dialog.

#### Note

The element `<displayName>` is also used in the auto-generation of applicability statements displayed in a data module.

A simple dialog can be auto-generated that consist of a parameter name (taken from the element `<displayName>`) and either a text fill-in or a menu selection. Careful consideration must be exercised when choosing to use a menu selection. If a given attribute definition specifies a finite set of enumerated values, then a menu selection can be provided, but if the set of values is large, the selection list can become difficult to use.

For example, if an attribute definition includes an enumeration statement using the element `<enumeration>` with values such as:

```
<enumeration applicPropertyValues="000000~999999" />
```

providing a selection of 1 million items can be impractical.

A viewer can only want to provide a menu selection if the set of values are defined without ranges, or the size of the set is in practical limits of the display device.

Regardless of the type of input field used (fill-in or selection), the viewer must ensure that the value entered conforms to the attribute definition, either by the allowed set of enumerated values and/or the attribute value pattern specification.

### 2.4.2 Authored dialogs

There are use-case scenarios where a simple dialog auto-generated with the element `<displayName>` is insufficient. The element `<displayName>` is used as part of the auto-generated applicability statements that are displayed in a data module. Therefore, it is recommended that the element `<displayName>` is not used to capture complex dialogs.

The ACT and CCT allow a means for an author to specify a prompt for the dialog and text for each choice (if appropriate).

An IETP viewer can still auto-generate dialogs if no prompt or choice text is available.

In the ACT, the element `<prompt>` is added to the element `<productAttribute>` to avoid affecting the applicability statement. In addition, the attribute `enumerationLabel` is added to the element `<enumeration>` to provide end user clear text in choosing an enumerated value.

In the CCT, the element `<prompt>` element is added to the element `<cond>` to avoid affecting the applicability statement. In addition, the attribute `enumerationLabel` is added to the element `<enumeration>` of the element `<condType>` to provide end user clear text in choosing an enumerated value.

### 2.4.3 Allowing modification of a product attribute value

It is a project decision if modifications to PCT assigned values are allowed. A PCT may only assign a subset of attributes and conditions for a given product since some attributes and conditions values cannot be determined when the PCT was generated, and/or some attributes and conditions are only known at run-time (eg, wind speed, temperature). A project must decide if values obtained at run-time are only for attributes and conditions not already assigned in the PCT, or if PCT assigned values can be modified/overridden at run-time. Modifying PCT assigned values for a given viewer session can be needed by projects where PCT data cannot accurately reflect product configuration at the time a procedure is being done.

#### Note

Any assignment and modifications to attribute values at run-time are in effect only for the viewer session where changes were entered. At no time must a viewer modify PCT data module source.

**Business rule decision point BRDP-S1-00548 - Modifying an assigned product attribute value in the PCT.**

- Decide if modifications to PCT assigned values are allowed.

## 3 Examples

### 3.1 Applicability markup example

An example of how to markup applicability for procedural steps is given in [Chap 3.9.5.3](#). The presentation of the example is given in [Chap 6.2.2](#).

### 3.2 Evaluation of applicability annotations

#### 3.2.1 Evaluation of assert annotations

##### 3.2.1.1 Textual assert annotation

The following example illustrates a textual assert annotation. Since this is not computable the result is a Boolean value of true.

Assert annotation:

```
<assert>in icy conditions</assert>
```

Boolean value result: true

##### 3.2.1.2 Value assert annotation with Boolean value result of true

The following example illustrates an element `<assert>` annotation testing the attribute `applicPropertyIdent` with a value of "model" for two attribute `applicPropertyValues`, with values of either "Brook trekker" or "Mountain storm". The selected product instance has an element `<assign>` with the attribute

applicPropertyIdent with a value of "model" and the attribute applicPropertyValue with a value of "Mountain storm" which matches one of the test values. The result is the Boolean value of true.

Assert annotation:

```
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker|Mountain storm"/>
```

Assign annotation from PCT:

```
<assign applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValue="Mountain
storm"/>
```

Boolean value result: true

### 3.2.1.3

Value assert annotation with Boolean value result of false

The following example illustrates an element <assert> annotation testing attribute applicPropertyIdent with a value of "model" for one attribute applicPropertyValues with a value of "Brook trekker". The selected product instance has an element <assign> with the attribute applicPropertyIdent with a value of "model" and the attribute applicPropertyValue with a value of "Mountain storm" which does not match the test value. The result is the Boolean value of false.

Assert annotation:

```
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker"/>
```

Assign annotation from PCT:

```
<assign applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValue="Mountain
storm"/>
```

Boolean value result: false

### 3.2.1.4

Range assert annotation with Boolean value result of false

The following example illustrates an element <assert> annotation testing the attribute applicPropertyIdent with a value of "serialno" for range in the attribute applicPropertyValues with values from "1B070643" to "1B070799". The selected product instance has an element <assign> with the attribute applicPropertyIdent with a value of "serialno" and the attribute applicPropertyValue with a value of "1B070642" which falls outside of the acceptable range. The result is the Boolean value of false.

Assert annotation:

```
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070643~1B070799"/>
```

Assign annotation from PCT:

```
<assign applicPropertyIdent="serialno"
applicPropertyType="prodattr" applicPropertyValue="1B070642"/>
```

Boolean value result: false

### 3.2.1.5 Combination assert annotation with Boolean value result of true

The following example illustrates an element `<assert>` annotation testing the attribute `applicPropertyIdent` with a value of "serialno" for multiple values and ranges. The selected product instance has an element `<assign>` with the attribute `applicPropertyIdent` with a value of "serialno" and the attribute `applicPropertyValue` with a value of "1B070642" which falls inside of one of the acceptable ranges. The result is the Boolean value of true.

Assert annotation:

```
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070640|1B070642~1B070720|1B070722|1B070730~1B070799"/>
```

Assign annotation from PCT:

```
<assign applicPropertyIdent="serialno"
applicPropertyType="prodattr" applicPropertyValue="1B070642"/>
```

Boolean value result: true

## 3.2.2 Evaluation of evaluate annotations

### 3.2.2.1 Logical "and" evaluate annotation

The following example illustrates an evaluate annotation performing a logical "and" operation. If all three assert annotations result in the Boolean value of true, then the evaluate result is the Boolean value of true. If any of the three assert annotations results in the Boolean value of false, then the evaluate result is the Boolean value of false.

Evaluate annotation:

```
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker"/>
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="Mk9"/>
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070643~1B070799"/>
</evaluate>
```

Assign annotation from PCT:

```
<assign applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValue="Brook
trekker"/><assign applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValue="Mk9"/><assign
applicPropertyIdent="serialno" applicPropertyType="prodattr"
applicPropertyValue="1B070643"/>
```

Boolean value result: true

### 3.2.2.2 Logical "or" evaluate annotation

The following example illustrates an evaluate annotation performing a logical "or" operation. If either assert annotation results in the Boolean value of true, then the evaluate result is the Boolean value of true. If both assert annotations result in the Boolean value of false, then the evaluate result is the Boolean value of false.

Evaluate annotation:

```
<evaluate andOr="or">
<assert applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker" />
<assert applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValues="Mountain
storm" />
</evaluate>
```

Assign annotation from PCT:

```
<assign applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValue="Brook
trekker" />
```

Boolean value result: true

### 3.2.2.3 Recursive evaluate annotation

The following example illustrates the recursive nature of the evaluate annotation. The outer evaluate annotation performs a logical "or" operation on the results of the two inner evaluate annotations.

Evaluate annotation:

```
<evaluate andOr="or">
<evaluate andOr="and">
<assert applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValues="Mountain
storm" />
<assert applicPropertyId="version"
applicPropertyType="prodattr" applicPropertyValues="Mk1" />
</evaluate>
<evaluate andOr="and">
<assert applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker" />
<assert applicPropertyId="version"
applicPropertyType="prodattr" applicPropertyValues="Mk9" />
</evaluate>
</evaluate>
```

Assign annotation from PCT:

```
<assign applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValue="Brook
trekker" /><assign applicPropertyId="version"
applicPropertyType="prodattr" applicPropertyValue="Mk1" />
```

Boolean value result: false

### 3.3 Generation of display text

#### 3.3.1 Conversion of assert annotations

##### 3.3.1.1 Textual assert annotation

Assert annotation:

```
<assert>in icy conditions</assert>
```

Human-readable format:

"in icy conditions"

##### 3.3.1.2 Assert annotation with a single value

Assert annotation:

```
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker" />
```

Product attribute declaration from ACT:

```
<productAttribute id="model" valuePattern=".">
<name>Model name</name>
<displayName>Model</displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Brook trekker|Mountain
storm" />
</productAttribute>
```

Human-readable format:

"Model: Brook trekker"

##### 3.3.1.3 Assert annotation with a multiple values

Assert annotation:

```
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker|Mountain storm" />
```

Product attribute declaration from ACT:

```
<productAttribute id="model" valuePattern=".">
<name>Model name</name>
<displayName>Model</displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Brook trekker|Mountain
storm" />
</productAttribute>
```

Human-readable format:

"Model: Brook trekker, Mountain storm"

#### Note

At presentation the vertical bar [|] is presented as a comma [,].

##### 3.3.1.4 Assert annotation with a single range

Assert annotation:

```
<assert applicPropertyId="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070643~1B070799" />
```

Product attribute declaration from ACT:

```
<productAttribute id="serialno" productIdentifier="primary">
<name>Serial number</name>
<displayName>Serial Number (SN)</displayName>
<descr>Serial number etched on the bicycle frame</descr>
</productAttribute>
```

Human-readable format:

"Serial Number (SN): 1B070643-1B070799"

#### Note

At presentation the tilde [~] is presented as a hyphen [-].

- 3.3.1.5 Assert annotation with a combination of values and ranges  
Assert annotation:

```
<assert applicPropertyId="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070640|1B070642~1B070720|1B070722|1B070730~1B070799" />
```

Product attribute declaration from ACT:

```
<productAttribute id="serialno">
<name>Serial number</name>
<displayName>SN</displayName>
<descr>Serial number etched on the bicycle frame</descr>
</productAttribute>
```

Human-readable format:

"SN: 1B070640, 1B070642-1B070720, 1B070722, 1B070730-1B070799"

### 3.3.2 Conversion of evaluate annotations

- 3.3.2.1 Single evaluate, logical "and" operation  
Evaluate annotation:

```
<evaluate andOr="and">
<assert applicPropertyId="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker" />
<assert applicPropertyId="version"
applicPropertyType="prodattr" applicPropertyValues="Mk9" />
<assert applicPropertyId="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070643~1B070799" />
</evaluate>
```

Product attribute declarations from ACT:

```
<productAttribute id="model" valuePattern=".">
<name>Model name</name>
```

```
<displayName>Model</displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Brook trekker|Mountain
storm"/>
</productAttribute>
<productAttribute id="version">
<name>Version</name>
<displayName>Version</displayName>
<descr> Version of the bike </descr>
<enumeration applicPropertyValues="Mk1|Mk9"/>
</productAttribute>
<productAttribute id="serialno">
<name>Serial number</name>
<displayName>SN</displayName>
<descr>Serial number etched on the bicycle frame</descr>
</productAttribute>
```

Human-readable format:

"Model: Brook trekker and Version: Mk9 and SN: 1B070643-1B070799"

### 3.3.2.2 Single evaluate, logical "or" operation

Evaluate annotation:

```
<evaluate andOr="or">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker"/>
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Mountain
storm"/>
</evaluate>
```

Product attribute declaration from ACT:

```
<productAttribute id="model" valuePattern=".">
<name>Model name</name>
<displayName>Model</displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Brook trekker|Mountain
storm"/>
</productAttribute>
```

Human-readable format:

"Model: Brook trekker or Model: Mountain storm"

### 3.3.2.3 Multiple evaluate, mixed logical operations

Evaluate annotation:

```
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker"/>
<evaluate andOr="or">
<evaluate andOr="and">
```

```
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070643~1B070720"/>
<assert applicPropertyIdent="SB-S001"
applicPropertyType="condition" applicPropertyValues="Post"/>
</evaluate>
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070721~1B070799"/>
</evaluate>
</evaluate>
```

Product attribute declaration from ACT:

```
<productAttribute id="model" valuePattern=".">
<name>Model name</name>
<displayName>Model</displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Brook trekker|Mountain
storm"/>
<productAttribute id="serialno">
<name>Serial number</name>
<displayName>SN</displayName>
<descr>Serial number etched on the bicycle frame</descr>
</productAttribute>
```

Condition declaration from CCT:

```
<condType id="SB">
<name>Service bulletin</name>
<descr>Generic service bulletin type</descr>
<enumeration applicPropertyValues="Pre|Post"/>
</condType>

<cond conTypeRefId="SB" id="SB-S001">
<name>Service bulletin (SB) S001</name>
<descr>Service bulletin S001 - Installation of the chain
guard</descr>
</cond>
```

Human-readable format:

"Model: Brook trekker and ((SN: 1B070643-1B070720 and Service bulletin (SB) S001: Post) or SN: 1B070721-1B070799)"

### 3.3.3 Use of display class

An example illustrating how the civil airline community might encode an applicability annotation using the attribute `applicDisplayClass` follows:

```
<applic>
<evaluate andOr="or">
<assert applicPropertyType="prodattr"
applicPropertyIdent="serialno"
applicPropertyValues="1~10|12~34"
applicDisplayClass="ConfirmedSN"/>
<evaluate andOr="and">
```

```

<assert applicPropertyType="prodattr"
applicPropertyIdent="serialno"
applicPropertyValues="101~118|201~213"
applicDisplayClass="ConditionalSN"/>
<evaluate andOr="or" applicDisplayClass="ConditionStack">
<evaluate andOr="and" applicDisplayClass="techcond">
<assert applicPropertyType="prodattr"
applicPropertyIdent="serialno" applicPropertyValues="101~118"/>
<assert applicPropertyType="condition"
applicPropertyIdent="SB-0001"
applicPropertyValues="Post" applicDisplayClass="sb"/>
<assert applicPropertyType="condition"
applicPropertyIdent="SB-0002"
applicPropertyValues="Post" applicDisplayClass="sb"/>
</evaluate>
<evaluate andOr="and" applicDisplayClass="techcond">
<assert applicPropertyType="prodattr"
applicPropertyIdent="serialno" applicPropertyValues="201~213"/>
<assert applicPropertyType="condition"
applicPropertyIdent="SB-0002"
applicPropertyValues="Post" applicDisplayClass="sb"/>
</evaluate>
</evaluate>
</evaluate>
</evaluate>
</applic>

```

#### Product attribute declaration from ACT:

```

<productAttribute id="serialno">
<name>Serial number</name>
<displayName>SN</displayName>
<descr>Serial number etched on the bicycle frame</descr>
</productAttribute>

```

#### Condition declaration from CCT:

```

<condType id="SB">
<name>Service bulletin</name>
<descr>Generic service bulletin type</descr>
<enumeration applicPropertyValues="Pre|Post"/>
</condType>

<cond conTypeRefId="SB" id="SB-0001">
<name>SB-A350-A-25-10-0004-00A-930A-C_001</name>
<descr>Equipment/Furnishings - Cabin escape facilities - Optimize
slide girt retention flap at pax doors 1, 2 and 4</descr>
</cond>

<cond conTypeRefId="SB" id="SB-0002">
<name>SB-A350-A-25-10-0001-00A-930A-C_002</name>
<descr>Equipment/Furnishings - Cabin escape facilities - Inspection of
slide girt retention flap for early detachment</descr>
</cond>

```

Human-readable format could be:

"SN: 1-10, 12-34 or ((SN: 101-118, 201-213) and ((SN: 101-118 and SB-A350-A-25-10-0004-00A-930A-C\_001: Post and SB-A350-A-25-10-0001-00A-930A-C\_002: Post) or (SN: 201-213 and SB-A350-A-25-10-0004-00A-930A-C\_001: Post)))"

This human-readable format can be hard to read and interpret. Using the display class attribute values (attribute `applicDisplayClass`), the following display can be generated, which meets specific project or organization requirements:

**Confirmed** on SN: 1-10, 12-34

**Conditional** on SN: 101-118, 201-213

SN: 101-118 and Post SB-A350-A-25-10-0004-00A-930A-C\_001 and SB A350-A-25-10-0001A-00A-930A-C\_002

SN: 201-213 and Post SB-A350-A-25-10-0004-00A-930A-C\_001

The attribute value "`ConfirmedSN`" provides the hint to display "Confirmed on SN" prior to the values.

The attribute value "`ConditionalSN`" provides the hint to display "Conditional on SN" prior to the values.

Other display class attribute values provide the information needed to generate the desired display.

Chap No./Document No.	Title
<a href="#">Chap 2.5.1</a>	Business rules - Categories and layers
<a href="#">Chap 4.10</a>	Information management - Business rules exchange

## **1 General**

The development and maintenance of business rules is by nature mainly a manual activity. Every S1000D business rules decision point has to be considered with respect to the requirements of an organization or project trying to implement the specification. In most cases, the requirements are collected from several places, such as from customers, internal processes, distribution environment and in-house infrastructure.

To some extent, which may vary based on the circumstances, it is possible to perform automatic processing on the business rules. In particular, but not exclusively, this is the case for rules expressed in the BREX data module. This chapter offers some points of view and advice related to the validation of CSDB objects against a BREX data module.

## **2 BREX processing**

### **2.1 Basics when validating objects against a BREX data module**

In [Chap 4.10](#) it is suggested that one of the use cases for the BREX data module is to utilize it for automatic validation that a data module conforms to the rules defined in a specific BREX.

A business rules checker, that makes an automatic check of a data module against the BREX data module to which it refers, can be made in many ways. Normally, and without excluding other functionality, a business rules checker would act in at least two steps:

- 1 Read the rules in the BREX data module and translate them into a syntax that is suitable/optimized for the checker.

- 2 Check the content of the data module (and additional data modules that refer to the same BREX data module) against the optimized rules.

## 2.2 Validating against layered BREX data modules

A data module is valid according to its BREX reference if it passes relevant rules at each BREX layer. This is accomplished by validating the data module against each BREX data module individually in the complete hierarchy of layered BREX data modules.

### Note

In this context, a relevant rule means a rule with a severity code such that breaking the rule invalidates the data module.

The results from each layer validation will indicate if there is a failure on that particular layer. The complete validation will be passed if and only if there are no failures at any of the layers checked.

### Note

A CSDB object can be validated against a BREX data module that is not explicitly referred to by the object. In this case, the same principle validation steps and methods apply.

### Note

The above strategy does not offer any specific guidance in writing layered BREX data modules. This is the responsibility of the organization or project to which the rules apply. Refer to [Chap 2.5.1](#).

<a href="#">Chap 8.4</a>	SNS, information codes and learn codes - Information codes
<a href="#">Chap 8.5</a>	SNS, information codes and learn codes - Learn codes

## 1 General

There are specific codes in the data module code that have definitions applied to them. These are:

- SNS
- information codes
- learn codes

---

## 2 SNS, information codes and learn codes

### 2.1 SNS

#### 2.1.1 Maintained SNS

The maintained SNS covers the requirements for air, land and sea and is subject to CPF action in the normal manner described in [Chap 1.5](#). A numeric, generic SNS is provided for common system information together with alphanumeric SNS specifically for air, land, sea, support and training, tactical missiles, communications, technical publications and ordnance. These SNS can be found in [Chap 8.2](#).

#### 2.1.2 Example SNS

A number of example SNS have been provided. The project or the organization can decide to reuse these SNS as they are or to modify them to suit their needs. These SNS are provided as examples only and will not be maintained by the S1000D Steering Committee. These are described in [Chap 8.3](#) and are available for download on [www.s1000d.org](http://www.s1000d.org).

#### 2.1.3 Use of the SNS

The SNS is used to codify the functional and/or physical breakdown of the Product. The project or the organization can decide to use any of the SNS given in this specification, either without change or with their own modifications. The project or the organization can also decide to create their own SNS that is not based on any of the SNS given herein. The allocation of definitions for the various levels of breakdown is given in [Chap 4.3.3](#).

### 2.2 Information codes

Information codes are used to identify the type of information. The definitions of these codes are given in the form of short and full definitions. These can be found in [Chap 8.4](#).

### 2.3 Learn codes

There are two types of learn codes:

- Human performance technology. These are used to identify information regarding the human performance system in which project will be used.
- Training. These are used to identify the type of information related to training but associated with the SNS and information code.

The learn codes can be found in [Chap 8.5](#).

## Chapter 8.2

<a href="#">Chap 8.2.8</a>	Maintained SNS - General sea vehicles

#### **1 General**

The S1000D Steering Committee maintains eight SNS.

If SNS values for the first three characters are not allocated a title/definition in the SNS tables, then these values are not available for projects. Refer to [Chap 1.3](#).

##### **Note**

Projects can develop their own SNS based on any of the maintained SNS being aware that a project specific allocated system/subsystem can be defined differently in a future issue of the specification.

#### **2 Content**

The long and short definitions of the SNS are given in the following chapters:

Applicable to: All

**S1000D-A-08-02-0000-00A-040A-A**

**Chap 8.2**

- [Chap 8.2.1](#) gives a generic numeric SNS that can be used for common and system level information
- [Chap 8.2.2](#) gives the maintained SNS for support and training equipment
- [Chap 8.2.3](#) gives the maintained SNS for ordnance
- [Chap 8.2.4](#) gives the maintained SNS for general communications
- [Chap 8.2.5](#) gives the maintained SNS for air vehicle, engines and equipment
- [Chap 8.2.6](#) gives the maintained SNS for tactical missiles
- [Chap 8.2.7](#) gives the maintained SNS for general surface vehicles
- [Chap 8.2.8](#) gives the maintained SNS for general sea vehicles

### 3 Translation of SNS titles and definitions

A project can, by project decision, translate the titles and the definitions given to the systems/subsystems/sub-subsystems listed in [Chap 8.2.1](#) thru [Chap 8.2.8](#). The translation must be a direct translation without any deviations in the scope of the titles or the definitions.

#### **Business rule decision point BRDP-S1-00549 - Translation of SNS titles and definitions:**

- Decide whether to translate and use the SNS titles and the definitions in the languages adopted by the project.

## 1 General

The SNS is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

## 2 Generic SNS

The coding and definitions for the generic SNS is appropriate for common and system level information for all products and is described in [Table 2](#). However, projects can decide not to use this generic SNS.

*Table 2 Index of standard systems*

<b>Note</b> This system is used for breaking down the information for land and sea systems. Refer to <a href="#">Chap 5.2.3.5</a> .	

### 2.1 Definitions of systems and subsystems

The SNS for the basic systems of the Product are given in [Table 3](#) thru [Table 16](#).

Table 3 System 00 - Product, General

System	Subsystem	Title	Definition
00		Product, General	General information for the complete Product, procedures for the Product safety and general Product maintenance, use of the Product safety and protective devices, information on the technical publication required to support the Product.
	-00	Product, Description	General description with illustrations of the Product and its systems to include type of Product, its roles, accommodation, salient constructional features, power system installation, systems and operational equipment.
	-10	Product, General maintenance	Those instructions necessary for the Product maintenance condition, electrical (static) grounding.
	-20	Product, Safety	Those specific or Product peculiar instructions necessary to make safe and prepare the Product for maintenance action. Includes instructions for returning the Product to its serviceable state.
	-30	Safety and protective devices	Those instructions necessary for the use or operation of devices such as safety pins, safety locks, safety pin flag assemblies, safety struts, safety strut extensions, etc. Instructions for removal and installation of protective covers, bungs, blanks, etc, are to be included.
	-40	Technical publication	Information on the technical publication required to support the Product (not a technical publication project in its own right) such as the Lists of Applicable Publications, Publication Guide, the coding system of technical publications, instruction for handling and updating technical publication.
	-41	Publications	Information on the suite of publications that are required by the customer.
	-42	Information Sets	Information on the information sets that were used to produce the suite of publications that are required by the customer.
	-50	Material data	Information concerning all material (products) used for the maintenance of the complete Product and its systems.
	-60 thru -80	Available for projects	
	-90	Battle damage repair	Information and data which cannot be allocated to a specific SNS because the involved zone of the Product contains more than one hardware "system".

Table 4 System 04 - Worthiness (fit for purpose) limitations

System	Subsystem	Title	Definition
04		Worthiness (fit for purpose) limitations	This System provides guidance for the calculation of lives for critical items/components and defines the operating parameters for such calculations.

Applicable to: All

S1000D-A-08-02-0100-00A-040A-A

Chap 8.2.1

System	Subsystem	Title	Definition
	-00	General	
	-10	Fatigue index calculations	Procedures and formulae for calculating Fatigue Index/Fatigue Lives of the Product structure from Fatigue Meter readings.
	-20	Operating spectrums	Assumed operating spectrums for the Product from which the safe fatigue lives are calculated.

Table 5 System 05 - Scheduled/unscheduled maintenance

System	Subsystem	Title	Definition
05		Scheduled/unscheduled maintenance	Manufacturers' recommendation for time limits inspection (both scheduled and unscheduled).
	-00	General	
	-10	Time limits	Those manufacturer recommended time limits for maintenance and overhaul of the Product, its systems and subassemblies, and life of its parts.
	-20	Scheduled maintenance checks lists	A list of the manufacturer recommended scheduled and unscheduled maintenance checks and inspections, including operating tests applicable to the Product, its systems and sub-assemblies. The checks listed at -40, -50 and -60 must be included.
	-30	Available for projects	
	-40	Scheduled maintenance checks	Those manufacturer recommended maintenance checks and inspections of the Product, its systems and sub-assemblies dictated by the time limits specified in -10 above. This section lists in more detail the items which are outlined on the user job forms (usually by title only) and cross references the detailed procedures included in the individual maintenance practices.
	-50	Unscheduled maintenance checks	Those maintenance checks and inspections on the Product, its systems and sub-assemblies which are dictated by special or unusual conditions which are not related to the time limits specified in -10 above.
	-60	Acceptance and functional check usage	Those current status functional checks necessary to fulfill inspection requirements to prove the safety/usage of all components and systems following delivery or maintenance activities.
	80	Maintenance allocation	The maintenance authority and responsibility for the performance of maintenance functions on a Product, including grouped maintenance functions (where necessary), lists of tools and lists of remarks.

Table 6 System 06 - Dimensions and areas

System	Subsystem	Title	Definition
06		Dimensions and areas	Those illustrations and text which show the principal dimensions of the Product and the zones, areas and reference lines used to locate sub-assemblies/components. It also includes all access and drainage provisions.
	-00	General	
	-10	Principal dimensions	To include a conventional 3-view illustration of the Product with principal dimensions.
	-20	Reference lines	To include a system for locating sub-assemblies/components in relation to the Product reference lines.
	-30	Zones and areas	To include Product sub-division by zone/area to identify the zone/area in which the maintenance task is done.
	-40	Access provisions	To identify all access doors and panels, and maintenance access points.
		<b>Note</b>	Walkways are covered in System 12.

Table 7 System 07 - Lifting, shoring, recovering and transporting

System	Subsystem	Title	Definition
07		Lifting, shoring, recovering and transporting	Includes all necessary procedures to lift the Product with jacks or slings, and to recover it in any of the conditions to which it can be subjected, including maintenance and repair. It also includes information on recovering the Product from any condition to which it can be subjected (including emergency recovering) and how to transport it by air/road/rail, etc.
	-00	General	
	-10	Jacking	Information on jacking points, adapters, balance weights, jacking procedures and the jacks used to lift the Product during Product maintenance, repair and recovery.
	-20	Shoring	Information on shoring points, shoring procedures and the shoring equipment used during Product maintenance, repair and recovery.
	-30	Slinging	Information on slinging points, slinging procedures and the slings used to lift the Product during maintenance, repair and recovery.
	-40	Recovering	Information on recovery procedures and the tools and equipment required to recover the Product from any condition to which it can be subjected, including emergency recovery.
	-50	Transporting	Information on how to dismantle the Product to a standard of breakdown consistent with the Product in which it can have to be transported. Information for the manufacture of transportation sledges or pallets. For removal procedures and maintenance information, refer to appropriate system/subsystem.

Applicable to: All

S1000D-A-08-02-0100-00A-040A-A

Chap 8.2.1

Table 8 System 08 - Leveling and weighing

System	Subsystem	Title	Definition
08		Leveling and weighing	This System includes the necessary information to level the Product for any of the various maintenance, overhaul or major repairs which becomes necessary during the life of the Product. It also includes those on- Product sub-assemblies or components which are specifically dedicated to record, store or compute mass and balance data. Includes those maintenance practices necessary to prepare the Product for weighing and the weighing procedure. Mass and center of gravity (c.g.) data also to be included.
	-00	General	
	-10	Mass and balance	Those sub-assemblies or components on the Product dedicated to the specific function of recording, storing or computing mass and balance data.
	-20	Leveling	Those instructions necessary to prepare the Product for leveling and the leveling procedure. Includes information on the leveling equipment used.
	-30	Weighing	Those instructions necessary to prepare the Product for weighing and the weighing procedure. Includes information on the weighing equipment used. To include limits of variation allowed between physical recorded mass and calculated mass based and specific Product record.
	-40	Mass and c.g. data	<p>Mass and moment or index information characteristic of the Product, limitations, datum points and lines, center of gravity, range, mass and balance management of the fuel and other expendable loads, residual fuel, ballast and the effects of role change.</p> <p>Can include:</p> <ul style="list-style-type: none"> <li>- Expression of c.g. as a percentage of Mean Aerodynamic Chord (MAC)</li> <li>- Diagram of c.g. envelope and equipment location charts if necessary</li> <li>- Effect on the c.g. position of dropping or picking up stores (with an example)</li> </ul> <p>Relevant equipment included in the basic mass, plus variable equipment (ie, "role" or "fit-list" equipment), tabulated and showing mass, load arm and moment or index of each item. Relationship between the Product and ECU datum lines including the jet pipe and/or propeller datum lines and the effect of an ECU change (with a worked example).</p>

System	Subsystem	Title	Definition
08	-50	Static stability	<p>Information detailing the static stability limits of the Product. Can include information required to determine the minimum nose wheel reaction necessary to ensure that the Product is stable about its main wheels whilst being moved and whilst static during servicing operations, and to ensure the Product remains stable during jacking operations.</p> <p>Can include tabular and graphical data for the calculation of nose wheel reaction in relation to Product mass and residual moment for both a fully equipped Product and for situations where items of equipment/stores have been removed or the fuel state is outside the normal sequence.</p> <p>Safety precautions and limitations cover de-fueling sequences, maximum movement speeds and movement on gradients or over rough ground.</p>

*Table 9 System 09 - Handling and maneuvering*

System	Subsystem	Title	Definition
09		Handling and maneuvering	Those instructions necessary to handle and taxi the Product. Illustrations showing the location of attachment points, turning radius, etc, are included. Includes those maintenance procedures necessary to prepare the Product for handling and taxiing.
	-00	General	
	-10	Handling	Those instructions necessary to tow, winch or handle the Product in normal or other conditions such as towing and handling with engines removed, berthing sea vessels, etc. It includes the equipment and materials required such as tow bars, steering arms, towing cables/bridles, etc, safety precautions and limitations.
	-20	Maneuvering	Those instructions necessary to maneuver or taxi the Product in normal or abnormal conditions such as adverse weather conditions, etc. It includes procedures to be used such as use of engines, interphone and brakes, ground turning techniques, etc; safety precautions and limitations such as exhaust danger areas, minimum turning radius, friction coefficients for various ground conditions, etc.

*Table 10 System 10 - Parking, mooring, storing and return to service*

System	Subsystem	Title	Definition
10		Parking, mooring, storing and return to service	This System is to contain the necessary information to park, moor and/or store the Product in all conditions to which it can be subjected. Where appropriate, it is to include the procedures to prepare for parking, mooring and storing and any related return to service requirements. Illustrations, where appropriate, are to show, for example, locations of any fixing or mooring points and any controls used in the parking/mooring and storing procedure.

Applicable to: All

**S1000D-A-08-02-0100-00A-040A-A**

**Chap 8.2.1**

System	Subsystem	Title	Definition
	-00	General	
	-10	Parking	Information necessary to park the Product in all weather conditions, where parking is considered as a routine short-term activity (eg, overnight, over-weekend) performed on a serviceable Product (ie, where return to service can normally be expected to be accomplished by a standard pre-operation check). Includes equipment required.
	-20	Mooring	Information necessary to moor the Product under all weather conditions, where mooring is considered as a long or short term activity whose purpose is to tie down or otherwise secure the unit. Must also include information such as special techniques applicable to ballasting, installation and use of special support equipment applicable to mooring (eg, installation of tie-down rings to strong points) precautions and limits for the safety of the Product in high wind conditions, etc.
	-30	Storing	<p>Information necessary to store the Product in normal or abnormal conditions under all weather conditions, where storing is considered as a non-operational period of long or short term duration in excess of that defined for parking. It includes all appropriate inspection and preventive maintenance to safeguard structural and system integrity during storage. Where applicable, a stored Product can also be moored. Mooring during storage is covered under Section -20, not integrated within Section -30.</p> <p>This includes equipment required.</p> <p>It also includes information concerning, but not limited to:</p> <ul style="list-style-type: none"> <li>– techniques for entry into and removal from storage (eg, cleaning and inhibition/de-inhibition), fluid system draining/replenishing, static grounding, protective blanking, etc</li> <li>– timescales for routine in-storage maintenance such as wheel rotation, pressure checks, engine running, etc</li> <li>– procedures or techniques uniquely applicable to long or short term storage (project-defined terms)</li> <li>– preparation of the Product after storage and return to service.</li> </ul>
	-40	Return to Service	Those instructions necessary to prepare the Product for operation following mooring, parking or a period of storage.

Table 11 System 11 - Placards and markings

System	Subsystem	Title	Definition
11		Placards and markings	All procurable placards, labels, etc, is included in the Illustrated Parts Catalog. They are illustrated, showing the part number, legend and location. The maintenance publications must provide the approximate location (eg, FWD UPPER RH) and illustrate each placard, label, marking, self-illuminating sign, etc, required for safety information, maintenance significant information or by government regulations. Those required by government regulations are so identified.
	-00	General	
	-10	Exterior color schemes and markings	The specifications and requirements covering Product exterior color schemes and markings.
	-20	Exterior placards and markings	Those placards and markings required for ground servicing instructions, inspections, cautions, warnings, etc.
	-30	Interior placards and markings	Those placards, markings self-illuminating signs, etc, required for interior general and emergency information, instructions, cautions, warnings, etc.

Table 12 System 12 - Servicing

System	Subsystem	Title	Definition
12		Servicing	Those instructions for the replenishment and depletion of fluids, scheduled and unscheduled servicing, applicable to the whole Product. The information is concise and preferably in tabular or chart form. Precautions to be observed in servicing a particular container (eg, tank, reservoir, bottle, LOX converter, tire) such as grounding and prevention of fire hazards, is clearly stated. A diagram showing the location of regular and emergency servicing points is included. "No-step" areas or walkways, with necessary precautions, are indicated.
	-00	General	
	-10	Replenishing and depleting	Those instructions necessary for the replenishment or depletion of fluids. Container capacities in US, imperial and SI units of measure are included. ANA or other standard specification number and grade (if applicable) of fuel, oil, fluid, and other material used are given. Specifications and grades should be shown grouped on one page to facilitate revisions. For fuel, give expansion volume, total fuel capacity, sump capacity, net fuel capacity (as applicable) for each tank. For oil give allowance for expansion.

System	Subsystem	Title	Definition
	-20	Scheduled servicing	Those instructions necessary to carry out servicing that can be scheduled. Includes instructions such as those for periodic lubrication of components, radioactivity decontamination, Product external and internal cleaning, etc. It does not include lubrication procedures required for the accomplishment of maintenance practices.
	-30	Unscheduled servicing	Those instructions necessary to carry out servicing that is normally unscheduled. Includes instructions such as those for ice and snow removal from parked Product.

*Table 13 System 14 - Product loading and offloading*

System	Subsystem	Title	Definition
14		Product loading and offloading	This System contains those procedures and illustrations necessary to load and offload internal and external stores and munitions and cargo. The System also contains information on the support equipment and special tools required. Cross-references are made to applicable systems for information on the Product attachment points, pylons and carriers.
	-00	General	
	-10	Support equipment	A list of all support equipment and special tools, also information and illustrations as necessary on those items not covered in other documentation.
	-20	Cargo	Examples of loading and offloading techniques, interior layout, floor loadings, location and strength of lashing points, methods of stowing and securing, capacities and dimensions of compartment and doors.
	-30	Internal and external stores	A list of stores carried and the carrier/adaptor on which they are fitted.
	-31	Basic information	Includes the basic information on internal and external stores.
	-32	Supplementary information	Includes any supplementary information on internal and external stores.
	-33	Loading procedures	Includes the loading procedures for internal and external stores.
	-34	Offloading procedures	Includes the offloading procedures for internal and external stores.
	-35	Loading and offloading procedures checklists	Includes the checklists for loading and offloading of internal and external stores.
	-40	Non-nuclear munitions	A list of the non-nuclear munitions (eg, rockets, missiles, bombs, ammunition) and the carrier/adaptor on which they are fitted.

System	Subsystem	Title	Definition
	-41	Basic information	Includes the basic information on non-nuclear munitions.
	-42	Supplementary information	Includes any supplementary information on non-nuclear munitions.
	-43	Loading procedures	Includes the loading procedures for non-nuclear munitions.
	-44	Offloading procedures	Includes the offloading procedures for non-nuclear munitions.
	-45	Loading and offloading procedures checklists	Includes the checklists for loading and offloading for non-nuclear munitions.
	-46	Integrated combat turnaround procedures	Includes information on integrated combat turnaround procedures.
	-47	Integrated combat turnaround procedures checklists	Includes the checklists for integrated combat turnaround procedures.
	-48	Cross servicing checklists	Includes the checklists for cross servicing for non-nuclear munitions.
	-50	Nuclear munitions	A list of the nuclear munitions and the carrier/adaptor on which they are fitted.

Table 14 System 15 - Crew information

System	Subsystem	Title	Definition
15		Crew information	<p>This System provides all specific information given to crew for performing all the designed missions of the Product.</p> <p>Description and function of the Product systems, system controls and installed equipment are included only to the extent that the information is essential to crew/operators and is not covered in the relevant system (21 and up).</p> <p><b>Note</b> Sub-subsystem 15-04, 15-05 and 15-06 are used for breaking down the information for land and sea systems. Refer to <a href="#">Chap 5.2.3.1</a> and <a href="#">Chap 5.2.3.2</a>.</p>
	-00	General	This section contains an introduction which gives a general overview of the salient features of the Product.
	-10	Aircraft release/operating limitations	This section contains all limitations that must be observed throughout the cleared operating envelope.

Applicable to: All

S1000D-A-08-02-0100-00A-040A-A

Chap 8.2.1

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
	-20	Operational characteristics	This section contains a comprehensive description of the operational characteristics of the Product including both those advantageous and those undesirable.
	-30	Normal procedures	<p>This section contains in narrative and/or checklist form all normal procedures required to accomplish operation. Procedures for special conditions such as scramble or missions requiring intermediate operational stops re included.</p> <p>This section also contains the handling of installed equipment, which is not satisfactorily covered in the systems with regard to crew.</p>
	-40	Emergency procedures	This section contains in narrative and/or checklists form the procedures to be followed to meet any emergency that could reasonably be expected.
	-41	General	Includes general information on crew/operator emergency procedures.
	-42	Ground emergencies	Includes information on crew/operator ground based emergency procedures.
	-43	Initialization emergencies	Includes information on crew/operator initialization emergency procedures.
	-44	System related emergencies	Includes information on crew/operator system related emergency procedures.
	-45	Single or multi-engine failures	Includes information on crew/operator single or multi-engine emergency failure procedures.
	-46	Arrival/Disembarking emergencies	Includes information on crew/operator arrival/disembarking emergencies.
	-47	Control system failures	Includes information on control system failures.
	-48	Other emergencies or failures	Includes information on other emergencies or failures.
	-49	Multi-function display readouts giving emergency information	Includes information on crew/operator multi-function display related emergencies.
	-50	Special conditions	This section contains information pertaining to the operation of the Product under special conditions (eg, adverse weather and climatic conditions).
	-60	Performance data	This section contains the Product performance data required by the project and agreed upon in the Performance Substantiation document.

System	Subsystem	Title	Definition
	-70	Role Operation/Weapon system procedures	This section contains in narrative and/or checklist form all normal and reversionary procedures relating to role operation and the role/weapons systems not covered in the relevant systems (21 and up). All relevant safety requirements must be specified.
	-80	Configuration	This section contains the various stores configurations, including weapons and fuel tanks, carried both internally and externally and should include details of the effect on weight, drag index, limitations.

*Table 15 System 16 - Change of role*

System	Subsystem	Title	Definition
16		Change of role	Those instructions necessary to change the Product from one role to another.
	-00	General	List of the primary and secondary roles of the Product, and the role equipment to be removed/installed, presented in tabular format.
	-10	Role changes	Individual procedures to cover all changes from any one role to any other role including any necessary testing.

*Table 16 System 18 - Vibration and noise analysis and attenuation*

System	Subsystem	Title	Definition
18		Vibration and noise analysis and attenuation	This System provides the necessary information to enable operators to monitor and diagnose vibration and noise levels in order to identify imbalance, damage or misalignment in the Product dynamic and structural components. It also includes those Product and components which furnish a means of automatically controlling and/or reducing the force and/or value of the levels of vibration and/or noise within the Product through the use of active or passive systems/equipment.
	-00	General	
	-10	Vibration analysis	Those instructions necessary to monitor, measure, diagnose and locate sources of vibration in dynamic and structural components.
	-20	Noise analysis	Those instructions necessary to monitor, measure, diagnose and locate sources of noise in dynamic and structural components.
	-30	Active attenuation/actuation	That portion of the system which from a power source ensures distribution to the system and provides a physical means of reducing vibration. Included are items such as actuating mechanisms, control valves, motors, plumbing, etc.

Applicable to: All

**S1000D-A-08-02-0100-00A-040A-A**

**Chap 8.2.1**

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
-40	Sensing		Those sub-assemblies or components which provide a means of detecting vibration levels and conveying information to the control computing or indicating systems. Includes items such as accelerometers.
-50	Control/computing		Those Product or components used for processing data, from multiple sources, employed to activate and control attenuation systems. Includes items such as computers, switches, etc.
-60	Passive attenuation		Those Product and components which provide a means of passive attenuation. Includes items such as vibration absorbers, suspension bars, etc.

Chap No./Document No.	Title
<a href="#">Chap 1.5</a>	Request for change
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system

## 1 General

The SNS is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

## 2 Support and training equipment SNS

The coding and definitions for the support and training equipment SNS are appropriate for common and system level information for all Products and is described in [Table 2](#) and shown in [Fig 1](#). However, projects can decide not to use this generic SNS. Business rules decision points are given at [Para 2](#).

ICN-83007-0000000115-001-01

Fig 1 Top level breakdown for support and training equipment

## 2.1 System breakdown

### 2.1.1 Main systems

This support and training equipment SNS is divided into systems categories.

*Table 2 Top level breakdown for support and training equipment*

System	Title
A	Measuring, testing and adjusting
B	Signal and power generating, supplying, storing and converting (excludes transducers)
C	Communicating, signaling and lighting
D	Engine and missile system checkout and testing
E	Gas and liquid supplying, processing, storing and shipping
F	Personnel and solid material protection
G	Maintenance and servicing
H	Handling, moving, stopping, propelling and landing
I	Not available for projects
J	Heating, cooling, ventilating, humidity control, pressurizing and filtering
K	Fire fighting, rescue and survival
L	Training and simulating
M	Detecting, ranging and fire control
N	Demolition and destruction
O	Flight control and navigation
P	Ignition systems
Q	Photographic
R	Data processing and storing
S	Automatic test equipment (ATE)
T	Not available for projects

## 2.2 Definition of systems category and subcategory

### 2.2.1 System category A - Measuring, testing and adjusting

*Table 3 System category A - Measuring, testing and adjusting*

System	Title	Definition
A	Measuring, testing and adjusting	

<b>System</b>	<b>Title</b>	<b>Definition</b>
AA	Voltage, current and resistance measuring and indicating	Includes voltage, current and resistance measuring, voltage leakage, short circuit, continuity and cable testing and multimeters.
AB	Standing wave ratio and impedance measuring	Includes standing wave ratio, impedance and related parameter measuring.
AC	Waveform measuring and analyzing	Includes oscillographs, oscilloscopes, synchrosopes, waveform and spectrum analyzing.
AD	Power and mechanical energy measuring	Includes electrical power measuring (including metered loads), radiated (non-cabled) and mechanical power measuring.
AE	Intensity measuring	Includes mechanical force, sound and light measuring, motion, displacement, impact, electric and magnetic field detecting and measuring, infrared, ultraviolet, X and nuclear radiation detecting and measuring.
AF	Acceleration, velocity, rate, frequency and time measuring and counting	Includes acceleration, velocity, rate and mechanical frequency measuring, electrical frequency measuring and indicating, mechanical and electrical counting, reference time, elapsed time and duration measuring and interval measuring (chronoscopes).
AG	Optical measuring, testing and aligning	Includes collimation and similar optical measuring, spectroscopic, spectrographic and microscopic testing, photographic measuring and testing.
AH	Material measuring and testing	Includes physical dimension, weight, density, volume, pressure, stress and strain, tension and compression, static and dynamic balance measuring, shock testing, solid, liquid and gas analysis.
AJ	Multifunction measuring and testing (excludes engines and missile systems but includes most test sets)	Includes electronic, electrical, mechanical and hydraulic systems and components testing, circuit board, circuit card, electron tube, semiconductor, relay, selsyn, synchro, etc testing.
AK	Standards and calibration equipment for measuring and testing	Includes calibration equipment for voltage, current and resistance measuring devices, SWR, impedance and related parameters, waveform measuring and analyzing devices, power, mechanical energy and intensity measuring devices, velocity, frequency and time measuring devices, optical devices, material measuring and testing devices.
AL	Active devices for test purposes (excludes most test sets)	Includes transducers, active filters, active mixers and modulators, active couplings matching and distribution devices, test amplifiers, active terminations and dummy loads.

System	Title	Definition
AM	Passive devices for test purposes (excludes most test sets)	Includes variable resistors and unqualified variable attenuators, variable capacitors, variable inductances, passive electrical coupling matching and distribution devices (including fixed attenuators and most dividers and probes), passive electromagnetic and electro-static coupling, matching and distribution devices (including inductive voltage dividers and probes), mounting devices and passive mechanical coupling devices, passive filters, passive delay devices, passive non-power measuring terminations and dummy loads, passive mixer, modulator and detectors.
AN	Nondestructive inspection and oil analysis	Includes fluorescent penetrant, magnetic particle, X-ray, ultrasonic, eddy current, oil analysis and acoustic emission.

## 2.2.2 System category B - Signal and power generating, supplying, storing and converting (excludes transducers)

*Table 4 System category B - Signal and power generating, supplying, storing and converting (excludes transducers)*

System	Title	Definition
B	Signal and power generating, supplying, storing and converting (excludes transducers)	
BA	Signal generating	Includes AM/FM pulse-modulated, audio, sweep, square-wave, triangular-wave, saw tooth etc generators, random noise and noise generators and waveform synthesizers.
BB	Electrical power supplying, generating, storing and converting	Includes electrical generators, converters, inverters, dynamotors, power supplies and battery chargers, transformers and distribution networks.
BC	Mechanical, hydraulic, pneumatic and vacuum power supplying, storing and converting	Includes mechanical power supplying, storage and converting (including motors, turbines etc), general purpose compressing and pumping, hydraulic and pneumatic power and vacuum generating and storing, mechanical, hydraulic, pneumatic and vacuum devices (including those which also supply power).

## 2.2.3 System category C - Communicating, signaling and lighting

*Table 5 System category C - Communicating, signaling and lighting*

System	Title	Definition
C	Communicating, signaling and lighting	

Applicable to: All

**S1000D-A-08-02-0200-00A-040A-A**

**Chap 8.2.2**

System	Title	Definition
CA	Communicating (excludes headsets, loudspeakers, etc)	Includes intercommunication systems, public address systems, non-airborne and airborne multifunction and special purpose communication devices.
CB	Signaling	Includes signal lights, mechanical signaling devices and special purpose signaling devices.
CC	Lighting	Includes area, search, marking and identification lighting and special purpose lighting.

#### 2.2.4 System category D - Engine and missile system checkout and testing

*Table 6 System category D - Engine and missile system checkout and testing*

System	Title	Definition
D	Engine and missile system checkout and testing	
DA	Engine checkout and testing	Includes automotive engine, air vehicle engine and missile engine testing and general and special purpose engine testing.  Note: This code is also applicable to engine modules and accessories.
DB	Missile system checkout and testing	Includes missile guidance, missile target or flight programming, missile telemetering and training, missile hydraulic, pneumatic and fuel systems checkout, miscellaneous missiles system checkout and testing and missile countdown equipment.

#### 2.2.5 System category E - Gas and liquid supplying, processing, storing and shipping

*Table 7 System category E - Gas and liquid supplying, processing, storing and shipping*

System	Title	Definition
E	Gas and liquid supplying, processing, storing and shipping	
EA	Gas storage, processing, supplying and shipping	Includes gas storage containers, gas storage processing, supplying and shipping equipment and vehicles and multipurpose and special purpose gas handling equipment.
EB	Liquid storage, processing, supplying and shipping	Includes liquid storage containers, liquid storage, processing, supplying and shipping equipment and vehicles and multipurpose and special purpose liquid handling equipment.

## 2.2.6 System category F - Personnel and solid material protection

*Table 8 System category F - Personnel and solid material protection*

System	Title	Definition
F	Personnel and solid material protection	
FA	Shelters and chambers	Includes personnel and maintenance shelters, test chambers and test shelters, special purpose and multipurpose shelters and chambers.
FB	Protective deflectors, shields, screens and coverings	Includes deflectors, shields, screens, protective coverings, miscellaneous protective equipment.
FC	Supports for shoring and shipping	Includes supports for storing and shipping.
FD	Special purpose and multipurpose devices	Includes special purpose and multipurpose devices.
FE	Flight clothing and accessories	Includes flight clothing and accessories.

## 2.2.7 System category G - Maintenance and servicing

*Table 9 System category G - Maintenance and servicing*

System	Title	Definition
G	Maintenance and servicing	
GA	General mechanical cleaning, degreasing and scaling	Includes pressure and vacuum cleaners, spray cleaners and degreasers, scalars, special purpose and multipurpose cleaning devices.
GB	Deicing and decontaminating	Includes deicing and decontaminating equipment.
GC	Road and runway cleaning and repairing	Includes road and runway cleaning and repairing, combination and special purpose road and runway cleaning and repairing and associated devices.
GD	Lubricating	Includes oiling and greasing equipment and special purpose lubricating equipment.
GE	Wheel, tire and mechanical system servicing	Includes wheel and tire servicing, brake, hydraulic and pneumatic systems servicing and special purpose and multipurpose mechanical system servicing.

System	Title	Definition
GF	Special purpose and multipurpose servicing	Includes maintenance tool sets, kits and machines, repair kits, maintenance trailers, welding machines, purging units, spray outfit preservation units, etc.
GG	Maintenance platform, stands, supports and accessories	Includes maintenance platforms and stands for personnel, equipment supports, weapon and special purpose supports and maintenance accessories.
GH	Special machines	Includes maintenance tools, (eg, extractors, guiders, stackers, specific spanners) and also other means such as complex machines/parts interfaces.

## 2.2.8 System category H - Handling, moving, stopping, propelling and landing

*Table 10 System category H - Handling, moving, stopping, propelling and landing*

System	Title	Definition
H	Handling, moving, stopping, propelling and landing	
HA	Hoisting, jacking, lifting, towing and positioning	Includes hoisting, lifting, jacking, erecting and towing equipment and special purpose and multipurpose lifting and positioning equipment.
HB	Transporting of equipment and solid material	Includes powered trucks and tractors, hand trucks, carts, dollies, trailers, transporting vehicles and devices, accessory equipment for transporting, delivery and recovery systems, tires and tubes.
HC	Launching	Includes air vehicle, guided missile, rocket and space vehicles launching equipment and special purpose and multipurpose launching equipment.
HD	Arresting, parking and securing	Includes auxiliary braking, emergency braking and arresting, securing, checking, looking and parking and similar storing.
HE	Special purpose and multipurpose handling and moving	Includes combined lifting and moving vehicles and equipment (trailers, dollies and cradles for air vehicle equipment and components handling, installation, removal, transportation and storage; handling adapter sets; trailers for ammunition lifting and transportation; trucks for loading munitions, fuel tanks, pylons and special weapons onto air vehicles, etc).
HF	Propulsion system	Includes rocket engines, motors and hybrids, reciprocating engines, turbine engines and miscellaneous engines and components.

## 2.2.9 System category J - Heating, cooling, ventilating, humidity control, pressurizing and filtering

Table 11 System category J - Heating, cooling, ventilating, humidity control, pressurizing and filtering

System	Title	Definition
J	Heating, cooling, ventilating, humidity control, pressurizing and filtering	
JA	Heating	Includes area heating equipment and special purpose and multipurpose heating equipment.
JB	Air cooling and air conditioning	Includes air cooling and air conditioning equipment and special purpose and multipurpose cooling equipment.
JC	Ventilating and air circulating	Includes ventilating and air circulating and special purpose and multipurpose ventilating and air conditioning equipment.
JD	Humidity controlling	Includes humidity reducing, humidity increasing, constant humidity equipment and special purpose and multipurpose humidity controlling equipment.
JE	Refrigerating	Includes general purpose refrigerating equipment and special purpose and multipurpose pressurizing equipment.
JF	Multipurpose and special purpose equipment	Includes multipurpose and special purpose heating, cooling, ventilating and humidity control equipment.
JG	Pressurizing	Includes compartment pressurizing and special purpose and multipurpose pressurizing equipment.
JH	Water cooling	Includes engine cooling systems and components and special purpose and multipurpose water cooling equipment.
JI	Filtering	Includes pneumatic and liquid filtering and special purpose and multipurpose filtering equipment.

## 2.2.10 System category K - Fire fighting, rescue and survival

Table 12 System category K - Fire fighting, rescue and survival

System	Title	Definition
K	Fire fighting, rescue and survival	
KA	Fire fighting, crash and rescue equipment	Includes fire fighting, crash, rescue equipment and special purpose and multipurpose fire fighting, crash and rescue equipment.
KB	Survival equipment and devices	Includes survival tools and accessories, survival vehicles and special purpose and multipurpose survival items.

Applicable to: All

S1000D-A-08-02-0200-00A-040A-A

Chap 8.2.2

## 2.2.11 System category L - Training and simulating

Table 13 System category L - Training and simulating

System	Title	Definition
L	Training and simulating	
LA	Pilot and flight crew flight simulators	Includes basic flight and advanced flight simulator trainers, instrument, flight trainers and mobile training units.
LB	Ground crew training flight simulators	Includes flight principle trainers, flight control, navigation, warning indicator instrument system trainers, mechanical and electrical systems trainers, engine operation and maintenance trainers, aircraft servicing equipment trainers and mobile training units.
LC	Armament trainers	Includes stationary airborne gunnery, free airborne gunnery, airborne rocketry, high altitude bombing, ground support bombing, armament components and multipurpose armament trainers and mobile training units.
LD	Navigation trainers	Includes dead-reckoning, celestial, electronic and crew navigation trainers, mobile and aerospace navigation training units.
LE	Radar and communications trainers	Includes primary and advanced communications equipment trainers, primary and advanced radar equipment trainers and radar countermeasures trainers.
LF	Psychological and psycho-physiological trainers	Includes low pressure chambers, ejection seat trainers, underwater escape trainers and other survival procedures, space environment and vertigo simulator trainers.
LG	Ground-to-ground and ground-to-air missile trainers	Includes ground crew, missile operation and maintenance trainers, launch control and flight control equipment trainers.
LH	Special project trainers	Includes synthetic warfare tactics trainers and combat information centers equipment trainers.
LJ	Training aids	Includes charts and posters, maneuvering boards and demonstrator panels, self instruction cards, training manuals, three-dimensional models, projectors, sound recorders and reproducers, training films and recordings and miscellaneous classroom teaching aids.
LK	Command training programs (tangible items)	Includes service-school training programs and activity training programs.
LL	Miscellaneous training and simulating devices	Includes automotive and airfield training devices, simulators for material testing, hydraulic, pneumatic, oxygen, fuel, air systems training, dummy guided missiles, simulated bombs for test aid training purposes, training dummy or practice warhead and aircraft simulated rockets.

## 2.2.12 System category M - Detecting, ranging and fire control

*Table 14 System category M - Detecting, ranging and fire control*

System	Title	Definition
M	Detecting, ranging and fire control	
MA	Detecting, range bearing and search	Includes transmitting, receiving, designating, indicating and locating equipment.
MB	Directing	Includes computing sights and devices, optical sighting and ranging, stabilizing mechanisms and transmitting and receiving equipment.
MC	Miscellaneous fire control	Includes fuse setters, ordnance cable system, aiming circles, flash and round ranging sets.

## 2.2.13 System category N - Demolition and destruction

*Table 15 System category N - Demolition and destruction*

System	Title	Definition
N	Demolition and destruction	
NA	Guns	Includes air vehicle and non air vehicle guns, ammunition feeders, loaders, storage drums, etc.
NB	Ammunition	Includes dummy or blank ammunition, tracer projectiles, live or special purpose ammunition.
NC	Bombs, rockets and missiles	Includes photo flashing, chemical warfare, general purpose, practice, guided or drones bombs and rockets and warheads and explosive components.

## 2.2.14 System category O - Flight control and navigation

*Table 16 System category O - Flight control and navigation*

System	Title	Definition
O	Flight control and navigation	
OA	Automatic flight or remote control	Includes guided missiles and spaces vehicles.
OB	Navigation	Includes airborne and non airborne direction finding equipment.

## 2.2.15 System category P - Ignition systems

*Table 17 System category P - Ignition systems*

System	Title	Definition
P	Ignition systems	
PA	Engine ignition system	Includes air vehicle and non air vehicle ignition systems.
PB	Special ignition systems	Includes special purpose and multipurpose ignition systems.

## 2.2.16 System category Q - Photographic

*Table 18 System category Q - Photographic*

System	Title	Definition
Q	Photographic	
QA	Picture taking equipment	Includes strike recording, aerial mapping, still and motion pictures.
QB	Picture processing equipment	Includes processing mechanisms, developers, washers and driers.
QC	Picture using equipment	Includes still projectors, motion picture projectors and viewing devices.

## 2.2.17 System category R - Data processing and storing

*Table 19 System category R - Data processing and storing*

System	Title	Definition
R	Data processing and storing	
RA	Analog computing	Includes all analog computing devices.
RB	Digital computing	Includes all digital computing devices.
RC	Hybrid computing	Includes all computing equipment that is a hybrid of analog and digital.
RD	Input/output and storage	Includes all input and out devices such as keyboards, mice, displays, projectors, flash cards, hard disks and other storage media.
RE	Collating, reading and interpreting	Includes cameras and scanners.
RF	Special purpose equipment	Includes special purpose and multipurpose data processing equipment.

## 2.2.18 System category S - Automatic test equipment (ATE)

*Table 20 System category S - Automatic test equipment (ATE)*

System	Title	Definition
S	Automatic test equipment (ATE)	
SA	Available for projects

## 2.2 Definitions of systems and subsystems

### 2.2.1 System A - Propulsion, General

*Table 3 System A0 - Propulsion, General*

System	Subsystem	Title	Definition
A0	-00	Propulsion, General	A system or equipment for producing and delivering power, to move/position the launcher.

*Table 4 System A1 - Power unit, General*

System	Subsystem	Title	Definition
A1	-00	Power unit, General	The power unit element refers to a discrete means for generating and delivering power for maneuvering the ordnance system in the battlefield. It can include, for example, flywheel and clutch assemblies.

-10	Engine	Refers to a diesel, petrol, electric, etc fuelled means for generating power and a means whereby this power can be delivered to the transmission. It can include, for example, flywheel and clutch assemblies and engine mounted cooling, fuel, air and exhaust, lubrication, auxiliary and electrical systems.
-20	Cooling system	Refers to systems designed to maintain the correct operating temperatures for the power unit. It includes, for example, cooling air ducting, coolant pumps, liquid filled radiators, intercoolers, fans and associated heat exchange equipment.
-30	Fuel systems	Refers to a system or equipment designed to deliver fuel to the power unit. It includes, for example, fuel storage facilities, pumps, filters, delivery pipes, drainage and cut-off valves, Fuel Injector Pumps (FIP) and injectors.
-40	Air and exhaust systems	Refers to a system which supplies air to, or collects and removes exhaust gasses from the engine. It includes, for example, all pipes, ducting, filters, couplings, gaskets, turbochargers/superchargers, silencers and catalytic converters.
-50	Lubrication systems	Refers to a system that provides lubrication to the power unit and any external components related to the power unit lubrication system. It includes, for example, delivery and return pipes, pumps, filters, intercoolers and separately mounted heat exchangers.
-60	Electrical	Refers to a system that provides or uses electrical power associated with the power unit. It includes, for example, starter motors, alternators and generators directly mounted on the power unit. It also includes, for example, ignition system components including spark plugs, distributor, coils and leads.
-70	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the power unit. It includes, for example, engine mountings.
-80	Hydraulic	Refers to a system that provides or uses hydraulic power associated with the power unit. It includes, for example, hydraulic pumps, valves, pipes, and tanks. It also includes any external components related to the power unit hydraulic systems.

*Table 5 System A2 - Transmission, General*

System	Subsystem	Title	Definition
A2	-00	Transmission, General	Refers to a means to transmit power from the engine to the driving member and can include clutch, torque converter, gearbox. It can also include steering and brakes if they are integral to the transmission. Also included are differentials and power takeoffs.
	-10	Gearbox	Refers to a means for varying the speed/torque delivered from the power unit to the driving member. It can include the steering control and brake assemblies.

-20	Steering control assembly	Refers to a discrete means for varying the drive applied, through the transmission system, to each of the launcher's driving members.
-30	Brake assembly	Refers to a discrete means for applying braking forces through the launcher transmission system.
-40	Auxiliary drive/power takeoff	Refers to an auxiliary means of obtaining an output from the engine. It includes transfer gearboxes which can also include a slip differential.
-50	Clutch	Refers to a means for engaging/disengaging the transmission to/from the engine, when fitted as a separate assembly.
-60	Drive shaft	Refers to the means for connecting power output from the engine to the driving member. It includes muff couplings, universal joints, chains, belts and final drives.
-70	Torque converter	Refers to a means for varying the torque delivered from the engine to the driving member.
-80	Differential	Refers to a means for changing the direction of rotation delivered from the engine to the driving member or wheels.

*Table 6 System A3 - Automotive/remote piloting and digital control systems, General*

System	Subsystem	Title	Definition
A3	-00	Automotive/remote piloting and digital control systems, General	The automotive and remote piloting and Digital Automotive Control System (DACS) element refers to that equipment (hardware/software) installed in the launcher which is used to plan and control its speed and direction either autonomously or via tele-operation. This includes equipment which senses, processes and displays imagery data such as stereo vision systems, laser scanners, multiple sensor fusion algorithms and processors, image enhancement algorithms and processors etc. This includes, for example, equipment which performs intelligence analysis and planning functions such as automated route planners, image understanding algorithms and processors, computer aided driving algorithms, DACS and processors.
	-10	Control	Refers to processing and control elements. It includes central processors, analogue/digital converters, associated software, memory boards, servo units, actuators, associated wiring, etc.
	-20	Sensors	Refers to sensors which are specifically associated with providing inputs to an automotive/remote piloting system or DACS.
	-30	Indicators	Refers to the part of the system used to indicate/ monitor an automotive/remote piloting system or DACS. It includes indicators, wiring, etc.

Table 7 System A4 - Controls (drivers), General

System	Subsystem	Title	Definition
A4	-00	Controls (drivers), General	Given in this element are the controls required to start, stop, steer and generally control the launcher, commensurate with the mobility role of the equipment. It includes, for example, on-board diagnostic systems.
	-10	Foot controls	Refers to the foot-operated controls to start, stop, steer and generally control the launcher. It includes, for example, pedal assemblies (clutch, brake, accelerator, etc), associated linkages, cables, hydraulic/pneumatic connections, master and slave cylinders, brake shoes and pads and disks and drums.
	-20	Hand controls	Refers to the hand-operated controls to start, stop, steer and generally control the launcher. It includes, for example, stop/start, steering (wheel, tiller, etc) and braking controls.
	-30	Ancillary controls	Refers to ancillary controls and associated systems. It includes, for example, such items as screen wash equipment, windscreen wipers and adjustable wing mirrors.
	-40	Propulsion control systems	Refers to systems which monitor and/or control engine speed and performance.
	-50	Instrumentation	Refers to systems (hardware/software) which monitor/ report on the operation of launcher systems. It includes, for example, the driver's instrumentation panel, warning lights and condition monitoring systems.

Table 8 System A5 - Launcher propulsion, General

System	Subsystem	Title	Definition
A5	-00	Launcher propulsion, General	The launcher propulsion element provides the forces to expel the complete round from the launcher to the target. It does not include propulsion provided by the projectile.
	-10	Chemical	Refers to the chemical launch element.
	-20	Mechanical	Refers to the mechanical launch element.
	-30	Electrical	Refers to the electrical launch element, including magnetic propulsion systems.
	-40	Pneumatic	Refers to the pneumatic launch element.

Table 9 System A6 - projectile propulsion, General

System	Subsystem	Title	Definition
A6	-00	Projectile propulsion, General	The projectile propulsion element provides the forces to transport the complete round from the launch position to the target. For artillery ammunition this element includes the cartridge case and if applicable the primer as well as the explosive charge itself. It does not include propulsion provided by the launcher assembly.

Applicable to: All

S1000D-A-08-02-0300-00A-040A-A

Chap 8.2.3

System	Subsystem	Title	Definition
	-10	Chemical	Refers to the chemical projectile propulsion element, including such devices as chemical precision initiation charges.
	-20	Mechanical	Refers to the mechanical projectile propulsion element.
	-30	Electrical	Refers to the electrical projectile propulsion element. It includes such devices as electric power charges.
	-40	Pneumatic	Refers to the pneumatic projectile propulsion element.
	-50	Rocket motor	Refers to the rocket motor projectile propulsion element.

## 2.2.2 System B - Structure, General

Table 10 System B0 - Structure, General

System	Subsystem	Title	Definition
B0	-00	Structure, General	Framework and/or basic structural housing for a system, including load bearing components.

Table 11 System B1 - Frame/carriage/ trail legs, General

System	Subsystem	Title	Definition
B1	-00	Frame/carriage/ trail legs General	The frame/carriage/trail legs element refers to the primary load bearing components of the launcher which provide the structural integrity to withstand operational loading stresses generated whilst in use, for example when traversing various terrain profiles. This element applies to firing posts, wheeled frames, etc. It does not apply to hand-held weapons. It includes all structural subassemblies and appendages which attach directly to the primary structure. This element, for example, includes towing and lifting fittings, bumpers, hatches and grilles. It also includes provision to accommodate other subsystems such as mountings for suspension, weapons, turret, track body, cab, special equipment, loads etc.
	-10	Frame/firing post	Refers to the basic structural housing for a non-wheeled ordnance system, including load bearing components, recoil mechanisms, mountings, firing platforms, stays, fittings and fixtures.
	-20	Carriage	Refers to the basic structural housing for a wheeled ordnance system, including load bearing components, recoil mechanisms, mountings, towing assemblies, fittings and fixtures.
	-30	Trail legs/spades	Refers to trail legs and spades provided to ensure launch platform stability during firing. They can also be used for towing.

System	Subsystem	Title	Definition
	-40	Traverse/ elevation mechanism	Refers to elevating/ traversing mechanisms (manual or powered) and their associated systems/components directly mounted on the frame/carriage/trail legs.
	-50	Armor	Refers to protective amour and associated components directly mounted on the frame/carriage/trail legs.
	-60	Ammunition storage	Refers to ammunition storage facilities and associated components directly mounted on the frame/carriage/trail legs.
	-70	Seats	Refers to seating which is directly mounted on the frame/ carriage/trail legs.

*Table 12 System B2 - Suspension/ wheels, General*

System	Subsystem	Title	Definition
B2	-00	Suspension/ wheels, General	The suspension/track/wheels element refers to the means for providing mobility or generating tractive effort, thrust and lift, generally at or in proximity to the earth's surface and adapting the launcher to the irregularities of the surface. It includes, for example, wheels and steering gears for traction and control functions. Also, it includes springs, shock absorbers, braking mechanisms, and other suspension members.
	-10	Suspension unit	Refers to the means for adapting the launcher to irregularities of the surface. It includes shock absorbers, leaf and coil springs, pneumatic suspension units, etc.
	-20	Axle	Refers to axle assemblies. It includes, for example, axle arms, links, torsion arms, bearings, wheels that transfer tractive effort to the surface and rolling wheels, hub assemblies, tires, valves, inner-tubes, brake drums, pads, slave cylinders and discs.
	-30	Braking assembly	Refers to a means for preventing un-planned movement of the ordnance system, not integral to the axle assembly. It includes, for example, hydraulic master cylinders, pipes, cables, over-run braking systems and hand brakes.

*Table 13 System B3 - projectile structure, General*

System	Subsystem	Title	Definition
B3	-00	Projectile structure, General	This element refers to the portion of the complete round which carries the payload to the target. It includes the casing of a projectile, the housing of a bomb and the body of a torpedo.
	-10	Projectile casing	Refers to the basic casing of the projectile. It includes those structural devices which provide stability (eg, fins).
	-20	Bomb housing	Refers to the basic housing of the bomb. It includes those structural devices which provide power, stability and control (eg, fins, parachutes, anchors, batteries).

System	Subsystem	Title	Definition
	-30	Torpedo body	Refers to the basic housing of the torpedo. It includes those structural devices which provide power, stability and control (eg, fins, parachutes, anchors, batteries).
	-40	Rocket housing	Refers to the basic housing of the rocket. It includes those structural devices which provide power, stability and control (eg, fins, parachutes, anchors, batteries).

### 2.2.3 System C - Armaments, General

*Table 14 System C0 - Armaments, General*

System	Subsystem	Title	Definition
C0	-00	Armaments, General	A defensive or offensive system or equipment.

*Table 15 System C1 - Gun control systems, General*

System	Subsystem	Title	Definition
C1	-00	Gun control systems, General	The gun control element refers to that equipment (hardware/software) installed in the launcher which provides intelligence necessary to power elevate and traverse the weapons systems and also to control via stabilization systems, and gun drives, including gun position indicators and sensors.
	-10	Installation	Refers to the Gun Control Equipment (GCE) installation.
	-20	Control panel	Refers to control panels associated with GCE.
	-30	Power supply	Refers to power supply units associated with GCE.
	-40	Switch units	Refers to switch units associated with GCE. It includes trimming units, fire control switches, etc.
	-50	Gun controller	Refers to control systems associated with GCE. It includes controls for the gun, motor generators, metadynes, amplidynes, magnicons, power amplifiers.
	-60	Power motors	Refers to gearbox drive motors, associated with GCE. It includes the power, elevation and traverse drive motors.
	-70	Gyroscope assembly	Refers to gyroscope assemblies associated with GCE.
	-80	Ancillary	Refers to ancillary GCE controls and associated systems. It includes such items as turnbuckle assemblies, traverse displacement units, fire control quadrants, inter-connecting boxes, wiring, connectors, etc.

Table 16 System C2 - Fire control systems, General

System	Subsystem	Title	Definition
C2	-00	Fire control systems, General	The fire control element refers to that equipment (hardware/software) installed in the launcher which provides intelligence necessary for weapons delivery such as launching and firing. This element includes, for example, radar and other sensors necessary for search recognition, meteorological and/ or tracking; controls and displays, fire control computers, and computer programs.
	-10	Computer/ interface	Refers to computer interface systems and equipment associated with fire control systems. It includes computer/ interface units, program loading facilities, etc.
	-20	Control/monitor	Refers to control and monitoring equipment associated with the fire control systems.
	-30	Filter units	Refers to filter units associated with the fire control systems.
	-40	Sensors	Refers to sensors associated with the fire control systems. It includes sensors for elevation and traverse displacement, trunnion tilt, sighting angle, etc.
	-50	Firing handles	Refers to firing handles associated with the fire control systems, including trigger mechanisms.
	-60	Fire control boxes	Refers to control boxes associated with the fire control system. It includes the commander's, and gunner's control boxes, the loader's safety box, etc.
	-70	Ancillary	Refers to ancillary items and associated systems. It includes, for example, such items as junction boxes, cables, connectors and services.

Table 17 System C3 - Thermal imaging, General

System	Subsystem	Title	Definition
C3	-00	Thermal imaging, General	This element refers to that equipment (hardware/software) which provides a thermal picture for the crew or operator to use for surveillance and weapon guidance. It includes thermal imaging sensor heads, drive units, processors, sights, power supply units, and display units.
	-10	Sensor	Refers to sensors specifically associated with thermal imaging systems. It includes scanner head assemblies, IR telescopes, tilt sensors, focal telescopes, etc.
	-20	Processing	Refers to processing elements associated with thermal imaging systems. It includes symbology units, processors, etc.
	-30	Display	Refers to the display elements of a thermal imaging system. It includes binocular viewers, commander's and gunner's display units, display drive units, etc.

System	Subsystem	Title	Definition
	-40	Control	Refers to the control elements of a thermal imaging system. It includes servo units, gunner's and commander's control units, etc.
	-50	Converter units	Refers to converter elements of a thermal imaging system. It includes isolating converter units, etc.
	-60	Structure and framework	Refers to framework and/or basic structural housing for a thermal imaging system, including load bearing components.
	-70	Ancillary	Refers to ancillary controls, items and associated systems related to thermal imaging systems. It includes such items as wash/wipe equipment, cables, connectors, services, etc.

*Table 18 System C4 - Thermal imaging cooling systems, General*

System	Subsystem	Title	Definition
C4	-00	Thermal imaging cooling systems, General	This element refers to that equipment which provides a cooling medium, for thermal images. It will include, for example, compressors, bottles, pipes, fans, mini coolers, air cleaning columns and stirling cycle cooling machines.
	-10	Compressors	Refers to the part of the system used to pressurize the cooling system. It includes motors, pumps, etc.
	-20	Storage	Refers to the part of the system used for storage of coolant. It includes tanks, pressurized containers, filling systems, sumps, drains, etc.
	-30	Distribution	Refers to the part of the system used for distribution of coolant. It includes pipes, valves, etc.
	-40	Indicating	Refers to the part of the system used to monitor the condition of coolant (quantity, temperature and pressure). It includes transmitters, indicators, wiring, warning systems, etc.

*Table 19 System C5 - Optical sighting systems, General*

System	Subsystem	Title	Definition
C5	-00	Optical sighting systems, General	The optical element refers to the sighting systems for search, observation, identification, tracking, range-finding and will include sensors and displays associated with this system.
	-10	Surveillance	Refers to optical surveillance equipment. It includes, for example, such items as observation periscopes, etc.
	-20	Sighting	Refers to optical sighting equipment. It includes, for example, such items as sighting and aiming periscopes and iron sights.
	-30	Reticle image projector	Refers to a means for displaying a reticle image in/on the sighting device.
	-40	Sighting unit	Refers to a means for displaying a reticle image in the sighting device.

System	Subsystem	Title	Definition
	-50	Ancillary	Refers to ancillary controls, items and associated systems related to optical sighting systems. It includes such items as wash/ wipe equipment, cables, connectors, services, etc.

*Table 20 System C6 - Weapon/gun, General*

System	Subsystem	Title	Definition
C6	-00	Weapon/gun, General	The weapon/gun element refers to the means for the launcher to deliver fire on hostile targets or for logistics and other vehicles to exercise self-defense. This element includes, for example, the main gun/ elevating mass and secondary armaments such as small arms and mortars. Fire control, gun control, and optical systems are excluded.
	-10	Launcher	The launcher assembly provides initial guidance for launch of projectiles. It includes, for example, barrels, tubes (mortar, torpedo, etc) and rails.
	-20	Breech, housing and firing mechanism	Refers to a system which provides a means of access for the projectile/case to enter the barrel. It also provides a pressure seal and firing mechanism, together with the means by which the breech and firing mechanism are housed within the equipment. It includes all associated housing items.
	-30	Mountings	Refers to the means for attaching the barrel assembly and can include the mountlet assembly as well as the means to balance the armament system. It also includes tripods and bipods.
	-40	Recoil mechanism	Refers to systems which provide a means for absorbing energy created by projectile launch. It includes recuperator and recoil assemblies, etc.
	-50	Smoke discharger	Refers to a means for dispersing smoke/fumes generated when a round is fired.
	-60	Secondary armaments installation	Refers to systems which provide a secondary armaments installation.
	-70	Sights	Refers to a mechanical sighting system used on small arms, machine guns, man-portable launchers, etc.
	-80	Ancillary	Refers to ancillary items and associated systems. It includes, for example, such items as spare barrels and other parts, wallets, cleaning kits and sustained fire kits.

Table 21 System C7 - Automatic loading systems, General

System	Subsystem	Title	Definition
C7	-00	Automatic loading systems, General	The automatic loading element consists of that equipment (hardware/software) providing the means to select ammunition from a stored position, its transfer to and loading of the armament system. This element also includes the means to eject spent cases and misfired rounds. Components include all ammunition storage racks, transfer/lift mechanisms, ramming and ejecting mechanisms as well as specialized hydraulic and electrical controls. It does not include storage provided externally from the main system.
	-10	Storage (ready round)	Refers to ammunition storage racks, bins, etc.
	-20	Rocket pods/mine racks/dispensers	Provides a means of holding/supporting the projectile during transportation, and a means of releasing the projectile.
	-30	Transfer/lift	Refers to the means to select ammunition from a stored position in the launcher and transfer it to the armament system. It includes transfer and lift mechanisms
	-40	Loading/ramming	Refers to the means to loading the armament system. It includes ramming and ejecting mechanisms.
	-50	Feed mechanism	The feed mechanism element refers to the equipment for placing ammunition in a position, ready for chambering.
	-60	Automatic loading devices	The automatic loading element consists of that equipment providing the means to select ammunition from a stored position and transferring it to a feed mechanism or ready magazine.
	-70	Control	Refers to the means to control loading the armament system. It includes specialized hydraulic and electrical controls and safety devices.

Table 22 System C8 - Armaments projectile, General

System	Subsystem	Title	Definition
C8	-00	Armaments projectile, General	This element refers to the portion of the projectile which carries the payload to the target. It is the basic housing of the bomb or rocket, casing of the projectile, body of a torpedo or the tactical munitions dispenser containing sub-munitions. It also includes those structural devices which provide stability and control (eg, fins, parachutes, anchors).
	-10	Payload	Payload element refers to the subsystem which contains the warhead and its support assemblies. In some munitions such as small arms and munitions, the payload can only be the warhead. With complex munitions the payload can contain sub munitions (the payload subsystem can also include discrete guidance and control, fuse, safety/armament and propulsion systems).

System	Subsystem	Title	Definition
	-20	Fuse	Fuse element refers to the mechanical or electronic device in the projectile designed to detonate or to set forces into action to detonate the charge or primer under desired conditions.
	-30	Initial safety & arming	The initial safety and arming element refers to the device in the projectile which controls the capability of initiating the explosive sequence.
	-40	Secondary safety & arming	The secondary safety and arming element refers to the device in the complete round which controls the capability of initiating the explosive sequence, should the initial safety and arming device fail.

*Table 23 System C9 - Dispenser containing sub-munitions, General*

System	Subsystem	Title	Definition
C9	-00	Dispenser containing sub-munitions, General	This element refers to the portion of the projectile which carries sub-munitions to the target.
	-10	Tactical munitions dispenser	Tactical munitions dispenser containing sub-munitions, other than those contained within the payload.

#### 2.2.4 System D - Electrical system, General

*Table 24 System D0 - Electrical systems, General*

System	Subsystem	Title	Definition
D0	-00	Electrical systems, General	A system or equipment for generation, distribution and/or control of electric power.

*Table 25 System D1 - Launcher electrical systems, General*

System	Subsystem	Title	Definition
D1	-00	Launcher electrical systems, General	This element refers to the electrical or electronic systems for the launcher. It will include wiring harnesses, line replaceable units (LRUs), sensors, lighting, batteries, generators, etc.
	-10	Generating	Refers to generating systems and equipment related to the launcher. It includes such items as alternators, dynamos, generator panels, etc.
	-20	Batteries	Refers to battery equipment related to the launcher. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.

System	Subsystem	Title	Definition
	-30	Instrumentation	Refers to instrumentation systems and equipment related to the launcher. It includes such items as tachometers, speedometers, indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment related to the launcher. It includes such items as inspection lights, etc.
	-50	Wiring	Refers to wiring and cable looms related to the launcher. It includes looms, wires, harnesses, etc.
	-60	Electrical equipment	Refers to electrical equipment related to the launcher. It includes, for example, actuators, engine controls and ignition systems.
	-70	Distribution	Refers to electrical distribution systems and equipment related to the launcher. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the launcher. It includes such items as fuses, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment related to the launcher. It includes such items as controllers, switches, relays, regulators, etc.

*Table 26 System D2 - projectile electrical systems, General*

System	Subsystem	Title	Definition
D2	-00	Projectile electrical systems, General	This element refers to the devices within the projectile which provide electrical power.
	-10	AC power	Refers to AC power systems within the projectile (eg, generators).
	-20	DC power	Refers to DC power systems within the projectile (eg, batteries, quartz crystal).
	-30	External power	That portion of the system within the projectile that connects external electrical power sources (eg, battery charging points).

## 2.2.5 System E - Communications, General

*Table 27 System E0 - Communications, General*

System	Subsystem	Title	Definition
E0	-00	Communications, General	A system or equipment for transferring information.

Table 28 System E1 - Launcher communications, General

System	Subsystem	Title	Definition
E1	-00	Launcher communications, General	The communications element refers to that equipment (hardware/ software) which provides the means within the system for commanding, controlling and transmitting/ receiving information and data to launcher crews and other personnel exterior to the operating environment. This element includes radio frequency equipment, microwave and optic communication links, networked equipment for multiple launcher control and intercoms and external phones systems. It can include navigational system and data displays when these are integral with the equipment of crew stations of the turret assembly or drivers automotive display.
	-10	UHF/SHF/EHF	Refers to that portion of the system used for communications utilizing ultra, super and extra high frequency (UHF, SHF, EHF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-20	VHF	Refers to that portion of the system used for communications utilizing very high frequency (VHF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-30	HF	Refers to that portion of the system used for communications utilizing high frequency (HF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-40	LF	Refers to that portion of the system used for communications utilizing low frequency (LF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-50	Audio	Refers to that portion of the system used for voice communications. It includes such items as intercoms, headphones, loudspeakers, switching/control panels, etc.
	-60	Digital	Refers to that portion of the system used for digital/data communications. It includes modems, encryption devices, etc.
	-70	Satellite	Refers to that portion of the system used for communications via satellites. It includes transmitters, receivers, control, antennas, etc.
	-80	Optical	Refers to that portion of the system used for communications via line-of-site. It includes transmitters, receivers, control, signaling devices, etc.
	-90	Ancillary	Refers to ancillary controls and associated systems. It includes such items as wiring, connectors, etc.

Table 29 System E2 - Launcher identification friend/foe (IFF), General

System	Subsystem	Title	Definition
E2	-00	Launcher identification friend/foe (IFF), General	IFF equipment is common to all services and is therefore interactive with many other users. It covers the equipment (hardware/software) that identifies friend or foe and transmits that information using the launcher communication system(s).
	-10	Transmitting	Refers to that part of the launcher system which is used to send data.
	-20	Receiving	Refers to that part of the launcher system which is used to receive IFF data.
	-30	Indicating	Refers to that part of the launcher system which is used to display IFF data.

Table 30 System E3 - Projectile communications, General

System	Subsystem	Title	Definition
E3	-00	Projectile communications, General	The communications element refers to that equipment (hardware/software) which provides the means within the system for commanding, controlling and transmitting/receiving information and data to the projectile. This element includes radio frequency equipment, microwave and optical communication links and networked equipment for multiple control. It can include navigational system and data displays when these are integral with the projectile equipment.
	-10	UHF/SHF/EHF	Refers to that portion of the system used for communications utilizing ultra, super and extra high frequency (UHF, SHF, EHF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-20	VHF	Refers to that portion of the system used for communications utilizing very high frequency (VHF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-30	HF	Refers to that portion of the system used for communications utilizing high frequency (HF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-40	LF	Refers to that portion of the system used for communications utilizing low frequency (LF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-50	Digital	Refers to that portion of the system used for digital/data communications. It includes modems, encryption devices, etc.
	-60	Satellite	Refers to that portion of the system used for communications via satellites. It includes transmitters, receivers, control, antennas, etc.
	-70	Optical	Refers to that portion of the system used for communications via line-of-site. It includes transmitters, receivers, control, signaling devices, etc.

System	Subsystem	Title	Definition
	-80	Ancillary	Refers to ancillary controls and associated systems. It includes such items as wiring, connectors, etc.

*Table 31 System E4 - Projectile identification friend/foe (IFF), General*

System	Subsystem	Title	Definition
E4	-00	Projectile identification friend/foe (IFF), General	IFF equipment is common to all services and is therefore interactive with many other users. It covers the equipment (hardware/software) within the projectile that identifies friend or foe.
	-10	Transmitting	Refers to that part of the launcher system which is used to send data.
	-20	Receiving	Refers to that part of the launcher system which is used to receive IFF data.
	-30	Indicating	Refers to that part of the launcher system which is used to display IFF data.

## 2.2.6 System F - Navigation, General

*Table 32 System F0 - Navigation, General*

System	Subsystem	Title	Definition
F0	-00	Navigation, General	A system or equipment used to determine, conduct, manage, or plot a position or course.

*Table 33 System F1 - Launcher navigation, General*

System	Subsystem	Title	Definition
F1	-00	Launcher navigation, General	The navigation element refers to that equipment (hardware/software) installed in the launcher which permits the crew to determine location and to plot a course. It includes navigation systems such as dead reckoning, inertial and global positioning systems. Landmark recognition algorithms and processors are also included.
	-10	Independent	Refers to that portion of the system (hardware/software) which provides information to determine position and is independent on ground installations or orbiting satellites. It includes inertial guidance systems, tracking systems, sextants, etc.
	-20	Dependant	Refers to that portion of the system (hardware/software) which provides information to determine position and is mainly dependant on ground installations or orbiting satellites. It includes GPS, radio compass, etc.

System	Subsystem	Title	Definition
	-30	Computing	Refers to that portion of the system (hardware/software) which combines/processes navigational data to compute or manage the geographical position of the launcher. It includes course computers, landmark recognition algorithms, processors, displays, etc.

*Table 34 System F2 - Launcher guidance and control, General*

System	Subsystem	Title	Definition
F2	-00	Launcher guidance and control, General	This system refers to the complex of electronic equipment/hardware/software, based on the launcher, which evaluates and correlates the path of the projectile with target information and which performs the necessary functions to enable the payload to intercept the target. This element also includes emplacement of mines.
	-10	Computers/software	This element refers to any computational devices hardware/software associated with launcher-based guidance and control of the projectile. This element also includes emplacement of mines.
	-20	Control consoles	This element refers to any control consoles (hardware/software), associated with launcher-based guidance and control of the projectile. This element also includes emplacement of mines.

*Table 35 System F3 - Projectile guidance and control, General*

System	Subsystem	Title	Definition
F3	-00	Projectile guidance and control, General	This system refers to the complex of electronic equipment/hardware/software which evaluates and correlates the path of the projectile with target information and which performs the necessary functions to enable the payload to intercept the target. It includes, for example, laser guided bombs.
	-10	Projectile built-in stability mechanisms	This element refers to the control devices within the projectile which provide stability during flight. It does not include fixed fins, etc which form part of the structure.
	-20	Projectile built-in control mechanisms	This element refers to the devices within the projectile which provide guidance control. For example navigation systems, laser target sensors, etc.

## 2.2.7 System G - Surveillance, General

*Table 36 System G0 - Surveillance, General*

System	Subsystem	Title	Definition
G0	-00	Surveillance, General	A system or equipment used to sense the environment.

Applicable to: All

**S1000D-A-08-02-0300-00A-040A-A**

**Chap 8.2.3**

Table 37 System G1 - Launcher surveillance, General

System	Subsystem	Title	Definition
G1	-00	Launcher surveillance, General	The surveillance element is defined as all equipment (hardware/software) and associated systems used to sense the surrounding environment and then process, display and record the resulting information. This can include, for example, Meteorological equipment. It does not include specific thermal imaging or meteorological/atmospheric systems.
	-10	Control	Refers to the processing, control and recording elements of the sensor systems. It includes central processors, analogue/digital converters, associated software, storage units, etc.
	-20	Indicating	Refers to the part of the system used to indicate/monitor sensor information. It includes data identification, indicators, displays panels, etc.
	-30	Recording	Refers to the part of the system used to record sensor information.
	-40	Infra-red	Refers to that portion of a system that uses heat-sensing devices to acquire information. It includes infra-red scanners and image intensifiers. It does not include specific thermal imaging systems.
	-50	Laser	Refers to that portion of a system that uses laser devices to acquire information. It includes distance measuring, target identification, etc.
	-60	Radar	Refers to that portion of a system that uses radar devices to acquire information. It includes antennas, receivers, transmitters, indicators, etc.
	-70	Magnetic	Refers to that portion of a system that uses magnetic sensors to acquire information. It includes magnetometers, amplifiers, processors, indicators, etc.
	-80	Sonar	Refers to that portion of a system that uses sonar to acquire information. It includes modulators, transducers, processors, indicators, etc.
	-90	Acoustic	Refers to that portion of a system that uses sound to acquire information. It includes listening devices, amplifiers, processors, indicators, etc.

Table 38 System G2 - Launcher sensors, General

System	Subsystem	Title	Definition
G2	-00	Launcher sensors, General	The sensor element refers to those systems (hardware/software) within the launcher that provide data required for targeting, launch, arming and payload delivery.

System	Subsystem	Title	Definition
	-10	Radar	The radar element refers to those radar systems (hardware/software) within the launcher that provide data required for targeting, launch, arming and payload delivery.
	-20	Sonar	The sonar element refers to those sonar systems (hardware/software) within the launcher that provide data required for targeting, launch, arming and payload delivery.
	-30	Thermal	The thermal imaging element refers to those thermal imaging and image intensifying systems (hardware/ software) within the launcher that provide data required for targeting, launch, and payload delivery.
	-40	Laser	The laser element refers to those laser target-designator systems (hardware/software) within the launcher that provide data required for targeting, launch, arming and payload delivery.
	-50	Magnetic	The magnetic element refers to those magnetic systems (hardware/software) within the launcher that provide data required for targeting, launch, arming and payload delivery.
	-60	Acoustic	The acoustic element refers to those sound sensing systems (hardware/ software) within the launcher that provide data required for targeting, launch, arming and payload delivery.
	-70	Pressure	The pressure element refers to those pressure systems (hardware/software) within the launcher that provide data required for targeting, launch, arming and payload delivery.
	-80	Proximity	This element refers to the proximity sensing systems (hardware/software) within the launcher that provide proximity sensing data required for targeting, launch, arming and payload delivery.

Table 39 System G3 - Projectile sensors, General

System	Subsystem	Title	Definition
G3	-00	Projectile sensors, General	The sensor element refers to those systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-10	Radar	The radar element refers to those radar systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-20	Sonar	The sonar element refers to those sonar systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-30	Thermal	The thermal imaging element refers to those thermal imaging and image intensifying systems (hardware/ software) within the projectile that provide data required for targeting, launch, and payload delivery.

System	Subsystem	Title	Definition
	-40	Laser	The laser element refers to those laser target-designator systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-50	Magnetic	The magnetic element refers to those magnetic systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-60	Acoustic	The acoustic element refers to those sound sensing systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-70	Pressure	The pressure element refers to those pressure systems (hardware/software) within the projectile that provide data required for targeting, launch, arming and payload delivery.
	-80	Proximity	This element refers to the proximity sensing systems (hardware/software) within the projectile that provide proximity sensing data required for targeting, launch, arming and payload delivery.

*Table 40 System G4 – Meteorological/atmospheric research, General*

System	Subsystem	Title	Definition
G4	-00	Meteorological/ atmospheric research, General	Refers to the systems and devices which furnish a means of providing, processing and recording meteorological data.
	-10	Weather	Refers to that portion of a system which is used to detect, measure, process or record weather (moisture, temperature, cloud, wind, etc) data. It includes hygrometers, thermometers, anemometers, etc.
	-20	Air turbulence	Refers to that portion of a system which is used to detect, measure, process or record air turbulence data.
	-30	Pollutants	Refers to that portion of a system which is used to detect, measure, process or record contaminated particles.
	-40	Magnetic/ gravitational	Refers to that portion of a system which is used to detect, measure, process or record the earth's magnetic or gravitational forces.

## 2.2.8 System H - Steering, General

*Table 41 System H0 - Steering, General*

System	Subsystem	Title	Definition
H0	-00	Steering, General	A system or equipment used to guide or govern direction.

Table 42 System H1 - Launcher guidance, General

System	Subsystem	Title	Definition
H1	-00	<b>Launcher guidance, General</b>	This element refers to the devices within the launcher used to guide or govern direction of the projectile.
	-10	Guidance mechanism	This element refers to the devices (hardware/software) within the launcher used to govern direction of the projectile.

Table 43 System H2 - Projectile guidance, General

System	Subsystem	Title	Definition
H2	-00	Projectile guidance, General	This element refers to the devices within the projectile used to govern direction or placement.
	-10	Projectile direction control	This element refers to the devices within the projectile which provide direction control. For example rudders, etc.

## 2.2.9 System J - Ventilation, heating, cooling, General

Table 44 System J0 - Ventilation/ heating/cooling, General

System	Subsystem	Title	Definition
J0	-00	Ventilation/ heating/cooling, General	A system or equipment used to provide a controlled environment.

Table 45 System J1 - Launcher ventilation/ heating/cooling, General

System	Subsystem	Title	Definition
J1	-00	Launcher ventilation/ heating/cooling, General	This element refers to those subassemblies or components which provide a micro-climatic condition (heating or cooling), for the launcher, including heating/cooling suits or components. It also covers purification systems not covered by NBC.
	-10	Compression	That portion of the system and its controls which supplies pressurized air/gas. Includes items such as controls and indicating systems related to pressure, gas-filled systems, etc.
	-20	Distribution	That portion of the system used to induct and distribute air. It includes equipment rack cooling, seals, demisting, waveguide pressurization system and items of such systems, like blowers, ducting and inlets.
	-30	Heating	That portion of the system and its controls which supply heated air. It includes items such as heater units, wiring, etc.

System	Subsystem	Title	Definition
	-40	Cooling	That portion of the system and its controls which supply cooled air. Includes items such as the cooling unit, indicating systems related to the cooler operation, wiring etc. Does not include temperature control and indicating systems.
	-50	Temperature control	That portion of the system used to control the temperature of the air. Includes items such as, thermal sensing devices, switches, indicators, wiring etc.
	-60	Moisture/air	That portion of the system used to contaminant control moisture in the air, to control ozone concentrations, to filter radioactive debris and chemical/biological contaminants, etc.
	-70	Liquid coolant	Those components required to supply liquid coolant to a cooling system.

*Table 46 System J2 - Projectile ventilation/ heating/cooling, General*

System	Subsystem	Title	Definition
J2	-00	Projectile ventilation/ heating/cooling, General	Those units and components which furnish a means of pressurizing, heating, cooling, moisture controlling, filtering and treating the air/gas used to condition areas of the projectile system environment. It includes cooling, heating, vents, ducts, seals, wiring etc.
	-10	Compression	That portion of the system and its controls which supplies pressurized air/gas. Includes items such as controls and indicating systems related to pressure, gas-filled systems, etc.
	-20	Distribution	That portion of the system used to induct and distribute air. It includes equipment rack cooling, seals, demisting, waveguide pressurization system and items of such systems like blowers, ducting and inlets.
	-30	Heating	That portion of the system and its controls which supply heated air. Includes items such as heater units, wiring, etc.
	-40	Cooling	That portion of the system and its controls which supply cooled air. Includes items such as the cooling unit, indicating systems related to the cooler operation, wiring etc. Does not include temperature control and indicating systems.
	-50	Temperature control	That portion of the system used to control the temperature of the air. Includes items such as, thermal sensing devices, switches, indicators, wiring etc.
	-60	Moisture/air	That portion of the system used to contaminant control moisture in the air, to control ozone concentrations, to filter radioactive debris and chemical/biological contaminants, etc.
	-70	Liquid coolant	Those components required to supply liquid coolant to an equipment cooling system.

## 2.2.10 System K - Hydraulic system, General

*Table 47 System K0 - Hydraulic systems, General*

System	Subsystem	Title	Definition
K0	-00	Hydraulic systems, General	A system or equipment for generation, distribution and/or control of hydraulic (or pneumatic) power.

*Table 48 System K1 - Launcher hydraulic system, General*

System	Subsystem	Title	Definition
K1	-00	Launcher hydraulic system, General	This element refers to a system or equipment within the launcher for the generation, distribution and/or control of hydraulic power.
	-10	Main	This element refers to a system or equipment within the launcher which is used to generate, store, distribute or control hydraulic power. It includes such items as tanks, valves, pumps, plumbing, etc. It does not include user systems classified elsewhere, or their connecting valves.
	-20	Auxiliary	That portion of the launcher hydraulic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main hydraulic system.
	-30	Indicating	That part of the launcher hydraulic system which is used to monitor condition of the hydraulic system or fluid. It includes transmitters, indicators, warning systems, etc.

*Table 49 System K2 - Projectile hydraulic system, General*

System	Subsystem	Title	Definition
K2	-00	Projectile hydraulic system, General	This element refers to a system or equipment within the projectile for the generation, distribution and/or control of hydraulic power.
	-10	Main	This element refers to a system or equipment within the projectile which is used to generate, store, distribute or control hydraulic power. It includes such items as tanks, valves, pumps, plumbing, etc. It does not include user systems classified elsewhere, or their connecting valves.
	-20	Auxiliary	That portion of the projectile hydraulic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main hydraulic system.
	-30	Indicating	That part of the projectile hydraulic system which is used to monitor condition of the hydraulic system or fluid. It includes transmitters, indicators, warning systems, etc.

Table 50 System K3 - Launcher pneumatic systems, General

System	Subsystem	Title	Definition
K3	-00	Launcher pneumatic systems, General	This element refers to a system or equipment (hardware/software) within the launcher for the generation, distribution and/ or control of pneumatic (including vacuum) power.
	-10	Main	This element refers to a system or equipment within the launcher which is used to generate, store, distribute or control pneumatic power. It includes such items as tanks, valves, pumps, plumbing, etc. It does not include user systems classified elsewhere, or their connecting valves.
	-20	Auxiliary	That portion of the launcher pneumatic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main pneumatic system.
	-30	Indicating	That part of the launcher pneumatic system which is used to monitor condition of the system. It includes transmitters, indicators, warning systems, etc.

Table 51 System K4 - Projectile pneumatic systems, General

System	Subsystem	Title	Definition
K4	-00	Projectile pneumatic systems, General	This element refers to a system or equipment (hardware/software) within the projectile for the generation, distribution and/or control of pneumatic (including vacuum) power.
	-10	Main	This element refers to a system or equipment within the projectile which is used to generate, store, distribute or control pneumatic power. It includes such items as tanks, valves, pumps, plumbing, etc. It does not include user systems classified elsewhere, or their connecting valves.
	-20	Auxiliary	That portion of the projectile pneumatic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main pneumatic system.
	-30	Indicating	That part of the projectile pneumatic system which is used to monitor condition of the system. It includes transmitters, indicators, warning systems, etc.

## 2.2.11 System L - Electronic system, General

Table 52 System L0 - Electronic system, General

System	Subsystem	Title	Definition
L0	-00	Electronic system, General	A system or equipment using electronic/automated software and/or firmware elements not specifically included in other systems.

Table 53 System L1 - Launcher electronic system, General

System	Subsystem	Title	Definition
L1	-00	Launcher electronic system, General	This element refers to a system or equipment within the launcher which uses electronic/automated software and/or firmware elements not specifically included in other systems.

Table 54 System L2 - Projectile electronic system, General

System	Subsystem	Title	Definition
L2	-00	Projectile electronic system, General	This element refers to a system or equipment within the projectile which uses electronic/automated software and/or firmware elements not specifically included in other systems.

## 2.2.12 System M - Auxiliary, General

Table 55 System M0 - Auxiliary, General

System	Subsystem	Title	Definition
M0	-00	Auxiliary, General	Subsidiary systems that provide services or support to main systems or equipment.

Table 56 System M1 - Launcher auxiliary systems, General

System	Subsystem	Title	Definition
M1	-00	Launcher auxiliary systems, General	This element refers to subsidiary systems that provide services or support to main systems or equipment related to the launcher system.
	-10	Magazine	The magazine element refers to the structure or compartment for storing ammunition or explosives in a 'ready for use' condition, or position, not directly mounted on the launcher.

Table 57 System M2 - Projectile auxiliary systems, General

System	Subsystem	Title	Definition
M2	-00	Projectile auxiliary systems, General	This element refers to subsidiary systems that provide services or support to main systems or equipment within the projectile.

Table 58 System M3 - Adapter kits, General

System	Subsystem	Title	Definition
M3	-00	Adapter kits, General	The adapter kits element refers to the equipment (hardware/software) for adapting the launch system to particular applications. For example, vehicle adapter kits and for adaption to different aircraft and/ or ship models. Also, kits for backpacking, etc.

## 2.2.13 System N - Survivability, General

Table 59 System N0 - Survivability, General

System	Subsystem	Title	Definition
N0	-00	Survivability, General	A system or equipment used to provide hazard detection, protection, survivability and escape facilities.

Table 60 System N1 - Launcher fire protection systems, General

System	Subsystem	Title	Definition
N1	-00	Launcher fire protection systems, General	This element refers to systems (hardware/software) that provide a warning to the launcher crew that a possible fire hazard exists. It includes the suppression/fire fighting and heat sensors required for this system.
	-10	Detecting	Refers to that part of the system which is used to sense the presence of excessive heat, smoke or fire.
	-20	Indicating	Refers to that part of the system which is used to indicate the presence of excessive heat, smoke or fire.
	-30	Extinguishing	Refers to that part of the system, either fixed or portable, which is used to extinguish fire.

Table 61 System N2 - Launcher nuclear, biological and chemical protection, General

System	Subsystem	Title	Definition
N2	-00	Launcher nuclear, biological and chemical protection, General	The NBC element refers to those subassemblies or components which provide nuclear, biological and chemical detection, protection and survivability to the launcher and/ or crew, either individually or collectively, during an NBC attack. This can include a positive pressure system, purification system, ventilated face piece (mask), NBC detection and warning devices, decontamination equipment and chemical resistant coatings. It can also include environmental control equipment, such as heaters, coolers, etc.
	-10	Pack	Refers to NBC protection packs.
	-20	Control	Refers to NBC protection controls.
	-30	Pressure relief	Refers to pressure relief devices specifically fitted for NBC protection purposes.

Applicable to: All

S1000D-A-08-02-0300-00A-040A-A

Chap 8.2.3

System	Subsystem	Title	Definition
	-40	Door assemblies	Refers to NBC protection fitted to doors and hatches.
	-50	Ancillary	Refers to ancillary controls and associated systems. It can include, for example, such items as wiring, connectors, heaters, coolers and ducting.

*Table 62 System N3 - Projectile fire protection systems, General*

System	Subsystem	Title	Definition
N3	-00	Projectile fire protection systems, General	This element refers to systems (hardware/software) that provide a warning within the projectile that a possible fire hazard exists. It includes the suppression/fire fighting and heat sensors required for this system.
	-10	Detecting	Refers to that part of the system which is used to sense the presence of excessive heat, smoke or fire.
	-20	Indicating	Refers to that part of the system which is used to indicate the presence of excessive heat, smoke or fire.
	-30	Extinguishing	Refers to that part of the system, either fixed or portable, which is used to extinguish fire.

*Table 63 System N4 - Projectile nuclear, biological and chemical protection, General*

System	Subsystem	Title	Definition
N4	-00	Projectile nuclear, biological and chemical protection, General	The NBC element refers to those subassemblies or components which provide nuclear, biological and chemical detection, protection and survivability to the projectile, either individually or collectively, during an NBC attack. This includes a positive pressure system, purification system, NBC detection and protection devices, decontamination equipment and chemical resistant coatings.
	-10	Pack	Refers to NBC protection packs.
	-20	Control	Refers to NBC protection controls.
	-30	Pressure relief	Refers to pressure relief devices specifically fitted for NBC protection purposes.
	-40	Door assemblies	Refers to NBC protection fitted to doors and hatches.
	-50	Ancillary	Refers to ancillary controls and associated systems. It includes such items as wiring, connectors, etc.

## 2.2.14 System P - Special equipment, General

*Table 64 System P0 - Special equipment, General*

System	Subsystem	Title	Definition
P0	-00	Special equipment, General	A system or equipment used to provide a special mission capability.

*Table 65 System P1 - Launcher special to type equipment, General*

System	Subsystem	Title	Definition
P1	-00	Launcher special to type equipment, General	This element refers to that special equipment (hardware/software) to be mated to a launcher, to enable the achievement of a special mission capability, recovery operations, winterization, etc. It can include, for example blades, booms, cranes, winches, robotic arms, and manipulators.
	-10	Launcher special recovery equipment	This element refers to that special recovery equipment (hardware/software) to be mated to a launcher, to enable the achievement of a recovery capability. It includes cranes and towing equipment.
	-20	Launcher special fit equipment	This element refers to that special fit equipment (hardware/software) to be mated to a launcher, to enable the achievement of a specialized capability. It will include supply, DROPS, lift trucks, side loaders, etc.
	-30	Launcher special purpose equipment	This element refers to that special-to-purpose equipment (hardware/software) to be mated to a launcher, for the achievement of a special mission purpose. It covers, for example, ISO container bodies and equipment and other special purpose vehicles.
	-40	Installation kit	The installation kit element refers to the equipment (hardware/software) for installation of the launch system related to a particular application.
	-50	Portability kit	The portability kit refers to that equipment required to prepare the launcher for transportation, other than its prime means of movement.
	-60	Bore variation/velocity change kits	This refers to equipment (hardware/software) designed to affect the velocity of a projectile.
	-70	Winterization kit	The winterization kit element refers to the equipment (hardware/software) for protection of the launcher/ crew, in adverse weather conditions.

Table 66 System P2 - Projectile special equipment/ systems, General

System	Subsystem	Title	Definition
P2	-00	Projectile special equipment/ systems, General	A system or equipment used to provide a special mission capability for the projectile.
	-10	Portability kit	The portability kit refers to that equipment required to prepare projectiles for transportation.

## 2.2.15 System Q - Outfit and furnishings, General

Table 67 System Q0 - Outfit and furnishings, General

System	Subsystem	Title	Definition
Q0	-00	Outfit and furnishings, General	A function or equipment used to provide habitability or operability that is not specifically included in other systems.

Table 68 System Q1 - Launcher stowage, General

System	Subsystem	Title	Definition
Q1	-00	Launcher stowage, General	This element is required to provide for personal equipment stowage as well as operational equipment stowage on or in the launcher.
	-10	Charge bin	Refers to charge bin stowage facilities.
	-20	Shell stowage	Refers to shell stowage facilities.
	-30	Ammunition	Refers to stowage facilities for both secondary and personal ammunition.
	-40	Launcher internal	Refers to stowage facilities within the launcher.
	-50	Launcher external	Refers to stowage facilities mounted on launcher.

Table 69 System Q2 - Complete equipment schedule (CES), General

System	Subsystem	Title	Definition
Q2	-00	Complete equipment schedule (CES), General	This element refers to lists detailing the equipment required by the user to operate and maintain the system. It includes, for example, both fitted and loose items, spares, tools and operator manuals.
	-10	Production CES	This element refers to the production version of the CES.
	-20	Service CES	This element refers to the service version of the CES.

Applicable to: All

S1000D-A-08-02-0300-00A-040A-A

Chap 8.2.3

System	Subsystem	Title	Definition
	-30	Complex CES	This element refers to the complex version of the CES.

*Table 70 System Q3 - Projectile stowage, General*

System	Subsystem	Title	Definition
Q3	-00	Projectile stowage, General	This element is required to provide for equipment stowage on or in the projectile.

## 2.2.16 System R - Training, General

*Table 71 System R0 - Training, General*

System	Subsystem	Title	Definition
R0	-00	Training, General	The training element is defined as the deliverable training services, devices, accessories, aids, equipment and facilities used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency. This element includes all effort associated design, development and production of deliverable training equipment as well as the execution of training services.

*Table 72 System R1 - Training services, General*

System	Subsystem	Title	Definition
R1	-00	Training services, General	The training services element refers to the deliverable training services, used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-10	Devices/ accessories/aids	The training devices/accessories/aids element refers to the deliverable devices, accessories and aids used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-20	Equipment	The training equipment element refers to the deliverable training equipment used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-30	Facilities	The training facilities element refers to the deliverable training facilities used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.

## 2.2.17 System S - Repair, test and support, General

*Table 73 System S0 - Repair test and support, General*

System	Subsystem	Title	Definition
S0	-00	Repair test and support, General	A system, equipment or facilities used to maintain operational capability.

*Table 74 System S1 - Launcher repair facilities, General*

System	Subsystem	Title	Definition
S1	-00	Launcher repair facilities, General	This element refers to the facility which will allow unserviceable launchers to be repaired, tested and returned to service use.
	-10	Mobile	This element refers to a mobile facility which will allow unserviceable launchers to be repaired, tested and returned to service use.
	-20	Fixed	This element refers to a static facility which will allow unserviceable launchers to be repaired, tested and returned to service use.

*Table 75 System S2 - Sighting systems repair facility, General*

System	Subsystem	Title	Definition
S2	-00	Sighting systems repair facility, General	This element refers to equipment (hardware/software) that enables the repair, test or calibration of the optical sighting equipment, including laser range finders for example.
	-10	Mobile	Refers to mobile (man-portable or vehicle mounted) equipment (hardware/software), which can be in a vehicle container or box body, that enables the repair, test and/or calibration of optical sighting equipment.
	-20	Fixed	Refers to static (permanent or temporary) equipment (hardware/software) that enables the repair, test or calibration of optical sighting equipment.

*Table 76 System S3 - Thermal imaging repair facility, General*

System	Subsystem	Title	Definition
S3	-00	Thermal imaging repair facility, General	To provide a transportable facility (hardware/software) whereby thermal imaging equipment including its associated cooling systems can be repaired, tested and returned to service. The equipment covered will include, for example, clean air equipment, jigs, fixtures, computer interface adapters and test equipment.

System	Subsystem	Title	Definition
	-10	Mobile	Refers to mobile (man-portable or vehicle mounted) equipment (hardware/software), which can be in a vehicle container or box body, that enables the repair, test and/or calibration of thermal imaging equipment.
	-20	Fixed	Refers to static (permanent or temporary) equipment (hardware/software) that enables the repair, test or calibration of thermal imaging equipment.

*Table 77 System S4, General purpose electronic repair facility, General*

System	Subsystem	Title	Definition
S4	-00	General purpose electronic repair facility, General	This element refers to equipment (hardware/software) that enables unserviceable electrical/electronic items to be repaired, tested and returned to service use.
	-10	Mobile	Refers to mobile (man-portable or vehicle mounted) equipment (hardware/software), which can be in a vehicle container or box body, that enables the repair, test and/or calibration of general purpose electronic equipment.
	-20	Fixed	Refers to static (permanent or temporary) equipment (hardware/software) that enables the repair, test or calibration of general purpose electronic equipment.

*Table 78 System S5 - Projectile repair facilities, General*

System	Subsystem	Title	Definition
S5	-00	Projectile repair facilities, General	This element refers to the facility which will allow unserviceable projectiles to be repaired, tested and returned to service use.
	-10	Mobile	This element refers to a mobile facility which will allow unserviceable projectiles to be repaired, tested and returned to service use.
	-20	Fixed	This element refers to a static facility which will allow unserviceable projectiles to be repaired, tested and returned to service use.

Table 79 System S6 - Launcher common support equipment, General

System	Subsystem	Title	Definition
S6	-00	Launcher common support equipment, General	The launcher common support equipment element refers to those items required to support and maintain the launcher or portions of the launcher systems while not directly engaged in the performance of its mission, and which are presently in the MOD inventory for support of other systems. This element includes all efforts required to assure the availability of this equipment for support of the particular defense Product item. It also includes the acquisition of additional quantities of this equipment if caused by the introduction of the defense material item into operational service.

Table 80 System S7 - Projectile common support equipment, General

System	Subsystem	Title	Definition
S7	-00	Projectile common support equipment, General	The projectile common support equipment element refers to those items required to support and maintain the projectiles or portions of the projectile systems while not directly engaged in the performance of their mission, and which are presently in the MOD inventory for support of other systems. This element includes all efforts required to assure the availability of this equipment for support of the particular defense Product item. It also includes the acquisition of additional quantities of this equipment if caused by the introduction of the defense material item into operational service.

Table 81 System S8 - Launcher test and measurement equipment, General

System	Subsystem	Title	Definition
S8	-00	Launcher test and measurement equipment, General	The launcher test and measurement equipment element is defined as common testing and measurement equipment which allows an operator or maintenance function to evaluate operational conditions of a launcher system or equipment by performing specific diagnostics, screening or QA effort at an organizational, intermediate, or depot level of equipment support. It includes test measurement and diagnostic equipment, precision measuring equipment, automatic test equipment, manual test equipment, automatic test systems, test program sets, appropriate interconnect devices, automated load modules, tap(s), and related software, firmware and support hardware (power supply equipment, etc) used at all levels of maintenance. It includes packages which enable a line or shop replaceable unit, printed circuit boards, or similar items to be diagnosed using automatic test equipment.

Table 82 System S9 - Projectile test and measurement equipment, General

System	Subsystem	Title	Definition
S9	-00	Projectile test and measurement equipment, General	The projectile test and measurement equipment element is defined as common testing and measurement equipment which allows an operator or maintenance function to evaluate operational conditions of a projectile, subsystem or equipment by performing specific diagnostics, screening or QA effort at an organizational, intermediate, or depot level of equipment support. It includes test measurement and diagnostic equipment, precision measuring equipment, automatic test equipment, manual test equipment, automatic test systems, test program sets, appropriate interconnect devices, automated load modules, tap(s), and related software, firmware and support hardware (power supply equipment, etc) used at all levels of maintenance. It includes packages which enable a line or shop replaceable unit, printed circuit boards, or similar items to be diagnosed using automatic test equipment.

Table 83 System SA - Launcher support and handling equipment, General

System	Subsystem	Title	Definition
SA	-00	Launcher support and handling equipment, General	The launcher support and handling equipment element is defined as the deliverable tools and handling equipment used for support of the launcher system. It typically includes ground support equipment, vehicular support equipment, powered support equipment, non-powered support equipment, and software support equipment.

Table 84 System SB - Projectile support and handling equipment, General

System	Subsystem	Title	Definition
SB	-00	Projectile support and handling equipment, General	The projectile support and handling equipment element is defined as the deliverable tools and handling equipment used for support of the projectile (eg, munitions Product handling equipment and software support equipment).

## 1 General

This is an SNS, for a general communications. It is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

## 2 General communications SNS

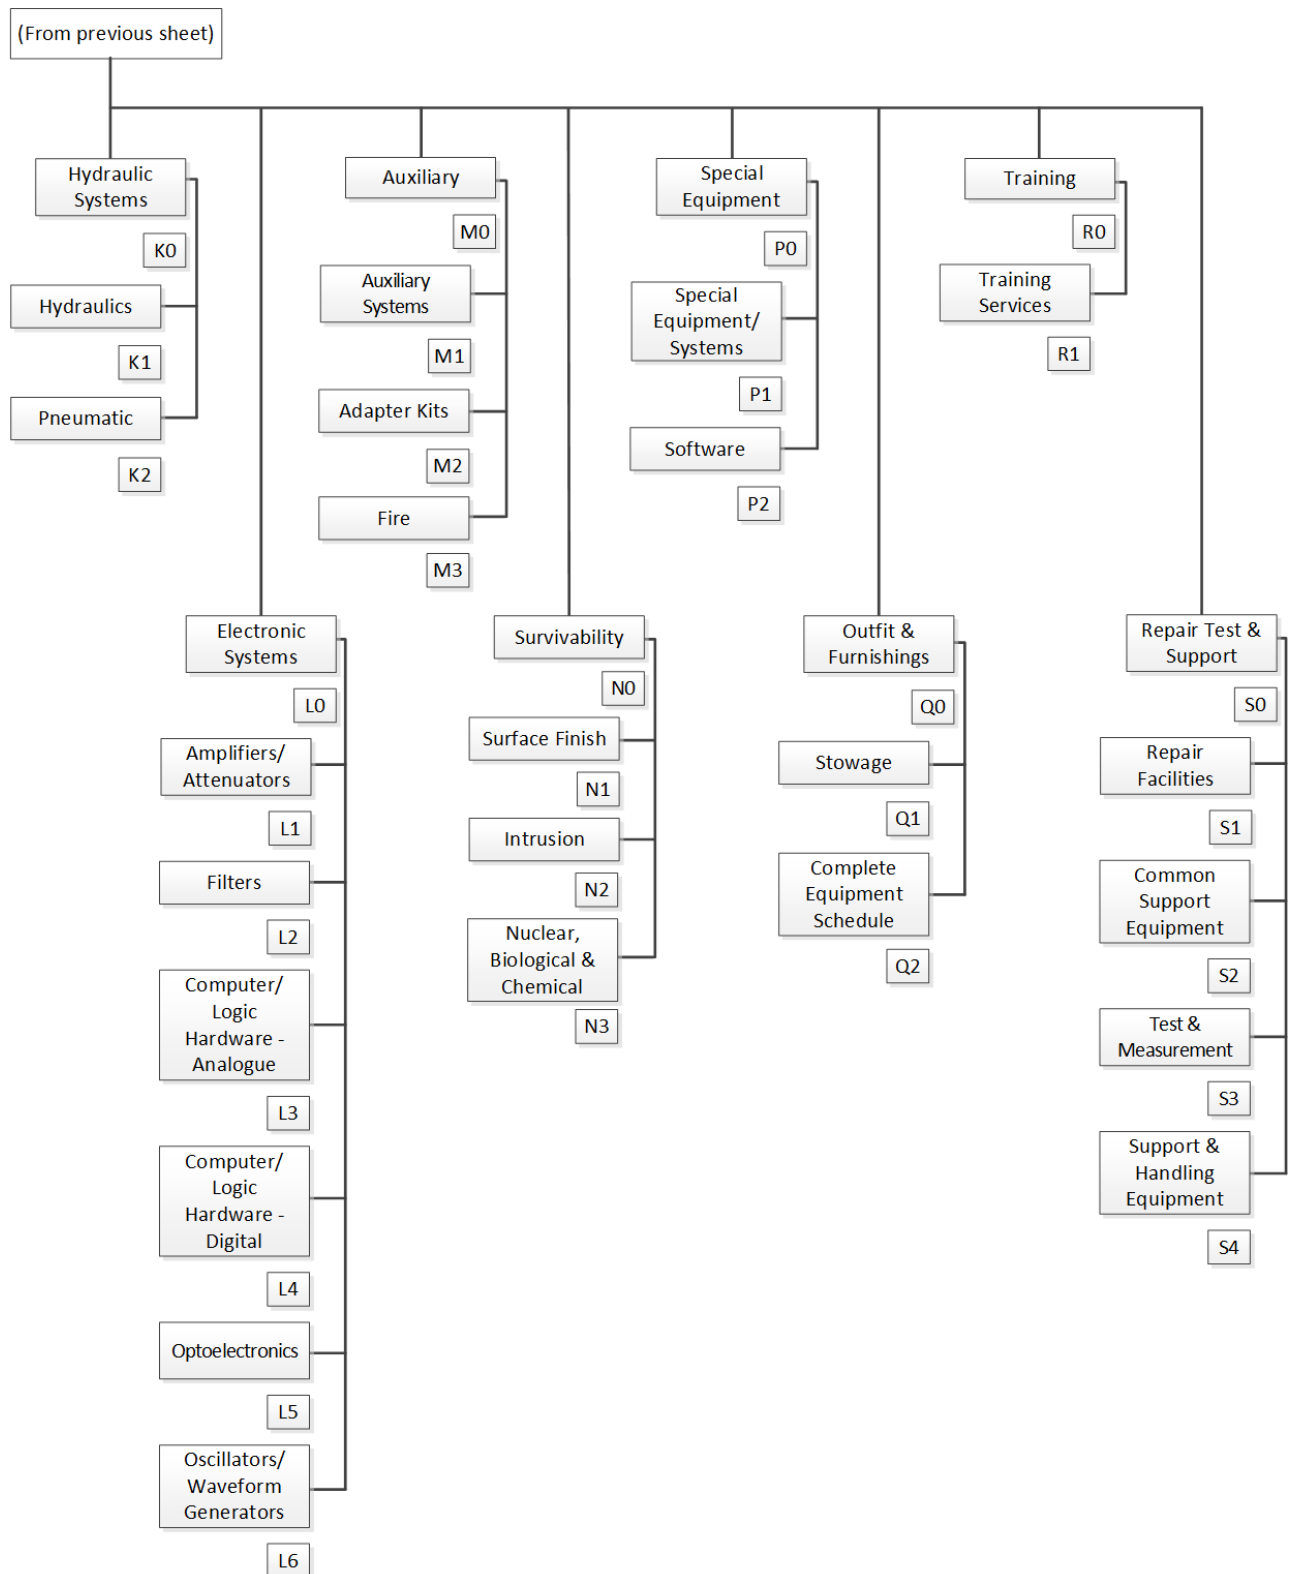

The coding and definitions for the general communications SNS is appropriate for common and system level information for all Products and is described in [Table 2](#) and shown in [Fig 1](#). However, projects can decide not to use this generic SNS.

## 2.2 Definitions of systems and subsystems

### 2.2.1 System A - Propulsion, General

Table 3 System A0 - Propulsion, General

System	Subsystem	Title	Definition
A0	-00	<b>Propulsion, General</b>	A system or equipment for producing and delivering power.

Table 4 System A1 - Power pack, General

System	Subsystem	Title	Definition
A1	-00	<b>Power pack, General</b>	The power pack element refers to a self-contained means for generating and delivering power. It includes such systems as the main engine, transmission and interfaces. Subsystems can include such items as cooling, fuel, air and exhaust, lubrication, auxiliaries and electrical.
	-10	Main engine	Refers to a diesel, petrol, electric, etc, fuelled means for generating power and a means whereby this power can be delivered to the transmission. It can include, for example, engine-mounted flywheel and clutch assemblies, cooling, fuel, air and exhaust, lubrication, auxiliary and electrical systems.
	-20	Transmission	Refers to a system which transmits power from the engine to the driving member and can include torque converter and gearbox. It can also include flywheel and clutch assemblies, steering and brakes if they are integral to the transmission. Also included are differentials and power takeoffs.
	-30	Power pack interfaces	Refers to the mounting assemblies connecting the main engine and transmission, together with associated ancillaries, including such systems as cooling, fuel, air and exhaust, lubrication, auxiliary and electrical. It can also include transmission items.

Table 5 System A2 - Power unit, General

System	Subsystem	Title	Definition
A2	-00	<b>Power unit, General</b>	The power unit element refers to a discrete means for generating and delivering power to the transmission. It can include, for example, flywheel and clutch assemblies.
	-10	Engine	Refers to a diesel, petrol, electric, etc, fuelled means for generating power and a means whereby this power can be delivered to the transmission. It can include, for example, flywheel and clutch assemblies and engine mounted cooling, fuel, air and exhaust, lubrication, auxiliary and electrical systems.
	-20	Cooling system	Refers to systems designed to maintain the correct operating temperatures for the power unit. It includes, for example, cooling air ducting, coolant pumps, liquid filled radiators, intercoolers, fans and associated heat exchange equipment.
	-30	Fuel systems	Refers to a system or equipment designed to deliver fuel to the power unit. It includes, for example, fuel storage facilities, pumps, filters, delivery pipes, drainage and cut-off valves, Fuel Injector Pumps (FIP) and injectors.
	-40	Air and exhaust systems	Refers to a system which supplies air to, or collects and removes exhaust gasses from the engine. It includes, for example, all pipes, ducting, filters, couplings, gaskets, turbochargers/superchargers, silencers and catalytic converters.
	-50	Lubrication systems	Refers to a system that provides lubrication to the power unit and any external components related to the power unit lubrication system. It includes, for example, delivery and return pipes, pumps, filters, intercoolers and separately mounted heat exchangers.
	-60	Electrical	Refers to a system that provides or uses electrical power associated with the power unit. It includes, for example, starter motors, alternators and generators directly mounted on the power unit. It also includes, for example, ignition system components including spark plugs, distributor, coils and leads .
	-70	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the power unit. It includes, for example, engine mountings.
	-80	Hydraulic	Refers to a system that provides or uses hydraulic power associated with the power unit. It includes, for example, hydraulic pumps, valves, pipes, and tanks. It also includes any external components related to the power unit hydraulic systems.

Table 6 System A3 - Engine cooling system, General

System	Subsystem	Title	Definition
A3	-00	<b>Engine cooling system, General</b>	This system includes cooling air ducting, coolant pumps, liquid filled radiators, fans and associated heat exchange equipment.
	-10	Fluid	Refers to fluid (water/oil) filled coolant systems. It includes pumps, radiators, fans, pipes and associated heat exchange equipment.
	-20	Air	Refers to cooling air ducting, fans and associated heat exchange equipment.

Table 7 System A4 - Fuel systems, General

System	Subsystem	Title	Definition
A4	-00	<b>Fuel systems, General</b>	Equipment to provide fuel storage facilities, filters, delivery pipes, drainage and cut-off valves, Fuel Injector Pumps (FIP) and injectors mounted externally to the power unit/pack.
	-10	Storage	Refers to the portion of the system which stores fuel. It includes, for example, tanks, filler necks, seals, valves, vents and drainage.
	-20	Distribution	Refers to the portion of the system which is used to distribute fuel from the storage system. It includes, for example, filters, restrictors, valves, controls and pipes.
	-30	Priming	Refers to the portion of the system which is used to pressurize/pump the fuel. It includes, for example, lift pumps, pressurization pumps, and cold starting systems.
	-40	Fuel injection	Refers to the portion of the system which delivers fuel. It includes, for example, FIP, fuel injectors, fuel pump metering and carburetors.
	-50	Indicating	Refers to the portion of the system which is used to monitor the condition of fuel (quantity, temperature and pressure). It includes, for example, transmitters, indicators, wiring and pressure warning systems.
	-60	Venting and de-fuelling	Refers to the portion of the system which is used to vent fumes from the fuel system and to provide a means for removing/dumping unwanted fuel.

Table 8 System A5 - Air and exhaust systems, General

System	Subsystem	Title	Definition
A5	-00	<b>Air and exhaust systems, General</b>	Refers to a system which supplies and filters air to the engine and collects and removes exhaust gases from the engine. It includes, for example, all filters, pipes, couplings, silencers, catalytic converters and ducting mounted externally to the power unit/pack.

Applicable to: All

S1000D-A-08-02-0400-00A-040A-A

Chap 8.2.4

System	Subsystem	Title	Definition
	-10	Air system	Refers to a system which supplies and filters air to the engine. It includes, for example, pre-filters, main air filters, and associated ducting. It can also include air cooling/heating systems and intercoolers.
	-20	Collector	Refers to that portion of the system which collects exhaust gases from the engine manifold. It includes pipes, joints, gaskets, etc.
	-30	Noise suppression	Refers to that portion of the system which reduces noise produced by the engine exhaust gases. It includes silencers, baffles, shields, etc.
	-40	Emission control	Refers to that portion of the system which is designed to reduce or eliminate engine exhaust gas emissions. It includes, for example, catalytic converters and tail pipes.

*Table 9 System A6 - Lubrication systems, General*

System	Subsystem	Title	Definition
A6	-00	<b>Lubrication systems, General</b>	This system is to include lubrication storage facilities that are external to the engine/power pack. It includes delivery and return pipes, pumps, filters and heat exchangers mounted externally to the power unit/pack.
	-10	Storage	Refers to the part of the system used for storage of engine and/or transmission lubricating oil. It includes tanks, filling systems, sumps, drains, etc.
	-20	Distribution	Refers to the part of the system used for distribution of lubricating oil to and from the engine and/or transmission. It includes pipes, pumps, filters, valves, etc.
	-30	Indicating	Refers to the part of the system used to monitor the condition of engine and/or transmission lubricating oil (quantity, temperature and pressure). It includes transmitters, indicators, wiring, pressure warning systems, etc.

*Table 10 System A7 - Transmission, General*

System	Subsystem	Title	Definition
A7	-00	<b>Transmission, General</b>	Refers to a means to transmit power from the engine to the driving member and can include clutch, torque converter, gearbox. It can also include steering and brakes if they are integral to the transmission. Also included are differentials and power takeoffs.
	-10	Gearbox	Refers to a means for varying the speed/torque delivered from the power unit to the driving member. It can include the steering control and brake assemblies.

System	Subsystem	Title	Definition
	-20	Steering control assembly	Refers to a discrete means for varying the drive applied, through the transmission system, to each of the vehicle's driving members (eg, tracked vehicles).
	-30	Brake assembly	Refers to a discrete means for applying braking forces through the vehicle transmission (eg, tracked vehicles).
	-40	Auxiliary drive/power takeoff	Refers to an auxiliary means of obtaining an output from the engine. It includes transfer gearboxes which can also include a slip differential.
	-50	Clutch	Refers to a means for engaging/disengaging the transmission to/from the engine, when fitted as a separate assembly (for clutches fitted to a flywheel, see A21000).
	-60	Drive shaft	Refers to the means for connecting power output from the engine to the driving member. It includes muff couplings, propeller shafts, universal joints and final drives.
	-70	Torque converter	Refers to a means for varying the torque delivered from the engine to the driving member.
	-80	Differential	Refers to a means for changing the direction of rotation delivered from the engine to the driving member or wheels. For wheeled vehicles, it includes the driving axles, half shafts, hubs, etc.

Table 11 System A8 - Automotive/remote piloting and digital control systems, General

System	Subsystem	Title	Definition
A8	-00	<b>Automotive/remote piloting and digital control systems, General</b>	The automotive and remote piloting and Digital Automotive Control System (DACS) element refers to that equipment (hardware/software) installed in the vehicle which is used to plan and control vehicle speed and direction either autonomously or via tele-operation. This includes equipment which senses, processes and displays imagery data such as stereo vision systems, laser scanners, multiple sensor fusion algorithms and processors, image enhancement algorithms and processors etc. This includes, for example, equipment which performs intelligence analysis and planning functions such as automated route planners, image understanding algorithms and processors, computer aided driving algorithms, DACS and processors.
	-10	Control	Refers to processing and control elements. It includes central processors, analogue/digital converters, associated software, memory boards, servo units, actuators, associated wiring, etc.
	-20	Sensors	Refers to sensors which are specifically associated with providing inputs to an automotive/remote piloting system or DACS.
	-30	Indicators	Refers to the part of the system used to indicate/monitor an automotive/remote piloting system or DACS. It includes indicators, wiring, etc.

Applicable to: All

S1000D-A-08-02-0400-00A-040A-A

Chap 8.2.4

Table 12 System A9 - Controls (drivers), General

System	Subsystem	Title	Definition
A9	-00	<b>Controls (drivers), General</b>	Given in this element are the controls required to start, stop, steer and generally control the vehicle commensurate with the mobility role of the equipment. It includes, for example, on-board diagnostic systems.
	-10	Foot controls	Refers to the foot-operated controls to start, stop, steer and generally control the vehicle. It includes, for example, pedal assemblies (clutch, brake, accelerator, etc), associated linkages, cables, hydraulic/pneumatic connections, master and slave cylinders, brake shoes and pads and disks and drums.
	-20	Hand controls	Refers to the hand-operated controls to start, stop, steer and generally control the vehicle. It includes, for example, stop/start, steering (wheel, tiller, etc) and braking controls.
	-30	Ancillary controls	Refers to ancillary controls and associated systems. It includes, for example, such items as screen wash equipment, windscreen wipers and adjustable wing mirrors.
	-40	Propulsion control systems	Refers to systems which monitor and/or control engine speed and performance.
	-50	Instrumentation	Refers to systems (hardware/software) which monitor/report on the operation of vehicle systems. It includes, for example, the drivers instrumentation panel, warning lights and condition monitoring systems.

### 2.2.2 System B - Structure, General

Table 13 System B0 - Structure, General

System	Subsystem	Title	Definition
B0	-00	<b>Structure, General</b>	Framework and/or basic structural housing for a system, including load bearing components.

Table 14 System B1 – Hull/frame, General

System	Subsystem	Title	Definition
B1	-00	<b>Hull/frame, General</b>	This element refers to the vehicles primary load bearing component which provides the structural integrity to withstand the operational loading stresses generated while traversing various terrain profiles. This element could be a simple wheeled vehicle frame or a more complicated combat vehicle hull which satisfies not only the structural requirements but also provides armor protection. It includes all structural subassemblies and appendages which attach directly to the primary structure. This element, for example, includes towing and lifting fittings, bumpers, hatches and grilles. It also includes provision to accommodate other Subsystems such as mountings for suspension, weapons, turret, track body, cab, special equipment, loads etc.
	-10	Internal mountings	Refers to internal fitments mounted on the hull/frame. It includes brackets, stud welding, floors and insulation panels.
	-20	External mountings	Refers to the chassis and external fitments mounted on the hull/frame. It includes brackets, stud welding, steps, bumpers, mud-guards, windows, etc.
	-30	Doors/hatches	Refers to loading/entry hatches and doors in, or directly mounted on, the hull/frame assembly. It includes shell loading doors, driver and passenger doors, hatches, locks, handles, drivers/operators hoods, cowls and windshields, etc.
	-40	Seats	Refers to seating which is directly mounted on the hull/frame.
	-50	Drinking water tank	Refers to a system designed to provide drinking water for the driver and crew, which is directly mounted on the hull/frame. It includes tanks, filler necks, filters, pipes, seals, valves, vents, drainage, etc.
	-60	Access cover plates	Refers to access cover plates directly mounted on the hull/frame. It includes, for example, guards, plugs, drain/inspection covers. It can also include deck area assemblies.
	-70	Gun crutch/depression rails	Refers to gun crutch and depression rails directly mounted on the hull/frame.
	-80	Skirting plates/brackets/splash plates	Refers to skirting plates, brackets and splash plates directly mounted on the hull/frame. It includes the plates and associated fittings, brackets, towing attachments, etc.

Table 15 System B2 - Body/cab, General

System	Subsystem	Title	Definition
B2	-00	<b>Body/cab, General</b>	Refers to the major components to be mated to a chassis or frame to provide a complete vehicle having a defined mission capability. This element includes accommodation for personnel, cargo, and such subsystems as need to be placed in proximity of the operators.

System	Subsystem	Title	Definition
	-10	Internal mountings	Refers to internal fitments mounted on the body/cab. It includes panels, brackets, clips, fascia, instrument panels, stud welding, internal windows, etc.
	-20	External mountings	Refers to external fitments mounted on the body/cab. It includes the external cab assembly, panels, brackets, stud welding, steps, windows, cab tilt and locking mechanism, etc.
	-30	Doors/hatches	Refers to loading/entry hatches and doors in, or directly mounted on, the body/cab. It includes loading doors, driver and passenger doors, hatches, locks, handles, etc.
	-40	Seats	Refers to seating and associated fittings which are directly mounted on the body/cab. It includes, for example, seat belts and harnesses.
	-50	Drinking water tank	Refers to a system designed to provide drinking water for the driver and crew, which is directly mounted on the body/cab. It includes tanks, filler necks, filters, pipes, seals, valves, vents, drainage, etc.
	-60	Access panels	Refers to access panels directly mounted on the body/cab.
	-70	Load bay	Refers to load (or passenger) carrying areas in the body/cab and any soft/hard top covering, supports, etc.
	-80	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the body or cab.

Table 16 System B3 - Suspension/track/wheels, General

System	Subsystem	Title	Definition
B3	-00	<b>Suspension/track/wheels, General</b>	This element refers to the means for generating tractive effort, thrust and lift, generally at or in proximity to the earth's surface and adapting the vehicle to the irregularities of the surface. It includes, for example, wheels, tracks and steering gears for traction and control functions. Also, it includes springs, shock absorbers, skirts and other suspension members such as track adjusting mechanisms. It does not include specific steering mechanisms.
	-10	Suspension unit	Refers to the means for adapting the vehicle to irregularities of the surface. It includes hydrogas units, shock absorbers, leaf and coil springs, pneumatic suspension units, etc. Also included is the lift mechanism, skirts, etc, for hovercraft.
	-20	Road wheel/hub assembly	Refers to a means for distributing the nominal ground pressure of the vehicle. On wheeled vehicles, it includes wheels that transfer tractive effort to the surface and rolling wheels. It includes road wheels, hub assemblies, tires, valves, inner-tubes, etc.
	-30	Sprocket wheel assembly	Refers to the sprocket drive wheels which transfer tractive effort to the track.
	-40	Track assembly	Refers to the track and associated linkages.

System	Subsystem	Title	Definition
	-50	Idler wheels	Refers to the feed/guide mechanism(s) associated with track laying. It includes idler wheels and track tensioners.
	-60	Roller assembly	Refers to the track roller guide assemblies.
	-70	Axle	Refers to non-driving axles not covered under the transmission system. It includes axle arms, links, bearings, etc.

Table 17 System B4 - Turret assembly, General

System	Subsystem	Title	Definition
B4	-00	<b>Turret assembly, General</b>	The turret assembly refers to the structures and equipment installation required to provide the fighting compartment element of combat vehicles. This element includes turret armour, EMC shielding, turret rings, slip rings, attachments and appendages such as latches and cupolas, and accommodation for personnel, weapons and C <sup>3</sup> I.
	-10	Internal mountings	Refers to internal fitments mounted in the turret. It includes drinking water installations, periscope mountings, panels, brackets, clips, stud welding, etc.
	-20	External mountings	Refers to external fitments mounted on the turret. It includes brush deflector assemblies, cooler boxes, gun covers, splash curtains, panels, brackets, stud welding, etc.
	-30	Hatches	Refers to loading/entry hatches in, or directly mounted on, the turret. It includes loading hatches, crew hatches and associated locks, handles, fittings, etc. It does not include cupolas.
	-40	Seats	Refers to seating which is directly mounted in the turret.
	-50	Ring assembly	Refers to a circular track and roller/ball-race assembly designed to facilitate turret rotation.
	-60	Cupola	Refers to a roof aperture and domed hatch assembly, primarily for observation purposes. It can be capable of rotation, and can also provide access for entry/exit.
	-70	Elevating/traversing gearbox	Refers to elevating traversing gearboxes mounted on the turret wall.
	-80	Turntable assembly	Refers to the turret turntable assembly. It includes drive and roller assemblies, RBJ mountings, etc.
	-90	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the turret. It includes such items as wash/wipe equipment, turret and elevation locks, position indicators and adjustable mirrors, etc.

Table 18 System B5 - Structures and buildings, General

System	Subsystem	Title	Definition
B5	-00	<b>Structures and buildings, General</b>	This element refers to the structural portion of the electronic/automated software system. It includes, for example, frames, chassis, racks, etc.
	-10	Frame/chassis	Refers to the structural frame or chassis of the electronic/automated software system.
	-20	Rack	Refers to the mounting rack of the electronic/automated software system.
	-30	Fixtures/fittings	Refers to fixtures and fittings in the racks of the electronic/automated software system. It includes, for example, blank panels, runners, bonding rails, anti-vibration mounts, grilles, cable trays and guides.
	-40	Encapsulation	Refers to the enclosure of items within the electronic/automated software system by use of a potting compound.

Table 19 System B6 - Sites, General

System	Subsystem	Title	Definition
B6	-00	<b>Sites, General</b>	This element refers to the physical make-up of a site where an electronic/automated software system is installed or housed. It includes, for example, boundaries, buildings, chambers, radomes and hard-standing.
	-10	Buildings	Refers to the buildings in which the electronic/automated software system is housed.
	-20	Radomes	Refers to the radomes in which the electronic/automated software system is housed.
	-30	Chambers	Refers to the chambers in the electronic/automated software system. It includes, for example, underground chambers, cable and EMP vaults, secure and other storage areas.
	-40	Hard standing	Refers to hard standing on the site where the electronic/automated software system is installed or located.

Table 20 System B7 - Masts, General

System	Subsystem	Title	Definition
B7	-00	<b>Masts, General</b>	Refers to structures erected to provide support for antennas etc. It includes, for example, masts, towers and securing equipment.
	-10	Masts	Refers to those erected structures which are not free-standing.
	-20	Towers	Refers to those erected structures which are free-standing.

System	Subsystem	Title	Definition
	-30	Securing equipment	Refers to the equipment and devices which is used to secure masts, towers and antennas.

*Table 21 System B8 - Containers, General*

System	Subsystem	Title	Definition
B8	-00	<b>Containers, General</b>	Refers to containers that form part of the electronic/automated software system. It includes, for example, ISO containers, cabins and cases.
	-10	ISO containers	Refers to ISO containers which form part of the electronic/automated software system.
	-20	Cabins	Refers to cabins which form part of the electronic/automated software system.
	-30	Cases	Refers to covers and cases which form part of the electronic/automated software system.

### 2.2.3 System C - Armaments, General

*Table 22 System C0 - Armaments, General*

System	Subsystem	Title	Definition
C0	-00	<b>Armaments, General</b>	A defensive or offensive system or equipment (including small arms and machine guns).

### 2.2.4 System D - Electrical system, General

*Table 23 System D0 - Electrical systems, General*

System	Subsystem	Title	Definition
D0	-00	<b>Electrical systems, General</b>	A system or equipment for generation, distribution and/or control of electric power.

*Table 24 System D1 - Mobile electrical systems (engine/power pack), General*

System	Subsystem	Title	Definition
D1	-00	<b>Mobile electrical systems (engine/power pack), General</b>	This element refers to the electrical or electronic systems for the engine/power pack. It will include wiring harnesses, line replaceable units (LRUs), sensors, lighting, batteries, generators, etc.
	-10	Generating	Refers to generating systems and equipment in the engine/power pack compartment that are not directly mounted on the engine/power-pack. It includes such items as alternators, dynamos, generator panels, etc.

Applicable to: All

**S1000D-A-08-02-0400-00A-040A-A**

**Chap 8.2.4**

System	Subsystem	Title	Definition
	-20	Batteries	Refers to battery equipment mounted in the engine/power pack compartment. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Instrumentation	Refers to instrumentation systems and equipment mounted in the engine/power pack compartment. It includes such items as tachometers, speedometers, indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment mounted in the engine/power pack compartment. It includes such items as inspection lights, etc.
	-50	Wiring	Refers to wiring and cable looms mounted in the engine/power pack compartment. It includes looms, wires, harnesses, etc.
	-60	Electrical equipment	Refers to electrical equipment mounted in the engine/power pack compartment. It includes, for example, actuators, engine controls and ignition systems.
	-70	Distribution	Refers to electrical distribution systems and equipment mounted in the engine/power pack compartment. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment mounted in the engine/power pack compartment. It includes such items as fuses, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment mounted in the engine/power pack compartment. It includes such items as controllers, switches, relays, regulators, etc.

Table 25 System D2 - Mobile electrical systems (hull/frame), General

System	Subsystem	Title	Definition
D2	-00	<b>Mobile electrical systems (hull/frame), General</b>	This element refers to the electrical or electronic systems for the hull and frame. It will include both internal and external wiring harnesses, junction and distribution boxes, line replaceable units (LRUs), sensors and lighting systems. It also includes the interfaces and connectors associated with the engine, power pack, generating and starting systems.
	-10	Internal electrical systems	Refers to the internal electrical or electronic systems mounted in the hull/frame. It will include, for example, wiring harnesses, LRUs, junction and distribution boxes. It also includes the interfaces and connectors associated with the engine, power pack, generating and starting systems.
	-20	Batteries	Refers to battery equipment related to the hull/frame. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Internal lights	Refers to lighting systems mounted internally in the hull/frame.

Applicable to: All

S1000D-A-08-02-0400-00A-040A-A

Chap 8.2.4

System	Subsystem	Title	Definition
	-40	External electrical systems	Refers to the electrical or electronic systems mounted externally on the hull/frame. It will include, for example, external lighting systems, horns and flashing beacons.
	-50	Wiring	Refers to wiring, cable looms and clips related to the hull/frame or associated with connecting to the engine/power pack. It includes looms, wires, clips, harnesses, connectors, etc.
	-60	Electrical equipment	Refers to electrical equipment related to the hull/frame. It includes, for example, actuators, wiper controls, heaters, cooking pots, horns, radio fittings and ancillary items.
	-70	Distribution	Refers to electrical distribution and interconnecting systems and equipment related to the hull/frame. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the hull/frame. It includes such items as fuses, fuse panels, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment related to the hull/frame. It includes such items as controllers, switches, relays, regulators, etc.

Table 26 System D3 - Mobile electrical systems (body/cab), General

System	Subsystem	Title	Definition
D3	-00	<b>Mobile electrical systems (body/cab), General</b>	This element refers to the electrical or electronic systems for either the body or cab. It will include wiring harnesses, line replaceable units (LRUs), sensors and lighting systems.
	-10	Generating	Refers to generating systems and equipment related to the body/cab. It includes such items as generator control panels, etc.
	-20	Batteries	Refers to battery equipment related to the body/cab. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Instrumentation	Refers to instrumentation systems and equipment related to the body/cab. It includes such items as indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment related to the body/cab. It includes such items as inspection lights, head lights, spot lights, tail/side lights, indicators, panel lights, convoy lights, etc.
	-50	Wiring	Refers to wiring and cable looms related to the body/cab. It includes looms, wires, harnesses, earthing straps, etc.

System	Subsystem	Title	Definition
	-60	Electrical equipment	Refers to electrical equipment related to the body cab. It includes, for example, actuators, wiper controls, heaters, cooking pots and horns.
	-70	Distribution	Refers to electrical distribution systems and equipment related to the body/cab. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the body/cab. It includes such items as fuses, fuse panels, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment related to the body/cab. It includes such items as controllers, switches, relays, regulators, etc.

*Table 27 System D4 - Mobile electrical systems (turret), General*

System	Subsystem	Title	Definition
D4	-00	<b>Mobile electrical systems (turret), General</b>	This element refers to the electrical or electronic systems for the turret. It will include wiring harnesses, line replaceable units (LRUs), sensors and lighting systems.
	-10	Generating	Refers to generating systems and equipment related to the turret. It includes such items as generator control panels, etc.
	-20	Batteries	Refers to battery equipment related to the turret. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Instrumentation	Refers to instrumentation systems and equipment related to the turret. It includes such items as indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment related to the turret. It includes such items as inspection lights, panel lights, roof lights, spot lights, convoy lights, etc.
	-50	Wiring	Refers to wiring and cable looms related to the turret. It includes looms, wires, harnesses, earthing straps, etc.
	-60	Electrical equipment	Refers to electrical equipment related to the turret. It includes, for example, actuators, wiper controls, heaters and cooking pots.
	-70	Distribution	Refers to electrical distribution systems and equipment related to the turret. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the turret. It includes such items as fuses, fuse panels, fusible links, trip switches, etc.

System	Subsystem	Title	Definition
	-90	Control	Refers to control systems and equipment related to the turret. It includes such items as controllers, switches, relays, regulators, etc.

*Table 28 System D5 - Power Supply, General*

System	Subsystem	Title	Definition
D5	-00	<b>Power supply, General</b>	Refers to the systems, subsystems, equipment and devices which provide power for a non-mobile facility. It includes, for example, AC power, DC power, external power and protection.

## 2.2.5 System E - Communications, General

*Table 29 System E0 - Communications, General*

System	Subsystem	Title	Definition
E0	-00	<b>Communications, General</b>	A system or equipment for transferring information.

*Table 30 System E1 - Communications systems, General*

System	Subsystem	Title	Definition
E1	-00	<b>Communications systems, General</b>	This element refers to the devices within the electronic/automated software system which provide the means for transmitting and receiving data. It includes, for example, fixed, tactical and mobile systems.
	-10	UHF/SHF/EHF	Refers to that portion of the electronic/automated software system that is used for communications utilizing UHF/SHF/EHF carriers (excluding satellite). It includes, for example, transmitters, receivers, antennas, signal processors, modems, etc.
	-20	VHF	Refers to that portion of the electronic/automated software system that is used for communications utilizing VHF carriers. It includes, for example, transmitters, receivers, antennas, signal processors, modems, etc.
	-30	HF	Refers to that portion of the electronic/automated software system that is used for communications utilizing HF carriers. It includes, for example, transmitters, receivers, antennas, signal processors, modems, etc.
	-40	LF	Refers to that portion of the electronic/automated software system that is used for communications utilizing LF carriers. It includes transmitters, receivers, antennas, signal processors, modems, etc.

System	Subsystem	Title	Definition
	-50	Digital	That portion of the electronic/automated software system that is used for digital/data communications. It includes, for example, data processors and DC line bays.
	-60	Audio/video	Refers to that portion of the electronic/automated software system that is used for audio and visual communications. It includes, for example, telephone equipment, fax machines, public address systems, modems and audio line bays.
	-70	Satellite	Refers to that portion of the electronic/automated software system that is used for communications via satellite. It includes, for example, satellite ground stations, fixed, transportable and portable satellite ground terminals.
	-80	Command & control	Refers to that portion of the electronic/automated software system that is used for command and control. It includes, for example, network and system control centers and other command and control subsystems.
	-90	Signal distribution	Refers to that portion of the electronic/automated software system that distributes signals. It includes, for example, switching matrices, combiners, dividers, slip-rings and commutators.

Table 31 System E2 - Connectivity, General

System	Subsystem	Title	Definition
E2	-00	<b>Connectivity, General</b>	Refers to that portion of the electronic/automated software system that provides connectivity. It includes, for example, landlines, twin-feeders, waveguides, inter and intra connection cabling, fiber optic cables and patching facilities.
	-10	Landlines	Refers to that portion of the electronic/automated software system that provides connectivity via landline.
	-20	Twin feeders	Refers to that portion of the electronic/automated software system that provides connectivity via twin feeders.
	-30	Inter-connectivity	Refers to that portion of the electronic/automated software system that provides inter-connectivity
	-40	Intra-connectivity	Refers to that portion of the electronic/automated software system that provides intra-connectivity
	-50	Optical fibre	Refers to that portion of the electronic/automated software system that provides connectivity via optical fiber cables.
	-60	Patching facilities	Refers to that portion of the electronic/automated software system that provides patching/switching facilities within the connectivity area. It includes, for example, jack-field panels.
	-70	Power cables	Refers to that portion of the electronic/automated software system that provides power connectivity.

Table 32 System E3 - Antennas, General

System	Subsystem	Title	Definition
E3	-00	<b>Antennas, General</b>	Refers to that portion of the electronic/automated software system that radiates or absorbs electromagnetic waves.
	-10	UHF/SHF/EHF	Refers to that portion of the electronic/automated software system that radiates or absorbs electromagnetic waves in the UHF/SHF/EHF frequency bands.
	-20	VHF	Refers to that portion of the electronic/automated software system that radiates or absorbs electromagnetic waves in the VHF frequency band.
	-30	HF	Refers to that portion of the electronic/automated software system that radiates or absorbs electromagnetic waves in the HF frequency band.

Table 33 System E4 - Tempest, General

System	Subsystem	Title	Definition
E4	-00	<b>Tempest, General</b>	Refers to that portion of the system that provides TEMPEST protection. It includes, for example, cages and vaults.
	-10	Cages	Refers to the cages in the electronic/automated software systems that provide TEMPEST protection.
	-20	Vaults	Refers to the vaults in the electronic/automated software systems that provide TEMPEST protection.

## 2.2.6 System F - Navigation, General

Table 34 System F0 - Navigation, General

System	Subsystem	Title	Definition
F0	-00	<b>Navigation, General</b>	A system or equipment used to determine, conduct, manage, or plot a position or course.

Table 35 System F1 - Navigation systems, General

System	Subsystem	Title	Definition
F1	-00	<b>Navigation systems, General</b>	Refers to that portion of the electronic/automated software system that provides range, bearing and/or height information for the system.
	-10	Radar	Refers to that portion of the electronic/automated software system which uses radar principles to provide range, bearing and/or height information. It includes, for example, air defense, precision and tracking radars.

-20	Radio guidance	Refers to that portion of the electronic/automated software system which uses modulated radio waves to provide range, bearing and/or height information. It includes, for example, beacons, landing aids and direction finding equipment.
-30	Laser	Refers to that portion of the electronic/automated software system which uses laser principles to provide range, bearing and/or height information.
-40	Satellite	Refers to that portion of the electronic/automated software system which uses satellites to provide range, bearing and/or height information. It includes, for example, both satellite and ground positioning elements.
-50	Magnetic	Refers to that portion of the electronic/automated software system which uses magnetic principles to provide range and/or bearing information. It includes, for example, compasses.
-60	Thermal	Refers to that portion of the electronic/automated software system which uses heat sensing or infra-red principles to provide range, bearing and/or height information.
-70	Optical	Refers to that portion of the electronic/automated software system which uses optical sighting to provide range, bearing and/or height information.

## 2.2.7 System G - Surveillance, General

Table 36 System G0 - Surveillance, General

System	Subsystem	Title	Definition
G0	-00	<b>Surveillance, General</b>	A system or equipment used to sense the environment.

Table 37 System G1 - Surveillance systems, General

System	Subsystem	Title	Definition
G1	-00	<b>Surveillance systems, General</b>	Refers to that portion of the electronic/automated software system which senses, monitors and, where required provides alarms and environmental data. It includes, for example, radar, sonar, thermal, optical and environmental technologies.
	-10	Radar	Refers to that portion of the electronic/automated software system which uses the principles of radar.
	-20	Sonar	Refers to that portion of the electronic/automated software system which uses the principles of sonar.
	-30	Thermal	Refers to that portion of the electronic/automated software system which uses thermal imaging/intensifying and temperature monitoring principles. It includes, for example, electronic thermostats and IR detectors.

System	Subsystem	Title	Definition
	-40	Optical	Refers to that portion of the electronic/automated software system which uses optical and/or laser principles. It includes, for example, CCTV.
	-50	Magnetic	Refers to that portion of the electronic/automated software system which uses magnetic principles.
	-60	Acoustic	Refers to that portion of the electronic/automated software system which uses acoustic principles.
	-70	Pressure	Refers to that portion of the electronic/automated software system which operates through pressure sensing techniques.
	-80	Proximity	Refers to that portion of the electronic/automated software system which operates through proximity sensing techniques.
	-90	Environmental	Refers to that portion of the electronic/automated software system which provides environmental data. It includes, for example, air quality (NBC, smoke) and weather (anemometer) monitoring.

## 2.2.8 System H - Steering, General

Table 38 System H0 - Steering, General

System	Subsystem	Title	Definition
H0	-00	<b>Steering, General</b>	A system or equipment used to guide or govern direction.

Table 39 System H1 - Steering systems, General

System	Subsystem	Title	Definition
H1	-00	<b>Steering systems, General</b>	Refers to those units and devices within the electronic/automated software system which govern movement and/or direction of assemblies. It includes, for example, motors, gearboxes, drives and turning gear.
	-10	Motors	Refers to the motor drive units within the electronic/automated software system which affect movement and/or direction of assemblies.
	-20	Gearboxes	Refers to the geared units within the electronic/automated software system which vary torque, speed and/or direction of movement of assemblies.
	-30	Drives	Refers to the interconnecting links between motor, gearbox and device, within the electronic/automated software system, which affect movement and/or direction of assemblies.
	-40	Turning gear	Refers to the final drive link to moving assemblies within the electronic/automated software system.

System	Subsystem	Title	Definition
	-50	Control systems	Refers to those units within the electronic/automated software system which control movement and/or direction of assemblies.

## 2.2.9 System J - Ventilation cooling & heating

*Table 40 System J0 - Ventilation cooling & heating*

System	Subsystem	Title	Definition
J0	-00	<b>Ventilation cooling &amp; heating</b>	A system or equipment used to provide a controlled environment.

*Table 41 System J1 - Ventilation cooling & heating systems, General*

System	Subsystem	Title	Definition
J1	-00	<b>Ventilation cooling &amp; heating systems, General</b>	Refers to those units and devices which furnish a means of pressurizing, heating, cooling, moisture controlling, filtering and treating the air/gas used to condition areas of the electronic/automated software system environment. It includes, for example, cooling, heating, vents, ducts and seals.
	-10	Compression	Refers to that portion of the electronic/automated software system which supplies pressurized air/gas. It includes, for example, gas-filled systems, controls and indicating systems.
	-20	Distribution	Refers to that portion of the electronic/automated software system used to induct and distribute air/gas. It includes, for example, rack cooling, seals, demisting, blowers, ducting and inlets.
	-30	Heating	Refers to that portion of the electronic/automated software system and its controls which supply heated air/gas. It includes, for example, heater units, control and indicating systems.
	-40	Cooling	Refers to that portion of the electronic/automated software system and its controls which supply cooled air/gas. It includes, for example, cooling units, control and indicating systems.
	-50	Temperature control	Refers to that portion of the electronic/automated software system used to control the temperature of the air/gas. It includes, for example, sensing devices, switches and indicators.
	-60	Moisture/air	Refers to that portion of the electronic/automated software system used to contaminant control the air/gas. It includes, for example, control of moisture and/or ozone concentrations, filtration of radioactive debris and removal of chemical/biological contaminants.

System	Subsystem	Title	Definition
	-70	Liquid coolant	Refers to those units and devices within the electronic/automated software system which supply liquid coolant to an equipment cooling system.

## 2.2.10 System K - Hydraulic systems, General

*Table 42 System K0 - Hydraulic systems, General*

System	Subsystem	Title	Definition
K0	-00	<b>Hydraulic systems, General</b>	A system or equipment for generation, distribution and/or control of hydraulic (or pneumatic) power.

*Table 43 System K1 - Hydraulic, General*

System	Subsystem	Title	Definition
K1	-00	<b>Hydraulic, General</b>	Refers to that portion of the electronic/automated software system which generates, distributes and/or controls hydraulic power.
	-10	Main	Refers to that portion of the electronic/automated software system which generates, distributes and/or controls primary hydraulic power. It includes, for example, tanks, valves, pumps and plumbing. It does not include user systems classified elsewhere, or their connecting valves.
	-20	Auxiliary	Refers to that portion of the electronic/automated software hydraulic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main hydraulic system.
	-30	Indicating	Refers to that portion of the electronic/automated software hydraulic system which is used to monitor its condition. It includes, for example, transmitters, indicators and alarm systems.
	-40	Support	Refers to that portion of the electronic/automated software system which is used to hydraulically raise or lower other units.

*Table 44 System K2 - Pneumatic, General*

System	Subsystem	Title	Definition
K2	-00	<b>Pneumatic, General</b>	Refers to that portion of the electronic/automated software system which generates, distributes and/or controls pneumatic (including vacuum) power.
	-10	Main	Refers to that portion of the electronic/automated software system which generates, distributes and/or controls primary pneumatic (including vacuum) power. It includes, for example, tanks, valves, pumps and plumbing. It does not include user systems classified elsewhere, or their connecting valves.

Applicable to: All

**S1000D-A-08-02-0400-00A-040A-A**

**Chap 8.2.4**

System	Subsystem	Title	Definition
	-20	Auxiliary	Refers to that portion of the electronic/automated software pneumatic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main pneumatic system.
	-30	Indicating	Refers to that portion of the electronic/automated software pneumatic system which is used to monitor its condition. It includes, for example, transmitters, indicators and alarm systems.
	-40	Pressurization	Refers to that portion of the electronic/automated software system which is used to pressurize cables, waveguides, and other system devices. It includes, for example, dehydrators and compressors.

### 2.2.11 System L - Electronic system, General

*Table 45 System L0 - Electronic system, General*

System	Subsystem	Title	Definition
L0	-00	<b>Electronic system, General</b>	A system or equipment using electronic/automated software and/or firmware elements not specifically included in other systems.

*Table 46 System L1 - Amplifiers/attenuators, General*

System	Subsystem	Title	Definition
L1	-00	<b>Amplifiers/attenuators, General</b>	Refers to equipment and devices within the electronic/automated software system which increase or decrease the magnitude of a signal, voltage or current. It applies to elements not specifically included in other groups.
	-10	Audio	Refers to equipment and devices within the electronic/automated software system which increase or decrease the magnitude of a signal, voltage or current within the audio frequency range (up to 30 kHz).
	-20	Power	Refers to equipment and devices within the electronic/automated software system which increase or decrease the magnitude of a signal, voltage or current with a power of greater than or equal to 5 watts.
	-30	RF	Refers to equipment and devices within the electronic/automated software system which increase or decrease the magnitude of a signal, voltage or current within the radio frequency range.

Table 47 System L2 - Filters, General

System	Subsystem	Title	Definition
L2	-00	<b>Filters, General</b>	Refers to that portion of the electronic/automated software system, which passes or rejects a signal, voltage or current. It applies to elements not specifically included in other groups.
	-10	Low-pass	Refers to equipment and devices within the electronic/automated software system which pass low-frequency and reject high frequency signals.
	-20	High-pass	Refers to equipment and devices within the electronic/automated software system which reject low-frequency and pass high frequency signals.
	-30	Band-pass	Refers to equipment and devices within the electronic/automated software system which pass signals within a defined frequency band.
	-40	Band-stop	Refers to equipment & devices within the electronic/automated software which reject signals within a range.

Table 48 System L3 - Computer/logic hardware-analogue, General

System	Subsystem	Title	Definition
L3	-00	<b>Computer/logic hardware-analogue, General</b>	Refers to equipment and devices within the electronic/automated software system which process or store analogue data. It applies to elements not specifically included in other groups.
	-10	Processing	Refers to equipment and devices within the electronic/automated software system which perform a process on a signal, voltage or current. It includes, for example, mixers, converters, decoders and microwave devices (including couplers, cavity devices and circulators).
	-20	Input	Refers to equipment and devices within the electronic/automated software system which provide a means for inputting analogue data. It includes, for example, acoustic couplers, work stations, analogue controls and microphones.
	-30	Output	Refers to equipment and devices within the electronic/automated software system which provide a means of outputting analogue data. It includes, for example, headphones, loudspeakers, moving coil displays, visual display units and projectors.
	-40	Data storage	Refers to equipment and devices within the electronic/automated software system which retain analogue data. It includes, for example, video and audio recorders.
	-50	Multiplexer	Refers to equipment and devices within the electronic/automated software system which multiplex and/or switch signals. It includes, for example, time division multiplexers and switching multiplexers.

System	Subsystem	Title	Definition
	-60	Comparator/ discriminator/ integrator	Refers to equipment and devices within the electronic/automated software system which compare, discriminate and/or integrate signals.

*Table 49 System L4 - Computer/logic hardware-digital, General*

System	Subsystem	Title	Definition
L4	-00	<b>Computer/logic hardware-digital, General</b>	Refers to equipment and devices within the electronic/automated software system which process or store digital data. It applies to elements not specifically included in other groups.
	-10	Processing	Refers to equipment and devices within the electronic/automated software system which receive and perform arithmetic and/or logic operations on digital data. It includes, for example, central processing units and math co-processors.
	-20	Input	Refers to equipment and devices within the electronic/automated software system which provide a means of inputting digital data. It includes, for example, punched tape readers, keyboards, digital joysticks, mice and image scanners.
	-30	Output	Refers to equipment and devices within the electronic/automated software system which provide a means of outputting digital data. It includes, for example, printers, plotters and monitors.
	-40	Data storage	Refers to equipment and devices (other than memory) within the electronic/automated software system which retain data and/or instructions. It includes, for example, floppy, hard and optical disks, magnetic tape and CD-ROM.
	-50	Memory	Refers to equipment and devices within the electronic/automated software system which store data or instructions. It includes, for example, RAM, ROM and bubble memory
	-60	Control	Refers to equipment and devices within the electronic/automated software system which control internal and/or external processes.

*Table 50 System L5 - Optoelectronics, General*

System	Subsystem	Title	Definition
L5	-00	<b>Optoelectronics, General</b>	Refers to equipment and devices within the electronic/automated software system which generate or detect radiation above the radio spectrum (including infra-red, ultra-violet and x-rays). It applies to elements not specifically included in other groups.

System	Subsystem	Title	Definition
	-10	Fiber-optic	Refers to equipment and devices within the electronic/automated software system which interface to and/or enhance the performance of fiber optic cables. It includes, for example, adapters, drivers, repeaters and ITLs.
	-20	Measurement	Refers to equipment and devices within the electronic/automated software system which measure light. It includes, for example, photometers.
	-30	Detection	Refers to equipment and devices within the electronic/automated software system which detect light. It includes, for example, photo-cells and cameras.
	-40	Emission	Refers to equipment and devices within the electronic/automated software system which emit light. It includes, for example, bulbs, lasers and LEDs.
	-50	Switching	Refers to equipment and devices within the electronic/automated software system which switches light. It includes (eg, beam splitters and resonating mirrors).

Table 51 System L6 - Oscillators/waveform generators, General

System	Subsystem	Title	Definition
L6	-00	<b>Oscillators/ waveform generators, General</b>	Refers to equipment and devices within the electronic/automated software system which produce varying or switched waveforms. It includes, for example, oscillating devices, timing subsystems and station clocks. It applies to elements not specifically included in other groups.
	-10	Astable	Refers to equipment and devices within the electronic/automated software system which continually switch or oscillate from one state to another.
	-20	Bistable	Refers to equipment and devices within the electronic/automated software system which can switch between two states.

## 2.2.12 System M - Auxiliary systems, General

Table 52 System M0 - Auxiliary systems, General

System	Subsystem	Title	Definition
M0	-00	<b>Auxiliary systems, General</b>	Refers to equipment and devices within the electronic/automated software system which provide services and/or support to the main systems or equipment. It applies to elements not specifically included in other groups.

Table 53 System M1 - Adapter kits, General

System	Subsystem	Title	Definition
M1	-00	<b>Adapter kits, General</b>	Refers to equipment and devices within the electronic/automated software system which adapt the system to particular applications.

Table 54 System M2 - Fire, General

System	Subsystem	Title	Definition
M2	-00	<b>Fire, General</b>	Refers to equipment and devices within the electronic/automated software system which provide a means of alerting and/or dealing with fire hazards. It includes, for example, detection and extinguishing facilities.
	-10	Detecting	Refers to equipment and devices within the electronic/automated software system which is used to sense the presence of excessive heat, smoke or flame.
	-20	Indicating	Refers to equipment and devices within the electronic/automated software system which is used to indicate the presence of excessive heat, smoke or flame.
	-30	Protection	Refers to equipment and devices within the electronic/automated software system which is used to extinguish fires.

## 2.2.13 System N - Survivability, General

Table 55 System N0 - Survivability, General

System	Subsystem	Title	Definition
N0	-00	<b>Survivability, General</b>	A system or equipment used to provide hazard detection, protection, survivability and escape facilities.

Table 56 System N1 - Surface finish, General

System	Subsystem	Title	Definition
N1	-00	<b>Surface finish, General</b>	Refers to equipment and devices within the electronic/automated software system which provides protection against corrosion. It includes, for example, painting, plating, dip coating and laminating.

Table 57 System N2 - Intrusion, General

System	Subsystem	Title	Definition
N2	-00	<b>Intrusion, General</b>	Refers to equipment and devices within the electronic/automated software system which provide a means of detecting and indicating an intrusion.

System	Subsystem	Title	Definition
	-10	Detecting	Refers to equipment and devices within the electronic/automated software system which provide a means of detecting an intrusion.
	-20	Indicating	Refers to equipment and devices within the electronic/automated software system which provide a means of indicating an intrusion.
	-30	Protection	Refers to equipment and devices within the electronic/automated software system which provide a means of protecting against an intrusion.

Table 58 System N3 - Nuclear, biological, chemical

System	Subsystem	Title	Definition
N3	-00	<b>Nuclear, biological, chemical</b>	Refers to equipment and devices within the electronic/automated software system which provide nuclear, biological and chemical detection, protection and survivability. It applies to elements not specifically included in other groups and includes positive pressure and purification systems, NBC detection and warning devices, decontamination equipment and chemical resistant coatings. It can also include environmental control equipment, such as heaters, coolers, etc.
	-10	Detecting	Refers to equipment and devices within the electronic/automated software system which detects an NBC hazard.
	-20	Indicating	Refers to equipment and devices within the electronic/automated software system which indicates an NBC hazard.
	-30	Protection	Refers to equipment and devices within the electronic/automated software system which provides a means of protection against an NBC hazard.

#### 2.2.14 System P - Special Equipment, General

Table 59 System P0 - Special equipment, General

System	Subsystem	Title	Definition
P0	-00	<b>Special equipment, General</b>	A system or equipment used to provide a special mission capability.

Table 60 System P1 - Special equipment/systems, General

System	Subsystem	Title	Definition
P1	-00	<b>Special equipment/systems, General</b>	Refers to equipment and devices within the electronic/automated software system which can be used to provide a special capability for the system.
	-10	Special recovery equipment	This element refers to that special recovery equipment to enable the achievement of a recovery capability. It includes cranes and towing equipment.
	-20	Launcher special fit equipment	This element refers to that special fit equipment to enable the achievement of a specialized capability. It will include supply, DROPS, lift trucks, side loaders, etc.
	-30	Launcher special purpose equipment	This element refers to that special-to-purpose equipment for the achievement of a special mission purpose. It covers, for example, ISO container bodies and equipment and other special purpose vehicles.
	-40	Installation kit	The installation kit element refers to the equipment for installation of the system related to a particular application.
	-50	Portability kit	The portability kit refers to that equipment required to prepare the system for transportation, other than its prime means of movement.
	-60	Winterization kit	The winterization kit element refers to the equipment for protection of the equipment and/or crew, in adverse weather conditions.

Table 61 System P2 - Software, General

System	Subsystem	Title	Definition
P2	-00	<b>Software, General</b>	Refers to software and associated items for the electronic/automated software system which cannot be linked to other areas within the SNS.

## 2.2.15 System Q - Outfit and furnishings, General

Table 62 System Q0 - Outfit and furnishings, General

System	Subsystem	Title	Definition
Q0	-00	<b>Outfit and furnishings, General</b>	A function or equipment used to provide habitability or operability that is not specifically included in other systems.

Table 63 System Q1 - Stowage, General

System	Subsystem	Title	Definition
Q1	-00	<b>Stowage, General</b>	Refers to provision for stowage of operational and/or personnel equipment.

Applicable to: All

S1000D-A-08-02-0400-00A-040A-A

Chap 8.2.4

Table 64 System Q2 - Complete equipment schedule (CES), General

System	Subsystem	Title	Definition
Q2	-00	<b>Complete equipment schedule, General</b>	This element refers to lists detailing the equipment required by the user to operate and maintain the system. It includes, for example, both fitted and loose items, spares, tools and operator manuals.
	-10	Production CES	This element refers to the production version of the CES.
	-20	Service CES	This element refers to the service version of the CES.
	-30	Complex CES	This element refers to the complex version of the CES.

## 2.2.16 System R - Training, General

Table 65 System R0 - Training, General

System	Subsystem	Title	Definition
R0	-00	<b>Training, General</b>	The training element is defined as the deliverable training services, devices, accessories, aids, equipment and facilities used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the electronic/automated software system with maximum efficiency. This element includes all effort associated with design, development and production of deliverable training equipment as well as the execution of training services.

Table 66 System R1 - Training services, General

System	Subsystem	Title	Definition
R1	-00	<b>Training services, General</b>	Refers to the deliverable training services used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-10	Training devices/ accessories/ aids	Refers to the deliverable devices, accessories and aids used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-20	Training equipment	Refers to the deliverable training equipment used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-30	Training facilities	Refers to the deliverable training facilities used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.

## 2.2.17 System S - Repair test and support, General

*Table 67 System S0 - Repair test and support, General*

System	Subsystem	Title	Definition
S0	-00	<b>Repair test and support, General</b>	A system, equipment or facilities used to maintain operational capability.

*Table 68 System S1 - Repair facilities, General*

System	Subsystem	Title	Definition
S1	-00	<b>Repair facilities, General</b>	Refers to the facilities which will allow unserviceable electronic/automated software systems to be repaired, programmed, tested, calibrated and returned to service use.

*Table 69 System S2 - Common support equipment, General*

System	Subsystem	Title	Definition
S2	-00	<b>Common support equipment, General</b>	Refers to common equipment and devices required to support and maintain the electronic/automated software system, whilst not directly engaged in the performance of its mission. The common support equipment must presently exist in the MOD inventory for support of other systems (ie, GFE). It also includes the acquisition of additional quantities of this equipment, where necessary, to support introduction of the electronic/automated software system into operational service.

*Table 70 System S3 - Test and measurement, General*

System	Subsystem	Title	Definition
S3	-00	<b>Test and measurement, General</b>	Refers to that peculiar or unique test and measurement equipment which allows an operator or maintainer to evaluate operational conditions of the system, including specific diagnostics, screening or QA effort at a unit, intermediate or base level of equipment support. It includes, for example, installation and maintenance test equipment, BIT/BITE, GPTE and STTE.
	-10	Installation	Refers to the test and measurement equipment which is used during the installation and commissioning process of the system.
	-20	Maintenance	Refers to the test and measurement equipment which is required during the performance of both corrective and preventive maintenance of the system.

System	Subsystem	Title	Definition
	-30	BIT/BITE	Refers to the built-in test and measurement equipment which provides a means of monitoring and/or testing the performance and/or condition of the system.
	-50	STTE	Refers to the test and measurement equipment which is special to type. The STTE must not exist in the present MOD inventory for support of other systems (ie, Not GFE).
	-40	GPTE	Refers to the test and measurement equipment which is general purpose. The GPTE must presently exist in the MOD inventory for support of other systems (ie, GFE). It also includes the acquisition of additional quantities of this equipment, where necessary, to support introduction of the electronic/automated software system into operational service.
	-60	NDT & specialist testing	Refers to the test and measurement of the structural integrity of structures and devices within the electronic/automated software system, through non-destructive means. It includes, for example, ultrasonic, dye-penetrant and X-ray techniques.

Table 71 System S4 - Support and handling equipment, General

System	Subsystem	Title	Definition
S4	-00	<b>Support and handling equipment, General</b>	The support and handling equipment element is defined as the deliverable tools and handling equipment used for support of the electronic/automated software system (eg, ground support equipment, mechanical handling equipment and software support equipment).

<a href="#">Chap 1.5</a>	Request for change
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system
<a href="#">Chap 8.2.1</a>	Maintained SNS - Generic

## 1 General

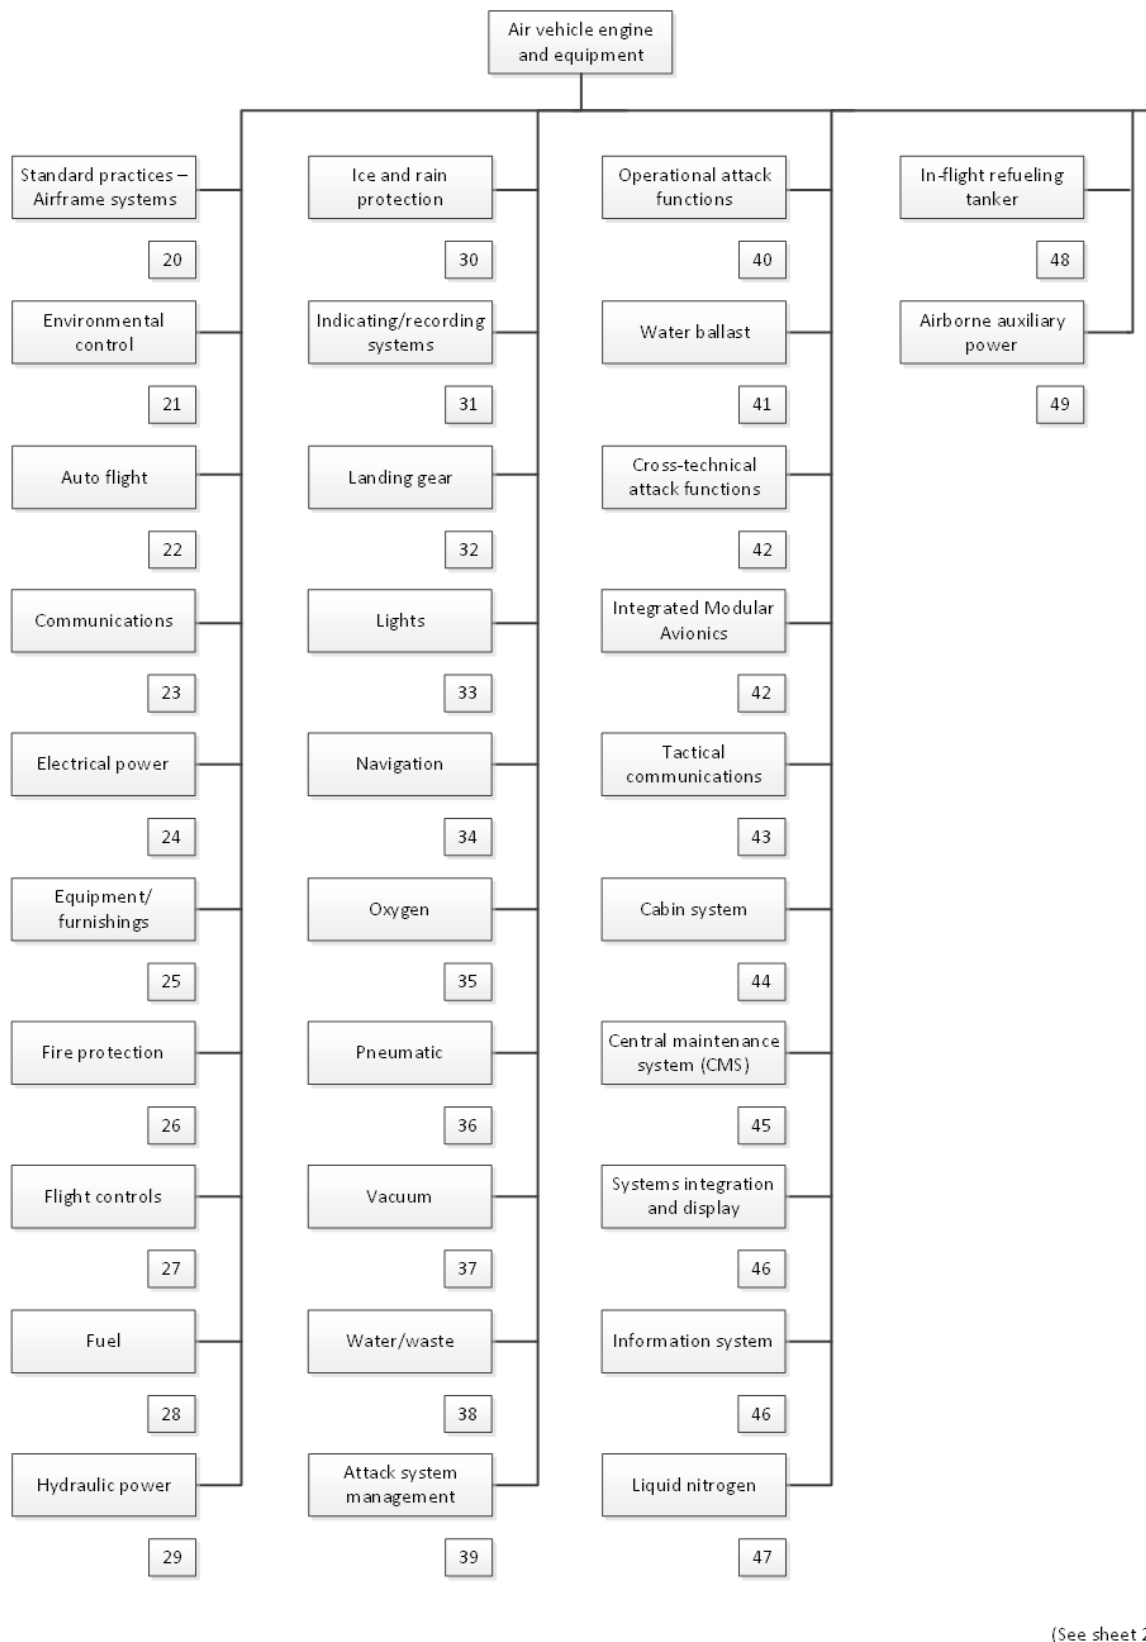

The SNS is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

This chapter gives the definitions for the systems and subsystems, which relate to systems and subsystems, for Air Vehicle, Engines and Equipment (AVEE). For details on how to use this SNS within the data module code, refer to [Chap 4.3.3](#).

## 2 Air vehicle, engines and equipment SNS

The coding and definitions for the AVEE SNS is appropriate for common and system level information for all Products and is described in [Table 2](#) and shown in [Fig 1](#). However, projects can decide not to use this SNS.

### 2.1.2 Definitions of systems and subsystems

This SNS is to be supplemented with the generic SNS given at [Chap 8.2.1](#).

### 2.1.3 System 20 - Standard practices - Airframe systems

*Table 3 System 20 - Standard practices - Airframe systems*

System	Subsystem	Title	Definition
20		<b>Standard practices - Airframe systems</b>	This System contains those standard mechanical and electrical electric/engineering practices applicable to more than one airframe system task which are not covered in systems 21 thru 49. It excludes those practices which are recognized as standard trade practices and also those practices/processes which are only applicable to manufacture. Practices for a particular application must be included in the appropriate airframe system as part of the procedure.
	-00	General	Standard practices applicable to all airframe systems.
	-10 thru -90		Sections -10 thru -90 are used to describe standard practice. The manufacturer or manufacturing partners can assign the section numbers to suit generic standard practices related to more than one airframe system.

### 2.1.4 System 21 - Environmental control

*Table 4 System 21 - Environmental control*

System	Subsystem	Title	Definition
21		<b>Environmental control</b>	Those units and components which furnish a means of pressurizing, heating, cooling, moisture controlling, filtering and treating the air used to ventilate the areas of the fuselage within the pressure seals. Includes cabin supercharger, equipment cooling, heater, heater fuel system, expansion turbine, valves, scoops, ducts, cabin seals, etc. Also includes such systems as canopy/door seals, anti-g, demisting, waveguide pressurization, etc.
	-00	General	
	-10	Compression	That portion of the system and its controls which supplies compressed air. Includes items such as controls and indicating systems related to the compressors, wiring, etc. Does not include the pressure control and indicating system for the cabin pressurization.
	-20	Distribution	That portion of the system used to induct and distribute air. Includes equipment rack cooling, canopy/door seals, anti-g, demisting, waveguide pressurization system and items of such systems like blowers, scoops, ducting, inlets, valves, wiring, etc. Does not include valves which are part of pressurization and temperature control.
	-30	Pressurization control	That portion of the system used to control the pressure within the fuselage. Includes items such as control valves, relief valves, indicators, switches, amplifiers, wiring, etc.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-40	Heating	That portion of the system and its controls which supply heated air. Includes items such as heater units, fuel system and control, ignition indicating systems related to heater operation, wiring, etc. Does not include temperature control and indicating systems.
	-50	Cooling	That portion of the system and its controls which supply cooled air. Includes items such as the cooling unit, indicating systems related to the cooler operation, wiring, etc. Does not include temperature control and indicating systems.
	-60	Temperature control	That portion of the system used to control the temperature of the air. Includes items such as control valves, thermal sensing devices, switches, indicators, amplifiers, wiring, etc.
	-70	Moisture/air contaminant control	That portion of the system used to control moisture in the air, to control ozone concentrations, to filter radioactive debris and chemical/biological contaminants from conditioned air, and to treat the air with deodorizers, insecticides, etc.
	-80	Liquid/gas coolant	Those components required to supply liquid/gas coolant to an equipment cooling system.
	-90	Integrated environmental control system (ECS)	That portion of the system which provides integrated functionality for conditioned, cooled, heated, pressurized air, NBC filtration, and emergency ventilation to sustain crew and component operation over wide range of temperatures. This includes avionics (component racks) cooling.

### 2.1.5 System 22 - Auto flight

Table 5 System 22 - Auto flight

System	Subsystem	Title	Definition
22		<b>Auto flight</b>	Those units and components which furnish a means of automatically controlling the flight of the air vehicle. Includes those units and components which control direction, heading, attitude, altitude and speed.
	-00	General	
	-10	Autopilot	That portion of the system that uses radio/radar signals, directional and vertical references, air data (pitot static), computed flight path data, or manually induced inputs to the system to automatically control the flight path of the air vehicle through adjustment to the pitch/roll/yaw axis or wing lift characteristics and provide visual cues for flight path guidance (ie, Integrated Flight Director). This includes power source devices, interlocking devices and amplifying, computing, integrating, controlling, actuating, indicating and warning devices such as computers, servos, control panels, indicators, warning lights, etc.

System	Subsystem	Title	Definition
	-20	Speed-attitude correction	That portion of the system that automatically maintains safe flight conditions by correcting for effects of speed and out-of-trim conditions by such means as automatic trim, mach trim or speed stability and mach feel. This includes sensing, computing, actuating, indicating, internal monitoring, and warning devices, etc.
	-30	Auto throttle	That portion of the system that automatically controls the position of the throttles to properly manage engine power during all phases of flight/attitude. This includes engaging, sensing, computing, amplifying, controlling, actuating and warning devices such as amplifiers, computers, servos, limit switches, clutches, gear boxes, warning lights, etc.
	-40	System monitor	That which provides separate or external monitoring/remote readout (for maintenance or other purposes) not directly related to the internal system monitoring (for system integrity flight crew warning). This includes sensing, computing, indicating and warning devices, control panels, etc.
	-50	Aerodynamic load alleviating	The system or portion of the system that automatically corrects/provides for gust loading/ upset, aerodynamic augmentation/ alleviations/ suppression, ride control, etc. This includes sensing, computing, actuating indicating internal monitoring, warning devices, etc.

## 2.1.6 System 23 - Communications

Table 6 System 23 - Communications

System	Subsystem	Title	Definition
23		<b>Communications</b>	Those units and components which furnish a means of communicating from one part of the air vehicle to another and between the air vehicle or ground stations. Includes voice, data C-W communicating components, PA system, intercom and tape reproducers-record player.
	-00	General	
	-10	Speech communication	That portion of the system which utilizes voice modulated electromagnetic waves to transmit and/or receive messages from air to air, or air to ground installations. Includes HF, VHF, UHF, etc, in-flight telephone, communication transmitting and receiving equipment.
	-15	SATCOM	That portion of the system which utilizes satellite communication systems (SATCOM).
	-20	Data transmission and automatic calling	That portion of the system which presents information derived from pulse coded transmissions. Includes Teleprinter, Selcal, Calsel, ACARS, etc.

System	Subsystem	Title	Definition
	-30	Passenger address and entertainment	That portion of the system used to address and entertain the passengers. Includes items such as amplifiers, speakers, handsets, reproducers, control panels, etc. Also includes items of audio, video and film equipment.
	-40	Interphone	That portion of the system which is used by flight and ground personnel to communicate between areas on the air vehicle. Includes items such as amplifier, handset, etc. Does not include the interphone system within the flight compartment which is part of the integrating system.
	-50	Audio integrating and voice command systems	That portion of the system which controls the output of the communications and navigation receivers into the flight crew headphones and speakers and the output of the flight crew microphones into the communications transmitters. Includes items such as audio selector control panel, microphones, headphones, cockpit loudspeakers, etc. Also includes those items which provide for voice command systems used by the operating crew members. (Not including items which are components of an associated air vehicle system).
	-60	Static discharging	That portion of the system which is used to dissipate static electricity.
	-70	Audio and video monitoring	Those installations that record, or monitor crew or passenger conversation or movement for security of safety purposes. Includes voice recorders, television, monitors, etc.
	-80	Integrated automatic tuning	That portion of the system which maintains integrated control of the operating frequencies of communication and navigation transmitter/receivers after either a manually inserted command or a preprogrammed integrated flight system command. Includes such items as integrated frequency selector panels, digital frequency control computers, integrated frequency display panels, etc.

### 2.1.7 System 24 - Electrical power

Table 7 System 24 - Electrical power

System	Subsystem	Title	Definition
24		<b>Electrical power</b>	Those electrical units and components which generate, control and supply AC and/or DC electrical power for other systems, including generators and relays, inverters, batteries etc, through the secondary busses. Also includes those units and components which provide for multiplexing of electrical power and common electrical items such as wiring, switches, connectors, etc.
	-00	General	

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
	-10	Generator drive	Mechanical devices that drive the generators at a desired RPM. Includes items such as oil system, connecting devices, indicating and warning systems for the drive, ram air turbine, etc.
	-20	AC generation	That portion of the systems used to generate, regulate, control, and indicate AC electrical power. Includes items such as inverters, AC generators/alternators, control and regulating components, indicating systems etc, all wiring to but not including main busses.
	-30	DC generation	That portion of the systems used to generate, regulate, control and indicate DC electrical power. Includes items such as generators/alternators, transformers, rectifiers, batteries, control and regulating components, indicating systems etc, all wiring to but not including main busses.
	-40	External power	That portion of the system within the air vehicle which connects external electrical power to the air vehicle's electrical system. Includes items such as receptacles, relays, switches, wiring, warning lights, etc.
	-50	AC electrical load distribution	That portion of the system which provides for connection of AC power to using systems. Includes items such as main and secondary busses, main system circuit breakers, power system devices, etc.
	-60	DC electrical load distribution	That portion of the system which provides for connection of DC power to using systems. Includes items such as main and secondary busses, main system circuit breakers, power system devices, etc.
	-70	Electrical monitoring and protection	That portion of the system used to supply aircraft or ground power to use the ground power switching system, avionics low cooling protection system, essential 28 V DC bus monitoring system and system monitoring. Also includes air vehicle grounding receptacles.
	-80	Electrical power multiplexing	Those units or components which provide for multiplexing of electrical power. Includes computers, remote terminals and related interfaces to transmit electrical power control signals.
	-90	Multipurpose equipment	Those units or components which are applicable to more than one system or system interfaces, such as junction boxes, relay panels, terminal blocks, etc.

## 2.1.8 System 25 - Equipment/furnishings

Table 8 System 25 - Equipment/furnishings

System	Subsystem	Title	Definition
25		<b>Equipment/furnishings</b>	Those removable items of equipment and furnishings contained in the flight and passenger compartments. Includes emergency, buffet and lavatory equipment. Does not include structures of equipment assigned specifically to other systems.
	-00	General	
	-10	Flight compartment	The compartment above the floor and between the forward passenger partition and the forward pressure dome. Includes items such as flight crew seats, tables, pilot check lists and food containers, wardrobes, curtains, manuals, electronic equipment rack, spare bulbs, fuses, etc. Does not include cargo compartments.
	-20	Passenger/operating crew compartment	The areas in which the passengers/operating crew are accommodated. Includes lounges but not dressing rooms. Includes items such as seats, consoles, equipment racks, berths, overhead storage compartments, curtains, wall coverings, carpets, magazine racks, movable partitions, wall type thermometers, spare bulbs, fuses, etc.
	-30	Buffet/galley	The areas in which food and beverages are stored and prepared. Includes items such as removable and fixed cabinets, ovens, refrigerators, garbage containers, dish racks, coffee maker and dispensers, containers, electrical outlets, wiring, etc.
	-40	Lavatories	The toilet and dressing room areas containing wash basins, dressing tables and water closet. Includes items such as mirrors, seats, cabinets, dispensing equipment, electrical outlets, wiring, etc. Wash basins and water closets are included in System 38.
	-50	Additional compartments	Those additional compartments for the use of passengers and/or crew. Includes such compartments as crew rest compartments, sleeping compartments etc.
	-60	Emergency	Those items of equipment carried for use in emergency procedures. Includes items such as evacuation equipment, life rafts, life jackets, emergency locator transmitters, underwater locator devices, first aid kit, incubators, oxygen tents, medical stretchers, landing and signal flares, drag parachutes, evacuation signaling systems, etc. Does not include fire extinguishers, oxygen equipment or masks.
	-70	Available for projects	

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-80	Insulation and lining	Those blankets which are used for heat and sound insulation. Includes flight compartments, passenger compartment, additional compartment insulation etc.

### 2.1.9 System 26 - Fire protection

Table 9 System 26 - Fire protection

System	Subsystem	Title	Definition
26		<b>Fire protection</b>	Those fixed and portable units and components which detect and indicate fire or smoke and store and distribute fire extinguishing agent to all protected areas of the air vehicle; including bottles, valves, tubing, etc.
	-00	General	
	-10	Detection	That portion of the system which is used to sense and indicate the presence of overheats, smoke or fire.
	-20	Extinguishing	That portion of those fixed or portable systems which is used to extinguish fire.
	-30	Explosion suppression	That portion of the system which is used to sense, indicate and extinguish a flame propagating into the fuel system to prevent an explosion.

### 2.1.10 System 27 - Flight controls

Table 10 System 27 - Flight controls

System	Subsystem	Title	Definition
27		<b>Flight controls</b>	Those units and components which furnish the means of controlling the flight attitude characteristics of the air vehicle. Also includes the functioning and maintenance of the primary and secondary flying control surfaces and lift augmenting systems but not the maintenance of the structure of control surfaces which is covered by the system structures. Includes items such as control stick grips, rudder pedals, gearboxes, control rods and cables, linkages, hydraulic valves, actuators, control units, controls and indicators, computers, transducers, transformers, sensor units, displays, gyros, accelerometers, servos, warning systems and control locking devices. This includes rotorcraft rotor controls which are covered in the rotor systems.
	-00	General	
	-10	Roll control	That portion of the system which controls the roll axis of the aircraft. Includes items such as the control wheels, cables, booster, linkages, control surfaces, indicators, etc.

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
	-20	Yaw control	That portion of the system which controls the yaw axis of the aircraft. Includes items such as the rudder pedals, tab control wheel, cables, boosters, linkages, control surfaces, position indicators, etc.
	-30	Pitch control	That portion of the system which controls the pitch axis of the aircraft. Includes items such as the control column, stickshaker units, automatic stall recovery devices, tab control wheels, cables, boosters, linkages, control surfaces, position indicators, stall warning systems etc.
	-40	Horizontal stabilizers	That portion of the system which controls the position and movement of the horizontal stabilizer/canard. Includes items such as control handle, cables, jackscrews, motors, warning systems, linkages, control surfaces, position indicators, etc.
	-50	Flaps	That portion of the system which controls the position and movement of the trailing edge flaps. Includes items such as control handles, cables, actuators, warning systems, linkages, control surfaces, position indicators, etc.
	-60	Spoilers, drag devices and variable aerodynamic fairings	That portion of the system which controls the position and movement of the spoilers, drag devices and variable aerodynamic fairings. Includes items such as control handles, cables, warning systems, linkages, spoilers, drag devices, position indicators, etc.
	-70	Gust lock and damper	That portion of the system which protects the control surfaces from movement by wind while the aircraft is on the ground. Does not include locking the control by means of flight control boost system.
	-80	Lift augmenting	That portion of the system which controls the position and movement of variable opening wings slots, leading edge wing flaps and similar auxiliary devices used for increasing aerodynamic lift. Includes items such as control handles, cables, actuators, linkages, warning systems, control surfaces, position indicators, etc. This does not include trailing edge flaps.
	-90	Primary Flight Control System (PFCS)	That portion of the system, which centralizes all controls and computing means common to multiple primary flying control surfaces. This includes items such as flight control computer, flight data concentrator, side sticks, BUS coupler, rate gyro meter, accelerometer, etc.

## 2.1.11 System 28 - Fuel

Table 11 System 28 - Fuel

System	Subsystem	Title	Definition
28		<b>Fuel</b>	Those units and components which store and deliver fuel to the engine. Includes engine driven fuel pumps for reciprocating engines, includes tanks (bladder), valves, boost pumps etc, and those components which furnish a means of dumping fuel overboard. Includes integral and tip fuel tank leak detection and sealing. Does not include the structure of integral or tip fuel tanks and the fuel cell backing boards which are covered by the system structures, and does not include fuel flow rate sensing, transmitting and/or indicating, which are covered in System 73.
	-00	General	
	-10	Storage	That portion of the system which stores fuel. Includes tank sealing, bladder type cells, venting system, drainage provisions for tank pumps, cell and tank inter-connectors, over wing filler necks and caps, etc. Also includes reservoir feed pumping systems and reservoirs within the tanks which are not part of the distribution system.
	-20	Distribution	That portion of the system which is used to distribute fuel from the filler connector to the storage system and from the storage system to and including the power plant fuel quick disconnect. Includes items such as plumbing, pumps, valves, controls, etc.
	-30	Dump	That portion of the system which is used to dump fuel overboard during flight. Includes items such as plumbing, valves, controls, chutes, etc.
	-40	Indicating	That portion of the system which is used to indicate the quantity, temperature and pressure of the fuel. Includes pressure warning systems for pumping systems within the tank, etc. Does not include engine fuel flow or pressure.
	-50	In-flight refueling	That portion of the system which provides the means of accepting in-flight refueling. This will include access door controls/actuators, fuel receptor, distribution system to fuel storage or interface with standard fuel distribution system, flow controls and indicators, and audio interconnections with the tanker aircraft. Includes manual transfer and refueling controls but excludes automatic systems based on fuel quantity and c.g. constraints which are covered in Fuel/c.g. Management (System 28-60) on air vehicles so equipped.
	-60	Fuel/center of gravity management	That portion of the system which controls fuel distribution during aerial and ground refueling to maintain a safe c.g. configuration. Utilizes fuel quantity and stores data to compute air vehicle c.g. Includes fuel quantity and c.g. indication for in-flight and ground refueling operations.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

### 2.1.12 System 29 - Hydraulic power

Table 12 System 29 - Hydraulic power

System	Subsystem	Title	Definition
29		<b>Hydraulic power</b>	Those units and components which furnish hydraulic fluid under pressure (includes pumps, regulators, lines, valves etc) to a common point (manifold) for redistribution to other defined systems.
	-00	General	
	-10	Main	That portion of the system which is used to store and deliver hydraulic fluid to using systems. Includes items such as tanks, accumulators, valves, pumps, levers, switches, cables, plumbing, wiring, external connectors, etc. Does not include the supply valves to the using systems.
	-20	Auxiliary	That portion of the system which is classified as auxiliary, emergency or standby, and which is used to supplement or take the place of the main hydraulic system. Includes items such as tanks and accumulators which are separate from the main system, hand pumps, auxiliary pumps, ram air turbine, valves, plumbing, wiring, etc.
	-30	Indicating	That portion of the system which is used to indicate the quantity, temperature and pressure of the hydraulic fluid. Includes items such as transmitters, indicators, wiring, warning systems, etc.

### 2.1.13 System 30 - Ice and rain protection

Table 13 System 30 - Ice and rain protection

System	Subsystem	Title	Definition
30		<b>Ice and rain protection</b>	Those units and components which provide a means of preventing or disposing of formation of ice and rain on various parts of the aircraft. Includes alcohol pump, valves, tanks, propeller/rotor anti-icing system, wing heaters, water line heaters, pitot heaters, scoop heaters, windshield wipers and the electrical and heated air portion of windshield ice control. Does not include the basic windshield panel.  For turbine type power plants using air as the anti-icing medium, engine anti-icing is contained in System 75.
	-00	General	
	-10	Airfoil	That portion of the system which is used to eliminate or prevent the formation of ice on all airfoil surfaces. Includes wings, airfoil sections of the empennage and pylons.
	-20	Air intakes	That portion of the system which is used to eliminate or prevent the formation of ice in or around air intakes. Includes power plant cowling anti-icing.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-30	Pitot and static	That portion of the system which is used to eliminate or prevent the formation of ice on the pitot and static systems.
	-40	Windows, windshields, canopies and doors	That portion of the system which is used to eliminate or prevent the formation and accumulation of ice, frost or rain on the windows, windshields, canopies and doors.
	-50	Antennas and radomes	That portion of the system which is used to eliminate or prevent the formation of ice on antennas and radomes.
	-60	Propellers/rotors	That portion of the system which is used to eliminate or prevent the formation of ice on propellers or rotors. Includes all components up to but not including rotating assembly.
	-70	Water lines	That portion of the system which is used to prevent the formation of ice in water supply and drain lines.
	-80	Detection	That portion of the system which is used to detect and indicate the formation of ice.

#### 2.1.14 System 31 - Indicating/recording systems

Table 14 System 31 - Indicating/recording systems

System	Subsystem	Title	Definition
31		<b>Indicating/recording systems</b>	Pictorial coverage of all instruments, instrument panels and controls. Procedural coverage of those systems which give visual or aural warning of conditions in unrelated systems. Includes units which record, store or compute data from unrelated systems and those units/systems that integrate indicating instruments into a central display system and instruments not related to any specific system.
	-00	General	
	-10	Instrument and control panels	Coverage of all panels fixed or movable with their replaceable components such as instruments, switches, circuit breakers, fuses, etc. Also includes general coverage of instrument panel vibrators and other panel.
	-20	Independent instruments	Those instruments, units and components which are not related to specific systems. Includes items such as inclinometers, clocks, etc.
	-30	Recorders	Those systems and components used for recording data not related to specific systems. Includes items such as flight recorders, performance or maintenance recorders, VG recorders, etc.

System	Subsystem	Title	Definition
	-40	General computers	Those systems and components used for computing data from a number of different sources without a preponderance of functions in any one system. Includes items such as Digital Core Avionic System (DCAS), stored check list, emergency procedures, company regulations etc, for call up on a display, integrated instrument systems such as engine, air vehicle power and central warning indicators when combined into a central display.
	-50	Central warning systems	Those systems and components which give audible or visual warning of conditions in unrelated systems. Includes items such as master warning or flight warning systems, central instrument warning or caution and warning systems, tone generators, annunciators, etc.
	-60	Display systems	Those systems and components which give visual display of conditions in unrelated systems.
	-70	Automatic data reporting systems	Those systems and components used for collating and computing data from unrelated systems and transmitting same automatically. Includes ASDAR systems and components.

## 2.1.15 System 32 - Landing gear

Table 15 System 32 - Landing gear

System	Subsystem	Title	Definition
32		<b>Landing gear</b>	Those units and components which furnish a means of supporting and steering the air vehicle on the ground or water, and make it possible to retract and store the landing gear in flight. Includes tail skid assembly, arresting hooks, landing assistance equipment, drag chutes, brakes, wheels, floats, skids, skis, doors, shock struts, tires, linkages, position indicating and warning systems. Also includes the functioning and maintenance aspects of the landing gear doors but does not include the structure which is covered in System 52.
	-00	General	
	-10	Main gear and doors	That portion of the system which provides the major support for the air vehicle while on the ground. Includes items such as shock struts, bogie axles, drag struts, doors, linkages, attach bolts, etc.
	-20	Nose/tail gear and doors	That portion of the system which supports the nose/tail of the air vehicle while the air vehicle is on the ground. Includes items such as shock struts, drag struts, doors, linkages, attach bolts, etc.

System	Subsystem	Title	Definition
	-30	Extension and retraction	That portion of the system which is used to extend and retract the landing gear and open and close the landing gear doors. Includes items such as actuating mechanisms, bogie trim, bungees, up and down latches, operating controls, valves and motors, cables, wiring, plumbing, etc.
	-40	Wheels and brakes	That portion of the system which provides for rolling and stopping the air vehicle while on the ground and stopping wheel rotation after retraction. Includes items such as bearings, tires, valves, de-boosters, swivel glands, anti-skid devices, pressure indicators, plumbing, etc.
	-50	Steering	That portion of the system which is used to control the direction of movement of the air vehicle on the ground. Includes items such as actuating cylinders, controls, bogie swivel unlock, etc.
	-60	Position and warning	That portion of the system which is used to indicate and warn of the position of the landing gear/doors. Includes items such as switches, relays, lights, indicators, horns, wiring, etc.
	-70	Supplementary gear	Devices used to stabilize the air vehicle while on the ground and prevent damage by ground contact. Includes items such as shock strut, ski block, wheels, etc.
	-80	Drag chute	That portion of the system used to aid in slowing the speed of the air vehicle when landing.
	-90	Arresting hook/landing assistance equipment	That portion of the system which is used to extend, retract and indicate the position of an arresting hook. Alternatively, those items providing landing assistance, such as helicopter winch-down systems and Harpoon system.

### 2.1.16 System 33 - Lights

Table 16 System 33 - Lights

System	Subsystem	Title	Definition
33		<b>Lights</b>	Those units and components (electrically powered) which provide for external and internal illumination such as landing lights, taxi lights, position lights, rotating lights, ice lights, master warning lights, passenger reading and cabin dome lights, etc. Includes light fixtures, switches and wiring. Does not include warning lights for individual systems or self-illuminating signs. Does not include lamps/bulbs which are covered in System 25.
			<b>Note</b> For those aircraft that do not contain passenger compartments, and where the flight compartment(s) can be reasonably divided, subsystem - 20 can be used to aid in defining such division.
	-00	General	

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-10	Flight compartment	The lighting subsystems in the compartment above the floor and between the forward passenger partition and the forward pressure dome. Does not include cargo compartment. Includes primary and secondary lighting and lighting control of work areas, panels, instruments, night vision goggles (NVG), lighting mode selection and lamp test operation. Includes master warning light and warning light dimming systems, where not integrated with a central audio or visual system under System 31-50.
	-20	Passenger compartments	The lighting subsystems in the areas in which the passengers are seated and in buffet/galley, lavatories, lounges and coat rooms. Includes items such as direct and indirect illumination, passenger call system, lighted signs, etc.
	-30	Cargo and service compartments	The lighting subsystems in the compartments for stowage or cargo and the housing of various components of accessories.
	-40	Exterior	The lighting subsystems used to provide illumination outside of the aircraft. Includes lights such as landing, navigation, position indicating, wing illumination, rotating, courtesy, taxi, etc.
	-50	Emergency lighting	The separate and independent subsystems used to provide illumination in case of primary electrical power failure. Includes items such as inertia flashlights, lanterns, etc.

#### 2.1.17 System 34 - Navigation

Table 17 System 34 - Navigation

System	Subsystem	Title	Definition
34		<b>Navigation</b>	Those units and components which provide air vehicle navigational information. Includes VOR, pitot, static, ILS, flight director, compasses, indicators, etc.
	-00	General	
	-10	Flight environment data	That portion of the system which senses environmental conditions and uses the data to influence navigation. Includes such items as Central Air Data Computers, pitot/static systems, air temperature, rate-of-climb, airspeed, high speed warning, altitude, altitude reporting, altimeter correction system, air disturbance detection system, etc.
	-20	Attitude and direction	That portion of the system which uses magnetic or inertia forces to sense and display the direction or attitude of the air vehicle. This includes sensing, computing, indicating and warning devices such as magnetic compasses, vertical and directional references, magnetic heading systems, attitude director systems, symbol generators, turn and bank, rate of turn, amplifiers, indicators, etc. Includes Flight Director when it is not integral with the auto pilot computation.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-30	Landing and taxiing aids	That portion of the system which provides guidance during approach, landing and taxiing. Includes items such as localizer, glide slope, ILS, markers, paravision director ground guidance systems, etc.
	-40	Independent position determining	That portion of the system which provides information to determine position and is mainly independent of ground installations or orbital satellites. Includes items such as inertial guidance systems, weather radar, Doppler, electronic/radar altimeter, proximity warning, collision avoidance, star tracker, etc. Also includes sextants/octants, etc.
	-50	Dependent position determining	That portion of the system which provides information to determine position and is mainly dependent on ground installations or orbital satellites. Includes items such as DME, transponders, radio compass, LORAN, VOR, ADF, OMEGA, GLOBAL POSITIONING, IFF, etc.
	-60	Flight management computing	That portion of the system which combines navigational data to compute or manage the air vehicle's geographical position or theoretical flight path. Includes items such as course computers, flight management computers, performance data computers and associated control display units, warning annunciators, etc.
	-70	Environment surveillance system	That portion of the system that integrates dependent and independent position determining, which identifies all kind of hazards external to the aircraft on its potential aircraft flight path and manage the actions to avoid these threads. Includes items that combine surveillance of weather events, windshear, turbulence, airborne collision, collision with terrain, etc. Functions are described under another 34 subsystem when they are managed as a standalone system.

### 2.1.18 System 35 - Oxygen

Table 18 System 35 - Oxygen

System	Subsystem	Title	Definition
35		<b>Oxygen</b>	Those units and components which store, generate, regulate, indicate, deliver and control oxygen to the passengers and crew, including bottles, relief valves, shut-off valves, outlets, regulators, masks, walk-around bottles, etc.
	-00	General	
	-10	Crew	That portion of the system which furnishes oxygen to the crew.
	-20	Passenger	That portion of the system which furnishes oxygen to the passengers.
	-30	Portable	That portion of the system which has an independent oxygen supply and which can be transported about the airplane.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-40	On board oxygen generating system	That portion of the system which generates oxygen for distribution in the other subsystems.

#### 2.1.19 System 36 - Pneumatic

*Table 19 System 36 - Pneumatic*

System	Subsystem	Title	Definition
36		<b>Pneumatic</b>	Those units and components (ducts and valves) which deliver large volumes of compressed air from a power source to connecting points for such other systems as air conditioning, pressurization, deicing, etc.
	-00	General	
	-10	Distribution	That portion of the system which is used to distribute high or low pressure air to using systems. Includes items such as ducts, valves, actuators, heat exchangers, controls, etc. Does not include the supply valves to the using systems.
	-20	Indicating	That portion of the system which is used to indicate temperature and pressure of the pneumatic system. Includes temperature and pressure warning systems.

#### 2.1.20 System 37 - Vacuum

*Table 20 System 37 - Vacuum*

System	Subsystem	Title	Definition
37		<b>Vacuum</b>	Those units and components used to generate, deliver and regulate negative air pressure, including pumps, regulators, lines etc, through and including the manifold.
	-00	General	
	-10	Distribution	That portion of the system which is used to distribute negative pressure air to using systems.
	-20	Indicating	That portion of the system which is used to indicate pressure. Includes pressure warning system.

## 2.1.21 System 38 - Water/waste

Table 21 System 38 - Water/waste

System	Subsystem	Title	Definition
38		<b>Water/waste</b>	Those fixed units and components which store and deliver for use, fresh water, and those fixed components which store and furnish a means of removal of water and waste. Includes wash basins, toilet assemblies, tanks, valves, etc.
	-00	General	
	-10	Potable	That portion of the system which is used to store and deliver fresh drinking water. Includes wash water system if the potable water is also used for washing.
	-20	Wash	That portion of the system which is used to store and deliver washwater which is not potable.
	-30	Waste disposal	That portion of the system which is used for disposal of water and waste. Includes items such as wash basins, water closets, flushing systems, etc.
	-40	Air supply	That portion of the system common to more than one subsystem which is used for pressurizing supply tanks to insure fluid flow.

## 2.1.22 System 39 - Attack system management

Table 22 System 39 - Attack system management

System	Subsystem	Title	Definition
39		<b>Attack system management</b>	Those functions and hardware used for attack system management. That includes digital information networking, crew-machine communication management (including knowledge-based help), stores management etc.
	-00	General	
	-10	Architecture management	General organization and its management depending on missions and their phases.
	-20	Attack system functions	Management of the different functions of the attack system depending on type of the missions and the different phases. In this section, the classification of these functions is indicated with the management of their activity during the missions.
	-30	Attack system resources	All the contributing resources of the attack system are listed and their role is presented depending on the missions and their different phases.
	-40	General rules of man-machine communication	Management of the man-machine communication by the system side (including knowledge based functions).

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-50	Digital networks	Hardware and software related to digital networks (eg, MIL-1553B or Stanag-3810). Management of exchanges by these means is also to be presented.
	-60	Other information networks	These other networks needed in attack systems (eg, network for video signals, network for blanking signals, etc).
	-70	Stores management	Hardware and software within the air vehicle itself used for stores management.

## 2.1.23 System 40 - Operational attack functions

Table 23 System 40 - Operational attack functions

System	Subsystem	Title	Definition
40		<b>Operational attack functions</b>	Those functions and hardware used for attack system operational aim. Links of these functions with technical functions are included.
	-00	General	
	-10	Navigational functions	Include localization (with updating), flight management, approach and landing management etc.
	-20	Nap of the earth flight	Terrain following and obstacle avoidance management.
	-30	Self-protection	Defensive maneuvers and tactics elaboration against threats.
	-40	Information exchange and cooperation	Elaboration of pieces of information to be exchanged for cooperation with other air vehicles including AWACS-type air vehicles and ground or surface weapons systems.
	-50	Identification	Aerial and surface objects identification based on autonomous but also external (available through cooperation) identification means.
	-60	Air-to-air functions	<p>Fire control functions related to air-to-air attacks. These sections can be divided as required to deal with bullet gun firing, short range missiles, medium range or beyond visual range missiles firing (for single or multiple targets attack). These functions are generally spread between weapons seekers and computers and aircraft sensors, computers, etc.</p> <p>This also includes air-to-air management after weapon launch (to guide or help the weapon for the target hitting).</p>
	-70	Air-to-surface functions	Fire control functions related to air-to-surface attacks. These sections can be divided as required to deal with bombs delivery, rockets or missiles firing (either short range, medium range or of fire and forget type). These weapons can be guided or not. These functions are generally spread between weapons seekers, computers, and aircraft sensors, computers, etc. Management of guidance when made onboard is also to consider in these sections.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

## 2.1.24 System 41 - Water ballast

Table 24 System 41 - Water ballast

System	Subsystem	Title	Definition
41		<b>Water ballast</b>	Those units and components provided for the storage, balancing, control, filling, discharge and dumping of water ballast. Does not include units or components covered in System 38.
	-00	General	
	-10	Storage	That portion of the system which stores water solely for the purpose of providing airship ballast. Includes removable tanks (bladder cells), interconnecting balance pipes, filler valves, etc.
	-20	Dump	That portion of the system used to dump water ballast during flight. Includes valves (remote/direct) manual/automatic controls, etc.
	-30	Indication	That portion of the system used to indicate quantity, condition and relative distribution of the water ballast.

## 2.1.25 System 42 - Cross-technical attack functions

Table 25 System 42 - Cross-technical attack functions

System	Subsystem	Title	Definition
42		<b>Cross-technical attack functions</b>	Those functions and hardware used for attacks execution. These technical functions considered in this System are common to many attack system operational functions, and therefore within the "crossroad" of the attack system.
	-00	General	
	-10	Mission system control and management	Functions in charge of scheduling and deciding about planned actions, priority management for resources consumption, etc.
	-20	Trajectory management	Functions dealing with trajectory constraints given by execution of operational functions and in charge of determination of the exact trajectory to follow (by autopilot) or to indicate (to the pilot).
	-30	Attack system compatibilities management	Function in charge of all the aspects related to electromagnetic compatibility between all the transmitters and receivers (including radios, ECM, radars, external stores, lasers, etc).
	-40	Tactical situation awareness	Functions in charge of establishing knowledge about tactical environment and its distribution to other functions (eg, fire control). The tactical situation awareness is based on information received from aircraft sensors, weapons seekers, cooperation, etc.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-50	Mission preparation	Embedded functions dedicated to deal with data given before flight and dispatch them to the other attack functions.
	-60	Mission restitution	Embedded functions dedicated to take care of all the data needed to replay the whole or part of the mission later on.
	-70	Warnings and cautions management	Functions in charge of telling crew or ground personnel bad events. Here is to consider only the result of each system warning and caution activity and mainly the filtering process (including knowledge based filters) to provide crew only with accurate messages depending on mission phases or aircraft status.

### 2.1.26 System 42 - Integrated modular avionics

#### Note

For this system the material item category code must be used in accordance with [Chap 4.3.3](#).

Table 26 System 42 - Integrated modular avionics

System	Subsystem	Title	Definition
42		<b>Integrated modular avionics</b>	Generalize computing devices that can host software applications for system functions that had traditionally been implemented in dedicated hardware. The actual system functions are covered in their respective systems.
	-00	General	
	-20	Core System	
	-30	Network Components	

### 2.1.27 System 43 - Tactical communications

Table 27 System 43 - Tactical communications

System	Subsystem	Title	Definition
43		<b>Tactical communications</b>	Those units and components that furnish the crew with a means of communicating within the air vehicle, one air vehicle to another, and from the air vehicle to ground stations. Includes voice, C-W communicating components, PA system, intercom and recorder/record player.
	-00	General	
	-10	Ultra, super and extra high frequencies (UHF/SHF/EHF)	That portion of the system which is used for communications utilizing UHF/SHF/EHF carriers. Includes items such as transmitters, receivers, control panel, selcal decoder, antenna, etc.

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
-20		Very high frequency (VHF)	That portion of the system which is used for communications utilizing VHF carriers. Includes items such as transmitters, receivers, control panel, selcal decoder, antenna, etc.
-30		High frequency (HF)	That portion of the system which is used for communications utilizing HF carriers. Includes items such as transmitters, receivers, power supply, control panel, antenna, coupler, etc.
-40		Low and very low frequency (LF/VLF)	That portion of the system which is used for communications utilizing LF/VLF carriers. Includes items such as transmitters, receivers, power supply, control panel, antenna, coupler, etc.
-50		Audio integrating	That portion of the system which controls the output of the communications and navigation receivers into the crews' headphones and speakers and the output of the crews' microphones into the communications transmitter. Includes items such as audio selector control panel, microphones, headphones, loudspeakers, etc.
-60		Digital	That portion of the system which is used for air vehicle to air vehicle or air vehicle to ground stations utilizing C-W. Includes items such as teletypewriters, modems, keyers, encryption devices, etc.
-70		Multiplex and audio switching	That portion of the system which is used for telephone communications between air vehicles or ground stations. Includes items such as telephones and multiplexing equipment.
-80		Interphone and passenger address	That portion of the system used to address the passengers and which is used by the crew to communicate between areas of the air vehicle. Includes items such as amplifiers, speakers, handsets, control panels, audio, video and film equipment. Does not include the interphone system within the flight compartment which is part of the integrating system.
-90		Satellite communications	That portion of the system which is used for air vehicle to satellite communications. Includes items such as receivers, transmitters, modems, amplifiers, etc.

## 2.1.28 System 44 - Cabin systems

Table 28 System 44 - Cabin systems

System	Subsystem	Title	Definition
44		<b>Cabin systems</b>	Those units and components which furnish a means of entertaining the passengers and providing communication within the aircraft and between the aircraft cabin and ground stations. Includes voice, data, music and video transmissions. Does not include SATCOM, HF, VHF, UHF, and all transmitting/receiving equipment, antennas, etc, which are covered in System 23 or System 46.
	-00	General	
	-10	Cabin core system	That portion of the system used to accomplish the integrated functional control, operation, testing and monitoring of cabin systems and the increase cabin comfort (such as active noise control). Includes items such as controllers, cabin control panels, handsets, signs, loudspeakers, etc.
	-20	Inflight entertainment system	That portion of the system used to entertain the passengers with music, video, information, games, etc. Includes items such as controllers, cabin control panels, audio and video equipment, etc.
	-30	External communication system	That portion of the system used by passengers and cabin crew to transmit and/or receive data/messages from air to air or from air to ground installations. Includes items such as telephones, telefaxes, modems, AM/FM radio units, etc.
	-40	Cabin mass memory system	That portion of the system used to store and process cabin related data, such as systems configuration data, multimedia programs, etc. Includes items such as controllers, terminals, keyboards, disk drives, printers, modems, etc.
	-50	Cabin monitoring system	The portion of the system used to monitor parts of the cabin area. Includes items such as surveillance cameras, monitors, etc. Does not include external anti-hijack devices or external video monitoring which are covered in System 23.
	-60	Miscellaneous cabin system	That portion of the system used to support miscellaneous cabin functions.

## 2.1.29 System 45 - Central maintenance system (CMS)

Table 29 System 45 - Central maintenance system (CMS)

System	Subsystem	Title	Definition
45		<b>Central maintenance system (CMS)</b>	Those units, components and associated system which interfaces with multiple air vehicle systems. Contains checkout and fault isolation procedures using a central computer complex and/or standard fault isolation procedures to locate a single system or component malfunction.
	-00	General	

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-04 thru -19	CMS/Air vehicle general	CMS interfaces with general air vehicle systems and identification of maintenance functions related to air vehicles.
	-20 thru -44 and -46 thru -49	CMS/Airframe systems	CMS interfaces with airframe systems and identification of maintenance functions related to airframe systems.
	-45	Central maintenance system	That portion of the system which interfaces with other airplane systems, flight line mechanics and radio communications. Includes computers, storage devices, control and display devices.
	-50 thru -59	CMS/structures	CMS interfaces with structures and identification of maintenance functions related to structures.
	-60 thru -69	CMS/propellers	CMS interfaces with propeller and identification of maintenance functions related to propellers.
	-70 thru -89	CMS/power plant	CMS interfaces with power plant and identification of maintenance functions related to power plant.
	-91 thru -99	CMS/military systems	CMS interfaces with military systems and identification of maintenance functions related to military systems.

#### Note

Subsystem/Section code is selected to match applicable system interface. For example, 45-21-XX identifies all air conditioning monitoring and testing provided by the CMS and provides directions for using the CMS to execute those maintenance functions. Detailed testing not capable of coverage in System 45 is appropriately cross referenced and provided in System 21. Similarly, 45-32-XX identifies landing gear monitoring and testing provided by the CMS. 45-45-XX identifies the CMS itself.

### 2.1.30 System 46 - Systems integration and display

Table 30 System 46 - Systems integration and display

System	Subsystem	Title	Definition
46		<b>Systems integration and display</b>	The primary air vehicle system used to provide central acquisition, processing and display of data from multiple sources such as flight controls, navigation computation, air data computation, warnings, engine parameters, etc.
	-00	General	

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

-10	Acquisition	Those units and components used to acquire data for integration and processing. Excludes components which are covered by the system dealing with the system/subsystem from which the data is being obtained.
-20	Processing and integration	Those units and components used to integrate and process data acquired from a variety of sources and output signals to display or warning devices. Includes such items as interfaces, central processing units, data bus controls.
-30	Display	Those units which display data warning units, remote displays, etc.
-40 thru -79	Systems integration, software packages	These sections are used to provide information about those software packages which are applicable to more than one system of the air vehicle and can be classified as multi-system applicable software. This can be taken to mean software for computers which, in the event of failure of the computer(s) in another system, assume responsibility for the management of that system and thus provides backup to the failed systems, even though the computer which is providing backup normally has no connection with the system for which it is the backup.

### 2.1.31 System 46 - Information system

#### Note

For this system the material item category code must be used in accordance with [Chap 4.3.3](#).

Table 31 System 46 - Information system

System	Subsystem	Title	Definition
46		<b>Information system</b>	Those units and components, which furnish a means of storing, updating and retrieving digital information traditionally provided on paper, microfilm, or microfiche. Includes units that are dedicated to the information storage and retrieval function such as the Electronic Library mass storage and controller. Does not include units or components installed for other uses and shared with other systems, such as flight deck printer or general use display.
	-00	General	
	-10	Airplane general information systems	
	-20	Flight deck information systems	That portion of the onboard information system that supports the flight deck systems, flight deck crew and flight operations.
	-30	Maintenance information systems	That portion of the onboard flight information system that supports all onboard maintenance system functions, maintenance technicians, and any ground based maintenance activity.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-40	Passenger cabin information systems	That portion of the onboard information system that supports the passenger cabin, cabin operations, and flight attendants.
	-50	Miscellaneous information systems	That portion of the onboard information system that supports other functions, as defined by the user that cannot be related to the flight deck, passenger cabin, or maintenance.

### 2.1.32 System 47 - Liquid nitrogen

Table 32 System 47 - Liquid nitrogen

System	Subsystem	Title	Definition
47		<b>Liquid nitrogen</b>	Those units and components used to generate, store, deliver and regulate liquid nitrogen to 2 or more using systems. Includes regulators, lines, manifolds, etc. Does not include liquid nitrogen handling components of the using system (ie, System 21-80).
	-00	General	
	-10	Generation/storage	That portion of the system which generates and/or stores nitrogen. Includes tanks, cells reservoirs, accumulators, etc. Does not include plumbing, pumps, valves, controls, etc.
	-20	Distribution	That portion of the system which is used to distribute nitrogen to the using systems. Includes plumbing, pumps, valves, regulators, etc.
	-30	Controlling	The nitrogen controls which meter the nitrogen to the distribution components and into the using systems. Includes items such as levers, switches, cables, etc.
	-40	Indicating	That portion of the system which is used to indicate the flow rate, temperature and pressure of the nitrogen. Includes items such as transmitters, indicators, etc.

### 2.1.33 System 48 - In-flight refueling tanker

Table 33 System 48 - In-flight refueling tanker

System	Subsystem	Title	Definition
48		<b>In-flight refueling tanker</b>	Those units and components which store, and deliver fuel to a receiver vehicle while in flight. Includes fuel storage units, distribution system, controls, sensors, etc, specifically used for in-flight refueling supply. Includes interfaces with other systems but does not include any dual purpose item that is identified with another system.

System	Subsystem	Title	Definition
			<b>Note</b> When systems and components serve both the operational and refueling system they are identified with the operational fuel system (System 28-00).
	-00	General	
	-10	Storage	That portion of the system which stores fuel specifically for the purpose of in-flight refueling. Includes tank sealing, bladder type cells, ventilating system, cell and tank inter-connectors, over wing filler necks and caps, etc. Also includes reservoir feed pumping systems and reservoirs within the tanks which are not part of the distribution system.
	-20	Distribution	That portion of the system which is used to distribute fuel from the filler connector to the storage system and from the storage system to and including the interface with the vehicle to vehicle transfer system. Includes such items as plumbing, pumps, valves, controls, etc.
	-30	Delivery	That portion of the system that accepts the fuel from the distribution portion and conducts it to the receiving vehicle. Includes refueling boom and nozzle or hose and drogue, boom control surfaces, actuators and hoist and stowage system. Does not include operator controls.
	-40	Controls	That portion of the system which is used to control the transfer of fuel from tanker to receiving vehicle. Includes operator controls, indicators, inter vehicle communications.
	-50	Indicating	That portion of the system which is used to indicate fuel quantity, temperature and pressure. Includes pressure warning systems for pumping within the storage and distribution areas.
	-60	Dump	That portion of the system which is used to dump fuel overboard during flight. When the tanker vehicle dump system (System 28-30) is used, the interface with it is identified in this system. Includes such items as plumbing, controls, indicators, chutes, etc.

### 2.1.34 System 49 - Airborne auxiliary power

Table 34 System 49 - Airborne auxiliary power

System	Subsystem	Title	Definition
49		<b>Airborne auxiliary power</b>	Those airborne power plants (engines) which are installed on the air vehicle for the purpose of generating and supplying a single type or combination of auxiliary electric, hydraulic, pneumatic or other power. Includes power and drive section, fuel, ignition and control systems; also wiring, indicators, plumbing, valves and ducts up to the power unit. Does not include generators, alternators, hydraulic pumps etc, or their connecting systems which supply and deliver power to their respective air vehicle systems.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-00	General	
	-10	Power plant	For definitions see System 71.
	-20	Engine	For definitions see System 72.
	-30	Engine fuel and control	For definitions see System 73.
	-40	Ignition/starting	For definitions see System 74 and 80.
	-50	Air	For definitions see System 75.
	-60	Engine controls	For definitions see System 76.
	-70	Engine indicating	For definitions see System 77.
	-80	Exhaust	For definitions see System 78.
	-90	Oil	For definitions see System 79.

### 2.1.35 System 50 - Cargo and accessory compartment

Table 35 System 50 - Cargo and accessory compartment

System	Subsystem	Title	Definition
50		<b>Cargo and accessory compartment</b>	Those compartments for storage of cargo and various components and accessories. Includes those systems used to load/unload cargo and other cargo related systems. Does not include aircraft structure which is in System 53.
	-00	General	
	-10	Cargo compartments	Those compartments for storage of cargo.
	-20	Cargo loading systems	Those systems which have components which are or can be mounted on the aircraft and used to load/unload, restrain, guide or service cargo. Includes drive systems rollers, latches, restraint nets, etc.
	-30	Cargo related systems	Those systems which are related to loading/unloading of cargo. Includes aircraft leveling, loader alignment systems etc. Does not include Cargo Loading Systems.
	-40	Aerial delivery	Those items required for air drop of cargo or personnel. Includes platforms, parachutes and drogue chutes, load release mechanisms and load transfer devices, anchor cables, static lines, retrieval winches, jump lines, etc.
	-50	Accessory compartments	Those compartments used for the housing of various components and accessories. Includes wheel wells, tell-hydraulic-electrical/electronic equipment racks, main battery structure, etc.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-60	Insulation	Those insulation blankets which are used for heat and sound insulation. Includes cargo compartments and accessory compartments, insulation, etc.

### 2.1.36 System 51 - Standard practices - Structures

Table 36 System 51 - Standard practices - Structures

System	Subsystem	Title	Definition
51		<b>Standard practices - Structures</b>	This System contains those standard practices, general procedures and typical repairs applicable to more than one structural task which are not specifically covered in Systems 52 thru 57. This excludes those standard practices which are recognized as standard trade practices, also those practices/processes which are only applicable to manufacture. Practices for a particular application are included in the appropriate structural system as part of the procedure.
	-00	General	Standard practices applicable to all structural systems. Air vehicle major structural breakdown and primary and secondary structure diagrams. Principal area and dimensional data. Restricted area diagram. Zoning diagram. Access door and panel identification. Glossary.
	-10	Investigation, cleanup and aerodynamic smoothness	Definition of damage classifications. Cleanup of dents, cracks, scratches, corrosion, etc. Aerodynamic smoothness requirements for the airplane, and permissible contour variations, gaps and mismatch data.
	-20	Processes	Special processes for use in the repair of the airplane. It does not include general engineering practices unless specific deviations are required. Unique processes such as welding specifications, etc., relative to a single repair are to be incorporated in the repair and only referenced here.
	-30	Materials	Description of materials (metallic and non-metallic) including extrusions, formed sections, sheet, sealants, adhesives, and special materials used in airplane repair. Where possible, permissible substitutes and sources of supply will be given.
	-40	Fasteners	Description of fastener types, materials, and sizes. Procedures for fastener installation and removal including hole preparation. Fastener strength values and substitution data.
	-50	Support of airplane for repair and alignment check procedures	Procedure for supporting the airplane to relieve loads during repairs. Includes location for supports and contour dimensions for required support equipment.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-60	Control-surface balancing	Procedures for adjusting the mass balance of control surfaces after repair. Where applicable, individual repairs will contain their own balancing instructions.
	-70	Repairs	Typical repairs suited for general use, not limited to one S1000D System
	-80	Electrical bonding	Topics concerning the electrical bonding of aircraft structures as well as electrical bonding of subsystems to aircraft structure.

### 2.1.37 System 52 - Doors

Table 37 System 52 - Doors

System	Subsystem	Title	Definition
52		<b>Doors</b>	Removable units used for entrance or exit and for enclosing other structure contained within the fuselage. Includes passenger and crew doors, cargo doors, emergency exits, etc. Electrical and hydraulic systems associated with door control are included as appropriate.
	-00	General	
	-10	Passenger/crew	Doors used for entrance and exit of the passengers and crew to and from the air vehicle. Includes items such as structure, latching mechanisms, handles, insulation, lining, controls, integral steps, ramps, handrails, attach/attached fittings, etc.
	-20	Emergency exit	Exit doors used to facilitate evacuation that are normally used for exit. Includes items such as structure, latching mechanisms, handles, insulation, lining, controls, attach/attached fittings, etc.
	-30	Cargo	Exterior doors used primarily to gain access to cargo compartments. Includes items such as structure, latching mechanisms, handles, insulation, lining, controls, integral steps, ramps, handrails, attach/attached fittings, etc.
	-40	Service and miscellaneous	Exterior doors used primarily to gain access for servicing air vehicle systems and equipment. Includes items such as structure, latching mechanisms, handles, insulation, lining, controls, integral steps, handrails, attach/attached fittings, etc.
	-50	Fixed interior	Doors inside the fuselage installed in fixed partitions. Includes items such as structure, latching mechanisms, handles, lining, attach/attached fittings, etc. Does not include doors installed in movable partitions which are covered in System 25.

System	Subsystem	Title	Definition
	-60	Entrance stairs	Stairs which operate in conjunction with but are not an integral part of entrance doors. Stairs whose primary structure is a door are covered under the appropriate topic. Includes items such as structure, actuating mechanisms and controls, handrails, attach/attached fittings, etc.
	-70	Door warning	That portion of the system which is used to indicate whether the doors are closed and properly latched. Includes items such as switches, lights, bells, horns, etc. Does not include landing gear door warning which is covered in System 32.
	-80	Landing gear	Structure of the doors used to enclose the landing gear compartments. Includes items such as structure, latching mechanisms, handles, insulation, lining, controls, attach/attached fittings, etc.

### 2.1.38 System 53 - Fuselage

Table 38 System 53 - Fuselage

System	Subsystem	Title	Definition
53		<b>Fuselage</b>	Structural units and associated components and members which make up the compartments for equipment, passengers, crew, cargo, plus the structure of the envelope and gondola of airships. Includes skins, belt frames, stringers, floor beams, floor, pressure dome, scuppers, tail cone, fuselage-to-wing-and-empennage fillets, attach/attached fittings, load curtains, cables, ballonets, etc. Also includes structural and removable pylons used for the carriage of external stores. Does not cover those pylons used for weapons which are covered in System 94-30.
	-00	General	
	-10 thru -90	Fuselage sections	Skins, main structure, secondary structure and fairings of the complete fuselage with any structural differences grouped together and highlighted by fuselage section location. The section locations are defined by manufacturing joints or other suitable demarcations in sequence from front to rear. Does not include movable partitions covered in System 25 nor the functional and maintenance aspects of variable aerodynamic fairings covered in System 27.

## 2.1.39 System 54 - Nacelles/pylons

Table 39 System 54 - Nacelles/pylons

System	Subsystem	Title	Definition
54		<b>Nacelles/pylons</b>	Structural units and associated components and members which furnish a means of mounting and housing the power plant or rotor assembly. Includes skins, longerons, belt frames, stringers, clamshells, scuppers, doors, nacelle fillets, attach/attached fittings, etc. Also includes the structure of power plant cowling inclusive of the structural portion of the inlet whether or not integral with the air vehicle. Structural portions of the exhaust systems are excluded where they are not integral with the airframe.
	-00	General	
	-10 thru -40	Nacelle section	Skins, primary structure, secondary structure, fillets and fairings of a complete nacelle with any structural differences grouped together and highlighted by specific nacelle designator. The section locations are defined by manufacturing joints or other suitable demarcations in a logical sequence.
	-50 thru -80	Pylon	Skins, primary structure, secondary structure, fillets and fairings of a complete pylon with any structure differences grouped together and highlighted by specific pylon designator. The section locations are defined by manufacturing joints or other suitable demarcations in a logical sequence.
	-90	Air management	Consists of those components which regulate and direct inlet air flow and/or provide engine air particle separation (EAPS).

## 2.1.40 System 55 - Stabilizers

Table 40 System 55 - Stabilizers

System	Subsystem	Title	Definition
55		<b>Stabilizers</b>	Horizontal and vertical stabilizers. Includes the structure of the elevator, rudder, auxiliary stabilizers and strakes.
	-00	General	
	-10	Horizontal stabilizer or canard	The horizontal airfoil of the tail or nose section to which an elevator can be attached. Includes items such as spars, ribs, stringers, skins, access covers, tips, attach/attached fittings, etc.
	-20	Elevator	Removable airfoil which is attached to the horizontal stabilizer or canard and used for pitch control. Includes items such as spars, ribs, stringers, skins, access covers, tabs, balance devices, attach/attached fittings, etc.
	-30	Vertical stabilizer	Vertical airfoil to which the rudder is attached. Includes items such as spars, ribs, stringers, skins, access covers, tips, attach/attached fittings, etc.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-40	Rudder	Removable airfoil which is attached to the vertical stabilizer and used for yaw control. Includes items such as spars, ribs, stringers, skins, access covers, tabs, balance devices, attach/attached fitting, etc.
	-50	Auxiliary stabilizers and strakes	Fuselage mounted auxiliary stabilizers and strakes includes items such as spars, ribs, stringers, skins, access covers.

#### 2.1.41 System 56 - Windows and canopies

Table 41 System 56 - Windows and canopies

System	Subsystem	Title	Definition
56		<b>Windows and canopies</b>	Fuselage and crew compartment windows and canopies, inclusive of windshield; also those windows installed in doors. Associated electrical/hydraulic/pneumatic actuation systems are to be included.
	-00	General	
	-10	Flight compartment	Compartment in which the crew fly the aircraft. Includes items such as the transparent material and its frame of movable and fixed windows, windshields and canopies, handles, latching mechanisms and associated electrical/hydraulic/pneumatic actuation systems, etc. Does not include doors or inspection/observation windows.
	-20	Fuselage compartment	The compartment used for passengers/tactical crew/cargo, etc. Includes lounges, lavatories, buffets/galleys and coatrooms. Includes items such as transparent material, its frame, frost shield, etc.
	-30	Door	Doors in the flight and fuselage compartments. Includes items such as transparent material, its frame, etc. Does not include emergency exit windows.
	-40	Inspection and observation	Windows used for examining compartments and equipment in and about the air vehicle, astrodomes used for celestial navigation, and in-flight refueling operator's windows. Includes items such as transparent material, its frame, etc.

## 2.1.42 System 57 - Wings

Table 42 System 57 - Wings

System	Subsystem	Title	Definition
57		<b>Wings</b>	Center wing and outer wing structural units and associated components and members which support the air vehicle in flight. Includes spars, skins, ribs, stringers, clamshells, scuppers etc, and integral fuel tank structure of the flaps, slats, ailerons or elevons (complete with tabs) and spoilers. Also includes structural and removable pylons used for carriage of external stores. Does not cover those pylons used for weapons which are covered in System 94-30.
	-00	General	
	-10	Center wing	Skins, primary structure, fillets and fairings of the center wing and attach/attached fittings.
	-20	Outer wing	Skins, primary structure, fillets and fairings of the outer wing and attach/attached fittings.
	-30	Wing tip	Skins and structure of the wing tip and attached fittings.
	-40	Leading edge and leading edge devices	Skins and structure of the wing leading edge and removable leading edge airfoils such as flaps, slats, attach/attached fittings, etc.
	-50	Trailing edge and trailing edge devices	Skins and structure of the wing trailing edge and removable trailing edge ailerons such as flaps and attach/attached fittings.
	-60	Ailerons, elevons and flaperons	The skin and structure of ailerons, elevons, flaperons and tabs including balancing devices and attach/attached fittings, etc.
	-70	Spoilers	Skins and structure of wing-mounted spoilers, airbrakes, lift dumpers, attach/attached fittings, etc.
	-80	Wing folding	System that controls the on-ground movement of any portion of the main wing structure. Includes mechanisms linkages, actuators, locks, indicating/warning systems, etc.
			<b>Note</b> This represents the wing stow system and is not to be confused with System 66 Folding blades/pylon.

#### 2.1.43 System 60 - Standard practices, Propeller/rotor

Table 43 System 60 - Standard practices, Propeller/rotor

System	Subsystem	Title	Definition
60		<b>Standard practices, Propeller/rotor</b>	This system contains those standard mechanical and electrical/electronic engineering practices applicable to more than one propeller/rotor which are not covered in Systems 61 thru 69. It excludes those practices which are recognized as standard trade practices, also those practices/processes which are only applicable to manufacture. Practices for a particular application are included in the appropriate propeller/rotor system as part of the procedure.
	-00	General	Standard practices applicable to all propeller/rotor systems.
	-10 thru -90		Sections -10 thru -90 are used to describe standard practices. The manufacturer or manufacturing partners can assign the section numbers to suit generic standard practices related to more than one propeller or rotor system.

#### 2.1.44 System 61 - Propellers/propulsors

Table 44 System 61 - Propellers/propulsors

System	Subsystem	Title	Definition
61		<b>Propellers/propulsors</b>	The complete mechanical or electrical propeller, pumps, motors, governor, alternators and those units and components external to or integral with the engine used to control the propeller blade angle. Includes propeller spinner synchronizers. Also includes propulsor duct assemblies, including aerodynamic fairing of mechanical components, stators, vectoring systems, etc.
	-00	General	
	-10	Propeller assembly	That portion of the system which rotates except the engine propeller shaft. Includes items such as blades, dome, hub, spinner, slip ring, deicer boot, distributor valve, etc.
	-20	Controlling	That portion of the system which controls the pitch of the propeller blades. Includes items such as governor synchronizers, switches, wiring, cables, levers, etc. Does not include any parts which rotate with the propeller assembly. Also includes all those units and components provided for the propulsor vector drive system. Includes flight deck control, drive motors, gearboxes, drive shafts, synchronizing shafts, etc.
	-30	Braking	That portion of the system which is used to decrease run-down time or stop propeller rotation during engine power-off conditions. Includes brake mechanisms, levers, pulleys, cables, switches, wiring, plumbing, etc.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-40	Indicating	That portion of the system used to indicate operation or activation of propeller/propulsor systems. Includes items such as light, switches, wiring, etc.
	-50	Propulsor duct	The complete duct assembly including vector drive attachment, fairings, stators, gearbox covers, etc.

#### 2.1.45 System 62 - Main rotors

Table 45 System 62 - Main rotors

System	Subsystem	Title	Definition
62		<b>Main rotors</b>	Rotor head assemblies and rotor blades, including the swash plate assemblies and the rotor shaft units if not an integral part of the gearboxes. Does not include the rotor anti-icing system which is dealt with in System 30, Ice and Rain Protection.
	-00	General	
	-10	Rotor blades	Rotor blade assemblies, including the heating mat (electrical resistors) for anti-icing.
	-20	Rotor heads	Complete rotor heads, including blade folding systems. Includes sleeves, spindles, dampers, rotor head fairings as well as rotor shafts and swash plates if the rotor head and shaft constitute a non-dissociable assembly.
	-30	Rotating controls, rotor shafts/swash plate assemblies	Includes pitch change rods and swash plate assemblies if not included in Section -20.
	-40	Indicating	That portion of the system which indicates operation or activation of rotor systems. Includes items such as lights, gauges, switches, wiring, etc.

#### 2.1.46 System 63 - Main rotor drives

Table 46 System 63 - Main rotor drives

System	Subsystem	Title	Definition
63		<b>Main rotor drives</b>	Includes all components transmitting power to the rotors: engine coupling components, drive shafts, clutch and free wheel units, gearboxes, it's (their) components, systems and securing elements.
	-00	General	
	-10	Engine/gearbox couplings	Drive shafts between engines and main gearboxes, gearbox to gearbox, and, if applicable, clutch and free wheel units.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-20	Gearboxes	Part of the system driving the rotors. Includes the mechanical power take-offs and accessory drives but does not include the accessories themselves (alternators, hydraulic pumps etc). Includes the gearbox lubricating systems and the rotor brakes if the latter forms part of the gearboxes.
	-30	Mounts and attachments	Suspension bars, vibration damping system providing attachment of the gearboxes to the airframe.
	-40	Indicating	That portion of the system which indicates operation or activation of rotor systems. Includes items such as lights, gauges, switches, wiring, etc.

#### 2.1.47 System 64 - Tail rotor

Table 47 System 64 - Tail rotor

System	Subsystem	Title	Definition
64		<b>Tail rotor</b>	Assembly that rotates in a plane nearly parallel to the symmetry plane and delivers a thrust opposing to the main rotor torque thus ensuring yaw control. Includes the rotor blades and rotor head. Does not include the rotor anti-icing system which is dealt with in System 30, Ice and Rain Protection.
	-00	General	
	-10	Rotor blades	Blade assemblies, including the heating mats (electrical resistors) for anti-icing.  <b>Note</b> For an integral unit, only one section will be used.
	-20	Rotor head	Tail rotor head  <b>Note</b> For an integral unit, only one section will be used.
	-30	Rotating controls	Includes pitch control beams, links and associated components.
	-40	Indicating	That portion of the system which indicates operation or activation of rotor systems. Includes items such as lights, gauges, switches, wiring, etc.  <b>Note</b> For an integral unit, only one section will be used.

#### 2.1.48 System 65 - Tail rotor drive

Table 48 System 65 - Tail rotor drive

System	Subsystem	Title	Definition
65		<b>Tail rotor drive</b>	Includes all the components transmitting power to the tail rotor: drive shafts, bearings, gearboxes.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-00	General	
	-10	Shafts	Drive shafts, bearings, flexible couplings.
	-20	Gearboxes	Intermediate gearbox. Tail gearbox.
	-30	Not available for projects	
	-40	Indicating	That portion of the system which indicates operation or activation of rotor system. Includes items such as lights, gauges, switches, wiring, etc.

#### 2.1.49 System 66 - Folding blades/pylon

Table 49 System 66 - Folding blades/pylon

System	Subsystem	Title	Definition
66		<b>Folding blades/pylon</b>	The whole of the system which provides automatic or manual folding and spreading of the rotor blades and/or tail pylon.  <b>Note</b> Procedures produced in accordance with this system can also affect the components described by other systems.
	-00	General	
	-10	Rotor blades	Part of the system ensuring rotor blade folding and spreading; includes the mechanical, hydraulic and electrical means permanently fitted on the air vehicle.
	-20	Tail pylon	Part of system ensuring tail pylon folding and spreading; includes mechanical, hydraulic and electrical means permanently fitted on the air vehicle.
	-30	Controls and indicating	Part of the system intended for controlling folding/spreading sequences and for indicating the system operation. Includes the control units, caption lights, indicator, wiring, etc.

#### 2.1.50 System 67 - Rotors flight control

Table 50 System 67 - Rotors flight control

System	Subsystem	Title	Definition
67		<b>Rotors flight control</b>	The system which provides means of manually controlling the flight attitude of the helicopter. Includes items such as control linkage and control cables for collective pitch, cyclic pitch, directional control, servo-controls and corresponding system. The trim system and the indicating and monitoring system.

System	Subsystem	Title	Definition
			<b>Note</b> This system includes the complete rigging of rotor control including the associated items not described under this system, such as auto-pilot, servo-control unit, automatic trim (System 22), blade pitch change rods, beams and swash plates (Systems 62 and 64).
-00	General		
-10	Rotor control		That portion of the system which controls the attitude by the angle of attack of the rotor blades. Includes items such as collective pitch lever, cyclic pitch stick and corresponding linkage and cable controls, coupling and mixing units and artificial feel unit systems. Also includes the control position indicating system.
-20	Anti-torque rotor control (yaw control)		That portion of the controls which control the direction of the helicopter (yaw control). Includes items such as tail rotor control pedals, relevant linkage and cable controls, bell cranks constituting the yaw control channel and the control position indicating system.
-30	Servo-control system		That portion of the system which from a power source ensures distribution to the rotor servo-control system. Includes items such as pressure relief valves, electro valves, check valves, accumulators and equipment needed for the operation of the servo-control system, the servo-controls, the systems used for monitoring and indicating the operation of the servo-control system.

#### 2.1.51 System 70 - Standard practices, Engine

Table 51 System 70 - Standard practices, Engine

System	Subsystem	Title	Definition
70		<b>Standard practices, Engine</b>	This system contains those standard mechanical, electrical, electronic etc, engineering practices applicable to more than one engine task which are not covered in Systems 71 thru 84. It excludes those practices which are recognized as standard trade practices, also those practices/processes which are only applicable to manufacture. Practices for a particular application are included in the appropriate engine system as part of the procedure.
-00	General		Standard practices applicable to all engine and associated systems.
-10	Marking and masking		This section contains marking and masking processes and any required test of process and/or product.
-20	Cleaning and coating removal		This section contains chemical and mechanical cleaning procedures, removal of coating by chemical or mechanical processes.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

System	Subsystem	Title	Definition
	-30	Inspection	This section contains inspection processes such as hardness measurement, fluorescent penetrant, eddy current, etc. Includes any required test of process and/or product.
	-40	Repair principles	This section contains various processes applicable to repair engine parts (eg, riveting, machining, heat treatment). Includes any required test of process and/or product.
	-50	Surface preparation	This section contains processes to prepare a surface of a part before coating application (eg, abrasive blast etching) or to modify the surface hardness (eg, glass bead peening). Includes any required test of process and/or product.
	-60	Coating application	This section contains processes to apply a coating on engine parts such as nickel plating, oxide film, lubricants, paints. Includes any required test of process and/or product.
	-70	Assembly	This section contains processes which are applied during engine assembly such as locking method. Includes any required test of process and/or product.
	-80	Disassembly	This section contains processes which are applied during engine disassembly such as requirements for installing blanks and special inspections.

#### 2.1.52 System 71 - Power plant

Table 52 System 71 - Power plant

System	Subsystem	Title	Definition
71		<b>Power plant</b>	The overall power package including engine, air intake, mount, cowling, scoops, cowl flaps.
	-00	General	This section includes general information, limits and procedures. This section also covers subjects such as engine changes, run-up, externally-mounted spare power plants, etc. This section also covers subjects such as power plant build-up, teardown, etc.
	-10	Cowling	Those removable coverings which extend over and around the power plant assembly. Includes the functioning and maintenance aspects of items such as accessory section cowls, cowl flaps, cowling supports and attach and locking mechanisms, etc. Does not include the structure integral with the airframe which is covered by the applicable system structure.
	-20	Mounts	The framework, either of build-up construction or forgings which support the engine and attach it to the nacelle or pylon. Includes items such as engine mounts, vibration dampeners, support links, mounting bolts, etc.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-30	Fire seals	Those fire resistant partitions and seals mounted on or about the power package for the purpose of isolating areas subject to fire. Does not include those fire walls which are included in System 54.
	-40	Attach fittings	Those fittings and brackets which are used for the support of equipment in and about the power package.
	-50	Electrical harness	Those electrical cables, conduits, plugs, sockets etc, which serve several power plant systems, but which are banded together to facilitate removal and installation of the power plant. Does not include the wiring which is specifically covered under another system.
	-60	Air intakes	That portion of the power plant system which directs and can or cannot vary the mass air flow to the engine. Includes items such as nose ring cowls, scoops, compressor fan cowls, buried engine ducts, vortex generators, actuators, control handles, cables, wiring, plumbing, linkages, doors, warning systems, position indicators, etc. This does not include integral structure with the airframe, which are included in the applicable system structure.
	-70	Engine drains	Those components and manifold assemblies which are used to drain off excess fluids from the power plant and its accessories. Includes drain lines, manifolds, tanks, flame arrestors, vents and their supporting brackets, etc. Also includes components that are an integral part of, or fitted to the power plant cowl.
	-80	Engine ancillary systems	Those components and manifold assemblies which are used to deliver compressor wash fluids to the engine. Includes plumbing, valves, controls, air supply lines for closing compressor bleeds etc.

### 2.1.53 System 72 - Engine

Table 53 System 72 - Engine

System	Subsystem	Title	Definition
72		<b>Engine</b>	<p>Those units and components which are used to induce and convert fuel-air mixture into power. Includes, for the basic turbine engine: - air inlet, compressor, diffuser, combustion chambers, turbine and exhaust; and for the reciprocating engine: - blower and clutch, clutch control valve, cylinders, cylinder baffles, intake pipes, crankshaft assembly, etc.</p> <p>Used to transmit power to the propeller shaft, if any, and accessory drives. Includes reduction gearing, gear trains, extension shaft and torque meter.</p>

Within the profile of the basic engine, used to supplement the functioning of other defined systems external to the engine. Includes items such as accessory drive, mechanical portion of the spark advance mechanism, oil transfer tubes from the propeller governor pad to the propeller shaft, BMEP section, etc.

Used to control and direct the flow of lubrication through the engine from the inlet fitting to the outlet fitting. Includes engine pumps (pressure and scavenger), pressure relief valves, screens, oil lines (internal and external), etc.

## 2.1.54 System 72 - Engine turbine/turboprop Ducted fan/inducted fan

Table 54 System 72 - Engine turbine/turboprop Ducted fan/inducted fan

System	Subsystem	Title	Definition
72		<b>Engine turbine/turboprop Ducted fan/inducted fan</b>	
	-00	General	This section is intended to cover general information, limits and procedures. In the engine manual it includes such subjects as tear down, cleaning, inspection, assembly, testing, etc.
	-10	Reduction gear, shaft section (turboprop and/or front mounted gear driven propulsor)	The section of the engine which contains the propeller shafts and reduction gears. Includes items such as drives for hose mounted accessories, etc. If applicable, the section of the engine which uses mechanical force, through a gear-driven system, to drive front mounted propulsors which provide the majority of the energy generated. Includes items such as propulsor blades, actuation systems, reduction gears, drive-shafts, etc.
	-20	Air inlet section	The section of the engine through which the air enters the compressor. Includes items such as guide vanes, shrouds, cases, etc.
	-30	Compressor section	The section of the engine in which the air is compressed. Includes items such as cases, vanes, shrouds, rotors, diffusers, etc. Also includes the maintenance of stator blades but not the operation of variable stator blades which is covered under System 75-30. Does not include compressor bleed system.
	-40	Combustion section	The section of the engine in which the air and fuel are combined and burned. Includes items such as burner cans, cases, etc.
	-50	Turbine section	The section of the engine containing the turbines. Includes items such as turbine nozzles, turbine rotors, cases, etc.

System	Subsystem	Title	Definition
	-60	Accessory drives	The mechanical power take-offs to drive accessories. Includes items such as engine mounted gear boxes, gears, seals, pumps, etc. Does not include remotely installed gear boxes which are covered in System 83.
	-70	By-pass section	The section of the engine which by-passes a portion of the normal engine airflow (either ram or compressed air) for the prime purpose of adding to engine thrust or reducing specific fuel consumption.
	-80	Propulsor section (rear mounted)	The section of the engine which contains a propulsors and provides the majority of the energy generated. The propulsor can be turbine driven or gear driven. Includes such items as propulsor turbines, propulsor blades, blade actuation, and frames (rotating and/or stationary).
	-90	Multi-system hardware	The section of the engine made up of more than one of the above given subsystems (eg, gas generator, core engine).

## 2.1.55 System 72 - Engine reciprocating

Table 55 System 72 - Engine reciprocating

System	Subsystem	Title	Definition
72		<b>Engine reciprocating</b>	
	-00	General	This section is intended to cover general information, limits and procedures. In the engine manual this section includes such subjects as tear down cleaning, inspection, assembly, testing, etc.
	-10	Front section	The section of the engine which contains the propeller shafts and reduction gears. Includes items such as drives for nose mounted accessories, etc.
	-20	Power section	The section of the engine which contains the crankshaft, master and link rod assemblies, cams, cam drive gears, tappet guides, rollers, carriers, etc.
	-30	Cylinder section	The section of the engine which contains the cylinders, valves, pistons, push rods, intake pipes, baffles, etc. Also includes rocker arm assembly, valve springs, etc.
	-40	Supercharger section	The section of the engine which contains cases, shroud plates, PRT coupling and gearing, impeller and drives, accessory drives, bushings, etc.
	-50	Lubrication	Those units and components which are used to distribute oil throughout the engine. Includes front and rear pressure and scavenger pumps, sumps, strainers, valves, etc. Also includes those oil lines not included in System 79. Does not include those items which form integral passages within the engine.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

## 2.1.56 System 73 - Engine fuel and control

Table 56 System 73 - Engine fuel and control

System	Subsystem	Title	Definition
73		<b>Engine fuel and control</b>	<p>For turbine engines, those units and components and associated mechanical systems or electrical circuits which furnish or control fuel to the engine beyond the main fuel quick disconnect and thrust augments, fuel flow rate sensing, transmitting and/or indicating units whether the units are before or beyond the quick disconnect.</p> <p>It includes coordinator or equivalent, engine driven fuel pump and filter assembly, main and thrust augments fuel controls, electronic temperature datum control, temperature datum valve, fuel manifold, fuel nozzles, fuel enrichment system, speed sensitive switch, relay box assembly, solenoid drip valve, burner drain valve, etc.</p> <p>For reciprocating engines, those units and components which deliver metered fuel and air to the engine. The fuel portion includes the carburetor/master control from the inlet side to the discharge nozzle, injection pumps, carburetor, injection nozzles and fuel primer. The air portion includes units from the scoop inlet to the vapor vent return and the impeller chamber.</p>
	-00	General	
	-10	Distribution	That portion of the system from the main quick disconnect to the engine, which distributes fuel to the engine burner section and the thrust augments. Includes items such as plumbing, pumps, temperature regulators, valves, filters, manifold, nozzles, etc. Does not include the main or thrust augments fuel control.
	-20	Controlling	The main fuel control which meters fuel to the engine and to the thrust augments. Includes items such as hydro mechanical or electronic fuel control, levers, actuators, cables, pulleys, linkages, sensors, valves, etc, which are components of the fuel control units.
	-30	Indicating	That portion of the system which is used to indicate the flow rate, temperature and pressure of the fuel. Includes items such as transmitters, indicators, wiring, etc. Does not include indication, if indication is accomplished as part of an integrated engine instrument system (System 77-40).

## 2.1.57 System 74 - Ignition

Table 57 System 74 - Ignition

System	Subsystem	Title	Definition
74		<b>Ignition</b>	Those units and components which generate, control, furnish, or distribute an electrical current to ignite the fuel air mixture in the cylinders of reciprocating engines or in the combustion chambers or thrust augmenters of turbine engines. Includes induction vibrators, magnetos, switches, lead filters, distributors, harnesses, plugs, ignition relays, exciters and the electrical portion of spark advance.
	-00	General	
	-10	Electrical power supply	That portion of the system which generates electrical current for the purpose of igniting the fuel mixture in the combustion chambers and thrust augmenters. Includes items such as magnetos, distributors, booster coils, exciters, transformers, storage capacitors and compositors, etc.
	-20	Distribution	That portion of the system which conducts high or low voltage electricity from the electrical power supply to the spark plugs, or igniters. Includes wiring between magneto and distributor in those systems where they are separate units. Includes items such as ignition harness, high tension leads, coils as used in low tension systems, spark plugs, igniters, etc.
	-30	Switching	That portion of the system which provides a means of rendering the electrical power supply inoperative. Includes items such as ignition switches, wiring, connectors, etc.

## 2.1.58 System 75 - Air

Table 58 System 75 - Air

System	Subsystem	Title	Definition
75		<b>Air</b>	For turbine engines, those external units and components and integral basic engine parts which go together to conduct air to various portions of the engine and the extension shaft and torque-meter assembly, if any. Includes compressor bleed systems used to control flow of air through the engine, cooling air systems and heated air systems for engine anti-icing. Does not include aircraft anti-icing, engine starting systems, nor exhaust supplementary air systems.
	-00	General	
	-10	Engine anti-icing	That portion of the system which is used to eliminate and prevent the formation of ice by bleed air in all parts of the engine, excluding power plant cowling which is covered under System 30. Includes items such as valves, plumbing, wiring, regulators, etc. Electrical anti-icing is covered in System 30.

System	Subsystem	Title	Definition
	-20	Cooling	That portion of the system which is used to ventilate the engine and accessories. Includes items such as valves, plumbing, wiring, jet pumps, vortex spoilers, etc.
	-30	Compressor control	That portion of the system which is used to control the flow of air through the engine. Includes items such as governors, valves, actuators, linkages, etc. Also includes the operation of variable stator blades, but not the maintenance which is covered under System 72-30.
	-40	Indicating	That portion of the system which is used to indicate temperature, pressure, control positions etc, of the air systems. Includes items such as transmitters, indicators, wiring, etc.
	-50	Air intake foreign object removal	That portion of the system which is used to remove foreign objects from the engine air intake.

## 2.1.59 System 76 - Engine controls

Table 59 System 76 - Engine controls

System	Subsystem	Title	Definition
76		<b>Engine controls</b>	Those controls which govern operation of the engine. Includes units and components which are interconnected for emergency shutdown. For turbo-prop engines, includes linkages and controls to the coordinator or equivalent and from the coordinator or equivalent to the propeller governor, fuel control unit or other units being controlled. For reciprocating engines, includes controls for blowers. Does not include units or components which are specifically included in other systems.
	-00	General	
	-10	Power control	That portion of the system which furnishes a means of controlling the main fuel control or coordinator. Includes controls to the propeller regulator on turbo-prop engines. Includes items such as linkages, cables, levers, pulleys, switches, wiring, etc. Does not include the units themselves.
	-20	Emergency shutdown	That portion of the system which furnishes a means of controlling the flow of fluids to and from the engine during emergency procedures. Includes items such as levers, cables, pulleys, linkages, switches, wiring, etc. Does not include the units themselves.

## 2.1.60 System 77 - Engine indicating

Table 60 System 77 - Engine indicating

System	Subsystem	Title	Definition
77		<b>Engine indicating</b>	Those units, components and associated systems which indicate engine operation. Includes indicators, transmitters, analyzers, etc. For turbo-prop engines includes phase detectors. Does not include systems or items which are specifically included in other systems except when indication is accomplished as part of an integrated engine instrument system (System 77-40).
	-00	General	
	-10	Power	That portion of the system which directly or indirectly indicates power or thrust. Includes items such as BMEP, pressure ratio, RPM, etc.
	-20	Temperature	That portion of the system which indicates temperatures in the engine. Includes items such as cylinder head, exhaust (turbine inlet), etc.
	-30	Analyzers	That portion of the system which is used to analyze engine performance or condition by means of instruments or devices such as oscilloscopes, etc. Includes items such as generators, wiring, amplifiers, oscilloscopes, etc.
	-40	Integrated engine instrument systems	That portion of the system which as an integrated concept receives several/all engine operating parameters and then transmits this to a central processor for crew presentation. Includes items such as display units, transmitters, receivers, computers, etc.

## 2.1.61 System 78 - Exhaust

Table 61 System 78 - Exhaust

System	Subsystem	Title	Definition
78		<b>Exhaust</b>	Those units and components which direct the engine exhaust gases overboard.  For turbine engines, includes units external to the basic engine such as thrust reverser and noise suppressor.  For reciprocating engines, includes augmenters, stacks, clamps, etc. Excludes exhaust driven turbines.
	-00	General	
	-10	Collector/nozzle	That portion of the system which collects the exhaust gases from the cylinders or turbines. Includes item such as collector rings, exhaust ducts, variable nozzles, actuators, plumbing, linkages, wiring, position indicators, warning systems, etc. Does not include power recovery turbines, turbo-superchargers etc, nor noise suppressors or thrust reversers where they are not an integral part of the nozzle system.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
	-20	Noise suppressor	That portion of the system which reduces the noise generated by the exhaust gases. Includes items such as pipes, baffles, shields, actuators, plumbing linkages, wiring, position indicators, warning systems, etc.  Use Section -10 where integral part of nozzle system.
	-30	Thrust reverser	That portion of the system which is used to change the direction of the exhaust gases for reverse thrust. Includes items such as clamshells, linkages, levers, actuators, plumbing, wiring, indicators, warning systems, etc.  Use Section -10 where integral part of nozzle system.
	-40	Supplementary air	That portion of the system which varies and controls supplementary air flow of the exhaust system. Includes items such as tertiary air doors, actuators, linkages, springs, plumbing, wiring, position indicators, warning systems, etc.
	-50	Augmenter	That portion of the system which provides additional thrust for takeoff and in-flight at the command of the pilot. Includes items such as liners, rings, actuators, linkages, wiring, indicators, warning systems, etc. Does not include augmentation external to the power plant which is covered in System 84 Propulsion augmentation.
	-60	Dissipation/deflection	That portion of the system which dilutes and/or redirects engine exhaust away from the aircraft for the purpose of reducing infrared (IR) signature and decreasing exhaust temperatures.

**2.1.62 System 79 - Oil**
*Table 62 System 79 - Oil*

<b>System</b>	<b>Subsystem</b>	<b>Title</b>	<b>Definition</b>
79		<b>Oil</b>	Those units and components external to the engine concerned with storing and delivering lubricating oil to and from the engine. Covers all units and components from the lubricating oil engine outlet to the inlet, including the inlet and outlet fittings, tank, radiator, by-pass valve etc, and auxiliary oil systems.
	-00	General	
	-10	Storage	That portion of the system used for storage of oil. Includes items such as tanks, filling systems, internal hoppers, baffles, tank sump and drain, etc. Does not include tanks which are an integral portion of the engine.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**
**Chap 8.2.5**

System	Subsystem	Title	Definition
	-20	Distribution	That portion of the system which is used to conduct oil from and to the engine. Includes items such as plumbing, valves, temperature regulator, control systems, etc.
	-30	Indicating	That portion of the system which is used to indicate the quantity, temperature and pressure of the oil. Includes items such as transmitters, indicators, wiring, warning systems, etc. Does not include indication if indication is accomplished as part of an integrated engine instrument system (System 77-40).

### 2.1.63 System 80 - Starting

Table 63 System 80 - Starting

System	Subsystem	Title	Definition
80		<b>Starting</b>	Those units, components and associated systems used for starting the engine. Includes electrical, inertia air or other starter systems. Does not include ignition systems which are covered in System 74.
	-00	General	
	-10	Cranking	That portion of the system which is used to perform the cranking portion of the starting operation. Includes items such as plumbing, valves, wiring, starters, switches, relays, etc.

### 2.1.64 System 81 - Turbines

Table 64 System 81 - Turbines

System	Subsystem	Title	Definition
81		<b>Turbines</b>	For reciprocating engines only. Includes power recovery turbine assembly and turbo-supercharger unit when external to the engine.
	-00	General	
	-10	Power recovery	The turbines which extract energy from the exhaust gases and are coupled to the crankshaft.
	-20	Turbo-supercharger	The turbines which extract energy from the exhaust gases and drive an air compressor.

## 2.1.65 System 82 - Water injection

Table 65 System 82 - Water injection

System	Subsystem	Title	Definition
82		<b>Water injection</b>	Those units and components which furnish, meter and inject water or water mixtures into the induction system, includes tanks, pumps, regulators, etc.
	-00	General	
	-10	Storage	That portion of the system which is used for the storage of water or water mixtures. Includes tank sealing, attachment of bladder type cells, ventilating system, cell and tank interconnections, filling systems, etc.
	-20	Distribution	That portion of the system which is used to conduct water or water mixtures from the tanks or cells to the engine. Includes items such as plumbing, cross feed system, pumps, valves, controls, etc.
	-30	Dumping and purging	That portion of the system which is used to dump injection water and to purge the system. Includes items such as plumbing, valves, controls, etc.
	-40	Indicating	That portion of the system which is used to indicate the quantity, temperature and pressure of the water or water mixtures. Includes items such as transmitters, indicators, wiring, etc.

## 2.1.66 System 83 - Accessory gearboxes

Table 66 System 83 - Accessory gearboxes

System	Subsystem	Title	Definition
83		<b>Accessory gearboxes</b>	Those units and components which are remotely installed and connected to the engine by a drive shaft and which drive multiple types of accessories. Does not include those accessory drives which are bolted to and are immediately adjacent to the engine. The latter item is covered under System 72.
	-00	General	
	-10	Drive shaft section	That portion of the system which is used to conduct power from the engine to the gearbox. Includes items such as drive shaft, adapters, seals, etc.
	-20	Gearbox section	The case which contains the gear trains and shafts. Includes items such as gears, shafts, seals, oil pumps, coolers, etc.

## 2.1.67 System 84 - Propulsion augmentation

Table 67 System 84 - Propulsion augmentation

System	Subsystem	Title	Definition
84		<b>Propulsion augmentation</b>	Those units and components that, independent of the primary propulsion system, furnish additional thrust of short duration. Includes solid or liquid propellants, controls, indicators, etc.
	-00	General	
	-10	Jet assist takeoff	Those units or components dedicated to jet assist takeoff systems.

## 2.1.68 System 85 - Fuel cell system

Table 68 System 85 - Fuel cell system

System	Subsystem	Title	Definition
85		<b>Fuel cell system</b>	Those units and components using an electrochemical conversion process to produce electricity from a fuel (on the anode side) and an oxidant (on the cathode side). This includes reactants and reaction products supply/exhaust devices, fuel cell stacks, electric power output devices, cooling and/or heating devices and a centralized control and monitoring subsystem.
	-00	General	This section is intended to cover general information, limits and procedures applicable for the complete system not only subsystems. It also includes the system control and indication. It does not include subsystem controls which are covered by each individual subsystem.
	-10	Fuel cell stack	That portion of the fuel cell system achieving electrochemical conversion of fuel and oxidant into electrical energy, thermal energy and exhaust gas. This includes fuel cell housing, fitting, wiring and all devices allowing the connection to other fuel cell subsystems.
	-20	Fuel storage and supply	Those units and components storing and/or delivering fuel to the fuel cell stacks.
	-30	Oxidant storage and supply	Those units and components storing and/or delivering oxygen/air to the fuel cell stacks.
	-40	Thermal management	That portion of the system which is used to cool or heat the fuel cell stacks, the power electronics and accessories. It includes items such as cooler, blower, heating devices, valves, etc.
	-50	Power conditioning	Those units and components used to provide the electrical power in the condition needed by the aircraft network and the fuel cell system itself. It includes converter, contactor, filter, etc.

-60	Exhaust conditioning	Those units and components necessary to process the exhaust for further use. It includes condenser, dryer, valves, etc.
-70	Interface	Those units and components used to connect the system to the rest of the aircraft: structure, the environment and other systems. This includes mounts, electrical harness, air intake/exhaust and drain, etc.

## 2.1.69 System 86 - Lift system

Table 69 System 86 - Lift system

System	Subsystem	Title	Definition
86		<b>Lift system</b>	Those units and components, which together with the primary propulsion system furnish vector able vertical thrust allowing the aircraft to achieve short take-off and vertical landing (STOVL). Also includes those units and components which provide the means for stabilizing the aircraft when in the STOVL mode.
	-00	General	
	-10	Fan	That portion of the system that provides lift for the aircraft when operating in a STOVL flight condition. This includes gearboxes, clutches and accessories.
	-20	Drive shaft	That portion of the system that provides a means of transmitting power from the engine to the STOVL lift system.
	-30	Variable area nozzle	That portion of the system that controls and ducts STOVL fan outlet air to provide aircraft STOVL lift.
	-40	Roll control	That portion of the system that ducts and controls main engine generated air for the control of aircraft roll attitude when in a STOVL flight configuration.

## 2.1.70 System 90 - Recovery

Table 70 System 90 - Recovery

System	Subsystem	Title	Definition
90		<b>Recovery</b>	Those systems, units and components used to recover air vehicles and equipment.
	-00	General	
	-10	Parachute recovery system	That part of the system that uses a parachute and its deployment devices to recover an air vehicle and equipment from flight. Includes items such as main- and drogue parachute container, ejection assembly, initiation assembly, deployment assembly and release assembly.

-20	Impact attenuation system	That part of the system which provides a shock for the air vehicle to absorb shock/attenuation. Includes items such as crushable impact attenuators, air bags, retrorocket landing attenuation systems, initiation assembly, deployment assembly and attenuator container.
-30	Sequencing system	That part of the system that provides the sequencing for the recovery. Includes items such as computer, interfaces, transmitter, electrical signal etc.
-40	Location system	That part of the system which provides information on the location of the aircraft after landing. Includes items such as computer, transmitter, antenna, etc.

### 2.1.71 System 91 - Air vehicle wiring

*Table 71 System 91 - Air vehicle wiring*

System	Subsystem	Title	Definition
91		<b>Air vehicle wiring</b>	Miscellaneous charts, diagrams and/or lists applicable to more than one system, or to system interfaces, such as wiring charts, spare wire charts, junction boxes charts, disconnect plug charts, conduit and wire routing charts, rigid tube charts, flexible hose charts, system integration diagrams, reusable hose component lists, control cable lists, multi-system consumables lists etc.

### 2.1.72 System 92 - Radar

*Table 72 System 92 - Radar*

System	Subsystem	Title	Definition
92		<b>Radar</b>	Those units and components which comprise multifunction radar systems used on fighters (generally nose-mounted), on maritime patrol air vehicles, on AWACS-type air vehicles, etc.
	-00	General	
	-10	Frequency generation	That portion of the system which gives the original signals used as references (micro-waves, clock signals, etc).
	-20	Transmission	That portion of the system acting for waves output.
	-30	Reception	That portion of the system which collects electro-magnetic signals, transposes the frequencies of collected signals or generates video-frequencies signals.
	-40	Processing	Computing resources used for signals processing, data processing, radar system management or I/O exchanges of information with other air vehicle systems processing functions.
	-50	Beam control	That portion of the system which points the beam in any direction of space. This device can be based on mechanical or electronic steering.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

System	Subsystem	Title	Definition
	-60	Power supply and safety	That portion of the system in charge of the setting of electrical power and all the safety functions concerning the starting phase and the current functioning states (eg, cut-off).
	-70	Conditioning	That portion of the system in charge of cooling and pressurization for the different modules.
	-80	Built-in tests	That portion of the system devoted to failures detection and states reporting.
			The content of these sections have to be determined in connection with the System 45-92-XX.

### 2.1.73 System 93 - Surveillance

Table 73 System 93 - Surveillance

System	Subsystem	Title	Definition
93		<b>Surveillance</b>	Those units and components which furnish a means of sensing the surrounding environment, and then process, display and record the resulting information.
	-00	General	
	-10	Data processing	That portion of the system that provides computation, switching and storage of signals acquired.
	-20	Data display	That portion of the system that provides the data display of information acquired by sensors.
	-30	Recording	That portion of the system that provides recording of information acquired by sensors.
	-40	Identification	That portion of the system that provides identification of information acquired by sensors.
	-50	Infrared sensors	That portion of the system that uses heat sensing devices such as infra-red scanners, infra-red image and detection to acquire information.
	-60	Laser sensors	That portion of the system that uses laser devices to acquire information for distance measuring, identification, etc.
	-70	Surveillance radar	That portion of the system that uses radar for surveillance or mapping purposes. This includes devices such as antennas, receivers, transmitters, indicators, etc.
			<b>Note</b> System 93-70 is to be used for surveillance oriented radars (eg, weather radar on transport aircraft). For large multifunction radars use System 92.
	-80	Magnetic sensors	That portion of the system that senses magnetic anomalies. This includes devices such as magnetometers, amplifiers, computers, indicators, etc.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

-90	Sonar sensors	That portion of the system that senses objects underwater. This includes devices such as modulators, computers, transducers, indicators, etc.
-----	---------------	---

#### 2.1.74 System 94 - Weapons system

Table 74 System 94 - Weapons system

System	Subsystem	Title	Definition
94		<b>Weapons system</b>	Those units and components which furnish a means of acquiring a target and releasing stores.
	-00	General	
	-10	Weapon release	The weapon release system consists of all equipment required to release, fire and/or jettison stores. Includes computers, displays, controls, stores management, etc.
	-20	Available for projects	
	-30	Weapon suspension	The weapon suspension system provides interconnecting equipment to transport and release/fire weapons. Includes multipurpose pylons if used for any weapon mounting role, specialist pylons, ejection racks, launchers, etc.
	-40	Available for projects	
	-50	Gunnery	The gunnery system consists of all guns and equipment necessary to fire guns.
	-60	Available for projects	
	-70	Weapon control	Those units and components which furnish a means of designating and acquiring a target. Includes radar, computers, displays etc, necessary to provide weapon release decision (aiming cues).

#### 2.1.75 System 95 - Crew escape and safety

Table 75 System 95 - Crew escape and safety

System	Subsystem	Title	Definition
95		<b>Crew escape and safety</b>	Those units and components which furnish a means of ejecting or jettisoning seats, hatches, canopies, capsules etc, from the airframe also includes safety and survival equipment.
	-00	General	
	-10	Ejection seats	That portion of the system which is used to eject flight crew or passenger seats individually from the airframe.

Applicable to: All

**S1000D-A-08-02-0500-00A-040A-A**

**Chap 8.2.5**

-20	Escape hatches/canopy	That portion of the escape system involving hatches and canopies including miniature detonating cord. Does not include the canopy and its actuating mechanisms which are covered in System 56.
-30	Capsule ejection	That portion of the escape system that provides a protective environment to the flight crew after separation from the airframe.
-40	Available for projects	
-50	Global survival kits	That portion of the system that insures flight crew survivability and/or after unplanned separation landing.
-60	Impact protection and floatation	That portion of the system providing protection to personnel/equipment after impact.
-70	Capsule flight	That portion of the system used to control attitude and direction of the capsule or container after ejecting or jettisoning from the airframe.

#### 2.1.76 System 96 - Missiles, drones and telemetry

*Table 76 System 96 - Missiles, drones and telemetry*

System	Subsystem	Title	Definition
96		<b>Missiles, drones and telemetry</b>	Those units and components which furnish a means of launching and controlling drones.
	-00	General	
	-10	Surface to surface missiles	That portion of the system which is used for launching and controlling surface to surface missiles.
	-20	Surface to air missiles	That portion of the system which is used for launching and controlling surface to air missiles.
	-30	Drones	That portion of the system which is used for launching and controlling drones.
	-40	Telemetry	That portion of the system which is used for telemetry, for applications other than missile, drone or decoy usage.

## 2.1.77 System 97 - Image recording

Table 77 System 97 - Image recording

System	Subsystem	Title	Definition
97		<b>Image recording</b>	Those units and components which furnish a means of recording events on film, video, disc or tape, etc. Does not cover recording systems which are part of any other system or Subsystem.
	-00	General	
	-10	Strike camera	That portion of the system which is used for recording the results of an air strike.
	-20	Bomb bay system camera	That portion of the system which is used for recording instruments and the dropping of bombs.
	-30	Fire control camera system	That portion of the system which is used for recording rocket or gunfire.
	-40	Instrumentation camera system	That portion of the system which is used for recording meters, dials, CRT display, etc.
	-50	Range camera system	That portion of the system which is used for range camera. Includes installation such as forward and oblique camera systems.
	-60	Reconnaissance camera system	That portion of the system which is used for reconnaissance.
	-70	Image recorder	That portion of the system which is used for storing the images on disc, tape (such as VCR), etc.

## 2.1.78 System 98 - Meteorological and atmospheric research

Table 78 System 98 - Meteorological and atmospheric research

System	Subsystem	Title	Definition
98		<b>Meteorological and atmospheric research</b>	Those units and components which furnish a means of providing and recording measurement of natural or man-made atmospheric, gravitation and magnetic phenomena.
	-00	General	
	-10	Weather	That portion of the system which is used to measure and record moisture, temperature, cloudiness, wind, etc.
	-20	Clear air turbulence	That portion of the system which is used to detect, measure and record clear air turbulence.
	-30	Pollutants	That portion of the system which is used to detect, measure and record contaminated particles.

Applicable to: All

S1000D-A-08-02-0500-00A-040A-A

Chap 8.2.5

-40	Magnetic/gravitational	That portion of the system which is used to detect measure and record the earth's magnetic and gravitational force.
-----	------------------------	---

## 2.1.79 System 99 - Electronic warfare

Table 79 System 99 - Electronic warfare

System	Subsystem	Title	Definition
99		<b>Electronic warfare</b>	Those units and components which furnish a means of detecting, analyzing, jamming, or nullifying the effectiveness of defensive detection devices and communication links (tactical or not).
	-00	General	
	-10	Active, electro-magnetic	That portion of the system operating in the electro-magnetic range of 1 Hz to 100 GHz. This subsystem can have the capability of receiving, analyzing, transmitting, etc.
	-20	Available for projects	
	-30	Passive, electro-magnetic	That portion of the system operating in the electro-magnetic field that has no active or radiating elements (eg, chaff).
	-40	Available for projects	
	-50	Elint (Electronic intelligence)	That portion of the system tasked with the gathering of electronic information and can include receivers, processors/analyzers and recorders.
	-60	Available for projects	
	-70	Infrared (IR)	That portion of the system operating in the IR range/field and can have the capability of receiving, analyzing and transmitting.
	-80	Laser	That portion of the system operating in the laser range/field and can have the capability of receiving, analyzing and transmitting.

## References

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 1.5</a>	Request for change
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system

## 1 General

This is an SNS, at the top level, for tactical missiles. It is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

Further breakdown will be required for its full use on projects and this breakdown must be applied in accordance with the design of the tactical missile system in question and the information and publication sets to be used.

## 2 Tactical missile SNS

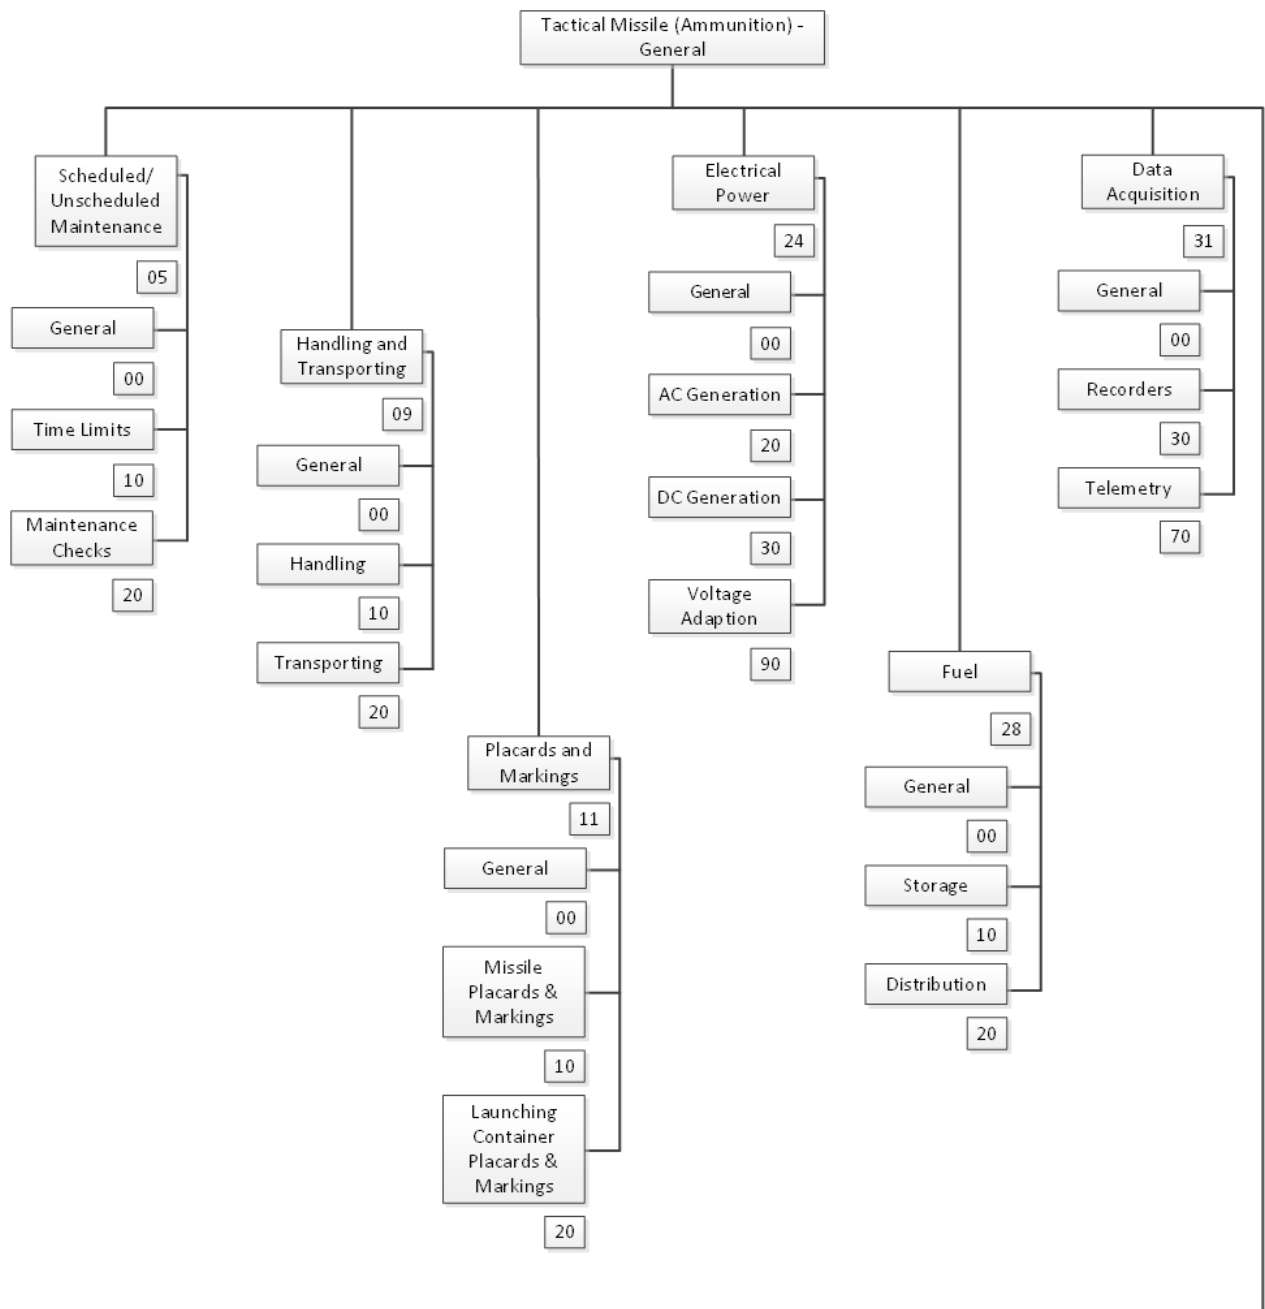

The coding and definitions for the tactical missile SNS is appropriate for common and system level information for all Products and is described in [Table 2](#). However, projects can decide not to use this generic SNS.

The basic structure of this SNS uses an alphanumeric breakdown, which begins with numbers and progresses onto alpha characters where required. This top level breakdown is as shown in [Fig 1](#) and listed in [Table 2](#).

### 2.1 Definitions

The following definitions are used:

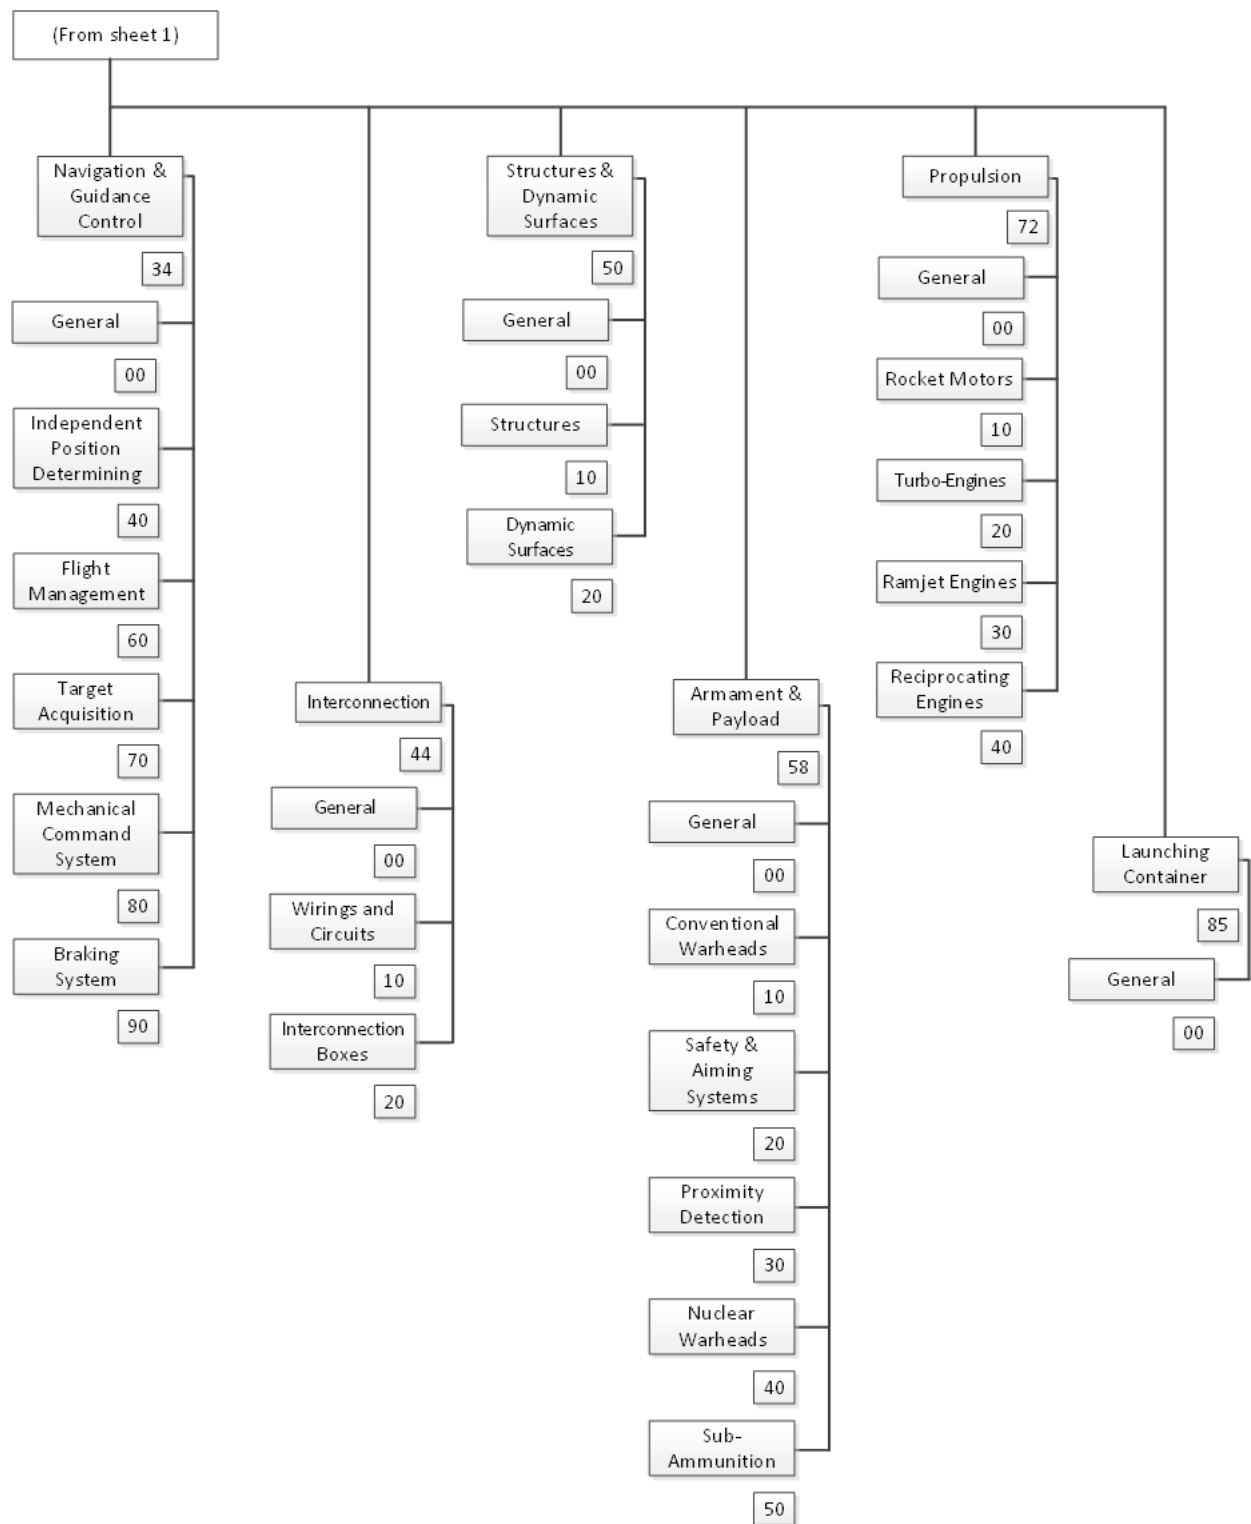

- **Tactical missile:** A propelled and guided air-vehicle, used for a given point target mission, with the aim of destroying or damaging a determined target. A tactical missile can be launched from an aircraft, a ship or any ground launching system.
- **Tactical ammunition:** A tactical missile in its launching container.

## 2.2 System breakdown

### 2.2.1 Main systems

This tactical missile SNS is divided into 13 main systems.

## 2.2.2 System 00 - Tactical missile (or ammunition), General

Table 3 System 00 - Tactical missile (or ammunition), General

System	Subsystem	Title	Definition
00		<b>Tactical missile (or ammunition), General</b>	<p>General information for the complete tactical missile (or ammunition) including description, main dimensions, etc.</p> <p>Instructions and procedures for tactical missile (or ammunition) safety.</p> <p>Information on the technical publication required to support the tactical missile (or ammunition).</p>
-00		Tactical missile (or ammunition) description	General description and dimensions with illustrations of tactical missile (or ammunition) including associated missiles such as training missile, dummy missile, etc.
-10		Available for projects	
-20		Tactical missile (or ammunition) safety	<p>Those instructions and procedures necessary to make safe the tactical missile (or ammunition) for storage, preparation and maintenance action.</p> <p>General information on tactical missile (or ammunition) safety such as risk divisions, dangerous components, hazard zones, etc.</p> <p>Those instructions necessary for the use or the operation of protective or safety devices such as: protective covers, plugs, safety pins, safety flags, etc.</p>

System	Subsystem	Title	Definition
	-30	Available for projects	
	-40	Technical publication	Information on the technical publication required to support the tactical missile (or ammunition) such as the Lists of Applicable Publications, Publication Guide, the coding system of technical publications, instructions for handling and updating technical publications.

### 2.2.3 System 05 - Scheduled/unscheduled maintenance

*Table 4 System 05 - Scheduled/unscheduled maintenance*

System	Subsystem	Title	Definition
05		<b>Scheduled/unscheduled maintenance</b>	The recommended time limits for inspection, maintenance checks and overhaul.  General information on maintenance policy of the tactical missile (or ammunition).
	-00	General	
	-10	Time limits	The recommended life limits in utilization and/or in storage of the tactical missile (or ammunition) equipment or components subject to wear or time limitation.  The recommended maintenance periodicities according to the storage and/or the utilization conditions of the tactical missile (or ammunition).
	-20	Maintenance checks	The recommended maintenance checks and inspections of the tactical missile (or ammunition) according to: - the storage and/or utilization conditions of the tactical missile (or ammunition) - the maintenance level or following: - unusual events - exposure to unusual conditions

### 2.2.4 System 09 - Handling and transporting

*Table 5 System 09 - Handling and transporting*

System	Subsystem	Title	Definition
09		<b>Handling and transporting</b>	Includes all the necessary procedures for handling the tactical missile (or ammunition) with illustrations showing hoisting and supporting points.
	-00	General	

Applicable to: All

**S1000D-A-08-02-0600-00A-040A-A**

**Chap 8.2.6**

System	Subsystem	Title	Definition
	-10	Handling	Those procedures for handling the tactical missile (or ammunition) in its storage and transportation container including information on the equipment required such as forklift truck, hoisting system, etc.
	-20	Transporting	Information on transporting the tactical missile (or ammunition) in its storage and transportation container by air/road/rail/sea, with reference to safety information covered in the first chapter.

## 2.2.5 System 11 - Placards and markings

Table 6 System 11 - Placards and markings

System	Subsystem	Title	Definition
11		<b>Placards and markings</b>	All placards, labels and markings of the tactical missile, the storage and transportation container, and the launching container in the case of tactical ammunition.  Includes illustrations showing the place and the meaning of each placard, label or marking.
	-00	General	
	-10	Missile placards and markings	Those placards, labels and markings of the tactical missile, required for ground servicing, identification, handling, cautions, warnings, etc.  Those placards, labels and markings of the storage and transportation container, required for storage identification, handling, cautions, warnings, etc, of the tactical missile in its container.
	-20	Launching container placards and markings	In the case of tactical ammunition, those placards, labels and markings required for ground servicing, identification, handling, cautions, warnings, etc.

## 2.2.6 System 24 - Electrical power

Table 7 System 24 - Electrical power

System	Subsystem	Title	Definition
24		<b>Electrical power</b>	All the electrical power units which generate, control and adapt DC and/or AC electrical power for other systems of the tactical missile.  Does not include those electrical units integrated in other systems of the tactical missile.
	-00	General	
	-10	Available for projects	

Applicable to: All

**S1000D-A-08-02-0600-00A-040A-A**

**Chap 8.2.6**

System	Subsystem	Title	Definition
	-20	AC generation	Electrical units which generate and control AC electrical power such as alternators etc.
	-30	DC generation	Electrical units which generate and control DC electrical power such as batteries, primable batteries, thermal batteries, etc.
	-40 thru -80	Available for projects	
	-90	Voltage adaptation	Those units which adapt and transform electrical power such as inverter, voltage generator, transformer, etc.

### 2.2.7 System 28 - Fuel

*Table 8 System 28 - Fuel*

System	Subsystem	Title	Definition
28		<b>Fuel</b>	All units and components which store and deliver fuel to engines.
	-00	General	
	-10	Storage	Units and components which store fuel such as: tank sealing, bladder type cells, venting system, filling circuit, etc.
	-20	Distribution	Units and components which distribute fuel to engine combustion chamber such as: plumbing, pumps, temperature and pressure regulators, valves, filters, nozzles, etc.

### 2.2.8 System 31 - Data acquisition

*Table 9 System 31 - Data acquisition*

System	Subsystem	Title	Definition
31		<b>Data acquisition</b>	All units and components which furnish the means of measuring, recording and transmitting the functioning data of the tactical missile.
	-00	General	
	-10 thru -20	Available for projects	
	-30	Recorders	In the case of airborne training and acquisition missile, units and components which record the functioning data of seeker during target detection. Could include other types of recorder if necessary.
	-40 thru -60	Available for projects	

Applicable to: All

**S1000D-A-08-02-0600-00A-040A-A**

**Chap 8.2.6**

System	Subsystem	Title	Definition
	-70	Telemetry	In the case of drill missile for firing campaign, units and components which measure and transmit to a ground tracking station, the functioning data sequences of the tactical missile during its free flight.

## 2.2.9 System 34 - Navigation guidance control

Table 10 System 34 - Navigation guidance control

System	Subsystem	Title	Definition
34		<b>Navigation guidance control</b>	All the units and components which furnish the means of controlling the trajectory of the tactical missile in correlation with target data in order to steer the missile towards its target. Includes units which determine and control position, direction, attitude and altitude of the tactical missile.
	-00	General	
	-10 thru -30	Available for projects	
	-40	Independent position determining	Mechanical and electronic units equipped with sensors able to determine position, direction, attitude and altitude of the tactical missile. Includes all types of sensors and associated electronic boxes such as: inertial guidance systems (inertial guidance units, accelerometers, gyroscopes, and gyro meters), altimeters, etc. Includes also global positioning systems (GPS).
	-50	Available for projects	
	-60	Flight management system	Units which combine guidance and navigational data, to compute and/or manage the geographical position of the missile, to determine its theoretical flight and to control the missile trajectory (direction and vertical references, computed or introduced trajectory parameters, maneuvering orders, etc). Includes computers, sequencers, order generators, etc.
	-70	Target acquisition	Units and components which furnish communication means between the missile and the firing control system and/or which participate in target acquisition (detection, location and tracking). Includes radars, seekers, receivers, transmitters, responders, laser offset detectors, wire guided systems, transcoders, etc.
	-80	Mechanical command system	Units and components which transform signals into mechanical actions and furnish the means to command the missile trajectory. Includes all types of actuators (without control surfaces), thrust deflectors, jet interceptors, thrust vector control systems, hydraulic and/or pneumatic control systems, etc. Not including thrust vectoring nozzles which are covered in the propulsion chapter.

Applicable to: All

S1000D-A-08-02-0600-00A-040A-A

Chap 8.2.6

System	Subsystem	Title	Definition
	-90	Braking system	Units and components used in some tactical missiles which furnish the means of temporary braking the missile during its free flight.

## 2.2.10 System 44 - Interconnections

Table 11 System 44 - Interconnections

System	Subsystem	Title	Definition
44		<b>Interconnections</b>	All the units and components which establish electrical connections (LF, HF, VHF, etc) and cryogenic connections (between units of equipment of the tactical missile). Includes also tactical missile external interfaces.
	-00	General	
	-10	Wirings and circuits	Units and components making electrical connections such as: wires, cables, ribbon cable, ground braid, optic fiber, coax, wave guide, etc. Units and components used to convey very high pressure gas to cool the infrared detection cell of infrared seeker such as: tube, pipe, pressure relief valve, pressure shear valve, etc.
	-20	Interconnection boxes	Units and components that centralize and distribute electrical and cryogenic systems.

## 2.2.11 System 50 - Structures and dynamic surfaces

Table 12 System 50 - Structures and dynamic surfaces

System	Subsystem	Title	Definition
50		<b>Structures and dynamic surfaces</b>	All the structural units and associated components which constitute the body of the tactical missile. All the fixed and mobile dynamic surfaces linked to the body of the tactical missile and allowing its motion in the air.
	-00	General	
	-10	Structures	Skins, tubes, nosecone, tail cone, doors, panels, frames, belts, fastenings, stiffeners, attachment fittings, fairing, air inlet, etc. Not including structural components belonging to structural equipment such as propulsion unit, seeker, etc, which are covered in the corresponding systems.
	-20	Dynamic surfaces	Wings, fins, control surfaces, etc. In case of retractable or folding wings or fins, includes the unfolding or spreading system.

## 2.2.12 System 58 - Armament and payload

Table 13 System 58 - Armament and payload

System	Subsystem	Title	Definition
58		<b>Armament and payload</b>	All units and components belonging to the safety, arming, and initiation chain of the warhead of the tactical missile. Includes also autonomous sub-ammunition and other types of autonomous units such as infrared video camera, etc.
	-00	General	
	-10	Conventional warheads and explosive trains	Units and components which contain and initiate high explosive material. Includes all types of warhead, detonators, boosters, etc.
	-20	Safety and arming systems	Mechanical and electric units used for the safety, arming and initiation of the warhead. Includes safety and arming mechanism, electric initiator, safety plug, etc.
	-30	Proximity detection and impact detection	Units such as proximity fuse which initiate the firing of the warhead explosive train after infrared or radio frequency, etc, detection in close proximity of the target. Devices which command the firing of the warhead explosive train after impact against the target.
	-40	Nuclear warheads and explosive trains	Units and components which contain and initiate high explosive nuclear material.
	-50	Sub-ammunition	Autonomous sub-ammunition equipped, following the types, with warhead, rocket motor, guidance system, etc, and ejected by some tactical missiles in the terminal flight phase.

## 2.2.13 System 72 - Propulsion

Table 14 System 72 - Propulsion

System	Subsystem	Title	Definition
72		<b>Propulsion</b>	All units and components used for the propulsion of the tactical missile including vector nozzles.
	-00	General	
	-10	Rocket motors	Non-air breathing reaction propulsion motors that consist of a combustion chamber, exhaust nozzles and a solid propellant charge from which hot gases are generated by combustion and expanded through the nozzles. Includes main rocket motors, acceleration rocket motors, ejection motors and their components.
	-20	Turbojet engines	Turbine engines that consist of compressor, diffuser, combustion chamber, turbine and nozzle, from which hot gases are generated by combustion of fuel-air mixture and expanded through the nozzle. Includes the engine and its components.

Applicable to: All

S1000D-A-08-02-0600-00A-040A-A

Chap 8.2.6

System	Subsystem	Title	Definition
	-30	Ramjet engines	Engines that consist of injector, combustion chamber and nozzle, in which the air compress by kinetic effect and from which hot gases are generated by combustion of fuel-air mixture and expanded through the nozzle. Includes the engine and its components.
	-40	Reciprocating engines	Engine in which fuel-air mixture is compressed by a piston within a cylinder and ignited to transform linear motion in circular motion to drive a propeller. Includes the engine and its components.

#### 2.2.14 System 85 - Launching container

Table 15 System 85 - Launching container

System	Subsystem	Title	Definition
85		<b>Launching container</b>	For tactical ammunition, system which includes all the mechanical, electrical and pyrotechnical, etc, units and components used to protect, to maintain, and to launch the tactical missile.
	-00	General

<a href="#">Chap 1.3</a>	How to use the specification
<a href="#">Chap 1.5</a>	Request for change
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system

## 1 General

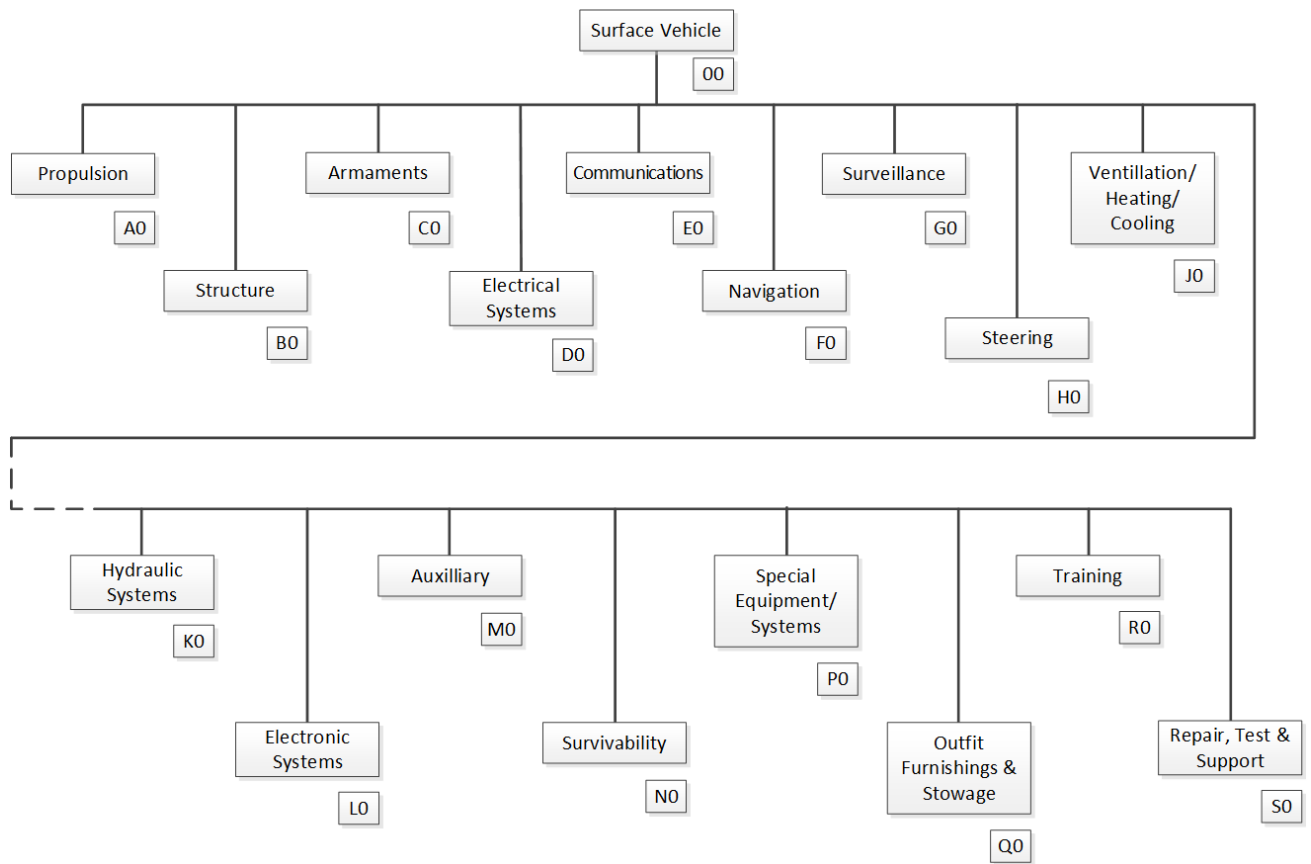

The SNS is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

This chapter gives the definitions which relate to systems and subsystems, for general surface vehicles. For details on how to use this SNS within the data module code, refer to [Chap 4.3.3](#).

## 2 General surface vehicles SNS

The coding and definitions for the general surface vehicles SNS is appropriate for common and system level information for all Products and is described in [Table 2](#). However, projects can decide not to use this generic SNS.

The basic structure of this SNS uses an alphanumeric breakdown. This top level breakdown is as shown in [Fig 1](#) and listed in [Table 2](#).

ICN-83007-0000000131-001-01

Fig 1 Top level breakdown of a general surface vehicle

## 2.1 System breakdown

### 2.1.1 Main systems

This surface vehicle SNS is divided into the 17 main systems shown in [Table 2](#).

*Table 2 Main systems*

System	Title
A0	Propulsion
B0	Structure
C0	Armaments
D0	Electrical systems
E0	Communications
F0	Navigation
G0	Surveillance
H0	Steering
J0	Ventilation/heating/cooling
K0	Hydraulic systems
L0	Electronic system
M0	Auxiliary
N0	Survivability
P0	Special equipment/systems
Q0	Outfit, furnishings and stowage
R0	Training
S0	Repair, test and support

### 2.1.2 System A - Propulsion

*Table 3 System A0 - Propulsion, General*

System	Subsystem	Title	Definition
A0		<b>Propulsion, General</b>	
	-00	General	A system or equipment for producing and delivering power.

*Table 4 System A1 - Power pack, General*

System	Subsystem	Title	Definition
A1		<b>Power pack - General</b>	

System	Subsystem	Title	Definition
	-00	General	The power pack element refers to a self-contained means for generating and delivering power. It includes such systems as the main engine, transmission and interfaces. Subsystems can include such items as cooling, fuel, air and exhaust, lubrication, auxiliaries and electrical.
	-10	Main engine	Refers to a diesel, petrol, electric, etc, fuelled means for generating power and a means whereby this power can be delivered to the transmission. It can include, for example, engine mounted flywheel and clutch assemblies, cooling, fuel, air and exhaust, lubrication, auxiliary and electrical systems.
	-20	Transmission	Refers to a system which transmits power from the engine to the driving member and can include torque converter and gearbox. It can also include flywheel and clutch assemblies, steering and brakes if they are integral to the transmission. Also included are differentials and power takeoffs.
	-30	Power pack Interfaces	Refers to the mounting assemblies connecting the main engine and transmission, together with associated ancillaries, including such systems as cooling, fuel, air and exhaust, lubrication, auxiliary and electrical. It can also include transmission items.

Table 5 System A2 - Power unit, General

System	Subsystem	Title	Definition
A2		<b>Power unit, General</b>	
	-00	General	The power unit element refers to a discrete means for generating and delivering power to the transmission. It can include, for example, flywheel and clutch assemblies.
	-10	Engine	Refers to a diesel, petrol, electric, etc, fuelled means for generating power and a means whereby this power can be delivered to the transmission. It can include, for example, flywheel and clutch assemblies and engine mounted cooling, fuel, air and exhaust, lubrication, auxiliary and electrical systems.
	-20	Cooling system	Refers to systems designed to maintain the correct operating temperatures for the power unit. It includes, for example, cooling air ducting, coolant pumps, liquid filled radiators, intercoolers, fans and associated heat exchange equipment.
	-30	Fuel systems	Refers to a system or equipment designed to deliver fuel to the power unit. It includes, for example, fuel storage facilities, pumps, filters, delivery pipes, drainage and cut-off valves, Fuel Injector Pumps (FIP) and injectors.

System	Subsystem	Title	Definition
	-40	Air and exhaust systems	Refers to a system which supplies air to, or collects and removes exhaust gasses from the engine. It includes, for example, all pipes, ducting, filters, couplings, gaskets, turbochargers/superchargers, silencers and catalytic converters.
	-50	Lubrication systems	Refers to a system that provides lubrication to the power unit and any external components related to the power unit lubrication system. It includes, for example, delivery and return pipes, pumps, filters, intercoolers and separately mounted heat exchangers.
	-60	Electrical	Refers to a system that provides or uses electrical power associated with the power unit. It includes, for example, starter motors, alternators and generators directly mounted on the power unit. It also includes, for example, ignition system components including spark plugs, distributor, coils and leads.
	-70	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the power unit. It includes, for example, engine mountings.
	-80	Hydraulic	Refers to a system that provides or uses hydraulic power associated with the power unit. It includes, for example, hydraulic pumps, valves, pipes, and tanks. It also includes any external components related to the power unit hydraulic systems.

Table 6 System A3 - Engine cooling system, General

System	Subsystem	Title	Definition
A3		<b>Engine cooling system, General</b>	
	-00	General	This system includes cooling air ducting, coolant pumps, liquid filled radiators, fans and associated heat exchange equipment mounted externally to the power unit/pack.
	-10	Fluid	Refers to fluid (water/oil) filled coolant systems. It includes pumps, radiators, fans, pipes and associated heat exchange equipment.
	-20	Air	Refers to cooling air ducting, fans and associated heat exchange equipment.

Table 7 System A4 - Fuel systems, General

System	Subsystem	Title	Definition
A4		<b>Fuel systems, General</b>	

System	Subsystem	Title	Definition
	-00	General	Equipment to provide fuel storage facilities, filters, delivery pipes, drainage and cut-off valves, Fuel Injector Pumps (FIP) and injectors mounted externally to the power unit/pack.
	-10	Storage	Refers to the portion of the system which stores fuel. It includes, for example, tanks, filler necks, seals, valves, vents and drainage.
	-20	Distribution	Refers to the portion of the system which is used to distribute fuel from the storage system. It includes, for example, filters, restrictors, valves, controls and pipes.
	-30	Priming	Refers to the portion of the system which is used to pressurize/pump the fuel. It includes, for example, lift pumps, pressurization pumps, and cold starting systems.
	-40	Fuel injection	Refers to the portion of the system which delivers fuel. It includes, for example, FIP, fuel injectors, fuel pump metering and carburetors.
	-50	Indicating	Refers to the portion of the system which is used to monitor the condition of fuel (quantity, temperature and pressure). It includes, for example, transmitters, indicators, wiring and pressure warning systems.
	-60	Venting and de-fuelling	Refers to the portion of the system which is used to vent fumes from the fuel system and to provide a means for removing/dumping unwanted fuel.

*Table 8 System A5 - Air and exhaust systems, General*

System	Subsystem	Title	Definition
A5		<b>Air and exhaust systems, General</b>	
	-00	General	Refers to a system which supplies and filters air to the engine and collects and removes exhaust gases from the engine. It includes, for example, all filters, pipes, couplings, silencers, catalytic converters and ducting mounted externally to the power unit/pack.
	-10	Air system	Refers to a system which supplies and filters air to the engine. It includes, for example, pre-filters, main air filters, and associated ducting. It can also include air cooling/heating systems and intercoolers.
	-20	Collector	Refers to that portion of the system which collects exhaust gases from the engine manifold. It includes pipes, joints, gaskets, etc.
	-30	Noise suppression	Refers to that portion of the system which reduces noise produced by the engine exhaust gases. It includes silencers, baffles, shields, etc.

System	Subsystem	Title	Definition
	-40	Emission control	Refers to that portion of the system which is designed to reduce or eliminate engine exhaust gas emissions. It includes, for example, catalytic converters and tail pipes.

Table 9 System A6 - Lubrication systems, General

System	Subsystem	Title	Definition
A6		<b>Lubrication systems, General</b>	
	-00	General	This system includes lubrication storage facilities that are external to the engine/power pack. It includes delivery and return pipes, pumps, filters and heat exchangers mounted externally to the power unit/pack.
	-10	Storage	Refers to the part of the system used for storage of engine and/or transmission lubricating oil. It includes tanks, filling systems, sumps, drains, etc.
	-20	Distribution	Refers to the part of the system used for distribution of lubricating oil to and from the engine and/or transmission. It includes pipes, pumps, filters, valves, etc.
	-30	Indicating	Refers to the part of the system used to monitor the condition of engine and/or transmission lubricating oil (quantity, temperature and pressure). It includes transmitters, indicators, wiring, pressure warning systems, etc.

Table 10 System A7 - Transmission, General

System	Subsystem	Title	Definition
A7		<b>Transmission, General</b>	
	-00	General	Refers to a means to transmit power from the engine to the driving member and can include clutch, torque converter, and gearbox. It can also include steering and brakes if they are integral to the transmission. Also included are differentials and power takeoffs.
	-10	Gearbox	Refers to a means for varying the speed/torque delivered from the power unit to the driving member. It can include the steering control and brake assemblies.
	-20	Steering control assembly	Refers to a discrete means for varying the drive applied, through the transmission system, to each of the vehicle's driving members (eg, tracked vehicles).
	-30	Brake assembly	Refers to a discrete means for applying braking forces through the vehicle transmission (eg, tracked vehicles).

System	Subsystem	Title	Definition
	-40	Auxiliary drive/ power takeoff	Refers to an auxiliary means of obtaining an output from the engine. It includes transfer gearboxes which can also include a slip differential.
	-50	Clutch	Refers to a means for engaging/disengaging the transmission to/from the engine, when fitted as a separate assembly (for clutches fitted to a flywheel, see A21000).
	-60	Drive shaft	Refers to the means for connecting power output from the engine to the driving member. It includes muff couplings, propeller shafts, universal joints and final drives.
	-70	Torque converter	Refers to a means for varying the torque delivered from the engine to the driving member.
	-80	Differential	Refers to a means for changing the direction of rotation delivered from the engine to the driving member or wheels. For wheeled vehicles, it includes the driving axles, half shafts, hubs, etc.

Table 11 System A8 - Automotive/remote piloting and digital control systems, General

System	Subsystem	Title	Definition
A8		<b>Automotive/ remote piloting and digital control systems, General</b>	
	-00	General	The automotive and remote piloting and Digital Automotive Control System (DACS) element refers to that equipment (hardware/software) installed in the vehicle which is used to plan and control vehicle speed and direction either autonomously or via tele-operation. This includes equipment which senses, processes and displays imagery data such as stereo vision systems, laser scanners, multiple sensor fusion algorithms and processors, image enhancement algorithms and processors etc. This includes, for example, equipment which performs intelligence analysis and planning functions such as automated route planners, image understanding algorithms and processors, computer aided driving algorithms, DACS and processors.
	-10	Control	Refers to processing and control elements. It includes central processors, analogue/digital converters, associated software, memory boards, servo units, actuators, associated wiring, etc.
	-20	Sensors	Refers to sensors which are specifically associated with providing inputs to an automotive/remote piloting system or DACS.
	-30	Indicators	Refers to the part of the system used to indicate/monitor an automotive/remote piloting system or DACS. It includes indicators, wiring, etc.

Table 12 System A9 - Controls (drivers), General

System	Subsystem	Title	Definition
A9		<b>Controls (drivers), General</b>	
	-00	General	Given in this element are the controls required to start, stop, steer and generally control the vehicle commensurate with the mobility role of the equipment. It includes, for example, on-board diagnostic systems.
	-10	Foot controls	Refers to the foot-operated controls to start, stop, steer and generally control the vehicle. It includes, for example, pedal assemblies (clutch, brake, accelerator, etc), associated linkages, cables, hydraulic/pneumatic connections, master and slave cylinders, brake shoes and pads and disks and drums.
	-20	Hand controls	Refers to the hand-operated controls to start, stop, steer and generally control the vehicle. It includes, for example, stop/start, steering (wheel, tiller, etc) and braking controls.
	-30	Ancillary controls	Refers to ancillary controls and associated systems. It includes, for example, such items as screen wash equipment, windscreen wipers and adjustable wing mirrors.
	-40	Propulsion control systems	Refers to systems which monitor and/or control engine speed and performance.
	-50	Instrumentation	Refers to systems (hardware/software) which monitor/report on the operation of vehicle systems. It includes, for example, the drivers instrumentation panel, warning lights and condition monitoring systems

### 2.1.3 System B - Structure

Table 13 System B0 - Structure, General

System	Subsystem	Title	Definition
B0		<b>Structure, General</b>	
	-00	General	Framework and/or basic structural housing for a system, including load bearing components.

Table 14 System B1 - Hull/frame, General

System	Subsystem	Title	Definition
B1		<b>Hull/frame, General</b>	

System	Subsystem	Title	Definition
	-00	General	This element refers to the vehicles primary load bearing component which provides the structural integrity to withstand the operational loading stresses generated while traversing various terrain profiles. This element could be a simple wheeled vehicle frame or a more complicated combat vehicle hull which satisfies not only the structural requirements but also provides armor protection. It includes all structural subassemblies and appendages which attach directly to the primary structure. This element, for example, includes towing and lifting fittings, bumpers, hatches and grilles. It also includes provision to accommodate other subsystems such as mountings for suspension, weapons, turret, track body, cab, special equipment, loads etc.
	-10	Internal mountings	Refers to internal fitments mounted on the hull/frame. It includes brackets, stud welding, floors and insulation panels.
	-20	External mountings	Refers to the chassis and external fitments mounted on the hull/frame. It includes brackets, stud welding, steps, bumpers, mud-guards, windows, etc.
	-30	Doors/hatches	Refers to loading/entry hatches and doors in, or directly mounted on, the hull/frame assembly. It includes shell loading doors, driver and passenger doors, hatches, locks, handles, drivers/operators hoods, cowls and windshields, etc.
	-40	Seats	Refers to seating which is directly mounted on the hull/frame.
	-50	Drinking water tank	Refers to a system designed to provide drinking water for the driver and crew, which is directly mounted on the hull/frame. It includes tanks, filler necks, filters, pipes, seals, valves, vents, drainage, etc.
	-60	Access cover plates	Refers to access cover plates directly mounted on the hull/frame. It includes, for example, guards, plugs, drain/inspection covers. It can also include deck area assemblies.
	-70	Gun crutch/depression rails	Refers to gun crutch and depression rails directly mounted on the hull/frame.
	-80	Skirting plates/brackets/splash plates	Refers to skirting plates, brackets and splash plates directly mounted on the hull/frame. It includes the plates and associated fittings, brackets, towing attachments, etc.

Table 15 System B2 - Body/cab, General

System	Subsystem	Title	Definition
B2		<b>Body/cab, General</b>	
	-00	General	The body/cab elements refer to the major components to be mated to a chassis or frame to provide a complete vehicle having a defined mission capability. This element includes accommodation for personnel, cargo, and such subsystems as need to be placed in proximity of the operators.

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-10	Internal mountings	Refers to internal fitments mounted on the body/cab. It includes panels, brackets, clips, fascia, instrument panels, stud welding, internal windows, etc.
	-20	External mountings	Refers to external fitments mounted on the body/cab. It includes the external cab assembly, panels, brackets, stud welding, steps, windows, cab tilt and locking mechanism, etc.
	-30	Doors/hatches	Refers to loading/entry hatches and doors in, or directly mounted on, the body/cab. It includes loading doors, driver and passenger doors, hatches, locks, handles, etc.
	-40	Seats	Refers to seating and associated fittings which are directly mounted on the body/cab. It includes, for example, seat belts and harnesses.
	-50	Drinking water tank	Refers to a system designed to provide drinking water for the driver and crew, which is directly mounted on the body/cab. It includes tanks, filler necks, filters, pipes, seals, valves, vents, drainage, etc.
	-60	Access panels	Refers to access panels directly mounted on the body/cab.
	-70	Load bay	Refers to load (or passenger) carrying areas in the body/cab and any soft/hard top covering, supports, etc.
	-80	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the body or cab.

Table 16 System B3 - Suspension/track/wheels, General

System	Subsystem	Title	Definition
B3		<b>Suspension/track/wheels, General</b>	
	-00	General	This element refers to the means for generating tractive effort, thrust and lift, generally at or in proximity to the earth's surface and adapting the vehicle to the irregularities of the surface. It includes, for example, wheels, tracks and steering gears for traction and control functions. Also, it includes springs, shock absorbers, skirts and other suspension members such as track adjusting mechanisms. It does not include specific steering mechanisms.
	-10	Suspension unit	Refers to the means for adapting the vehicle to irregularities of the surface. It includes hydrogas units, shock absorbers, leaf and coil springs, pneumatic suspension units, etc. Also included is the lift mechanism, skirts, etc, for hovercraft.
	-20	Road wheel hub assembly	Refers to a means for distributing the nominal ground pressure of the vehicle. On wheeled vehicles, it includes wheels that transfer tractive effort to the surface and rolling wheels. It includes road wheels, hub assemblies, tires, valves, inner-tubes, etc.

System	Subsystem	Title	Definition
	-30	Sprocket wheel assembly	Refers to the sprocket drive wheels which transfer tractive effort to the track.
	-40	Track assembly	Refers to the track and associated linkages.
	-50	Idler wheels	Refers to the feed/guide mechanism(s) associated with track laying. It includes idler wheels and track tensioners.
	-60	Roller assembly	Refers to the track roller guide assemblies.
	-70	Axle	Refers to non-driving axles not covered under the transmission system. It includes axle arms, links, bearings, etc.

Table 17 System B4 - Turret assembly, General

System	Subsystem	Title	Definition
B4		<b>Turret assembly, General</b>	
	-00	General	The turret assembly refers to the structures and equipment installation required to provide the fighting compartment element of combat vehicles. This element includes turret armor, EMC shielding, turret rings, slip rings, attachments and appendages such as latches and cupolas, and accommodation for personnel, weapons and C <sup>3</sup> I.
	-10	Internal mountings	Refers to internal fitments mounted in the turret. It includes drinking water installations, periscope mountings, panels, brackets, clips, stud welding, etc.
	-20	External mountings	Refers to external fitments mounted on the turret. It includes brush deflector assemblies, cooler boxes, gun covers, splash curtains, panels, brackets, stud welding, etc.
	-30	Hatches	Refers to loading/entry hatches in, or directly mounted on, the turret. It includes loading hatches, crew hatches and associated locks, handles, fittings, etc. It does not include cupolas.
	-40	Seats	Refers to seating which is directly mounted in the turret.
	-50	Ring assembly	Refers to a circular track and roller/ball-race assembly designed to facilitate turret rotation.
	-60	Cupola	Refers to a roof aperture and domed hatch assembly, primarily for observation purposes. It can be capable of rotation, and can also provide access for entry/exit.
	-70	Elevating/traversing gearbox	Refers to elevating/traversing gearboxes mounted on the turret wall.
	-80	Turntable assembly	Refers to the turret turntable assembly. It includes drive and roller assemblies, RBJ mountings, etc.

System	Subsystem	Title	Definition
	-90	Ancillary	Refers to ancillary controls, items and associated systems in, or directly mounted on, the turret. It includes such items as wash/wipe equipment, turret and elevation locks, position indicators and adjustable mirrors, etc.

#### 2.1.4 System C - Armaments

*Table 18 System C0 - Armaments, General*

System	Subsystem	Title	Definition
C0		<b>Armaments, General</b>	
	-00	General	A defensive or offensive system or equipment.

*Table 19 System C1 - Gun control systems, General*

System	Subsystem	Title	Definition
C1		<b>Gun control systems, General</b>	
	-00	General	The gun control element refers to that equipment (hardware/software) installed in the vehicle which provides intelligence necessary to power elevate and traverse the weapons systems and also to control via stabilization systems, and turret and gun drives, including gun position indicators and sensors.
	-10	Installation	Refers to the Gun Control Equipment (GCE) installation.
	-20	Control panel	Refers to control panels associated with FV GCE.
	-30	Power supply	Refers to power supply units associated with FV GCE.
	-40	Switch units	Refers to switch units associated with FV GCE. It includes trimming units, fire control switches, etc.
	-50	Gun controller	Refers to control systems associated with GCE. It includes controls for the gun, motor generators, metadynes, amplidynes, magnicons, and power amplifiers.
	-60	Power motors	Refers to gearbox drive motors, associated with GCE. It includes the power, elevation and traverse drive motors.
	-70	Gyroscope assembly	Refers to gyroscope assemblies associated with GCE.
	-80	Ancillary	Refers to ancillary GCE controls and associated systems. It includes such items as turnbuckle assemblies, traverse displacement units, fire control quadrants, inter-connecting boxes, wiring, connectors, etc.

Table 20 System C2 - Fire control systems, General

System	Subsystem	Title	Definition
C2		<b>Fire control systems, General</b>	
	-00	General	The fire control element refers to that equipment (hardware/software) installed in the vehicle which provides intelligence necessary for weapons delivery such as launching and firing. This element includes, for example, radar and other sensors necessary for search recognition, meteorological and/or tracking; controls and displays, fire control computers, and computer programs.
	-10	Computer/interface	Refers to computer interface systems and equipment associated with fire control systems. It includes computer/interface units, program loading facilities, etc.
	-20	Control/monitor	Refers to control and monitoring equipment associated with the fire control systems.
	-30	Filter units	Refers to filter units associated with the fire control systems.
	-40	Sensors	Refers to sensors associated with the fire control systems. It includes sensors for elevation and traverse displacement, trunnion tilt, sighting angle, etc.
	-50	Firing handles	Refers to firing handles associated with the fire control systems.
	-60	Fire control boxes	Refers to control boxes associated with the fire control system. It includes the commander's, and gunner's control boxes, the loader's safety box, etc.
	-70	Ancillary	Refers to ancillary items and associated systems. It includes such items as junction boxes, cables, connectors, services, etc.

Table 21 System C3 - Thermal imaging, General

System	Subsystem	Title	Definition
C3		<b>Thermal imaging, General</b>	
	-00	General	This element refers to that equipment (hardware/software) which provides a thermal picture for the crew to use for surveillance and weapon guidance. It includes thermal imaging sensor heads, drive units, processors, power supply units, and display units.
	-10	Sensor	Refers to sensors specifically associated with thermal imaging systems. It includes scanner head assemblies, IR telescopes, tilt sensors, focal telescopes, etc.

System	Subsystem	Title	Definition
	-20	Processing	Refers to processing elements associated with thermal imaging systems. It includes symbology units, processors, etc.
	-30	Display	Refers to the display elements of a thermal imaging system. It includes binocular viewers, commander's and gunner's display units, display drive units, etc.
	-40	Control	Refers to the control elements of a thermal imaging system. It includes servo units, gunner's and commander's control units, etc.
	-50	Converter units	Refers to converter elements of a thermal imaging system. It includes isolating converter units, etc.
	-60	Structure and framework	Refers to framework and/or basic structural housing for a thermal imaging system, including load bearing components.
	-70	Ancillary	Refers to ancillary controls, items and associated systems related to thermal imaging systems. It includes such items as wash/wipe equipment, cables, connectors, services, etc.

Table 22 System C4 - Thermal imaging cooling systems, General

System	Subsystem	Title	Definition
C4		<b>Thermal imaging cooling systems, General</b>	
	-00	General	This element refers to that equipment which provides a cooling medium, for thermal images. It will include, for example, compressors, bottles, pipes, fans, mini coolers, air cleaning columns and sterling cycle cooling machines.
	-10	Compressors	Refers to the part of the system used to pressurize the cooling system. It includes motors, pumps, etc.
	-20	Storage	Refers to the part of the system used for storage of coolant. It includes tanks, filling systems, sumps, drains, etc.
	-30	Distribution	Refers to the part of the system used for distribution of coolant. It includes pipes, valves, etc.
	-40	Indicating	Refers to the part of the system used to monitor the condition of coolant (quantity, temperature and pressure). It includes transmitters, indicators, wiring, warning systems, etc.

Table 23 System C5 - Optical sighting systems, General

System	Subsystem	Title	Definition
C5		<b>Optical sighting systems, General</b>	
	-00	General	The optical element refers to the sighting systems for search, observation, identification, tracking, range-finding and will include sensors and displays associated with this system.
	-10	Surveillance	Refers to optical surveillance equipment. It includes such items as observation periscopes, etc.
	-20	Sighting	Refers to optical sighting equipment. It includes such items as sighting and aiming periscopes, etc.
	-30	Reticle image projector	Refers to a means for displaying a reticle image in/on the sighting device.
	-40	Sighting unit	Refers to a means for displaying a reticle image in the sighting device.
	-50	Ancillary	Refers to ancillary controls, items and associated systems related to optical sighting systems. It includes such items as wash/wipe equipment, cables, connectors, services, etc.

Table 24 System C6 - Weapon/gun, General

System	Subsystem	Title	Definition
C6		<b>Weapon/gun, General</b>	
	-00	General	The weapon/gun element refers to the means for the launcher to deliver fire on hostile targets or for logistics and other vehicles to exercise self-defense. This element includes, for example, the main gun/elevating mass and secondary armaments such as small arms and mortars. Fire control, gun control, and optical systems are excluded.
	-10	Barrel	The barrel assembly provides initial guidance for launch of projectiles.
	-20	Breech, housing and firing mechanism	Refers to a system which provides a means of access for the projectile/case to enter the barrel. It also provides a pressure seal and firing mechanism, together with the means by which the breech and firing mechanism are housed within the equipment. It includes all associated housing items.
	-30	Mountings	Refers to the means for attaching the barrel assembly and can include the mountlet assembly as well as the means to balance the armament system. It also includes tripods and bipods.
	-40	Recoil mechanism	Refers to systems which provide a means for absorbing energy created by projectile launch. It includes recuperator and recoil assemblies, etc.

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-50	Smoke discharger	Refers to a means for dispersing smoke/fumes generated when a round is fired.
	-60	Secondary armaments installation	Refers to systems which provide a secondary armament installation.
	-70	Sights	Refers to a mechanical sighting system used on small arms, machine guns, man-portable launchers, etc.
	-80	Ancillary	Refers to ancillary items and associated systems. It includes, for example, such items as spare barrels and other parts, wallets, cleaning kits and sustained fire kits.

Table 25 System C7 - Automatic loading systems, General

System	Subsystem	Title	Definition
C7		<b>Automatic loading systems, General</b>	
	-00	General	The automatic loading element consists of that equipment (hardware/software) providing the means to select ammunition from a stored position in the vehicle, its transfer to and loading of the armament system. This element also includes the means to eject spent cases and misfired rounds. Components include all ammunition storage racks, transfer/lift mechanisms, ramming and ejecting mechanisms as well as specialized hydraulic and electrical controls.
	-10	Storage (ready round)	Refers to ammunition storage racks, bins, etc.
	-20	Transfer/lift	Refers to the means to select ammunition from a stored position in the vehicle and transfer it to the armament system. It includes transfer and lift mechanisms
	-30	Loading/ramming	Refers to the means to loading the armament system. It includes ramming and ejecting mechanisms.
	-40	Control	Refers to the means to control loading the armament system. It includes specialized hydraulic and electrical controls and safety devices.

#### 2.1.5 System D - Electrical systems

Table 26 System D0 - Electrical systems, General

System	Subsystem	Title	Definition
D0		<b>Electrical systems, General</b>	

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-00	General	A system or equipment for generation, distribution and/or control of electric power.

*Table 27 System D1 - Electrical systems (engine/power pack), General*

System	Subsystem	Title	Definition
D1		<b>Electrical systems (engine/power pack), General</b>	
	-00	General	This element refers to the electrical or electronic systems for the engine/power pack. It will include wiring harnesses, line replaceable units (LRUs), sensors, lighting, batteries, generators, etc.
	-10	Generating	Refers to generating systems and equipment in the engine/power pack compartment that are not directly mounted on the engine/power-pack. It includes such items as alternators, dynamos, generator panels, etc.
	-20	Batteries	Refers to battery equipment mounted in the engine/power pack compartment. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Instrumentation	Refers to instrumentation systems and equipment mounted in the engine/power pack compartment. It includes such items as tachometers, speedometers, indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment mounted in the engine/power pack compartment. It includes such items as inspection lights, etc.
	-50	Wiring	Refers to wiring and cable looms mounted in the engine/power pack compartment. It includes looms, wires, harnesses, etc.
	-60	Electrical equipment	Refers to electrical equipment mounted in the engine/power pack compartment. It includes, for example, actuators, engine controls and ignition systems.
	-70	Distribution	Refers to electrical distribution systems and equipment mounted in the engine/power pack compartment. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment mounted in the engine/power pack compartment. It includes such items as fuses, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment mounted in the engine/power pack compartment. It includes such items as controllers, switches, relays, regulators, etc.

Table 28 System D2 - Electrical systems (hull/frame), General

System	Subsystem	Title	Definition
D2		<b>Electrical systems (hull/frame), General</b>	
	-00	General	This element refers to the electrical or electronic systems for the hull and frame. It will include both internal and external wiring harnesses, junction and distribution boxes, line replaceable units (LRUs), sensors and lighting systems. It also includes the interfaces and connectors associated with the engine, power pack, generating and starting systems.
	-10	Internal electrical systems	Refers to the internal electrical or electronic systems mounted in the hull/frame. It will include, for example, wiring harnesses, LRUs, junction and distribution boxes. It also includes the interfaces and connectors associated with the engine, power pack, generating and starting systems.
	-20	Batteries	Refers to battery equipment related to the hull/frame. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Internal lights	Refers to lighting systems mounted internally in the hull/frame.
	-40	External electrical systems	Refers to the electrical or electronic systems mounted externally on the hull/frame. It will include, for example, external lighting systems, horns and flashing beacons.
	-50	Wiring	Refers to wiring, cable looms and clips related to the hull/frame or associated with connecting to the engine/power pack. It includes looms, wires, clips, harnesses, connectors, etc.
	-60	Electrical equipment	Refers to electrical equipment related to the hull/frame. It includes, for example, actuators, wiper controls, heaters, cooking pots, horns, radio fittings and ancillary items.
	-70	Distribution	Refers to electrical distribution and interconnecting systems and equipment related to the hull/frame. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the hull/frame. It includes such items as fuses, fuse panels, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment related to the hull/frame. It includes such items as controllers, switches, relays, regulators, etc.

Table 29 System D3 - Electrical systems (body/cab), General

System	Subsystem	Title	Definition
D3		<b>Electrical systems (body/cab), General</b>	
	-00	General	This element refers to the electrical or electronic systems for either the body/cab. It will include wiring harnesses, line replaceable units (LRUs), sensors and lighting systems.
	-10	Generating	Refers to generating systems and equipment related to the body/cab. It includes such items as generator control panels, etc.
	-20	Batteries	Refers to battery equipment related to the body/cab. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Instrumentation	Refers to instrumentation systems and equipment related to the body cab. It includes such items as indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment related to the body cab. It includes such items as inspection lights, head lights, spot lights, tail/side lights, indicators, panel lights, convoy lights, etc.
	-50	Wiring	Refers to wiring and cable looms related to the body/cab. It includes looms, wires, harnesses, earthing straps, etc.
	-60	Electrical equipment	Refers to electrical equipment related to the body/cab. It includes, for example, actuators, wiper controls, heaters, cooking pots and horns.
	-70	Distribution	Refers to electrical distribution systems and equipment related to the body/cab. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the body/cab. It includes such items as fuses, fuse panels, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment related to the body/cab. It includes such items as controllers, switches, relays, regulators, etc.

Table 30 System D4 - Electrical systems (turret), General

System	Subsystem	Title	Definition
D4		<b>Electrical systems (turret), General</b>	

System	Subsystem	Title	Definition
	-00	General	This element refers to the electrical or electronic systems for the turret. It will include wiring harnesses, line replaceable units (LRUs), sensors and lighting systems.
	-10	Generating	Refers to generating systems and equipment related to the turret. It includes such items as generator control panels, etc.
	-20	Batteries	Refers to battery equipment related to the turret. It includes such items as battery containers, lagging kits, battery assemblies, connecting straps, etc.
	-30	Instrumentation	Refers to instrumentation systems and equipment related to the turret. It includes such items as indicating panels, electronic circuit panels, control transmitters, etc.
	-40	Lights	Refers to lighting systems and equipment related to the turret. It includes such items as inspection lights, panel lights, roof lights, spot lights, convoy lights, etc.
	-50	Wiring	Refers to wiring and cable looms related to the turret. It includes looms, wires, harnesses, earthing straps, etc.
	-60	Electrical equipment	Refers to electrical equipment related to the turret. It includes, for example, actuators, wiper controls, heaters and cooking pots.
	-70	Distribution	Refers to electrical distribution systems and equipment related to the turret. It includes such items as controllers, switches, relays, regulators, etc.
	-80	Protection	Refers to electrical protection systems and equipment related to the turret. It includes such items as fuses, fuse panels, fusible links, trip switches, etc.
	-90	Control	Refers to control systems and equipment related to the turret. It includes such items as controllers, switches, relays, regulators, etc.

## 2.1.6 System E - Communications system

Table 31 System E0 - Communications, General

System	Subsystem	Title	Definition
E0		<b>Communications, General</b>	
	-00	General	A system or equipment for transferring information.

Table 32 System E1 - Communication systems, General

System	Subsystem	Title	Definition
E1		<b>Communication systems, General</b>	

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-00	General	The communications element refers to that equipment (hardware/software) which provides the means within the system for commanding, controlling and transmitting/receiving information and data to vehicle crew members and other personnel exterior to the operating vehicle. This element includes radio frequency equipment, microwave and optic communication links, networked equipment for multiple vehicle control and intercoms and external phones systems. It can include navigational system and data displays when these are integral with the equipment of crew stations or drivers for automotive display.
	-10	UHF/SHF/EHF	Refers to that portion of the system used for communications utilizing ultra, super and extra high frequency (UHF, SHF, EHF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-20	VHF	Refers to that portion of the system used for communications utilizing very high frequency (VHF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-30	HF	Refers to that portion of the system used for communications utilizing high frequency (HF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-40	LF	Refers to that portion of the system used for communications utilizing low frequency (LF) carriers. It includes transmitters, receivers, control, antennas, etc.
	-50	Audio	Refers to that portion of the system used for voice communications. It includes such items as intercoms, headphones, loudspeakers, switching/control panels, etc.
	-60	Digital	Refers to that portion of the system used for digital/data communications. It includes modems, encryption devices, etc.
	-70	Satellite	Refers to that portion of the system used for communications via satellites. It includes transmitters, receivers, control, antennas, etc.
	-80	Optical	Refers to that portion of the system used for communications via line-of-site. It includes transmitters, receivers, control, signaling devices, etc.
	-90	Ancillary	Refers to ancillary controls and associated systems. It includes such items as wiring, connectors, etc.

Table 33 System E2 - Identification friend/foe (IFF), General

System	Subsystem	Title	Definition
E2		Identification friend/foe (iff), General	

System	Subsystem	Title	Definition
	-00	General	IFF equipment is common to all services and is therefore interactive with many other users. It covers the equipment (hardware software) that identifies friend or foe and transmits that information. It can use the vehicle communication system(s).
	-10	Transmitting	Refers to that part of the system which is used to send data.
	-20	Receiving	Refers to that part of the system which is used to receive IFF data.
	-30	Indicating	Refers to that part of the system which is used to display IFF data.

### 2.1.7 System F - Navigation system

*Table 34 System F0 - Navigation, General*

System	Subsystem	Title	Definition
F0		<b>Navigation, General</b>	
	-00	General	A system or equipment used to determine, conduct, manage or plot a position or course for the system.

*Table 35 System F1 - Navigation systems, General*

System	Subsystem	Title	Definition
F1		<b>Navigation systems, General</b>	
	-00	General	The navigation element refers to that equipment (hardware/software) installed in the vehicle which permits the crew to determine vehicle location and to plot the course of the vehicle. It includes navigation systems such as dead reckoning, inertial and global positioning systems. Landmark recognition algorithms and processors are also included.
	-10	Independent	Refers to that portion of the system (hardware/software) which provides information to determine position and is independent on ground installations or orbiting satellites. It includes inertial guidance systems, tracking systems, sextants, etc.
	-20	Dependant	Refers to that portion of the system (hardware/software) which provides information to determine position and is mainly dependant on ground installations or orbiting satellites. It includes GPS, radio compass, etc.

System	Subsystem	Title	Definition
	-30	Computing	Refers to that portion of the system (hardware/software) which combines/processes navigational data to compute or manage the vehicle's geographical position. It includes course computers, landmark recognition algorithms, processors, displays, etc.

## 2.1.8 System G - Surveillance system

Table 36 System G0 - Surveillance, General

System	Subsystem	Title	Definition
G0		<b>Surveillance, General</b>	
	-00	General	A system or equipment used to sense the environment.

Table 37 System G1 - Surveillance systems, General

System	Subsystem	Title	Definition
G1		<b>Surveillance systems, General</b>	
	-00	General	The surveillance element is defined as all equipment (hardware/software) and associated systems used to sense the surrounding environment and then process, display and record the resulting information. This can include, for example, Meteorological equipment. It does not include specific thermal imaging or meteorological/atmospheric systems.
	-10	Control	Refers to the processing, control and recording elements of the sensor systems. It includes central processors, analogue/digital converters, associated software, storage units, etc.
	-20	Indicating	Refers to the part of the system used to indicate/monitor sensor information. It includes data identification, indicators, displays panels, etc.
	-30	Recording	Refers to the part of the system used to record sensor information.
	-40	Optical/infra-red	Refers to that portion of a system that uses optical and/or heat-sensing devices to acquire information. It includes, for example, driver's, commander's and gunner's periscopes, infra-red scanners, heat sensors and image intensifiers. It does not include specific thermal imaging systems or sighting equipment.
	-50	Laser	Refers to that portion of a system that uses laser devices to acquire information. It includes distance measuring, target identification, etc.

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-60	Radar	Refers to that portion of a system that uses radar devices to acquire information. It includes antennas, receivers, transmitters, indicators, etc.
	-70	Magnetic	Refers to that portion of a system that uses magnetic sensors to acquire information. It includes magnetometers, amplifiers, processors, indicators, etc.
	-80	Sonar	Refers to that portion of a system that uses sonar to acquire information. It includes modulators, transducers, processors, indicators, etc.
	-90	Acoustic	Refers to that portion of a system that uses sound to acquire information. It includes listening devices, amplifiers, processors, indicators, etc.

Table 38 System G2 - Meteorological/atmospheric research, General

System	Subsystem	Title	Definition
G2		<b>Meteorological/ atmospheric research, General</b>	
	-00	General	Refers to the systems and devices which furnish a means of providing, processing and recording meteorological data.
	-10	Weather	Refers to that portion of a system which is used to detect, measure, process or record weather (moisture, temperature, cloud, wind, etc) data. It includes hygrometers, thermometers, anemometers, etc.
	-20	Air turbulence	Refers to that portion of a system which is used to detect, measure, process or record air turbulence data.
	-30	Pollutants	Refers to that portion of a system which is used to detect, measure, process or record contaminated particles.
	-40	Magnetic/ gravitational	Refers to that portion of a system which is used to detect, measure, process or record the earth's magnetic or gravitational forces.

## 2.1.9 System H - Steering system

Table 39 System H0 - Steering, General

System	Subsystem	Title	Definition
H0		<b>Steering, General</b>	
	-00	General	A system or equipment used to guide or govern direction.

Table 40 System H1 - Steering systems, General

System	Subsystem	Title	Definition
H1		<b>Steering systems, General</b>	
	-00	General	This element refers to the devices (hardware/software) which are part of the vehicle not contained within the suspension system or driver controls that govern the vehicle's direction. This will include, for example, rudder and thrust devices and trim valves for amphibians.
	-10	Rudders	Refers to rudder devices designed to control the vehicle's direction.
	-20	Trim valves	Refers to trim valves designed to control the vehicle's direction.
	-30	Thrusters	Refers to thrust devices designed to control the vehicle's direction.

#### 2.1.10 System J - Ventilation/heating/cooling system

Table 41 System J0 - Ventilation/heating/cooling, General

System	Subsystem	Title	Definition
J0		<b>Ventilation/heating/cooling, General</b>	
	-00	General	A system or equipment used to provide a controlled environment.

Table 42 System J1 - Ventilation/heating/cooling systems, General

System	Subsystem	Title	Definition
J1		<b>Ventilation/heating/cooling systems, General</b>	
	-00	General	This element refers to those subassemblies or components which provide a micro-climatic condition (heating or cooling), inside the vehicle, including personnel heating/cooling suits or components. It also covers purification systems not covered by NBC.
	-10	Compression	That portion of the system and its controls which supplies pressurized air/gas. Includes items such as controls and indicating systems related to pressure, gas-filled systems, etc.

System	Subsystem	Title	Definition
	-20	Distribution	That portion of the system used to induct and distribute air. It includes equipment rack cooling, seals, demisting, waveguide pressurization system and items of such systems, like blowers, ducting and inlets.
	-30	Heating	That portion of the system and its controls which supply heated air. It includes items such as heater units, wiring, etc.
	-40	Cooling	That portion of the system and its controls which supply cooled air. Includes items such as the cooling unit, indicating systems related to the cooler operation, wiring etc. It does not include temperature control and indicating systems.
	-50	Temperature control	That portion of the system used to control the temperature of the air. Includes items such as, thermal sensing devices, switches, indicators, wiring etc.
	-60	Moisture/air	That portion of the system used to contaminant control moisture in the air, to control ozone concentrations, to filter radioactive debris and chemical/biological contaminants, etc.
	-70	Liquid coolant	Those components required to supply liquid coolant to a cooling system.

#### 2.1.11 System K - Hydraulic systems system

Table 43 System K0 - Hydraulic systems, General

System	Subsystem	Title	Definition
K0		<b>Hydraulic systems, General</b>	
	-00	General	A system or equipment for generation, distribution and/or control of hydraulic (or pneumatic) power.

Table 44 System K1 - Hydraulics, General

System	Subsystem	Title	Definition
K1		<b>Hydraulics, General</b>	
	-00	General	This element refers to a system or equipment (hardware/software) within the vehicle for the generation, distribution and/or control of hydraulic power.
	-10	Main	Refers to a system or equipment which is used to generate, store, distribute or control hydraulic power. It includes such items as tanks, valves, pumps, oil coolers, plumbing, etc. It does not include user systems classified elsewhere, or their connecting valves.

System	Subsystem	Title	Definition
	-20	Auxiliary	Refers to that portion of the hydraulic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main hydraulic system.
	-30	Indicating	Refers to that part of the hydraulic system which is used to monitor the condition of the hydraulic system or fluid. It includes transmitters, indicators, warning systems, etc.

*Table 45 System K2 - Pneumatic systems, General*

System	Subsystem	Title	Definition
K2		<b>Pneumatic systems, General</b>	
	-00	General	This element refers to a system or equipment (hardware/software) within the vehicle for the generation, distribution and or control of pneumatic (including vacuum) power.
	-10	Main	Refers to a system or equipment which is used to generate, store, distribute or control pneumatic power. It includes such items as tanks, valves, pumps, plumbing, etc. It does not include user systems classified elsewhere, or their connecting valves.
	-20	Auxiliary	Refers to that part of the pneumatic system which is classified as auxiliary, emergency or standby and which is used to supplement, or replace the main pneumatic system.
	-30	Indicating	Refers to that part of the pneumatic system which is used to monitor the condition of the system. It includes transmitters, indicators, warning systems, etc.

#### 2.1.12 System L - Electronic system

*Table 46 System L0 - Electronic system, General*

System	Subsystem	Title	Definition
L0		<b>Electronic system, General</b>	
	-00	General	A system or equipment using electronic/automated software and/or firmware elements not specifically included in other systems.

Table 47 System L1 - Electronics, General

System	Subsystem	Title	Definition
L1		<b>Electronics, General</b>	
	-00	General	This element refers to a system or equipment within the vehicle which uses electronic/automated software and/or firmware elements not specifically included in any other systems.

### 2.1.13 System M - Auxiliary system

Table 48 System M0 - Auxiliary, General

System	Subsystem	Title	Definition
M0		<b>Auxiliary, General</b>	
	-00	General	Subsidiary systems that provide services or support to main systems or equipment.

Table 49 System M1 - Auxiliary systems, General

System	Subsystem	Title	Definition
M1		<b>Auxiliary systems, General</b>	
	-00	General	This element refers to subsidiary systems (hardware/software) that provide services or support to main systems or equipment within the vehicle, not covered elsewhere.

### 2.1.14 System N - Survivability system

Table 50 System N0 - Survivability, General

System	Subsystem	Title	Definition
N0		<b>Survivability, General</b>	
	-00	General	A system or equipment used to provide hazard detection, protection, survivability and escape facilities.

Table 51 System N1 - Fire protection systems, General

System	Subsystem	Title	Definition
N1		<b>Fire protection systems, General</b>	

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-00	General	This element refers to systems (hardware/software) that provide a warning to the crew that a possible fire hazard exists. It includes the suppression/fire fighting and heat sensors required for this system.
	-10	Detecting	Refers to that part of the system which is used to sense the presence of excessive heat, smoke or fire.
	-20	Indicating	Refers to that part of the system which is used to indicate the presence of excessive heat, smoke or fire.
	-30	Extinguishing	Refers to that part of the system, either fixed or portable, which is used to extinguish fire.

*Table 52 System N2 - Nuclear, biological, chemical, General*

System	Subsystem	Title	Definition
N2		<b>Nuclear, biological, chemical, General</b>	
	-00	General	The NBC element refers to those subassemblies or components which provide nuclear, biological and chemical detection, protection and survivability to the vehicle or crew, either individually or collectively, during an NBC attack. This includes a positive pressure system, purification system, ventilated face piece (mask), NBC detection and warning devices, decontamination equipment and chemical resistant coatings. It can also include environmental control equipment, such as heaters, coolers, etc.
	-10	Pack	Refers to NBC protection packs.
	-20	Control	Refers to NBC protection controls.
	-30	Pressure relief	Refers to pressure relief devices specifically fitted for NBC protection purposes.
	-40	Door assemblies	Refers to NBC protection fitted to doors and hatches.
	-50	Ancillary	Refers to ancillary controls and associated systems. It can include, for example, such items as wiring, connectors, heaters, coolers and ducting.

## 2.1.15 System P - Special equipment/systems, General

Table 53 System P0 - Special equipment/systems, General

System	Subsystem	Title	Definition
P0		<b>Special equipment/systems, General</b>	
	-00	General	A system or equipment used to provide a special mission capability.

Table 54 System P1 - Special to type equipment, General

System	Subsystem	Title	Definition
P1		<b>Special to type equipment, General</b>	
	-00	General	This element refers to that special equipment (hardware/software) to be mated to a hull/turret or to a chassis/frame/body/cab assembly, to enable the achievement of a special mission capability. It includes blades, booms, cranes, winches, robotic arms, manipulators, etc.
	-10	Structure	Refers to that special hardware to be mated to a main assembly (hull, turret, chassis, frame, body or cab). It can include, for example, slide and tilt frames, launch frames and their winches, launch rails, bipods and platforms.
	-20	Electrical systems	Refers to electrical systems associated with special hardware that is mated to a main assembly. It can include, for example, launch/recovery mechanism electrical systems.
	-30	Hydraulics	Refers to hydraulic systems associated with special hardware that is mated to a main assembly. It can include, for example, the generation, distribution and control systems.
	-40	Handling equipment	Refers to handling equipment or systems that are mated to a main assembly. It can include, for example, cranes, winches, base stabilizers, support tools and actuators.
	-50	Ancillary	Refers to ancillary equipment for a system that is mated to a main assembly. It can include, for example, cradles, special tools, lifting beams and restraints.
	-60	Stowage	Refers to stowage provisions for operational equipment that are provided on a main assembly.

Table 55 System P2 - Special recovery equipment, General

System	Subsystem	Title	Definition
P2		<b>Special recovery equipment, General</b>	
	-00	General	This element refers to that special recovery equipment (hardware/software) to be mated to a hull turret or to a chassis/frame/body/cab assembly, to enable the achievement of a recovery capability. It includes cranes and towing equipment.

Table 56 System P3 - Special fit equipment, General

System	Subsystem	Title	Definition
P3		<b>Special fit equipment, General</b>	
	-00	General	This element refers to that special fit equipment (hardware/software) to be mated to a hull/turret or to a chassis/frame/body/cab assembly, to enable the achievement of a specialized capability. It will include supply, DROPS, lift trucks, side loaders, etc.

Table 57 System P4 - Special purpose equipment, General

System	Subsystem	Title	Definition
P4		<b>Special purpose equipment, General</b>	
	-00	General	This element refers to that special-to-purpose equipment (hardware/software) to be mated to a hull/turret or to a chassis/frame/body/cab assembly, for the achievement of a special mission purpose. It covers, for example, ISO container bodies and equipment for command or repair workshop, medical and other special purpose vehicles.

## 2.1.16 System Q - Outfit, furnishings and stowage, General

Table 58 System Q0 - Outfit, furnishings and stowage, General

System	Subsystem	Title	Definition
Q0		<b>Outfit, furnishings and stowage, General</b>	

Applicable to: All

S1000D-A-08-02-0700-00A-040A-A

Chap 8.2.7

System	Subsystem	Title	Definition
	-00	General	A function or equipment used to provide habitability, operability or stowage facilities that is not specifically included in other systems.

*Table 59 System Q1 - Stowage, General*

System	Subsystem	Title	Definition
Q1		<b>Stowage, General</b>	
	-00	General	This element is required to provide for personal equipment stowage as well as operational equipment stowage on the vehicle including hull and turret.
	-10	Charge bin	Refers to charge bin stowage facilities.
	-20	Shell stowage	Refers to shell stowage facilities.
	-30	Ammunition	Refers to stowage facilities for both secondary and personal ammunition.
	-40	Body/cab internal	Refers to stowage facilities within the body or cab.
	-50	Body/cab external	Refers to stowage facilities mounted on the body or cab.
	-60	Hull/frame internal	Refers to stowage facilities mounted internally to the hull or frame. It includes, for example, the drivers, fighting, crew and engine/transmission compartments.
	-70	Hull/frame external	Refers to stowage facilities mounted externally on the hull or frame.
	-80	Turret internal	Refers to stowage facilities mounted internally to the turret.
	-90	Turret external	Refers to stowage facilities mounted externally on the turret.

*Table 60 System Q2 - Complete equipment schedule (CES), General*

System	Subsystem	Title	Definition
Q2		<b>Complete equipment schedule (CES), General</b>	
	-00	General	This element refers to lists detailing the equipment required by the user to operate and maintain the system. It includes, for example, both fitted and loose items, spares, tools and operator manuals.
	-10	Production ces	This element refers to the production version of the CES.
	-20	Service ces	This element refers to the service version of the CES.

System	Subsystem	Title	Definition
	-30	Complex ces	This element refers to the complex version of the CES.

## 2.1.17 System R - Training, General

Table 61 System R0 - Training, General

System	Subsystem	Title	Definition
R0		<b>Training, General</b>	
	-00	General	The training element is defined as the deliverable training services, devices, accessories, aids, equipment and facilities used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency. This element includes all effort associated design, development and production of deliverable training equipment as well as the execution of training services.

Table 62 System R1 - Training services, General

System	Subsystem	Title	Definition
R1		<b>Training services, General</b>	
	-00	General	The training services element refers to the deliverable training services, used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-10	Devices/ accessories/aids	The training devices/accessories/aids element refers to the deliverable devices, accessories and aids used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-20	Equipment	The training equipment element refers to the deliverable training equipment used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.
	-30	Facilities	The training facilities element refers to the deliverable training facilities used to provide instruction through which personnel will acquire sufficient concepts, skills and aptitudes to both operate and maintain the system with maximum efficiency.

## 2.1.18 System S - Repair Test and Support, General

Table 63 System S0 - Repair test and support, General

System	Subsystem	Title	Definition
S0		<b>Repair test and support, General</b>	
	-00	General	A system, equipment or facilities used to maintain operational capability.

Table 64 System S1 - Power pack repair facility, General

System	Subsystem	Title	Definition
S1		<b>Power pack repair facility (PPRF), General</b>	
	-00	General	This element refers to a facility which will allow unserviceable vehicle power packs to be repaired, including major assembly exchange, tested and returned to service use. PPRFs can be transportable and will include tools, jigs and fixtures commensurate with the type of equipment they are due to repair.
	-10	Mobile	This element refers to a mobile facility which will allow unserviceable vehicle power packs to be repaired, including major assembly exchange, tested and returned to service use. This section will not include the basic container body and its associated equipment.
	-20	Fixed	This element refers to a static facility which will allow unserviceable vehicle power packs to be repaired, including major assembly exchange, tested and returned to service use.

Table 65 System S2 - Sighting systems repair facility, General

System	Subsystem	Title	Definition
S2		<b>Sighting systems repair facility, General</b>	
	-00	General	This element refers to equipment (hardware/software) that enables the repair, test or calibration of the optical sighting equipment, including laser range finders for example.
	-10	Mobile	Refers to mobile (man-portable or vehicle mounted) equipment (hardware/software), which can be in a vehicle container or box body, that enables the repair, test and/or calibration of optical sighting equipment.

System	Subsystem	Title	Definition
	-20	Fixed	Refers to static (permanent or temporary) equipment (hardware/software) that enables the repair, test or calibration of optical sighting equipment.

*Table 66 System S3 - Thermal imaging repair facility, General*

System	Subsystem	Title	Definition
S3		<b>Thermal imaging repair facility, General</b>	
	-00	General	To provide a transportable facility (hardware/software) whereby thermal imaging equipment including its associated cooling systems can be repaired, tested and returned to service. The equipment covered will include, for example, clean air equipment, jigs, fixtures, computer interface adapters and test equipment.
	-10	Mobile	Refers to mobile (man-portable or vehicle mounted) equipment (hardware/software), which can be in a vehicle container or box body, that enables the repair, test and/or calibration of thermal imaging equipment.
	-20	Fixed	Refers to static (permanent or temporary) equipment (hardware/software) that enables the repair, test or calibration of thermal imaging equipment.

*Table 67 System S4 - General purpose electronic repair facility, General*

System	Subsystem	Title	Definition
S4		<b>General purpose electronic repair facility, General</b>	
	-00	General	This element refers to equipment (hardware/software) that enables unserviceable electrical/electronic items to be repaired, tested and returned to service use.
	-10	Mobile	Refers to mobile (man-portable or vehicle mounted) equipment (hardware/software), which can be in a vehicle container or box body, that enables the repair, test and/or calibration of general purpose electronic equipment.
	-20	Fixed	Refers to static (permanent or temporary) equipment (hardware/software) that enables the repair, test or calibration of general purpose electronic equipment.

Table 68 System S5 - Common support equipment, General

System	Subsystem	Title	Definition
S5		<b>Common support equipment, General</b>	
	-00	General	The common support equipment element refers to those items required to support and maintain the system or portions of the systems while not directly engaged in the performance of its mission, and which are presently in the MOD inventory for support of other systems. This element includes all efforts required to assure the availability of this equipment for support of the particular defense product item. It also includes the acquisition of additional quantities of this equipment if caused by the introduction of the defense material item into operational service.

<a href="#">Chap 1.5</a>	Request for change
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system

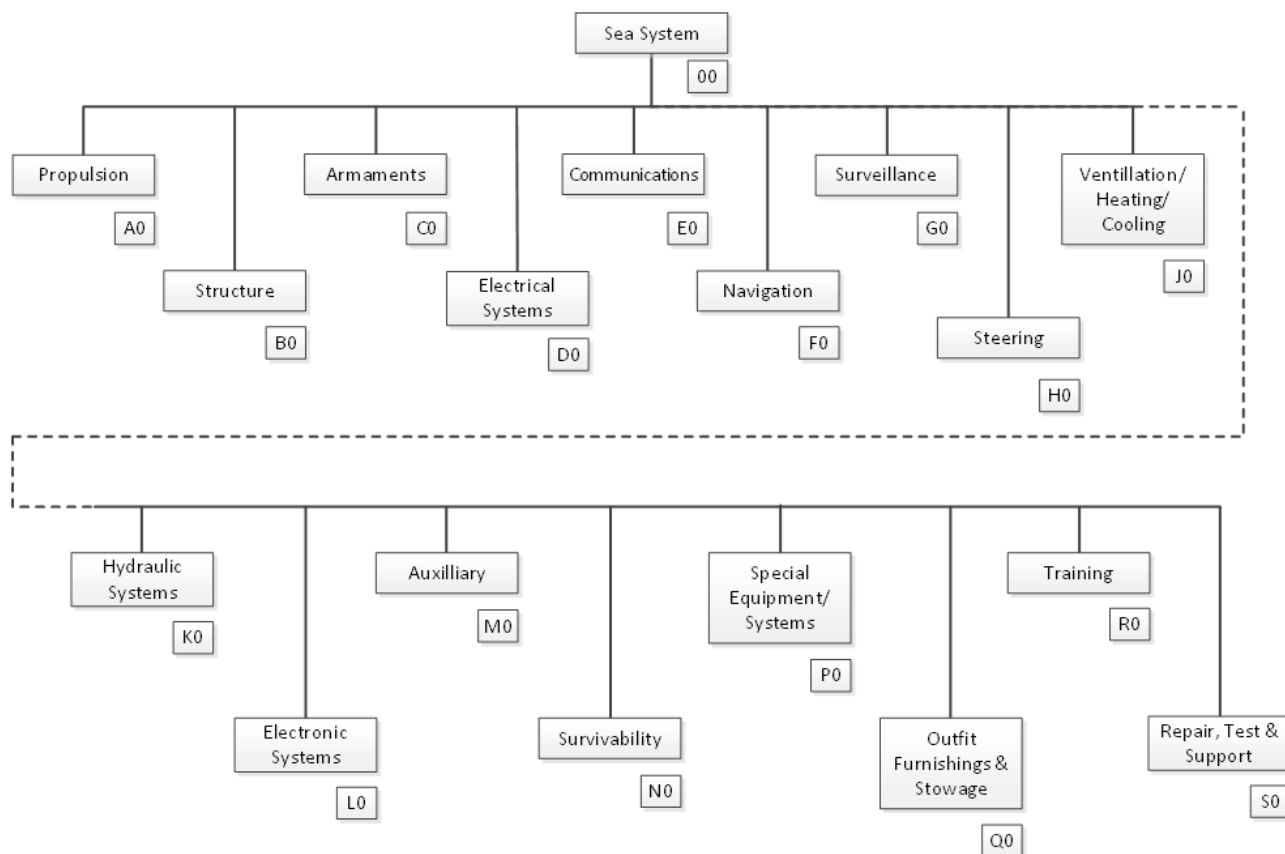

## 1 General

The SNS is used in this specification as a method to describe the functional and/or physical breakdown of items of the Product. Its position in the data module code and structure is defined in [Chap 4.3.3](#). This is an SNS that will be maintained by the S1000D Steering Committee and is subject to normal CPF action in accordance with [Chap 1.5](#).

This chapter gives the definitions which relate to systems and subsystems, for general sea vehicles. For details on how to use this SNS within the data module code, refer to [Chap 4.3.3](#).

## 2 General sea vehicles SNS

The coding and definitions for the general sea vehicles SNS is appropriate for common and system level information for all Products and is described in [Table 2](#) and shown in [Fig 1](#). However, projects can decide not to use this generic SNS.

## 2.2 Definitions of systems and subsystems

### 2.2.1 System A - Propulsion

*Table 3 System A0 - Propulsion, General*

System	Subsystem	Title	Definition
A0		<b>Propulsion, General</b>	
	-00	General	A system or equipment for producing and delivering power.

*Table 4 System A1 - Power pack, General*

System	Subsystem	Title	Definition
A1		<b>Power pack, General</b>	
	-00	Main propulsion drives, General	The propulsion prime mover. It includes, for example, nuclear, electrical, steam, gas turbine and diesel primary propulsion drives.
	-10	Propulsion nuclear	A nuclear fuelled propulsion prime mover
	-20	Propulsion electrical	An electrically powered propulsion prime mover.
	-30	Propulsion steam	A propulsion prime mover driven by steam. It includes, for example, boilers, hoppers and turbines.
	-40	Propulsion gas turbine	A gas turbine powered propulsion prime mover.
	-50	Propulsion diesel	A propulsion prime mover fuelled by diesel.

Table 5 System A2 - Secondary propulsion drives, General

System	Subsystem	Title	Definition
A2		<b>Secondary propulsion drives, General</b>	
	-00	Secondary propulsion drives, General	A secondary means of providing propulsion.

Table 6 System A3 - Emergency propulsion drives, General

System	Subsystem	Title	Definition
A3		<b>Emergency propulsion drives, General</b>	
	-00	Emergency propulsion drives, General	An emergency means of providing propulsion.

Table 7 System A4 - Propulsion transmission systems, General

System	Subsystem	Title	Definition
A4		<b>Propulsion transmission systems, General</b>	
	-00	Propulsion transmission systems, General	A system that transmits torque (main/secondary/emergency) to the platform's propulsion drive.
	-10	Propulsion gearing	A system that converts torque, speed or rotational direction between the propulsion and the drive system.
	-20	Propulsion clutches and couplings	A system that connects or removes the drive from the propulsion system.
	-30	Propulsion shafting	A means of transmitting drive from the propulsion system.
	-40	Propulsion bearings	A means of support for propulsion shafting.
	-50	Propulsion propulsors/propellers	A means of converting propulsion energy into movement of the platform.

Table 8 System A5 - Propulsion support systems, General

System	Subsystem	Title	Definition
A5		<b>Propulsion support systems, General</b>	
	-00	Propulsion support systems, General	Ancillary systems in support of a platforms prime mover.
	-10	Circulating and cooling systems	This system includes cooling air ducting, coolant pumps, liquid filled radiators, fans and associated heat exchange equipment.
	-20	Uptakes and down takes	Refers to a system which supplies and filters air to the propulsion system and collects and removes exhaust gases from the propulsion system. It includes, for example, funnels, all filters, pipes, couplings, silencers, catalytic converters, ducting and combustion air systems.
	-30	Propulsion fuel systems	Equipment to provide fuel storage facilities, fuel filters, delivery pipes, drainage and cut-off valves, Fuel Injector Pumps (FIP) and injectors.
	-40	Propulsion lubricating systems	This system includes lubrication storage facilities. It includes delivery and return pipes, sumps and heat exchangers.
	-50	Propulsion lubrication transfer and purification	This system includes lubrication pumps and filters.

Table 9 System A6 - Propulsion control systems, General

System	Subsystem	Title	Definition
A6		<b>Propulsion control systems, General</b>	
	-00	Propulsion control systems, General	Systems designed to control the various propulsion modes of a platform.
	-10	Propulsion control systems automatic	Refers to those systems that automatically control propulsion.
	-20	Propulsion control systems manual	Refers to those systems that manually control propulsion.

Chap 8.2.8

Table 10 System A7 - Propulsion control systems, Alarms

System	Sub-system	Title	Description
A7		<b>Propulsion control systems - Alarms</b>	
	-00	Propulsion control systems - Alarms (General)	Systems that are designed to provide alarms on propulsion systems.
	-10	Automatically control propulsion - Alarms	Refers to those systems that automatically control propulsion.
	-20 thru -40	Not given	
	-50	Manually control propulsion - Alarms	Refers to those systems that manually control propulsion.
	-60 thru -90	Not given	

Table 11 System A8 - Propulsion control systems, Data logging

System	Sub-system	Title	Description
A8		<b>Propulsion control systems - Data logging</b>	
	-00	Propulsion control systems - Data logging (General)	Systems designed to control the various propulsion modes of a platform.
	-10	Automatically control propulsion - Data logging	Refers to data logger systems of automatically controlled propulsion.
	-20 thru -40	Not given	

System	Sub-system	Title	Description
	-50	Manually control propulsion - Data logging	Refers to data logger systems of manually controlled propulsion.
	-60 thru -90	Not given	

### 2.2.2 System B - Structure

*Table 12 System B0 - Structure, General*

System	Subsystem	Title	Definition
B0		<b>Structure, General</b>	
	-00	General	Framework and/or basic structural housing for a system, including load bearing components.

*Table 13 System B1 - Hull, General*

System	Subsystem	Title	Definition
B1		<b>Hull - General</b>	
	-00	Hull, General	Structured contained envelope providing the overall platform for systems, weapons and personnel.
	-10	Hull fittings	Fittings that are permanently attached to the hull of a platform.
	-20	Hydrofoils	A structure designed to raise the hull out of the water when in motion enabling it to travel fast and economically.

*Table 14 System B2 - Body/cab, General*

System	Subsystem	Title	Definition
B2		<b>Body/cab, General</b>	
	-00	Main supporting structures, General	Beams and columns that provide support for load bearing decks/bulkheads.
	-10	Transverse frames	Refers to a frame that runs athwart ships.
	-20	Longitudinal frames	Refers to a frame that runs fore and aft.

Applicable to: All

**S1000D-A-08-02-0800-00A-040A-A**

**Chap 8.2.8**

System	Subsystem	Title	Definition
	-30	Superstructure	Refers to a structure that is above deck level. This does not include masts, towers, derricks etc.

Table 15 System B3 - Special structures, General

System	Subsystem	Title	Definition
B3		<b>Special structures, General</b>	
	-00	Special structures, General	Structures that are not main supporting but are integral to platform design (eg, sonar domes).
	-10	Structural castings, forgings and welding	Refers to castings, forging and welding which form part of the structure.
	-20	Ballistic plating, sonar domes and stacks	Refers to armour plating, covers for sonar sensors and funnels.
	-30	Special purpose closures and structures	Refers to other structures not covered above.

Table 16 System B4 - Bulkheads/decks, General

System	Subsystem	Title	Definition
B4		<b>Bulkheads/decks, General</b>	
	-00	Bulkheads/decks, General	Vertical/horizontal structures, which divide the interior of the hull into compartments or spaces with provision for personnel/stores access.
	-10	Watertight/non watertight bulkheads	Refers to all bulkheads.
	-20	Main decks	Refers to all main decks.
	-30	Floors	Refers to a deck in a land-based structure.

Table 17 System B5 - Masts, General

System	Subsystem	Title	Definition
B5		<b>Masts, General</b>	

Applicable to: All

S1000D-A-08-02-0800-00A-040A-A

Chap 8.2.8

System	Subsystem	Title	Definition
	-00	Masts, General	Exterior vertical structures which carry those items of equipment (or stores) which by their nature require to be given height well above the deck areas of the platform.
	-10	Submarine masts and periscope integration	Refers to masts and periscopes fitted to a submarine.
	-20	Fixed masts	Refers to solid structures that are fixed to a superstructure.
	-30	Service platforms	Refers to service platforms that are mounted on masts.
	-40	Towers	Refers to lattice (mast type) structures.

Table 18 System B6 - Access, General

System	Subsystem	Title	Definition
B6		<b>Access, General</b>	
	-00	General	Refers to interior and exterior access points.
	-10	Doors	Refers to hinged or sliding covers for access points in a bulkhead. May be Watertight and/or Airtight.
	-20	Hatches	Refers to square or rectangular access point in the deck. May be Watertight and/or Airtight
	-30	Scuttles	Refers to round watertight openings and covers in a bulkhead.
	-40	Covers	Refers to something that protects hatches or scuttles. May be Watertight and/or Airtight.
	-50	Portable Plates	Refers to Removable Plates and/or Panels which are integral parts of the ships structure that are secured with bolts and/or screws to allow access for maintenance.

### 2.2.3 System C - Armaments

Table 19 System C0 - Armaments, General

System	Subsystem	Title	Definition
C0		<b>Armaments, General</b>	
	-00	General	A defensive or offensive system or equipment.

Table 20 System C1 - Gun systems, General

System	Subsystem	Title	Definition
C1		<b>Gun systems, General</b>	
	-00	Gun systems, General	An integrated system for platform protection and destruction of the aggressor. Additionally will include Small Arms for personal protection and aggression.
	-10	Gun mountings	Refers to that part of a weapons system that secures the barrel/breach assembly.
	-20	Directors	Refers to that part of a weapon system that allows for aiming of the gun.
	-30	Ancillaries	Refers to that part of a weapon system that is not described above.
	-40	Small arms	Refers to personal weapon systems.
	-50	Portable weapons	Refers to portable weapon systems.

Table 21 System C2 - Guided missile systems, General

System	Subsystem	Title	Definition
C2		<b>Guided missile systems, General</b>	
	-00	Guided missile systems, General	Equipment to deliver a self propelled warhead that can be guided through its flight to a target.
	-10	Control	Refers to that part of the guided weapon system that provides control.
	-20	Aerials	Refers to the aerials of the guided weapon system.
	-30	Radars	Refers to the target acquisition and guidance radar equipment within the guided weapon system.
	-40	Launchers	Refers to the launching equipment within the guided weapon system.
	-50	Ancillaries	Refers to all parts of the guided weapon system not described above.

Table 22 System C3 - Rocket systems and pyrotechnics, General

System	Subsystem	Title	Definition
C3		<b>Rocket systems and pyrotechnics, General</b>	
	-00	Rocket systems and pyrotechnics, General	Projectiles which are used as an aid, signal or illumination.
	-10	Signals	Refers to those projectiles used for signaling.

Table 23 System C4 - Aircraft related weapon systems, General

System	Subsystem	Title	Definition
C4		<b>Aircraft related weapon systems, General</b>	
	-00	Aircraft related weapon systems, General	For protection in the surveillance role and additionally equipment to provide the ability to deliver/fire weapons to selected targets.
	-10	Aircraft weapon systems	Refers to weapon systems mounted on an aircraft.
	-20	Aircraft weapon control	Refers to the control system of an aircraft mounted weapon system.

Table 24 System C5 - Fire control systems, General

System	Subsystem	Title	Definition
C5		<b>Fire control systems, General</b>	
	-00	Fire control systems, General	Equipment provided to fire weapons according to the protection or aggression scenario.
	-10	Weapon direction systems and sights	Refers to that part of a weapon system that directs fire to a given target.
	-20	Gun fire control systems	Refers to the control system of a weapon system.

System	Subsystem	Title	Definition
	-30	Missile fire control systems	Refers to the fire control systems for missiles.
	-40	Underwater fire control systems	Refers to fire control systems for underwater weapon Systems.

*Table 25 System C6 - Torpedo systems, General*

System	Subsystem	Title	Definition
C6		<b>Torpedo systems, General</b>	
	-00	General	The equipment provided for the discharge of torpedoes to their targets in a timely and controlled manner.
	-10	Submarine torpedo systems	Refers to the submarine torpedo systems.
	-20	Surface launch torpedo equipment	Refers to the surface launch systems for torpedoes.
	-30	Torpedo handling and stowage	Refers to the handling and stowage facilities for torpedoes.
	-40	Acoustic	That portion of the system that uses sound to acquire information. It includes listening devices, amplifiers, processors, indicators etc

*Table 26 System C7 - Electronic warfare, General*

System	Subsystem	Title	Definition
C7		<b>Electronic warfare, General</b>	
	-00	General	Those units and components which furnish a means of detecting, analyzing, jamming, or nullifying the effectiveness of defensive detection devices and communication links.
	-10	Active	That portion of the system consisting of receivers, transmitters, repeaters, blanking and modulating devices (eg, infra-red, laser).
	-20	Passive	That portion of the system that contains no active elements (eg, chaff).
	-30	Data processing	That portion of the system that processes and analyses received data.

## 2.2.4 System D - Electrical system

*Table 27 System D0 - Electrical system, General*

System	Subsystem	Title	Definition
D0		<b>Electrical system, General</b>	
	-00	General	A system or equipment for generation, distribution and/or control of electric power.

*Table 28 System D1 - Electrical power generation, General*

System	Subsystem	Title	Definition
D1		<b>Electrical power generation, General</b>	
	-00	General	Power produced to satisfy all electrical power requirements using a generator driven by a prime mover.
	-10	Turbo generators and control equipment	Refers to the control equipment for turbo generators.
	-20	Gas turbine generators and control equipment	Refers to the control equipment for gas turbine generators.
	-30	Diesel generators and control equipment	Refers to the control equipment for diesel generators.
	-40	Motor generators	Refers to motor generators.

*Table 29 System D2 - Primary supply and distribution systems, General*

System	Subsystem	Title	Definition
D2		<b>Primary supply and distribution systems, General</b>	
	-00	General	Refers to the primary supply and distribution systems of electrical power.

Table 30 System D3 - Electrical power converted supplies, General

System	Subsystem	Title	Definition
D3		<b>Electrical power converted supplies, General</b>	
	-00	General	Refers to the converted electrical power supplies.

Table 31 System D4 - Electrical power lighting, General

System	Subsystem	Title	Definition
D4		<b>Electrical power lighting, General</b>	
	-00	General	Lighting equipment that is powered from the mains electrical distribution systems.
	-10	Cabling	Refers to the cabling used in electrical power systems.

Table 32 System D5 - Electrical power support systems, General

System	Subsystem	Title	Definition
D5		<b>Electrical power support systems, General</b>	
	-00	General	The equipment that provides alternative/back-up electrical supplies for use with certain electrical circuits in the event of a power failure.

Table 33 System D6 - Electrical power emergency supplies, General

System	Subsystem	Title	Definition
D6		<b>Electrical power emergency supplies, General</b>	
	-00	General	Emergency supply systems for use in the event of 'normal' power supply failure.

Table 34 System D7 - Electrical control systems, General

System	Subsystem	Title	Definition
D7		<b>Electrical control systems, General</b>	
	-00	General	Systems designed to provide safe and effective control of electrical power requirements.

Table 35 System D8 - Batteries, General

System	Subsystem	Title	Definition
D8		<b>Batteries, General</b>	
	-00	General	Static and limited (dc) electrical power sources used to provide main, secondary, emergency and/or back-up supplies, additionally to provide supplies to certain portable electrical equipment.
	-10	Primary batteries	Refers to all primary batteries.
	-20	Secondary batteries	Refers to all secondary batteries.
	-30	Battery charging systems	Refers to the charging systems for all batteries.

## 2.2.5 System E - Communications system

Table 36 System E0 - Communications, General

System	Subsystem	Title	Definition
E0		<b>Communications, General</b>	
	-00	General	The communications element refers to that equipment fitted to a platform which provides the means to receive information from off-ship source, to transmit to off-ship receivers and to distribute information throughout the ship.

Table 37 System E1 - SHF/EHF, General

System	Subsystem	Title	Definition
E1		<b>SHF/EHF, General</b>	

Applicable to: All

S1000D-A-08-02-0800-00A-040A-A

Chap 8.2.8

System	Subsystem	Title	Definition
	-00	General	The shipboard communications system/equipment using super and extra high frequency carriers.
	-10	Aerials	Refers to the SHF/EHF aerials used in a communications system.
	-20	Aerial multi-couplers and tuners	Refers to the aerial multi-couplers and tuners of an SHF/EHF communications system.
	-30	Receivers	Refers to the receiver equipment of an SHF/EHF communications system.
	-40	Transmitters	Refers to the transmitter equipment of an SHF/EHF communications system.
	-50	Transceivers	Refers to the transceiver equipment of an SHF/EHF communications system.
	-60	Ancillaries	Refers to all parts of an SHF/EHF communications system not detailed above. It includes, for example, patching facilities, modems and other ancillary equipment.

Table 38 System E2 - UHF/VHF, General

System	Subsystem	Title	Definition
E2		<b>UHF/VHF, General</b>	
	-00	General	The shipboard communications system/equipment using very high frequency carriers.
	-10	Aerials	Refers to the UHF/VHF aerials used in a communications system.
	-20	Aerial multi-couplers and tuners	Refers to the aerial multi-couplers and tuners of a UHF/VHF communications system.
	-30	Receivers	Refers to the receiver equipment of a UHF/VHF communications system.
	-40	Transmitters	Refers to the transmitter equipment of a UHF/VHF communications system.
	-50	Transceivers	Refers to the transceiver equipment of a UHF/VHF communications system.
	-60	Ancillaries	Refers to all parts of a UHF/VHF communications system not detailed above. It includes, for example, patching facilities, modems and other ancillary equipment.

Table 39 System E3 - HF/MF, General

System	Subsystem	Title	Definition
E3		<b>HF/MF, General</b>	
	-00	General	The communication system/equipment using high and medium frequency carriers.
	-10	Aerials	Refers to the HF/MF aerials used in a communications system.
	-20	Aerial multi-couplers and tuners	Refers to the aerial multi-couplers and tuners of an HF/MF communications system.
	-30	Receivers	Refers to the receiver equipment of an HF/MF communications system.
	-40	Transmitters	Refers to the transmitter equipment of an HF/MF communications system.
	-50	Transceivers	Refers to the transceiver equipment of an HF/MF communications system.
	-60	Ancillaries	Refers to all parts of an HF/MF communications system not detailed above. It includes, for example, patching facilities, modems and other ancillary equipment.

Table 40 System E4 - LF/VLF, General

System	Subsystem	Title	Definition
E4		<b>LF/VLF, General</b>	
	-00	LF/VLF, General	The shipboard communications system/equipment using low and very low frequency carriers.
	-10	Aerials	Refers to the LF/VLF aerials used in a communications system.
	-20	Aerial multi-couplers and tuners	Refers to the aerial multi-couplers and tuners of an LF/VLF communications system.
	-30	Available for projects	
	-40	Receivers	Refers to the receiver equipment of an LF/VLF communications system.
	-50	Transmitters	Refers to the transmitter equipment of an LF/VLF communications system.
	-60	Transceivers	Refers to the transceiver equipment of an LF/VLF communications system.

System	Subsystem	Title	Definition
	-70	Ancillaries	Refers to all parts of an LF/VLF communications system not detailed above. It includes, for example, patching facilities, modems and other ancillary equipment.

*Table 41 System E5 - Audio integration, General*

System	Subsystem	Title	Definition
E5		<b>Audio integration, General</b>	
	-00	General	The shipboard communications system/equipment that is used for integration distribution and control of communications.
	-10	Control outfits	Refers to the control equipment for the shipboard communications system.

*Table 42 System E6 - Digital, General*

System	Subsystem	Title	Definition
E6		<b>Digital - General</b>	
	-00	General	The shipboard communications system/equipment that is used for digital data transmission and reception. It includes, for example, modems, encryption devices and teletypes.
	-10	Cryptographic receivers	Refers to the receiver encryption devices.
	-20	Cryptographic transmitters	Refers to the transmitter encryption devices.
	-30	Teletype/message handling	Refers to the teletype and message handling devices that form part of the shipboard communications system.
	-40	Tele-printers	Refers to the tele-printers used in a shipboard communications system
	-50	Modems	Refers to the modems used in a shipboard communications system.
	-60	Displays	Refers to the visual display equipment used in a shipboard communications system.

*Table 43 System E7 - Internal, General*

System	Subsystem	Title	Definition
E7		<b>Internal, General</b>	

System	Subsystem	Title	Definition
	-00	General	The shipboard communications system/equipment that provides communications within the confines of the platform.
	-10	Broadcasts	Refers to the shipboard broadcasting and public address systems.
	-20	Inter-communication	Refers to the shipboard intercommunications system.
	-30	Networks	Refers to all shipboard networks. It includes, for example, Local Area Networks (LAN), Wide Area Networks (WAN), etc.
	-40	Recreational	Refers to all shipboard domestic electronic devices. It includes, for example, radios, televisions and video recorders, etc.
	-50	Alarms	Refers to the shipboard alarm systems.
	-60	Control	Refers to the control equipment used for shipboard communications systems.
	-70	Telephones	Refers to the telephone equipment used on shipboard communications systems.

Table 44 System E8 - Flight Control and instrument landing systems, General

System	Subsystem	Title	Definition
E8		<b>Flight control and instrument landing systems, General</b>	
	-00	General	Communication equipment provided for the safe take-off, operation and landing of aircraft.

## 2.2.6 System F - Navigation system

Table 45 System F0 - Navigation, General

System	Subsystem	Title	Definition
F0		<b>Navigation, General</b>	
	-00	General	A system or equipment used to determine, conduct, manage or plot a position or course for the system.

Table 46 System F1 - Independent, General

System	Subsystem	Title	Definition
F1		<b>Independent, General</b>	
	-00	General	Refers to the navigation equipment fitted to a platform that is independent of ground stations and orbiting satellites (eg, NATO SINS, compasses, Log Systems, wind gear).
	-10	Gyro compasses	Refers to compasses using gyro principles.
	-20	Magnetic compasses	Refers to all compasses using magnetic principles.
	-30	Inertial	Refers to all aspects of inertial navigation. It includes, for example, inertial platforms and gyroscope assemblies, etc.
	-40	Speed and distance	Ship speed and distance systems.
	-50	Depth	Refers to shipboard depth determining systems.
	-60	Wind speed and direction	Systems to measure and indicate wind speed and direction. It includes, for example, standard wind gear and lightweight wind gear.

Table 47 System F2 - Dependent, General

System	Subsystem	Title	Definition
F2		<b>Dependent, General</b>	
	-00	General	Refers to the navigation equipment fitted to a platform that is dependent on ground stations and orbiting satellites. It includes, for example, Global Positioning System, Hyper fix, etc.
	-10	Satellite	Refers to the satellite navigation equipment fitted to a platform.
	-20	Radio	Refers to the radio navigation equipment fitted to a platform.
	-30	Radar	Refers to the radar navigation equipment fitted to a platform.

Table 48 System F3 - Computing, General

System	Subsystem	Title	Definition
F3		<b>Computing, General</b>	
	-00	General	Refers to the navigation equipment fitted to a platform which combines/processes navigational data to compute or manage the platforms geographical position. It includes the ship data distribution systems.

Applicable to: All

S1000D-A-08-02-0800-00A-040A-A

Chap 8.2.8

System	Subsystem	Title	Definition
	-10	Plotting	Refers to those navigational aids used for plotting.
	-20	Data distribution	Refers to that equipment used for the distribution of navigational data.
	-30	Data retransmission	Refers to the equipment used for the retransmission of navigational data.

### 2.2.7 System G - Surveillance system

*Table 49 System G0 - Surveillance, General*

System	Subsystem	Title	Definition
G0		<b>Surveillance, General</b>	
	-00	General	Refers to that portion of equipment fitted to a platform which senses, monitors and, where required provides alarms and environmental data. It includes, for example, radar, sonar, thermal, optical and environmental technologies.

*Table 50 System G1 - Control, General*

System	Subsystem	Title	Definition
G1		<b>Control, General</b>	
	-00	General	Refers to that part of the surveillance equipment fitted to a platform that processes and controls the sensor systems. It includes combat systems.
	-10	Data processing	Refers to the equipment used for the processing surveillance data.
	-20	Displays	Refers to that equipment used to visually display surveillance data.

*Table 51 System G2 - Radar, General*

System	Subsystem	Title	Definition
G2		<b>Radar, General</b>	
	-00	General	Refers to that part of the surveillance equipment fitted to a platform that uses radar devices to acquire information. It includes, for example, aerial outfits and surveillance radar.
	-10	Aerials	Refers to the aerials used as part of radar surveillance.
	-20	Receiver	Refers to the receiver equipment used as part of radar surveillance.

Applicable to: All

**S1000D-A-08-02-0800-00A-040A-A**

**Chap 8.2.8**

System	Subsystem	Title	Definition
	-30	Transmitter	Refers to the transmitter equipment used as part of radar surveillance.
	-40	Ancillaries	Refers to the ancillary equipment used as part of radar surveillance.
	-50	Distribution	Refers to the equipment used to distribute radar surveillance data.
	-60	Displays	Refers to the equipment used to visually display radar surveillance data.

*Table 52 System G3 - Sonar, General*

System	Subsystem	Title	Definition
G3		<b>Sonar, General</b>	
	-00	General	Refers to that part of the surveillance equipment fitted to a platform that uses sonar devices to acquire information
	-10	Transducers	Refers to the transducers used as part of sonar surveillance.
	-20	Receiver	Refers to the receiver equipment used as part of sonar surveillance.
	-30	Transmitter	Refers to the transmitter equipment used as part of sonar surveillance.
	-40	Ancillaries	Refers to the ancillary equipment used as part of sonar surveillance.
	-50	Distribution	Refers to the equipment used to distribute radar sonar data.
	-60	Displays	Refers to the equipment used to visually display sonar surveillance data.

*Table 53 System G4 - Electromagnetic, General*

System	Subsystem	Title	Definition
G4		<b>Electromagnetic, General</b>	
	-00	General	Refers to that part of the surveillance equipment fitted to a platform that is used to detect and identify EM emissions.
	-10	ESM aerals	Refers to aerals used for Electronic Surveillance Measures (ESM).
	-20	ESM receivers	Refers to receivers used for Electronic Surveillance Measures (ESM).

Table 54 System G5 - Optical, General

System	Subsystem	Title	Definition
G5		<b>Optical, General</b>	
	-00	General	Refers to that part of the surveillance equipment fitted to a platform that uses optical devices to acquire information. It includes, for example, periscopes and GPEOD.
	-10	Thermal imaging	This element refers to that equipment (hardware/software) which provides a thermal picture surveillance and weapon guidance. It includes thermal imaging sensor heads, drive units, processors, sights, power supply units, and display units.
	-20	Periscopes	Refers to the periscopes used as part of the optical surveillance equipment.

Table 55 System G6 - Digital, General

System	Subsystem	Title	Definition
G6		<b>Digital, General</b>	
	-00	General	Refers to that part of the surveillance equipment fitted to a platform that provides data transfer capabilities. It includes, for example, data highways and combat system highways.
	-10	Data highway	Refers to the digital data busses used as part of the surveillance system.

Table 56 System G7 - Identification systems, General

System	Subsystem	Title	Definition
G7		<b>Identification systems, General</b>	
	-00	General	Surveillance equipment provided for the selection and identification of friendly and hostile targets.
	-10	Radar aerials	Refers to the radar aerials used as part of the identification system.
	-20	Integrators transponders	Refers to the shipboard, built-in transponders used as part of the identification system of the surveillance system.

## 2.2.8 System H - Steering system

*Table 57 System H0 - Steering, General*

System	Subsystem	Title	Definition
H0		<b>Steering, General</b>	
	-00	General	Refers to those units and devices within the platform which govern movement and/or direction of assemblies. It includes, for example, motors, gearboxes, drives, thrusters and rudders.

*Table 58 System H1 - Steering systems and control, General*

System	Subsystem	Title	Definition
H1		<b>Steering systems and control, General</b>	
	-00	General	The system designed to transmit the requirements given at the steering position, to the receiver that controls the movements of the rudders or other steering mechanisms.

*Table 59 System H2 - Thrusters, General*

System	Subsystem	Title	Definition
H2		<b>Thrusters, General</b>	
	00	General	Power units fitted in the ship below the surface to give lateral thrust when maneuvering the ship.

*Table 60 System H3 - Stabilizing systems and control, General*

System	Subsystem	Title	Definition
H3		<b>Stabilizing systems and control, General</b>	
	00	General	The equipment provided to minimize the effect of wave movement on a ship.

Table 61 System H4 - Diving control systems, General

System	Subsystem	Title	Definition
H4		<b>Diving control systems, General</b>	
	00	General	The system designed to control the submerged depth of a submersible

Table 62 System H5 - Hydroplanes, General

System	Subsystem	Title	Definition
H5		<b>Hydroplanes, General</b>	
	00	General	Equipment provided to control the attitude of a submersible underwater.

## 2.2.9 System J - Ventilation/heating/cooling system

Table 63 System J0 - Ventilation/heating/cooling, General

System	Subsystem	Title	Definition
J0		<b>Ventilation and air conditioning, General</b>	
	-00	General	A system or equipment used to provide a controlled environment

Table 64 System J1 - Climatic control systems, General

System	Subsystem	Title	Definition
J1		<b>Climatic control systems, General</b>	
	-00	General	Equipment provided to control climatic/environmental conditions within a given space.

Table 65 System J2 - Ventilation systems, General

System	Subsystem	Title	Definition
J2		<b>Ventilation systems, General</b>	

Applicable to: All

S1000D-A-08-02-0800-00A-040A-A

Chap 8.2.8

System	Subsystem	Title	Definition
	-00	General	Air supply and exhaust systems which provide habitable conditions in working and living spaces within a platform.

*Table 66 System J3 - Air conditioning systems, General*

System	Subsystem	Title	Definition
J3		<b>Air conditioning systems, General</b>	
	-00	General	Systems which control the humidity and temperature of living spaces, and some working spaces within a platform.
	-10	Compartment heating systems	That portion of the system and its controls which supply heat. It includes items such as heater units, wiring, etc.

*Table 67 System J4 - Oxygen generating system, General*

System	Subsystem	Title	Definition
J4		<b>Oxygen generating system, General</b>	
	-00	General	A machinery plant that generates oxygen which can be stored in liquid or gaseous form.

## 2.2.10 System K - Hydraulic system

*Table 68 System K0 - Hydraulic system, General*

System	Subsystem	Title	Definition
K0		<b>Hydraulic system, General</b>	
	-00	General	A system or equipment for generation, distribution and/or control of hydraulic power.

*Table 69 System K1 - Main hydraulic power systems, General*

System	Subsystem	Title	Definition
K1		<b>Main hydraulic power systems, General</b>	

Applicable to: All

**S1000D-A-08-02-0800-00A-040A-A**

**Chap 8.2.8**

System	Subsystem	Title	Definition
	-00	General	Equipment required to provide fluidic power for a prime mover/requirement.

*Table 70 System K2 - Auxiliary hydraulics power systems, General*

System	Subsystem	Title	Definition
K2		<b>Auxiliary hydraulics power systems, General</b>	
	00	General	Equipment required to provide fluidic power for the control of engineering systems and machinery.

*Table 71 System K3 - Pneumatic system, General*

System	Subsystem	Title	Definition
K3		<b>Pneumatic systems, General</b>	
	-00	General	Systems that are designed to move and store air under pressure.
	-10	Servo air systems	Systems that move under air under pressure.

## 2.2.11 System L - Electronic system

*Table 72 System L0 - Electronic system, General*

System	Subsystem	Title	Definition
L0		<b>Electronic systems, General</b>	
	-00	General	A system or equipment using electronic/automated software and/or firmware elements not included in other systems.

*Table 73 System L1 - Cathodic protection, General*

System	Subsystem	Title	Definition
L1		<b>Cathodic protection, General</b>	

Applicable to: All

**S1000D-A-08-02-0800-00A-040A-A**

**Chap 8.2.8**

System	Subsystem	Title	Definition
	-00	General	A system that uses electrolysis for the protection of a ships hull against wastage caused by the corrosive effect of salt water.

*Table 74 System L2 - Degaussing, General*

System	Subsystem	Title	Definition
L2		<b>Degaussing, General</b>	
	-00	General	A system designed to neutralize the magnetic field surrounding a platform.

## 2.2.12 System M - Auxiliary system

*Table 75 System M0 - Auxiliary, General*

System	Subsystem	Title	Definition
M0		<b>Auxiliary, General</b>	
	-00	General	Subsidiary systems that provide services or support to main systems or equipment.

*Table 76 System M1 - Aircraft handling systems, General*

System	Subsystem	Title	Definition
M1		<b>Aircraft handling systems, General</b>	
	-00	General	The equipment provided for the safe movement of aircraft within the hangar or to and from the flight deck or runway.
	-10	Aircraft handling systems servicing and stowage	Aircraft handling and associated support facilities.
	-20	Aircraft recovery support systems	Aircraft recovery and associated support facilities.

Table 77 System M2 - Sea water systems, General

System	Subsystem	Title	Definition
M2		<b>Sea water systems, General</b>	
	-00	General	Systems to provide firefighting, machinery cooling, controlled flooding of watertight compartments and some domestic services.
	-10	Firemain and flushing systems	Piping, firemain and flushing pumps, and controls.
	-20	Sprinkler systems	Sea water sprinkler systems.
	-30	Pre-wetting systems	Countermeasure pre-wetting systems.
	-40	Auxiliary sea water systems	Auxiliary machinery sea water system pumps and associated pipes, controls, etc.
	-50	Scuppers and deck drains	Refers to scuppers, deck drains and associated equipment.
	-60	Plumbing and drainage	Refers to drains, plumbing and associated pipes, control valves, etc.
	-70	Drainage and ballasting systems	Refers to piping, drainage and ballasting system, pumps and controllers.

Table 78 System M3 - Fresh water systems, General

System	Subsystem	Title	Definition
M3		<b>Fresh water systems, General</b>	
	-00	General	Refers to systems provided for domestic purposes and other services, where the corrosive effect of sea water would be unacceptable.
	-10	Distilling plant	Flash type, vapor compression, heat recovery and submerged tube type.
	-20	Auxiliary fresh water cooling	Cooling water, electronics, DW/CW.
	-30	Potable water	Refers to fresh and distilled water services. It includes, for example, drinking water supplies.

Table 79 System M4 - Fuels and lubricants systems, General

System	Subsystem	Title	Definition
M4		<b>Fuels and Lubricants Systems, General</b>	
	-00	General	Refers to systems that are designed to move and store propellant and lubricating fluids.
	-10	Ship fuel and fuel compensating systems	Ship fuel filling and transfer system pumps, fuel transfer systems and associated equipment.
	-20	Aviation and general purpose fuels	Piping aviation and general purpose fuel system pumps, aviation and general purpose fuel MOGAS handling and piping.
	-30	Aviation and general purpose lubricating oil	Lubricating oil systems, aviation and general purpose.
	-40	Auxiliary lubrication systems	Lubrication outboard and lubrication inboard.
	-50	Special fuel and lubricants handling and storage	Handling and storage systems for special fuel and lubricants.

Table 80 System M5 - Gas systems, General

System	Subsystem	Title	Definition
M5		<b>Gas systems, General</b>	
	-00	General	Systems that are designed to move and store air and certain gases, under pressure.
	-10	Compressed air systems	This element refers to a system or equipment (hardware/software) for the generation, distribution and/or control of pneumatic power and compressed air.
	-20	Compressed gases	Compressed gas system nitrogen.
	-30	Vacuum systems	This element refers to a system or equipment (hardware/software) for the generation, distribution and/or control of vacuum power.

Table 81 System M6 - Cargo handling replenishment systems, General

System	Subsystem	Title	Definition
M6		<b>Cargo handling replenishment systems, General</b>	
	-00	General	Cargo handling machinery and systems which are used for replenishment.
	-10	RAS systems	RAS Winches, RAS booms, rigging and hardware, control stations.
	-20	Vertical replenishment systems	VETREP systems.
	-30	Ships stores and equipment handling systems	Refers to ships stores and equipment handling systems.

Table 82 System M7 - Machinery, General

System	Subsystem	Title	Definition
M7		<b>Machinery, General</b>	
	-00	General	Any item of machinery other than those directly associated with weapons system not identified elsewhere.
	-10	Engineering and functional machinery	Refers to engineering and functional machinery.
	-20	Domestic machinery	Refers to machinery installed for domestic purposes.

Table 83 System M8 - Deck machinery

System	Subsystem	Title	Definition
M8		<b>Deck machinery</b>	
	-00	General	Any item of machinery other than those directly associated with deck machinery.
	-10	Cranes	Refers to cranes used on deck.
	-20	Winches	Refers to winches used on deck.

## 2.2.13 System N - Survivability system

*Table 84 System N0 - Survivability, General*

System	Subsystem	Title	Definition
N0		<b>Survivability, General</b>	
	00	General	A system or equipment used to provide hazard detection, protection, survivability and escape facilities

*Table 85 System N1 - Damage control, General*

System	Subsystem	Title	Definition
N1		<b>Damage control, General</b>	
	-00	General	Equipment for the limitation, control and repair (within the platform resources) of material damage however caused in peace and war.
	-10	Detection systems	Refers to equipment for the detection of material damage.

*Table 86 System N2 - Escape facilities, General*

System	Subsystem	Title	Definition
N2		<b>Escape facilities, General</b>	
	-00	General	The facilities that are fitted specifically to assist in escaping from danger or to prolong life in times of crisis. It includes, for example, BIBS and HIS

*Table 87 System N3 - Firefighting systems, General*

System	Subsystem	Title	Definition
N3		<b>Firefighting systems, General</b>	
	00	General	The equipment that provides the ability to limit the spread of fire, extinguish and prevent re-ignition. It includes, for example, detecting, indicating and extinguishing systems.

Table 88 System N4 - Nuclear, biological, chemical, General

System	Subsystem	Title	Definition
N4		<b>Nuclear, biological, chemical, General</b>	
	-00	General	The NBC element refers to those subassemblies or components which provide nuclear, biological and chemical detection, protection and survivability to the platform and crew, either individually or collectively, during an NBC attack. This includes positive pressure and purification systems, ventilated face pieces (masks), NBC detection and warning devices, decontamination equipment and chemical resistant coatings.

Table 89 System N5 - Salvage systems, General

System	Subsystem	Title	Definition
N5		<b>Salvage systems, General</b>	
	-00	General	Refers to systems for the performance of salvage operations.

Table 90 System N6 - Stability, General

System	Subsystem	Title	Definition
N6		<b>Stability, General</b>	
	-00	General	Refers to systems for the provision of stability, following damage to or flooding of compartments.

#### 2.2.14 System P - Special equipment/system

Table 91 System P0 - Special equipment/system, General

System	Subsystem	Title	Definition
P0		<b>Special equipment/ system, General</b>	
	-00	General	A system or equipment used to provide a special mission capability.

Table 92 System P1 - Special to type equipment, General

System	Subsystem	Title	Definition
P1		<b>Special to type equipment, General</b>	
	-00	General	This element refers to that special equipment (hardware/software) to enable the achievement of a special mission capability.

Table 93 System P2 - Special recovery equipment, General

System	Subsystem	Title	Definition
P2		<b>Special recovery equipment, General</b>	
	-00	General	This element refers to that special recovery equipment (hardware/software) to enable the achievement of a recovery capability. It includes cranes, winches and towing equipment.

Table 94 System P3 - Special fit equipment, General

System	Subsystem	Title	Definition
P3		<b>Special fit equipment, General</b>	
	-00	General	This element refers to that special fit equipment (hardware/software) to enable the achievement of a specialized capability.

Table 95 System P4 - Special purpose equipment, General

System	Subsystem	Title	Definition
P4		<b>Special purpose equipment, General</b>	
	-00	General	This element refers to that special-to-purpose equipment (hardware/software) for the achievement of a special mission purpose. It covers, for example, equipment for repair workshops, medical and other special purpose platforms.

## 2.2.15 System Q - Outfit, Furnishings and stowage system

*Table 96 System Q0 - Outfit and furnishings, General*

System	Subsystem	Title	Definition
Q0		<b>Outfit and furnishings, General</b>	
	-00	General	A function or equipment used to provide habitability, operability or stowage facilities that is not specifically included in other systems.

*Table 97 System Q1 - Preservations and coverings, General*

System	Subsystem	Title	Definition
Q1		<b>Preservations and coverings, General</b>	
	-00	General	Coverings made from weatherproof fabrics, plastics and synthetics to protect items of exposed equipment and machinery from the elements (particularly salt water spray)

*Table 98 System Q2 - Protective coatings, General*

System	Subsystem	Title	Definition
Q2		<b>Protective coatings, General</b>	
	-00	General	Protective paint (usually oil based and anti fouling) applied to surfaces which are exposed to sea water or other corrosive elements.

*Table 99 System Q3 - Storerooms, General*

System	Subsystem	Title	Definition
Q3		<b>Storerooms, General</b>	
	-00	General	Spaces that are designed to hold stores of a long term or ready use nature (other than weapons, ammunition and food supplies.
	-10	Utility space	Spaces that are designed and specifically fitted out for the storage or provision of utilities.

Table 100 System Q4 - Bathrooms and toilets, General

System	Subsystem	Title	Definition
Q4		<b>Bathrooms and toilets, General</b>	
	-00	General	Spaces that are designed and specifically fitted out for the provision of bathroom and toilet facilities.

Table 101 System Q5 - Workshops, General

System	Subsystem	Title	Definition
Q5		<b>Workshops, General</b>	
	-00	General	Spaces that are designed and specifically fitted out for the maintenance of machinery and certain specialized equipment.

Table 102 System Q6 - Laboratories, General

System	Subsystem	Title	Definition
Q6		<b>Laboratories, General</b>	
	-00	General	Rooms that are used for carrying out scientific tests on items of equipment and some substances.

Table 103 System Q7 - Test areas, General

System	Subsystem	Title	Definition
Q7		<b>Test areas, General</b>	
	-00	General	Rooms that are used for carrying out tests on items of equipment.

Table 104 System Q8 - Galley/pantry scullery, General

System	Subsystem	Title	Definition
Q8		<b>Galley/pantry scullery, General</b>	
	00	General	Rooms that are used for preparation and serving of food and refreshments.

Table 105 System Q9 - Commissary, General

System	Subsystem	Title	Definition
Q9		<b>Commissary, General</b>	
	-00	General	Rooms that are used for storage of food and drink, sometimes with specialized storing requirements such as frozen food.

Table 106 System QA - Accommodation spaces, General

System	Subsystem	Title	Definition
QA		<b>Accommodation spaces, General</b>	
	-00	General	Spaces that are designed and fitted to provide habitable (living and recreational) accommodation.

Table 107 System QB - Offices, General

System	Subsystem	Title	Definition
QB		<b>Offices, General</b>	
	-00	General	Spaces in which work of an administrative nature is carried out.

Table 108 System QC - Control centers, General

System	Subsystem	Title	Definition
QC		<b>Control centers, General</b>	
	-00	General	Rooms that are used for the control of operations and/or processes.

Table 109 System QD - Machinery spaces, General

System	Subsystem	Title	Definition
QD		<b>Machinery spaces, General</b>	
	-00	General	Spaces that contain permanent and fixed items of machinery.

Table 110 System QE - Medical, dental and pharmaceutical spaces, General

System	Subsystem	Title	Definition
QE		<b>Medical, dental and pharmaceutical spaces, General</b>	
	-00	General	Rooms that are used for the provision of medical, dental and pharmaceutical facilities.

Table 111 System QF - Laundry, General

System	Subsystem	Title	Definition
QF		<b>Laundry, General</b>	
	-00	General	Spaces that are designed and specially fitted for the washing and drying of linen and fabrics.

## 2.2.16 System R - Training system

Table 112 System R0 - Training, General

System	Subsystem	Title	Definition
R0		<b>Training, General</b>	
	-00	General	A system or equipment used to provide training capabilities.
	-10	Training	The training element is defined as the deliverable training services, devices, accessories, aids, equipment and facilities used to enable instruction through which personnel will acquire sufficient concepts, skill and aptitudes to operate and maintain the system with maximum efficiency. This element includes all effort associated with the design, development and production of deliverable training equipment as well as the execution of training services.
	-20	Non weapon trainers and simulators	A system or equipment used to provide training capabilities for non weapon systems and simulators
	-30	Weapon systems trainers and simulators	A system or equipment used to provide training capabilities for weapon systems and simulators.

## 2.2.17 System S - Repair test and support system

*Table 113 System S0 - Repair test and support, General*

System	Subsystem	Title	Definition
S0		<b>Repair test and support, General</b>	
	-00	General	A system, equipment or facilities used to maintain operational capability.

## 2.2.18 System T - Management system

*Table 114 System T0 - Management system*

System	Subsystem	Title	Definition
T0		<b>Management system, General</b>	
	-00	General	A system, equipment or facilities used to manage the totality of complex integrated management systems.

*Table 115 System T1 - Platform management system*

System	Subsystem	Title	Definition
T1		<b>Platform management system, General</b>	
	-00	General	A system, equipment or facilities used to monitor and manage the totality of Power systems.
	-10	Operator facilities	Refers to the roles and facilities provided to the operator at the Consoles by the MMI
	-20	Data processing	Refers to equipment fitted to a platform, which combines and processes Power systems data
	-30	Consoles	Refers to the consoles fitted to the platform.
	-40	Monitor	Refers to the equipment fitted to the platform which monitors systems.
	-50	Cabinets	Refers to Equipment Cabinets, which can be configured with equipment units from multiple systems.
	-60	Maintainer facilities	Refers to the Maintainers and Diagnostic facilities fitted to the platform
	-70	Peripheral equipment	Refers to any peripheral support equipment fitted to the platform (eg; printers).

Applicable to: All

**S1000D-A-08-02-0800-00A-040A-A**

**Chap 8.2.8**

Table 116 System T2 - Not available for projects

System	Subsystem	Title	Definition
T2		Not available for projects	
	-00 thru -90	Available for projects	

Table 117 System T3 - Combat management and data transfer system, General

System	Subsystem	Title	Definition
T3		<b>Combat management and data transfer system, General</b>	
	-00	General	A system, equipment or facilities used to a platform which combines, processes, and distributes Central Maintenance System (CMS) Data.
	-10	Operator facilities	Refers to the roles and facilities provided to the operator at the Consoles by the MMI.
	-20	Combat management	Refers to equipment fitted to a platform, which combines and processes CMS data.
	-30	Consoles	Refers to the consoles fitted to the platform.
	-40	Data transfer	Refers to the DTS equipment fitted to the platform which distributes the CMS data.
	-50	Cabinets	Refers to Equipment Cabinets, which can be configured with equipment units from multiple systems.
	-60	Maintainer facilities	Refers to the Maintainers and Diagnostic facilities fitted to the platform
	-70	Peripheral equipment	Refers to any peripheral support equipment fitted to the platform (eg, printers).

## 2.2.19 System U - Meteorological and oceanography system

Table 118 System U0 - Meteorological and Oceanography systems, General

System	Subsystem	Title	Definition
U0		<b>Meteorological and Oceanography systems - General</b>	

Applicable to: All

S1000D-A-08-02-0800-00A-040A-A

Chap 8.2.8

System	Subsystem	Title	Definition
	-00	General	A platform system, equipment or facilities used to collect, process, and distribute meteorological and oceanographic data.

*Table 119 System U1 - Meteorological systems, General*

System	Subsystem	Title	Definition
U1		<b>Meteorological systems - General</b>	
	-00	General	A system, equipment or facilities used to collect, process systems, and distribute meteorological data.

*Table 120 System U2 - Oceanography systems, General*

System	Subsystem	Title	Definition
U2		<b>Oceanography systems - General</b>	
	-00	General	A system, equipment or facilities used to collect, process systems and distribute oceanographic data.

*Table 121 System U3 - Data transmission, General*

System	Subsystem	Title	Definition
U3		<b>Data transmission - General</b>	
	-00	General	A system, equipment or facilities used for the transmission and distribution of meteorological and oceanographic (METOC) data, including ship borne Ethernet.

*Table 122 System U4 - Data processing, General*

System	Subsystem	Title	Definition
U4		<b>Data processing - General</b>	
	-00	General	Refers to the equipment used for the collation and processing of METOC data.

Table 123 System U5 - Man-Machine Interfaces, General

System	Subsystem	Title	Definition
U5		<b>Man-Machine Interfaces - General</b>	
	-00	General	Refers to the equipment used for receiving non-ship borne (remote) METOC data (eg, consoles, laptops, etc).

Table 124 System U6 - Data receivers, General

System	Subsystem	Title	Definition
U6		<b>Data receivers, General</b>	
	-00	General	Refers to the equipment used for receiving non-ship borne (remote) METOC data.

*Table 1 References*

Chap No./Document No.	Title
None	

#### **1      General**

To assist in the data module coding strategy, example SNS have been provided on [www.s1000d.org](http://www.s1000d.org). Projects can decide to use these SNS without modification or use part and modify those areas that do not suit their needs. If these example SNS or the maintained SNS do not suit a projects needs, then projects can decide to design their own complete SNS. The examples are not maintained by any of the S1000D committees.

#### **2      Example SNS**

The example SNS are:

- combat vehicle project
- MIL-STD-1808 based project
- Geräteaufgliederungsplan (GAPL) based project
- power provision project
- climate control project
- automated handling project
- artillery radar project
- software project
- training project
- electrical project
- communications project
- electronic project
- surveillance project
- navigation project
- deployable airbase project
- medical project

- 
- command post project
  - technical publications project

### References

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 8.4.1</a>	Information codes - Short definitions
<a href="#">Chap 8.4.2</a>	Information codes - Full definitions

## 1 General

Information codes are used to describe the type of information related to the Product about which the data module has been written. Each code has a full definition and a short definition. The short definitions are normally used to populate the element `<infoName>` in the element `<dmTitle>`. Projects can allocate specific information codes following the rules in [Para 2.1](#).

## 2 Allocating codes and definitions

### 2.1 Project specific information codes

Codes that are defined as "Not available for projects" are controlled by S1000D. It is important, when allocating definitions, that the hierarchy of information codes is maintained and that the new definitions are used in a consistent manner.

Information codes have a hierarchy which is defined in [Chap 8.4.1](#) and [Chap 8.4.2](#). The secondary code (2nd character) is a child of the primary code (1st character) and the tertiary code (3rd character) is a child of the secondary code.

Projects can define project specific information codes in accordance with the following:

- With the exception of codes "00A" thru "00Z" projects can allocate alpha characters to the tertiary code only if the primary and secondary codes are already defined in [Chap 8.4.1](#) and [Chap 8.4.2](#)

- The hierarchy must be preserved when allocating information codes and definitions
- The project must agree to its own short and full definitions

**Business rule decision point BRDP-S1-00550 - Allocation of project specific information codes:**

- Decide and agree on allocation of project specific information codes and give them short and full definitions.

## 2.2 Use of information codes

The use of the detailed information code breakdown is applicable only where the appropriate extensive and detailed information needs to be provided or is needed for the sake of clarity. In simple cases, information must not be broken down unnecessarily. The information must be provided under the next higher information code in a summarized form. Should this still result in an unnecessary breakdown, all information must be furnished under the appropriate primary information code.

For general technical publications, some of the SNS (eg, systems 05 thru 12 of the SNS) already identify the requirement for the type of information for the data module (eg, subsystem 05-10 requires time limits), a standard information code "000" is used in these cases.

The hierarchy is organized into primary and secondary codes. The primary codes are defined at [Para 2.3](#) and the secondary codes are defined at [Chap 8.4.1](#) for short definitions and [Chap 8.4.2](#) for full definitions.

## 2.3 Primary codes

The primary codes are defined as:

- 000 Function, data for plans and description
- 100 Operation
- 200 Servicing
- 300 Examinations, tests and checks
- 400 Fault report and isolation procedures
- 500 Disconnect, remove and disassemble procedures
- 600 Repairs and locally make procedures and data
- 700 Assemble, install and connect procedures
- 800 Storage procedures and data
- 900 Miscellaneous
- C00 Computer systems, software and data

## 3 Translation of information code definitions

A project can, by project decision, translate the definitions given to the information codes listed in [Chap 8.4.1](#) and [Chap 8.4.2](#). The translation must be a direct translation without any deviations in the scope of the definitions.

**Business rule decision point BRDP-S1-00551 - Translation of information code definitions:**

- Decide whether to translate and use the information code definitions in the languages adopted by the project.

Table 1 References

Chap No./Document No.	Title
None	

## 1 General

The following tables contain the short definitions for information codes. Refer to default BREX rule BREX-S1-00180.

## 2 Short definitions

### 2.1 Primary codes

The identification elements are applicable to the Product, engine and equipment data modules.

*Table 2 Primary codes*

Primary code	Definition
000	Function, data for plans and description
100	Operation
200	Servicing
300	Examinations, tests and checks
400	Fault reports and isolation procedures
500	Disconnect, remove and disassemble procedures
600	Repairs and locally make procedures and data
700	Assemble, install and connect procedures
800	Package, handling, storage and transportation
900	Miscellaneous
C00	Computer systems, software and data

The short definitions are given in [Table 3](#) thru [Table 13](#).

### 2.2 Primary code 000 - Function, data for plans and description

*Table 3 Code 000 - Function, data for plans and description*

IC	Definition	Remarks
000	Function, data for plans and description	
001	Title page	
002	List of pages or data modules	See also code 00R and code 00S
003	Change record or highlights	See also code 00T and code 00U
004	Access illustration	
005	List of abbreviations	
006	List of terms

**Chap 8.4.1**

IC	Definition	Remarks
OB6 thru OBZ	Not available for projects	

## 2.3 Primary code 100 - Operation

*Table 4 Code 100 - Operation*

IC	Definition	Remarks
100	Operation	
101	List of consumables associated with operation	
102	List of materials associated with operation	
103	List of expendables associated with operation	
104	List of special support equipment and tools associated with operation	
105	List of support equipment and tools associated with operation	
106	List of software associated with operation	
107	Parts list associated with operation	
108 and 109	Not available for projects	
110	Controls and indicators	
111	Controls and indicators	This code is used for crew
112	Modes of operation	This code is used for crew
113 and 114	Not available for projects	
115	Displays and alerts	
116 thru 119	Not available for projects	
120	Pre-operation	
121	Pre-operation procedure	This code is used for crew
122	Siting	
123	Shelter	
124	Not available for projects	

<b>IC</b>	<b>Definition</b>	<b>Remarks</b>
125	Pre-operation procedures checklist	This code is used for crew
126	Conditions of readiness	
127	Establish operating position	
128 thru 129	Not available for projects	
130	Normal operation	
131	Normal operation procedure	This code is used for crew
132	Start-up procedure for maintenance	
133	Shutdown procedure for maintenance	
134	Aviation checklist	
135	Normal operation procedures checklist	This code is used for crew
136	Ground running check	
137	Not available for projects	
138	Ground running performance adjustment	
139	Nuclear, biological and chemical procedures	
140	Emergency procedure	
141	Emergency operation procedure	This code is used for crew
142	Operation under unusual conditions	
143	Radio interference suppression	
144	Jamming and electronic countermeasures (ECM)	
145	Emergency operation procedures checklist	This code is used for crew
146	Emergency shutdown operation procedure	
147 thru 149	Not available for projects	
150	Post-operation	
151	Post-operation procedure	This code is used for crew
152 thru 154	Not available for projects	

IC	Definition	Remarks
155	Post-operation procedures checklist	This code is used for crew
156	Not available for projects	
157	Establish maintenance position	
158 thru 159	Not available for projects	
160	Loading/Unloading procedure	
161	Special operation	
162	Non-tactical operation	
163 thru 168	Not available for projects	
169	Mass & Balance	
170	Handling	
171	Lifting	
172	Jacking	
173	Shoring	
174	Towing	
175	Taxiing	
176	Lowering	
177	Stabilizing	
178	Tethering	
179	Debogging	
180	Dispatch deviation	
181	Deactivate for dispatch deviation	
182 thru 199	Not available for projects	

## 2.4 Primary code 200 - Servicing

Table 5 Code 200 - Servicing

IC	Definition	Remarks
200	Servicing	
201	List of consumables associated with servicing	
202	List of materials associated with servicing	

Applicable to: All

S1000D-A-08-04-0100-00A -040A-A

Chap 8.4.1

IC	Definition	Remarks
203	List of expendables associated with servicing	
204	List of special support equipment and tools associated with servicing	
205	List of support equipment and tools associated with servicing	
206	List of software associated with servicing	
207	Parts list associated with servicing	
208 and 209	Not available for projects	
210	Fill	
211	Refuel	
212	Fill with oil	
213	Fill with oxygen	
214	Fill with nitrogen	
215	Fill with air	
216	Fill with water	
217	Fill with hydrogen	
218	Fill with other liquid	
219	Fill with other gas	
220	Drain liquid and release pressure	
221	Defuel and drain fuel	
222	Drain oil	
223	Release oxygen pressure	
224	Release nitrogen pressure	
225	Release air pressure	
226	Drain water	
227	Release hydrogen pressure	
228	Drain other liquid	
229	Release other gas pressure	
230	Bleed and prime	
231	Bleed	
232	Prime	
233	Dry	

IC	Definition	Remarks
234	Facility requirements associated with servicing	
235	Not available for projects	
236	Fill with inert gas/inert liquid	
237	Evacuate	
238 and 239	Not available for projects	
240	Lubrication	
241	Oil	
242	Grease	
243	Dry film	
244 thru 249	Not available for projects	
250	Clean and apply surface protection	
251	Clean with chemical agent	
252	Clean by abrasive blast	
253	Clean by ultrasonics	
254	Clean mechanically	
255	Purge	
256	Polish and apply wax	
257	Paint and apply marking	
258	Other procedure to clean	
259	Other procedure to protect surfaces	
260	Remove and prevent ice and remove contamination	
261	Remove ice	
262	Prevent ice	
263	Use disinfectant/Sanitize	
264	Remove contamination	
265 thru 269	Not available for projects	
270	Adjust, align and calibrate	
271	Adjust	
272	Align	

IC	Definition	Remarks
273	Calibrate	
274	Harmonize	
275	Grooming	
276	Rig	
277	Compensate	
278	Easily and quickly adjust after a battle damage repair	
279	Easily and quickly align after a battle damage repair	
280	Inspection	
281	Scheduled inspection	
282	Unscheduled inspection	
283	Special regular inspection	
284	Special irregular inspection	
285	Structure inspection for allowable damage limits	
286	Structure inspection for repair	
287	Not available for projects	
288	Overhaul and retirement schedule	
289	Check filling quantity	
290	Change of liquid/gas	
291	Not available for projects	
292	Change of oil	Code 222 + code 212
293	Change of oxygen	Code 223 + code 213
294	Change of nitrogen	Code 224 + code 214
295	Change of air	Code 225 + code 215
296	Change of water	Code 226 + code 216
297	Change of hydrogen	
298	Change of other liquid	Code 228 + code 218
299	Change of other gas	Code 229 + code 219

## 2.5 Primary code 300 - Examinations, tests and checks

Table 6 Code 300 - Examinations, test and checks

IC	Definition	Remarks
300	Examinations, tests and checks	
301	List of consumables associated with examinations, tests and checks	
302	List of materials associated with examinations, tests and checks	
303	List of expendables associated with examinations, tests and checks	
304	List of special support equipment and tools associated with examinations, tests and checks	
305	List of support equipment and tools associated with examinations, tests and checks	
306	List of software associated with examinations, tests and checks	
307	Parts list associated with examinations, tests and checks	
308 and 309	Not available for projects	
310	Visual examination	
311	Visual examination without special equipment	
312	Examination with a borescope	
313 and 314	Not available for projects	
315	QA requirements	
316 thru 319	Not available for projects	
320	Operation test	
321	Unit break-in	
322	Test and inspection	
323 thru 329	Not available for projects	
330	Test preparation	
331	Connection of test equipment	
332	Removal of test equipment	

Applicable to: All

S1000D-A-08-04-0100-00A -040A-A

Chap 8.4.1

IC	Definition	Remarks
333	Installation of the unit before the test	
334	Removal of the unit after the test	
335	Final measures	
336 thru 339	Not available for projects	
340	Function test	
341	Manual test	
342	Automatic test	
343	BIT	
344	Compatibility test	
345	System test	
346	Other check	
347	Start-up procedure for test	
348	Final acceptance test (FAT)	
349	Test records	
350	Structure test	
351	Test for surface cracks with dye penetrant	
352	Test for surface cracks with magnetic particles	
353	Test for cracks and other defects with eddy current	
354	Test for cracks and other defects with X-rays	
355	Test for cracks and other defects with ultrasonics	
356	Hardness test	
357	Gamma-ray test	
358	Resonance frequency test	
359	Thermographic test	
360	Design data/tolerances check	
361	Dimensions check	
362	Pressure check	
363	Flow check	
364	Leak check	
365	Continuity check	
366	Resistance check	

IC	Definition	Remarks
367	Electrical power check	
368	Signal strength check	
369	Other check	
370	Monitor the condition	
371	Oil analysis	
372	Vibration analysis	
373	Tracking check	
374	Fuel analysis	
375	Shooting accidental discharge analysis	
376	Check post application of adhesive	
377	Contamination analysis	
378	Not available for projects	
thru		
389		
390	Sample test	
391	Not available for projects	
thru		
395		
396	Flight control surface movement	
397	Landing gear movement	
398	Product configuration	
399	Not available for projects	

## 2.6 Primary code 400 - Fault reports and isolation procedures

Table 7 Code 400 - Fault reports and isolation procedures

IC	Definition	Remarks
400	Fault reports and isolation procedures	
401	List of consumables associated with fault diagnosis	
402	List of materials associated with fault diagnosis	
403	List of expendables associated with fault diagnosis	
404	List of special support equipment and tools associated with fault diagnosis	
405	List of support equipment and tools associated with fault diagnosis	

Applicable to: All

S1000D-A-08-04-0100-00A -040A-A

Chap 8.4.1

IC	Definition	Remarks
406	List of software associated with fault diagnosis	
407	Parts list associated with fault diagnosis	
408 and 409	Not available for projects	
410	General fault description	
411	Isolated fault	
412	Detected fault	
413	Observed fault	
414	Correlated fault	
415	Impact of fault	
416 thru 419	Not available for projects	
420	General fault isolation procedure	
421 thru 428	Fault isolation procedure	
429	Diagnostics	
430	Fault isolation task supporting data	
431 thru 439	Not available for projects	
440	Index	
441	Fault code index	
442	Maintenance message index	
443	Post-troubleshooting shutdown procedure	
444 thru 449	Not available for projects	
450 thru 499	Not available for projects	

## 2.7 Primary code 500 - Disconnect, remove and disassemble procedures

*Table 8 Code 500 - Disconnect, remove and disassemble procedures*

IC	Definition	Remarks
500	Disconnect, remove and disassemble procedures	

IC	Definition	Remarks
501	List of consumables associated with removal	
502	List of materials associated with removal	
503	List of expendables associated with removal	
504	List of special support equipment and tools associated with removal	
505	List of support equipment and tools associated with removal	
506	List of software associated with removal	
507	Parts list associated with removal	
508 and 509	Not available for projects	
510	Disconnect procedure	
511 thru 519	Not available for projects	
520	Remove procedure	
521	Return to basic configuration	Undressing
522	Remove support equipment/Remove from support equipment	
523	Preparation before removal	
524	Follow-on maintenance	
525	Ammunition unloading	
526	Deactivate launching device	
527 thru 529	Not available for projects	
530	Disassemble procedure	
531	Disassemble on operation site	
532 thru 539	Not available for projects	
540	Open for access procedure	
541 thru 549	Not available for projects	
550	Unload software procedure	
551	Fault monitoring storage readout (downloading)	
552	Data erasing	

IC	Definition	Remarks
553	Display, copy and print of data	
554 thru 559	Not available for projects	
560	Deactivation procedure	
561	De-energize electrical network	
562	Depressurize hydraulics	
563	Deactivation maintenance practice	
564 thru 599	Not available for projects	

## 2.8 Primary code 600 - Repairs and locally make procedures and data

Table 9 Code 600 - Repairs and locally make procedures and data

IC	Definition	Remarks
600	Repairs and locally make procedures and data	
601	List of consumables associated with repairs	
602	List of materials associated with repairs	
603	List of expendables associated with repairs	
604	List of special support equipment and tools associated with repairs	
605	List of support equipment and tools associated with repairs	
606	List of software associated with repairs	
607	Parts list associated with repairs	
608 and 609	Not available for projects	
610	Add material	
611	Insulation	
612	Metalize	
613	Pot	
614	Remetal	
615	Retread	
616 thru 619	Not available for projects	

IC	Definition	Remarks
620	Attach material	
621	Bond	
622	Crimp	
623	Braze	
624	Rivet	
625	Solder	
626	Splice	
627	Weld	
628 and 629	Not available for projects	
630	Change the mechanical strength/structure of material	
631	Anneal	
632	Case harden	
633	Cure	
634	Normalize	
635	Shot-peen	
636	Temper	
637	Not available for projects	
638	Other treatment	
639	Other process to change the mechanical strength/structure of material	
640	Change the surface finish of material	
641	Anodize	
642	Buff	
643	Burnish	
644	Chromate	
645	Hone	
646	Lap	
647	Plate	
648	Polish	
649	Cleanup of dents, cracks and scratches	
650	Remove material	

IC	Definition	Remarks
651	Abrasive blast	
652	Bore/drill/ream	
653	Electrical/electrochemical/chemical etch	
654	Broach	
655	Grind	
656	Mill	
657	Thread/tap	
658	Turn	
659	Other process to remove material	
660	Structure repair procedure and data	
661	Allowable damage	
662	Temporary repair procedure	
663	Standard repair procedure	
664	Special repair procedure	
665	Fly-in repair procedure	
666	Material classification	
667	Structure classification	
668	Allowable damage of composite structures	
669	Allowable damage of mixed structures	
670	Locally make procedure and data	
671	Making of parts	
672 thru 679	Not available for projects	
680	Battle damage repair procedure and data	
681	Damage repair symbol marking	
682	Identification of damaged hardware	
683	Damage assessment	
684	Utilization degradation	
685	Repair procedure	
686	Isolation procedure	
687	Function test after battle damage repair	
688	Battle damage repair kit	

IC	Definition	Remarks
689	Damage repair	
690	Miscellaneous	
691	Marking	
692	Connector repair	
693	Varnish	
694 thru 699	Not available for projects	

## 2.9 Primary code 700 - Assemble, install and connect procedures

Table 10 Code 700 - Assemble, install and connect procedures

IC	Definition	Remarks
700	Assemble, install and connect procedures	
701	List of consumables associated with installation	
702	List of materials associated with installation	
703	List of expendables associated with installation	
704	List of special support equipment and tools associated with installation	
705	List of support equipment and tools associated with installation	
706	List of software associated with installation	
707	Parts list associated with installation	
708 and 709	Not available for projects	
710	Assemble procedure	
711	Tighten procedure	
712	Lock procedure	
713	Pack procedure	
714	Assemble on operation site	
715 thru 719	Not available for projects	
720	Install procedure	
721	Build up to usable configuration	Dressing

IC	Definition	Remarks
722	Install support equipment/Install on support equipment	
723	Preparation before installation	
724	Follow-on maintenance	
725	Ammunition loading	
726	Activate launching device	
727	Site location plans	
728	Foundation preparation	
729	Not available for projects	
730	Connect procedure	
731 thru 739	Not available for projects	
740	Close after access procedure	
741 thru 749	Not available for projects	
750	Load software procedure	
751	Not available for projects	
752	Data loading	
753 thru 759	Not available for projects	
760	Reactivation procedure	
761	Energize electrical network	
762	Pressurize hydraulics	
763 thru 799	Not available for projects	

## 2.10 Primary code 800 - Package, handling, storage and transportation

Table 11 Code 800 - Package, handling, storage and transportation

IC	Definition	Remarks
800	Package, handling, storage and transportation	
801	List of consumables associated with storage	
802	List of materials associated with storage	

Applicable to: All

S1000D-A-08-04-0100-00A -040A-A

Chap 8.4.1

<b>IC</b>	<b>Definition</b>	<b>Remarks</b>
803	List of expendables associated with storage	
804	List of special support equipment and tools associated with storage	
805	List of support equipment and tools associated with storage	
806	List of software associated with storage	
807	Parts list associated with storage	
808 and 809	Not available for projects	
810	Preservation procedure	
811	Preparation for vehicle transportation	
812	Shipping and storage - General	
813 thru 819	Not available for projects	
820	Procedure to remove preservation material	
821 thru 829	Not available for projects	
830	Procedure to put item in containers	
831	Vehicle loading	
832	Procedure to pack items	
833 thru 839	Not available for projects	
840	Procedure to remove item from containers	
841	Vehicle unloading	
842	Procedure to unpack items	
843 thru 849	Not available for projects	
850	Procedure to keep item serviceable when in storage	
851 thru 859	Not available for projects	
860	Procedure to move item when in storage	
861 thru 869	Not available for projects	

IC	Definition	Remarks
870	Procedure to prepare item for use after storage	
871	Set on condition	
872 thru 879	Not available for projects	
880	Procedure when item got out of storage	
881 thru 889	Not available for projects	
890	Life data of item when in storage	
891 thru 899	Not available for projects	

## 2.11 Primary code 900 - Miscellaneous

Table 12 Code 900 - Miscellaneous

IC	Definition	Remarks
900	Miscellaneous	
901	Miscellaneous list of consumables	
902	Miscellaneous list of materials	
903	Miscellaneous list of expendables	
904	Miscellaneous list of special support equipment and tools	
905	Miscellaneous list of support equipment and tools	
906	Miscellaneous list of software	
907	Miscellaneous parts list	
908 and 909	Not available for projects	
910	Miscellaneous	
911	Illustration	
912	Handling procedure	Not to be used for new projects. Use IC 170 instead.
913	General maintenance procedure	
914	Container data module	
915	Facilities	

Applicable to: All

S1000D-A-08-04-0100-00A -040A-A

Chap 8.4.1

IC	Definition	Remarks
916	Maintenance allocation	
917	Non-S1000D publication	
918 and 919	Not available for projects	
920	Change = Remove and install	
921	Change = Remove and install a new item	
922	Change = Remove and install the removed item	
923	Change = Disconnect and connect an item	
924 thru 929	Not available for projects	
930	Service bulletin	
931	Service bulletin data	Not available for projects. (Used for service bulletins following the rules in Issue 4.0 or earlier issues.)
932	Planning information	Not available for projects. (Used for service bulletins following the rules in Issue 4.0 or earlier issues.)
933	Accomplishment procedure - Task set	
934	Material information	
935 thru 939	Not available for projects	
940	Provisioning data	
941	Illustrated parts data	IPD
942	Numerical index	IPD
943 thru 949	Not available for projects	
950	Composite information	
951	Generic process	
952	Generic learning content	

IC	Definition	Remarks
953 thru 960	Not available for projects	
961	Calculation worksheets	
962 thru 969	Not available for projects	
970	Approved vendor processes	
971 thru 979	Not available for projects	
980	Environmental protection, fire-fighting and rescue	
981	Air cleaning	For example, filtering to obtain clean air
982	Sewage treatment	
983 thru 988	Not available for projects	
989	Fire-fighting and rescue	
990	Neutralization and disposal	
991	Neutralization of ordnance	
992	Neutralization of substance	
993 thru 995	Not available for projects	
996	Disposal of ordnance	
997	Disposal of Product	
998	Disposal of substance	
999	Not available for projects	

## 2.12 Primary code C00 - Computer systems, software and data

Table 13 Code C00 - Computer systems, software and data

IC	Definition	Remarks
C00	Computer systems, software and data	
C01	Miscellaneous list of consumables associated with computer systems, software and data	
C02	Miscellaneous list of materials associated with computer systems, software and data	

IC	Definition	Remarks
C03	Miscellaneous list of expendables associated with computer systems, software and data	
C04	Miscellaneous list of special support equipment and tools associated with computer systems, software and data	
C05	Miscellaneous list of support equipment and tools associated with computer systems, software and data	
C06	Miscellaneous list of software associated with computer systems, software and data	
C07	Miscellaneous parts list associated with computer systems, software and data	
C08 thru C12	Not available for projects	
C13	Notes	
C14	Problem handling	
C15	Summary of content	
C16 thru C19	Not available for projects	
C20	System administration	
C21	System monitoring	
C22	Description of command	
C23	Connect hardware	
C24	Not available for projects	
C25	System recovery	
C26	Backup and restore	
C27	Reboot	
C28 and C29	Not available for projects	
C30	Coordinate	
C31	Defragmentation	
C32	Input/Output media	
C33	Disk mirroring	
C34	Clear interference	
C35	Time check	

IC	Definition	Remarks
C36	Compatibility check	
C37 thru C49	Not available for projects	
C50	Manage data	
C51	Move data	
C52	Manipulate/Use data	
C53	Description of data storage	
C54 thru C59	Not available for projects	
C60	Programming information	
C61	Program flow chart	
C62	Processing reference guide	
C63 thru C69	Not available for projects	
C70	Security and privacy	
C71	Not available for projects	
C72	Security information	
C73	Security procedures	
C74	List of security/classification codes	
C75	Access control	
C76 thru C89	Not available for projects	
C90	Miscellaneous	
C91	Quality assurance	
C92	Vendor information	
C93 and C94	Not available for projects	
C95	Naming conventions	
C96	Technical requirements	
C97 thru C99	Not available for projects

## 1 General

The following tables contain the full definitions for information codes.

## 2 Full definitions

### 2.1 Primary codes

The identification elements are applicable to the Product, engine and equipment data modules.

*Table 2 Primary codes*

Primary code	Definition
000	Function, data for plans and description
100	Operation
200	Servicing
300	Examinations, tests and checks
400	Fault reports and isolation procedures
500	Disconnect, remove and disassemble procedures
600	Repairs and locally make procedures and data
700	Assemble, install and connect procedures
800	Package, handling, storage and transportation
900	Miscellaneous
C00	Computer systems, software and data

The full definitions are given in [Table 3](#) thru [Table 13](#).

### 2.2 Primary code 000 - Function, data for plans and description

*Table 3 Code 000 - Function, data for plans and description*

Primary code	Secondary code	Definition
000		<p>Function, data for plans and description</p> <p>Code 000 data tells the user the function, operation, limits and location (if necessary) of the Product equipment or component. If the data is for more than one configuration or model, the differences are given. The code also includes more general data if this is necessary for operation and/or maintenance persons. This general data can be:</p> <ul style="list-style-type: none"> <li>– general warnings, cautions and related safety data</li> <li>– symbols and abbreviations used</li> <li>– all necessary material, support equipment, software and special tools.</li> </ul>

Primary code	Secondary code	Definition
	001	<p>Title page</p> <p>Code 001 gives information on a set of information (publication or a volume of publication). This information can be for example:</p> <ul style="list-style-type: none"> <li>– the title</li> <li>– issue number and date</li> <li>– change number and date.</li> </ul>
	002	<p>List of pages or data modules</p> <p>Code 002 gives a list of pages or data modules in a set of information (publication or a volume of publication). The list can give for example:</p> <ul style="list-style-type: none"> <li>– document identifier</li> <li>– page number</li> <li>– page/document date</li> <li>– applicability.</li> </ul> <p>The code is used for List of Effective Pages (LOEP) and List of Effective Data Modules (LOEDM), refer to <a href="#">Chap 3.9.4</a>.</p> <p>For separate codes for LOEP and LOEDM, refer to code 00R and 00S respectively.</p>
	003	<p>Change record or highlights</p> <p>Code 003 gives information on the change state, including its history, of a set of information (publication or a volume of publication). It is also used for compilation of reason for changes of a set of information.</p> <p>The code is used for Change Record (CR) and Highlights. Refer to <a href="#">Chap 3.9.4</a>.</p> <p>For separate codes for Change record and Highlights, refer to code 00T and 00U respectively.</p>
	004	<p>Access illustration</p> <p>Code 004 gives an illustration and its identification and status information used for graphical access.</p>
	005	<p>List of abbreviations</p> <p>Code 005 gives the abbreviations standards used in the data. Those abbreviations used that are not to the given standards are given in tables. This list also includes acronyms.</p>
	006	<p>List of terms</p> <p>Code 006 gives the terms used in the data. Those terms used that are not to the given standards are given in tables.</p>
	007	<p>List of symbols</p> <p>Code 007 gives the symbol standards from which symbols used on:</p> <ul style="list-style-type: none"> <li>– illustrations</li> <li>– wiring, routing and schematic diagrams.</li> </ul> <p>Those symbols used that are not to the given standards are given in tables.</p>
	008	<p>Technical standard record</p> <p>Code 008 gives information on incorporated technical changes in a set of information (publication or a volume of publication). The code is used for Technical Standard Record (TSR).</p>

Primary code	Secondary code	Definition
	009	Table of contents Code 009 gives, in tabular format, the content of a set of information (publication or a volume of publication).
	010	General data Code 010 gives general data necessary for the operation and/or maintenance persons. This general data can be: <ul style="list-style-type: none"> <li>– general warnings, cautions and related safety data</li> <li>– the symbols and abbreviations used</li> <li>– lists of special and dangerous materials</li> <li>– a list of related data not in the common source data base.</li> </ul>
	011	Function Code 011 gives the function for persons at command level, supervisors and other such users. With this data they can easily and quickly find what it does and how.
	012	General warnings and cautions and related safety data Code 012 gives general WARNINGS and CAUTIONS related to operation and/or maintenance. Refer to <a href="#">Chap 3.9.3</a> for definition and use of safety data.
	013	Numeric index Code 013 gives indexes in numeric order.
	014	Alphabetic and alphanumeric index Code 014 gives indexes in alphabetic or alphanumeric order. Used also for list of applicable publications.
	015	List of special materials Code 015 gives data on items made of metals and metal alloys which are easily damaged by corrosion (for example magnesium). The data is given in tables and identifies the item and its location.
	016	List of dangerous materials Code 016 gives data on materials which can damage a person's health. The data identifies the dangerous material and its location.
	017	List of related data Code 017 gives available data on standards, regulations, conversion factors, etc which the CSDB does not include. It is also used for List of Applicable Specifications and Documentation, (LOASD) For an explicit LOASD code, refer to code 00V.
	018	Introduction Code 018 gives introductory information on the content of a set of information (publication or a volume of publication). The information can include the purpose, scope, structure, special format and use of the information set. Information of a general nature, which is not specified in any other data module in the information set, can also be included.
	019	Supplier list Code 019 gives lists of suppliers providing products used for the maintenance of Product, engines or components and their equipment.
	020	Configuration Code 020 gives data on configuration or model differences.

Primary code	Secondary code	Definition
	021	Copyright Code 021 gives copyright statements.
	022	Business rules Code 022 gives information relating to the project specific business rules.
	023	Administrative forms and data Code 023 gives standard administrative forms required in technical data often located in front and rear matter (eg, promulgation letters, authentication information, warranty information).
	024	Business rules document Code 024 identifies business rules document data modules containing solutions to business rule decision points and other product related business rules that are used to produce the suite of publications created for the Product.
	025 thru 027	Not available for projects.
	028	General Code 028 gives information of general nature. For example a summary of information in some accompanying data modules or an overview presentation of a Product.  Note: Code 018 must be used for introductory information of general nature for Information sets.
	029	Data structure Code 029 gives the project specific configuration and usage of each element of the wiring data description Schema for the associated wiring data Schema
	030	Technical data Code 030 is a list of data on the Product, system, equipment or component. The data is equivalent to (but can be more or less than) the examples of data that follow: <ul style="list-style-type: none"> <li>– identification: name, type, model, part No., NATO stock No., etc</li> <li>– dimension and mass</li> <li>– performance data and tolerances: rating, input/output, consumption, operation speeds, thrust range, turning radius, etc</li> <li>– environmental limitations/requirements: ambient temperatures, humidity limits, coolant requirements (air/oil/water flow), etc</li> <li>– power supply requirements</li> <li>– operation materials: oils, fuels, coolant, etc</li> <li>– capacities</li> <li>– identification of sub-assemblies: name, type, model, part No., NATO stock No., etc.</li> </ul>
	031	Electrical standard parts data Code 031 gives the technical information for each defined electrical standard part.
	032	Not available for projects.

Primary code	Secondary code	Definition
	033	Technical data (functional breakdown) Code 033 represents the technical data in respect to the functional breakdown of the Product, system, equipment or component.
	034	Technical data (physical breakdown) Code 034 represents the technical data in respect to the physical breakdown of the Product, system, equipment or component
	035 thru 039	Not available for projects.
	040	Description Code 040 gives information on how the object was made and the material used: the code also gives all the related data about its functions. This can also include descriptions, limitations, specifications and theory of operation.
	041	Description of how it is made Code 041 gives sufficient data for the user to know how the object was made and assembled. The data includes: <ul style="list-style-type: none"> <li>– the materials the object is made of (steel, aluminum, magnesium, etc)</li> <li>– the manufacturing processes used to make the object (cast, machine, weld, etc)</li> <li>– the subject of disassembly.</li> </ul>
	042	Description of function Code 042 gives sufficient data for the user to know the functions of the object so that he can do maintenance and failure isolation correctly. Where more than one subsystem or unit make a complete system, the relation is given.
	043	Description of function attributed to crew (functional breakdown) Code 043 gives a basic overview with sufficient detail for the crew to know the function of the systems and, if applicable, information on malfunction analysis and emergency operation. Information on operating limitations and characteristics in normal as well as in adverse weather and climatic conditions is also given. The information enables the crew to convert to and subsequently operate the Product safely and effectively without recourse to associated engineering documents. The information given under this code can also be used by maintainers.
	044	Description of function (physical breakdown) Code 044 gives a basic overview with sufficient detail for the maintainers to know the physical breakdown of the systems and, if applicable, information on malfunction analysis and emergency operation. Information on operating limitations and characteristics in normal as well as in adverse weather and climatic conditions is also given. The information enables the crew to convert to and subsequently operate the Product safely and effectively without recourse to associated engineering documents. The information given under this code can also be used by the crew.
	045	Designated use Code 045 gives the short description of the designated use of a Product.
	046	Dependence on peripheral systems/equipment Code 046 gives the short description of the dependence on peripheral systems/equipment.

Primary code	Secondary code	Definition
	047 thru 049	Not available for projects.
	050	Diagram/List Code 050 gives the electrical, electronic and mechanical diagrams and lists for the Product, system, equipment or component. These diagrams and lists are necessary to do maintenance and with the code 042 data, help know the function. Refer to code 430 for data on failure symptom diagrams.
	051	Wiring diagram Code 051 gives the diagrams which show all the electrical and electronic circuits for the Product, system, equipment or component. The diagrams include the identification of wires and connections and the location of equipment and components. At the level of the Product, system, subsystem, sub-subsystem, the diagrams do not show the internal circuits of the equipment or components.
	052	Routing diagram Code 052 gives the diagrams which show the routing on the Product, system, equipment or component of all the pipes, hoses etc, and the electrical and electronic cables and harnesses. The diagrams also show the location of the components.
	053	Connection list Code 053 gives a full list of those connection points which are not a complete unit in the wiring diagrams. The connection points include high density connectors, bulkhead fairleads, distributors, strip connectors, ground connections etc.
	054	Schematic diagram Code 054 gives the diagrams which show how all the systems, equipment and components connect together. The diagrams give the complete operation to help the user isolate failures. The diagrams only show the internal circuit or equipment or components where necessary. Some systems have more than one level of diagrams: Block, simplified system schematic, system schematic, signal flow, pressure flow, etc.
	055	Location diagram Code 055 gives diagrams which show the location of all equipment and components such as circuit breakers, fuses, wire harnesses, etc, at system, subsystem or sub-subsystem level.
	056	Equipment list Code 056 gives a list of all equipment in the Product with details of each equipment or component.
	057	Wire list Code 057 gives a list of all wires in the Product with details of each wire and its connections.
	058	Harness list Code 058 gives a list of all harnesses in the Product with salient details of each harness.
	059	Maintenance envelope diagram Code 059 gives the diagrams that identify the maintenance envelopes within the Product.

Primary code	Secondary code	Definition
	060	Product support equipment, tools and software Code 060 is a general list of all necessary support equipment, tools and software
	061	Special support equipment and tools Code 061 is a list of all necessary support equipment and tools which have been made especially for the Product, equipment and component.
	062	Standard support equipment and tools Code 062 is a list of all necessary support equipment tools which have not been made especially for the Product, equipment and component.
	063	Government supplied support equipment and tools Code 063 is a list of all necessary support equipment tools supplied by the government for the Product, equipment, or component.
	064	Locally made support equipment and tools Code 064 is a list of drawings for all the necessary support equipment tools which the user has to make for the Product, equipment, or component.
	065	Software Code 065 is a list of all necessary computer software.
	066	Support equipment and tools data Code 066 gives information on support equipment tools. The equipment information includes, for example: <ul style="list-style-type: none"> <li>– dimensions</li> <li>– mass</li> <li>– a parts list (normally a minimal list of parts that can be replaced by the user)</li> <li>– an illustration of the equipment.</li> </ul>
	067	Decals and instruction plates Code 067 gives the illustrations and descriptions of decals and operating instruction plates located on the equipment, which are essential for operation.
	068 and 069	Not available for projects.
	070	Consumables, materials and expendables Code 070 is a list of all necessary materials and contains safety data on those materials that are dangerous.
	071	Consumables Code 071 is a list of all the consumables (eg, oil, greases, sealants, safety wire) which help to do maintenance on the Product, system, equipment, or component (to make an item to repair damage). When necessary international equivalents are given.
	072	Materials Code 072 is a list of all necessary materials (eg, sheet metal, rubber) required by the user to do maintenance on the Product, equipment or component (eg, to make an item to repair damage). When necessary international equivalents are given.

Primary code	Secondary code	Definition
	073	Expendables Code 073 is a list of all items which the user must replace, or items which he cannot repair.
	074	Data sheet for dangerous consumables and materials Code 074 are data sheets for consumables and materials that are dangerous. The data sheet gives, for example: <ul style="list-style-type: none"> <li>– the name</li> <li>– the manufacturer's name, address and NATO Code</li> <li>– the function</li> <li>– when it is dangerous and the cause</li> <li>– the safety precautions the user must follow (eg, safety equipment to use, medical first aid)</li> <li>– the precautions when you discard it</li> <li>– the type of fire extinguishers to use</li> <li>– how to keep it in storage</li> <li>– its flash point/radiation strength.</li> </ul>
	075	Parts list Code 075 is a consolidated list of parts (other than expendables listed under code 073) identified in procedures and requiring data cross-referencing such as parts number.
	076	Fluid Code 076 gives data on fluids such as gases and water.
	077	Data sheet for consumables and materials Code 077 gives the list of data sheets for consumables and materials that are not dangerous.
	078	Fasteners Code 078 gives data (such as materials, specifications, sizes or procedures for installation) related to fasteners.
	079	Not available for projects.
	080	Mixture and solution Code 080 gives information on solutions and mixtures and also gives safety data on those materials that are dangerous.
	081	Chemical solution Code 081 gives all information to prepare, use and regenerate a chemical solution.
	082	Chemical mixture Code 082 gives all information to prepare, use and regenerate a chemical mixture.
	083 thru 089	Not available for projects.

<b>Primary code</b>	<b>Secondary code</b>	<b>Definition</b>
	090	Software documentation Code 090 gives sufficient data to help the user use the applicable computer software.
	091 thru 095	Not available for projects
	096	Safety items and parts Code 096 gives a list of safety critical items and parts.
	097 thru 099	Not available for projects
	00A	List of illustrations (normally used in front matter) Code 00A gives the list of illustrations for a publication.
	00B	List of support equipment (normally used in front matter) Code 00B gives the list of support equipment for a publication.
	00C	List of supplies (normally used in front matter) Code 00C gives the list of supplies for a publication.
	00D	List of spares (normally used in front matter) Code 00D gives the list of spares for a publication.
	00E	Functional item numbers common information repository Code 00E gives the list of all functional item numbers and their associated information.
	00F	Circuit breakers common information repository Code 00F gives the list of all circuit breakers and their associated information.
	00G	Parts common information repository Code 00G gives the list of all parts and their associated information.
	00H	Zones common information repository Code 00H gives the list of all zones and their associated information.
	00J	Access panels and doors common information repository Code 00J gives the list of all access panels and doors and their associated information.
	00K	Organizations common information repository Code 00K gives the list of all suppliers and their associated information.
	00L	Supplies - List of products common information repository Code 00L gives the list of all consumables and their associated information.
	00M	Supplies - List of requirements common information repository Code 00L gives the list of all consumables requirements or use cases and their associated information.
	00N	Support equipment common information repository Code 00N gives the list of all tools and their associated information.

Primary code	Secondary code	Definition
	00P	Product Cross-reference Table (PCT) Code 00P gives the values for product attributes and conditions for each product instance listed in a Products cross-reference table data module.
	00Q	Conditions Cross-reference Table (CCT) Code 00Q gives the conditions that have an effect on the applicability of data and is used to define the incorporation status for technical conditions.
	00R	List of effective pages Code 00R gives lists of pages or data modules in a set of information (publication or a volume of publication). Refer to <a href="#">Chap 3.9.4</a> for details.
	00S	List of effective data modules Code 00S gives lists of pages or data modules in a set of information (publication or a volume of publication). Refer to <a href="#">Chap 3.9.4</a> for details.
	00T	Change record Code 00T gives information on the change state, including its history, of a set of information (publication or a volume of publication). Refer to <a href="#">Chap 3.9.4</a> for details.
	00U	Highlights Code 00U gives a compilation of reason for changes of a set of information (publication or a volume of publication). Refer to <a href="#">Chap 3.9.4</a> for details.
	00V	List of applicable specifications and documentation Code 00V gives a List of Applicable Specifications and Documentation, (LOASD). Refer to <a href="#">Chap 3.9.4</a> for details.
	00W	Applicability Cross-reference Table (ACT) Code 00W gives the gives product attribute declarations to be used by the project in applicability statements within the applicability cross-reference table, together with links to the PCT and the CCT.
	00X	Controls and indicators common information repository Code 00X gives the list of controls and indicators
	00Y	List of charts and forms Code 00Y gives a list of charts and or forms that can be required in front matter. It can also be used to give actual charts and forms (eg, as required in air crew data).
	00Z	List of tables Code 00Z gives a list of tables for the technical data typically found in front matter.
	0A1	Functional and/or physical areas repository Code 0A1 gives the functional and/or physical breakdown of the functional and/or physical areas.
	0A2	Applicability repository Code 0A2 gives the applicability annotations used in all data modules.
	0A3	Applicability cross-reference table catalog Code 0A3 gives the applicability cross-reference table catalog which supports multi-partner projects with several ACT/CCT/PCT sets. It provides relationships between the different ACT/CCT sets constituting the project.

<b>Primary code</b>	<b>Secondary code</b>	<b>Definition</b>
	0A4	Warnings - List of warnings in the common information repository Code 0A4 gives the list of warnings that are stored in a warnings CIR data module and that are used in several other data modules.
	0A5	Cautions - List of cautions in the common information repository Code 0A5 gives the list of cautions that are stored in a cautions CIR data module and that are used in several other data modules.
	0A6 thru 0AZ	Not available for projects
	0B0	Maintenance planning information Code 0B0 gives the information necessary to define scheduled maintenance tasks.
	0B1	Time limits Code 0B1 gives recommended time limits for inspections, maintenance and overhaul of the Product, its systems, units and life of its parts.
	0B2	System maintenance/inspection tasks list Code 0B2 gives the list of scheduled tasks that shall be performed for Product systems and power plant. For each task a reference to the corresponding procedure can be provided.
	0B3	Structure maintenance/inspection tasks list Code 0B3 gives the list of scheduled tasks that shall be performed for structural components of a Product. For each task a reference to the corresponding procedure can be provided.
	0B4	Zonal maintenance/inspection tasks list Code 0B4 gives the list of scheduled tasks that shall be performed in a given major zone of a Product. For each task a reference to the corresponding procedure can be provided.
	0B5	Unscheduled check Code 0B5 allows to provide the list of unscheduled checks after particular events (eg, check after bird strike, hard/overweight landing). For each event/check the relevant references to inspection data modules can be provided.
	0B6 thru 0BZ	Not available for projects.

## 2.3 Primary code 100 - Operation

Table 4 Code 100 - Operation

Primary code	Secondary code	Definition
100		Operation Code 100 gives all the procedure necessary to operate the Product, equipment, or component to do the specified task. The procedure includes data on the necessary controls and indicators, pre and post-operation procedure, operation and emergency procedure.
	101	List of consumables associated with operation
	102	List of materials associated with operation
	103	List of expendables associated with operation
	104	List of special support equipment and tools associated with operation
	105	List of support equipment and tools associated with operation
	106	List of software associated with operation
	107	Parts list associated with operation
	108 and 109	Not available for projects.
	110	Controls and indicators Code 110 gives data on the applicable controls and indicators to operate the system, equipment or component.
	111	Controls and indicators Code 111 gives a crew-oriented view of controls and indicators showing their positions and relations to functionality. The information enables the crew to operate the Product safely and without recourse to associated engineering documents. The information given under this code can also be used by maintainers.
	112	Modes of operation Code 112 gives a crew-oriented description of the various modes of operation possible for each system or subsystem, including results and recovery actions. The information enables the crew to operate the Product safely and without recourse to associated engineering documents. The information given under this code can also be used by maintainers.
	113 and 114	Not available for projects.
	115	Displays and alerts Code 115 gives data on system/equipment software displays and alerts.
	116 thru 119	Not available for projects.

Primary code	Secondary code	Definition
	120	Pre-operation Code 120 gives in narrative and checklist form the procedures/conditions the user must follow/monitor before he operates the Product, equipment or component.
	121	Pre-operation procedure Code 121 gives, for crew members, in narrative and, if applicable, in checklist form, all pre-operation procedures/conditions preceding a journey. Information on the relevant switch positions and what the indicators must show before the start of the usual operation is given. Maintenance and self-test controls are included. The top and bottom limits of indicators such as dials (ie, those which have a range of indicators) are given. The initial conditions of related systems/equipment that can directly change the operation of the system/equipment are also given.
	122	Siting Code 122 gives siting descriptions and/or procedures. This can include descriptions of requirements concerning locations, proximity to power sources, effective ranges, terrain requirements to avoid screening reflections, ground clutter and other poor operational conditions due to terrain, technical requirements, etc.
	123	Shelter Code 123 gives shelter descriptions and/or procedures. This can include amount of floor, wall and height space required, a plan for a typical layout, required weight capacity of the building floor, dimensions required for installed equipment, environmental conditions (eg, venting), unusual requirements specific to equipment, such as air-conditioning, etc.
	124	Not available for projects.
	125	Pre-operation procedures checklist Code 125 gives, for crew members, in listed form the checks pertaining to the procedures given by code 121.
	126	Conditions of readiness Code 126 gives descriptions of and procedures required for conditional readiness of the Product.
	127	Establish operating position Code 127 gives the necessary procedures to bring a device back into operating position after maintenance was performed.
	128 thru 129	Not available for projects.
	130	Normal operation Code 130 gives in narrative and checklist form all normal procedures required to accomplish usage of the Product.

Primary code	Secondary code	Definition
	131	<p>Normal operation procedure</p> <p>Code 131 gives, for crew members, in narrative and, if applicable, in checklist form, procedure and data to operate the Product, equipment or component correctly in all its modes. The procedure is given in a sequence of major or minor functions, alternative procedure, the usual procedure instructions and the results. The procedures to start the usual operation again if the operation stops and the procedure to stop and disconnect are given.</p>
	132	<p>Start-up procedure for maintenance</p> <p>Code 132 gives in narrative or checklist form, those procedures and data to start and operate equipment correctly for maintenance purposes. The procedures are given in a sequence of major or minor functions, including, where applicable, alternative procedures. They must include the procedures to start the operation again if it stops, including time and other limits as required.</p>
	133	<p>Shutdown procedure for maintenance</p> <p>Code 133 gives in narrative or checklist form, those procedures and data to stop and shut down equipment being run for maintenance purposes. The procedures are given in a sequence of major or minor functions, including, where applicable, alternative procedures.</p>
	134	<p>Aviation checklist</p> <p>Code 134 gives the aviation related checklists.</p>
	135	<p>Normal operation procedures checklist</p> <p>Code 135 gives, for crew members, in listed form the checks (drills) for normal operation of the Product. If applicable, the checks for handling of installed equipment are included. Operating data can be included, if relevant for safe and effective operation of the Product.</p>
	136	<p>Ground running check</p> <p>Code 136 gives the procedures and data for the performance of ground running checks. It does not cover the procedures for examinations, tests and checks given in information code 3xx.</p>
	137	<p>Not available for projects.</p>
	138	<p>Ground running performance adjustment</p> <p>Code 138 gives the procedures for ground running performance adjustments. It does not cover the procedures for examinations, tests and checks given in information code 3xx.</p>
	139	<p>Nuclear, biological and chemical procedures</p> <p>Code 139 gives procedures related to Nuclear, Biological and Chemical (NBC) exposure or prevention. This is alternately referred to as Chemical, Biological and Radiological (CBR) procedures.</p>
	140	<p>Emergency procedure</p> <p>Code 140 gives in narrative and checklist form the procedures to be followed to meet any emergency that could reasonably be expected.</p>
	141	<p>Emergency operation procedure</p> <p>Code 141 gives, for crew members, in narrative and, if applicable, in checklist form, procedure and data for the emergency operation of the Product, equipment or component. The code also gives the special controls for emergency operation and how the use of these controls changes the usual operation of the system.</p>

Primary code	Secondary code	Definition
	142	Operation under unusual conditions Code 142 gives descriptions and procedures related to operating the Product under unusual conditions. This can include operation in unusual weather, or degraded conditions.
	143	Radio interference suppression Code 143 gives procedures related to Radio interference suppression. This includes procedures for installation, testing and removal of suppression components.
	144	Jamming and electronic countermeasures (ECM) Code 144 gives procedures for operation of the equipment in an ECM environment through transmitted and reflected deception signals and through transmitted and reflected jamming.
	145	Emergency operation procedures checklist Code 145 gives, for crew members, in listed form the checks (drills) for emergency operation of the Product.
	146	Emergency shutdown operation procedure Code 146 gives, for crew members, in narrative and, if applicable, in checklist form, procedure and data for the emergency shutdown operation of the Product, equipment or component.
	147 thru 149	Not available for projects.
	150	Post-operation Code 150 gives in narrative and checklist form the procedures/conditions the user must follow/monitor after he has operated the Product, equipment, or component.
	151	Post-operation procedure Code 151 gives, for crew members, in narrative and, if applicable, in checklist form, all post-operation procedures/conditions following usage. Information on the relevant switch positions and what the indicators must show when the system/equipment is stopped and disconnected after a usual or emergency operation is given.
	152 thru 154	Not available for projects.
	155	Post-operation procedures checklist Code 155 gives, for crew members, in listed form the checks pertaining to the procedures given by code 151.
	156	Not available for projects.
	157	Establish maintenance position Code 157 gives the necessary procedures to bring a device into maintenance position.
	158 thru 159	Not available for projects.

<b>Primary code</b>	<b>Secondary code</b>	<b>Definition</b>
	160	Loading/Unloading procedure Code 160 gives the procedure and data applicable to load planning and loading/unloading of a Product equipped for carrying cargo.
	161	Special operation Code 161 gives, for crew members, in narrative and, if applicable, in checklist form, procedure and data for the special operation of the Product, equipment or component.
	162	Non-tactical operation Code 162 gives the procedure for non-tactical operation. It shall include, but not be limited to, such non-tactical operations as training exercises using dummy missiles and simulated targets, training and evaluation exercises using telemetering missiles and recording equipment.
	163 thru 168	Not available for projects.
	169	Mass & Balance Code 169 gives information related to mass and balance of the Product. It can also include procedures for calculating mass and balance data.
	170	Handling Code 170 gives the procedures and data necessary for Product ground handling under normal and abnormal operational conditions.
	171	Lifting Code 171 describes lifting procedures using any authorized lifting equipment. It can be a partial lifting (eg, wheel change).
	172	Jacking Code 172 describes jacking procedures using any authorized jacking equipment. It can be a normal jacking, an auxiliary or a partial jacking.
	173	Shoring Code 173 describes shoring procedures using any authorized jacking equipment. It does not include lifting or jacking.
	174	Towing Code 174 describes towing or pushing procedures in normal or abnormal conditions, using any authorized towing or pushing equipment. It can be by nose or main landing gear or another attachment point.
	175	Taxiing Code 175 describes movement procedures using engine power.
	176	Lowering Code 176 describes lowering procedures applied after lifting or jacking.
	177	Stabilizing Code 177 describes actions to stabilize the Product.
	178	Tethering Code 178 describes actions to tether the Product
	179	Debogging Code 179 describes actions to remove the Product from bog with any means.

Primary code	Secondary code	Definition
	180	Dispatch deviation Code 180 gives procedures and data necessary for Product dispatch under the approved minimum equipment list.
	181	Deactivate for dispatch deviation Code 181 gives procedures and data necessary to deactivate systems for the purpose of continued flight under dispatch deviation.
	182 thru 199	Not available for projects.

## 2.4 Primary code 200 - Servicing

Table 5 Code 200 - Servicing

Primary code	Secondary code	Definition
200		Servicing Code 200 gives procedures and data necessary to do servicing on the Product, equipment, or component. The servicing can be scheduled or not scheduled such as procedures to fill and drain containers, procedures to bleed, prime, lubricate, clean, adjust, align, calibrate, inspect, etc. Procedures to do servicing are complete instructions.
	201	List of consumables associated with servicing
	202	List of materials associated with servicing
	203	List of expendables associated with servicing
	204	List of special support equipment and tools associated with servicing
	205	List of support equipment and tools associated with servicing
	206	List of software associated with servicing
	207	Parts list associated with servicing
	208 and 209	Not available for projects.
	210	Fill Code 210 gives the procedure and data necessary to fill containers with fuel, oil, oxygen, nitrogen, air, water and other fluids (gases or liquids).
	211	Refuel
	212	Fill with oil
	213	Fill with oxygen
	214	Fill with nitrogen
	215	Fill with air

Primary code	Secondary code	Definition
	216	Fill with water
	217	Fill with hydrogen
	218	Fill with other liquid
	219	Fill with other gas
	220	Drain liquid and release pressure Code 220 gives the procedure and data necessary to defuel, drain liquids and release gas pressure to a specified quantity.
	221	Defuel and drain fuel
	222	Drain oil
	223	Release oxygen pressure
	224	Release nitrogen pressure
	225	Release air pressure
	226	Drain water
	227	Release hydrogen pressure
	228	Drain other liquid
	229	Release other gas pressure
	230	Bleed and prime Code 230 gives the procedure and data necessary to: <ul style="list-style-type: none"> <li>– bleed a system, equipment or component</li> <li>– fill a system, equipment or component with a liquid to remove a gas</li> <li>– fill with an inert gas/inert liquid to increase the safety of a container in order to displace oxygen</li> <li>– remove gas/liquid or reactant to prepare a vacuum.</li> </ul>
	231	Bleed Code 231 gives the procedure to bleed a system, equipment, or component.
	232	Prime Code 232 gives the procedure to fill a system, equipment, or component with a liquid to remove a gas.
	233	Dry Code 233 gives the procedure to dry a system, equipment, or component.
	234	Facility requirements associated with servicing Code 234 lists (in tabular form) the requirements for the facility to service the equipment. It should contain: <ul style="list-style-type: none"> <li>– Work area, space and storage requirements</li> <li>– Shop machine, handling and support equipment.</li> </ul>
	235	Not available for projects.

Primary code	Secondary code	Definition
	236	<p>Fill with inert gas/inert liquid</p> <p>Code 236 gives the procedure and data necessary to fill with an inert gas/inert liquid to increase the safety of a fuel tank or other sealed or closed-in tanks/containers that contain highly inflammable material, by pumping nitrogen, steam, carbon dioxide, or some of other inert gas or vapor into its air space in order to displace oxygen.</p>
	237	<p>Evacuate</p> <p>Code 237 gives the procedure and data necessary to remove gas/liquid or the specific reactant completely to prepare a vacuum with support of special technical equipment.</p>
	238 and 239	Not available for projects.
	240	<p>Lubrication</p> <p>Code 240 gives the procedure and data necessary to lubricate a system, equipment, component, or item.</p>
	241	Oil
	242	Grease
	243	Dry film
	244 thru 249	Not available for projects.
	250	<p>Clean and apply surface protection</p> <p>Code 250 gives the procedure and data necessary to remove contamination mechanically, chemically or with ultrasonic. The code also gives procedure to:</p> <ul style="list-style-type: none"> <li>– apply wax and to polish (to protect surfaces)</li> <li>– paint and apply markings.</li> </ul>
	251	<p>Clean with chemical agent</p> <p>Code 251 describes the removal of surface deposits from a part, component, or Product by use of a chemical cleaning agent. The chemical agent dissolves or loosens the deposit, which is washed or rinsed away after a soaking period. Also included is power flushing with a chemical agent.</p>
	252	<p>Clean by abrasive blast</p> <p>Code 252 describes the removal of surface deposits from a part, component, or Product by wet or dry particle impingement.</p>
	253	<p>Clean by ultrasonics</p> <p>Code 253 describes the removal of surface deposits and entrapped material by use of high frequency sound waves to produce cavitations at the surface of the part, component, or Product. Cleaning is performed in a liquid bath that transmits the sound energy and keeps the removed material in suspension.</p>
	254	<p>Clean mechanically</p> <p>Code 254 describes the use of a brush, fell bob, sandpaper or other hand (or machine) action to remove surface deposits from a part, component, or Product (eg, removal of paint or coatings by any authorized mechanical process from metallic and nonmetallic surfaces).</p>

Primary code	Secondary code	Definition
	255	Purge Code 255 gives the procedure necessary to remove contamination (eg, unwanted gas, liquids, materials) from a system, equipment, or component.
	256	Polish and apply wax
	257	Paint and apply marking Code 257 gives the procedure necessary to paint a surface and to identify it with letters, numbers, symbols, etc. The code also gives the procedure to apply transfers.
	258	Other procedure to clean Code 258 gives the procedure necessary to remove contamination which is not covered by codes 251 thru 255.
	259	Other procedure to protect surfaces Code 259 gives the procedure necessary to protect surfaces which is not covered by codes 256 and 257.
	260	Remove and prevent ice and remove contamination Code 260 gives the procedure and data necessary to remove ice and contamination and to prevent the start of ice on surfaces.
	261	Remove ice
	262	Prevent ice
	263	Use disinfectant/Sanitize Code 263 includes cleaning procedures given because of health (ie, purification of potable water system, etc).
	264	Remove contamination Code 264 gives the procedure to remove or to make neutral contamination (eg, radioactive, bacteriological and chemical).
	265 thru 269	Not available for projects.
	270	Adjust, align and calibrate Code 270 gives the procedure and data necessary to adjust, align or calibrate a system, equipment or component.
	271	Adjust Code 271 gives the procedure to adjust a system, equipment, or component to a serviceable condition.
	272	Align Code 272 gives the procedure to align a system, equipment, or component to a serviceable condition.
	273	Calibrate Code 273 gives the procedure to calibrate a system, equipment, or component to make sure it is serviceable.
	274	Harmonize Code 274 gives the procedure to align a system, equipment, or component in all axes.

Primary code	Secondary code	Definition
	275	<p>Grooming</p> <p>Code 275 gives the procedure and data necessary to groom a system, equipment, component, or item. It involves a combination of visual inspections and tolerance checks and their necessary corrections. It can be completed after a major repair just before functional testing. It can also be performed as part of general maintenance. It involves such activities as verifying connections are tight, bolts and nuts are torqued and equipment is clean.</p>
	276	<p>Rig</p> <p>Code 276 gives procedure to rig (hooking-up, arranging or adjusting) a component or accessory linkage for proper system operation.</p>
	277	<p>Compensate</p> <p>Code 277 gives the procedure to compensate the effects of an undesirable external influence on measurement devices (eg, compass).</p>
	278	<p>Easily and quickly adjust after a battle damage repair</p> <p>Code 278 gives the procedure necessary to adjust a system, equipment or component of a Product after a battle damage repair has been carried out. The adjustment procedure to make the Product serviceable is easily and quickly done but the Product can have a limit of operation.</p>
	279	<p>Easily and quickly align after a battle damage repair</p> <p>Code 279 gives the procedure necessary to align a system, equipment or component after a battle damage repair has been done. The procedure to make the Product serviceable is easily and quickly done but the Product can have a limit of operation.</p>
	280	<p>Inspection</p> <p>Code 280 gives the maintenance and overhaul inspections necessary to keep a Product, system, equipment or component serviceable.</p>
	281	<p>Scheduled inspection</p> <p>Code 281 gives the maintenance and overhaul inspections necessary to keep a Product, system, equipment or component serviceable. The inspections are done to a schedule at a specified time given by the manufacturer. The manufacturer also gives the lives of equipment, components, items, or parts.</p>
	282	<p>Unscheduled inspection</p> <p>Code 282 gives the maintenance and overhaul inspections necessary to keep a Product, system, equipment or component serviceable. These inspections are done at a specified time given by the manufacturer but cannot be included in a schedule (refer to code 281).</p>
	283	<p>Special regular inspection</p> <p>Code 283 gives the maintenance and overhaul inspections necessary to keep a Product, system, equipment or component serviceable. They are special inspections at the time given by the manufacturer which cannot be included in a schedule (eg, time equipment operates, the number of rounds fired by a gun).</p>
	284	<p>Special irregular inspection</p> <p>Code 284 gives special irregular inspections which do not occur frequently and which cannot be included in a schedule (eg, heavy landing inspection, lightning strike inspection).</p>

Primary code	Secondary code	Definition
	285	Structure inspections for allowable damage limits Code 285 gives the procedure and data for required inspections following the assessment of allowable damage on the Product and that requires supplemental inspections to ensure continued mission worthiness. This procedure contains the reference to the allowable damage procedure, which causes the scheduled inspection; the applicability information, the procedures for inspection and test and the schedule. This procedure is associated with an allowable damage procedure.
	286	Structure inspections for repair Code 286 gives the procedure and data for required inspections following the embodiment of a structure repair on the Product that requires supplemental inspections to ensure continued mission worthiness. This procedure contains the reference to the repair procedure, which causes the scheduled inspection; the applicability information, the procedures for inspection and test and the schedule. This procedure is associated with a repair procedure.
	287	Not available for projects.
	288	Overhaul and retirement schedule Code 288 gives the overhaul and retirement schedule for a part or Product. This can include overhaul and/or retirement interval hours, maximum operating time allowed on the part or the Product before it is to be overhauled, overhaul interval notes and any additional information required for the part or Product's overhaul and/or retirement interval of the Product.
	289	Check filling quantity Code 289 gives the procedure to check filling quantities.
	290	Change of liquid/gas Code 290 gives the combined procedures and data necessary for codes 220 and 210.
	291	Not available for projects.
	292	Change of oil Code 292 gives the combined procedures and data necessary for codes 222 and 212.
	293	Change of oxygen Code 293 gives the combined procedures and data necessary for codes 223 and 213.
	294	Change of nitrogen Code 294 gives the combined procedures and data necessary for codes 224 and 214.
	295	Change of air Code 295 gives the combined procedures and data necessary for codes 225 and 215.
	296	Change of water Code 296 gives the combined procedures and data necessary for codes 226 and 216.

Primary code	Secondary code	Definition
	297	Change of hydrogen Code 297 gives the combined procedure and data necessary for codes 227 and 217.
	298	Change of other liquid Code 298 gives the combined procedures and data necessary for codes 228 and 218.
	299	Change of other gas Code 299 gives the combined procedures and data necessary for code 229 and 219.

## 2.5 Primary code 300 - Examinations, tests and checks

Table 6 Code 300 - Examinations, test and checks

Primary code	Secondary code	Definition
300		Examinations, tests and checks Code 300 gives procedures and data necessary to examine and to do tests and checks on, the Product, system, equipment, component or item.
	301	List of consumables associated with examinations, tests and checks
	302	List of materials associated with examinations, tests and checks
	303	List of expendables associated with examinations, tests and checks
	304	List of special support equipment and tools associated with examinations, tests and checks
	305	List of support equipment and tools associated with examinations, tests and checks
	306	List of software associated with examinations, tests and checks
	307	Parts list associated with examinations, tests and checks
	308 and 309	Not available for projects
	310	Visual examination Code 310 gives the procedure and data necessary to visually examine a Product, system, equipment, component equipment, component, or item for specific defects/failures.
	311	Visual examination without special equipment Code 311 describes a thorough examination of a zone, system, subsystem, component or part, to a level defined by the manufacturer, to detect structural failure, deterioration or damage; and to determine the need for corrective maintenance.
	312	Examination with a borescope

<b>Primary code</b>	<b>Secondary code</b>	<b>Definition</b>
	313 and 314	Not available for projects.
	315	QA requirements Code 315 gives general descriptions of QA of the Product. This can include references to QA procedures, statement of responsibility, requirements for maintenance or calibration of tools and test equipment used for QA, certification requirements, etc.
	316 thru 319	Not available for projects.
	320	Operation test Code 320 gives the procedure and data necessary to do operation tests of a system, equipment or component to make sure it is serviceable (ie, in the tolerances given by the manufacturer but not necessarily to the design standards). These tests require no special test equipment other than that installed on the Product, system, equipment or component.
	321	Unit break-in Code 321 gives the procedure and data necessary to initially operate a system or equipment under special operating at lower tolerances until the break-in period ends.
	322	Test and inspection Code 322 gives the procedure and data for testing and inspecting the Product, equipment or component.
	323 thru 329	Not available for projects.
	330	Test preparation Code 330 gives the procedure and data necessary to prepare a Product, system, equipment or component to do operation tests, function tests or structure tests.
	331	Connection of test equipment Code 331 gives the procedure and data necessary to connect test equipment to a Product, system, equipment or component.
	332	Removal of test equipment Code 332 gives the procedure and data necessary to remove test equipment from a Product, system, equipment or component.
	333	Installation of the unit before the test Code 333 gives the procedure and data necessary to install an equipment or component to test equipment to do a test.
	334	Removal of the unit after the test Code 334 gives the procedure and data necessary to remove an equipment or component from test equipment after the test is carried out.
	335	Final measures Code 335 gives procedures and checks which must be done following a test procedure. The content of this code exceeds the range of content of codes 332 and 334.

Primary code	Secondary code	Definition
	336 thru 339	Not available for projects
	340	Function test Code 340 gives the procedure and data necessary to make sure a system, equipment, or component operates correctly. A function test is more complete than an operation test (code 320) and usually requires special test equipment. The procedure tells what to do and what the effects/indicators are. If the effects/indicators are incorrect, the procedure tells what to do (eg, refer to failure reports and isolation tables - code 400, adjust/align procedure - code 270). This must be possible without additional documents.
	341	Manual test Code 341 gives the procedure and data to do a function test of a system, equipment, or component. Special test equipment can be used but not automatic test equipment.
	342	Automatic test Code 342 gives the procedure and data to do a function test of a system, equipment, or component with automatic test equipment only.
	343	BIT Code 343 describes the Built-in Test procedure.
	344	Compatibility test Code 344 gives the procedure and data necessary to perform compatibility tests.
	345	System test Code 345 describes procedures containing all adjustment specifications and tolerances required to maintain system and/or unit performance at maximum efficiency and design specifications. It must be self-contained and can duplicate other tests. It is normally used at major maintenance periods.
	346	Other check Code 346 describes special checks such as smoke check, sniff check, audible checks, etc.
	347	Start-up procedure for test Code 347 gives, for crew members, in narrative and, if applicable, in checklist form, the procedure and data to perform a maintenance turn-on (test) of the Product, equipment or component.
	348	Final acceptance test (FAT) Code 348 provides instructions on how to perform and record a FAT and how to properly disseminate FAT results.
	349	Test records Code 349 gives the description of test reports, test data sheets, test protocols, etc.
	350	Structure test Code 350 gives the procedure and data necessary to do tests for hardness and to detect faults such as cracks.
	351	Test for surface cracks with dye penetrant
	352	Test for surface cracks with magnetic particles

Primary code	Secondary code	Definition
	353	Test for cracks and other defects with eddy current
	354	Test for cracks and other defects with X-rays
	355	Test for cracks and other defects with ultrasonics
	356	Hardness test Code 356 gives the procedure and data necessary to measure how hard a material is.
	357	Gamma-ray test
	358	Resonance frequency test
	359	Thermographic test Code 359 gives procedures and data necessary to describe a thermographic test, which can be performed on parts to detect certain local changes in materials that occur in homogenous parts. These can be considered typically (but not exclusively) as voids, inclusions, disbonds, liquid ingress or contamination, foreign objects and damaged or broken structural assemblies.
	360	Design data/tolerances check Code 360 gives the procedure and data necessary to make sure a system, equipment or component is correct to the design data/tolerances.
	361	Dimensions check Code 361 describes a detailed dimensional (visual/dimensional) inspection check, which is a comparison of the dimensional and material condition of parts.
	362	Pressure check Code 362 describes the measurement of pressure or the effect of pressure, or establishing the ability of a normally pressurized component or system to operate properly.
	363	Flow check
	364	Leak check Code 364 describes the ability of a component or system to operate without leaking or leaking within permissible limits.
	365	Continuity check
	366	Resistance check
	367	Electrical power check
	368	Signal strength check
	369	Other check Code 369 gives the procedure and data for design data/tolerances checks not related to codes 361 thru 368 (eg, bonding check, frequency check, bandwidth check).
	370	Monitor the condition Code 370 gives the procedure and data necessary to monitor the condition of a Product, system, equipment or component: the condition is monitored by the analysis of oil, vibration, tracking, etc.

Primary code	Secondary code	Definition
	371	Oil analysis Code 371 gives the procedure and data necessary to monitor the condition of a system, equipment, or component by an analysis of oil.
	372	Vibration analysis Code 372 gives the procedure and data necessary to monitor the condition of a Product, system, equipment or component by analysis of its vibration.
	373	Tracking check Code 373 gives the procedure and data necessary to monitor the precision of tracking.
	374	Fuel analysis Code 374 gives the procedure and data necessary to monitor the condition of a system, equipment or component by the analysis of fuel.
	375	Shooting accidental discharge analysis Code 375 gives the procedure and data necessary to analyze an accidental discharge incident of a weapon system.
	376	Check post application of adhesive Code 376 gives the procedure and data necessary to verify relevant system after a gluing.
	377	Contamination analysis Code 377 describes a test used to assist in identifying certain materials by electro-mechanically determining the presence or absence of known contamination elements.
	378 thru 389	Not available for projects
	390	Sample test Code 390 gives the procedure to ensure the quality of a process by checking it on a specimen or sample part.
	391 thru 395	Not available for projects
	396	Flight control surface movement Code 396 gives procedures to put or to make sure a flight control surface is in a prescribed position (eg, flap extended to 15°).
	397	Landing gear movement Code 397 gives procedures to put or to make sure main, nose or complete landing gear is in a prescribed position.
	398	Product configuration Code 398 gives actions required to bring the Product, unit, or test equipment to a prescribed condition or position using normal functions and operations (eg, opening or closing circuit breakers or switches, positioning controls or control surfaces, calibration or operation of test equipment, pressurizing or depressurizing, raising or lowering landing gear, energizing electrical system). It includes packing flexible parts into normal pre-operation configuration (eg, oxygen masks, escape slides).

Primary code	Secondary code	Definition
	399	Not available for projects

## 2.6 Primary code 400 - Fault reports and isolation procedures

*Table 7 Code 400 - Fault reports and isolation procedures*

Primary code	Secondary code	Definition
400		Fault reports and isolation procedures Code 400 gives the procedures and data necessary to get accurate reports on faults and malfunctions and to isolate the faults.
	401	List of consumables associated with fault diagnosis
	402	List of materials associated with fault diagnosis
	403	List of expendables associated with fault diagnosis
	404	List of special support equipment and tools associated with fault diagnosis
	405	List of support equipment and tools associated with fault diagnosis
	406	List of software associated with fault diagnosis
	407	Parts list associated with fault diagnosis
	408 and 409	Not available for projects
	410	General fault description Code 410 gives maintenance messages and symptoms of faults with information on and references to the isolation and/or corrective procedures.
	411	Isolated fault Code 411 gives the maintenance messages relative to an isolated fault which can be memorized by the Product centralized monitoring system. It provides the information and procedure necessary to correct each isolated fault.
	412	Detected fault Code 412 gives the maintenance messages relative to a detected fault which can be stored by the Product centralized monitoring system. It provides the information and procedure necessary to isolate and correct each detected fault.
	413	Observed fault Code 413 gives all symptoms related to observed faults which can be reported by the crew. Symptoms are sorted by system/subsystem and must be simply and unambiguously described. It provides the information and procedure necessary to isolate and correct each observed fault.
	414	Correlated fault Code 414 gives the set of maintenance messages and warnings/malfunctions which have been correlated, and which can be recognized by the Product centralized monitoring system. It provides the information and procedures necessary to correct each correlated fault.

Primary code	Secondary code	Definition
	415	Impact of fault Code 415 gives the criteria required to determine the impact of specific faults on combat system capabilities.
	416 thru 419	Not available for projects
	420	General fault isolation procedure Code 420 gives the procedure and data necessary to isolate the fault. Each fault isolation procedure contains all operations needed to isolate the fault and must terminate with instructions for correcting it.
	421 thru 428	Fault isolation procedure
	429	Diagnostics Code 429 gives procedures related to diagnostics of the Products. This is typically used with the process data module.
	430	Fault isolation task supporting data Code 430 contains explanations and diagrams which identify fault symptoms accurately and make the fault isolation easier.
	431 thru 439	Not available for projects
	440	Index
	441	Fault code index Code 441 contains a list of fault codes with references to the fault isolation procedures.
	442	Maintenance message index Code 442 contains a list of maintenance messages with references to the fault isolation procedures.
	443	Post-troubleshooting shutdown procedure Code 443 gives the procedure and data for Post-troubleshooting shutdown procedure of the Product, equipment or component.
	444 thru 449	Not available for projects
	450 thru 499	Not available for projects

## 2.7 Primary code 500 - Disconnect, remove and disassemble procedures

Table 8 Code 500 - Disconnect, remove and disassemble procedures

Primary code	Secondary code	Definition
500		Disconnect, remove and disassemble procedures Code 500 gives the procedures and data necessary to disconnect, remove and disassemble equipment, components and items. Included in the procedures is how to install seals/caps.
	501	List of consumables associated with removal
	502	List of materials associated with removal
	503	List of expendables associated with removal
	504	List of special support equipment and tools associated with removal
	505	List of support equipment and tools associated with removal
	506	List of software associated with removal
	507	Parts list associated with removal
	508 and 509	Not available for projects
	510	Disconnect procedure Code 510 gives the procedure and data necessary to disconnect equipment, components or items. Included in the procedure is the installation of caps to protect disconnected equipment, components or items.
	511 thru 519	Not available for projects
	520	Remove procedure Code 520 gives the procedure and data necessary to remove equipment, components and items. The following codes can divide or add to code 520 when the necessary depth of detail needs a separate data module:
	521	Return to basic configuration Undressing
	522	Remove support equipment/Remove from support equipment
	523	Preparation before removal
	524	Follow-on maintenance Code 524 is used only when the follow-on maintenance cannot be included in code 520.
	525	Ammunition unloading Code 525 gives the procedure and data necessary to unload ammunition from a weapon system.
	526	Deactivate launching device Code 526 gives the procedure and data necessary to deactivate launching devices as a preliminary requirement to any operation on a weapon system.

Applicable to: All

S1000D-A-08-04-0200-00A-040A-A

Chap 8.4.2

Primary code	Secondary code	Definition
	527 thru 529	Not available for projects
	530	Disassemble procedure Code 530 gives the procedure and data necessary to disassemble equipment, components and items to the necessary level. Included in the procedure is the installation of caps to protect disconnected equipment, components or items.
	531	Disassemble on operation site Code 531 gives the procedures and data necessary to disassemble equipment on operation site.
	532 thru 539	Not available for projects
	540	Open for access procedure Code 540 gives the procedure and data necessary to open panels or doors when this procedure is not easily done and is necessary before the start of other maintenance tasks. Usually this is applicable to engine bay doors, landing gear doors, etc.
	541 thru 549	Not available for projects
	550	Unload software procedure Code 550 gives the description of the methods/devices/interfaces implemented to download the software from one item and the time required.
	551	Fault monitoring storage readout (downloading)
	552	Data erasing
	553	Display, copy and print of data Code 553 gives the description/procedures/data to display, copy and print data.
	554 thru 559	Not available for projects
	560	Deactivation procedure Code 560 describes procedures to render a system inoperable for maintenance purposes or for operation under dispatch deviation procedures.
	561	De-energize electrical network Code 561 gives procedures to de-energize the Product electrical network regardless of the power source used (engine, APU, external).
	562	Depressurize hydraulics Code 562 gives procedures to de-pressurize hydraulic systems, sub-systems or components regardless of the power source used.
	563	Deactivation maintenance practice Code 563 gives procedures to deactivate equipment for the purposes of performing maintenance.

Primary code	Secondary code	Definition
	564 thru 599	Not available for projects

## 2.8 Primary code 600 - Repairs and locally make procedures and data

Table 9 Code 600 - Repairs and locally make procedures and data

Primary code	Secondary code	Definition
600		Repairs and locally make procedures and data Code 600 gives the procedures and data necessary to repair a Product, equipment, component or item. Procedures and data necessary to locally make specified items are also given.
	601	List of consumables associated with repairs
	602	List of materials associated with repairs
	603	List of expendables associated with repairs
	604	List of special support equipment and tools associated with repairs
	605	List of support equipment and tools associated with repairs
	606	List of software associated with repairs
	607	Parts list associated with repairs
	608 and 609	Not available for projects
	610	Add material Code 610 gives the procedure and data necessary which add materials to repair a Product, equipment, component or item.
	611	Insulation
	612	Metalize
	613	Pot
	614	Remetal
	615	Retread
	616 thru 619	Not available for projects
	620	Attach material Code 620 gives the procedure and data necessary which attach materials to repair a Product, equipment, component or item.
	621	Bond
	622	Crimp

Applicable to: All

S1000D-A-08-04-0200-00A-040A-A

Chap 8.4.2

Primary code	Secondary code	Definition
	623	Braze
	624	Rivet
	625	Solder
	626	Splice
	627	Weld
	628 and 629	Not available for projects
	630	Change the mechanical strength/structure of material Code 630 gives the procedure and data necessary to change the mechanical strength/structure of materials.
	631	Anneal
	632	Case harden
	633	Cure
	634	Normalize
	635	Shot-peen
	636	Temper
	637	Not available for projects
	638	Other treatment Code 638 gives the procedure and data necessary to heat treat metal or metal alloys which are not in codes 631, 632, 634 and 636.
	639	Other process to change the mechanical strength/structure of material Code 639 gives the procedure and data necessary to change the mechanical strength/structure of material which are not in codes 633 and 635.
	640	Change the surface finish of material Code 640 gives the procedure and data necessary to change the surface finish of material.
	641	Anodize
	642	Buff
	643	Burnish
	644	Chromate
	645	Hone
	646	Lap
	647	Plate
	648	Polish

Primary code	Secondary code	Definition
	649	Cleanup of dents, cracks and scratches Code 649 gives information on negligible and/or minor dents, cracks, scratches and the description of the surface treatment after their repair.
	650	Remove material Code 650 gives the procedure and data necessary to remove material.
	651	Abrasive blast
	652	Bore/drill/ream
	653	Electrical/electrochemical/chemical etch
	654	Broach
	655	Grind
	656	Mill
	657	Thread/tap
	658	Turn
	659	Other process to remove material Code 659 gives the procedure and data necessary to remove material which is not in code 651 thru code 658.
	660	Structure repair procedure and data Code 660 gives the procedure and data necessary to repair damage and also gives the permitted damage.
	661	Allowable damage Code 661 describes allowable damage limits information regarding structures.
	662	Temporary repair procedure
	663	Standard repair procedure
	664	Special repair procedure Code 664 gives the procedure and data necessary to do special structure repairs. Usually a special repair is a repair to a damaged area or item of structure which is not in code 663 and which the manufacturer has written to repair damage that has occurred.
	665	Fly-in repair procedure Code 665 gives the procedure necessary to carry out fly-in repairs to the structure of a Product, equipment, or component. Usually a fly-in repair is to permit transport to a base for a standard repair (code 663) or a special repair (code 664).
	666	Material classification Code 666 gives data necessary for material classification.
	667	Structure classification Code 667 gives data necessary for structure classification.
	668	Allowable damage of composite structures Code 668 describes allowable damage limits information regarding composite structures.

Primary code	Secondary code	Definition
	669	Allowable damage of mixed structures Code 669 describes allowable damage limits information regarding mixed structures.
	670	Locally make procedure and data Code 670 gives the procedure and data necessary to locally make items, parts or equipment.
	671	Making of parts Code 671 gives the necessary information for making parts.
	672 thru 679	Not available for projects
	680	Battle damage repair procedure and data Code 680 gives the procedure and data necessary to perform battle-damage functions on a Product, system, equipment or component. The repair is easily and quickly done but the Product can have a limit of operation.
	681	Damage repair symbol marking Code 681 gives the rules and symbols to be used to clearly mark the damaged zones, areas, components and parts and indicate the action to be performed following the damage assessment.
	682	Identification of damaged hardware Code 682 gives information to establish a precise relationship between the observed damaged hardware and the coding of the data module providing its damage assessment data.
	683	Damage assessment Code 683 gives, for a damaged and identified hardware, the necessary data and information to establish: <ul style="list-style-type: none"> <li>– the effect of the hardware on the operation of the Product</li> <li>– if the hardware can be left damaged without repair or isolation</li> <li>– whether it can be repaired and/or isolated</li> <li>– the relevant action which must be applied</li> <li>– consequences of the actions on the Product utilization (mission, limitation, etc).</li> </ul>
	684	Utilization degradation Code 684 gives the consequence on the Product utilization (mission, limitation, etc) of the actions performed on the damaged hardware if this information is not provided under code 683. Note: It is recommended to provide utilization degradation under code 683 as last step of the damage assessment process.
	685	Repair procedure Code 685 gives the procedure to repair battle damaged hardware. Generally, the procedure is only performed with the hardware making up the battle damage repair kit.
	686	Isolation procedure Code 686 gives the procedure to isolate damaged portions of the system or one of its damaged components.

Primary code	Secondary code	Definition
	687	Function test after battle damage repair Code 687 gives the procedure to ensure that repaired systems can fulfill the requirements of the mission. Generally, these procedures make full use of on-board test facilities. If a test leads to operating limits, they are noted in the procedure.
	688	Battle damage repair kit Code 688 gives the list of self-contained hardware (tools, materials, expendables and consumables) provided as a battle damage repair kit and necessary to perform the battle damage repairs.
	689	Damage repair
	690	Miscellaneous Code 690 gives the procedure and data on various processes necessary during refurbishment of materials which are not in code 610 thru code 680.
	691	Marking Code 691 gives the procedure and data to temporarily or permanently mark parts.
	692	Connector repair Code 692 gives the procedure and data necessary to repair connectors.
	693	Varnish Code 693 gives the procedures to varnish surfaces.
	694 thru 699	Not available for projects

## 2.9 Primary code 700 - Assemble, install and connect procedures

Table 10 Code 700 - Assemble, install and connect procedures

Primary code	Secondary code	Definition
700		Assemble, install and connect procedures Code 700 gives the procedures and data necessary to assemble, install, connect and secure equipment, components or items.
	701	List of consumables associated with installation
	702	List of materials associated with installation
	703	List of expendables associated with installation
	704	List of special support equipment and tools associated with installation
	705	List of support equipment and tools associated with installation
	706	List of software associated with installation
	707	Parts list associated with installation

Primary code	Secondary code	Definition
	708 and 709	Not available for projects
	710	Assemble procedure Code 710 gives the procedure and data necessary to assemble equipment, components and items from the disassembled level. Included in the procedure is the removal of caps, the installation of seals, the torque and make secure attaching parts.
	711	Tighten procedure Code 711 gives the procedure to tighten and to apply torque to threaded fasteners such as bolts, nuts and fittings.
	712	Lock procedure Code 712 gives the procedure to secure parts by use of safety wire or safety cable, cotter pin, tab washers, etc.
	713	Pack procedure Code 713 gives the procedure to pack equipment (eg, survival pack).
	714	Assemble on operation site Code 714 gives the procedures and data necessary to assemble equipment on operation site.
	715 thru 719	Not available for projects
	720	Install procedure Code 720 gives the procedure and data necessary to install equipment, components and items. Included in the procedure are the removal of caps and the installation of seals.
	721	Build up to usable configuration Dressing
	722	Install support equipment/Install on support equipment Code 722 describes installation of any item of test equipment (ie pitot static tester, flight control rigging quadrant, etc) used on the Product, system, unit to determine system, component condition or position. It can describe also installation of any item of support equipment (ie, fish pole hoist, hydraulic jeep, safety locks, special tools, etc) used on the Product, system, unit to assist in performing the procedure or step, excluding test equipment.
	723	Preparation before installation
	724	Follow-on maintenance Code 724 is only used when follow-on maintenance cannot be included in code 720.
	725	Ammunition loading Code 725 gives the procedure and data necessary to load ammunition on a weapon system.
	726	Activate launching device Code 726 gives the procedure and data necessary to activate launching devices on a weapon system.

Primary code	Secondary code	Definition
	727	Site location plan Code 727 gives plans and drawings associated with the site (location) where equipment or a system is to be installed.
	728	Foundation preparation Code 728 gives preparation of foundation data supplemental to the installation drawings.
	729	Not available for projects
	730	Connect procedure Code 730 gives the procedure and data necessary to connect equipment, components and items. Included in the procedure is the removal of caps and the installation of seals
	731 thru 739	Not available for projects
	740	Close after access procedure Code 740 gives the procedure and data necessary to close panels or doors at the end of a maintenance task, when this procedure is not easily done and applies to different tasks. Usually this is applicable to engine bay doors, etc.
	741 thru 749	Not available for projects
	750	Load software procedure Code 750 gives the description of the methods/devices/interfaces implemented to load software on the item and the time required.
	751	Not available for projects
	752	Data loading
	753 thru 759	Not available for projects
	760	Reactivation procedure Code 760 gives actions taken to restore a system to normal operation which has been previously deactivated.
	761	Energize electrical network Code 761 gives procedures to energize the electrical network regardless of the power source used (engine, APU, external).
	762	Pressurize hydraulics Code 762 gives procedures to pressurize the hydraulic systems, subsystems or components regardless of the power source used.
	763 thru 799	Not available for projects

## 2.10 Primary code 800 - Package, handling, storage and transportation

Table 11 Code 800 - Package, handling, storage and transportation

Primary code	Secondary code	Definition
800		Package, handling, storage and transportation Code 800 gives the procedures and data necessary to put Product, systems, equipment or components in storage, to keep them serviceable while in storage, to pack and transport them and to prepare them for transportation. Data of storage life is also included.
	801	List of consumables associated with storage
	802	List of materials associated with storage
	803	List of expendables associated with storage
	804	List of special support equipment and tools associated with storage
	805	List of support equipment and tools associated with storage
	806	List of software associated with storage
	807	Parts list associated with storage
	808 and 809	Not available for projects
	810	Preservation procedure Code 810 gives the procedure and data necessary to protect Product, systems, equipment or components before they are put in storage. The servicing to be done on a Product, system, equipment or component and special data to move them is given if necessary.
	811	Preparation for vehicle transportation Code 811 gives the procedure and data necessary to prepare the vehicle for transportation.
	812	Shipping and storage - General Code 812 gives procedures related to general shipping and storage of the Product.
	813 thru 819	Not available for projects
	820	Procedure to remove preservation material Code 820 gives the information and data necessary to remove material and parts used to keep Products, systems equipment or components serviceable when in storage.
	821 thru 829	Not available for projects
	830	Procedure to put item in containers Code 830 gives the procedure and data necessary to install products, equipment or components in containers for storage and/or to move them by road, rail, air or sea.

<b>Primary code</b>	<b>Secondary code</b>	<b>Definition</b>
	831	Vehicle loading Code 831 gives the procedure and data necessary to load a vehicle into another one for transportation.
	832	Procedure to pack items Code 832 gives the procedures and data necessary to pack equipment or components if no container exists for storing and/or moving them by road, rail, air or sea.
	833 thru 839	Not available for projects
	840	Procedure to remove item from containers Code 840 gives the procedure and data necessary to remove products, equipment or components from their containers. The procedure includes the removal of the material used for protection.
	841	Vehicle unloading Code 841 gives the procedure and data necessary to unload a vehicle from another one after transportation.
	842	Procedure to unpack items Code 842 gives the procedures and data necessary to unpack equipment or components if no container exists for storing and/or moving them by road, rail, air or sea.
	843 thru 849	Not available for projects
	850	Procedure to keep item serviceable when in storage Code 850 gives the information and data necessary to make sure products, systems, equipment, or components stay serviceable when in storage.
	851 thru 859	Not available for projects
	860	Procedure to move item when in storage Code 860 gives the procedure and data necessary to move products, systems equipment or components by road, rail, air or sea after they are installed in containers.
	861 thru 869	Not available for projects
	870	Procedure to prepare item for use after storage Code 870 gives the procedure and data necessary to prepare products, systems, equipment or components for use after storage.
	871	Set on condition Code 871 gives the procedure and data necessary to set the vehicle on condition after transportation.
	872 thru 879	Not available for projects

Primary code	Secondary code	Definition
	880	Procedure when item got out of storage Code 880 gives the procedure and data necessary to accept Products, systems, equipment or components from storage before they are prepared for use (code 870).
	881 thru 889	Not available for projects
	890	Life data of item when in storage Code 890 gives the information on how long the Product can be kept in a storage condition and stay safe/serviceable.
	891 thru 899	Not available for projects

## 2.11 Primary code 900 - Miscellaneous

Table 12 Code 900 - Miscellaneous

Primary code	Secondary code	Definition
900		Miscellaneous
	901	Miscellaneous list of consumables
	902	Miscellaneous list of materials
	903	Miscellaneous list of expendables
	904	Miscellaneous list of special support equipment and tools
	905	Miscellaneous list of support equipment and tools
	906	Miscellaneous list of software
	907	Miscellaneous parts list
	908 and 909	Not available for projects
	910	Miscellaneous
	911	Illustration Code 911 gives an illustration and its identification and status information. The code can be used for storing and transmission of illustrations in the form of data module.

Primary code	Secondary code	Definition
	912	<p>Handling procedure</p> <p>Code 912 gives the general handling procedure and standard practices not specifically identified in other codes. This code covers procedure for the careful handling of components that can be easily damaged. It can apply to any component.</p> <p><b>Note</b></p> <p>Not to be used for new projects. Use code 170 instead.</p>
	913	<p>General maintenance procedure</p> <p>Code 913 gives the general maintenance procedure and standard practices not specially identified in other codes. This code is used to identify procedure where the maintenance is general. That is in order to cover very small assembly/clean/inspect/repair/disassembly etc. procedures that are too small to warrant their own data module or are always performed together.</p>
	914	<p>Container data module</p> <p>Code 914 indicates a container data module that refers to or includes different kinds of information and so cannot be covered by another dedicated information code.</p>
	915	<p>Facilities</p> <p>Code 915 gives the description of facilities required for operation, maintenance, repairs, or storage of the Product.</p>
	916	<p>Maintenance allocation</p> <p>Code 916 gives Maintenance allocation information for the Product.</p>
	917	<p>Non-S1000D publication</p> <p>Code 917 gives a Non-S1000D publication (eg, legacy manual in PDF) as a standard data module, in which the legacy is considered as a figure.</p>
	918 and 919	Not available for projects
	920	<p>Change = Remove and install</p> <p>Code 920 gives the combined procedures and data for code 520 Remove and code 720 Install.</p>
	921	<p>Change = Remove and install a new item</p> <p>Code 921 gives the combined procedures and data for code 520 Remove and code 720 Install a new item.</p>
	922	<p>Change = Remove and install the removed item</p> <p>Code 922 gives the combined procedures and data for code 520 Remove and code 720 Install again the removed item.</p>
	923	<p>Change = Disconnect and connect an item</p> <p>Code 923 gives the combined procedures and data to disconnect code 510 and connect a removed item code 730.</p>
	924 thru 929	Not available for projects

Primary code	Secondary code	Definition
	930	Service bulletin Code 930 gives the necessary administrative and material provisioning information and accomplishment procedures to implement a service bulletin (Product modification, inspection or change of operational characteristics).
	931	Service bulletin data Code 931 is not available for projects. (It is used for service bulletins following the rules in Issue 4.0 or earlier issues).
	932	Planning information Code 932 is not available for projects. (It is used for service bulletins following the rules in Issue 4.0 or earlier issues).
	933	Accomplishment procedure – Task set Code 933 gives the procedures, in the form of a task set, to accomplish the work required by a service bulletin. The task set refers to procedural data modules which are part of the Service bulletin.
	934	Material information Code 934 gives the information regarding the material and components required to accomplish the service bulletin, their interchangeability and disposition data.
	935 thru 939	Not available for projects
	940	Provisioning data Code 940 gives data necessary for provisioning and to identify support items and spare parts.
	941	Illustrated parts data Code 941 gives data necessary to identify support items and spare parts relating to Product, equipment or components. Data are prepared in accordance with <a href="#">Chap 5.3.1.3</a> . Related illustrations associated to the data are also included under this code.
	942	Numerical index Code 942 contains Illustrated Parts Data (IPD) cross reference index information, which identifies all IPD items.
	943 thru 949	Not available for projects
	950	Composite information Code 950 gives a compilation of information on a range of different types that together are needed to support the user in a given activity or process. These information codes must only be used when this type of information cannot be covered by another, specific, dedicated information code.
	951	Generic process Code 951 indicates a process data module that refers to or includes different kinds of information and so cannot be covered by another dedicated information code.

Primary code	Secondary code	Definition
	952	Generic learning content Code 952 gives a description of maintenance or operational learning goals or of a range of information in a SCO Content data module. It is only used when no other information code adequately describes this information.
	953 thru 960	Not available for projects
	961	Calculation worksheets Code 961 gives a calculation worksheets forms. For example, to be used by the recovery team during the recovery of a disabled Product.
	962 thru 969	Not available for projects
	970	Approved vendor processes Code 970 describes processes that can be proprietary and controlled by a particular manufacturer, or by non-proprietary and approved for application by conforming vendors.
	971 thru 979	Not available for projects
	980	Environmental protection, fire-fighting and rescue Gives descriptions, procedures and operating instructions for environmental protection, fire-fighting and rescue
	981	Air cleaning Code 981 gives descriptions, procedures and operating instructions for air cleaning (eg, filtering to obtain clean air).
	982	Sewage treatment Code 982 gives descriptions, procedures and operating instructions for sewage treatment.
	983 thru 988	Not available for projects
	989	Fire-fighting and rescue Code 989 gives descriptions, procedures and operating instructions for fire protection, fire-fighting and rescue.
	990	Neutralization and disposal Code 990 gives the procedure and data necessary for neutralization of ordnance and substances and for the disposal of ordnance, material, equipment, or substances.
	991	Neutralization of ordnance Code 991 gives the procedure and data necessary to make ordnance (eg, missiles, weapons and ammunition, safe or inert to prevent operation and/or explosion).
	992	Neutralization of substance Code 992 gives procedure and data necessary to destroy the distinctive or active property of the chemical substance (eg, neutralization of an acid).

Applicable to: All

S1000D-A-08-04-0200-00A-040A-A

Chap 8.4.2

Primary code	Secondary code	Definition
	993 thru 995	Not available for projects
	996	Disposal of ordnance Code 996 gives the procedure and data necessary to dispose of ordnance, such as missiles, weapons, or ammunition by explosion, fire, physical destruction, making inert, disassembly, etc. This code covers destruction of ordnance to prevent enemy use.
	997	Disposal of Product Code 997 gives the procedure and data necessary to dispose of Product such as Product, equipment, components etc (eg, by destruction, disassembly and/or recycling of its materials). This code also covers the destruction of Product to prevent enemy use.
	998	Disposal of substance Code 998 gives the procedure and data necessary to dispose of substance, such as chemicals, radioactive material, waste material, etc, by recycling, permanent storage in a safe place, cleaning for reuse, etc.
	999	Not available for projects

## 2.12 Primary code C00 - Computer systems, software and data

Table 13 Code C00 - Computer systems, software and data

Primary code	Secondary code	Definition
C00		Computer systems, software and data
	C01	Miscellaneous list of consumables associated with computer systems, software and data
	C02	Miscellaneous list of materials associated with computer systems, software and data
	C03	Miscellaneous list of expendables associated with computer systems, software and data
	C04	Miscellaneous list of special support equipment and tools associated with computer systems, software and data
	C05	Miscellaneous list of support equipment and tools associated with computer systems, software and data
	C06	Miscellaneous list of software associated with computer systems, software and data
	C07	Miscellaneous parts list associated with computer systems, software and data
	C08 thru C12	Not available for projects

Primary code	Secondary code	Definition
	C13	Notes Code C13 gives notional information required by the user or maintainer of the software or hardware Product.
	C14	Problem handling Code C14 gives problem handling procedures required by the user or maintainer of the software or hardware Product.
	C15	Summary of content Code C15 gives a summary of the content contained in the scope of the software or hardware Product technical information.
	C16 thru C19	Not available for projects
	C20	System administration Code C20 gives system administration procedures or data required by the administrator of the software, hardware, or data product.
	C21	System monitoring Code C21 gives procedures and data related to monitoring the software or hardware Product.
	C22	Description of command Code C22 gives descriptions and data related software or hardware commands.
	C23	Connect hardware Code C23 gives procedures and data related to connecting computer hardware.
	C24	Not available for projects
	C25	System recovery Code C25 gives procedures and data related to computer hardware and software system recovery.
	C26	Backup and restore Code C26 gives procedures and data related to backup and restore of software and data.
	C27	Reboot Code C27 gives procedures and data related to reboot of a computer system.
	C28 and C29	Not available for projects
	C30	Coordinate Code C30 gives procedures and data related to coordination of computer hardware, software and data.
	C31	Defragmentation Code C31 gives procedures and data related to defragmenting a computer hard drive.

Primary code	Secondary code	Definition
	C32	Input/Output media Code C32 gives procedures and data related to computer data storage media.
	C33	Disk mirroring Code C33 gives procedures and data related to mirroring computer disks.
	C34	Clear interference Code C34 gives procedures and data related to clearing interference.
	C35	Time check Code C35 gives procedures and data related to computer hardware and software time check.
	C36	Compatibility check Code C36 gives procedures and data related to computer hardware and software compatibility check.
	C37 thru C49	Not available for projects
	C50	Manage data Code C50 gives procedures and data related to management of data stored and accessed on a computer.
	C51	Move data Code C51 gives procedures and data related to movement of data stored and accessed on a computer.
	C52	Manipulate/Use data Code C52 gives procedures and data related to use and manipulation of data stored and accessed on a computer.
	C53	Description of data storage Code C53 gives descriptions of data stored and accessed on a computer.
	C54 thru C59	Not available for projects
	C60	Programming information Code C60 gives information and data related to software programming associated with the Product.
	C61	Program flow chart Code C61 gives information and data related to software programming flow charts associated with the Product.
	C62	Processing reference guide Code C62 gives information and data related to computer software and hardware processing.
	C63 thru C69	Not available for projects
	C70	Security and privacy Code C70 gives procedures and data related to management and use of computer hardware, software and data security and privacy controls.

Primary code	Secondary code	Definition
	C71	Not available for projects
	C72	Security information Code C72 gives data related to computer hardware, software and data security.
	C73	Security procedures Code C73 gives procedures related to computer hardware, software and data security.
	C74	List of security/classification codes Code C74 gives lists of security and classification codes associated with computer hardware, software and data.
	C75	Access control Code C75 gives procedures and data related to access control of computer hardware, software and data.
	C76 thru C89	Not available for projects
	C90	Miscellaneous
	C91	Quality assurance Code C91 gives quality control procedures and data related to computer hardware, software and data.
	C92	Vendor information Code C92 gives vendor information related to computer hardware, software and data.
	C93 and C94	Not available for projects
	C95	Naming conventions Code C95 gives naming conventions related to computer hardware, software and data
	C96	Technical requirements Code C96 gives technical requirements related to computer hardware, software and data.
	C97 thru C99	Not available for projects

Chap No./Document No.	Title
<a href="#">Chap 1.3</a>	How to use the specification
<a href="#">Chap 8.5.1</a>	Learn codes - Human performance technology codes
<a href="#">Chap 8.5.2</a>	Learn codes - Training codes

## 1 General

Learn codes are used in learning data modules to consistently identify a type of human performance data or training content. Learn code selections are determined as information about an organization, its workers and its material and products for accomplishing work that are collected during a Performance Analysis (PA) or as information about workers' instructional requirements as collected during a Training Needs Analysis (TNA). Together, the SNS, information code and learn code represent human performance data or training requirements for successful maintenance and operation activities on a product. For example, animated demonstrations of a procedure for use as learner guidance during a training event can be represented by a single learn code within the data module code.

## 2 Learn codes

Learn codes are used in the data module code for learning data modules. There are two types of learn codes:

- Human performance technology codes, which always start with an "H". Refer to [Chap 8.5.1](#).
- Training codes, which always start with a "T". Refer to [Chap 8.5.2](#).

H learn codes are used to identify information, requirements, or specifications that affect human performance for maintenance or operation activities on the system. For example, if the results of a PA reveals that a maintenance task can only be successfully completed with the use of a multimeter, then this requirement can be captured in a data module assigned an H18 learn

code. In this example, H18 represents requirements resulting from an analysis of the work environment. Each H code has a short definition and a full definition. Refer to [Chap 8.5.1](#).

T learn codes are used to identify training content intended for a training product. For example, if a TNA reveals the requirement for a technician to wear an Electro-Static Device (ESD) strap when performing a maintenance task, then the instructional designer may decide that a demonstration of proper ESD grounding is warranted in technician training. This training content would then be identified in a data module assigned a T32 learn code. In this example, T32 represents a demonstration of ESD strap use, which can be used within a training intervention to help a technician recall proper technique for ESD strap use. Each T code has a short definition and a full definition. Refer to [Chap 8.5.2](#).

Learn codes that are defined as "Not available for projects" are controlled by S1000D Steering Committee. Refer to [Chap 1.3](#).

### 3 Translation of learn code definitions

A project can, by project decision, translate the definitions given to the learn codes listed in [Chap 8.5.1](#) and [Chap 8.5.2](#). The translation must be a direct translation without any deviations in scope of the definitions.

#### **Business rule decision point BRDP-S1-00552 - Translation of learn code definitions:**

- Decide whether to translate and use the learn code definitions in the languages adopted by the project.

Chap No./Document No.	Title
<a href="#">Chap 4.3.9</a>	Data module code - Learn code
<a href="#">Chap 4.3.10</a>	Data module code - Learn event code

## **1 General**

Learning data modules that contain the results of a Performance Analysis (PA) are used to establish human performance requirements for maintenance and operation activities on a system. The addition of the human performance technology codes to the data module code allows human performance technologists to create data modules that can:

- assist in the planning of technical data module and training data module requirements
- evaluate the effectiveness of technical data modules and training data modules created to support the human performance system or training system requirements of a project
- map requirements to assessments and other content

The data module coding framework for human performance technology content in a learning data module is derived from an industry-recognized human performance technology model developed by Darlene M. VanTiem, James L. Moseley, and Joan Conway Dessinger.

All human performance technology learn codes have the first character set to "H", followed by two alphanumeric characters.

Learn codes are used in conjunction with a learn event code, as defined in [Chap 4.3.10](#).

## 2 Human performance technology definitions

### 2.1 Short definitions

The short definitions of the alphanumeric characters for human performance technology data modules are given in [Table 2](#). These are used to populate the optional attribute learnCode of the element <dmCode>. Refer to [Chap 4.3.9](#).

*Table 2 Human performance technology codes - Short definitions*

Learn code	Definition	Remarks
H00 thru H0Z	Not available for projects	
H10	Performance analysis	
H11	Organizational analysis	
H12	Gap analysis	
H13 thru H16	Not available for projects	
H17	Environmental analysis - Organizational environment	Society, stakeholders, competition, etc.
H18	Environmental analysis - Work environment	Resources, tools used, policies, etc.
H19	Performer analysis - Worker	Knowledge, skill, motivation, role, etc.
H1A thru H1Z	Not available for projects	
H20	Cause Analysis	
H21	Environmental factor	
H22	Internal factor	
H23 thru H2Z	Not available for projects	
H30	Intervention definition	Generic intervention definition
H31	Performance support intervention	
H32	Job/Work design intervention	
H33	Personal development intervention	
H34	Human resource development intervention	
H35	Organizational communication intervention	
H36	Organizational design and development intervention	

Applicable to: All

S1000D-A-08-05-0100-00A-040A-A

Chap 8.5.1

Learn code	Definition	Remarks
H37	Training intervention	
H38	Non-training intervention	Only used if a non-training intervention type other than H31 thru H36 is required.
H39 thru H3Z	Not available for projects	
H40	Intervention implementation	
H41 thru H4Z	Not available for projects	
H50	Performance evaluation	
H51	Formative evaluation	
H52	Summative evaluation	
H53 thru H5Z	Not available for projects	

## 2.2 Full definitions

The full definitions of the alphanumeric codes for human performance technology data modules are given in [Table 3](#). These are used to populate the optional attribute `learnCode` of the element `<dmCode>`. Refer to [Chap 4.3.9](#).

*Table 3 Human performance technology codes - Full definitions*

Learn code	Definition	Remarks
H00 thru H0Z	Not available for projects	
H10	Performance analysis Technical analysis of a human performance need or opportunity for improvement from the perspective of the organization. The result is a clearly defined and measurable statement of the organization's optimal end state when the identified need or opportunity is realized.	This analysis is conducted from the organization's perspective.

Learn code	Definition	Remarks
H11	<p>Organizational analysis</p> <p>A set of technical analysis subtasks required to complete a comprehensive Performance Analysis (PA). The organization analysis subtasks can result in the following information related to the human performance system:</p> <ul style="list-style-type: none"> <li>– Vision statement - The highest level statement describing the long-term end-state of an organization. Used to state a measurable, valued outcome in relation to society.</li> <li>– Mission statement - A high level statement describing the mid-term end-state of an organization. Used to state a measurable, valued outcome in relation to and aligned with an organization's vision statement.</li> <li>– Values - Statements that describe the ethical boundaries within which an organization operates to achieve its purpose in society</li> <li>– Goal statement - A broad, measurable statement that describes what an organization must achieve as the result of some campaign or initiative. For example, a goal can involve increasing the ship fleet by 30% within eight years.</li> <li>– Objective statement(s) - A specific, measurable statement that describes what an organization must do to achieve its goal. For example, one objective could be to acquire three new destroyers within five years. Another could be to acquire five frigates within eight years.</li> </ul>	This analysis is conducted from the organization's perspective.
H12	<p>Gap analysis</p> <p>A technical analysis subtask required to complete a comprehensive PA. This analysis can result in one or more performance gap statements. Each gap statement is objectively measurable and defines the delta between an organization's desired end state and its current state. Generally stated in relation to organizational goal and objective statements.</p>	These are performance gaps, not training gaps. May or may not be direct result of humans in the system.
H17	<p>Environmental analysis - Organizational environment</p> <p>A technical analysis subtask required to complete a comprehensive PA. Describes internal and external forces that can influence an organization's ability to meet its vision, mission, goals and objectives. Some examples include: special interest groups in society, enterprise stakeholders, competitors, laws, and internal politics.</p>	
H18	<p>Environmental analysis - Work environment</p> <p>A technical analysis subtask required to complete a comprehensive PA. Describes work design factors that can influence an organization's workers' abilities to meet its vision, mission, goals and objectives. Such factors are external to the workers. Some examples include: material resources, tools used, work flow, job hierarchy, location, policies and procedures enforced.</p>	
H19	<p>Performer analysis - Worker</p> <p>A technical analysis subtask required to complete a comprehensive PA. Describes factors internal to an organization's workforce that can influence its abilities to meet its vision, mission, goals and objectives. Some examples include: knowledge, skills, motivation, and physical capabilities.</p>	

Learn code	Definition	Remarks
H1A thru H1Z	Not available for projects	
H20	Cause analysis Technical data containing the root causes of a potential or observed human performance gap. Used to document the results of a cause analysis.	
H21	Environmental factor Identifies a specific cause of a potential or observed human performance gap. These factors are external to the performers subject to the cause analysis.	A category of cause.
H22	Internal factor Identifies a specific cause of a potential or observed human performance gap. These factors are internal to the performers subject to the cause analysis.	A category of cause.
H23 thru H2Z	Not available for projects	
H30	Intervention definition Technical data that describes the type and attributes of an intervention that will be designed to remedy the causes of a potential or observed human performance gap.	
H31	Performance support intervention Technical data that describes a performance support type of intervention that will be designed to remedy the causes of a potential or observed human performance gap.	
H32	Job/Work design intervention Technical data that describes an intervention that will require the re-design of a job's responsibilities, processes, placement within the organization, reporting structure, etc, to remedy the causes of a potential or observed human performance gap. It could also describe the requirements of completely new job or work flow, versus modification of an existing one.	
H33	Personal development intervention Technical data that describes an intervention that will target the improvement of existing personnel thru knowledge, skill, physical, etc, development to remedy the causes of a potential or observed human performance gap.	
H34	Human resource development intervention Technical data that describes an intervention that will target the creation or modification of personnel selection processes to remedy the causes of a potential or observed human performance gap.	
H35	Organizational communication intervention Technical data that describes an intervention that will re-design or establish communication patterns in an organization to remedy the causes of a potential or observed human performance gap.	

Applicable to: All

S1000D-A-08-05-0100-00A-040A-A

Chap 8.5.1

Learn code	Definition	Remarks
H36	Organizational design intervention Technical data that describes an intervention that will re-design or establish the divisions, departments, etc, needed by an organization to remedy the causes of a potential or observed human performance gap.	
H37	Training intervention Technical data that describes and defines the requirements for a training intervention.	
H38	Non-training intervention Technical data that describes and defines the requirements for a non-training intervention of any type that cannot be assigned a learn code of H31 thru H36.	
H39 thru H3Z	Not available for projects	
H40	Intervention implementation Technical data regarding requirements for successful release and use of an intervention among the target population. For example, process consulting requirements, end user development needs, communication methods or channels required to inform about/release the intervention, etc. This data module will reference a "3x" type of human performance technology data module.	
H41 thru H4Z	Not available for projects	
H50	Performance evaluation Technical data regarding the requirements for an evaluation instrument or plan that will determine the success of an intervention. This data module will reference a "3x" type of human performance technology data module.	
H51	Formative evaluation Technical data regarding the requirements for an evaluation instrument or plan that will be used during the development and testing of an intervention to determine how successful an intervention will be before its final release or implementation. This data module will reference a "3x" type of human performance technology data module.	

Learn code	Definition	Remarks
H52	<p>Summative evaluation</p> <p>A technical analysis subtask required to complete a comprehensive performance evaluation. This data module will reference a "3x" type of human performance technology data module.</p> <p>The summative evaluation subtask can result in the following information related to an intervention's effect within the human performance system:</p> <ul style="list-style-type: none"> <li>– Immediate performance competence -Technical data regarding the requirements for an evaluation instrument or plan that determines whether an intervention resulted in the desired immediate effect on performance.</li> <li>– Job transfer - Technical data regarding the requirements for an evaluation instrument or plan that determines whether an intervention resulted in the desired effect on performance in the work environment, and that effect is sustained after initial release of the intervention.</li> <li>– Organizational impact/ROI -Technical data regarding the requirements for an evaluation instrument or plan that determines whether an intervention resulted in the desired effect on overall performance of the organization (not just at the worker or job level).</li> </ul>	
H53 thru H5Z	Not available for projects

Chap No./Document No.	Title
<a href="#">Chap 4.3.9</a>	Data module code - Learn code
<a href="#">Chap 4.3.10</a>	Data module code - Learn event code

## 1 General

Training data modules can be defined within a project to capture and identify training information, requirements and specifications resulting from an Training Needs Analysis (TNA). They can also be used as a project progresses to identify and capture content intended for a training product.

The data module coding framework for training data modules is derived from a theory of instruction by Robert Gagne, known as the Nine Events of Instruction. Trained or certified Instructional Systems Design (ISD) professionals should be familiar with these events of instruction and relevant theory application as a framework for designing training systems and products. Other well-established theories of instruction, learning, and/or motivation are also reflected in the training learn codes to facilitate their use and understanding across ISD professionals.

All training learn codes have their first character set to "T", followed by two alphanumeric characters.

Learn codes are used in conjunction with a learn code event code, as defined in [Chap 4.3.10](#).

## 2 Training code definitions

### 2.1 Short definitions

The short definitions of the alphanumeric characters for training data modules are given in [Table 2](#). These are used to populate the attribute `learnCode` of the element `<dmCode>`. Refer to [Chap 4.3.9](#).

*Table 2 Training codes - Short definitions*

LC	Definition	Remarks
T00 thru T0Z	Not available for projects	
T10	Attention	The attention category (T1x) could be used as overview events.
T11	Perceptual - Concrete example	
T12	Perceptual - Incongruity/Conflict	
T13	Inquiry - Incongruity/Conflict	
T14	Inquiry - Participatory exercise	
T15	Inquiry - Relevance

## 2.2 Full definitions

The full definitions of the alphanumeric characters for training data modules are given in [Table 3](#). These are used to populate the attribute `learnCode` of the element `<dmCode>`. Refer to [Chap 4.3.9](#).

Table 3 Training codes - Full definitions

LC	Definitions	Remarks
T00 thru T0Z	Not available for projects	
T10	Attention Abrupt stimulus designed to activate learner's internal process of reception and alertness to the forthcoming technical information.	
T11	Perceptual - Concrete example Attention technique that uses novelty, surprise or uncertainty in the learner to gain their attention. Media are used as anchors for specific, tangible representations of content to be learned.	
T12	Perceptual - Incongruity/Conflict Attention technique that creates incongruity or contradiction in the learner to gain their attention. Media are used to provide a different perspective on the content to be learned.	
T13	Inquiry - Incongruity/Conflict Attention technique that creates incongruity or contradiction in the learner, followed by a question or problem that will unfold throughout the learning event, to gain their attention. Media are used to provide a different perspective on the content to be learned.	
T14	Inquiry - Participatory exercise Attention technique that creates incongruity or contradiction in the learner, followed by a problem or challenge the learner must actively solve throughout the learning event, to gain their attention. Media are used to provide a different perspective on the content to be learned.	
T15	Inquiry - Relevance Attention technique that assists the learner in connecting the content to their personal or professional interests. Media are used to provide the learner with "what's in it for me" to gain attention.	
T16 thru T1Z	Not available for projects	
T20	Learning objectives States the action, condition, behavior and standard expected of the learner by the end of a learning event.	
T21	Terminal objective - Intellectual skill - Discriminations Highest level learning objective. States the action, condition, behavior and standard expected of the learner to distinguish critical, physical attributes.	
T22	Terminal objective - Intellectual skill - Concepts Highest level learning objective. States the action, condition, behavior and standard expected of the learner to recognize and classify based on knowledge of critical attributes.	

LC	Definitions	Remarks
T23	Terminal objective - Intellectual skill - Rules/Principles Highest level learning objective. States the action, condition, behavior and standard expected of the learner to specify relationships among multiple concepts.	
T24	Terminal objective - Intellectual skill - Processes Highest level learning objective. States the action, condition, behavior and standard expected of the learner to describe how a system or organization operates.	
T25	Terminal objective - Intellectual skill - Procedures Highest level learning objective. States the action, condition, behavior and standard expected of the learner to apply prescribed sequences of learned rules or principles to defined problems.	
T26	Terminal objective - Intellectual skill - Higher order rules Highest level learning objective. States the action, condition, behavior and standard expected of the learner to apply unique combinations of learned rules or principles to ill-defined problems.	Problem solving, troubleshooting.
T27	Terminal objective - Verbal information - Facts Highest level learning objective. States the action, condition, behavior and standard expected of the learner to recall rote information or facts.	
T28	Terminal objective - Motor skill Highest level learning objective. States the action, condition, behavior and standard expected of the learner to perform physical actions.	
T29	Enabling objective - Intellectual skill - Discriminations Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to recognize and classify critical attributes.	
T2A	Enabling objective - Intellectual skill - Concepts Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to recognize and classify based on knowledge of critical attributes.	
T2B	Enabling objective - Intellectual skill - Rules/Principles Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to specify relationships among multiple concepts.	
T2C	Enabling objective - Intellectual skill - Processes Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to describe how a system or organization operates.	
T2D	Enabling objective - Intellectual skill - Procedures Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to apply prescribed sequences of learned rules or principles to defined problems.	

LC	Definitions	Remarks
T2E	Enabling objective - Intellectual skill - Higher order rules Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to apply unique combinations of learned rules or principles to ill-defined problems.	Problem solving, troubleshooting.
T2F	Enabling objective - Verbal information - Facts Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to recall rote information or facts.	
T2G	Enabling objective - Motor skill Subordinate level learning objective. States the action, condition, behavior and standard expected of the learner to perform physical actions.	
T2H thru T2Z	Not available for projects	
T30	Recall Stimulus designed to aid learner in retrieving relevant information expected to be encoded in long-term memory to working memory for the purpose of aiding semantic meaning on the forthcoming technical information.	
T31	Analogy A strategy for stimulating learner recall of previously learned content by stating similarities between attributes of the learned and to-be-learned content.	
T32	Demonstration A strategy for stimulating learner recall of previously learned content by showing the learner what will be accomplished and how the task is performed.	
T33	Informative practice A strategy for stimulating learner recall of previously learned content that provides the learner specific component knowledge (previously learned in parts) while performing a new task.	
T34	Comparative organizer A strategy for stimulating learner recall of previously learned content by generating a table or grid that lists the attributes, key points, etc, of previously learned content and compares new content on the same attributes, key points, etc.	
T35	Metaphoric device A strategy for stimulating learner recall of previously learned content by referring to the to-be-learned content as if it were something else (usually something more familiar to the learner).	
T36	Prerequisite concept review A strategy for stimulating learner recall of previously learned content by engaging in a review type of event where the learner re-examines component concepts in context of a new or more advanced application for the root concepts.	

LC	Definitions	Remarks
T37	Question/problem A strategy for stimulating learner recall where a question or problem relevant to the purpose of to-be-learned content is presented to the learner that requires the learner to apply previously learned content.	
T38	Similar-task review A strategy for stimulating learner recall of previously learned rules or procedures that have similar steps, tasks, or purposes as those found in the to-be-learned content.	
T39 thru T3Z	Not available for projects	
T40	Content A data module that contains the information intended for use in the learning event. It is training content that has been modified for instructional purpose from the authoritative technical source. This is the raw content and is often complemented with a T5x data module (Learning Guidance).	
T41	Static content - Discrimination Expositive, inactive media used to support the learner in developing the knowledge required to form a discrimination.	
T42	Static content - Fact Expositive, inactive media used to provide the learner with specific facts to be learned.	
T43	Static content - Concept Expositive, inactive media used to provide the learner with examples and non-examples of concepts to be learned.	
T44	Static content - Rule/principle Expositive, inactive media used to provide the learner with a rule or principle to be learned.	
T45	Static content - Procedure Expositive, inactive media used to provide the learner with a procedure to be learned.	
T46	Static content - Higher order rule Expositive, inactive media used to provide the learner with an example of higher order rules to be learned.	
T47	Static content - Processes Expositive, inactive media used to provide the learner with a process to be learned.	
T48	Animated content - Discrimination Expositive, active animation or video used to provide the learner in developing the knowledge required to form a discrimination.	
T49	Animated content - Fact Expositive, active animation or video used to provide the learner with specific facts to be learned.	

Applicable to: All

S1000D-A-08-05-0200-00A-040A-A

Chap 8.5.2

LC	Definitions	Remarks
T4A	Animated content - Concept Expositive, active animation or video used to provide the learner with examples and non-examples of concepts to be learned.	
T4B	Animated content - Rule/Principle Expositive, active animation or video used to provide the learner with a rule or principle to be learned.	
T4C	Animated content - Procedure Expositive, active animation or video used to provide the learner with a procedure to be learned.	
T4D	Animated content - Higher order rule Expositive, active animation or video used to provide the learner with an example of higher order rules to be learned.	
T4E	Animated content - Processes Expositive, active animation or video used to provide the learner with a process to be learned.	
T4F	Interactive content - Discrimination Exploratory interactive simulation, animation or video used to support the learner in developing the knowledge required to form a discrimination.	
T4R	Interactive content - Fact Exploratory interactive simulation, animation or video used to provide the learner with specific facts to be learned.	
T4G	Interactive content - Concept Exploratory interactive simulation, animation or video used to provide the learner with examples and non-examples of concepts to be learned.	
T4H	Interactive content - Rule/Principle Exploratory interactive simulation, animation or video used to provide the learner with a rule or principle to be learned.	
T4J	Interactive content - Procedure Exploratory interactive simulation, animation or video used to provide the learner with a procedure to be learned.	
T4K	Interactive content - Higher order rule Exploratory interactive simulation, animation or video used to provide the learner with an example of higher order rules to be learned.	
T4L	Interactive content - Processes Exploratory interactive simulation, animation or video used to provide the learner with a process to be learned.	
T4M thru T4Z	Not available for projects	

LC	Definitions	Remarks
T50	<p>Learner guidance</p> <p>An instructional strategy designed to support the learner's internal process of encoding the information contained in a T4x (Content) data module. For example, this data module could contain a mnemonic device designed to help the learner encode the steps of a procedure contained in a T45 data module.</p>	
T51	<p>Analogy</p> <p>An instructional strategy for improving learner comprehension and encoding that uses the similarities in attributes between familiar and to-be-learned content.</p>	
T52	<p>Metaphoric device</p> <p>An instructional strategy for improving learner comprehension and encoding that uses a more familiar concept or schema and refers to it as if it were the to-be-learned content. For example, "Life is a box of chocolates."</p>	
T53	<p>Drill and practice/informative practice</p> <p>An instructional strategy for improving learner comprehension and encoding provides the learner specific component knowledge while practicing a new task.</p>	
T54	<p>Case study</p> <p>An instructional strategy for improving learner comprehension and encoding that requires the learner to respond to problems wrapped in the context of a realistic situation, by applying newly learned concepts, rules, principles, etc.</p>	
T55	<p>Comparative organizer</p> <p>An instructional strategy for improving learner comprehension and encoding that requires the learner to generate (or complete) a table or grid that lists the attributes, key points, etc, of familiar content and compare them on the same attributes, key points, etc, to the newly learned content.</p>	
T56	<p>Concept map/trees</p> <p>An instructional strategy for improving learner comprehension and encoding that uses a hierarchical or spidering representation of newly learned content for the learner to generate, complete or review.</p>	
T57	<p>Demonstration</p> <p>An instructional strategy for improving learner comprehension and encoding that presents to the learner the steps required to accomplish a task and how the steps are expected to be performed.</p>	
T58	<p>Example/non-example</p> <p>An instructional strategy for improving learner comprehension and encoding that provides the learner with an array of representative examples of the newly learned content simultaneously with counter-examples.</p>	

LC	Definitions	Remarks
T59	<p>Game</p> <p>An instructional strategy for improving learner comprehension and encoding that places the newly learned content in a competitive format and scores the learner. (Note: Such scoring is usually in relation to the game, not the learning objective.)</p>	
T5A	<p>Mnemonic device</p> <p>An instructional strategy for improving learner comprehension and encoding that provides the learner with a memory device that relates to the newly learned content to make it more memorable. For example, "Stalactites hold tight to the cave ceiling..."</p>	
T5B	<p>Problem solving</p> <p>An instructional strategy for improving learner comprehension and encoding that requires the learner to respond to a specific problem by applying newly learned concepts, rules, principles, etc.</p>	
T5C	<p>Simulation</p> <p>An instructional strategy for improving learner comprehension and encoding that places the learner in an activity (possibly as a character) that mimics reality and allows the learner to complete tasks or solve problems as they would in the real world, by applying newly learned concepts, rules, principles, etc.</p>	
T5D	<p>Story</p> <p>An instructional strategy for improving learner comprehension and encoding that wraps newly learned content in the context of story (fictional or non-fictional) or anecdote.</p>	
T5E thru T5Z	Not available for projects	
T60	<p>Performance</p> <p>A practice exercise designed to ensure that the learner's encoding of information received from a T4x data module will be stable and lasting in long-term memory. This is often complemented with a T7x data module (Feedback).</p>	
T61	<p>Drag-and-drop/matching exercise</p> <p>A practice exercise data module that contains objects that the learner must match appropriately.</p>	
T62	<p>Multiple-choice - Single select</p> <p>A practice exercise data module that provides the learner with a question or statement, and then requires their response to be a selection of one item from a set of provided answers.</p>	
T63	<p>Multiple-choice - Multi-select</p> <p>A practice exercise data module that provides the learner with a question or statement, and then requires their response to be a selection of one or more items from a set of provided answers.</p>	

LC	Definitions	Remarks
T64	Short answer free text A practice exercise data module that provides the learner with a question or statement, and then requires their response to be the entry of a typed response in a blank field embedded in or following the question/statement.	
T65	Simulation A practice exercise module that provides the learner with in an activity that mimics reality and requires the learner to complete a task or solve a problem as they would in the real world.	
T66	Game A practice exercise data module that provides the learner with a competitive format and scores the learner in relation to the corresponding learning objective.	
T67 thru T6Z	Not available for projects	
T70	Feedback A data module containing the necessary information about the degree of correctness regarding a learner's response to a T6x data module. The content of this data module is designed to reinforce or adjust the learner's mental representation of the content being learned.	
T71	Knowledge of correct response Data module used to inform the learner whether their response was correct or incorrect and provide explanatory information. Used for objectives providing discrimination, concept, rule, principle, or procedure learning.	
T72	Knowledge of correct solution Data module used to provide the learner with information relevant to their response. Learner uses this data module to determine their own correctness of response and possible changes in cognitive strategy. Used for objectives providing rule, principle, procedure, problem solving, or process learning.	
T73	Knowledge of consequence Data Module used to provide an example of consequence to the learner in relation to their response/action. Degree of correctness is inherent. Used for objectives providing rule, principle, procedure, problem solving, or process learning.	
T74 thru T7Z	Not available for projects	

LC	Definitions	Remarks
T80	<p>Assessment</p> <p>A test -designed to determine the learner's ability to retrieve and apply information from long-term memory to meet the standard set by a corresponding T2x (Objectives) data module. The purpose of this data module's content is to ensure the learner's capability is complete and stable.</p>	Map to or reference an assessment strategy element defined within the learn plan branch of the learning schema.
T81	<p>Drag-and-drop/matching exercise</p> <p>An assessment data module that contains objects that the learner must match appropriately.</p>	
T82	<p>Multiple-choice - Single select</p> <p>An assessment data module that provides the learner with a question or statement, and then requires their response to be a selection of one item from a set of provided answers.</p>	
T83	<p>Multiple-choice - Multi-select</p> <p>An assessment data module that provides the learner with a question or statement, and then requires their response to be a selection of one or more items from a set of provided answers.</p>	
T84	<p>Short answer free text</p> <p>An assessment data module that provides the learner with a question or statement, and then requires their response to be the entry of a typed response in a blank field embedded in or following the question/statement.</p>	
T85	<p>Simulation</p> <p>An assessment data module that provides the learner with in an activity that mimics reality and requires the learner to complete a task or solve a problem as they would in the real world.</p>	
T86	<p>Game</p> <p>An assessment data module that provides the learner with a competitive format and scores the learner in relation to the corresponding learning objective.</p>	
T87	<p>Pre-test</p> <p>An assessment data module that provides multiple, potentially varied, assessment types designed to evaluate a learner in relation to one or multiple corresponding learning objectives prior to exposure to the content.</p>	
T88	<p>Post-test</p> <p>An assessment data module that provides multiple, potentially varied, assessment types designed to evaluate a learner in relation to one or multiple corresponding learning objectives following exposure to the content.</p>	
T89	<p>Hot Spot</p> <p>An assessment data module that provides the learner with an image or illustration, and then requires their selection of an area in response to a given stimulus.</p>	

LC	Definitions	Remarks
T8A thru T8Z	Not available for projects	
T90	Retention and transfer A data module designed to provide more advanced or complex content, practice, or guidance than a learner originally experienced in a related T4x, T5x, or T6x data module. The purpose of this data module content is to reinforce the learner's retrieval ability of encoded information and increase likelihood of applying it to novel situations.	
T91	Drill and practice/informative practice A strategy for enhancing the retention and/or transfer of learned content by applying it to a task that varies in complexity and context from the initial learning task(s). Throughout the task, specific component knowledge is provided to the learner as reinforcement.	
T92	Case study A strategy for enhancing the retention and/or transfer of learned content that requires the learner to respond to problems wrapped in the context of a realistic situation and apply learned concepts, rules, principles, etc. to the problems.	
T93	Comparative organizer A strategy for enhancing the retention that requires the learner to generate (or complete) a table or grid that lists the attributes, key points, etc. of familiar content and compare them on the same attributes, key points, etc. to the learned content.	
T94	Demonstration A strategy for enhancing the retention and/or transfer of learned content that provides the learner a holistic view of the steps required to accomplish a task and how the steps are expected to be performed.	
T95	Example/non-example A strategy for enhancing the retention and/or transfer of learned content that provides the learner with or requires the learner to generate an array of representative examples of learned content simultaneously with counter-examples.	
T96	Game A strategy for enhancing the retention and/or transfer of learned content by placing it in a competitive format and scores the learner in relation to the corresponding learning objectives.	
T97	Problem solving A strategy for enhancing the retention and/or transfer of learned content that requires the learner to respond to a specific problem by applying learned concepts, rules, principles, etc.	

LC	Definitions	Remarks
T98	<p>Simulation</p> <p>A strategy for enhancing the retention and/or transfer of learned content that places the learner in an activity (possibly as a character) that mimics reality and allows the learner to complete tasks or solve problems, as they would in the real world, by applying learned concepts, rules, principles, etc.</p>	
T99	<p>Story</p> <p>A strategy for enhancing the retention and/or transfer of learned content by wrapping learned content in the context of story (fictional or non-fictional) or anecdote.</p>	
T9A thru T9Z	Not available for projects	

## Chapter 9

#### **1      General**

[Chap 9.2](#) provides a comprehensive glossary of terms used in this specification. It also includes a list of abbreviations and acronyms used within S1000D. These include all specific S1000D definitions, abbreviations and some basic abbreviations to be used when authoring data modules. A subject index is included for easy access to specific functions and concepts given in the specification.

The content of the electronic Schema documentation is presented in [Chap 9.3](#). The complete Schema documentation is downloadable for easy use off line from [www.s1000d.org](http://www.s1000d.org). You can search for elements in a specific Schema or just for elements and attributes.

## 1 Glossary of terms

access illustration	An access illustration is a data module with one or more illustrations used to support the navigation of an interactive publication.
access point	The door, panel, hatch, fillet, fairing, internal floor or ceiling panels, cargo hold linings, etc, which has to be opened in order to give access to an item as defined in <a href="#">Chap 3.4</a> .
airborne equipment	A component necessary in the air to operate the air vehicle.
air vehicle	A generic term for aircraft, airships, gliders, spacecraft, missiles, etc.

animation	An illusion of movement, resulting from the change in object behavior within a 2D or 3D scene. This can be a result of user interaction or running a predetermined script
applicability	The identification of the context for which an information object, or parts thereof, is valid. This context is often associated with the physical or logical configuration of the Product but can include other aspects such as availability of resources and environmental conditions.
Applicability Cross-reference Table (ACT)	A cross-reference table which gives Product attribute definitions to be used by the project in applicability statements, together with links to the PCT and the CCT.
assembly	A number of items that are connected for a specified function. Refer to <a href="#">Fig 1</a> .
basic part	A part that cannot be further disassembled without destruction of its function.
Business Rule (BR)	A rule that has been applied by a project or an organization about how to implement a particular aspect of S1000D and is normally the result of a business rule decision.
business rule decision	A decision answering the question or task posed by a business rule decision point. BR decisions define business rules, which must be followed by project and/or organization, in order to implement S1000D according to project/organization requirements. A BR decision can also be an already existing rule inside a project or organizational documentation produced before the generation of the given BR documentation set began. Default BREX rules are S1000D business rules decisions.
Business Rule Decision Point (BRDP)	A place in S1000D that indicates where a decision must be made, the results of which is captured in the business rules of a given project and/or organization.
business rules category	A unique grouping that describes rules applicable to product definition, maintenance philosophy, concepts of operation, security, business processes, data creation, data exchange, data integrity, data output and/or legacy data conversion, management, handling and other issues.
business rules checker	A software tool (or part of a software application) that validates S1000D data for a project against business rules applicable to a certain project and/or organization.
business rule decision point priority	A BRDP priority indicates the sequence of addressing business rules decision points within BR generation process. In other words, it defines which business rule decision points must be addressed first and which later. BRDP priority is applied during BR generation process.

business rules document data module	A data module that provides information about the project and/or organizational business rules. It can contain definitions, guidance material, examples, as well as information on the progress of the business rules production process. The information captured in a BR data module can be used to create a BREX data module.
Business Rules EXchange (BREX)	The S1000D concept for exchange of the business rules adopted by a project or an organization implementing the specification. The BREX data module provides a structure for standardized formal exchange and unambiguous definition of such rules
business rules layer	A level of stakeholders within the hierarchy to which the business rules apply.
business rules production tool	A software tool (or part of a software application) that is used to produce business rules publications and their components (including BR data modules, BREX data modules and accompanying information) that are in response to business rules decision points defined in S1000D and/or project/organizational documents.
business rules publication	The set of data modules holding the business rule documentation for a project or an organization. A business rule publication can be produced at various layers within a given hierarchy.
business rules reports	The reports generated or created during business rule generation and use processes. The content and structure of these reports are not specified by S1000D.
business rule severity	The level of BR severity indicating what happens if a certain BR decision is not followed. It is applied during the business rule use process.
business rule template data module	A document that contains all of the BRDP defined by the specification. The business rules template can be amended with addition of project specific BRDP. Any BRDP which do not apply to the project, must be addressed ("Not used", "Does not apply", etc) so that every decision point is accounted for. When the business rules template is filled-in with decisions for each BRDP, it can be used as the basis for a project and/or organization specific business rules document data module. Refer to <a href="#">Chap 2.5.3</a> and <a href="#">Chap 4.10.1</a> .
category 1 container	Reusable container designed to be used as a shipping and storage container without impairment of its protective function and which can be repaired and/or refitted.
chapterized IPD	An IPD in which the data module codes are based on the SNS of the Product as given in <a href="#">Chap 8</a> .

Commercial and Government Entity code (CAGE code)	<p>The CAGE code is a unique identifier assigned to organizations and establishments, such as contractors, suppliers and customers. CAGE codes provide a standardized method of identifying a given facility at a specific location. It is for example used to identify senders and receivers when exchanging data.</p> <p><b>Note</b> The CAGE code is sometimes known as the NATO CAGE code (NCAGE).</p>
Common Source DataBase (CSDB)	A conceptual and non-implementation specific information store for the storage of all objects required to produce the technical publications within a project.
common source database object	An object (data module, etc) in the form required by S1000D when it is exchanged from a CSDB management system.
Common source database (management) system	A tool that assists the management of a CSDB in terms of defining, creating, managing and delivery of CSDB objects.
company	<p>A business organization that makes, buys, or sells goods or provides services in exchange for money.</p> <p><b>Note</b> Used as a synonym to <a href="#">enterprise</a> when a business organization is referred to.</p> <p><b>Note</b> The terms <a href="#">manufacturer</a> (Product manufacturer, equipment manufacturer, aircraft manufacturer) and <a href="#">supplier</a> are used when needed in context.</p>
compliance	The state of being compliant.
compliant	A process step, a procedure, or the like, is compliant to S1000D if and only if it is carried out in accordance with what is specified by S1000D, and does not violate the criteria in <a href="#">Chap 1.4.2</a> (eg, the assignment of codes to denote responsible partner companies can be compliant).
component	Any self-contained parts, combination of parts, subassemblies or units that do a specified function for the correct operation of a system. Equivalent term: Unit. Refer to <a href="#">Fig 1</a> .
condition	A property other than a product attribute that has an effect on the applicability of data. Conditions differ from product attributes in that values of a condition are more likely to change throughout service life of a product instance or are often not tracked against a product instance. Conditions can be associated with the physical configuration of the Product, with maintenance conditions, with weather conditions or any other condition that has an effect on the applicability of data.
Conditions Cross-reference Table (CCT)	A cross-reference table which describes condition types that affect the applicability of data and define the incorporation status for technical conditions.
conformance	The state of being conformant.

conformant	An object, or a set of related objects, is conformant to S1000D if and only if it fulfills the form requirements of such an object, as specified by S1000D, for example a data module can be conformant.
consumable	Supply required to maintain the Product (eg, oils, greases, locking wire).
content section	The second part of a data module containing text and illustrations.
content sensitive help	Help information based on the data being presented or the tasks being performed. Refer to <a href="#">Chap 6.4.1</a> .
context related BREX rule	A BREX rule that exclusively constrains how an element or attribute, or a combination of such, can be included and/or populated in an XML object in the CSDB. Refer to <a href="#">context independent BREX rule</a> .
context independent BREX rule	A BREX rule that does not exclusively apply to how an element or attribute, or a combination of such, can be included and/or populated in an XML object in the CSDB. Refer to <a href="#">context related BREX rule</a> .
customer	The individual or corporate identity using the Product and/or receiving post delivery services for such products.
database	A store for data modules.
Data Module (DM)	A self-contained unit of data for the description, operation, identification of parts or maintenance of the Product and its support equipment. The unit of data consists of an identification and status section and contents section and is produced in such a form that it can be input into and retrieved from, a database using the data module code as the identifier.
Data Module Code (DMC)	A 17 to 41 character alphanumeric code identifying to which part or function of the Product a data module is related and what type of data it contains, thus enabling it to be input into and retrieved from, a database. The DMC is part of the unique identifier of a data module. Refer to <a href="#">Chap 4.3</a> .
Data Module code - Extended (DME)	An extended data module code identifying one of many (eg, customized instances of a data module). The data module code is extended by the attributes given in the element <a href="#">&lt;identExtension&gt;</a> . Refer to <a href="#">Chap 4.12</a> .
data update file	An S1000D object to be used as an exchange file for incremental update of Common Information Repository (CIR) data modules.
data UPdate File code (UPF)	A 17 to 37 character alphanumeric code identifying a data update file. The UPF is part of the unique identifier of a data update file. Refer to <a href="#">Chap 4.13.2</a> .
data UPdate file code - Extended (UPE)	An extended data UPdate File code (UPF) identifying one of many (eg, customized instances of an update file). The UPdate File code is extended by the attributes given in the element <a href="#">&lt;identExtension&gt;</a> . Refer to <a href="#">Chap 4.12</a> .

disassembly code	The fourth (together with disassembly code variant) part of the data module code. Consists of 2 characters. Identifies the breakdown condition of an assembly to which information applies. Refer to <a href="#">Chap 4.3.4</a> .
disassembly code variant	The fourth (together with disassembly code) part of the data module code. Consists of 1, 2 or 3 characters. Identifies alternative items of equipment or components differing slightly in design, but not enough to warrant a change of the system difference code. Refer to <a href="#">Chap 4.3.5</a> .
document	A generic term used to describe the presentation of the content of one data module irrespective of the media of presentation or the content of specially created information for a paper publication (eg, front matter).
elapsed time	The estimated total time (elapsed) necessary to do the task (in hours and hundredths of hours).
Electrical Structure Network (ESN)	The ESN is a distributed high conductivity network, located inside the pressurized fuselage only, and intended to provide a shared resource to several systems in order to ensure several electrical and environmental functions.
Electronic Performance Support System (EPSS)	A component of a software package or application in which training and educational information is embedded. An (EPSS) can include a tutorial, expert system and hypertext jumps to reference material.
Enabling Learning Objective (ELO)	A statement in behavioral terms of what is expected of the student in demonstrating mastery at the knowledge and skill level necessary for achievement of a Terminal Learning Objective (TLO) or another ELO.
Engineering Order (EO)	Equivalent to a Service bulletin, except that the customer defines the "design change". The engineering order can be defined based on a manufacturer Service bulletin or from scratch.
engine module number	The number allocated to an engine module. Modules are defined for engines of modular design and each module is a combination of assemblies, subassemblies and parts, contained in one package, or so arranged as to be installed in one maintenance action.
enterprise	A generic term when a company and/or organization is referred to. <b>Note</b> The terms <a href="#">manufacturer</a> (Product manufacturer, equipment manufacturer, aircraft manufacturer) and <a href="#">supplier</a> are used when needed in context.
equipment	The items necessary to operate and maintain the Product and its support equipment. Includes training items and tools.

Equivalent Full Charge (EFC)	The EFC is a weighted vector whose value is determined by the type and amount of explosive charge in the munitions. It is based on the most powerful (and therefore erosive) charge used in the gun. The aim is to gage the wear effect of munitions on the weapon. Different types of munitions might have different wear factors depending on their powder charges. Subsequently a calculation is performed to estimate the remaining number of EFC rounds that may be fired.
expendable	An item of supply required to maintain the Product (eg, O-rings, gaskets, tab washers).
figure	One or more illustration sheets and the figure reference line. The figure is the image (or view), which will be presented to the reader.
figure number	A sequential number given to a figure within a data module.
figure reference line	A line of text in a data module consisting of a figure number and, if necessary, a title. The figure reference line follows the last line of the text portion to which the figure relates.
Functional Check (FNC)	A quantitative check to determine if one or more functions of an item perform within the specified limits.
functional item number	A functional item number allows to uniquely identifying an item performing a function in a system at a given position.
Hard Time (HT)	A primary maintenance process under which an item must be removed from service at or before a previously specified time.
help, content sensitive	Refer to <a href="#">content sensitive help</a> .
human-readable	A format that is a representation of data or information that can be naturally read by humans
identification and status section	The first part of a data module containing identification elements (DMC, title, issue number and date, etc) and status elements (applicability, technical standard, QA status, etc) for the management of the data module.
illustration	A graphical representation of hardware or a process. Includes diagrams, schematics, graphs and photographs. If the graphical presentation cannot be shown within a specified page image area, it can be divided into two or more illustration sheets.
illustration reproduction area	The illustration reproduction area is the area on the presentation media in which the graphic, diagrammatic, photograph, or photo-realistic computer generated images are placed.
illustration sheet	The visible presentation of an illustration, or part of an illustration, including its specified illustration reproduction area. Each illustration sheet has its own information control number.

Information Control Number (ICN)	A number (set of characters), which gives the address of an illustration sheet or a multimedia object in the CSDB.
information code	The fifth (together with information code variant) part of the data module code. Consists of 3 characters. Identifies the type of information within a data module. Refer to <a href="#">Chap 4.3.6</a> .
information code variant	The fifth (together with information code) part of the data module code. Consists of 1 character. Identifies any variation in the activity defined by the information code. Refer to <a href="#">Chap 4.3.7</a> .
information object	An object stored, managed, addressable and exchangeable in the CSDB. The following objects are available: <ul style="list-style-type: none"> <li>– data modules as defined in <a href="#">Chap 3.9.5</a></li> <li>– illustrations, multimedia and other data associated with and called up by data modules as defined in <a href="#">Chap 3.9.2</a></li> <li>– data management lists as described in <a href="#">Chap 4.5</a></li> <li>– comments as described in <a href="#">Chap 4.6</a></li> <li>– publication modules as described in <a href="#">Chap 4.9</a></li> <li>– data update file as described in <a href="#">Chap 4.13.2.1</a></li> <li>– data dispatch notes as described in <a href="#">Chap 7.5</a></li> </ul>
information set	The required information in a defined scope and depth (author view) in the form of data modules managed in the CSDB. A project data management requirement list lists all required data modules and publications for that project.
Instruction Management System (IMS)	An IT application used to create and manage training material to be used on e-Learning environments.
Interactive Electronic Technical Publication (IETP)	A set of information needed for the description, operation and maintenance of the Product, optimally arranged and formatted for interactive screen presentation to the end user on an electronic display system. IETP includes conditional branching mechanisms, which can be based on user feedback. Parameters are evaluated at runtime and their values can depend on context and specific user input.
item	Any level of an assembly (eg, system, subsystem part, component, unit, tool). Refer to <a href="#">Fig 1</a> .
item location code	The last part of the data module code. Consists of one character. Identifies the situation to which the information is applicable, for example where the maintenance task will be carried out in terms of a Product. Refer to <a href="#">Chap 4.3.8</a> .
Job Instruction (JI)	A detailed step-by-step procedure. Each special support equipment, tool, software, consumable and material are referenced in the procedure at the applicable step. Their identification and coding if any, in the text and illustrations must be in accordance with the relevant information given in the content of the data module. Refer to <a href="#">Chap 3.9.5.2.3</a> .

learn code	First optional code, after the <a href="#">item location code</a> , that is applied only to Human Performance Technology (HPT) and training data modules for those projects that have a requirement to be SCORM conformant or wish to use the functionality brought about by the LC. It describes the type of HPT or training information that is in the content of the data module. Consists of two alphanumeric characters. Refer to <a href="#">Chap 4.3.9</a> .
learn event code	Second optional code that is applied only to Human Performance Technology (HPT) or training data modules for those projects that have a requirement to be SCORM conformant or wish to use the functionality brought about by the LEC. Defines which branch of the Learning Schema is used. Consists of one alpha character. Refer to <a href="#">Chap 4.3.10</a> .
learning	The process of enhancing and/or increasing knowledge and skills through an event or activity.
Learning Management System (LMS)	A software application or Web-based technology used to plan, implement and assess a specific learning process.
line check	A routine check, inspection and malfunction rectification performed at en-route and base stations during transit, turn-around or night stop.
Line Replaceable Unit (LRU)	An item, which can be readily changed on the Product during line maintenance operation.
Logistics Support Analysis (LSA)	The selective application of scientific and engineering efforts undertaken during the development process, as part of the system engineering and design process, to assist in complying with supportability and other Logistics Support Analysis (LSA). This is achieved by the use of, for example, <a href="#">S3000L</a> or MIL-STD-1388 employing a repetitive process of definition, synthesis, trade-off, test and evaluation.
main procedure	The core of the procedure to fulfill a task. It excludes the tasks given in Required conditions and Requirements after job completion.
maintenance	The servicing and/or the repair of the Product, its support and training equipment to keep it serviceable.
maintenance task	Start-to-finish, step-by-step, procedural data arranged in a logical sequence to do maintenance.
manufacturer	An enterprise manufacturing an item (eg, Product manufacturer, equipment manufacturer, aircraft manufacturer).
manufacturing batch number	The sequential number allocated by the manufacturer to an individual manufacturing batch or production lot of the Product.
manufacturing part number	A combination of characters assigned by the manufacturer to identify, without ambiguity, an item manufactured to a certain specification.

manufacturing serial number	The manufacturer assigned sequential number identifying the individual manufactured part by its rank in the series production batch of equal parts having identical part numbers.
material	A supply required to maintain the Product. For example gasket sheet, sheet metal, plastic, copper.
material set	Set of items used to maintain or modify the Product. The items are grouped by sets to ease ordering process, shipping process, manufacturing process, Product modification preparation process, etc.
model identification code	The first part (2 to 14 characters) of the data module code. Identifies the Product to which the data applies. The code is allocated by NSPA (formerly NAMS) and is used to identify the Product. Refer to <a href="#">Chap 4.3.1</a> .
modification (Mod)	A "design change" defined by the manufacturer and implemented (embodied) before or after product delivery.
multimedia	A generic term referring to any combination of integrated digital media, such as sound, video, animation, graphics or text, hyperlinked from within an electronic document or software presentation or product.
munitions	A general term covering bombs, fuses, missiles, rockets, pyrotechnics, launchers, dispensers and items such as impulse cartridge jettison charges, training items, ammunitions and other inventory items considered similar or relative to munitions, including accessories which have been pre-loaded.
NATO Item Identification Number (NIIN)	The identification number within NATO for an item of supply. It forms the last nine digits of the NATO Stock Number (NSN). <b>Note</b> NIN is used as the Text Element Identifier (TEI) for NIIN.
NATO/National Stock Number (NSN)	The unique identification of an item of supply by a number assigned by the national codification bureau to each approved item identification. It comprises the NSC followed by the NIIN.
NATO Supply Class (NSC)	The supply classification assigned under the NATO/National Codification system to an item of supply, an item of production and/or a homogeneous area of commodities in respect to their physical or performance characteristics. It forms the first four characters of the NATO/National stock number (NSN).
non-chapterized IPD	An IPD in which the data module codes are based on a specific SNS as given in <a href="#">Chap 4.3.3</a> .
On Condition (OC)	An item that is maintained on condition and is not subjected to a limit whatsoever.

Operational Check (OPC)	A task to determine that an item is fulfilling its intended purpose. The check does not require quantitative tolerances. This is a failure finding task.
Operation Limit	This is the maximum time an item can operate before change or repair at O- or I-level.
organization	An administrative or functional structure (such as a business or a government body) implementing an S1000D project.
page image area	The page image area is the area on the presentation media other than the header and footer in which information can be placed.
Para	A piece of information (text paragraphs, lists and graphics) with a numbered title. A Para can be cross-referenced.
paragraph	A part of a piece of writing that usually deals with one subject, that begins on a new line, and that is made up of one or more sentences.
part	An item of Product, forming part of an assembly or subassembly, which is not normally broken down further. Refer to <a href="#">Fig 1</a> .
post engineering modification	The configuration or build standard of the Product after a particular engineering modification is incorporated.
post Service bulletin	The configuration or build standard of the Product after a particular Service bulletin requirement is incorporated.
pre engineering modification	The configuration or build standard of the Product before a particular engineering modification is incorporated.
pre Service bulletin	The configuration or build standard of the Product before a particular Service bulletin requirement is incorporated.
product, the Product	Any platform, system or equipment (air, sea, land vehicle, equipment or facilities, civil or military). The term the Product is used in this specification to mean platforms, systems, subsystems, sub-subsystems, assemblies, equipment, LRU, components, parts, etc.
product attribute	A property of the Product that can affect the applicability of technical data. Product attributes are properties of the Product that are typically set at the time of manufacture of a product instance and will usually not change throughout the service life of a product instance. Examples of product attributes are model, series and serial number.
Product Cross-reference Table (PCT)	A cross-reference table which identifies the product instances and the values for product attributes and conditions for each product instance.
product instance	A single physical occurrence of the Product.
project	The task to develop, maintain and dispose of the Product.
prompting label	A specific text that can be used to create a dialog in order to obtain values for product attributes or conditions from an end user.

publication ( <i>noun, count</i> )	<p>A generic term used to describe the presentation of a compilation of data modules, which have been arranged to make a publication, checklist, guide, catalog, etc, on a particular subject, irrespective of the media of presentation (eg, paper or screen).</p> <p>A publication can be a subset of or equal to an information set, but it can also be a superset of several information sets or parts of them.</p>
publication ( <i>noun, non-count</i> )	<p>The act or process of compilation of information, and making it available for, for example a customer. The compilation can be an IETP, a paper publication compiled from DM or a publication containing legacy data. Refer to <a href="#">publication module</a>.</p>
publication module	<p>The publication module defines the content (references to data modules, other publication modules or legacy data) of a publication and its structure. Uses the publication module code as the identifier. Refer to <a href="#">Chap 4.9.1</a>.</p>
Publication Module Code (PMC)	<p>A 12 to 24 character standardized and structured identifier of a publication module or a final deliverable publication. The PMC is part of the unique identifier of a publication module. Refer to <a href="#">Chap 4.9.2</a>.</p>
Publication Module code - Extended (PME)	<p>An extended Publication Module Code (PMC) identifying one of many (eg, customized instances of a publication module). The publication module code is extended by the attributes given in the element <code>&lt;identExtension&gt;</code>. Refer to <a href="#">Chap 4.12</a>.</p>
publish	<p>To publish information is to make it known to the public. Refer to <a href="#">publication (noun, non-count)</a>.</p>
repository-dependent data module	<p>The delivery of the common information repository data modules and the data modules to the customer or end user (or an IETP application). The customer, end user or the IETP has to resolve any links before use or during use of the IETP viewer/browser. Refer to <a href="#">self-contained data module</a>.</p>
SCORM Content Aggregation Model (SCORM CAM)	<p>A learning-taxonomy neutral means for designers and implementers of instruction to aggregate learning resources for the purpose of delivering a desired learning experience to a LMS.</p> <p>The SCORM CAM is one of the books in the SCORM specifications. It describes the components used in a learning experience, how to package those components for exchange from system to system, how to describe those components to enable search and discovery and how to define sequencing information for the components. Refer to SCORM at <a href="http://www.adlnet.org">www.adlnet.org</a>.</p>
SCORM content package	<p>A self-contained ZIP file containing content defined by the SCORM standard. The file is known as a Package Interchange File (PIF) and it contains all files needed to deliver the content package via a SCORM runtime environment and/or learning management system (LMS).</p>

SCORM Content Package Module (SCPM)	A module that aggregates and arranges learning data modules and maintenance modules in preparation for courses, lessons or performance support
SCORM content package Module Code (SMC)	A SCORM content package module code is the standardized and structured identifier of an S1000D SCORM content package module. The SMC is part of the unique identifier of a SCORM content package module. Refer to <a href="#">Chap 4.15.2</a> .
SCORM content package Module code - Extended (SME)	An extended SCORM content package Module Code (SMC) identifying one of many (eg, customized instances of a SCORM content package module). The SCORM content package module code is extended by the attributes given in the element <code>&lt;identExtension&gt;</code> . Refer to <a href="#">Chap 4.12</a> .
self-contained data module	A self-standing data module ready to be delivered for use to the customer or end user. For projects that use repositories, all links from repository data modules are resolved and the data module is in a form that is ready to be delivered to the customer or end user. Refer to <a href="#">repository-dependent data module</a> .
Service Bulletin (SB)	A "design change" defined by the manufacturer but implemented (applied) after product delivery to the customer. Service bulletins are applied on already delivered Product. Refer to <a href="#">Chap 5.2.1.16</a> .
servicing	Any act of replenishment for the purpose of maintaining the inherent design operating capabilities of an item.
Since Last Maintenance (SLM)	This is the time elapsed to next same maintenance task. For example borescope check of the engine each 200 hours of operation.
software program edition	An identification allocated to a software program or a combination of software programs, which identifies it as to its purpose and relates it to a certain level of development.
Shop Replaceable Unit (SRU)	An item, which can be only changed at shop level.
Standard Numbering System (SNS)	The third part of the data module code. Consists of three groups of characters. Intended to provide standardization in the arrangement or addressing of the Product. Refer to <a href="#">Chap 4.3.3</a> .
store	A generic term covering non-munitions items carried externally on or internally in the Product such as fuel tanks, reconnaissance pods, chaff and flares dispensers, transportation pods, missile warning system pods.
subassembly	An assembly, which is part of a larger assembly. Refer to <a href="#">Fig 1</a> .
subsystem	A major functional part of a system, which contributes to operational completeness of a system. Refer to <a href="#">Fig 1</a> .

supplier	An enterprise providing an item to a customer or another enterprise.
supplies	Consumables, material and expendables required to maintain the Product.
support equipment	<p>A general term for an item of equipment required to maintain the Product in its operational state. It includes, for example, test equipment such as test benches, voltmeters, signal generators, ladders, platforms, torque wrenches with a particular value range, standard tools (refer to <a href="#">tool, standard</a>), special tools (refer to <a href="#">tool, special (special-to-type)</a>) and related computer programs.</p> <p>Support equipment can be special (specific-to-type) or standard. Refer to standard and special tool.</p>
system	A combination of inter-related items arranged to perform a specific function. Refer to <a href="#">Fig 1</a> .
system difference code	The second part (1 to 4 characters) of the data module code. Identifies alternative versions of the system and subsystem/sub-subsystem identified by the SNS without affecting the type, model or variant identity. Refer to <a href="#">Chap 4.3.2</a> .
task set	A listing of several procedures as procedural steps including any complementary individual steps by the use of a Procedural Schema. When used for accomplishment instruction of a Service bulletin, a task set is defined as a safe and complete set of maintenance activities to accomplish before the Product returns into service.
Terminal Learning Objective (TLO)	A statement of the instructor's expectations of student performance at the end a specific lesson or unit.
Text Element Identifier (TEI)	The text element identifier is a code (three characters) assigned to identify <a href="#">S2000M</a> data elements.
Time Between Overhaul (TBO)	The maximum interval that the subject part is permitted to operate between scheduled overhauls. The interval as qualified by the time/cycle code is expressed as unit flight hours, operating cycles or aircraft landing cycles.
tool, standard	A general term covering those general hand tools such as screwdrivers, spanners, pliers, etc, which do not require special identification. As a general rule, such tools form part of a typical tradesman's toolkit. It also includes, based on project decision, for example basic test equipment such as voltmeters or signal generators, but also torque wrenches with particular value ranges <b>not</b> specific to the Product.
tool, special (special-to-type)	A general term covering those hand tools or other devices which have been manufactured specifically to enable the tradesman to correctly accomplish a given action, task or procedure. Includes tools specific to the Product. Such tools must be positively identified (usually by Part No. or other identifying code).

training	The activities designed to facilitate learning and development of new and existing skills.
training content package	A generic term for a collection of SCPMs, Learning and Maintenance modules intended for use in a non-SCORM environment. S1000D does not require that learning data modules be transformed into SCORM for all use cases.
Training Equipment (TE)	The equipment necessary to train personnel on how to operate and maintain the Product and its support equipment.
training information	Information used in the development of, and during, activities that facilitate learning and the development of new and existing skills.
Training Needs Analysis (TNA)	An analysis of the occupational and industrial training requirements both quantitatively and qualitatively in a particular cluster of occupations.
unit	A component that normally does one function.
version rank	The manufacturer assigned number identifying the Product for a specific customer.
video	The term video means a linear sequence of changing images in single file. Video can also include audio.
work area	The location or area where work is accomplished.
Work Sheet (WS)	Chronological sequence of instructions, JI and/or WS, necessary to perform complex work on an assembly, a component, etc.
zone	The global geographical localization of an item on the Product as defined in <a href="#">Chap 3.4</a> .
3D component	The items of a 3D scene, such as part, assembly (objects of real life).
3D object	The set of data representing a 3D scene (IT/digital).

ICN -S3627-S1000D0002-001-01

## 1 Abbreviations and acronyms

### 1.1 General

When there is doubt whether an abbreviation or acronym will be understood or whenever there is ample space to write in full, the term must be written out rather than abbreviated. Refer to [Chap 3.9.1](#).

### 1.2 Word combination - Acronym

Abbreviations for word combinations, acronyms, must be used as such and not separated for use singly, unless authorized singly.

Single abbreviations can be combined when necessary if there is no abbreviation listed for the combination.

### 1.3 Tense and number

The same abbreviation must be used for all tenses, possessive cases, singular and plural forms of a given word.

### 1.4 Abbreviation and acronym list

AC	Alternating Current
ACCP	Air vehicle Corrosion Control Publication

ACL P	Air vehicle Cargo Loading Publication
ACRW	Aircrew (Information set)
ACRWP	Aircrew Publication
ACSP	Air vehicle Cross Servicing Publication
ACT	Applicability Cross-reference Table
ADF	Automatic Direction Finding
ADL	Advanced Distributed Learning
AECMA	The European Association of Aerospace Industries. AECMA has since April 2004 changed its name to ASD. Refer to <a href="#">ASD</a> .

### *References*

*Table 1 References*

Chap No./Document No.	Title
None	

#### 1 General

The goal of this chapter is to provide to S1000D users an index of subjects defined/described by S1000D.

#### 2 Definition

The entries in the given index are listed in alphabetical order. Each entry contains the following information:

- Name of the subject and its abbreviation/acronym if available
- Indication of related topics, whether it is an information set and/or whether it is supported by a separate Schema definition, etc
- Chapter number where the given subject is defined and/or described
- A list of the related chapters

##### **Note 1**

The chapter numbers correspond to the status in the present Issue of S1000D. Chapter numbers in earlier issues can differ.

##### **Note 2**

The lists of related chapters contain only major chapters (eg, [Chap 1](#), [Chap 2](#), [Chap 3](#)). This is done in order to minimize the volume, to decrease complexity and to increase readability of this chapter. An exception is done for [Chap 3.9](#) "Information generation - Authoring", which is listed separately, because of its considerable volume and importance for S1000D users.

### Note 3

There are a number of abbreviations and/or acronyms which relate to multiple subjects. These are: ACT, BREX, CCT, CIR, CSDB, IPD, IETP, PCT and SCORM. For the purpose of readability and usability, these multiple subjects were grouped together. Full definitions of these abbreviations and acronyms refer to the place they can be found within the subject index. Example for Applicability Cross-reference Table: Refer to "ACT" subjects. Example for a subject not containing the given abbreviation but relating to it, context independent rules: Refer to "BREX data module - Context independent rules".

## 3 Subject index

access (functionality definition)	<b>Definition:</b> <a href="#">Chap 6.4.1</a> "Functionality - Background and explanation" <b>Related chapters:</b> <a href="#">Chap 6</a> , <a href="#">Chap 7</a>
access illustration	<b>Definition:</b> <a href="#">Chap 3.9.4</a> "Authoring - Front matter" <b>Related chapters:</b> <a href="#">Chap 4</a> , <a href="#">Chap 5</a> , <a href="#">Chap 6</a> , <a href="#">Chap 7</a> , <a href="#">Chap 8</a> , <a href="#">Chap 9</a>
access information	<b>Definition:</b> <a href="#">Chap 3.4</a> "Information generation - Zoning and access" <b>Related chapters:</b> <a href="#">Chap 5</a>
access point	<b>Definition:</b> <a href="#">Chap 3.4</a> "Information generation - Zoning and access" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a> , <a href="#">Chap 8</a> , <a href="#">Chap 9</a>
access point repository	<b>Definition:</b> <a href="#">Chap 3.9.5.2.11.5</a> "Common information repository - Access points" <b>Related chapters:</b> <a href="#">Chap 3.9</a>
Applicability Cross-reference Table, ACT, concept	<b>Definition:</b> <a href="#">Chap 4.14.1</a> "Applicability - Applicability cross-reference table" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a> , <a href="#">Chap 5</a> , <a href="#">Chap 6</a> , <a href="#">Chap 7</a> , <a href="#">Chap 8</a> , <a href="#">Chap 9</a>
ACT data module (supported by Schema)	<b>Definition:</b> <a href="#">Chap 3.9.5.3.1</a> "Applicability - Applicability cross-reference table" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a> , <a href="#">Chap 5</a> , <a href="#">Chap 6</a> , <a href="#">Chap 7</a> , <a href="#">Chap 8</a> , <a href="#">Chap 9</a>

ACT catalog concept

**Definition:**

[Chap 4.14.4](#) "Applicability - Applicability cross-reference table catalog"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 7](#)

ACT catalog data module  
(supported by Schema)

**Definition:**

[Chap 3.9.5.3.4](#) "Applicability - Applicability cross-reference table catalog"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 5](#), [Chap 6](#), [Chap 7](#), [Chap 8](#),  
[Chap 9](#)

airborne equipment

**Definition:**

[Chap 9.2.1](#) "Terms, acronyms and subject index - Glossary of terms"

**Related chapters:**

[Chap 3](#), [Chap 5](#)

air vehicle

**Definition:**

[Chap 9.2.1](#) "Terms, acronyms and subject index - Glossary of terms"

**Related chapters:**

[Chap 1](#), [Chap 2](#), [Chap 3](#), [Chap 4](#), [Chap 5](#), [Chap 8](#)

Aircrew, ACRW (air specific  
information set)

**Definition:**

[Chap 5.2.2.7](#) "Air specific information sets - Aircrew information"

**Related chapters:**

[Chap 3.9](#), [Chap 5](#)

Aircrew Publication,  
ACRWP

**Definition:**

[Chap 5.3.2.1](#) "Air specific publications - Aircrew information"

**Related chapters:**

[Chap 3.9](#), [Chap 5](#)

air specific information set

**Definition:**

[Chap 5.2.2](#) "Information sets - Air specific information sets"

**Related chapters:**

[Chap 5](#)

air specific publication

**Definition:**

[Chap 5.3.2](#) "Publications - Air specific publications"

**Related chapters:**

[Chap 5](#)

Air vehicle Cross Servicing  
Guide, ACSG

**Definition:**

[Chap 5.3.2.2](#) "Air specific publications - Cross servicing guide"

**Related chapters:**

[Chap 5](#)

air vehicle cross servicing  
information (air specific  
information set)

**Definition:**

[Chap 5.2.2.3](#) "Air specific information sets - Cross servicing information"

**Related chapters:**

[Chap 5](#)

Air vehicle Structure  
Repair, ASR (air specific  
information set)

**Definition:**

[Chap 5.2.2.2](#) "Air specific information sets - Structure repair information"

**Related chapters:**

[Chap 5](#)

alternates concept

**Definition:**

[Chap 4.13.3](#) "Optimizing and reuse - Alternates concept"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#)

animation (multimedia)

**Definition:**

[Chap 3.9.2.4](#) "Illustration rules and multimedia - Multimedia, General"

**Related chapters:**

[Chap 3.9](#), [Chap 7](#), [Chap 8](#), [Chap 9](#)

annotation (functionality  
definition)

**Definition:**

[Chap 6.4.1](#) "Functionality - Background and explanation"

**Related chapters:**

[Chap 3.9](#), [Chap 6](#)

applicability

**Definition:**

[Chap 4.14](#) "Information management - Applicability"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 6](#), [Chap 7](#), [Chap 9](#)

applicability annotation

**Definition:**

[Chap 4.14](#) "Information management - Applicability"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 5](#), [Chap 6](#), [Chap 7](#)

applicability (authoring)

**Definition:**

[Chap 3.9.5.3](#) "Data modules - Applicability"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 6](#), [Chap 7](#), [Chap 9](#)

Applicability Cross-reference Table, ACT

Refer to "ACT" subjects.

assembly

**Definition:**

[Chap 9.2.1](#) "Terms, acronyms and subject index - Glossary of terms"

**Related chapters:**

[Chap 1](#), [Chap 3](#), [Chap 3.9](#), [Chap 4](#), [Chap 5](#), [Chap 6](#), [Chap 7](#), [Chap 8](#)

assembly code

**Definition:**

[Chap 4.3.3](#) "Data module code - Standard numbering system"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#)

attribute

**Definition:**

[Chap 3.9.6](#) "Authoring - Attributes"

**Related chapters:**

[Chap 1](#), [Chap 2](#), [Chap 3](#), [Chap 3.9](#), [Chap 4](#), [Chap 5](#), [Chap 6](#), [Chap 7](#), [Chap 8](#), [Chap 9](#)

audio (multimedia)

**Definition:**

[Chap 3.9.2.4](#) "Illustration rules and multimedia - Multimedia, General"

**Related chapters:**

[Chap 3.9](#), [Chap 5](#), [Chap 6](#), [Chap 7](#), [Chap 8](#)

Battle Damage Assessment and Repair, BDAR (common information set)

**Definition:**

[Chap 5.2.1.14](#) "Common information sets - Battle damage assessment and repair information"

**Related chapters:**

[Chap 3.9](#), [Chap 5](#), [Chap 6](#)

BREX, Business Rules EXchange, concept

**Definition:**

[Chap 4.10](#) "Information management - Business rules"

**Related chapters:**

[Chap 2](#), [Chap 4](#), [Chap 7](#), [Chap 9.2.1](#)

BREX data module (supported by Schema)

**Definition:**

[Chap 4.10.2](#) "Business rules- BREX data module"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 7](#)

BREX data module - Context independent rule

**Definition:**

[Chap 4.10.2.3](#) "BREX data module - Context independent rules"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#)

BREX data module - Context related rule	<b>Definition:</b> <a href="#">Chap 4.10.2.2</a> "BREX data module - Context related rules" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a>
BREX data module - SNS rules	<b>Definition:</b> <a href="#">Chap 4.10.2.1</a> "BREX data module - SNS rules" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a>
BREX data module, default	<b>Definition:</b> <a href="#">Chap 4.10.3</a> "Business rules- Default BREX data module" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a> , <a href="#">Chap 7</a> , <a href="#">Chap 8</a>
BREX data module, layered	<b>Definition:</b> <a href="#">Chap 4.10</a> "Information management - Business rules" <b>Related chapters:</b> <a href="#">Chap 7</a>
BREX processing	<b>Definition:</b> <a href="#">Chap 7.9</a> "Information processing - Business rules processing" <b>Related chapters:</b> <a href="#">Chap 2</a> , <a href="#">Chap 4</a>
building of publications	<b>Definition:</b> <a href="#">Chap 4.9.3</a> "Publication management - Building of publications" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a> , <a href="#">Chap 5</a> , <a href="#">Chap 7</a>
building of SCO	<b>Definition:</b> <a href="#">Chap 4.15.3</a> "Learning information - Building SCORM content package modules" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 4</a>
Business Rule, BR	<b>Definition:</b> <a href="#">Chap 2.5</a> "Documentation process - Business rules" <b>Related chapters:</b> <a href="#">Chap Copyright</a> , <a href="#">Chap 1</a> , <a href="#">Chap 2</a> , <a href="#">Chap 4</a> , <a href="#">Chap 7</a> , <a href="#">Chap 9.2</a>
business rules concept	<b>Definition:</b> <a href="#">Chap 4.10</a> "Information management - Business rules" <b>Related chapters:</b> <a href="#">Chap 2</a> , <a href="#">Chap 2.5.2</a> , <a href="#">Chap 4</a> , <a href="#">Chap 7</a>

business rule decision

**Definition:**

[Chap 4.10.1](#) "Business rules - Business rules document data module"

**Related chapters:**

[Chap 2.5.2](#), [Chap 9.2.1](#)

Business Rule Decision Point, BRDP

**Definition:**

[Chap 2.5.3](#) "Business rules - Business rule decision points index"

**Related chapters:**

[Chap 2](#), [Chap 3](#), [Chap 4](#), [Chap 5](#), [Chap 6](#), [Chap 7](#), [Chap 8](#), [Chap 9.2](#)

business rule decision points index

**Definition:**

[Chap 2.5.3](#) "Business rules - Business rule decision points index"

**Related chapters:**

[Chap 2.5.2](#)

business rule decision point priority

**Definition:**

[Chap 2.5.2](#) "Business rules - Generation and use"

**Related chapters:**

[Chap 4.10.1](#), [Chap 9.2.1](#)

business rules document data module, concept

**Definition:**

[Chap 4.10.1](#) "Business rules - Business rules document data module"

**Related chapters:**

[Chap 2.5.2](#), [Chap 2.5.3](#), [Chap 4.10](#)

business rules document data module (supported by Schema)

**Definition:**

[Chap 4.10.1](#) "Business rules - Business rules document data module"

**Related chapters:**

[Chap 2.5.2](#), [Chap 2.5.3](#), [Chap 4.10](#), [Chap 9.2.1](#)

Business Rules Exchange, BREX

Refer to "BREX" subjects.

business rules layer

**Definition:**

[Chap 2.5.1](#) "Business rules - Categories and layers"

**Related chapters:**

[Chap 4](#), [Chap 9](#)

business rules processing

**Definition:**

[Chap 7.9](#) "Information processing - Business rules processing"

**Related chapters:**

[Chap 2](#)

business rule severity	<b>Definition:</b> <a href="#">Chap 2.5.2</a> "Business rules - Generation and use" <b>Related chapters:</b> <a href="#">Chap 4.10.1</a>
business rule template data module	<b>Definition:</b> <a href="#">Chap 4.10.1</a> "Business rules - Business rules document data module" <b>Related chapters:</b> <a href="#">Chap 2.5.2</a> , <a href="#">Chap 2.5.3</a> , <a href="#">Chap 4.10</a>
caption (group)	<b>Definition:</b> <a href="#">Chap 3.9.5.2.1.4</a> "Common constructs - Caption groups" <b>Related chapters:</b> <a href="#">Chap 3.9</a> , <a href="#">Chap 6</a> , <a href="#">Chap 7</a>
Cargo Loading, CL (common information set)	<b>Definition:</b> <a href="#">Chap 5.2.1.11</a> "Common information sets - Cargo loading information" <b>Related chapters:</b> <a href="#">Chap 5</a> , <a href="#">Chap 6</a> , <a href="#">Chap 8</a>

Component Maintenance  
Publications, CMP

**Definition:**

[Chap 5.3.1.4](#) "Common requirements - Component maintenance"

**Related chapters:**

[Chap 3](#), [Chap 3.9](#), [Chap 5](#), [Chap 6](#), [Chap 9](#)

Computer Graphics  
Metafile, CGM (S1000D  
CGM profile)

**Definition:**

[Chap 7.3.2](#) "CSDB objects - Graphics"

**Related chapters:**

[Chap 2](#), [Chap 3.9](#), [Chap 4](#), [Chap 7](#)

condition

**Definition:**

[Chap 9.2.1](#) "Terms, acronyms and subject index - Glossary of terms"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 5](#), [Chap 6](#), [Chap 7](#), [Chap 8](#), [Chap 9](#)

Conditions Cross-reference  
Table, CCT

Refer to "CCT" subjects.

conformant/conformance

**Definition:**

[Chap 1.4.2](#) "How to tailor for a specific project - Conformance and compliance"

**Related chapters:**

[Chap 3.9](#), [Chap 4](#), [Chap 6](#), [Chap 7](#), [Chap 9](#)

Corrosion Control, CC  
(common information set)

**Definition:**

[Chap 5.2.1.3.4](#) "Maintenance information - Corrosion control"

**Related chapters:**

[Chap 3.9](#), [Chap 5](#), [Chap 6](#)

consumable (see also  
supplies)

**Definition:**

[Chap 9.2.1](#) "Terms, acronyms and subject index - Glossary of terms"

**Related chapters:**

[Chap 3](#), [Chap 3.9](#), [Chap 4](#), [Chap 5](#), [Chap 8](#)

container data module  
(supported by Schema)

**Definition:**

[Chap 3.9.5.2.12](#) "Content section - Container data module"

**Related chapters:**

[Chap 1](#), [Chap 3.9](#), [Chap 4](#), [Chap 7](#), [Chap 8](#)

container data module  
concept

**Definition:**

[Chap 4.13.4](#) "Optimizing and reuse - Container data module"

**Related chapters:**

[Chap 3.9](#), [Chap 8](#)

functionality	<p><b>Definition:</b>  <a href="#">Chap 6.4.1</a> "Functionality - Background and explanation"</p> <p><b>Related chapters:</b>  <a href="#">Chap 3</a>, <a href="#">Chap 3.9</a>, <a href="#">Chap 4</a>, <a href="#">Chap 5</a>, <a href="#">Chap 6</a>, <a href="#">Chap 7</a>,  <a href="#">Chap 8</a>, <a href="#">Chap 9</a></p>

functionality matrix

**Definition:**

[Chap 6.4.2](#) "Functionality - Functionality matrix"

**Related chapters:**

[Chap 6](#)

general criteria  
(conformance and  
compliance)

**Definition:**

[Chap 1.4.2](#) "How to tailor for a specific project -  
Conformance and compliance"

**Related chapters:**

[Chap 2](#), [Chap 4](#), [Chap 7](#)

generation of publications

**Definition:**

[Chap 7.4](#) "Information processing - Generation of  
publications"

**Related chapters:**

[Chap 7](#)

graphics functionality  
(functionality definition)

**Definition:**

[Chap 6.4.1](#) "Functionality - Background and explanation"

**Related chapters:**

[Chap 3](#), [Chap 3.9](#), [Chap 5](#), [Chap 6](#), [Chap 7](#)

granularity

**Definition:**

None identified, but in a number of related chapters the  
following wording reflects the granularity definition: "The  
granularity of data modules is to follow the breakdown  
reflected by the SNS." Thus, refer to "Standard Numbering  
System, SNS".

**Related chapters:**

[Chap 2](#), [Chap 3.9](#), [Chap 4](#)

help, content sensitive

Refer to "content sensitive help".

HIGHlights, HIGH (front  
matter)

**Definition:**

[Chap 3.9.4](#) "Authoring - Front matter"

**Related chapters:**

[Chap 3.9](#), [Chap 6](#)

hotspot

**Definition:**

[Chap 3.9.5.2.1.8](#) "Common constructs - Hotspots"

**Related chapters:**

[Chap 2](#), [Chap 3.9](#), [Chap 6](#), [Chap 7](#)

Hard Time, HT

**Definition:**

[Chap 9.2.1](#) "Terms, acronyms and subject index - Glossary  
of terms"

**Related chapters:**

[Chap 3.9](#)

identification and status section	<p><b>Definition:</b>  <a href="#">Chap 3.9.5.1</a> "Data modules - Identification and status section"</p> <p><b>Related chapters:</b>  <a href="#">Chap 1</a>, <a href="#">Chap 3</a>, <a href="#">Chap 3.9</a>, <a href="#">Chap 4</a>, <a href="#">Chap 5</a>, <a href="#">Chap 6</a>, <a href="#">Chap 7</a>, <a href="#">Chap 9</a></p>

Chap No./Document No.	Title
<a href="#">Chap 3.9.5</a>	Authoring - Data modules

#### 1 General

Descriptions of all element types declared within all the S1000D Schema are available on the S1000D web site on [www.s1000d.org](http://www.s1000d.org).

#### 2 Data dictionary

The complete Schema documentation is downloadable for easy use offline. You can search for elements in a specific Schema or just for an element. The following information can be found:

- **element** gives the name of an element within the start-tag delimiters (as it would be used within the data module instance)
- **group** gives the name of an element group (element groups do not appear within a data module instance)
- **complexType** gives the name of a complex type (complex types are used for schema management and do not appear within a data module instance)
- **simpleType** gives the name of a simple type (simple types are used for schema management and do not appear within a data module instance)
- **attributeGroup** gives the name of an attribute group (attribute groups do not appear within a data module instance)
- **diagram** gives a graphical representation of the content of an element, group, complexType, simpleType, or attributeGroup using symbols as defined in [Chap 3.9.5](#)
- **namespace** gives the namespace of an element, simpleType, or attributeGroup which is defined outside of the S1000D namespace
- **type** gives whether an element is a simpleType or complexType
- **properties** gives information about the element, simpleType or complexType such as whether mixed content is allowed, the base type, and whether simple or complex content is allowed
- **children** gives the list of elements contained by this element, group, or complexType

- **used by** gives the list of elements, groups, complexTypes and attributes containing this element, group, complexType, simpleType, or attributeGroup
- **attributes** gives the list of attributes contained by this element further divided into the following fields:
  - **Name** gives the name of the element
  - **Type** gives the simpleType of the attribute
  - **Use** gives the cardinality of the attribute
    - No value indicates the attribute is optional
    - **required** indicates the attribute is required
  - **Default** gives a default value for the attribute which can be overridden
  - **Fixed** gives a value for the attribute which cannot be overridden
  - **Annotation** is not used
- **facets** gives any restrictions on the content of an element or simpleType expressed as a pattern of allowable values
- **source** gives the schema fragment defining this element, group, complexType, simpleType, or attributeGroup

The HyperText Markup Language (HTML) Schema documentation can be found at [www.s1000d.org](http://www.s1000d.org).
