### **2 Special usage rights**

Irrevocable permission to use, sell, or manufacture from the information contained in this document or any subsequent modification or revision thereof, and the right to reproduce or publish this document or any subsequent modification or revision thereof, in whole or in part, free of charge, is hereby given to the following:

- 1 National Associations who are members of ASD and all their member companies
- 2 Members of Aerospace Industries Association of America
- 3 Members of the ATA e-Business Program
- 4 Members of International Coordinating Council of Aerospace Industries Associations (ICCAIA) not included in Categories 1 thru 2 inclusive
- 5 Airlines and Armed Forces that are customers of Companies included in Categories 1 thru 3 inclusive
- 6 Ministries of Defence of the member countries of ASD
- 7 The Department of Defense of the USA

### **3 Agreement for use of the specification S1000D™ suite of information**

#### **3.1 Definitions**

**S1000D™ suite of information** means, but is not limited to:

- the technical publications specification S1000D
- examples (eg, XML instances, PDF files, stylesheets), XML schemas
- any other software or information on the page titled "S1000D Downloads" on the website [www.s1000d.org](http://www.s1000d.org).

**Copyright Holders** means AeroSpace and Defence Industries Association of Europe (ASD) and Ministries of Defence of the member countries of ASD.

## **2.1 Notice to user**

By using all or any portion of **S1000D™ suite of information** you accept the terms and conditions of this User Agreement.

This User Agreement is enforceable against you and any legal entity that has obtained **S1000D™ suite of information** or any portion thereof and on whose behalf it is used.

## **2.2 License to use**

As long as you comply with the terms of this User Agreement, the Copyright Holders grant to you a non-exclusive license to use **S1000D™ suite of information**.

## **2.3 Intellectual property rights**

**S1000D™ suite of information** is the intellectual property of and is owned by the Copyright Holders, AIA and ATA. Except as expressly stated herein, this User Agreement does not grant you any intellectual property right in the **S1000D™ suite of information** and all rights not expressly granted are reserved by the Copyright Holders, AIA and ATA.

## **2.4 No modifications**

You must not modify, adapt or translate, in whole or in part, the **S1000D™ suite of information** unless otherwise explicitly stated in the specification. You can however add business rules.

## **2.5 No warranty**

**S1000D™ suite of information** is being delivered to you "as is". The Copyright Holders do not warrant the performance or result you may obtain by using the **S1000D™ suite of information**. The Copyright Holders make no warranties, representations or indemnities, express or implied, whether by statute, common law, custom, usage or otherwise as to any matter including without limitation merchantability, integration, satisfactory quality, fitness for any particular purpose, or non-infringement of third parties rights.

## **2.6 Limitation of liability**

In no event will the Copyright Holders be liable to you for any damages, claims or costs whatsoever or any consequential, indirect or incidental damages, or any lost profits or lost savings or for any claim by a third party, even if the Copyright Holders have been advised of the possibility of such damages, claims, costs, lost profits or lost savings.

## **2.7 Indemnity**

You agree to defend, indemnify, and hold harmless the Copyright Holders and its parents and affiliates and all of their employees, agents, directors, officers, proprietors, partners, representatives, shareholders, servants, attorneys, predecessors, successors, assigns, and those who have worked on the preparation, publication or distribution of the **S1000D™ suite of information** from and against any and all claims, proceedings, damages, injuries, liabilities, losses, costs, and expenses (including reasonable attorneys' fees and litigation expenses), relating to or arising from your use of the **S1000D™ suite of information** or any breach by you of this User Agreement.

## **2.8 Governing law**

This User Agreement will be governed by and construed in accordance with the laws of the Kingdom of Sweden.

Any dispute, controversy or claim arising out of or in connection with this User Agreement, or the breach, termination or invalidity thereof shall be finally settled by arbitration in accordance with the Rules of the Arbitration Institute of the Stockholm Chamber of Commerce. The arbitral

tribunal shall be composed of a sole arbitrator. The place of arbitration shall be Stockholm. The language to be used in the arbitral proceedings shall be English.

If the dispute, inclusive of any counterclaims, claims for set-off and interest should comprise of an amount less than SEK 500000, exclusive of VAT, the Rules for Expedited Arbitrations of the Arbitration Institute of the Stockholm Chamber of Commerce shall be applied.

## 1 General

Changes that are included in this Issue 4.2 are brought about by Change Proposal Forms (CPF) and White Papers (WP) that are approved by the Steering Committee (SC).

### 1.1 Scope

The chapters that are affected in this Issue 4.2 are listed herein together with the CPF and WP and their identification that called for changes.

### 1.2 Deleted chapters

CPF 2013-004GB called for the listed referenced specifications to be moved from Chap 4.2.2 to [Chap 2.2](#). This left Chap 4.2.1 as an orphan. Therefore, the content of Chap 4.2.1 has been moved to [Chap 4.2](#).

Issue 4.1 included past issue summaries of changes to:

- data module Schemas - Chap 7.3.1.1.1 thru Chap 7.3.1.1.6
- backwards compatibility - Chap 7.3.1.4.1 thru Chap 7.3.1.4.7
- publication module Schema - Chap 7.4.2.1.1 thru Chap 7.4.2.1.6

#### Note

In Issue 4.1, Chap 7.4.2.2, past issue summaries of changes to the SCORM content package module Schema were included. These summaries are also removed.

Readers requiring this historical information are referred to Issue 4.1.

### 1.3 Business rule decision points

There have been a large number of changes to Business Rule Decision Points. These include:

- 23 new BRDPs are introduced. Refer to [Table 13](#).
- 136 BRDPs are deleted. Refer to [Table 14](#).
- 128 BRDPs have been reworded to some extent. Refer to [Chap 2.5.3](#).

### 1.4 Editorial changes

There have been a significant amount of editorial changes to all chapters. All chapters, whether affected by a CPF or WP, or not have:

- been changed in order to comply with the new Authoring Rules
- had the new S-Series template applied
- had previous change bars removed
- been up-issued from Issue 4.1

Editorial changes are not changed marked in this Issue 4.2.

## 2 Content

There are eight CPFs that called for changes to a significant number of chapters. Rather than list these repeatedly for every chapter, they are listed separately. [Table 2](#) lists the changes that are common to many chapters.

Highlights of changes to the front matter and chapter 1 through chapter 9 (and their subchapters), are provided. For:

- front matter, refer to [Table 3](#)
- chapter 1, refer to [Table 4](#)
- chapter 2, refer to [Table 5](#)
- chapter 3, refer to [Table 6](#)
- chapter 4, refer to [Table 7](#)

- chapter 5, refer to [Table 8](#)
- chapter 6, refer to [Table 9](#)
- chapter 7, refer to [Table 10](#)
- chapter 8, refer to [Table 11](#)
- chapter 9, refer to [Table 12](#)

Table 2 Common changes

CPF No	Summary of changes
CPF 2012-020US	Added element < <a href="#">derivativeClassification</a> > and attribute <a href="#">derivativeClassificationRefId</a>
CPF 2013-012NN	Consistent use of (M), (C) and (O) for elements and attributes. Elements are from now on not marked with (M), (O) or (C). The information is given in the XML illustrations. M and O are used for attributes.
CPF 2013-016NN	Consistent use of company - enterprise - manufacturer - supplier - vendor. Reading conventions of enterprise/company introduced to clarify the use of "company", "enterprise", "manufacturer", "business organization", etc.
CPF 2013-024NN	Illustration observations including correction of ICN and update of titles
CPF 2013-033AA	Corrected inconsistencies in graphic style
CPF 2014-008IGBRTT	BRDP cleanup for Issue 4.2. This included rewording, move of BRDP to other chapter and deletion of duplication, for example on optional attributes. Refer to <a href="#">Chap 2.5.3</a> .
CPF 2014-009IGBRTT	Added unique ID inside default BREX and references to default BREX rules in chapter text
CPF 2016-006NN	Reduction of BRDPs on configurable attributes

Chapter	Summary of changes
	CPF 2013-004GB: – Updated to WebCGM 2.1
<a href="#">Chap 7.3.3</a>	CPF 2013-047LSHTT: – Support for SCORM runtime files in S1000D. Added entries to table in Para 2.2.4. CPF 2013-053LSHTT: – Support metadata information related to multimedia resources in S1000D. Added reference to ICN metadata file.
<a href="#">Chap 7.4.1.1.3</a>	CPF 2015-009NN: – Incorrect element name in Para 2.1 eliminated
<a href="#">Chap 7.4.1.2</a>	CPF 2013-053LSHTT: – Added IMF to the list of S1000D URN subnamespaces
<a href="#">Chap 7.4.2.1</a>	The chapter is revised with new content. CPF 2010-012SE – Harmonization of name instantiation between Common information repository (CIR) zones and CIR access points: CPF 2013-026GB - Addition of references to Reason for update: – Added the new optional and repeatable element <code>&lt;simpleRefPara&gt;</code> to the element <code>&lt;reasonForUpdate&gt;</code> CPF 2013-028CMPTT - Addition of a type to publication module information: – Added the new project configurable optional attribute <code>pmType</code> to the element <code>&lt;pm&gt;</code> CPF 2013-041AA - Revision marking consistency: – Added the optional attributes <code>changeType</code> , <code>changeMark</code> and <code>reasonForUpdateRefIds</code> to the elements <code>&lt;quantity&gt;</code> , <code>&lt;internalRef&gt;</code> , <code>&lt;footnoteRef&gt;</code> , <code>&lt;inlineSignificantData&gt;</code> and <code>&lt;shortName&gt;</code> The subchapters are removed.
Chap 7.4.2.1.1 thru Chap 7.4.2.1.6	Chapters deleted
<a href="#">Chap 7.4.2.2</a>	CPF 2010-012SE: – Added element <code>&lt;shortName&gt;</code> to the element <code>&lt;accessPointRef&gt;</code> CPF 2010-034US: – Added attribute group “securityAttGroup” to the elements <code>&lt;techName&gt;</code> and <code>&lt;infoName&gt;</code>

Chapter	Summary of changes

	CPF 2013-018NN: – MSG changed to MSG (MSG-3) CPF 2013-043AA: – New term and acronym ESN - Electrical Structure Network
<a href="#">Chap 9.2.3</a>	Para 3 subject index is updated to reflect the editorial and technical changes in the specification

Table 13 New BRDPs

BRDP ID	Chap No	BRDP Title
00553	3.6	Retention of derivative classifications changes
00554	3.9.2.1	Illustration annotations written in upper or sentence case
00555	3.9.2.1	Inclusion of the ICN in the illustration
00556	3.9.2.3	Use color line art
00557	3.9.2.7	Reuse of the generic ICN title in data modules
00558	3.9.5.1	Use of the element <code>&lt;derivativeClassification&gt;</code> within data modules
00559	3.9.5.2.1.4	Caption style guide
00560	3.9.5.2.1.10	Identification of parts
00561	3.9.5.2.13	Use of titles in the Learning data module
00562	3.9.5.2.5	Use of the top level preliminary requirements construct for maintenance inspections
00563	3.9.5.2.5	Use of the attribute <code>timeLimitCategoryValue</code>
00564	4.10.1	Single or multiple business rules document
00565	4.10.1	Level of depth of business rules document data modules
00566	4.10.1	Identification numbering
00567	4.10.1	Standardized responses to describe business rules decision values
00568	6.2.1	Presentation of derivative classification markings
00569	6.2.2	Presentation of ICN
00570	6.2.2	Presentation of controlled content
00571	6.2.3.1	Number of levels in Table of contents
00572	6.2.3.3	Presentation of data module code extension in references and tables
00573	6.2.3.3	Presentation of issue number of the data module or the technical publication in references and tables
00574	6.2.3.3	Presentation of Production management data

BRDP ID	Chap No	BRDP Title
00575	6.2.3.3	Presentation of Name and Alternate name

*Table 14 Deleted BRDPs*

BRDP ID	Chap No	Title
00012	3.6	Define security classification values and terms (attribute securityClassification)
00036	3.9.4	Presentation of the issue number and the inwork number on the title page
00038	3.9.4	Presentation the of issue date or the issue number in the LOEP
00039	3.9.4	Presentation of applicability information in the LOEP
00040	3.9.4	Presentation of the issue date or the issue number in the LOEDM
00041	3.9.4	Presentation of applicability information in the LOEDM
00043	3.9.4	Presentation of issue the date or the issue number in the Highlights
00044	3.9.4	Presentation of applicability information for the Highlights
00045	3.9.4	Presentation of issue the date and the issue number in the TOC
00047	3.9.5.1	Country and language codes
00048	3.9.5.1	Exchange of draft data modules
00050	3.9.5.1	Source of the technical names

#### 1 General

This chapter gives a basic overview of the S1000D purpose including the history of the development.

#### 2 Purpose

S1000D is an international specification for the procurement and production of technical publications. While the title restricts its use to technical publications, it has been found through application that the principles of the specification can be applied to non-technical publications.

This specification was initially developed by the AeroSpace and Defence Industries Association of Europe (ASD). This issue has been jointly produced by ASD, the Aerospace Industries Association of America (AIA), and the Air Transport Association of America (ATA) together with their customers. These form the S1000D Council and the S1000D Steering Committee to establish standards for documentation agreed by the participating parties.

From Issue 2, the scope has been extended to include land and sea specific applications. The specification can also be used for the support of any type of equipment including both civil and military products. All items in this specification are referred to as "the Product".

#### 2.1 Background

The concept of this specification was originated in the aerospace field within ASD in early 1980s. At that time, most civil aviation projects were being documented in accordance with the ATA 100 specification. Military projects in Europe were supported by documentation produced to various national military specifications, although some attempts of rationalization had been made in certain collaborative projects. Thus, by comparison, the situation for the support of civil aircraft was more stable and manageable. The multiplicity of existing military procedures and

the continual introduction of new procedures were producing ever greater problems and increased costs for industry and its military customers, as both became more reliant upon the use of complex computer-based systems in the field of technical publication support activities.

This situation, added to the increasing number of collaborative projects and the necessity to recognize the developments in Integrated Logistics Support (ILS) and in information technology, prompted the Customer and Product Support Committee (CPSC) of ASD to establish a Documentation Working Group (DWG). This DWG consisted of European industry representatives tasked to report on current documentation practices and to recommend a unified method of documentation for air vehicle projects.

The DWG recognized that the only internationally accepted specification in the aerospace field, although not formally recognized as an international standard, was ATA 100. It was therefore decided to attempt to harmonize civil and military documentation standards using ATA 100 as a source document. Many national military specifications used by the participating nations have their roots in the United States (US) Mil Specs and these were therefore to be considered. The DWG invited the nations to provide military representatives who would participate in its activities and established a subsidiary, which was designated the Augmented Documentation Working Group (ADWG).

This group realized that their attempts to harmonize specifications and to establish commonality wherever possible had the following major advantages:

- cost saving in information generation - avoidance of duplications
- more economic support planning
- cheaper deliverable publications
- uniformity of standard for participants in the project
- standard format for data exchange to exploit future developments
- enhanced interoperability
- improved opportunity for clarity - use of ASD Simplified Technical English (ASD-STE100®)
- easier and cheaper translation also possible because of ASD-STE100®

The ADWG established task groups which undertook studies of specific areas to enable the development of the CSDB proposals which are contained in this specification. The final task was the incorporation of these international CSDB proposals into this publications specification which has been agreed by the participating nations.

The ADWG was later renamed Technical Publication Specification Maintenance Group (TPSMG). Their duties have now been taken over by the S1000D Council and the S1000D Steering Committee, which have the full responsibility of maintaining the specification. The S1000D Council and the S1000D Steering Committee includes members from ministries and industry.

To take care of the rapid development of information technology, a group of specialists, the Electronic Publications Working Group (EPWG) supports the S1000D Steering Committee.

In 2003, a Memorandum of Understanding (MOU) was signed between ASD and AIA establishing the parameters for an agreement between the two organizations harmonizing US and European guidance related to technical publications data.

In 2004, the ASD signed an MOU with ADL. The two organizations are working together to harmonize the requirements of the Shareable Content Object Reference Model (SCORM).

In 2005, a MOU was signed between ASD, AIA and ATA in order to promote common, interoperable, international technical publication data in the Aerospace and Defense industries and to work in concert on the joint development and maintenance of S1000D.

In 2007, the MOU between ASD, AIA and ATA has been renewed to enable the three organizations to jointly further develop, maintain and promote the S1000D in the international arena.

#### 1 General

This chapter gives a basic overview of the S1000D scope. Refer to [Fig 1](#).

#### 2 Scope

S1000D covers the planning and management, production, exchange, distribution and use of technical documentation that support the life cycle of any civil or military project. Projects include air, land and sea vehicles or equipment (hereafter known as the Product).

The specification adopts International Standards Organization (ISO), Continuous Acquisition and Life-cycle Support (CALS) and World Wide Web Consortium (W3C) standards, in which information is generated in a neutral format. This means that it can be implemented on different and often disparate systems. Neutrality, added to the concept of modularization, makes the specification applicable to the wider international community.

Information produced in accordance with S1000D is created in a modular form, called a "data module". A data module is defined as "the smallest self-contained information unit within a technical publication".

A data module contains the following information:

- An identification and status section with all management information
- A content section

The data module can support the following types of content and constructs:

- Applicability cross-reference information
- Business rules information
- Common information repository
- Conditions cross-reference information
- Container information
- Crew/operator information
- Descriptive information
- Fault information
- Front matter information
- IPD information
- Maintenance checklists and inspections
- Maintenance planning information
- Procedural information
- Process information
- Products cross-reference information
- Service bulletin information
- Training information
- Wiring data information
- Wiring data description information

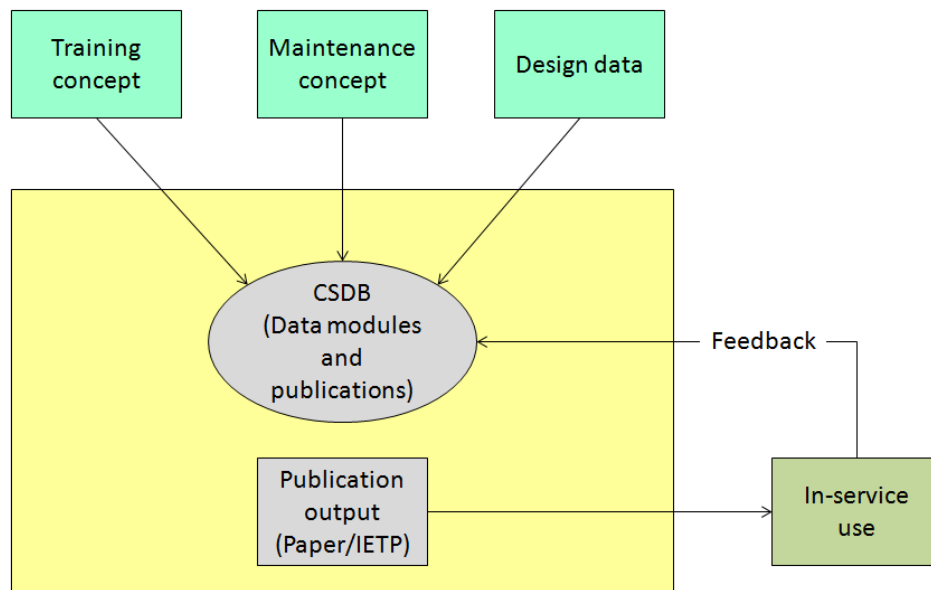

All data modules applicable to the Product are gathered and managed in a database, which is hereafter referred to as the CSDB.

A benefit of the CSDB is to enable production of platform-independent output in either page-oriented or IETP.

Data managed in S1000D is not duplicated in the CSDB. Data modules enable data to be stored once and used for multiple outputs. A single change to an individual data module can update multiple outputs and multiple deliveries.

Other benefits of using S1000D are that:

- it is based on international neutral standards
- it reduces maintenance costs for technical information
- it transforms data into configuration items
- it allows subsets of information to be generated to meet specific user needs
- it facilitates the transfer of information and electronic output between disparate systems
- many different output forms can be generated from the same base data thus ensuring safety of data and that every user regardless of output form is getting the same message
- the S1000D data module concept can be applied to legacy data
- it is non-proprietary and allows neutral delivery of data and management of data
- the specification incorporates the planning and management, production, exchange, distribution and use of data in electronic form for different types of output (from page oriented to IETP) as shown in [Fig 1](#)

## 1 General

This chapter gives an overview of:

- the structure and content of the specification
- the basic production and delivery methods
- the fundamental reading rules

## 2 Field of application

S1000D is an international specification, which is designed to cover technical publication and learning information in support of any platform, system or equipment project (air, sea, land vehicle, equipment or facilities, civil or military).

The following aspects of technical publication and training information are described:

- information generation (authoring)
- management within the CSDB
- publication generation - page-oriented and IETP
- exchange of data modules, publications and training content packages
- commenting

The specification addresses two main delivery methods of technical publications and training content packages:

- Data exchange - S1000D objects (data modules and supporting objects) delivery for further processing
- Publishing - Delivery of publications and training content packages - Information ready to use

Refer to [Para 5](#) for further details on the delivery methods.

## 3 Basic definitions

the Product	Any platform, system or equipment (air, sea, land vehicle, equipment or facility, civil or military)
Project	The task to develop, maintain and dispose of the Product
technical publications	Operational and maintenance documentation and data. Technical publications do not include design documentation (eg, design drawings or CAD models).
learning information	Information used in the development of training activities that facilitate learning and the development of new and existing skills.
self-contained data module	A data module which is ready to use without a need for any common information repository data modules. Refer to <a href="#">Para 4</a> .
CIR-dependent data modules	A data module which needs access to one or more Common Information Repository (CIR) data modules. Refer to <a href="#">Para 4</a> .

## 4 Self-contained vs CIR-dependent data modules

There are two basic methods of production (authoring) and delivery (publishing) of data modules and publications:

- Using self-contained data modules only. This is the basic method to deliver data modules.
- Using common information repository data modules (eg, warnings, cautions, externalized applicability annotations) as a necessary part of the delivery. This method means that the "ordinary" data modules are delivered CIR-dependent.

The CIR provides the ability to further optimize and reuse data. It does this by using:

- CIR data modules. Refer to [Chap 4.13.1](#).
- Incremental updates of CIR data modules. Refer to [Chap 4.13.2](#).
- Alternates. Refer to [Chap 4.13.3](#).
- Container data modules. Refer to [Chap 4.13.4](#).

**Note**

The CIR concept can be implemented in the production process as "internal repositories" and thus not necessarily as CIR data modules.

The delivery from a production environment using CIR data modules can be done in two ways:

- Self-contained data modules

These data modules include all information needed to understand a description or fulfill the maintenance task. Data from the CIR data modules (eg, warnings, cautions, externalized applicability annotations), if used, are included (not linked) in the data modules to be delivered to the customer or end user.

For example, if warnings, cautions and/or applicability CIR are used these must be included in the data modules to which they apply, if self-contained data modules are the deliverables.

**Note**

Only a limited set of data from the repository data modules can be included in the data modules.

**Note**

The CIR data modules can still be delivered together with the self-contained data modules as the repository data modules include useful additional/detailed information which cannot be accommodated in the data modules but used in an IETP.

- CIR-dependent data modules

These data modules are dependent on CIR data modules as pieces of information are "removed" or externalized into one or more CIR data modules prior to delivery to the customer or end user (or an IETP application). The customer, end user or the IETP application, resolves any links before use or during use of the IETP viewer/browser.

The authoring rules differ between the two methods which are explained in the authoring chapters. Refer to [Chap 3.9.5.2.1](#). When using CIR data modules certain information does not require authoring but would require referencing (linking) to the appropriate CIR data module. For example, the name of the support equipment being referenced (linked) to a CIR data module rather than being authored.

Refer to [Chap 4.13.1](#) for details on the use of the CIR concept.

Refer to [Chap 4.13.4](#) for details on the use of the container concept.

## 5 Delivery methods

### 5.1 Data exchange

The delivery method based on data exchange of S1000D objects (refer to [Para 2](#)) is used when the receiving organization has a CSDB and is expected to process the data and even include changes (eg, due to adaptation of the data modules to internal regulations and needs). The receiver can then produce another interchange package or produce the final ready-to-use publications or SCORM content package modules. Refer to [Fig 1](#).

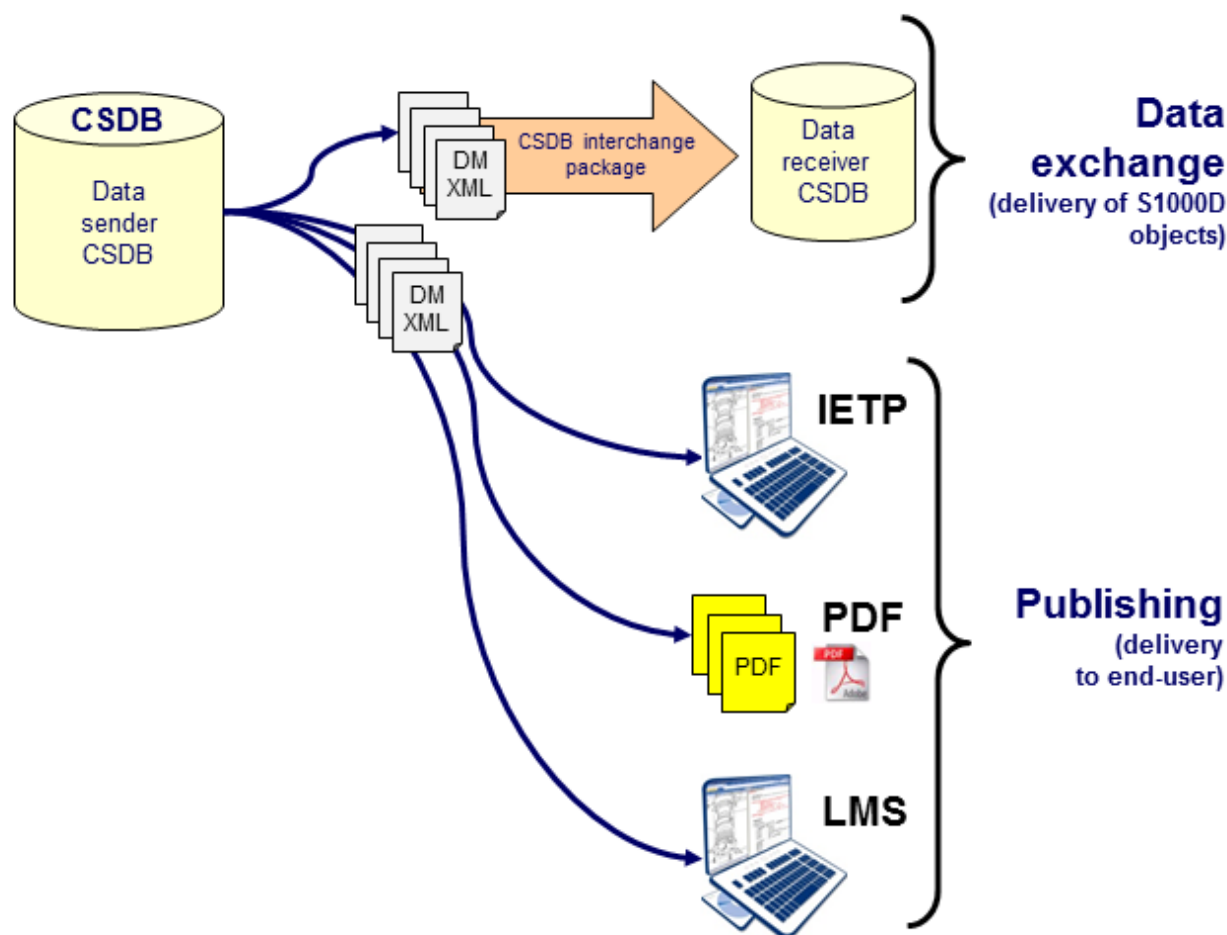

Data exchange is done between two CDSB, a sender CDSB and a receiver CDSB. The exchange could be between a subcontractor and a prime, or between a contractor and a customer.

The data exchange packages consist primarily of data modules and their associated illustrations and multimedia files. Publication modules, SCORM content package modules, and supporting files such as data dispatch notes and data management lists can also be exchanged.

The interchange of transfer packages is done as described in [Chap 4.8](#).

## 5.2 Delivery of ready-to-use publications or training content packages

This method is used when the CDSB owner, contractor or customer, delivers a final ready-to-use product to the end user. It can be page-oriented publications delivered as paper publications in binders or electronic publications in PDF, the latter with some linking mechanisms. The deliverable can also be an IETP generated as described in [Chap 7.4.1](#), or a training related product. The latter could be used as SCORM, just-in-time training, instructor or student guides.

ICN-S3627-S1000D0601-001-01

Fig 1 Main delivery methods

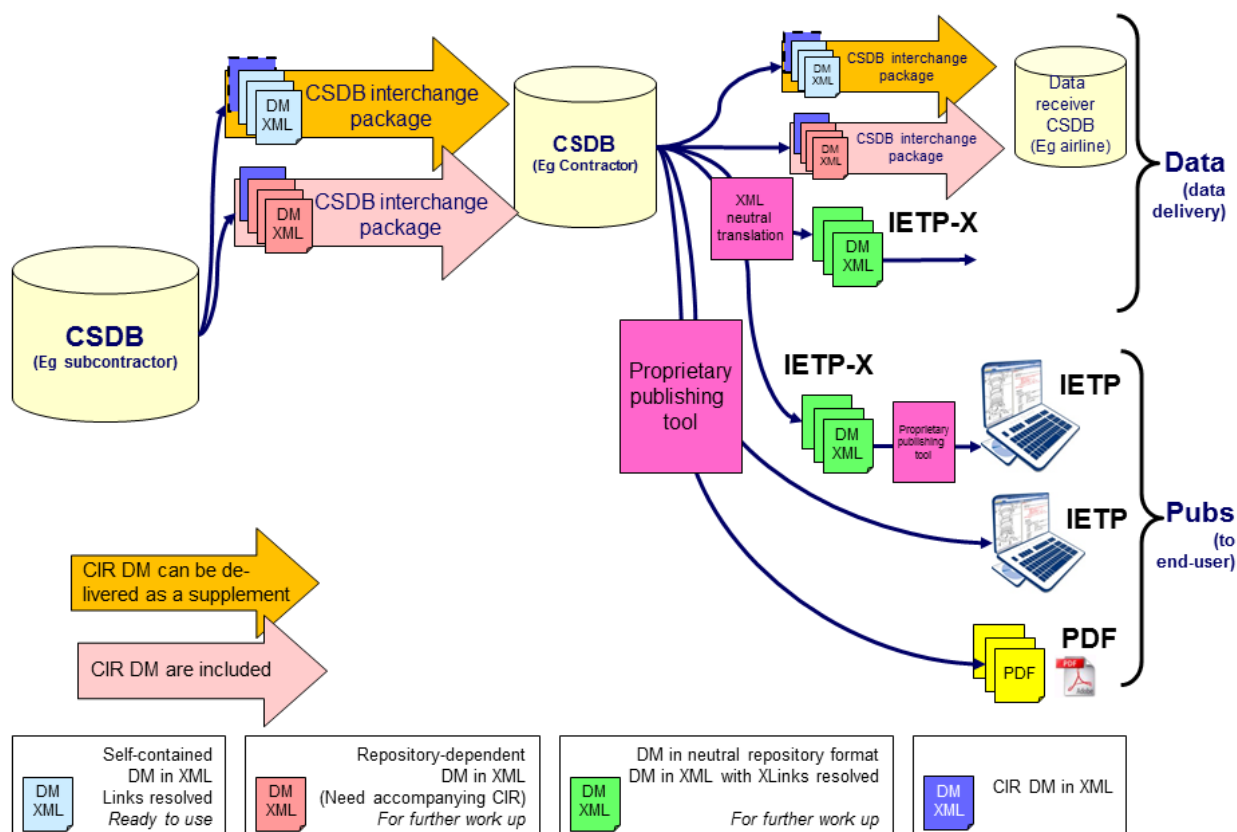

## 5.3 Delivery with and without CIR

The exchange of data modules can be done based on self-contained or on CIR-dependent data modules.

An interchange (transfer) package of CIR-dependent data modules must be accompanied with the relevant CIR.

An interchange package of self-standing data modules does not necessarily include any CIR. However it can be useful to exchange CIR between partners (subcontractor and contractor) to have consistent data for supplies, support equipment, warnings and cautions.

[Fig 2](#) shows the interchange of data between different CSDB. It also briefly shows the "data transfer" from a CSDB to an end user IETP via the neutral IETP-X format described in [Chap 7.4.1](#).

ICN-S3627-S1000D0602-002-01

Fig 2 Delivery methods for technical publications - Detailed view

## 6 Reading conventions

### 6.1 General

Throughout the S1000D specific conventions are used to aid common understanding and to minimize duplication. These conventions are:

Available for projects

SNS and attribute values that are available for projects or organizations to give their own specific definitions.

Not available for projects

SNS, information codes and attribute values that are not available for projects or organizations to give their own specific definitions. Projects or organizations can apply for formal definitions by the normal CPF process.

M	<p><b>Mandatory</b></p> <p>The attribute affected must be given in the data module and the required entries in the construct must be populated.</p> <p><b>Note</b></p> <p>(M) is used in some chapters to, for example, explain the use or presentation of specific data.</p>
O	<p><b>Optional</b></p> <p>The attribute affected can be omitted if a project or organization decides.</p> <p><b>Note</b></p> <p>(O) is used in some chapters to, for example, explain the use or presentation of specific data.</p>
(D)	<p><b>Default value</b></p> <p>The affected markup value is the default value.</p>
enterprise/company	<p>Enterprise is used as the generic term when a company and/or organization is referred to. Company is used as a synonym to enterprise when a business organization is referred to.</p> <p>The term manufacturer (Product manufacturer, equipment manufacturer, aircraft manufacturer) and supplier are used when needed in context only. These rules are being successively introduced in S1000D.</p>
must	<p>Mandatory to follow the given rules.</p>
name	<p>The name of a "thing" such as a part, a component, an assembly. Sometimes called description, nomenclature or designation. Name is used consistently throughout S1000D.</p>
can, could	<p>Options to be followed by project or organization decision.</p>

## 6.2 Permissible characters in codes and numbers

Throughout the S1000D the following definitions on permissible characters (alphas and numbers) when used in codes (eg, data module codes, publication module codes, learn codes, learn event codes, data management lists) and numbers (eg, issue numbers) are given below.

### 6.2.1 Alpha characters

The code abbreviation is "A".

The permissible characters are:

- "A" thru "Z" in uppercase. It is recommended that the use of "I" and "O" is avoided.

### 6.2.2 Numeric characters

The code abbreviation is "X".

The permissible characters are:

- "0" thru "9"

#### Note

"NN" is frequently used to indicate a numerical sequence starting from "00" or "01". Details for the interpretation are given where used in the specification.

### 6.2.3 Alphanumeric

The code abbreviation is "Y".

The permissible characters are:

- "0" thru "9"
- "A" thru "Z" in uppercase. It is recommended that the use of "I" and "O" is avoided.

#### 6.2.4 Specific alpha character values

When an alpha character is given in a data module code that is intended to indicate a value, it is presented by underlining the character. For example, A means the value "A" and not an alpha character. "A" means an alpha character and not the value "A".

#### 6.2.5 Use of the alpha characters "I" and "O"

**Business rule decision point BRDP-S1-00001 - Use of "I" and "O":**

- Decide whether and when to use the alpha characters "I" and "O".

## 7 Use of, and application for CAGE codes

The specification uses CAGE (Commercial And Government Entity) codes to uniquely identify enterprises and organizations. The values of some elements and attributes mandate that a registered CAGE code is used, for example, when using the identification extension in **DME** and **PME** (refer to [Chap 4.12](#)), when using the CAGE code based **ICN** (refer to [Chap 4.4](#)), when using **data management lists** (refer to [Chap 4.5](#)) and when commenting using the **Commenting Schema** (refer to [Chap 4.6](#)). To perform a **file based transfer** (refer to [Chap 7.5.1](#)) you also need a CAGE code.

As it is essential to uniquely identify parts in many cases, the specification bases the identification of those parts on the CAGE code.

**Business rule decision point BRDP-S1-00002 - List of permitted CAGE codes and/or names to be used for the technical publication project:**

- Create a list of permitted CAGE codes and/or names of the enterprises.

Enterprises and organizations that do not have a CAGE code, can apply for a code at their National Codification Bureau (NCB) or at:

NSPA  
S2000M Administrator  
L-8325 CAPELLEN  
G.-D. Luxembourg  
Email: [Spec2000M@nspa.nato.int](mailto:Spec2000M@nspa.nato.int)

## 8 Acronyms

Throughout the S1000D common acronyms are used to aid understanding and to minimize duplication. These acronyms are:

2D	Two Dimensional
3D	Three Dimensional
ASD	AeroSpace and Defense Industries Association of Europe
ATA	Air Transport Association
BREX	Business Rules Exchange
CAGE	Commercial And Government Entity
CGM	Computer Graphics Metafile

CIR	Common Information Repository
CPF	Change Proposal Form
CSDB	Common Source DataBase
CSN	Catalog Sequence Number
IC	Information Code
ICN	Information Control Number
IETP	Interactive Electronic Technical Publication
IPD	Illustrated Parts Data
LMS	Learning Management System
LOAP	List of Applicable Publications
LOM	Learning Object Metadata
LSA	Logistic Support Analysis
PDF	Portable Document Format
PLCS	Product Life Cycle Support
QA	Quality Assurance
SCO	Sharable Content Object
SGML	Standard Generalized Markup Language
SCORM	Sharable Content Object Reference Model
SNS	Standard Numbering System
XML	Extensible Markup Language

A list of all acronyms is given in [Chap 9.2](#).

## 9 Organization of S1000D

S1000D is organized into nine chapters, which are described briefly below.

*Table 2 S1000D structure overview*

Chapter	Title	Description
<a href="#">Chap 1</a>	Introduction to the specification	History, scope of the specification, basic definitions and change procedure
<a href="#">Chap 2</a>	Documentation process	Overview of the documentation process, implementation guide, business rules concept and relation with other specifications
<a href="#">Chap 3</a>	Information generation	General rules which apply to technical publications that are produced on the basis of data modules and CSDB concepts

Chapter	Title	Description
<a href="#">Chap 4</a>	Information management	Data module structure, rules for interchange and updating of data modules. Concepts for using BREX, process data modules, master - customized data modules, applicability and optimizing and reuse of information
<a href="#">Chap 5</a>	Information sets and publications	Common and specific requirements for information sets and publications
<a href="#">Chap 6</a>	Information presentation/use	Information presentation and functionality for page oriented publications, and IETP
<a href="#">Chap 7</a>	Information processing	Information for the information systems specialists, including Schemas, graphic and notation specifications, resources, resolutions and interchange conventions
<a href="#">Chap 8</a>	SNS, information codes and learn codes	The listings and definitions of the maintained system/functional breakdown structures, the information codes and the learn codes
<a href="#">Chap 9</a>	Terms and definitions	Glossary of terms and abbreviations, subject index and definitions for XML data elements

## 9.1 General breakdown of chapters

In general, all chapters are structured as follows:

- At the beginning of the chapter, there is a table of references that occur in the chapter.
- [Para 1](#) gives a general introduction.
- [Para 2](#) is the main body of the chapter. The main body can be broken down into several main content paragraphs. The paragraph also gives all business rules described in their context.
- [Para 3](#) contains the markup examples, if any. Short/simple examples can also be found in the main body paragraphs.

## 9.2 Chap 1 - Introduction to the specification

This chapter provides general information about the specification. The scope of the specification, how to use it, how to tailor it and the way to address change request are explained.

## 9.3 Chap 2 - Documentation process

This chapter explains the generic documentation process. It provides an overview of the documentation process including the use of information technology and the relation to other processes and specifications as for instance S2000M and PLCS. Thru the process diagram, a reference to the corresponding chapters is also defined.

[Chap 2.5](#) contains definition of business rules and addresses various aspects of business rules such as their classification into categories, layering, generation and use. An index of all identified business rules decision points is given in [Chap 2.5.3](#).

## 9.4 Chap 3 - Information generation

This chapter provides general rules which apply to technical publications that are produced on the basis of data modules and CSDB concepts. This chapter is primarily in support of authors and illustrators.

All data modules have a basic structure which is defined in [Chap 3.2](#).

Information sets are used to establish the required scope of the information and data module coding strategy. The use of these information sets is fully defined in [Chap 3.3](#).

The rules for zoning and access are given in [Chap 3.4](#).

The issues surrounding the updating of data modules are explained in [Chap 3.5](#).

The rules for the allocation for the protective marking of data modules that reflects their security classification, etc, are detailed in [Chap 3.6](#).

During the development and update of data modules/publications, QA procedures are required to ensure that the contents of the data modules/publications are adequate and technically accurate. Details of these procedures are given in [Chap 3.7](#).

In order to reflect the potential breakdown of equipment, rules for disassembly are detailed in [Chap 3.8](#).

All data modules are produced in accordance with structural rules. Authoring rules for text, illustrations and multimedia, together with front matter and warnings, cautions and notes, reinforces these structural rules which are supported by specific guidance for authoring data modules including the learning content types. These rules are given in [Chap 3.9](#).

The chapter also includes the rules for populating the supporting data module types:

- common information repository data modules
- container data modules
- the data modules supporting the applicability model given in [Chap 4.14](#)

In all cases, the rules given in all chapters in this specification take precedence over the Schemas.

### Note

The Schemas, in some constructs, allow more than is given in the narrative of the specification due to simplified Schema design and reduced maintenance.

## 9.5 Chap 4 - Information management

The data module code structure, rules for interchange and updating of data modules are presented. This chapter is provided in support of the project data module, illustration, publication and SCORM Content Package Module (SCPM) management.

Information management comprises the addressing, storage and handling of information objects such as data modules ([Chap 4.2](#)), illustrations and publications to enable the production and use of common technical documentation within a project.

This chapter contains the required information to establish an information database, called the CSDB ([Chap 4.2](#)), to interchange the data ([Chap 4.8](#)) and to handle publications ([Chap 4.9](#)) and training content packages ([Chap 4.15](#)) derived from the CSDB.

It also gives details about the coding of data modules ([Chap 4.3](#)) and their associated illustrations and multimedia information ([Chap 4.4](#)). It describes data management lists ([Chap 4.5](#)) used for planning, management and control of CSDB content, and defines the handling of comments on data modules and publications ([Chap 4.6](#)). The means to enable version control ([Chap 4.7](#)) of data modules, publication modules and SCORM content package modules are also described in this chapter.

The BREX ([Chap 4.10](#)) its use and the development of a project specific BREX and the use of the process data module ([Chap 4.11](#)) is explained.

Managing a multi-customer environment is described in the master-customized concept ([Chap 4.12](#)).

The chapter also includes the concept of optimizing and reuse of data ([Chap 4.13](#)). Optimizing and reuse includes handling of significant data within a data module and a mechanism to group properties related to different technical information types with the aim to reduce redundant information and to increase support consistency (the CIR data module concept). A production management mechanism to associate several data modules representing the same data with different product configuration (the container data module concept) is also described.

An applicability model is presented which can be used at many different levels, from simple to very complex. The model is capable of supporting from a static textual output to a dynamic output that is filtered for the actual configuration of the product instance. An overview and functional capabilities of the applicability model are explained ([Chap 4.14](#)).

[Chap 4.15](#) supports the aggregation of learning content used for training and performance products. This support is managed thru the use of the SCORM content package module. The SCPM document structure is based on the SCORM Content aggregation model. The SCORM content package module schema allows courseware developers to collect learning and maintenance modules into training products. The SCPM is mainly used to assist in the preparation of S1000D training materials for presentation by an SCORM compliant Learning management system.

[Chap 4.16](#) explains how to manage a dedicated markup for content specific (technical information and paragraph significant data) and quantity data, with the aim of enabling enhanced processing and/or display of the information.

## 9.6 **Chap 5 - Information sets and publications**

This chapter contains common and specific requirements for information sets and publications, necessary to operate and maintain the Product. This chapter is primarily provided for project publication procurement, management, authors and illustrators.

An information set is the required information needed in a defined scope and depth (author's view), in the form of data modules, managed in the CSDB.

A publication is the compilation and publishing of information for a customer (user's view). This can be an IETP, a paper publication compiled from data modules or a publication with legacy data. It can be a subset of or equal to an information set, but it can also be a superset of several information sets or parts of them.

Requirements for information sets are given in [Chap 5.2](#) and for publications in [Chap 5.3](#).

## 9.7 **Chap 6 - Information presentation/use**

This chapter provides information presentation and use rules for page-oriented publications ([Chap 6.2](#)), and IETP ([Chap 6.3](#)). The functionality matrix for page oriented publications, both paper and screen based, together with the display of information in a non-linear fashion, are explained in [Chap 6.4](#). This chapter is mainly provided in support of project publication procurement, management, authors, illustrators and information technology specialists.

## 9.8 **Chap 7 - Information processing**

This chapter describes the technical aspects of the Schemas, graphics and notations together with information interchange, resolution of resources and software requirements.

---

**9.9 Chap 8 - SNS, information codes and learn codes**

This chapter gives a description of a common SNS and the information codes used in the data module code.

The S1000D maintained set of SNS is given in [Chap 8.2](#) for air vehicles, engines and equipment, tactical missiles, support equipment general land and general sea Product.

[Chap 8.3](#) refers to examples of SNS (eg, power provision, artillery radar, software, medical and technical publication projects). These example SNS are given on the S1000D website ([www.s1000d.org](http://www.s1000d.org)).

The detailed definitions of the information codes are given in [Chap 8.4](#) and the learn/training codes are given in [Chap 8.5](#).

**9.10 Chap 9 - Terms and definitions**

This chapter provides a glossary of terms ([Chap 9.2.1](#)), abbreviations and acronyms ([Chap 9.2.2](#)) used within S1000D. A subject index is also included ([Chap 9.2.3](#)). The definitions for XML data elements are given in [Chap 9.3](#).

#### 1 General

This chapter gives a basic introduction to business rules and where to find information to tailor S1000D for a specific project or organization.

#### 2 Content

This specification has been produced to cater for many different types of products. Therefore, to make it suitable for a given project or organization, some aspects of tailoring will be required. It is recommended that the tailored version of this specification is referred to in the project's contractual documentation. This tailoring must not affect the XML Schemas or its basic philosophies, but must be restricted to tailoring within the narrative specification.

Project business rules must be agreed between parties to document the details of the agreed tailoring of this specification. These rules must cover the requirements for optional elements, their population from specific data sources, and the use of specific values.

[Chap 2.5](#) defines the term "business rules" and describes the standardization of the business rules scope within S1000D. [Chap 2.5.1](#) groups various business rules into categories and introduces the construct of business rules layers that describe various organizational and project levels at which business rules are produced. [Chap 2.5.2](#) addresses the mechanisms of business rules generation and use. [Chap 2.5.3](#) contains a complete index of business rule decision points.

[Chap 4](#) includes a description of the BREX mechanism provided to record and exchange specific business rules between parties involved in a project.

[Chap 3](#) thru [Chap 8](#) give guidance on the project and/or organization specific business rules decisions.

**Chap 1.4.2**

## 1 Introduction

Implementing S1000D for an organization or a project involves tailoring of the specification. In making such tailoring it is necessary to know the type and degree of tailoring that is acceptable without leaving the S1000D concept. This chapter gives the criteria which constitute the definition of conformance and compliance to S1000D Issue 4.2. The criteria do not necessarily extend into future issues.

## 2 Conformance and compliance

### 2.1 Background and basics

S1000D provides a complete process and a set of supporting tools, such as predefined structures/XML Schema for representing different types of information. The degree of adherence to the process and tools specified by S1000D is expressed in terms of compliance and conformance to the specification.

Requirements related to conformance and compliance only apply to information exchange and delivery. The specification does not identify how a certain process step or object is handled inside a producing environment, before exposure to an external environment.

#### 2.1.1 About certification

While S1000D defines what S1000D conformance and compliance means, it does not formally certify or endorse any third party S1000D objects, processes, software or other information products.

### 2.2 Definitions

In this context, the definitions in [Para 2.1.1](#) thru [Para 2.2.3](#) apply.

#### 2.2.1 Definition of conformant/conformance

"Conformant" and "conformance" refer to the similarity in form of one or another object to the specification of how such an object must be formed.

Definition: An object, or a set of related objects, is conformant to S1000D if and only if it fulfills the form requirements of such an object, as specified by S1000D (eg, a data module can be conformant).

#### 2.2.2 Definition of compliant/compliance

"Compliant" and "compliance" refer to the adherence to one or another process or procedure as defined by a specification.

Definition: A process step, a procedure, or the like, is compliant to S1000D if and only if it is carried out in accordance with what is specified by S1000D, and does not violate the criterion in [Para 2.2.1](#) (eg, the assignment of codes to denote responsible partner companies can be compliant).

#### 2.2.3 Definition of CSDB, CSDB management system and CSDB object

For definitions of the terms CSDB, CSDB management system and CSDB object. Refer to [Chap 4.2](#).

### 2.3 Criteria

S1000D provides rules, guidance and tools covering various aspects of the documentation process. Within each aspect, the functionality is offered as a set of functions and provisions, and a set of object types.

Some requirements concerning a specific aspect can be crucial to obtain commonly comprehensible S1000D information. These requirements form a core of criteria which characterizes S1000D conformant objects and compliant processes.

In addition to the core criteria there are a number of S1000D aspects for which the specification offers a choice to the user of the specification between, on one hand, applying the provisions it offers or, on the other hand, replacing them by an alternative solution.

The S1000D aspects, for which conformance/compliance criteria can be defined, are:

- General, overall properties
- The documentation process
- The CSDB and the CSDB objects that it contains
- Exchange of data between CSDB
- Delivery and presentation of information to users in page-oriented format
- Delivery and presentation of information to users as IETP

To reflect the situation described above, the conformance and compliance criteria defined below is organized as follows:

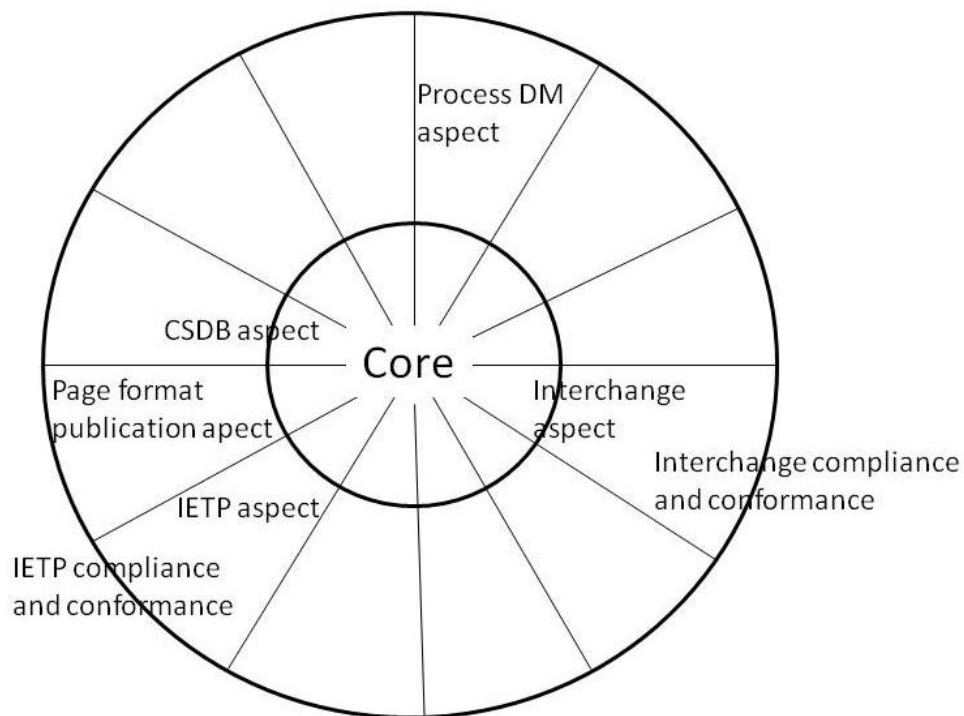

1 Core criteria

These criteria must be fulfilled to achieve S1000D conformance and compliance. Refer to [Para 2.3.1](#).

2 Criteria on aspect options

In order to achieve conformance and/or compliance regarding the aspects concerned, certain criteria that must be fulfilled per aspect. The aspects themselves, however, can be fully or partially optional. Refer to [Para 2.3.2](#).

An aspect covers a certain functional area such as the generation of IETP, CSDB management, etc. Refer to [Fig 1](#).

ICN-N4701-AASER00008-001-01

Fig 1 Simplified illustration of aspect core vs aspect options

### 2.3.1 Core criteria

CSDB objects are S1000D Core conformant and related processes are S1000D Core compliant if and only if they meet the criteria given below.

#### 2.3.1.1 General criteria

A CSDB object that fulfills the criteria herein in relation to Issue 4.2 of S1000D is "conformant to S1000D Issue 4.2" (or "S1000D Issue 4.2 conformant").

#### Note

Graphics and multimedia objects can potentially be conformant to several S1000D issues, since they are not controlled by the Schemas of a given S1000D issue.

#### 2.3.1.1.1 Schemas verses specification text

S1000D properties for process, objects, etc, are defined in the specification text. XML object structures are defined by schemas.

#### Criterion regarding adherence to Schema and specification text:

An S1000D conformant XML object must meet the requirements defined by the applicable specification text and by the referred XML Schema. Unless explicitly supported by S1000D, an XML object must not depend on namespaces or any other XML data and feature to be fully understandable and possible to render as needed.

#### 2.3.1.1.2 Business rules

#### Criterion regarding Business rules:

The business rules for a project or an organization must be defined, documented and provided to any party that needs to receive, create, manage or deliver CSDB objects to those rules.

Business rules valid for a certain level in a layered business rules structure must obey the parent level business rules. Ultimately, business rules for a project or an organization must obey the business rules specified in the S1000D default BREX data module.

A CSDB object must adhere to the business rules to which it is written and/or to which it refers.

#### 2.3.1.2 Documentation process criteria

##### **Criterion regarding documentation process:**

To be S1000D documentation process compliant a documentation process must at a minimum fulfill the requirements described in [Chap 3.9.5.1](#) (including subchapters) with regard to:

- Requirements for published and unpublished versions of objects
- Security and data restriction requirements
- Quality assurance requirements

#### 2.3.1.3 CSDB and the CSDB object criteria

##### 2.3.1.3.1 *CSDB objects, general*

##### **Criteria regarding conformance to Schema:**

Any of the XML objects in a CSDB must fully conform to one of the Issue 4.2 Schemas provided by S1000D (as given in the CSDB object's Schema declaration).

Refer to default the BREX rules BREX-S1-00027, BREX-S1-00028 and BREX-S1-00246, BREX-S1-00247, BREX-S1000D-00248, BREX-S1000D-00249 and BREX-S1-00250.

Any one XML object must contain a reference to an S1000D XML Schema, the structure of which it is aimed to follow as described in the specification. Refer to [Chap 7.3.1.3](#).

##### 2.3.1.3.2 *CSDB object identification and status*

##### **Criteria regarding Identification of objects:**

The identity of a CSDB object, including objects not being S1000D recognized XML objects, must fully conform to the identification data structure that applies to its object type.

Apart from the exceptions offered by the specification, the identification principle of a data module code must be applied to a data module. The identification must be built on two parts:

- The first part identifies the product item (up to and including the disassembly code variant)
- The second part identifies the type of information about the item

##### **Criterion regarding identification codes:**

A CSDB object is S1000D conformant if and only if it does not deviate from the coding schemes offered by the specification.

##### **Criterion regarding status of objects**

All XML objects exchanged from a CSDB must be populated with the set of status/metadata items required by the applied issue of S1000D.

##### 2.3.1.3.3 *CSDB object content section*

##### **Criterion regarding use of elements and attributes:**

An S1000D conformant object must use the elements and attributes in accordance with the definitions expressed in S1000D including the referred XML Schema and the default BREX.

#### 2.3.2 **Criteria on aspect options**

The criteria below all relate to functional aspects of S1000D which are optional. Thus, it is possible to be S1000D core compliant/conformant but choose not to be compliant/conformant with regard to various options described in the specification.

However, in order to reach S1000D conformance and/or compliance in any of the listed aspects the criteria for that aspect must be fulfilled.

Aspects not explicitly covered by the specification do not influence the degree of conformance and compliance. Further, where there is a decision point identified in the specification, projects can do whatever is within the bounds of the decision point and still be compliant/conformant.

**Criterion related to process:**

To be S1000D process compliant, a documentation process must apply:

- DMRL/CSL objects in accordance with [Chap 4.5](#)
- comment objects in accordance with [Chap 4.6](#)

**Criterion related to transfer:**

An S1000D conformant data transfer package must fulfill all the applicable requirements specified in [Chap 4.8](#) and [Chap 7.5](#).

**Criterion related to a CSDB delivery:**

An S1000D conformant CSDB data delivery package is a data package defined and transferred in accordance with [Para 2.3.1.3](#), [Chap 4.8](#) and [Chap 7.5](#).

**Criterion related to an IETP delivery:**

An S1000D conformant IETP data package is a data package defined and transferred in accordance with [Para 2.3.1.3](#) and which consists of objects conformant to IETP neutral repository format specified in [Chap 4.8](#), [Chap 7.4.1](#) and [Chap 7.5](#).

**Criterion related to page-oriented format publication:**

An S1000D conformant and compliant page-oriented format data package must fulfill the requirements specified in [Chap 6.2](#) of the specification.

**Criterion related to IETP presentation:**

An S1000D conformant and compliant IETP presentation must fulfill the requirements specified in [Chap 6.3](#) of the specification.

## Chapter 1.5

## 1 General

Proposals to amend S1000D must be submitted in the full knowledge that all users, both military and industrial, can be affected by changes to the specification, and will be accepted only under international agreement.

The maintenance of this specification is vested in the S1000D Steering Committee who will obtain agreement from the participating organizations prior to publication of changes. The S1000D Steering Committee considers change proposals at each meeting and can ratify them for incorporation in the specification. The S1000D Steering Committee also decides when changes will be published in S1000D.

Any queries or proposals relating to changes to the specification must be addressed to the S1000D Steering Committee using the online CPF facility which can be found at [www.s1000d.org](http://www.s1000d.org).

Proposals from the S1000D member nations and organizations must follow the process outlined below.

Copies of the specification can be obtained at [www.s1000d.org](http://www.s1000d.org).

## 2 Online change proposals

### 2.1 Convention

The online change proposal facility uses two conventions for CPF, which are explained in detail on the web site:

Proposal A CPF that is in draft

CPF A CPF that is formally submitted to the S1000D Steering Committee

### 2.2 Tiers

There are two tiers to the online CPF facility. These are explained in detail on the web site. The lower tier is used for drafting proposals and the upper tier is used for S1000D Steering Committee review of formal CPFs. The upper tier is available for public view, so that members can see what changes are being proposed.

### 2.3 Groups

Access to the lower tier is obtained by being a member of a group. Groups are made up by nation and organization and comprise their members. A CPF can only be submitted by these groups. It is possible to be a member of more than one group. See your national or organizational representative, which are listed on the web site, to become a member of a group.

### 2.4 Roles

Within each group, only the administrator role can promote a draft CPF to a formal status of "New" for the S1000D Steering Committee to review.

### 2.5 CPF cycle

#### 2.5.1 Creation

There is a process that is explained in detail on the web site. This creates the proposal in the national or organizational lower tier.

#### 2.5.2 Workflow

There are two types of workflow:

- Pre-submittal
- S1000D Steering Committee

##### 2.5.2.1 Pre-submittal workflow

The pre-submittal is where draft proposals are developed. Group administrators can set pre-submittal statuses to suit their own group's workflow.

##### 2.5.2.2 S1000D Steering Committee workflow

The S1000D Steering Committee workflow moves through the statuses that are defined on the website.

#### 1 General

The relationship between the S1000D process and processes from other specifications and standards such as S2000M, ISO 10303 AP 239 (PLCS) and SCORM is briefly addressed here.

#### 2 S2000M

Both S1000D and S2000M use the same rules for model identification coding. They also both use the same illustration rules as defined in [Chap 3.9.2](#).

There are two methods for producing an IPD, historically known as the Illustrated Parts Catalog (IPC):

- the "traditional" method (ie, compilation by authors from parts source data or generated/supported from project specific parts databases)
- the extraction from an S2000M database

These methods are described in detail in [Chap 3.9.5.2.7](#) and [Chap 5.3.1.3](#).

### 3 ISO 10303 AP 239 - PLCS

A set of data exchange specifications to establish the relationship between S1000D and PLCS is under development.

### 4 SCORM

The relationship between S1000D and SCORM has been established so that training content can be developed using the data module concepts of S1000D. Specifically, the learning data module captures five different learning information types, and the SCO content data module corresponds to the sharable content objects of SCORM. Refer to [Chap 3.9.5.2.13](#). Also, to provide the link to the SCORM LMS, connectivity is provided thru the LOM in the SCORM content package module.

Information about SCORM can be found at [www.adlnet.gov](http://www.adlnet.gov).

<a href="#">Chap 2.5.2</a>	Business rules - Generation and use
<a href="#">Chap 2.5.3</a>	Business rules - Index

## 1 General

The goal of this chapter is to categorize various types of information contained in business rules specified by a project or an organization. This chapter also addresses the standardization of S1000D business rules generation and use within an S1000D project.

[Chap 2.5.1](#) introduces and explains business rules categories and layers.

[Chap 2.5.2](#) describes the methods for business rules generation and use.

[Chap 2.5.3](#) contains an index of all identified business rule decision points.

## 2 Business rules

### 2.1 Definition

Business rules are decisions that are made by a project or an organization on how to implement S1000D. Business rules cover all aspects of S1000D and are not limited to authoring or illustrating. They can also address issues that are not defined in S1000D such as rules related to how S1000D interfaces with other standards, specifications and business processes that are related to its implementation.

### 2.2 Business rules decision points

Throughout the specification, in particular the authoring chapters, business rule decision points have, wherever possible, been identified. However, in many cases, there could be places where

---

no BRDP was identified but a decision must still be made. Projects and organizations must still decide for themselves whether certain business rule decisions must be made in these cases.

## 1 General

This chapter gives the concepts of business rules categories and layers that exist in S1000D.

Grouping business rules into categories will help projects and organizations to differentiate between, and understand, the relevance of various business rules, as well as to be able to group them in certain classes. This classification is made to help standardize business rules scope.

S1000D recognizes that a number of decisions related to its implementation are made not only on a project level but often also on an organizational level (eg, national Ministries or Departments of Defense (MoD or DoD), international consortia such as Civil Aviation Working Group (CAWG)). The structure and content of business rules between projects and various organizations can differ considerably.

In support of the business rule categories, a layered model of business rules is introduced.

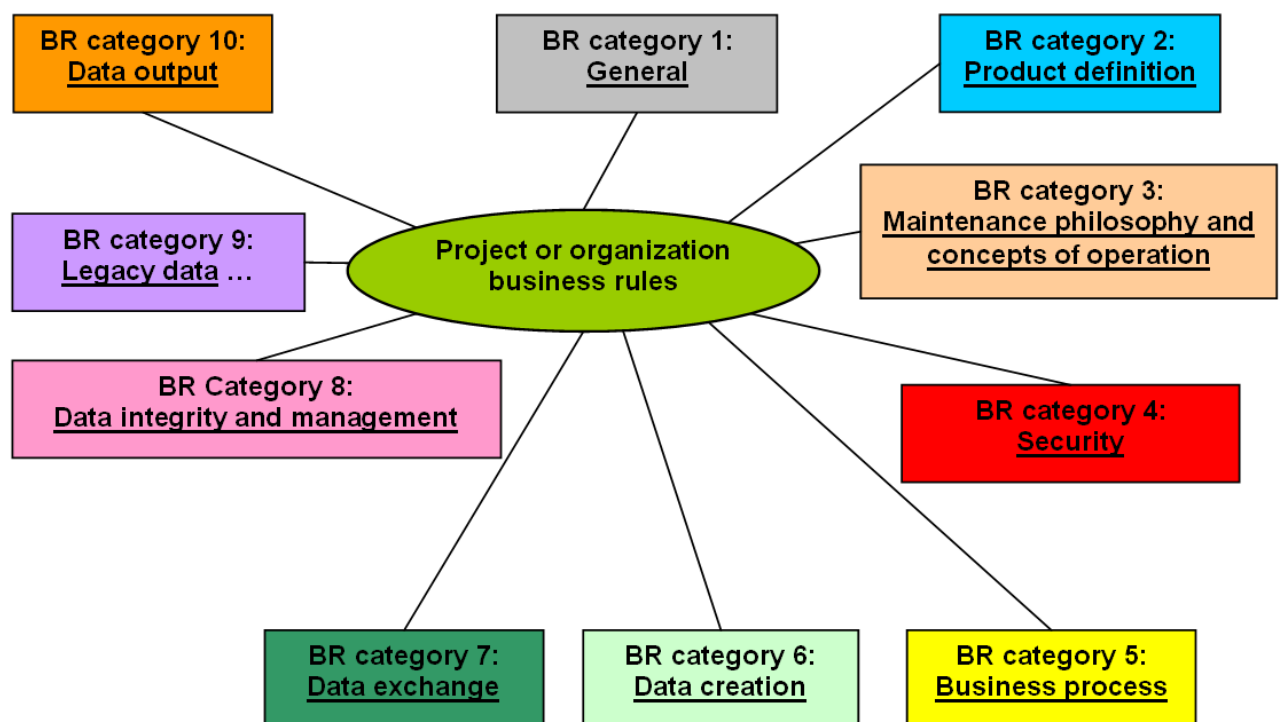

Introduction of the layered model implies that business rules can be written not only for a project but also for an organization. Various layers of business rules can also be arranged in a certain hierarchy that is appropriate for the implementation. Each layer of this hierarchy represents some of the business rules decisions to be made by a project or an organization.

It is possible that business rules on different layers contain redundant and/or conflicting business rules. Additionally, the layered structure of business rules usually has a tree-like structure rather than a one-dimensional layered form. Any change in a higher level business rule required by a lower level of the business rules hierarchy can be in conflict with the related business rules of the other layers. [Para 5](#) of this chapter points out various conflicting aspects in business rules creation and provides guidance as well as recommendations to avoid these conflicts.

## 2 Business rules categories

A business rules category is a unique grouping that describes rules applicable to product definition, maintenance philosophy, concepts of operation, security, business processes, data creation, data exchange, data integrity, data output and/or legacy data conversion, management, handling and other issues.

Ten different business rule categories have been identified. These categories are defined to ensure that business rules developers consider all major business rules decisions within S1000D. Each sample business rule is assigned to one business rules category. Some business rules can belong to one or more categories. Apart from that, the business rule categories cannot be considered in isolation from each other. They relate to and complement each other (eg, data exchange, data integrity and management business rule categories as shown in [Para 2.8](#), as well as data creation and data output business rule categories as shown in [Para 2.10](#)). The business rule categories are identified in [Fig 1](#).

ICN-83007-S1000D001-001-01

Fig 1 Business rule categories

The examples given after the definitions of each business rules category in [Para 2.1](#) thru [Para 2.10](#) are not exhaustive and are only intended to provide the reader with a guide how these categories of rules can be covered. The word "must" means in this example that a certain business rule must be followed only by this particular example project or organization.

## 2.1 Business rules category 1 - General business rules

### 2.1.1 Definition

General business rules cover all decisions made by a project or organizations that are not covered by any of the specific business rule categories below. They serve as overall decisions for the implementation of S1000D.

These decisions include but are not limited to:

- decision on which issue of S1000D to be implemented
- identification of the parts of S1000D to be used and implemented in the project
- definition of terms used throughout the project, so there is a clear understanding of their meanings

### 2.1.2 Examples

- **Decision example on an organizational level:** The technical documentation of all new vehicles must be produced to S1000D Issue 4.0 or higher.
- **Decision example on a project level:** The whole technical documentation in this project must be realized on the basis of S1000D Issue 2.1. Exceptions/Additions: Authoring rules for wiring will be adopted from S1000D Issue 2.2. Layout rules will be implemented on the basis of S1000D Issue 2.3.

### 2.1.3 Business rules category 1 - General

The following business rules are basic rules and must be decided upon before any other business rules can be addressed:

#### **Business rule decision point BRDP-S1-00003 - Issue of S1000D to be used:**

- Decide which issue or issues of S1000D to be used.

#### **Business rule decision point BRDP-S1-00004 - Information sets to be used:**

- Decide which information sets, given in S1000D and/or project specific, to be used.

#### **Business rule decision point BRDP-S1-00005 - Publications to be produced:**

- Decide which publications to be produced.

#### **Business rule decision point BRDP-S1-00006 - Schemas to be used:**

- Decide which Schemas to be used and in which information set they are to be used.

#### **Business rule decision point BRDP-S1-00007 - Use of optional elements and attributes:**

- Decide whether and how to use each optional element and attribute in its structural context.

#### **Business rule decision point BRDP-S1-00008 - Possible deliverables:**

- Decide on the possible deliverables, such as:
  - S1000D objects (eg, data modules, publication modules, illustration sheets and multimedia objects, data management lists) using file based transfer. Refer to [Chap 7.5.1](#).
  - Page-oriented publications and/or interactive electronic technical publications

---

## 2.2 Business rules category 2 - Product definition business rules

### 2.2.1 Definition

Product definition business rules cover the data module coding strategy related to how the Product is broken down (eg, physical or functional). Included is the definition of the model identification codes to be used in the Product and its subsystems. Supplier subsystems and identifications also need to be considered.

The project specific SNS is normally defined in conjunction with the product breakdown structures defined by engineering or design. The SNS specification is a set of information that is produced to detail these rules.

Applicability rules are also defined in this category.

Additionally, definition of zones and access points fall under this category.

To summarize, the product definition business rules include but are not limited to:

- model identification codes for the Product and its subsystems and components
- system difference code
- material item category code
- SNS specification (decision on which SNS scheme to be chosen or defined)
- disassembly code
- disassembly code variant
- applicability rules
- zoning rules
- access rules

### 2.2.2 Examples

- The rules for the data module coding strategy related to the product breakdown are defined in the project BREX data module
- The permissible model identification codes for this project are "1B" for airframe, "E2" for engine
- A list of SNS together with technical names and data module types is given in the data module with data module code DMC-YY-Y-YY- ...
- The rules for applicability are as follows:
  - The model of bicycle must be "Brook trekker" or "Mountain storm"
  - The version of bicycle must be "Mk1" or "Mk9"
  - The serial number must be "001" thru "999"
- The zones and access points follow the rules for zoning and access given in [Chap 3.4](#) or are detailed in a specific document for the Product defined here by the project

## 2.3 Business rules category 3 - Maintenance philosophy and concepts of operation business rules

### 2.3.1 Definition

Maintenance philosophy and concepts of operation business rules cover the types of information that a project or an organization requires. They include for example a list or detailed specification<sup>1</sup> of chosen information sets, an information codes specification which details the information codes, and information names that describe the data module content.

A definition of the required item location codes is also included.

---

<sup>1</sup> It is up to the project or the organization to decide where within this business rules category the detailed information is maintained.

The maintenance philosophy and concepts of operation business rules are determined by the contract (eg, is first, second and third maintenance level information to be delivered?).

Definition of these rules must be performed in conjunction with operation, maintainability, repair and other aspects of LSA.

The data module coding strategy for the definition of information codes, information code variants and item location codes is included in this category. This ensures that the information codes, information code variants and item location codes match with the product definitions for each level within the breakdown of the technical documentation decided upon within the general business rules category (business rules category 1).

Training and skill levels are also defined or identified by this category.

To summarize, the maintenance philosophy and concepts of operation business rules include but are not limited to:

- list of relevant information sets given in [Chap 5](#) or modified information sets
- detailed specifications of project specific information sets
- list or detailed specification of information codes and information names to be used in the project
- item location codes to be used
- specification of the depth of information to be delivered in accordance with the maintenance level
- matching the information codes and item location codes to the breakdown part of the data module code, as defined within the product definition business rules (business rules category 2)
- decision on how to apply information code variants
- training and skill levels

### 2.3.2 Examples

- A list of allowed information codes together with information names and data module types is given in ...
- The mapping between the breakdown part of the data module code (model identification code, system difference code, SNS, disassembly code and disassembly code variant) and the information part (information code, item code variant and item location code) of the data module code as well as the data module types is given in ...

## 2.4 Business rules category 4 - Security business rules

### 2.4.1 Definition

Security business rules cover all security issues and intellectual property rights. They include security classifications, copyright markings, use or disclosure restrictions, destruction instructions and any other data restrictions.

There are also issues concerning data creation access. For example in multi-partner projects, the Product is broken down into areas of responsibility. It is possible that the organization of the multiple partners means that write access can be provided only to the design authority of a data module.

The rules concerning data access during production must be considered here (eg, who is allowed to edit a data module or an illustration?). It is important that these rules are established first. These rules do not explain job roles, positions and accountability/responsibility but define which roles have what rights with respect to viewing, creating and modifying data.

Special consideration must be given to national security restrictions.

The creation of security business rules is performed using the project security instructions.

To summarize, the security business rules include but are not limited to:

- security classifications and the definitions of their use
- copyright markings
- use of disclosure
- destruction instructions and suitable methods
- national security restrictions
- specific project security instructions (if available)
- other restrictions
- specification of access to various "classes" of data modules

#### 2.4.2 Examples

- The values of the security classification attribute and their interpretation are listed in Table ...
- LP Compressor data modules must always be North Atlantic Treaty Organization (NATO) Restricted ...
- Inline security markings must not be used
- Only Company A's authors are allowed to edit/view data modules with responsible partner Company B when they are located in the Peterborough office
- Data modules marked "NATO Restricted" must not be exchanged with Company C

## 2.5 Business rules category 5 - Business process business rules

### 2.5.1 Definition

Business process business rules cover how technical publications development is coordinated with other disciplines within an organization or within the project level at that organization or the project as a whole. For example, they describe the rules and relationships with LSA, S2000M specification, compliant initial provisioning, engineering/design and training (eg, SCORM conformance).

The rules for QA must be considered as well as the interaction between the organization, its partners and suppliers.

When there is a requirement to produce training content using S1000D, rules must be established that satisfy both the content development needs of instructional designers (on the learning side) and the authors (on the maintenance and operation side) who support a common system.

In addition, business rules and processes must be established to ensure that instructional designers and technical writers collaborate to preplan for reusable content.

These rules also take into account the data module coding strategy to achieve:

- the optimal reusable data granularity for screen presentation in learning products and the system maintenance philosophy for presentation in IETP
- the development of maintenance, operational and learning content for use in interactive multimedia and simulations
- the process of developing the appropriate amount of data modules that meet the intended need of a SCO in SCORM
- the relationship between data module/publication module codes and the requirements for learning content registration

To summarize, the business process business rules include but are not limited to:

- input and output definition of other disciplines into technical publications
- order of project hierarchy for deliverables and input from subcontractors
- agreed upon workflow procedures between manufacturer, subcontractor and customer
- approved integration methods with external systems (eg, logistic databases)
- verification rules with respect to interaction between the organization, its partners and suppliers related to QA
- preplanning, reusability and interoperability rules

### 2.5.2 Examples

- When mapping LSA task codes to data module codes, the following rules apply ...
- Graphics extracted from CAD systems must use these parameters for use in publications ...
- When a data module is ready for exchange, it must receive a verification certificate from engineering. After this is received, mark the data module as first verified
- When the customer supplies a verification certificate, increment the issue number of the data module with issue type "status" and set QA to second verified
- The data module is ready for QA at this specific point and these are the steps to be followed for verification
- Initial provisioning data must be coded in conformance with S2000M Issue 6.0
- The values of the following elements and attributes in the IPD Schema must be imported from S2000M Issue 4.0, Chapter 1 Initial provisioning
- Training data modules must use only the following learn codes ...

## 2.6 Business rules category 6 - Data creation business rules

Data creation business rules give information about the creation of text, illustrations and multimedia objects.

The data creation business rules include:

- rules for creating textual data
- rules for creating graphics, 3D content and multimedia objects

### 2.6.1 Business rules category 6a - Data creation business rules - Text

#### 2.6.1.1 Definition

Text creation business rules consist of rules and guidelines (including terminology rules such as language and dictionaries, and the order of preference) for maximizing the amount of reuse that can be achieved within technical publications, and between technical publications and supporting training content.

Text creation business rules provide rules and guidance on how the technical and learning content is to be developed. They also specify for example, the use of dictionaries, how numbers must be expressed, how the author must refer to technical terms, how multimedia, maintenance, operational and learning content is to support IETP and training, and the establishment and use of a terminology database.

Markup business rules provide information about which markup elements and attributes must be used and populated. These rules are often project or organization specific.

To summarize, the data creation business rules for text include but are not limited to:

- writing rules (including terminology rules, use of dictionaries, rules for numbers, etc)
- markup rules
- requirements for text incorporation in multimedia objects

#### 2.6.1.2 Examples

- The Simplified Technical English (STE) dictionary, ASD-STE100, must be used.
- The list of technical terms is given in ...
- All fault data modules must have their fault codes listed in the fault code index
- Names used in the list of support equipment, list of spares and list of supplies must be the full name as specified in the S2000M database. When referring to these tools, spares or supplies in the procedure, use these corresponding names.
- The applicability block markup requirements are ...
- The element `<techStandard>` must not be used

## 2.6.2 Business rules category 6b - Data creation business rules - Illustrations and multimedia

### 2.6.2.1 Definition

Illustration and multimedia creation business rules cover the creation of illustrations and multimedia objects. They are divided into style, detail and data format.

Data style rules for illustrations and multimedia objects govern characteristics such as illustration sizes, use of color, line weights, fonts, projection methods (isometric or trimetric).

The rules for illustrations cover for example the use of hotspots.

Data format rules cover the formats in which the information must be stored. For a CGM illustration, this will cover the elements that are permitted (eg, coordinate types, polylines, restricted text). For raster images it can include the resolution and orientation. It is often difficult to separate style from format.

To summarize, the data creation business rules for illustrations and multimedia objects include but are not limited to:

- graphic style rules
- interactivity detail rules
- multimedia format rules
- linking rules

### 2.6.2.2 Examples

- The rules for 2D are ...
- The rules for 3D are ...
- Trimetric projection must be used for ...
- Photographs are permitted for ...
- Joint Photographic Experts Group (JPEG) format must be used for ...
- The image size must be ...
- Raster image resolution must be a minimum of 300dpi
- Simulations will be produced in Flash™

## 2.7 Business rules category 7 - Data exchange business rules

### 2.7.1 Definition

The rules for how data must be exchanged between partners and customers are covered in business rules category 7. This includes for example the use of data dispatch notes and how data management requirement lists as well as CSDB status lists are used. The rules in this category include how the S1000D file based transfer protocol is used, the frequency of data exchanges, if unverified data are exchanged, the rules for data module and graphic issue numbers, and the acceptance and rejection criteria.

To summarize, the data exchange business rules include but are not limited to:

- rules for use of data dispatch notes
- rules for the use of data management requirements lists
- rules for CSDB status lists
- rules for the usage of the file based transfer protocol
- agreement on the frequency of data exchanges
- rules for data module issue numbers
- rules for information objects coded with an ICN
- agreed to criteria for acceptance and rejection

#### Business rule decision point BRDP-S1-00009 - Frequency of data exchanges:

- Decide on the frequency of data exchanges.

**2.7.2 Examples**

- Data must be exchanged using the S1000D file based transfer method
- Comments and data management lists must be exchanged in separate packages
- The data dispatch note must conform to the following business rules ...
- Data module deliveries will occur once per calendar month
- Following each exchange, a CSDB status list must be produced and verified before any further exchanges can occur. The business rules for CSDB status lists are ...
- The exchange of unverified information is not allowed

**2.8 Business rules category 8 - Data integrity and management business rules****2.8.1 Definition**

Data integrity and management business rules enforce the referential integrity within the CSDB. Closely coupled with the data exchange business rules (refer to [Para 2.7](#)), they cover how data is managed by both the creator and the customer.

If necessary, this category can include rules defining processes for submission and acceptance of non-compliant data when suppliers are unable to produce S1000D compliant data.

The workflow business rules (both internal and external) and the rules for QA are also covered in this category. These are also connected to the data exchange business rules.

To summarize, the data integrity and management business rules include but are not limited to:

- workflow business rules (both internal and external)
- QA business rules

**2.8.2 Examples**

- Gaps in data module issue numbers are not allowed
- No data modules will be accepted unless all referenced illustrations are contained in the exchange package
- All data modules and graphics must pass the business rules criteria before they can be accepted

**2.9 Business rules category 9 - Legacy data conversion, management and handling business rules****2.9.1 Definition**

Legacy data conversion, management and handling business rules are quite separate from the other categories outlined above and can be considered (to some extent) as being outside of the scope of S1000D. They cover rules for converting data from say, an ATA iSpec 2200 project, to data modules and will vary from project to project depending on the format of the source data (word processor, paper, SGML, XML), and how the target data modules must be treated.

To summarize, the legacy data conversion business rules include but are not limited to:

- conversion rules including mapping between elements and attributes of source and target specifications
- rules for inclusion of legacy information in a technical publication

**2.9.2 Examples**

- Maintenance handbooks will be converted into data modules using the descriptive and procedural schemas
- The following ICN codes apply to the operator's handbook No. XYZ

**2.10 Business rules category 10 - Data output business rules****2.10.1 Definition**

Data output business rules specify the output formats for S1000D data. These formats can include page-oriented (eg, paper, pdf) formats, IETP formats, multimedia formats and SCORM

formats. The decision regarding which portion of the data will be published, and in what formats, must be agreed and written within these business rules.

These rules include details on how to style element and attribute content. The data creation business rules (especially for text, business rules category 6a) are strongly related to this business rules category. For example, the authors need to know in which elements there is generated text in order to avoid authoring redundancies and inconsistencies after publication generation.

Where required, a project functionality matrix is created according to the recommendations given by the S1000D functionality matrix (refer to [Chap 6.4](#)). Decisions made in completing a project functionality matrix will have direct impact on data output rules.

To summarize, data output business rules include but are not limited to:

- decisions regarding which portion must be in paper (or page-oriented) and which in IETP
- presentation rules for paper (or page-oriented) and IETP output
- decisions regarding which data modules will be output in SCORM format
- decisions regarding which data modules will be output in simulations
- look and feel business rules

#### 2.10.2 Examples

- The S1000D standard page-oriented layout in [Chap 6.2](#) must be used for page-oriented presentations
- For hardcopies printed from the IETP, the following time expiry message must be printed on inner margin of every page: "This page is a working copy. Must not be used after 2017-03-15".
- All learning data modules will be output in SCORM format
- Maintenance data will be incorporated into system simulations
- Warnings must be according to the symbolic warning type described in [Chap 6.2.2](#)
- Random list item elements that have prefix "pfXX" must have a 26 pt bullet character (&bull;) printed before the item or the first bullet of the item
- The page size for printed output is A4 and A3 for foldouts

### 3 Sequence of business rules generation

An exact timeline for project business rules production can be defined only by a project or an organization (by the latter often only to some extent). This specification can only give an example for the sequence of business rules elaboration. [Fig 2](#) presents such an example.

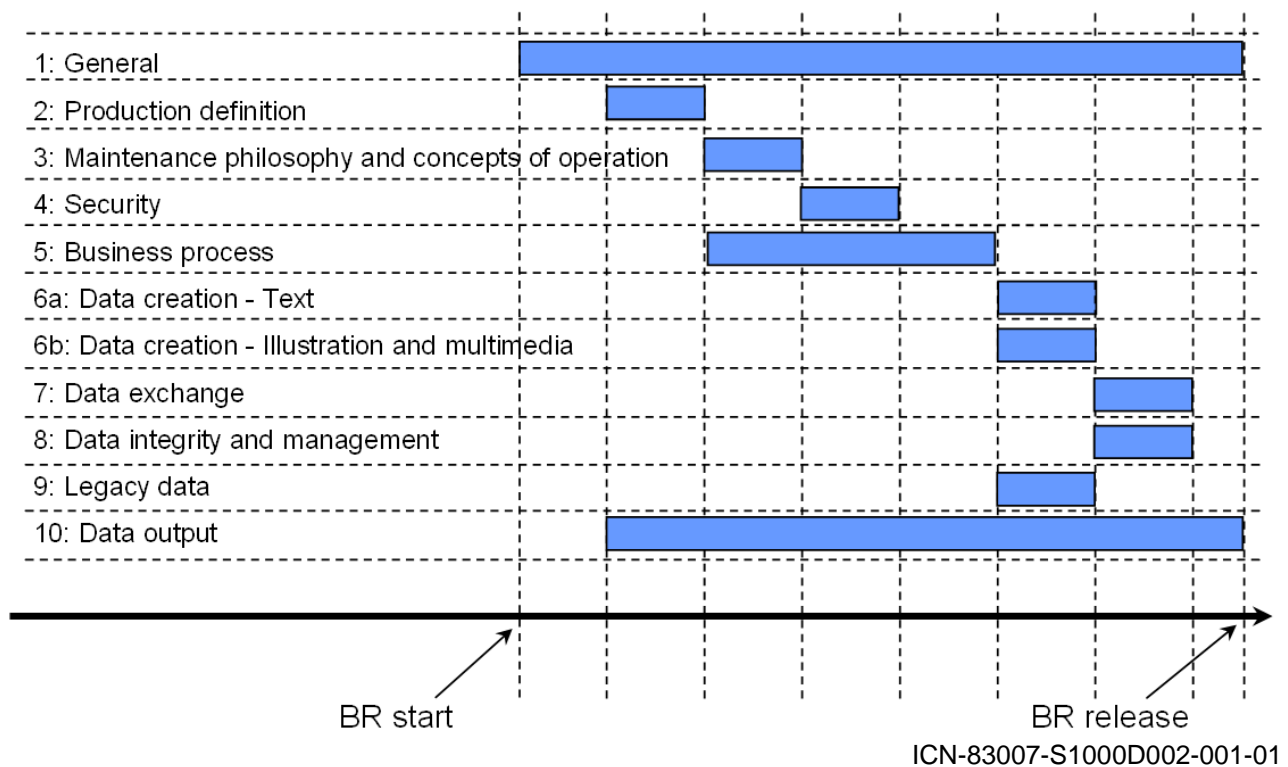

Fig 2 Example sequence of business rules production relative to the business rule categories

[Fig 2](#) illustrates the example sequence of the business rules generation process in relation to business rule categories. It neither implies when business rules are generated nor does it indicate when authoring of technical data begins. These issues will be discussed in more detail in the implementation guide. Refer to [Chap 2.4](#).

At this point, it is important to emphasize that it is up to the project or the organization to decide when to produce a certain category of business rules. In general, the following recommendation applies:

- the more thorough the business rule planning before contracting and content development, the more successful the implementation

In practice, various experiences have been gathered:

- thorough contracts that include required project business rule decisions on model identification codes, on SNS structures
- brief contracts for technical documentation claiming only S1000D conformance and leaving many decisions up to a later stage in the project (eg, authoring)

The success of both depends on the communication and agreement practices between the project partners.

It is also important to stress the dynamic life of business rules. They must be reviewed on a regular basis throughout the lifecycle of a Product and must be updated accordingly.

Another important issue is that some business rules and parts of them can only be written after the acquisition process is completed. This is not only limited to acquisition but also changes throughout the lifecycle.

## 4 Business rules layers

### 4.1 Definition

A business rules layer indicates the level of stakeholders within the hierarchy to which the business rules apply.

### 4.2 Business rules layered model

The layering of business rules can be shown as a layered model with each layer "inheriting", "extending" and "profiling" the upper layer. [Fig 3](#) shows a general view of the layered model. Layer 2 to Layer N vary in accordance with the organization and/or project structure. The core of the uppermost layer of the model is always represented by S1000D itself. Progressing through the "lower" layers, the number of business rules grows and the number of decision points remaining decreases. The reason for this is that an organization and/or a project inherits all business rules from the upper layer and decides which of the remaining decision points are relevant at their level. The goal is to have all decisions made prior to reaching the author's level and at the very least to keep any decisions at the author's level to a minimum.

ICN-83007-S1000D003-001-01

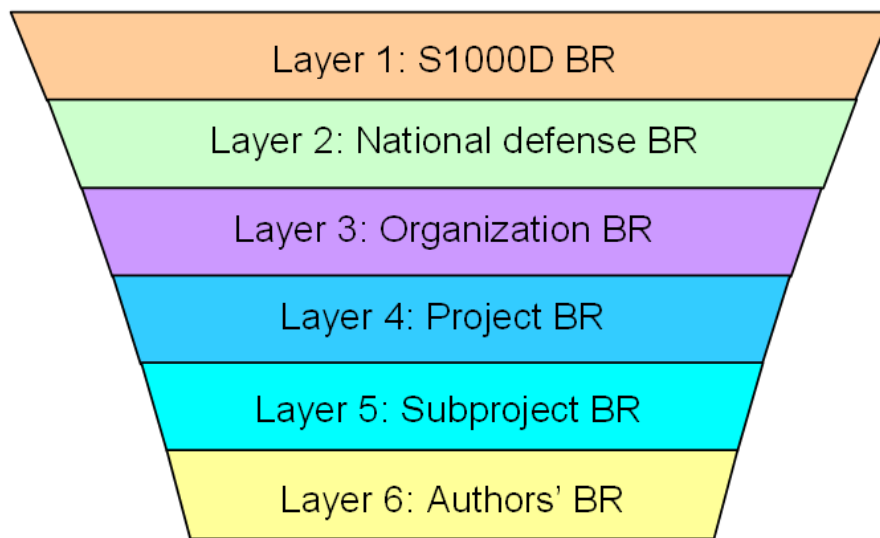

*Fig 3 The layered business rules model*

The project or the organization can add or define their own decision points at their layer.

Every available decision point must be considered at each layer.

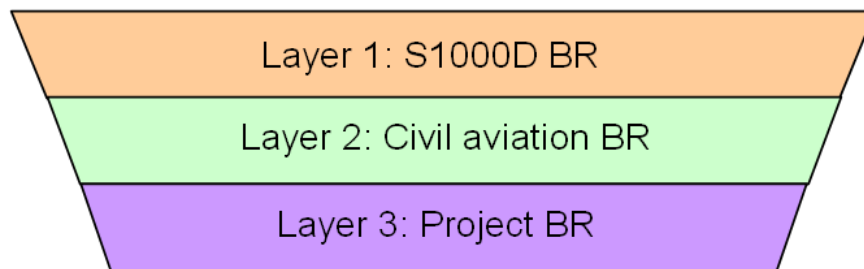

[Fig 4](#) and [Fig 5](#) show examples of the layered business rules model for a defense and a civil aviation project, respectively.

In the example of [Fig 4](#) the organization (department) level is below national defense business rules (eg, business rules of Air Force, Army and Navy organizations or departments). The "lowest" layer (in this example the authors' business rules) must only contain minimum open decision points.

ICN-83007-S1000D004-001-01

*Fig 4 Example of a six-layered defense business rules model*

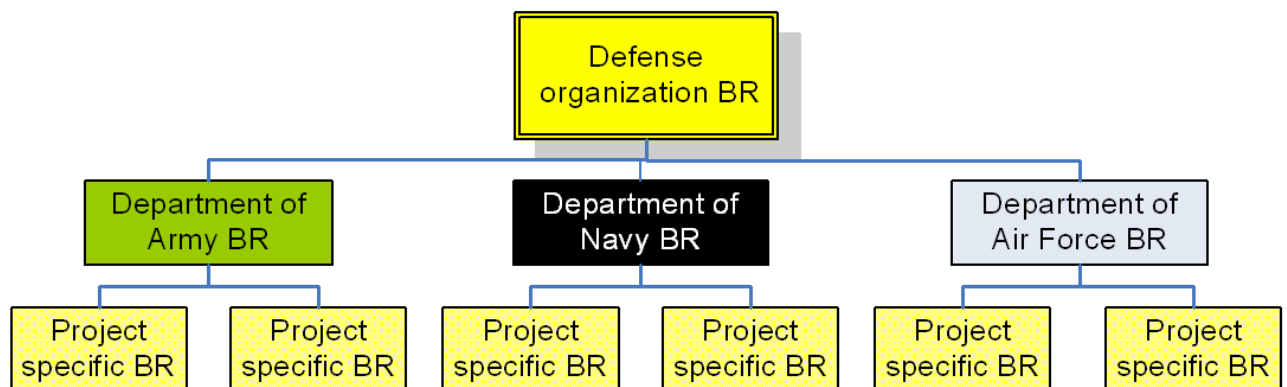

ICN-83007-S1000D005-001-01

*Fig 5 Example of a three-layered civil business rules model*

The civil aviation business rule layer is used to define a comprehensive set of business rules that will remain consistent across all civil aviation industry applications. The project layer is used to define project specific business rules not previously covered.

Layering is only one dimension of the business rules "cascading" structure. An alternative representation of business rules is a tree-like structure. [Fig 6](#) presents an example of such a tree-like business rules structure. Along the "vertical" axis in this figure, the layering as shown in [Fig 4](#) can be easily recognized. Across the figure, "branches" representing various "parallel" departments/organizations (in [Fig 6](#): Army, Navy and Air Force) with their own projects situated at the same level with their "counterparts" but having different "commitments", can be clearly seen. All of them inherit business rules of the upper level and make their own independent decisions on the remaining decision points. Although these business rules seem to be perfectly independent from each other at a first glance, a change of national MoD/DoD rules, for example raised by one of the departments, will require review and agreement by the other departments.

ICN-83007-S1000D006-001-01

Fig 6 Example of a defense tree-like business rules model

## 5 Resolving conflicting business rules

As described above in [Para 4](#), the business rules in the lower ("children") layers must adopt or must be conformant to the business rules of the higher (their "parent") layer. This can for example cause a problem when the same technical data are delivered to more than one customer. In some cases, due to conflicting business rules, data modules must be rewritten, filtered or processed to make the data module variants conform to the rules demanded by each customer. Refer to [Chap 4.12](#).

Consider the national defense layer shown in [Fig 4](#). For a multi-national project, it is most likely that the business rules demanded by each nation are different to various other nations' DoDs/MoDs. In other words, there is again a "tree"-like business rules structure with "branches" situated at the same layer but having separate business rules definitions for this particular layer. This kind of situation can demand a potential rewrite of information. The amount of the information to be rewritten can be considerable. In order to avoid or diminish this effect, common areas between national business rules are recommended to be considered and harmonized/brought into consensus for a given project before any authoring commences.

Similar problems can occur in the project layers when the same Product is used in different projects (refer to [Fig 7](#) for an example). Consider an engine that is used in different airframes where one airframe manufacturer imposes different rules than another. Another example is when a given Product is used for both civil and military use, which can mean data rewrites. A consensus/harmonization to minimize data rewrites for a given project is vital.

Before any authoring or implementation of S1000D begins on a project, all stakeholders who have their own business rules must reach consensus on the business rules to be deployed for that project.

This has adverse effects on costs and data redundancy. Business rule developers must keep this in mind. Lower layers (if available) must be taken in consideration while producing business rules at a given layer. If possible, participants from all layers must be involved in the production of the business rules. Developers of business rules must carefully consider the impact on reuse between projects and the potential for multiple customers and users of project data.

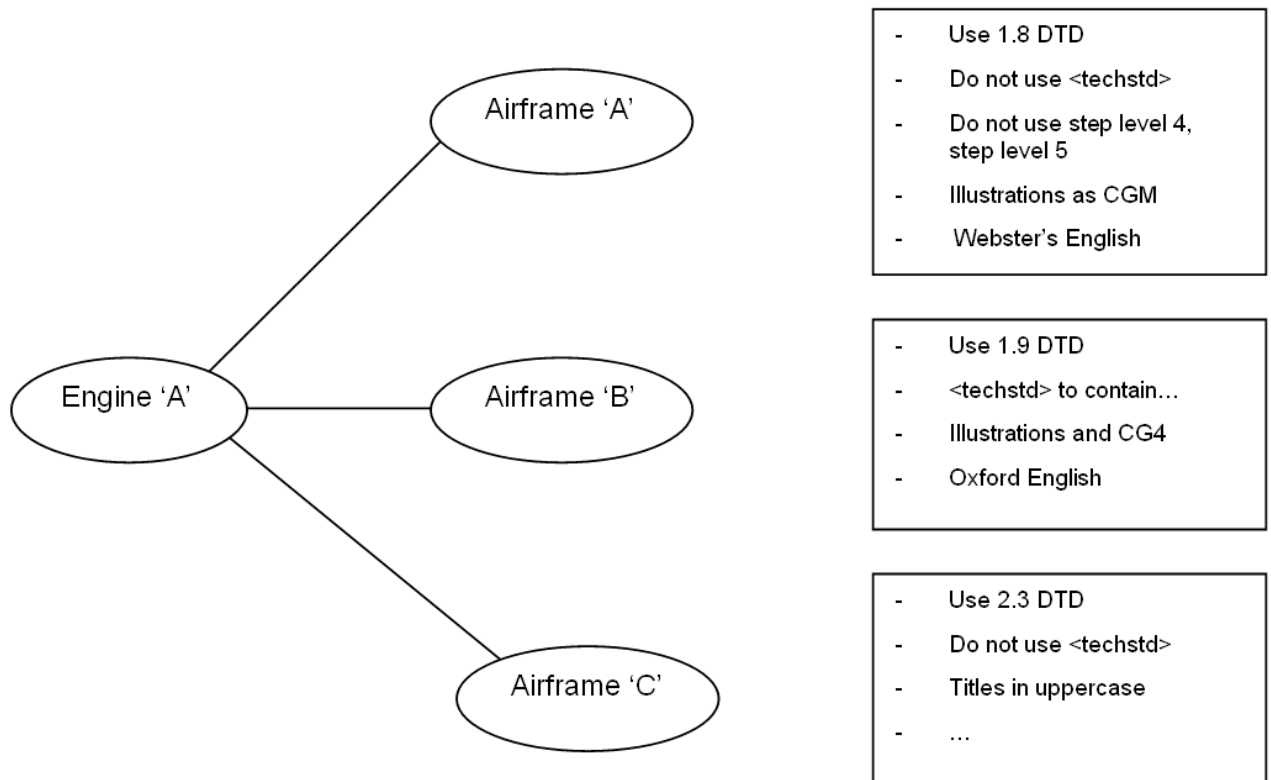

When S1000D data already exists for a product, and that product is installed on a new product (for example, the same ejection seat used in different airframes), due to the high costs of duplicating and maintaining multiple versions of the same data, S1000D strongly recommends that this data is reused without changes to the business rules that govern the data that already exists.

As a minimum requirement, the higher layers are responsible for informing the lower layers on their business rules. For example, organizations must provide information to projects, which organizational business rules must be followed and which decision points are up to the projects.

When projects are presented with conflicting business rules from multiple customers or parent organizations, projects must resolve these conflicts. These conflicts must be resolved by:

- coordinating a change or waiver to the conflicting rules with one or more of the customers or parent organizations
- producing data modules to comply with each set of rules

ICN-83007-S1000D007-001-01

Fig 7 Example of business rules conflicts

## 1 General

This chapter explains the business rules production process and its use.

## 2 Business rules production

### 2.1 General

This chapter gives the production process for a business rules publication and use case for business rule constructs. The process can be amended to include specific business rules assigned by the project.

A business rule publication comprises multiple documents that contain guidance, policy, project specific information and business rules summarized in the BREX data module. A business rules index, and related business rules generation (audit) reports can also be a part of a business rules publication. Refer to [Chap 4.10.1](#).

A business rules publication can be defined at each layer of the business rules hierarchy. Refer to [Chap 2.5.1](#).

## 2.2 Generation of business rules publications

### 2.2.1 Major steps in producing business rules

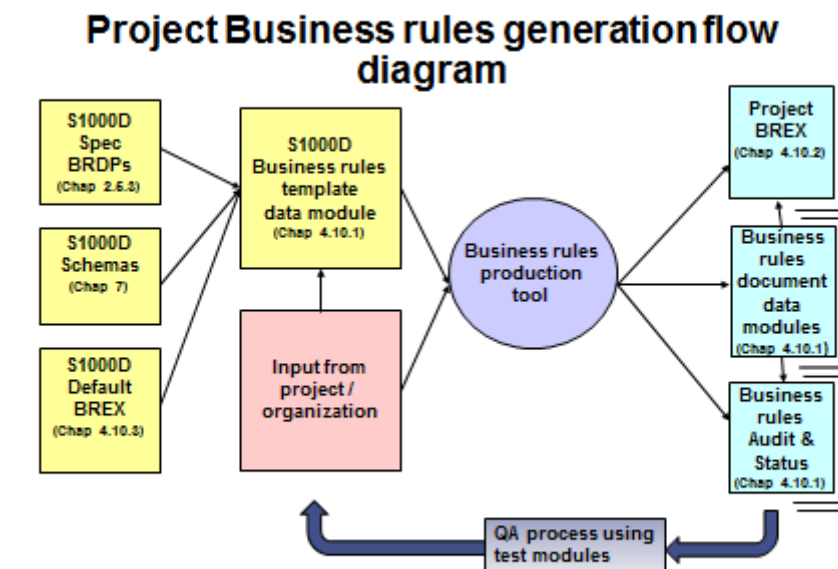

The following describes the business rules production process. The process can be amended to include project specific requirements.

- 1 Identify stakeholders
  - 2 Decide on the layers for business rules documentation
  - 3 Decide on the structure of the business rules publications and how they should be presented
  - 4 Use the BRDP index ([Chap 2.5.3](#)) to make the following decisions:
    - BRDP-S1-00003, Which Issue(s) of S1000D are to be used
    - BRDP-S1-00004, Which information sets are to be used
    - BRDP-S1-00005, Which publications are to be produced
    - BRDP-S1-00006, The Schemas that are to be used
- Note**
- The decisions on these BRDP must be considered together as they are related, and they depend on the available S1000D environments as well as on the budget of the project or the organizations concerned.
- 5 If used define the priority for each decision made on each BRDP. This priority sets the sequence of the business rule decisions definition. That is, it indicates the necessary order to address each business rule. Refer to [Chap 4.10.1](#).
  - 6 If used define the business rule severity level for each business rule decision. The business rule severity level indicates the impact magnitude, if a certain business rule decision is not followed. Business rule severity must not be confused with business rule priority. Refer to [Chap 4.10.1](#).
  - 7 Define remaining business rules decisions using BRDP index ([Chap 2.5.3](#)). BRDP relationships can determine whether or not a BRDP is applicable. For example, determining the use of the element `<wireType>` (BRDP-S1-00239) is not necessary when the project has determined that the use of the wiring data description data module (BRDP-S1-00238) is not required. A BRDP that is not required for a project must be annotated accordingly. Refer to [Chap 4.10.1](#).
  - 8 Review all S1000D chapters to determine if any further decisions have to be made which do not have a specific BRDP. Record all the decisions in the business rules document data module.

- 9 Define non-context business rules decisions and how they are documented and checked. An example of a non-context BRDP is a decision regarding the frequency of data exchanges between partners.
- 10 Define use cases for each business rules decision and, if necessary, also for BRDP. In general there will be more than one use case for each BRDP and for each of its business rules decisions. These uses cases can vary from customer products, technical publications, which the given business rules publication addresses, to various roles of the personnel involved in the production and use of technical publications. The use cases must be captured by using applicability on business rules paragraph (containing all the information for the given BRDP) and on business rules decisions. The use cases will be defined on business rules decisions. Differentiation between the applicability of various business rules decision points, especially of project and/or organization specific BRDP, might be necessary. Refer to [Para 3](#).
- 11 Produce business rules documents and verify them with stakeholders
- 12 Produce test data, test and evaluation plan and verify the business rules
- 13 Decide on the life cycle maintenance of the project business rules to include:
  - a review process
  - an assessment on schedule and cost impact
  - the update frequency
  - the ownership and governance process
  - responsibilities
  - update process

## 2.2.2 Business rules generation process

Fig 1 shows how a typical process for business rules generation looks like following the process in [Para 2.2.1](#).

The diagram is for information only to provide a typical flow for project business rules generation

ICN-I9005-0205020001-001-01

Fig 1 Typical project business rules generation flow diagram

### 3 Business rules documents and their use

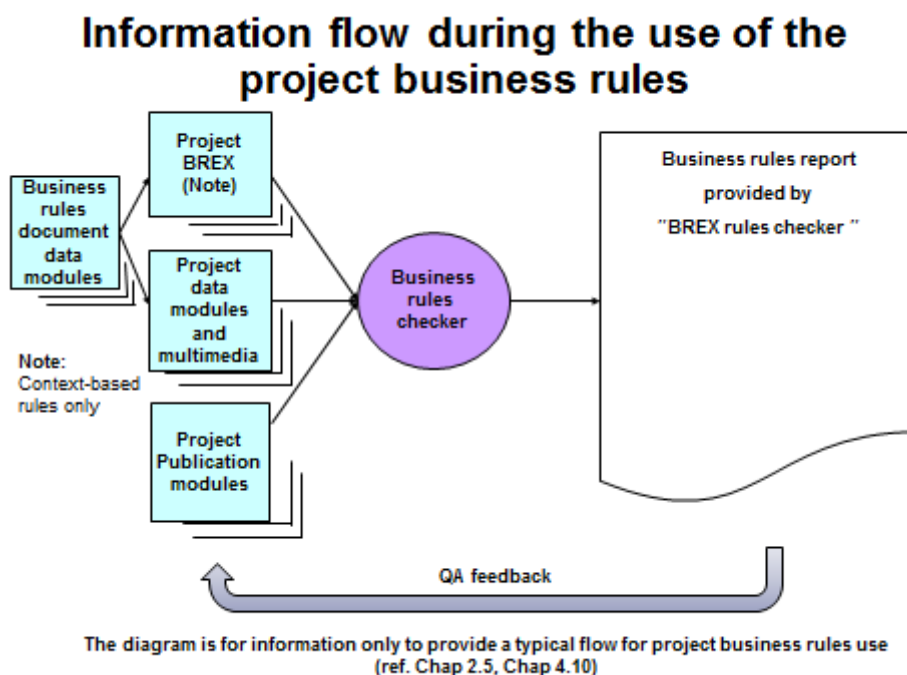

#### 3.1 Business rules documents

The business rules document data module is used to create guidance information to be used by the project through life. Example documents are:

- Data authoring style guide
- Illustrator's style guide
- Security rules and procedures
- SNS definitions
- Information codes
- Data exchange processes

#### 3.2 Business rules usage

[Fig 2](#) shows how business rules are typically used.

ICN-I9005-0205020002-001-01

*Fig 2 Information flow during the use of the project business rules*

Typical project business rules use process for context based rules only:

- Single or multiple business rules document data modules are used as input for the project BREX generation
- BREX checker uses project BREX and project data modules and publication modules as input
- BREX checker output provides list of checked data modules, publication modules, and error reports showing business rules violations
- BREX output report is used as feedback to correct erroneous data

## 1 General

The Business Rule Decision Point (BRDP) index provides a list of every identified BRDP within S1000D. The BRDP index enables organizations and projects to define Business Rules (BR) that reference the unique ID for each BRDP. The ID for each BRDP is permanently assigned and provides a method for organizations and projects to manage BR as new issues of S1000D are released.

Each Business Rule Decision Point (BRDP) is identified in S1000D as follows:

**Business rule decision point BRDP-S1-NNNNN – Title of the decision point:**

- Description of the decision point.

where:

- S1 indicates that the decision point originated in S1000D

- NNNNN is a unique number assigned by S1000D to each decision point in the specification

**Note**

This number will not change between Issues of this specification. Any new BRDP will be assigned a completely new unique number.

Organizations can create and manage organization-specific decision points to ensure that all projects within the organization generate business rules for organization-specific decision points. S1000D strongly recommends that organizations prefix BRDP with the organization's CAGE code. The same applies to BRDP specific to all levels of projects. S1000D uses the prefix "S1" for this purpose.

Organization-specific IDs for BRDP in the case when CAGE code is used must conform to the format:

BRDP-XXXXX-NNNNN

Where:

- XXXXX is the organization's CAGE code
- NNNNN is a unique number assigned by the organization to each decision point

**Note**

This number must not change between issues of the organizational/project business rules. Any new BRDP must be assigned a completely new unique number.

If the given organization does not have a CAGE code, then it must generate a code that will not be confused with CAGE code and that will be consistently used for all business rules it creates. This alternative code must be shorter or longer than 5 characters. If the prefix is 5 characters long then it indicates that it is a CAGE code.

If a chapter is not included in the following tables, that chapter contains no BRDP.

## 2 Business rule decision points index

*Table 2 Chap 1 - Business rule decision points index*

BRDP reference Location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 1.3</a> Para 6.2.4	<a href="#">BRDP-S1-00001</a>	Use of "I" and "O"	Decide whether and when to use the alpha characters "I" and "O".
<a href="#">Chap 1.3</a> Para 7	<a href="#">BRDP-S1-00002</a>	List of permitted CAGE codes and/or names to be used for the technical publications	Create a list of permitted CAGE codes and/or names of the enterprises.

Table 3 Chap 2 - Business rule decision points index

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 2.5.1</a> Para 2.1.3	<a href="#">BRDP-S1-00003</a>	Issue of S1000D to be used	Decide which issue or issues of S1000D to be used.
<a href="#">Chap 2.5.1</a> Para 2.1.3	<a href="#">BRDP-S1-00004</a>	Information sets to be used	Decide which information sets, given in S1000D and/or project specific, to be used.
<a href="#">Chap 2.5.1</a> Para 2.1.3	<a href="#">BRDP-S1-00005</a>	Publications to be produced	Decide which publications to be produced.
<a href="#">Chap 2.5.1</a> Para 2.1.3	<a href="#">BRDP-S1-00006</a>	Schemas to be used	Decide which Schemas to be used and in which information set they are to be used.
<a href="#">Chap 2.5.1</a> Para 2.1.3	<a href="#">BRDP-S1-00007</a>	Use of optional elements and attributes	Decide whether and how to use each optional element and attribute in its structural context.
<a href="#">Chap 2.5.1</a> Para 2.1.3	<a href="#">BRDP-S1-00008</a>	Possible deliverables	Decide on the possible deliverables, such as: <ul style="list-style-type: none"> <li>– S1000D objects (eg, data modules, publication modules, illustration sheets and multimedia objects, data management lists) using file based transfer. Refer to <a href="#">Chap 7.5.1</a>.</li> <li>– Page-oriented publications and/or interactive electronic technical publications.</li> </ul>
<a href="#">Chap 2.5.1</a> Para 2.7.1	<a href="#">BRDP-S1-00009</a>	Frequency of data exchanges	Decide on the frequency of data exchanges.

Table 4 Chap 3 - Business rule decision points index

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.4</a> Para 2	<a href="#">BRDP-S1-00010</a>	Zone and access point identification system	Decide whether to use a zoning and access identification system.
<a href="#">Chap 3.4</a> Para 2.1.1	<a href="#">BRDP-S1-00011</a>	Method for zoning and identifying access points	Decide which method to use for zoning and identifying access points.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.6</a> Para 2.1.4	<a href="#">BRDP-S1-00016</a>	Presentation of security classifications	Decide on how the security classifications will be marked and/or indicated.
<a href="#">Chap 3.6</a> Para 2.4	<a href="#">BRDP-S1-00013</a>	Use and markings of security classifications (attribute securityClassification)	Determine how the security classifications will be used.
<a href="#">Chap 3.6</a> Para 2.4	<a href="#">BRDP-S1-00014</a>	Application of caveats	Determine if the policies that apply to security marking, instructions, etc, and how those markings are required to be applied within the given project.
<a href="#">Chap 3.6</a> Para 2.5	<a href="#">BRDP-S1-00015</a>	Retention of security classifications changes	Decide on the retention of security classification changes.
<a href="#">Chap 3.6</a> Para 2.5	<a href="#">BRDP-S1-00553</a>	Retention of derivative classifications changes	Decide on the retention of derivative classifications changes.
<a href="#">Chap 3.7</a> Para 2.1	<a href="#">BRDP-S1-00017</a>	Rules for quality assurance	Identify the project quality assurance rules and how those rules affect the methods used to perform quality assurance of the data modules/technical publications.
<a href="#">Chap 3.7</a> Para 2.2.2	<a href="#">BRDP-S1-00018</a>	Rules for first and second verification	Decide on the rules for first and second verification. For example, such a rule might be that all data modules that have a safety related procedure must have first verification carried out "On object".
<a href="#">Chap 3.7</a> Para 2.4	<a href="#">BRDP-S1-00019</a>	Review cycle process	Decide on the review cycle processes and procedures.
<a href="#">Chap 3.9.1</a> Para 2.1	<a href="#">BRDP-S1-00020</a>	Specify the language	Decide which language to use for producing data modules.
<a href="#">Chap 3.9.1</a> Para 2.1	<a href="#">BRDP-S1-00021</a>	Use of ASD-STE100®	When producing data modules in English, decide whether to use ASD-STE100®.
<a href="#">Chap 3.9.1</a> Para 2.1	<a href="#">BRDP-S1-00022</a>	Standard dictionary	Decide which standard dictionary to use for producing data modules.

<b>BRDP reference location</b>	<b>BRDP unique identifier</b>	<b>BRDP title</b>	<b>BRDP definition</b>
<a href="#">Chap 3.9.1</a> Para 2.1	<a href="#">BRDP-S1-00023</a>	Use of a terminology database or glossary	Decide whether to use a terminology database or a glossary. If used, agree on its content and management.
<a href="#">Chap 3.9.1</a> Para 2.2	<a href="#">BRDP-S1-00024</a>	Use of a standard list of abbreviations	Decide whether to use a standard list of abbreviations. If used, agree on its content and management.
<a href="#">Chap 3.9.1</a> Para 2.5	<a href="#">BRDP-S1-00025</a>	Units of measure	Identify the standard to use for both primary and secondary units of measure.
<a href="#">Chap 3.9.1</a> Para 2.9	<a href="#">BRDP-S1-00026</a>	Highlighting text	Decide which method to use to highlight text.
<a href="#">Chap 3.9.2</a> Para 2.1	<a href="#">BRDP-S1-00027</a>	Need of printable data	Decide which parts of the documentation (data modules and publications including IETP) need to be printable.
<a href="#">Chap 3.9.2.1</a> Para 2	<a href="#">BRDP-S1-00028</a>	Engineering numbers and revision status within the illustration reproduction area	Decide if schematics derived from engineering drawings include the original drawing number and revision status within the illustration reproduction area.
<a href="#">Chap 3.9.2.1</a> Para 2.2.2.1	<a href="#">BRDP-S1-00029</a>	Use of color in the final deliverable	Decide whether to use color in the final deliverable.
<a href="#">Chap 3.9.2.1</a> Para 2.2.2.2	<a href="#">BRDP-S1-00554</a>	Illustration annotations written in upper or sentence case	Decide whether to write illustration annotations in upper or lower case.
<a href="#">Chap 3.9.2.1</a> Para 2.8	<a href="#">BRDP-S1-00555</a>	Inclusion of the ICN in the illustration	Decide whether to allow the ICN to be included in the illustration.
<a href="#">Chap 3.9.2.3</a> Para 2.2.3	<a href="#">BRDP-S1-00556</a>	Use color line art	Decide whether to allow the use of color line art.
<a href="#">Chap 3.9.2.7</a> Para 2.1.1.3.1	<a href="#">BRDP-S1-00557</a>	Reuse of the generic ICN title in data modules	Decide if, and under which circumstances, the generic ICN title given in the ICN metadata file should be used to populate figure and multimedia titles in data modules.
<a href="#">Chap 3.9.3</a> Para 2	<a href="#">BRDP-S1-00030</a>	Use of general warnings, cautions and notes as separate data modules	Decide whether to produce general warnings, cautions and notes in separate descriptive data modules.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.3</a> Para 2	<a href="#">BRDP-S1-00031</a>	Use of warning and/or caution collections	Decide whether to use warning and/or caution collections, internal or external.
<a href="#">Chap 3.9.3</a> Para 2.1	<a href="#">BRDP-S1-00032</a>	Use of the attribute <code>vitalWarningFlag</code>	Decide whether and how to use the attribute <code>vitalWarningFlag</code> .
<a href="#">Chap 3.9.3</a> Para 2.1	<a href="#">BRDP-S1-00033</a>	Use of the attribute <code>warningType</code>	Decide whether and how to use the attribute <code>warningType</code> .
<a href="#">Chap 3.9.3</a> Para 2.2	<a href="#">BRDP-S1-00034</a>	Use of the attribute <code>cautionType</code>	Decide whether and how to use the attribute <code>cautionType</code> .
<a href="#">Chap 3.9.3</a> Para 2.3	<a href="#">BRDP-S1-00035</a>	Use of the attribute <code>noteType</code>	Decide whether and how to use the attribute <code>noteType</code> .
<a href="#">Chap 3.9.4</a> Para 2.2.1	<a href="#">BRDP-S1-00037</a>	Use of LOEP or LOEDM	Decide whether to use the LOEP or the LOEDM.
<a href="#">Chap 3.9.4</a> Para 2.5.2	<a href="#">BRDP-S1-00042</a>	Use of Highlights with updating instructions	Decide whether to use Highlights with updating instructions.
<a href="#">Chap 3.9.4</a> Para 2.11	<a href="#">BRDP-S1-00046</a>	Use of linear or hierarchically subdivided Table of contents	Decide whether to use a linear or a hierarchically subdivided Table of contents.
<a href="#">Chap 3.9.4</a> Para 2.11	<a href="#">BRDP-S1-00305</a>	Use of the element <code>&lt;pmRef&gt;</code> in the element <code>&lt;tocEntry&gt;</code>	Decide whether publications have to be listed by the publication only or also by its individual data modules.
<a href="#">Chap 3.9.5.1</a> Para 2.1.2.1	<a href="#">BRDP-S1-00049</a>	Definition of the issue date	Decide on the definition of the issue date.
<a href="#">Chap 3.9.5.1</a> Para 2.1.2.2.2	<a href="#">BRDP-S1-00052</a>	Allocation of the information codes and the information names	Decide which information codes and associated information names will be used.
<a href="#">Chap 3.9.5.1</a> Para 2.2	<a href="#">BRDP-S1-00053</a>	Data module change/revised ratio	Decide on the threshold that a data module is considered revised rather than changed.
<a href="#">Chap 3.9.5.1</a> Para 2.2.3	<a href="#">BRDP-S1-00054</a>	Use and definitions of the attributes <code>commercialClassification</code> and <code>caveat</code>	Decide on the use and definitions of the attributes <code>commercialClassification</code> and <code>caveat</code> .

Applicable to: All

S1000D-A-02-05-0300-00A-040A-A

Chap 2.5.3

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.1</a> Para 2.2.3	<a href="#">BRDP-S1-00055</a>	Priorities and relationships of the security attributes securityClassification, commercialClassification and caveat	Decide on the priorities and relationships between the attributes securityClassification, commercialClassification and caveat if they are used.
<a href="#">Chap 3.9.5.1</a> Para 2.2.4	<a href="#">BRDP-S1-00058</a>	Use of the element <derivativeClassification> within data modules	Decide whether and how to use the element <derivativeClassification>.
<a href="#">Chap 3.9.5.1</a> Para 2.2.4.2.1	<a href="#">BRDP-S1-00065</a>	Use of the element <copyright> and source of copyright information	Decide whether and how to use the element <copyright>. Any copyright information must be obtained from the relevant authority.
<a href="#">Chap 3.9.5.1</a> Para 2.2.4.2.1	<a href="#">BRDP-S1-00066</a>	Method of populating copyright information (in each data module or in a consolidated data module)	Decide whether to populate copyright information in each data module or whether to cross-reference to a copyright data module.  <b>Note</b> While choosing the population method, assess the impact of changes to copyright information on updating of data modules.
<a href="#">Chap 3.9.5.1</a> Para 2.2.7	<a href="#">BRDP-S1-00070</a>	Use of the element <enterpriseName> and/or the attribute enterpriseCode for the partner company	Decide whether to use the element <enterpriseName> and/or the attribute enterpriseCode to capture the name and CAGE code respectively, of the responsible partner company. If the name is used it must be done consistently and be mandatory for the project.
<a href="#">Chap 3.9.5.1</a> Para 2.2.8	<a href="#">BRDP-S1-00071</a>	Use of the element <enterpriseName> and/or the attribute enterpriseCode for the originator	Decide whether to use the element <enterpriseName> and/or the attribute enterpriseCode to capture the name and CAGE code respectively, of the originator. If the name is used it must be done consistently and be mandatory for the project.
<a href="#">Chap 3.9.5.1</a> Para 2.2.12.1	<a href="#">BRDP-S1-00077</a>	Exchange of draft data modules	Decide whether the project will allow the exchange of draft data modules.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.1</a> Para 2.2	<a href="#">BRDP-S1-00089</a>	Standard sentences for reasons for update	Decide whether standard sentences for reason for update sentences are to be used.
<a href="#">Chap 3.9.5.2.1.1</a> Para 2.2	<a href="#">BRDP-S1-00090</a>	Use of reason for update in conjunction with the production process	Decide whether the element <code>&lt;reasonForUpdate&gt;</code> is used during the production process.
<a href="#">Chap 3.9.5.2.1.1</a> Para 2.2	<a href="#">BRDP-S1-00091</a>	Use of applicability information	Decide whether it is permissible to differentiate reasons for update based on Product configuration.
<a href="#">Chap 3.9.5.2.1.1</a> Para 2.5	<a href="#">BRDP-S1-00092</a>	Use of change marks for tables	Decide whether and how to use change marks for tables.
<a href="#">Chap 3.9.5.2.1.1</a> Para 2.6	<a href="#">BRDP-S1-00093</a>	Use of change marks for figures	Decide whether and how to use change marks for figures.
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1	<a href="#">BRDP-S1-00094</a>	Extent of cross-referencing	Decide on the extent of cross-referencing within data modules and the methods used for populating the various attributes.
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1	<a href="#">BRDP-S1-00095</a>	Use of the element <code>&lt;internalRef&gt;</code> in titles	Use of the element <code>&lt;internalRef&gt;</code> in titles is strongly discouraged. However, decide whether to use cross-references in titles.
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1	<a href="#">BRDP-S1-00096</a>	Use of the attribute <code>targetTitle</code>	Decide whether to use the attribute <code>targetTitle</code> .  When used (populated), it is a tooltip in a viewer application.
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1	<a href="#">BRDP-S1-00098</a>	Use of the textual content of the element <code>&lt;internalRef&gt;</code> in cross-references	Decide whether to use the textual content of the element <code>&lt;internalRef&gt;</code> .  When used (populated), it must be presented.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1	<a href="#">BRDP-S1-00099</a>	Use of the "identifiers" given in the elements <code>&lt;reqSupportEquips&gt;</code> , <code>&lt;reqSupplies&gt;</code> , <code>&lt;reqSpares&gt;</code> or <code>&lt;workLocation&gt;</code>	Decide whether to use any of the "identifiers" given in the elements <code>&lt;reqSupportEquips&gt;</code> , <code>&lt;reqSupplies&gt;</code> , <code>&lt;reqSpares&gt;</code> or <code>&lt;workLocation&gt;</code> as the presented link (textual content of the element <code>&lt;internalRef&gt;</code> ), or as a tooltip in a viewer application (value of the attribute <code>targetTitle</code> ).  <b>Note</b> The "identifiers" can be derived from the content of the child elements or the attributes of the four elements.
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1	<a href="#">BRDP-S1-00100</a>	Use of the attribute <code>internalRefTargetType</code>	Decide whether to use the attribute <code>internalRefTargetType</code> , which values to use and allocate suitable definitions to the values. Refer to <a href="#">Chap 3.9.6.1</a> .
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.1.1	<a href="#">BRDP-S1-00101</a>	Define the format of the cross-reference attributes <code>id</code> and <code>internalRefId</code>	Decide whether the values of the cross-reference attributes <code>id</code> and <code>internalRefId</code> must be prefixed by alpha characters that identify the type of the target element.  <b>Example:</b> <ul style="list-style-type: none"> <li>Structure: Prefix followed by a hyphen and a four digit number to make it unique within the data module (eg, "par-0001").</li> </ul> <b>Prefixes:</b> <ul style="list-style-type: none"> <li>"fig" for figures and alternates</li> <li>"tab" for tables</li> <li>"mma" for multimedia and alternates</li> <li>"sup" for supplies</li> <li>"seq" for support equipment</li> <li>"spa" for spares</li> <li>"par" for levelled paragraphs and alternates</li> <li>"stp" for steps of procedure, fault isolation, etc, and alternates</li> <li>"gra" for graphics (multiple sheets)</li> <li>"mmo" for multimedia objects</li> <li>"hot" for hotspots (eg, "fig-0001-hot-0002")</li> <li>"pme" for parameters</li> <li>"zon" for zones</li> </ul>

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
			<ul style="list-style-type: none"> <li>– "wla" for work locations</li> <li>– "mat" for single material or material sets</li> <li>– "msl" for material set lists</li> <li>– "acp" for access points</li> </ul> <p><b>Note</b> The four digit number has no connection to, for example, the figure or table number which is generated for data module presentation. For example, the value of the attribute <code>id</code> can be "fig-0345" for "Fig 1". Refer to Para 2.1.</p> <p><b>Note</b> Refer to <a href="#">Chap 3.9.5.2.1.10</a> for the equivalent business rule decision point regarding footnotes. Example: "ftn-0001".</p>
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.6	<a href="#">BRDP-S1-00106</a>	Population of the element <code>&lt;refs&gt;</code>	Decide if and how the element <code>&lt;refs&gt;</code> is populated. If populated, the order of items in the list must be specified.
<a href="#">Chap 3.9.5.2.1.2</a> Para 2.7	<a href="#">BRDP-S1-00107</a>	Define the words before and after the reference elements	<p>Define the words before and after the elements <code>&lt;dmRef&gt;</code>, <code>&lt;pmRef&gt;</code> and <code>&lt;externalPubRef&gt;</code>. This is important as it has implications on the stylesheets used.</p> <p>Example: For one implementation, the stylesheet can automatically generate the words "Refer to data module: " when it recognizes the element <code>&lt;dmRef&gt;</code>. This will cause problems if the author has written "Refer to " within the paragraph before the element <code>&lt;dmRef&gt;</code>.</p>
<a href="#">Chap 3.9.5.2.1.4</a> Para 1	<a href="#">BRDP-S1-00559</a>	Caption style guide	Decide on a project style guide to be used for captions.
<a href="#">Chap 3.9.5.2.1.4</a> Para 2.2.1	<a href="#">BRDP-S1-00117</a>	Inline use of captions	Decide whether inline captions affect the text line spacing and how this is defined.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.5</a> Para 2	<a href="#">BRDP-S1-00118</a>	Use of the element <code>&lt;title&gt;</code>	Decide how to use the element <code>&lt;title&gt;</code> and on which elements.
<a href="#">Chap 3.9.5.2.1.5</a> Para 2	<a href="#">BRDP-S1-00119</a>	Use of cross-references from titles	Decide whether to allow cross-referencing from titles.
<a href="#">Chap 3.9.5.2.1.5</a> Para 2	<a href="#">BRDP-S1-00120</a>	Use of titles for the elements <code>&lt;levelledPara&gt;</code> and <code>&lt;proceduralStep&gt;</code> from sublevel six thru eight for legacy data	Decide whether titles can be included for the elements <code>&lt;levelledPara&gt;</code> and <code>&lt;proceduralStep&gt;</code> from sublevel six thru eight when converting legacy data to S1000D.
<a href="#">Chap 3.9.5.2.1.6</a> Para 2.3	<a href="#">BRDP-S1-00121</a>	Use of standard table types	Decide if a list of standard table types applies to the project (eg, inspection, examination) and define what the business rules are for these types in terms of their presentation requirements and certain textual values (eg, titles and heading row values). Each of these standard types must have a defined value that can be applied to the table's attribute <code>tabstyle</code> .
<a href="#">Chap 3.9.5.2.1.6</a> Para 2.4	<a href="#">BRDP-S1-00122</a>	Use of tables as graphics	Decide if tables represented as graphics are allowed, and if they are, in what situations they can be used.
<a href="#">Chap 3.9.5.2.1.6</a> Para 2.6	<a href="#">BRDP-S1-00123</a>	Use of applicability information of various table child elements - attribute <code>applicRefId</code> of the element <code>&lt;table&gt;</code>	Decide whether and how to use the attribute <code>applicRefId</code> of various <code>&lt;table&gt;</code> child elements. The child elements can be differentiated based on Product configuration.
<a href="#">Chap 3.9.5.2.1.7</a> Para 2.2.1.2	<a href="#">BRDP-S1-00128</a>	Types of legends	Decide on the strategy for legends, if used. Legends can appear as part of the illustration or as text using the element <code>&lt;legend&gt;</code> . The advantage of making the legend part of the text is that: <ul style="list-style-type: none"> <li>– the same illustration can have different legends wherever it appears (eg, in multi-language projects)</li> <li>– the text of the element <code>&lt;legend&gt;</code> can be searched (this might not be the case if the legend is part of the illustration)</li> </ul>

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
			<ul style="list-style-type: none"> <li>– items in the illustration can be linked to the legend by the use of hotspots</li> <li>– the legend in the text can save space on the illustration (particularly when the legends are long)</li> </ul>
<a href="#">Chap 3.9.5.2.1.7</a> Para 2.3.1	<a href="#">BRDP-S1-00129</a>	Suitability of multimedia use	Decide whether using multimedia is suitable for the environment in which the project will operate.
<a href="#">Chap 3.9.5.2.1.7</a> Para 2.3.2.1	<a href="#">BRDP-S1-00130</a>	Permitted types of multimedia	Decide what types of multimedia objects are permitted.
<a href="#">Chap 3.9.5.2.1.7</a> Para 2.4	<a href="#">BRDP-S1-00131</a>	Use of foldouts	Decide whether to use the element <code>&lt;foldout&gt;</code> and, if used, where its use is allowed (eg, within specific information sets).  <b>Note</b> It is only used for page-oriented publications, as it will not have an effect in the screen view of an IETP.
<a href="#">Chap 3.9.5.2.1.8</a> Para 2.3	<a href="#">BRDP-S1-00132</a>	Use of hotspots	Decide whether and how to use hotspots. <ul style="list-style-type: none"> <li>– If hotspots are to be used decide whether hotspots can be used to link to graphical objects from local text</li> <li>– If hotspots are to be used decide whether hotspots can be used to link from graphical objects to other graphical objects or local text</li> <li>– If hotspots are to be used decide whether hotspots can be used to link from graphical objects to other data modules</li> </ul>
<a href="#">Chap 3.9.5.2.1.8</a> Para 2.8	<a href="#">BRDP-S1-00133</a>	Use of the element <code>&lt;parameter&gt;</code>	Decide whether to use the element <code>&lt;parameter&gt;</code> and how to use it. If used, specify the attributes to be used within the project or organization.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2	<a href="#">BRDP-S1-00134</a>	Use of the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether to use the element <code>&lt;preliminaryRqmts&gt;</code> in maintenance planning, fault isolation, maintenance checklist and/or process data modules.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2	<a href="#">BRDP-S1-00135</a>	Use of the element <code>&lt;workAreaLocationGroup&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;workAreaLocationGroup&gt;</code> . The possibility of duplication and mismatch of data given in the maintenance planning information must be taken into account.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2.1	<a href="#">BRDP-S1-00136</a>	Use of the element <code>&lt;workLocation&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;workLocation&gt;</code> . If used, decide the data module types with which it will be used.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2.1.1	<a href="#">BRDP-S1-00137</a>	Use of the element <code>&lt;workArea&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;workArea&gt;</code> . If used, decide which data module types to use it.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2.1.2	<a href="#">BRDP-S1-00138</a>	Use of the element <code>&lt;installationLocation&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;installationLocation&gt;</code> . If used, decide which data module types to use it.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2.1.3	<a href="#">BRDP-S1-00139</a>	Use of the element <code>&lt;productItem&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;productItem&gt;</code> . If used, decide which data module types to use it.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2.1.3	<a href="#">BRDP-S1-00140</a>	Use of the attribute <code>productName</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the attribute <code>productName</code> .
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.2.1.3	<a href="#">BRDP-S1-00141</a>	Use of the attribute <code>productItemType</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the attribute <code>productItemType</code> .
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.1.3	<a href="#">BRDP-S1-00142</a>	Use of the element <code>&lt;taskDuration&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;taskDuration&gt;</code> . The possibility of duplication and mismatch of data given in the maintenance planning information must be taken into account.

Chap 2.5.3

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.2.4	<a href="#">BRDP-S1-00143</a>	Inclusion of a circuit breaker list as part of the preliminary conditions - (element <code>&lt;reqCondCircuitBreaker&gt;</code> )	Decide if circuit breaker lists are allowed in required conditions and thus the use of the element, or if all the circuit breaker settings must be part of the steps. In this latter case the element <code>&lt;circuitBreakerDescrGroup&gt;</code> in steps content can be used.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.3	<a href="#">BRDP-S1-00144</a>	Use of the element <code>&lt;reqPersons&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;reqPersons&gt;</code> . For example, use either the element <code>&lt;personnel&gt;</code> or <code>&lt;person&gt;</code> or use both elements.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.3.1.1	<a href="#">BRDP-S1-00145</a>	Values for the attribute <code>personCategoryCode</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Define a list of skill categories/types (eg, Airframe, Electrical, Avionic, Engine).
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.3.1.3	<a href="#">BRDP-S1-00146</a>	Values for the attribute <code>trade</code> in the context of the element <code>&lt;preliminaryRqmts&gt;</code>	If trades are required, define a list of trades/trade codes.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.4.1	<a href="#">BRDP-S1-00147</a>	Use of the element <code>&lt;reqTechInfoGroup&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether and how to use the element <code>&lt;reqTechInfoGroup&gt;</code> .
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.5	<a href="#">BRDP-S1-00149</a>	Listing of standard tools in Preliminary requirements	Decide what types of standard tools or toolkits to be identified and listed in the table "Support equipment".
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.5.1	<a href="#">BRDP-S1-00150</a>	Use of the attribute <code>id</code> on the element <code>&lt;supportEquipDescr&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether to link from the body of the procedure to the support equipment listed in Preliminary requirements.  <b>Note</b> The attribute <code>id</code> on element <code>&lt;supportEquipDescr&gt;</code> is used to establish the link between the two and will guarantee consistent use of identification throughout the procedure. The use of cross-references is encouraged.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.5.1	<a href="#">BRDP-S1-00151</a>	Use of the attribute <code>materialUsage</code> in the element <code>&lt;supportEquipDescr&gt;</code> , the element <code>&lt;supplyDescr&gt;</code> and the element <code>&lt;spareDescr&gt;</code> context	Decide whether to use the attribute <code>materialUsage</code> in the elements <code>&lt;supportEquipDescr&gt;</code> , <code>&lt;supplyDescr&gt;</code> and <code>&lt;spareDescr&gt;</code> context and what values to be used.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.5.1.3	<a href="#">BRDP-S1-00152</a>	Use of identification elements in the element <code>&lt;supportEquipDescr&gt;</code> , the element <code>&lt;supplyDescr&gt;</code> and the element <code>&lt;spareDescr&gt;</code> context	Decide which of the elements <code>&lt;catalogSeqNumberRef&gt;</code> , <code>&lt;natoStockNumber&gt;</code> , <code>&lt;identNumber&gt;</code> , <code>&lt;toolRef&gt;</code> , <code>&lt;supplyRef&gt;</code> , <code>&lt;supplyRqmtRef&gt;</code> , <code>&lt;partRef&gt;</code> , <code>&lt;functionalItemRef&gt;</code> and <code>&lt;materialSetRef&gt;</code> to use for identification and how to populate these elements.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.6.1	<a href="#">BRDP-S1-00155</a>	Use of the attribute <code>id</code> on the element <code>&lt;supplyDescr&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether to use the attribute <code>id</code> to create cross-references from the procedure to the supplies listed in Preliminary requirements. The attribute <code>id</code> on element <code>&lt;supplyDescr&gt;</code> is used to establish the link between the two and will guarantee consistent use of identification throughout the procedure. The use of cross-references is encouraged.
<a href="#">Chap 3.9.5.2.1.9</a> Para 2.7.1	<a href="#">BRDP-S1-00156</a>	Use of the attribute <code>id</code> on element <code>&lt;sparesDescr&gt;</code> in the element <code>&lt;preliminaryRqmts&gt;</code>	Decide whether to use the attribute <code>id</code> to create cross-references from the procedure to the spares listed in Preliminary requirements. The attribute <code>id</code> on element <code>&lt;sparesDescr&gt;</code> is used to establish the link between the two and will guarantee consistent use of identification throughout the procedure. The use of cross-references is encouraged.
<a href="#">Chap 3.9.5.2.1.9</a> Para 3.1	<a href="#">BRDP-S1-00157</a>	Use of the element <code>&lt;closeRqmts&gt;</code> in the process data modules	Decide whether to use the element <code>&lt;closeRqmts&gt;</code> in the process data modules.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.1	<a href="#">BRDP-S1-00158</a>	Use of the attribute <code>circuitBreakerAction</code> in text element <code>&lt;circuitBreakerRef&gt;</code>	Decide whether to use the attribute <code>circuitBreakerAction</code> . If used, establish writing rules to ensure that authors will be consistent in the paragraph text and the value of the attribute itself.
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.1	<a href="#">BRDP-S1-00159</a>	Use of the attribute <code>checksum</code> in text element <code>&lt;circuitBreakerRef&gt;</code>	Decide whether to use and how to populate the attribute <code>checksum</code> .
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.3	<a href="#">BRDP-S1-00160</a>	Types of inline significant data to markup using the attribute <code>significantParaDataType</code> in the text element <code>&lt;inlineSignificantData&gt;</code>	Decide whether to use the attribute <code>significantParaDataType</code> and which types of data to mark up and in what contexts. <b>Note</b> It must also be considered that data modules can be less portable if the paragraph significant data types are extended in the BREX file past the standard types.
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.4.1	<a href="#">BRDP-S1-00163</a>	Use of the value (element <code>&lt;quantityValue&gt;</code> ) and tolerance (element <code>&lt;quantityTolerance&gt;</code> ) decomposition in the text element <code>&lt;quantity&gt;</code>	Decide whether and how to use to use the element <code>&lt;quantityValue&gt;</code> and the element <code>&lt;quantityTolerance&gt;</code> decomposition.
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.4.1	<a href="#">BRDP-S1-00164</a>	Unit of measure to be used	If using the value and tolerance decomposition, decide at which level of the markup the attribute <code>quantityUnitOfMeasure</code> must be included. Allowable locations are on the parent element <code>&lt;quantityGroup&gt;</code> which applies to all child elements or on the individual child elements <code>&lt;quantityValue&gt;</code> and <code>&lt;quantityTolerance&gt;</code> . A consistent usage of the attribute <code>quantityUnitOfMeasure</code> is required to produce a consistent display or printout to the user.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.5	<a href="#">BRDP-S1-00166</a>	Use of the element <code>&lt;zoneRef&gt;</code>	Decide whether and how to use the element <code>&lt;zoneRef&gt;</code> . Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken.
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.6	<a href="#">BRDP-S1-00167</a>	Use of the element <code>&lt;accessPointRef&gt;</code>	Decide whether to use the element <code>&lt;accessPointRef&gt;</code> and how to use it. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken.
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.7	<a href="#">BRDP-S1-00169</a>	Use of the text element <code>&lt;indexFlag&gt;</code>	Decide whether a publishing index is required and to what level.
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.9	<a href="#">BRDP-S1-00171</a>	Use of the symbols	Decide whether and how to use symbols using the text element <code>&lt;symbol&gt;</code> .
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.12	<a href="#">BRDP-S1-00172</a>	Use of footnotes	Decide whether and how to use the text element <code>&lt;footnote&gt;</code> and when used, decide whether the use of footnotes is limited to regular text and titles (inline) and/or to tables (table footnotes).
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.1.12	<a href="#">BRDP-S1-00173</a>	Types of footnote markers	Decide on the types of footnote markers (attribute <code>footnoteMark</code> ) to use. It is recommended to use: <ul style="list-style-type: none"> <li>only one type of footnote marker for each of the table footnotes and the inline footnotes throughout a project</li> <li>superscripted numbers for both.</li> </ul>
<a href="#">Chap 3.9.5.2.1.10</a> Para 2.5.3	<a href="#">BRDP-S1-00560</a>	Identification of parts	Decide whether the project can use OEM renamed part numbers instead of part numbers allocated by the part design authority in the attribute <code>partNumberValue</code>
<a href="#">Chap 3.9.5.2.1.11</a> Para 2	<a href="#">BRDP-S1-00176</a>	Presentation of controlled content	Decide how to present controlled content using the attributes <code>authorityName</code> and <code>authorityDocument</code> .
<a href="#">Chap 3.9.5.2.1.12</a> Para 2.1	<a href="#">BRDP-S1-00177</a>	Use of common information	Decide whether to use the element <code>&lt;commonInfo&gt;</code> in business rules exchange, common repositories, fault, maintenance checklist, maintenance

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
			planning, procedural, process, and service bulletin data modules. If decided to be used, then determine the circumstances for its use for each related data module type, and give guidance and rules that will make sure it is consistently used.
<a href="#">Chap 3.9.5.2.1.12</a> Para 2.1.1.2	<a href="#">BRDP-S1-00178</a>	Markup method for common information text	Decide which markup method to use for common information text: <ul style="list-style-type: none"> <li>– the method containing <code>&lt;note&gt;</code>, <code>&lt;para&gt;</code> and <code>&lt;commonInfoDescrPara&gt;</code> or</li> <li>– the method containing only <code>&lt;commonInfoDescrPara&gt;</code></li> </ul>
<a href="#">Chap 3.9.5.2.2</a> Para 2.4	<a href="#">BRDP-S1-00180</a>	Maximum number of subordinate levelled paragraphs in a descriptive data module	Decide on the maximum number of levelled paragraphs allowed in a descriptive data module. Exceeding five levels of depth is strongly discouraged in development of new data. It is recommended that additional levels are only used in a conversion effort where the existing data is authored to this depth (maximum eight levels) and restructuring of data is not feasible.
<a href="#">Chap 3.9.5.2.2</a> Para 2.4	<a href="#">BRDP-S1-00181</a>	Minimum levelled paragraph occurrences	Decide whether to impose a minimum of two occurrences of child elements <code>&lt;levelledPara&gt;</code> and/or <code>&lt;levelledParaAlts&gt;</code> .
<a href="#">Chap 3.9.5.2.3</a> Para 2.4	<a href="#">BRDP-S1-00185</a>	Use of the alternates concept within the element <code>&lt;mainProcedure&gt;</code>	Decide whether to use the alternates concept for steps, figures and multimedia within the element <code>&lt;mainProcedure&gt;</code> . This concerns the child elements <code>&lt;proceduralStepAlts&gt;</code> (refer to Para 2.4.2), <code>&lt;figureAlts&gt;</code> (refer to <a href="#">Chap 3.9.5.2.1.7</a> ) and <code>&lt;multimediaAlts&gt;</code> (refer to <a href="#">Chap 3.9.5.2.1.7</a> ).
<a href="#">Chap 3.9.5.2.3</a> Para 2.4.1	<a href="#">BRDP-S1-00186</a>	Maximum number of step levels in a procedure	Decide on the maximum number of step levels allowed in a procedure. Exceeding five levels of depth is strongly discouraged in development of new data. It is recommended that additional levels are only used in a conversion effort where the existing data is authored to this depth

			(maximum eight levels) and restructuring of data is not feasible.
<a href="#">Chap 3.9.5.2.3</a> Para 2.4.1	<a href="#">BRDP-S1-00187</a>	Minimum number of substeps in a step	Decide whether to allow for a single substep, or to insist on a minimum of two substeps in a step.  <b>Note</b> The Schema allows for a single substep.
<a href="#">Chap 3.9.5.2.4</a> Para 2.5.7.1.5	<a href="#">BRDP-S1-00192</a>	Use of correlation fault concept	Decide whether to use the correlated fault concept.
<a href="#">Chap 3.9.5.2.4</a> Para 2.5.7.1.5	<a href="#">BRDP-S1-00193</a>	Use of correlated fault messages and warnings	Decide how to populate the elements <code>&lt;warningMalfunction&gt;</code> , <code>&lt;assocWarningMalfunction&gt;</code> and <code>&lt;bitMessage&gt;</code> when using the correlated fault concept.
<a href="#">Chap 3.9.5.2.4</a> Para 2.5.7.1.5	<a href="#">BRDP-S1-00194</a>	Use of detection and description information elements	Decide whether the repetition of the detection and description information for the basic fault which has been correlated (elements <code>&lt;faultDescr&gt;</code> and <code>&lt;detectionInfo&gt;</code> ) is used. Projects can consider that the detection and description information can for example be populated during IETP generation by picking up the information in the detected fault list data module describing the basic faults.
<a href="#">Chap 3.9.5.2.4</a> Para 2.6.1.2	<a href="#">BRDP-S1-00195</a>	Use of the attribute <code>independentCheck</code> in the element <code>&lt;isolationProcedure&gt;</code> , <code>&lt;isolationStep&gt;</code> and <code>&lt;isolationProcedureEnd&gt;</code>	Decide whether to use the attribute <code>independentCheck</code> , which values to use and allocate suitable definitions.
<a href="#">Chap 3.9.5.2.5</a> Para 2.4.1.1.4	<a href="#">BRDP-S1-00197</a>	Values for the attribute <code>inspectionTypeCategory</code>	Decide which values to use for the attribute <code>inspectionTypeCategory</code> and allocate suitable definitions.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.5</a> Para 2.4.1.2	<a href="#">BRDP-S1-00562</a>	Use of the top level preliminary requirements construct for maintenance inspections	Decide whether to use the top level preliminary requirements for maintenance inspections.
<a href="#">Chap 3.9.5.2.5</a> Para 2.5.2	<a href="#">BRDP-S1-00198</a>	Methodology of assigning tasks into the element <code>&lt;taskGroup&gt;</code>	Decide on a methodology of assigning tasks to groups.
<a href="#">Chap 3.9.5.2.5</a> Para 2.5.2.1.3	<a href="#">BRDP-S1-00199</a>	Use of the attribute <code>markerType</code>	Decide whether which values to use for the attribute <code>markerType</code> , which values to use and allocate suitable definitions.
<a href="#">Chap 3.9.5.2.5</a> Para 2.6.1	<a href="#">BRDP-S1-00202</a>	Values for the attribute <code>sourceOfRqmt</code>	Decide which values to use for the attribute <code>sourceOfRqmt</code> and allocate suitable definitions.
<a href="#">Chap 3.9.5.2.5</a> Para 2.6.3	<a href="#">BRDP-S1-00204</a>	Use of the element <code>&lt;preliminaryRqmts&gt;</code> in the element <code>&lt;taskDefinition&gt;</code>	Decide whether to use the element <code>&lt;preliminaryRqmts&gt;</code> in the context of task definition.
<a href="#">Chap 3.9.5.2.5</a> Para 2.8.2	<a href="#">BRDP-S1-00563</a>	Use of the attribute <code>timeLimitCategoryValue</code>	In case standard descriptions are not applicable, describe how the values "1" and "2", respectively, will be used for the attribute <code>timeLimitCategoryValue</code>
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5	<a href="#">BRDP-S1-00219</a>	Use of the element <code>&lt;partSegment&gt;</code> in the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether to use the element <code>&lt;partSegment&gt;</code> to store the part data in the IPD data module each time the part is listed, or store the part data once externally in the part CIR data module.  <b>Note</b> The element <code>&lt;partSegment&gt;</code> must be used for S2000M IPD data modules.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5.3.4	<a href="#">BRDP-S1-00221</a>	Use of the element <code>&lt;physicalSecurityPilferageCode&gt;</code> in the element <code>&lt;techData&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether and how to use the element <code>&lt;physicalSecurityPilferageCode&gt;</code> . S2000M lists the possible codes in the data definition for physical security pilferage code (PSC).

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5.3.7	<a href="#">BRDP-S1-00222</a>	Use of the attribute <code>unitOfMeasure</code> in the element <code>&lt;unitOfIssueQualificationSegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide on the range and definitions of the values for the attribute <code>unitOfMeasure</code> .  <b>Note</b> When the IPD data modules are created from S2000M, the list of allowed unit of measure (UOM) values must contain those defined in the data definition in S2000M. When S2000M is used, it is strongly recommended to use the S2000M UOM values throughout the project.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5.4.3	<a href="#">BRDP-S1-00223</a>	Use of the element <code>&lt;optionalPart&gt;</code> in the element <code>&lt;partRefGroup&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide on the method of identification of the optional part.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5.4.4	<a href="#">BRDP-S1-00224</a>	Use of the element <code>&lt;preferredSparePart&gt;</code> in the element <code>&lt;partRefGroup&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide on the method of identification of the preferred spare part.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5.4.5	<a href="#">BRDP-S1-00225</a>	Use of the element <code>&lt;alteredFromPart&gt;</code> in the element <code>&lt;partRefGroup&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide on the method of identification of the altered from part.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.5.4.7	<a href="#">BRDP-S1-00226</a>	Use of the element <code>&lt;localFabricationMaterial&gt;</code>	Decide on the method of identification of the local fabrication material.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.7.1	<a href="#">BRDP-S1-00229</a>	Use of the element <code>&lt;usableOnCodeEquipment&gt;</code> in the element <code>&lt;applicabilitySegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether and how to use the element <code>&lt;usableOnCodeEquipment&gt;</code> . If used, decide on the values and their definitions. S2000M lists the possible codes and their usage in the data definition for usable on code equipment (UCE).

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.7.2	<a href="#">BRDP-S1-00230</a>	Use of the element <code>&lt;usableOnCodeAssy&gt;</code> in the element <code>&lt;applicabilitySegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether and how to use the element <code>&lt;usableOnCodeAssy&gt;</code> . If used, decide on the values and their definitions. S2000M lists the possible codes and their usage in the data definition for usable on code assembly (UCA).
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.7.3	<a href="#">BRDP-S1-00231</a>	Use of the element <code>&lt;interchangeability&gt;</code> in the element <code>&lt;applicabilitySegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether and how to use the element <code>&lt;interchangeability&gt;</code> . If used, decide on the values and their definitions. When S2000M is used, the list must be as stated in the data element definition for the S2000M element ICY.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.9.2	<a href="#">BRDP-S1-00232</a>	Use of the element <code>&lt;service&gt;</code> in the element <code>&lt;locationRcmdSegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide on the values and definitions of the third character of the element <code>&lt;service&gt;</code> .
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.9.3	<a href="#">BRDP-S1-00233</a>	Use of the element <code>&lt;sourceMaintRecoverability&gt;</code> in the element <code>&lt;locationRcmdSegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide which values to use for the sixth character of the element <code>&lt;sourceMaintRecoverability&gt;</code> and allocate suitable definitions.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.9.4	<a href="#">BRDP-S1-00234</a>	Use of the element <code>&lt;modelVersion&gt;</code> in the element <code>&lt;locationRcmdSegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether and how to use the element <code>&lt;modelVersion&gt;</code> . If used, decide on the values and their definitions.
<a href="#">Chap 3.9.5.2.7</a> Para 2.5.9.5	<a href="#">BRDP-S1-00235</a>	Use of the element <code>&lt;effectivity&gt;</code> in the element <code>&lt;locationRcmdSegment&gt;</code> within the element <code>&lt;itemSeqNumber&gt;</code>	Decide whether and how to use the element <code>&lt;effectivity&gt;</code> . If used, decide on its range and the definition of the values to be used.
<a href="#">Chap 3.9.5.2.7</a>	<a href="#">BRDP-S1-00237</a>	Use of the BREX to define the non S2000M elements	Decide whether to use BREX for the definition of the non S2000M elements.

Chap 2.5.3

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
			modules are also a deliverable to the customer.
<a href="#">Chap 4.13.1</a> Para 1.5	<a href="#">BRDP-S1-00377</a>	Types of CIR data modules to be used	Decide which CIR data module types to be used. In order to avoid any redundancy and inconsistency, care must be paid on some types, depending on other project specific decisions, for example tailoring of the S2000M (IPD data modules vs Part CIR data module).
<a href="#">Chap 4.13.1</a> Para 1.5	<a href="#">BRDP-S1-00378</a>	Delivery of CIR-dependent data module	Decide whether CIR-dependent data modules are delivered to customer, as it implies a specific process to retrieve the self-standing data modules from the CIR-dependent data module and the CIR data module.
<a href="#">Chap 4.13.1</a> Para 1.5	<a href="#">BRDP-S1-00379</a>	Publishing of CIR data modules	Decide whether and which CIR data module types to be published.
<a href="#">Chap 4.13.1</a> Para 4	<a href="#">BRDP-S1-00380</a>	Use of one or several data modules for a CIR type	Decide whether there is one single or several data modules for a dedicated type of CIR data module within a project or an organization, or for a specific model identification code.
<a href="#">Chap 4.13.1</a> Para 5.1.2	<a href="#">BRDP-S1-00381</a>	Use of implicit or explicit reference method to CIR data module	Decide whether to use implicit or explicit references, or both, between content specific data elements and the CIR data modules.  <b>Note</b> It is recommended to use only one method to avoid difficulties which might appear during the publishing process.
<a href="#">Chap 4.13.3</a> Para 2	<a href="#">BRDP-S1-00382</a>	Use of alternates groups in data module content	Decide whether to use alternates group elements. If used, specify which groups and in which data modules types.
<a href="#">Chap 4.13.3</a> Para 2	<a href="#">BRDP-S1-00383</a>	Mix of alternates groups and elements	Decide whether alternates groups and elements can be mixed in a given structure.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 4.13.4</a> Para 2.3.2	<a href="#">BRDP-S1-00385</a>	Identification of container data module	Decide which identification method to use for container data modules. The chosen method must be used systematically.
<a href="#">Chap 4.13.4</a> Para 2.5	<a href="#">BRDP-S1-00386</a>	Use of applicability within container data module content	Decide whether applicability annotations are duplicated from the referenced data modules to the container data module.
<a href="#">Chap 4.14</a> Para 2.1.2	<a href="#">BRDP-S1-00387</a>	Use of applicability	Decide if the project or the organization will use applicability.
<a href="#">Chap 4.14</a> Para 2.1.2	<a href="#">BRDP-S1-00388</a>	Applicability functionality	Define the required functionality for applicability.
<a href="#">Chap 4.14</a> Para 2.1.2	<a href="#">BRDP-S1-00389</a>	Use of applicability data module types (ACT, CCT, and PCT)	If functionality is limited to print and static display, decide if applicability data module types (ACT, CCT, and PCT) will be used.
<a href="#">Chap 4.14</a> Para 2.1.2.1	<a href="#">BRDP-S1-00390</a>	Product attribute and conditions naming and identification scheme	Define a consistent naming and identification scheme for product attributes and conditions, when ACT and CCT data modules are implemented.
<a href="#">Chap 4.14</a> Para 2.1.2.5	<a href="#">BRDP-S1-00391</a>	Presentation of content that is not applicable	Specify the method that content is presented which is not valid for the current maintenance context. The content can be removed, hidden or de-emphasized in some manner.
<a href="#">Chap 4.14</a> Para 2.1.3	<a href="#">BRDP-S1-00392</a>	Providing the human readable part of applicability	Decide whether to also provide the human readable part of applicability or rely on the viewer to build the human readable part, when providing the computer processing part of applicability.
<a href="#">Chap 4.14</a> Para 2.2.1	<a href="#">BRDP-S1-00393</a>	Number of ACT, CCT and PCT data module instances	Decide whether to provide one instance of each data module types (ACT, CCT and PCT) or to segregate the project or the organization into multiple instances of each data module type, and the method for segregation.
<a href="#">Chap 4.14.1</a> Para 2.1.1	<a href="#">BRDP-S1-00394</a>	Classifying product attributes and conditions an ACT data module	Decide how to divide the properties of the Product into product attributes or condition types.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 4.14.1</a> Para 2.1.1	<a href="#">BRDP-S1-00395</a>	Configuration management of product attributes in an ACT data module	Decide on the extent of configuration management and editing access to be applied to product attributes within an ACT data module.
<a href="#">Chap 4.14.2</a> Para 2.3	<a href="#">BRDP-S1-00396</a>	Use of the incorporation status list in a CCT data module	Decide whether to use the incorporation status list in the CCT data module.
<a href="#">Chap 4.14.3</a> Para 2.3	<a href="#">BRDP-S1-00397</a>	Scope of the product instances in a PCT data module	Decide which product instances are contained in a PCT data module. Options include listing all product instances in-service or listing only the product instances within an organization.
<a href="#">Chap 4.14.3</a> Para 2.4	<a href="#">BRDP-S1-00398</a>	Use of a published or a transient PCT data module	Decide whether to publish a static issue of the PCT data module or use the data module as a temporary input between an external system and a viewer.
<a href="#">Chap 4.14.3</a> Para 2.4	<a href="#">BRDP-S1-00399</a>	Management of the product instance configurations in PCT data modules	Decide how to maintain the list of product instance configuration specifications and the associated values for product attributes and conditions.
<a href="#">Chap 4.14.4</a> Para 1	<a href="#">BRDP-S1-00400</a>	Use of the ACT catalog data module	Decide whether to use the ACT catalog data module.
<a href="#">Chap 4.14.4</a> Para 5	<a href="#">BRDP-S1-00401</a>	Internal or external definition of supplier applicability attributes	Decide whether the supplier applicability attributes are defined in the ACT data module or if the supplier definition is used.
<a href="#">Chap 4.16</a> Para 2.1.1.3	<a href="#">BRDP-S1-00403</a>	Technical information object properties to be included in the data module at delivery	Decide which properties associated to the technical information objects (eg, names, short names) to store within the data module when delivered.

<a href="#">Chap 5.2.1.4</a> Para 2.4.2.1	<a href="#">BRDP-S1-00420</a>	Generation of harness wire list data modules	Decide whether and how to generate harness wire list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.
<a href="#">Chap 5.2.1.4</a> Para 2.4.2.2	<a href="#">BRDP-S1-00421</a>	Generation of connection list data modules	Decide whether and how to generate connection list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.
<a href="#">Chap 5.2.1.4</a> Para 2.4.2.3.1	<a href="#">BRDP-S1-00422</a>	Generation of plug and receptacle list data modules	Decide whether and how to generate harness plug and receptacle list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.
<a href="#">Chap 5.2.1.4</a> Para 2.4.2.3.2	<a href="#">BRDP-S1-00423</a>	Generation of terminal list data modules	Decide whether and how to generate terminal list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.
<a href="#">Chap 5.2.1.4</a> Para 2.4.2.3.3	<a href="#">BRDP-S1-00424</a>	Generation of splice list data modules	Decide whether and how to generate splice list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.
<a href="#">Chap 5.2.1.4</a> Para 2.4.2.3.4	<a href="#">BRDP-S1-00425</a>	Generation of earth point list data modules	Decide whether and how to generate earth point list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.
<a href="#">Chap 5.2.1.9</a> Para 2.2.1	<a href="#">BRDP-S1-00427</a>	Level of detail to be provided in the technical descriptions in Equipment information sets	Decide what level of detail to provide in the functional and technical descriptions.
<a href="#">Chap 5.2.1.9</a> Para 2.2.3	<a href="#">BRDP-S1-00428</a>	Use of wiring Schema in Equipment information sets	Decide whether the Wiring data Schema and the Wiring data description Schema are to be used or not. Interactive wiring publication functionalities are only to be made available if the Wiring Schema is used. Refer to <a href="#">Chap 3.9.5.2.9</a> .

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 5.2.1.9</a> Para 2.4	<a href="#">BRDP-S1-00429</a>	Level of detail to be provided in the maintenance and servicing data modules in Equipment information sets	Decide what level of detail to provide in the maintenance and servicing data modules.
<a href="#">Chap 5.2.1.9</a> Para 2.4.3	<a href="#">BRDP-S1-00430</a>	Use of consolidated lists for Support equipment, Consumables, materials, expendables, etc, in Equipment information sets	Decide whether to use consolidated lists for Support equipment, Consumables, materials, expendables, etc..
<a href="#">Chap 5.2.1.9</a> Para 2.4.3	<a href="#">BRDP-S1-00431</a>	Use of equivalent substitutes in Equipment information sets	Decide whether to allow the use equivalent substitutes for support equipment, consumables, materials and expendables.
<a href="#">Chap 5.2.1.9</a> Para 2.5	<a href="#">BRDP-S1-00432</a>	Level of detail to be provided in the IPD data modules in Equipment information sets	Decide what level of detail to provide in the IPD modules.
<a href="#">Chap 5.2.1.14</a> Para 2.2.2	<a href="#">BRDP-S1-00433</a>	Separation of product frame and engine BDAR information in the BDARP	Decide whether to separate the BDARP into product frame and engine BDAR information.
<a href="#">Chap 5.2.1.14</a> Para 2.2.6	<a href="#">BRDP-S1-00434</a>	Separate data modules for utilization degradation in BDAR information sets	Decide whether to prepare separate data modules for degradation information, or to include this information in the damage assessment data modules.
<a href="#">Chap 5.2.1.14</a> Para 2.4	<a href="#">BRDP-S1-00435</a>	Interactive BDARP	Decide whether to produce an interactive BDARP and define the required functionalities.
<a href="#">Chap 5.2.1.16</a> Para 2.2.2.1	<a href="#">BRDP-S1-00436</a>	Use of external material information in service bulletins	Decide whether material information must be a part of the "core" SB data module or if it can (depending on the volume) be presented in one or more referenced separate SB data modules. Refer to Fig 2.
<a href="#">Chap 5.2.1.16</a> Para 2.2.4	<a href="#">BRDP-S1-00437</a>	Treatment of alert and standard Service bulletins	Decide whether or not to allow classifying Service bulletins as Alert.
<a href="#">Chap 5.2.1.16</a> Para 2.2.5	<a href="#">BRDP-S1-00438</a>	Service bulletin compliance categories	Decide whether to use the four compliance categories or to define others.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 5.2.1.16</a> Para 2.2.6.1.4	<a href="#">BRDP-S1-00439</a>	Minimum impact on weight in Service bulletins	Decide the threshold for minimum impact on weight that must be reported in a Service bulletin.
<a href="#">Chap 5.2.1.16</a> Para 2.2.6.1.4	<a href="#">BRDP-S1-00440</a>	Minimum impact on balance in Service bulletins	Decide the threshold for minimum impact on balance that must be reported in a Service bulletin.
<a href="#">Chap 5.2.1.16</a> Para 2.2.6.1.4	<a href="#">BRDP-S1-00441</a>	Minimum impact on electrical load to be reported in Service bulletins	Decide the threshold for minimum impact on electrical load that must be reported in a Service bulletin.
<a href="#">Chap 5.2.1.16</a> Para 2.2.6.1.4	<a href="#">BRDP-S1-00442</a>	Definitions and use of maintenance and operational publications in Service bulletins	Decide on the precise definitions of "maintenance publications" and "operational publications" and whether to separate them into different listings in the Impact on publications.
<a href="#">Chap 5.2.1.20</a> Para 1.2	<a href="#">BRDP-S1-00445</a>	Use of a set of publication list data modules or a publication module for the LOAP	Decide whether to use a set of publication list data modules or a publication module to list the applicable publications and other documents including individual data modules.
<a href="#">Chap 5.2.1.20</a> Para 1.2	<a href="#">BRDP-S1-00446</a>	Schema to use for the publication list data modules of the LOAP	Decide whether to use the front matter Schema or the descriptive Schema for the publication list data modules.
<a href="#">Chap 5.2.1.20</a> Para 1.2	<a href="#">BRDP-S1-00447</a>	One consolidated or several separate publication list data modules for the LOAP	Decide whether to deliver the publications and documents listed in one data module/publication module (with one or more lists presented as tables) or as separate data modules/publication modules (eg, by operational publications or maintenance publications).
<a href="#">Chap 5.2.1.20</a> Para 2.2.1	<a href="#">BRDP-S1-00448</a>	Inclusion of unpublished publications and documents in the LOAP	Decide whether to include publications and documents that are not published. <b>Note</b> When used as a contractual document, all publications and documents, published or not, must be included.
<a href="#">Chap 5.2.1.20</a> Para 2.2.2.4	<a href="#">BRDP-S1-00449</a>	Markup of the publication entry as a link in the LOAP	Decide whether to markup the publication entry as a link when using the descriptive Schema.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 5.2.1.20</a> Para 2.2.2.4	<a href="#">BRDP-S1-00450</a>	Include the manufacturer's part number or reference number in the LOAP	Decide whether to include and present the manufacturer's part number or reference number.
<a href="#">Chap 5.2.1.20</a> Para 2.2.2.4	<a href="#">BRDP-S1-00451</a>	Use of language in the LOAP	Decide whether to include and present the language of the publication or document in the entries.
<a href="#">Chap 5.2.2.4</a> Para 1.3.2	<a href="#">BRDP-S1-00452</a>	Additional information in parts lists for engine maintenance information sets	Decide whether to indicate additional information under the heading of the parts list "Remarks" (eg, modification number applicable to the item).
<a href="#">Chap 5.2.2.7</a> Para 2.2.3.8.6	<a href="#">BRDP-S1-00453</a>	Standards of performance data in aircrew information	Decide on the standards of performance to be used in the calculation.
<a href="#">Chap 5.2.2.7</a> Para 2.2.4.2	<a href="#">BRDP-S1-00455</a>	Select model for checklist for structures in aircrew information	Decide which of the two models are used to structure checklists.
<a href="#">Chap 5.2.2.7</a> Para 2.2.4.7	<a href="#">BRDP-S1-00456</a>	Order of drills in aircrew information	Decide whether the order of drills will be project specific. Limitations and operating data required by the project must be included.
<a href="#">Chap 5.2.2.7</a> Para 2.2.4.7	<a href="#">BRDP-S1-00457</a>	Supplementing the order of drills in aircrew information	Decide whether to supplement the order of drills checklist listing.
<a href="#">Chap 5.2.2.7</a> Para 2.2.4.8	<a href="#">BRDP-S1-00458</a>	Numbering of checks within drills in aircrew information	Decide on the numbering of checks within each drill.
<a href="#">Chap 5.2.3.1</a> Para 1.2.2	<a href="#">BRDP-S1-00459</a>	Description types for land/sea Products for the crew/operators	Decide on the description types to be used: functional, physical breakdown, or external equipment.
<a href="#">Chap 5.3.1.1</a> Para 2.2	<a href="#">BRDP-S1-00426</a>	Schema to be used for front matter data modules	Decide which Schemas to be used to capture the different front matter data module types.
<a href="#">Chap 5.3.1.1</a> Para 2.2	<a href="#">BRDP-S1-00461</a>	Front matter information codes	Decide which front matter information codes to use, the basic (eg, 00R) or the alternative (eg, 002).
<a href="#">Chap 5.3.1.1</a> Para 2.3	<a href="#">BRDP-S1-00460</a>	Front matter to be included in page-oriented publications and IETP, respectively	Decide which front matter is to be included (mandatory or optional) in each of the page-oriented publications and in the IETP. The decisions must be based on the rules given in <a href="#">Chap 3.9.4</a> .

<a href="#">Chap 6.2</a> Para 1	<a href="#">BRDP-S1-00473</a>	Use of the S1000D standard page-oriented presentation chapters.	Decide whether to use the S1000D standard page-oriented presentation given in <a href="#">Chap 6.2.2</a> and <a href="#">Chap 6.2.3</a> or to use any other rules for presentation to meet specific project or organization requirements. The business rules must specify the information needed to contract the desired presentation.

<b>BRDP reference location</b>	<b>BRDP unique identifier</b>	<b>BRDP title</b>	<b>BRDP definition</b>
<a href="#">Chap 6.2.1</a> Para 1	<a href="#">BRDP-S1-00474</a>	Use of mirrored headers and footers	Decide whether to use mirrored headers and footers.
<a href="#">Chap 6.2.1</a> Para 2.1	<a href="#">BRDP-S1-00475</a>	Page size	Decide which page size to be used (including sizes when foldouts are allowed) per publication.
<a href="#">Chap 6.2.1</a> Para 2.1	<a href="#">BRDP-S1-00476</a>	Presentation of foldouts in page-oriented publications	Decide where (eg, interspersed or at the end of the publication) the foldouts must be located in page-oriented publications.
<a href="#">Chap 6.2.1</a> Para 2.2	<a href="#">BRDP-S1-00477</a>	Presentation of inwork markings	Decide whether to present the inwork markings. The details must be documented.
<a href="#">Chap 6.2.1</a> Para 2.3	<a href="#">BRDP-S1-00478</a>	Presentation of "Produced by" - "Printed in"	Decide whether to present the responsible producer of the page-oriented output and/or where the publication was printed.
<a href="#">Chap 6.2.1</a> Para 2.4.1.1	<a href="#">BRDP-S1-00479</a>	Presentation of publication module code	Decide whether to use the S1000D standard page-oriented presentation rules for the publication module code or to create project or organization specific rules for its positioning and style within the header.
<a href="#">Chap 6.2.1</a> Para 2.4.1.2	<a href="#">BRDP-S1-00480</a>	Presentation of data module code	Decide whether to use the S1000D standard page-oriented presentation rules for the data module code or to create project or organization specific rules for its positioning and style within the footer.
<a href="#">Chap 6.2.1</a> Para 2.4.1.3	<a href="#">BRDP-S1-00481</a>	Presentation of issue date	Decide whether to use S1000D standard page-oriented presentation rules for the issue date or to create project or organization specific rules for its positioning in the bottom of the footer.
<a href="#">Chap 6.2.1</a> Para 2.4.1.4	<a href="#">BRDP-S1-00482</a>	Presentation of page number	Decide whether to use the S1000D standard page-oriented presentation rules for the page number or to create project or organization specific rules for its positioning in the footer.
<a href="#">Chap 6.2.1</a> Para 2.4.1.4	<a href="#">BRDP-S1-00483</a>	Page numbering of foldout pages	Decide whether to use double numbering of pages when printed on one (right-hand) side only (eg, 11/12, 13/14).

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 6.2.1</a> Para 2.4.1.5	<a href="#">BRDP-S1-00484</a>	Presentation of applicability annotation	Decide whether to use the S1000D standard page-oriented presentation rules for the applicability annotation or to create project or organization specific rules for the presentation.
<a href="#">Chap 6.2.1</a> Para 2.4.2	<a href="#">BRDP-S1-00485</a>	Presentation of security markings	Decide whether to present the security markings in sentence case instead of in uppercase.
<a href="#">Chap 6.2.1</a> Para 2.4.2	<a href="#">BRDP-S1-00486</a>	Presentation of commercial classification and/or caveat as security markings	Decide whether to use the commercial classification (value of attribute <code>commercialClassification</code> ) and/or national caveat (value of attribute <code>caveat</code> ) as an alternative to the security classification (value of the attribute <code>securityClassification</code> ).
<a href="#">Chap 6.2.1</a> Para 2.4.2	<a href="#">BRDP-S1-00487</a>	Exclude presentation of security markings for unclassified publications	Decide whether to exclude the presentation of security markings for unclassified publications.
<a href="#">Chap 6.2.1</a> Para 2.4.2	<a href="#">BRDP-S1-00568</a>	Presentation of derivative classification markings	Decide whether to use and when to use the derivative classification (value of the <code>&lt;classificationAction&gt;</code> elements within the <code>&lt;classificationActionGroup&gt;</code> defined by the IDREF in the attribute <code>derivativeClassificationRefId</code> ).
<a href="#">Chap 6.2.1</a> Para 2.4.3	<a href="#">BRDP-S1-00488</a>	Presentation of safety classification	Decide whether to use the S1000D standard page-oriented presentation rules for the safety classification (attribute <code>safetyLabel</code> of the element <code>&lt;productSafety&gt;</code> ) or to create project or organization specific rules for the presentation.
<a href="#">Chap 6.2.1</a> Para 2.4.4	<a href="#">BRDP-S1-00489</a>	Presentation of the element <code>&lt;logo&gt;</code>	Decide whether to present any of the logotypes given in the element <code>&lt;logo&gt;</code> and how this element is presented (eg, size, color).
<a href="#">Chap 6.2.1</a> Para 2.4.5	<a href="#">BRDP-S1-00490</a>	Presentation of "End of data module" statement	Decide on the text that will be used to identify the end of a data module, either "End of data module" or "End of" followed by the data module title.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 6.2.1</a> Para 2.4.5	<a href="#">BRDP-S1-00491</a>	Placement of the end of data module statement	Decide whether to present the "End of" statement in the footer or in the body of the page.
<a href="#">Chap 6.2.1</a> Para 2.5	<a href="#">BRDP-S1-00492</a>	Use of double column text	Decide whether to use double column text, and under what circumstances. Typography for double column page layout must be documented.
<a href="#">Chap 6.2.1</a> Para 2.6.1	<a href="#">BRDP-S1-00493</a>	Double sided printing of foldout pages	Decide whether to use double sided printing on foldout pages. <b>Note</b> A3L paper in A3L binders are normally printed on both sides.
<a href="#">Chap 6.2.2</a> Para 2.3.1	<a href="#">BRDP-S1-00494</a>	Presentation of the procedural step titles from the element <code>&lt;proceduralStep&gt;</code>	Decide whether to present the titles for the element <code>&lt;proceduralStep&gt;</code> and to which level.
<a href="#">Chap 6.2.2</a> Para 2.3.1	<a href="#">BRDP-S1-00495</a>	Presentation of the crew drill step titles from the element <code>&lt;crewDrillStep&gt;</code>	Decide whether to present the titles for the element <code>&lt;crewDrillStep&gt;</code> and to which level. <b>Note</b> Presentation of the titles for steps on level six thru level eight are not given. The use of these elements is discouraged and their use and presentation are project decisions.
<a href="#">Chap 6.2.2</a> Para 2.3.1	<a href="#">BRDP-S1-00496</a>	Presentation of the document title	Decide whether to present the document title as a Centerhead No. 1 and a Centerhead No. 2 or as a Centerhead No. 1 only (including both element <code>&lt;techName&gt;</code> and element <code>&lt;infoName&gt;</code> ).
<a href="#">Chap 6.2.2</a> Para 2.3.2.2.1	<a href="#">BRDP-S1-00497</a>	Number of sidehead levels to be presented in the Table of contents	Decide whether to present more than three sidehead levels in the table of contents. The allowed number of sidehead levels must be stated in the business rules.
<a href="#">Chap 6.2.2</a> Para 2.3.2.2.2	<a href="#">BRDP-S1-00498</a>	Presentation of List of tables	Decide whether to present the List of tables.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 6.2.2</a> Para 2.3.2.2.2	<a href="#">BRDP-S1-00499</a>	Present the prefix "Table" in the List of tables	Decide whether to present the prefix "Table" before the table number in the List of tables.
<a href="#">Chap 6.2.2</a> Para 2.3.2.2.3	<a href="#">BRDP-S1-00500</a>	Presentation of List of figures	Decide whether to present the List of figures.
<a href="#">Chap 6.2.2</a> Para 2.3.2.2.3	<a href="#">BRDP-S1-00501</a>	Present the prefix "Fig" in the List of figures	Decide whether to present the prefix "Fig" before the figure number in the List of figures.
<a href="#">Chap 6.2.2</a> Para 2.3.2.3	<a href="#">BRDP-S1-00502</a>	Presentation (layout) of titles	Decide whether to use the S1000D standard presentation rules for titles (Sidehead 1 thru Sidehead 5 or if used thru Sidehead 8) or to create project or organization specific rules such as type size, leading and justification.
<a href="#">Chap 6.2.2</a> Para 2.3.2.3	<a href="#">BRDP-S1-00503</a>	Presentation of the leveled para titles from the element <code>&lt;levelledPara&gt;</code> on level six thru eight	Decide whether to present the titles for the element <code>&lt;levelledPara&gt;</code> on level six thru eight.
<a href="#">Chap 6.2.2</a> Para 2.3.2.4	<a href="#">BRDP-S1-00504</a>	Use of the alternative method for labeling procedural steps at presentation	Decide whether to use the preferred or the alternative method for labeling procedural steps.
<a href="#">Chap 6.2.2</a> Para 2.4	<a href="#">BRDP-S1-00505</a>	Presentation of paragraphs of text	Decide whether to use the recommended presentation rules for type size, spacing and justification.
<a href="#">Chap 6.2.2</a> Para 2.5	<a href="#">BRDP-S1-00506</a>	Presentation of hierarchical indented steps, when used without titles in procedural steps	Decide whether to use hierarchical indented steps, when used without titles.
<a href="#">Chap 6.2.2</a> Para 2.6.2.1	<a href="#">BRDP-S1-00507</a>	Prefixes to be used for random lists at presentation	Decide whether to use a consistent set of prefixes for random list throughout the project.
<a href="#">Chap 6.2.2</a> Para 2.7.1	<a href="#">BRDP-S1-00508</a>	Presentation of footnote numbers	Decide whether to present the footnote markers as superscripted numbers (default) or as numbers presented within parenthesis.
<a href="#">Chap 6.2.2</a> Para 2.7.2	<a href="#">BRDP-S1-00509</a>	Presentation of inline footnotes	Decide whether to present the inline footnotes at the bottom of the page (default) or at the end of the data module.

<a href="#">Chap 6.2.2</a> Para 2.13.1	<a href="#">BRDP-S1-00517</a>	Display of change marks	Decide whether to display change marks.
<a href="#">Chap 6.2.2</a> Para 2.13.1	<a href="#">BRDP-S1-00518</a>	Presentation of change marks	Decide whether to use an alternative visual presentation as change marker
<a href="#">Chap 6.2.2</a> Para 2.13.1	<a href="#">BRDP-S1-00519</a>	Presentation of change marking of individual table rows	Decide whether to change marks for individual table rows.
<a href="#">Chap 6.2.2</a> Para 2.13.1	<a href="#">BRDP-S1-00570</a>	Presentation of controlled content	Decide how to present controlled content using the attributes <code>authorityName</code> and <code>authorityDocument</code> .
<a href="#">Chap 6.2.2</a> Para 2.14.1	<a href="#">BRDP-S1-00520</a>	Presentation of data module titles in the reference table	Decide whether to present the data module title in the reference table ("Table 1 References").
<a href="#">Chap 6.2.2</a> Para 2.14.1	<a href="#">BRDP-S1-00521</a>	Presentation of publication module/non-S1000D publication titles in the reference table	Decide whether to present the title (element <code>&lt;pmTitle&gt;</code> / <code>&lt;externalPubTitle&gt;</code> ) or the short title (element <code>&lt;shortPmTitle&gt;</code> / <code>&lt;shortExternalPubTitle&gt;</code> ), or both, in the reference table ("Table 1 References").
<a href="#">Chap 6.2.2</a> Para 2.14.1	<a href="#">BRDP-S1-00522</a>	Order of presentation of references in the reference table	Decide in which order the referenced document is presented in the reference table ("Table 1 References"): In order of appearance, alphabetical order, data modules before publications, etc.
<a href="#">Chap 6.2.2</a> Para 2.14.2	<a href="#">BRDP-S1-00523</a>	Inline presentation of non-S1000D publication titles	Decide whether to present the external publication code (element <code>&lt;externalPubCode&gt;</code> ), the title (element <code>&lt;externalPubTitle&gt;</code> ) or the short title (element <code>&lt;shortExternalPubTitle&gt;</code> ) as the inline reference.
<a href="#">Chap 6.2.2</a> Para 2.15	<a href="#">BRDP-S1-00524</a>	Presentation of the name of spares, supplies and support equipment	Decide whether to present the name (element <code>&lt;name&gt;</code> ) or the abbreviated alternate name (element <code>&lt;shortName&gt;</code> ), as the cross-reference in the text.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 6.2.2</a> Para 2.16	<a href="#">BRDP-S1-00097</a>	Presentation of the target titles in cross-references	Decide whether to present the target titles given in the element <title>.  <b>Note</b> Presentation of the titles depends on the presentation system and its settings.
<a href="#">Chap 6.2.2</a> Para 2.16.1	<a href="#">BRDP-S1-00525</a>	Use of the alternative method for presentation of applicability statements	Decide whether to use the preferred or the alternative method for presentation of applicability statements.
<a href="#">Chap 6.2.2</a> Para 2.16.3	<a href="#">BRDP-S1-00526</a>	Decide on highlighting the applicability default heading and statement at presentation	Decide whether to highlight (blue and bold) the default heading and applicability statement at presentation.
<a href="#">Chap 6.2.3.1</a> Para 2.2	<a href="#">BRDP-S1-00527</a>	Elements and attributes to be presented on the Title page	Decide which elements and attributes to be presented on the Title page.  <b>Note</b> The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in <a href="#">Chap 3.9.4</a> and <a href="#">Chap 3.9.5.2.16</a> .
<a href="#">Chap 6.2.3.1</a> Para 2.2	<a href="#">BRDP-S1-00528</a>	Size of the product illustration on the Title page	Decide on the height of the product illustration on the Title page, if used.
<a href="#">Chap 6.2.3.1</a> Para 2.3	<a href="#">BRDP-S1-00529</a>	Elements and attributes to be presented on the Table of contents page	Decide which elements and attributes to be presented on the Table of contents page.  <b>Note</b> The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in <a href="#">Chap 3.9.4</a> and <a href="#">Chap 3.9.5.2.16</a> .
<a href="#">Chap 6.2.3.1</a> Para 2.3	<a href="#">BRDP-S1-00571</a>	Number of levels in Table of contents	Decide on the number of levels to be presented in Table of contents.
<a href="#">Chap 6.2.3.1</a> Para 2.4	<a href="#">BRDP-S1-00530</a>	Elements and attributes to be presented on the List of effective pages	Decide which elements and attributes to be presented on the List of effective pages.

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
			<b>Note</b> The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in <a href="#">Chap 3.9.4</a> and <a href="#">Chap 3.9.5.2.16</a> .
<a href="#">Chap 6.2.3.1</a> Para 2.5	<a href="#">BRDP-S1-00531</a>	Elements and attributes to be presented on the List of effective data modules	Decide which elements and attributes to be presented on the List of effective data modules.  <b>Note</b> The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in <a href="#">Chap 3.9.4</a> and <a href="#">Chap 3.9.5.2.16</a> .
<a href="#">Chap 6.2.3.1</a> Para 2.7	<a href="#">BRDP-S1-00532</a>	Elements and attributes to be presented on the Highlights data modules	Decide which elements and attributes to be presented on the Highlights data modules.  <b>Note</b> The decisions must be coordinated/based on the decisions taken for the Business rules decision points given in <a href="#">Chap 3.9.4</a> and <a href="#">Chap 3.9.5.2.16</a> .
<a href="#">Chap 6.2.3.3</a> Para 1	<a href="#">BRDP-S1-00572</a>	Presentation of data module code extension in references and tables	Decide whether and when to present the DME in references and tables.
<a href="#">Chap 6.2.3.3</a> Para 1	<a href="#">BRDP-S1-00573</a>	Presentation of issue number of the data module or the technical publication in references and tables	Decide whether and when to present the issue number of the data module or the technical publication in references and tables.
<a href="#">Chap 6.2.3.3</a> Para 2.5.1	<a href="#">BRDP-S1-00574</a>	Presentation of Production management data	Decide whether to present Production management data.
<a href="#">Chap 6.2.3.3</a> Para 2.5.5.2	<a href="#">BRDP-S1-00575</a>	Presentation of Name and Alternate name	Decide whether to present only Name or both Name and Alternate name in the list of support equipment.  When an Alternate name is used, this is the name that is presented in the data module when referred to by its attribute <code>internalRefId</code> .

BRDP reference location	BRDP unique identifier	BRDP title	BRDP definition
<a href="#">Chap 6.3</a> Para 2	<a href="#">BRDP-S1-00533</a>	Use of rules and guidance for IETP	Decide whether to use the rules and guidance for look and feel, and printed output from an IETP detailed in <a href="#">Chap 6.3.1</a> or an alternate output specification.
<a href="#">Chap 6.3.1</a> Para 2.4.2	<a href="#">BRDP-S1-00534</a>	Main menu bar functions in the IETP viewer	Decide which, if any, of the basic set of main menu bar functions to mandate.
<a href="#">Chap 6.3.1</a> Para 2.4.2.6	<a href="#">BRDP-S1-00535</a>	Printing of classified data	Decide whether to allow the printing of classified data. If not allowed, the print function must be disabled when classified data is presented in the IETP viewer
<a href="#">Chap 6.3.1</a> Para 2.4.3	<a href="#">BRDP-S1-00536</a>	Additional information bar in the IETP viewer	Decide on the use of an additional information bar. If used, it must be decided which information to be available in the additional information bar.
<a href="#">Chap 6.4.1</a> Para 2.1.1.12	<a href="#">BRDP-S1-00537</a>	Use of the functionality matrix	Decide whether to use the functionality matrix. If used, fill in the functionality matrix. Refer to <a href="#">Chap 6.4.2</a> .
<a href="#">Chap 6.4.1</a> Para 2.3.4	<a href="#">BRDP-S1-00538</a>	Modification of the functionality matrix due to selection of information sets	Decide on which modifications are needed in the functionality matrix due to the selection of information sets. Refer to BRDP-S1-00004.
<a href="#">Chap 6.4.1</a> Para 2.4.12.3	<a href="#">BRDP-S1-00539</a>	Selection of functionality using the functionality matrix	Decide on which functionality is required in the technical publications.

#### 1 General

This chapter provides an introduction to the chapters that describe how information is generated in an S1000D project.

#### 2 Content

Information required to support the Product must be produced, as discrete pieces of information called data modules, and stored in a CSDB as described in [Chap 4.2](#).

This chapter provides general rules, which apply to technical information produced in that manner.

---

All data modules have a basic structure which is fully defined in [Chap 3.2](#).

Information sets are used to establish the required scope of the information and data module coding strategy. The use of information sets is fully defined in [Chap 3.3](#). Depth of information is defined as a combination of the breakdown (as represented by the SNS and disassembly code and described in [Chap 4.3.3](#) and [Chap 4.3.4](#)) and the requirements of the Product maintenance policy.

For the purposes of dividing the Product into zones for maintenance and detailing access, the rules are given in [Chap 3.4](#).

The issues surrounding the updating of data modules are explained in [Chap 3.5](#).

The rules for the allocation for the protective marking of data modules that reflects their security classification, etc are detailed in [Chap 3.6](#).

During the development and update of data modules/publications, QA procedures are required to ensure that the contents of the data modules are adequate and technically accurate. Details of these procedures are given in [Chap 3.7](#).

Data modules must reflect the breakdown of the Product. The initial breakdown is described by the SNS. Further disassembly is then as detailed in [Chap 3.8](#).

All data modules are produced in accordance with structural rules. These are reinforced by writing and illustration rules, together with front matter and warnings, cautions and notes. The rules are supported by specific guidance for authoring data modules. These rules are given in [Chap 3.9](#).

## 1 General

This chapter explains the general structure of a data module. There are a number of data module types, which are appropriate for use in the production of all technical information required in operation and maintenance of the Product.

## 2 Basic structure

All data modules have a basic structure, which is comprised of two sections:

- identification and status section, which is defined in [Chap 3.9.5.1](#)
- content section, which is defined in [Chap 3.9.5.2](#)

## 2.1 Identification and status section

The identification and status section is the first part of a data module.

It contains identification data (eg, data module code, title, issue number, issue date, language) and status data (eg, security classification, responsible partner company and originator, applicability, technical standard, QA status, skill, reason for update). Specific details are given in [Chap 3.9.5.1](#).

The identification and status section provides data that can be used for:

- management of the data module within the CSDB
- management of the use of applicability
- management of the quality control process
- management and control of retrieval functions
- automatic compilation of sets or subsets of information
- general information for users accessing the CSDB

### 2.1.1 Applicability

The overall applicability for an entire data module is captured in the identification and status section and is explained in [Chap 3.9.5.3](#).

### 2.1.2 Security classification

The general rules for security classifications are explained in [Chap 3.6](#). The detailed application of security classifications for an entire data module is captured in the identification and status section and is explained in [Chap 3.9.5.1](#).

### 2.1.3 Quality assurance

The process for QA is explained in [Chap 3.7](#).

### 2.1.4 Reason for update

The reason for update can be used to record the reason for developing the initial issue of a data module or the reason for any changes made to the data module. Refer to [Chap 3.9.5.2.1.1](#).

## 2.2 Content section

The content section is the second part of a data module. It contains the text and illustrations that is presented to the user. The different types of the content section and their use are described in [Chap 3.9.5.2](#).

### 2.2.1 Applicability

Content applicability can be allocated to elements within the content section. Refer to [Chap 3.9.5.3](#).

### 2.2.2 Security classification

A security classification can be allocated to elements within the content section. Refer to [Chap 3.9.5.2.1](#).

### 2.2.3 Reason for change

Within the content section, changes can be identified and this can include the reason for change. Details of how to apply change is explained in [Chap 3.9.5.2.1.1](#).

## 1 General

The complete production process involves agreeing the purpose, scope and depth of the technical information, establishing the business rules for data module coding, generating a data module requirement list, producing and publishing the data modules. Information sets are provided to assist the generation part of the process.

## 2 Information sets

These define the purpose, scope and depth of the technical information that is to be produced for operation and maintenance of the Product and subsequently establishing the basic data module requirement list. The content of information sets is described in [Chap 5.2](#). They can also be used for the definition of the publications that are generated as the final deliverable, as described in [Chap 5.3](#).

### 2.1 Common information sets

A number of information sets are considered to be appropriate for use on the Product. These information sets are shown in [Table 2](#) and explained in [Chap 5.2.1](#).

Table 2 Common information sets

## 2.2 Information sets for air systems

The additional specific information sets for air systems are given in [Chap 5.2.2](#).

## 2.3 Information sets for land and sea systems

Since the range of the Product within land/sea systems is so varied, it is impracticable to define one suite of information sets that is appropriate to all land/sea systems. Therefore, for land/sea systems, the project or the organization must define the information sets that are appropriate to their projects. However, to assist with this, a suite of information sets has been provided which can be used. In either case, the project specific information sets must be agreed between the customer and the contractor.

The concepts for the additional information sets for land/sea systems are given in [Chap 5.2.3](#).

<a href="#">Chap 3.4.3.1</a>	Sea systems - Surface ships
<a href="#">Chap 3.4.3.2</a>	Sea systems - Submarines

## 1 General

When indicating the location of the Product equipments, assemblies, access doors and panels, ports, etc within data modules and identifying locations for maintenance planning, the Product is divided into areas and sub-areas known as zones.

When zoning and access information is a requirement for data modules, the principles and requirements as provided in this chapter must be used by the Product contractor's design authorities in the design stage of the project.

Zoning and access identification systems can vary between types of the Product, due to different manufacturing build systems.

[Chap 3.4.1](#) gives the rules for air systems.

[Chap 3.4.2](#) gives the rules for land systems.

[Chap 3.4.3](#) gives the general rules for sea systems.

[Chap 3.4.3.1](#) gives the rules for surface ships.

[Chap 3.4.3.2](#) gives the rules for submarines.

## 2 Zoning requirements

The zoning identification system must be simple, logical in arrangement and suitable for inclusion in data processing systems.

A zone is identified by a standard number consisting of three digits. The first digit is used to indicate the major structural area of the Product. The second digit indicates zones and on which side of the center line (if any) the zone is located. Odd digits apply to left side facing forward, even digits to right side. Zones which are situated over the center line can be allocated numbers which are odd or even. The third digit is used to indicate sub-zones.

Fuselages/hull zones must be allocated longitudinally from forward to aft. Vertical allocation is for the Product with a floor as separation between upper and lower compartments upwards or downwards from that floor and for other types of the Product from the top to the bottom.

Major structural components such as entrance doors, cargo doors, landing gear, landing gear doors, control surfaces, chassis, bulkheads, etc must have individual zone numbers.

Wherever possible, the boundaries of zones can be related to actual physical boundaries of compartments or components such as wing spars, ribs, fuselage/hull frames, turrets, bulkheads or longerons, areas of skin or control surface edges.

Compatibility must be maintained between all versions of the Product wherever possible. Major changes in construction will necessitate the allocation of new zone numbers specific to the version.

Zone charts and diagrams must clearly indicate zone boundaries and their station numbers. A physical description of the zone boundaries must be provided.

Zoning allocation in the fuselage/hull must not divide major compartments, which are separately zoned.

Zone boundaries must embrace related structures such as door frames. A door frame for a specific door must not be divided between zones.

Doors such as cabin doors, cargo doors and main landing gear doors are themselves zones.

### **Business rule decision point BRDP-S1-00010 - Zone and access point identification system:**

- Decide whether to use a zoning and access identification system.

## 2.1 Identification of access points

### 2.1.1 General

Typical access points are: doors, panels, hatches, fillets, fairings, internal floor and ceiling panels, cargo hold linings, etc. If an access point has an identifier on it, this must be used to identify it in data modules.

#### **Note**

Not all Products have identifiers on the actual access points. If not, they must be assigned a number in data modules.

### **Business rule decision point BRDP-S1-00011 - Method for zoning and identifying access points:**

- Decide which method to use for zoning and identifying access points.

---

**2.1.2 Diagrams and tables**

Access identification diagrams must be given in the data modules, which clearly illustrate the position of access points on the Product. Associated tables giving the access point identifier (cross-referenced to the access diagram), and the Product indicate an access point that gives access to (if applicable), can also be a requirement. These tables can be prepared using the descriptive data module type.

**2.1.3 Access points numbering requirements**

Access points must be numbered in association with the Product zoning system.

Letters I and O must not be used in letter suffix or preceding letter coding sequence.

Blow out doors and tank vents are not normally assigned specific access point identifiers.

Access points in the fuselage center line must be coded with left hand designators.

Access points in vertical stabilizer or rudder must be coded from bottom to top.

Access points which are situated in more than one zone must be allocated the zone number of the lowest zone involved.

If a small access point is located in a larger access point, the larger point must be coded first.

An access point on a zone boundary (eg, a bulkhead) must be allocated the zone number of the side of the bulkhead from which the door or panel is removed.

Chap No./Document No.	Title
<a href="#">Chap 3.4</a>	Information generation - Zoning and access

### 1 General

The general rules for zoning and access are given at [Chap 3.4](#).

### 2 Zoning and access

#### 2.1 Methods of identifying zones

##### 2.1.1 Specific zoning requirements

Wing zones must be allocated from the root to the tip and from the forward to aft. This method of allocation is also to apply to horizontal and vertical stabilizers and to all auxiliary stabilizers and strakes.

Wing leading and trailing edges, wheel wells, fuel tanks, accessory (mission equipment) compartments, the flight compartment/cockpit, toilets, galleys and other possible areas of congestion during maintenance must be suitably zoned to define the work area.

Areas between aerodynamic components and the fuselage, enclosed by fillets, must be considered fuselage zones.

When the air vehicle design incorporates a center wing, which is located within, or is integral with, the fuselage, the center wing must be considered a fuselage zone.

##### 2.1.2 Zone identification

As already indicated, within the requirements of zoning, different zone identification systems can be applied. The following examples of zoning systems are typical for a transport air vehicle (method A), for a fighter air vehicle (method B), and for a helicopter (method C).

##### 2.1.2.1 Method A

Method A is shown in [Fig 1](#). The major areas must be identified as shown in [Table 2](#).

Table 2 Major areas (zones) - Method A

Major area (zone) (Standard number grouping)	Area
100	Lower half of fuselage, below the main cabin deck rearward to the aft pressure bulkhead
200	Upper half of fuselage, above the main cabin deck rearwards to the aft pressure bulkhead
300	Empennage
400	Power plants and engine pylons
500	Left wing
600	Right wing
700	Landing gear and associated doors
800	Doors (load carrying, pressure barrier or latching)

Major area (zone) (Standard number grouping)	Area
900	Reserved for major differences in models, versions or series of the same air vehicle type not covered by the standard number groupings

Zones in major areas (eg, 200, 300) must be subdivided into zones using the second element digit of the standard number grouping. As an example, zone 300 can be subdivided as shown in [Table 3](#).

*Table 3 Major sub-zones*

Major zone	Major sub-zone	Area
300		Empennage
	310	- Fuselage aft of the pressure bulkhead
	320	- Right vertical stabilizer and rudder
	330	- Left vertical stabilizer and rudder
	340	- Right horizontal stabilizer and elevator
	350	- Left horizontal stabilizer and elevator

The major sub-zones must be subdivided into zones using the third element digit. A possible subdivision of a major sub-zone is given in [Table 4](#).

*Table 4 Zone No.*

Major sub-zone	Zone No.	Area
320		Right vertical stabilizer and rudder
	321	- Right vertical stabilizer leading edge
	322	- Right vertical stabilizer auxiliary spar to front spar
	323	- Right vertical stabilizer front spar to rear spar
	324	- Lower rudder
	326	- Upper rudder
	327	- Right vertical stabilizer tip

Major zone 100 fuselage under floor  
 Major zone 200 fuselage above floor  
 Major zone 300 empennage  
 Major zone 400 power plants and pylons  
 Major zone 500 left wing  
 Major zone 600 right wing  
 Major zone 700 landing gear and landing gear doors  
 Major zone 800 doors (passenger/crew, baggage and emergency)

ICN-S3627-S1000D0741-001-01

Fig 1 Zoning of a transport air vehicle - Example of method A

Applicable to: All

**S1000D-A-03-04-0100-00A-040A-A**

**Chap 3.4.1**

- 2.1.2.2 Method B  
Method B is shown in [Fig 2](#). The major areas must be identified as shown in [Table 5](#).

*Table 5 Major areas (zones) - Method B*

Major area (zone) (Standard number grouping)	Area
100	Front fuselage
200	Center fuselage
300	Rear fuselage
400	Wings
500	Tail (empennage) unit
600	Pylons/Stubwings
700	Canards/Strakes
800	Doors (load carrying, pressure barrier or latching)
900	Reserved for major differences in models, versions or series of the same air vehicle type not covered by the standard number groupings

Zones in major areas (eg, 200, 300) must be subdivided into zones using the second element digit of the standard number grouping. As an example, zone 100 can be subdivided as shown in [Table 6](#).

*Table 6 Major sub-zones*

Major zone	Major sub-zone	Area
100		Front fuselage
	110	- Radar bay
	120	- Forward equipment and IFR probe compartment
	130	- Front cockpit
	140	- Rear cockpit
	150	- Nose wheel compartment
	160	- Ventral bay
	170	- Left hand side compartment
	180	- Right hand side compartment
	190	- Rear compartment and tank

The major sub-zones must be subdivided into zones using the third element digit. A possible subdivision of a major sub-zone is shown in [Table 7](#).

*Table 7 Zone No.*

<b>Major sub-zone</b>	<b>Zone No.</b>	<b>Area</b>
120		Forward equipment and IFR probe compartment
	121	- Electronic rack 1
	122	- Electronic rack 2
	123	- Electronic rack 4

ICN-S3627-S1000D0742-001-01

Fig 2 Zoning of a fighter air vehicle - Example of method B

## 2.1.2.3

## Method C

Method C is shown in [Fig 3](#). The major areas must be identified as shown in [Table 8](#).

*Table 8 Major areas (zones) - Method C*

Major area (zone) (Standard number grouping)	Area
100	Fuselage
200	Cockpit
300	Aft section
400	Power plants, transmissions and rotors
500	Left (multipurpose) wing
600	Right (multipurpose) wing
700	Landing gear
800	Specific mission equipment
900	Reserved for major differences in models, versions or series of the same air vehicle type not covered by the standard number groupings

Zones in major areas (eg, 200, 300) must be subdivided into zones using the second element digit of the standard number grouping. As an example, zone 300 can be subdivided as shown in [Table 9](#).

*Table 9 Major sub-zone*

Major zone	Major sub-zones	Area
300		Aft section
	310	- Empennage structure with vertical wing
	320	- Rear vertical fin, tail and tail wheel fairing
	330	- Left horizontal stabilizer with horizontal stabilizer fin
	340	- Right horizontal stabilizer with horizontal stabilizer fin
	350	- Upper vertical fin

The major sub-zones must be subdivided into zones using the third element digit. A possible subdivision of a major sub-zone is shown in [Table 10](#).

*Table 10 Zone No.*

Major sub-zone	Zone No.	Area
320		Rear vertical fin, tail and tail wheel fairing

Major sub-zone	Zone No.	Area
	321	- Right vertical fin leading edge
	322	- Right vertical tail fairing
	323	- Right vertical tail wheel fairing

The zoning arrangements must permit definition of a work task or inspection area. The zone identifications can be applied to external inspections to define the limit of area to be inspected.

Example:

- Zone 300 - Inspect external structure (Empennage)
- Zone 320 - Inspect external structure (Right vertical stabilizer and rudder)
- Zone 321 - Inspect external structure (Right vertical stabilizer leading edge)

ICN-S3627-S1000D0743-001-01

Fig 3 Zoning of a helicopter - Example of method C

## 2.2 Methods for identifying access points

As already indicated, different access point numbering systems can be applied. The two following methods are given as examples. Method One is typical for a transport air vehicle (reference method A for zoning) and method Two for a fighter air vehicle (reference method B for zoning). For a helicopter either method One or method Two can be used.

### 2.2.1 Method One

Method One is shown in [Fig 4](#). The identifier is built up using the three-digit number of the zone in which the access point is located, followed by a basic two letter suffix and an additional third suffix letter as necessary.

The first of the two suffix letters is the primary identifier and is allocated in a logical sequence, (ie, inboard to outboard, or forward to aft, beginning with "A" in each zone).

The second suffix letter is the locator, which differentiates the access provision in relation to the zone in the air vehicle, if required.

Example:

- T - Top
- B - Bottom
- L - Left hand
- R - Right hand
- Z - Internal

A third suffix letter can be used to further identify floor, wall or ceiling panels.

Example:

- F and G\* Floor panels
- W and X\* Wall or side panels
- C and D\* Ceiling panels

\* When the F, W or C combinations have been used the letters G, X and D will be used to replace them.

Access points located symmetrically on opposite side of the air vehicle must be assigned the same letter designators, even though the zone numbers can be different (eg, 521CB for the left wing, 621CB for the right wing).

[Fig 4](#) shows an example of a code applied to a left hand floor panel located in zone 215.

ICN-S3627-S1000D0744-001-01

*Fig 4 Access codes - Example of method One*

This is panel A in the left side of the floor of zone 215, upper fuselage.

[Table 11](#) shows further examples of access codes using only two suffix letters.

*Table 11 Access codes - Examples of method One*

Panel No Zone	Suffix	
521	AT	Panel A in zone 521 Top (of the wing)
521	CB	Panel C in zone 521 Bottom (of the wing)
321	AL	Panel A in zone 321 Left side (vertical stabilizer)
321	AZ	Panel Z in zone 321 Interior (vertical stabilizer)

ICN-S3627-S1000D0745-001-01

Fig 5 Access point location diagram for a transport air vehicle - Example of method One (Sheet 1 of 2)

ICN-S3627-S1000D0746-001-01

Fig 5 Access point location diagram for a transport air vehicle - Example of method One (Sheet 2 of 2)

## 2.2.2 Method Two

Method Two is shown in [Fig 6](#). The identifier is built up using:

- a letter
- a three-digit number
- a second letter

Applicable to: All

S1000D-A-03-04-0100-00A-040A-A

Chap 3.4.1

The first letter indicates where the access point is located:

- T - Top (for body and upper surface of the wing)
- B - Bottom (for body and lower surface of the wing)
- L - Left Hand
- R - Right Hand

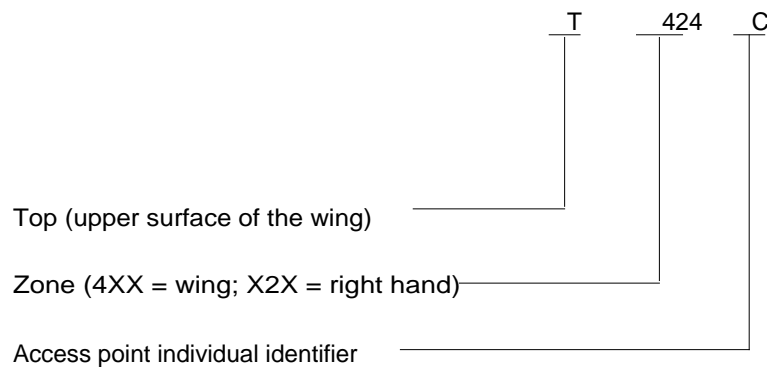

The three-digit number is the zone identifier in which the access point is located.

The second letter identifies each individual access point in the zone. This letter is allocated in a logical sequence, (ie, inboard to outboard or forward to aft, beginning with "A" in each zone).

#### Note

In some cases, the access point (like a panel) can be located in another larger one (a bay door, for instance). In these cases, it is recommended to use letters starting from "S" for these secondary access points.

[Fig 6](#) shows an example of a code applied to a panel located on top of the right hand wing.

ICN-S3627-S1000D0747-001-01

*Fig 6 Access codes - Example of method Two*

[Table 12](#) shows further examples of access codes for method Two.

*Table 12 Access codes - Example of method Two*

Panel No. Prefix	Zone	Suffix	
T	123	A	Panel A in zone 123 (at the top of the front fuselage)
T	123	B	Panel B in zone 123 (at the top of the front fuselage)

<b>Panel No. Prefix</b>	<b>Zone</b>	<b>Suffix</b>	
B	422	B	Panel B in zone 422 (at the bottom of the right hand wing)
L	231	A	Panel A in zone 231 (left hand in the central part of the fuselage)
L	231	S	Panel S in zone 231 (left hand in the central part of the fuselage, access located in a major one)

ICN-S3627-S1000D0748-001-01

Fig 7 Access point location diagram for a fighter air vehicle - Example of method Two

## 2.3 Engine zones and identification of engine-mounted airborne equipment and access ports

### 2.3.1 General

The identification of engine zones, engine-mounted airborne equipment and engine access ports must be included in engine and engine-related data modules/technical publications. All appropriate data modules/technical publications must contain specific statements on how

Applicable to: All

S1000D-A-03-04-0100-00A-040A-A

Chap 3.4.1

engine zones, engine-mounted airborne equipment and access ports can be easily identified. These statements must be included in the data modules/technical publications containing description and operation. Illustrations or tables must be used where necessary to give the locations.

### **2.3.2 Requirements**

The main areas of the engine must be indicated by name based on their function (eg, combustion chamber, low-pressure turbine).

Main bearings must be numbered sequentially by location. These numbers can then be used to identify the bearings, their associated housings, seal or other ancillary items.

Location references such as left, right, clockwise, counterclockwise, upper, lower, apply to the engine as viewed from the aft (exhaust) end with the engine in its normally installed position.

Location of engine-mounted equipment/items, interior access ports combustion chambers (turbines), and cylinders (piston engines), must be identified by location and clock position (eg, diffuser case, three o'clock).

Chap No./Document No.	Title
<a href="#">Chap 3.4</a>	Information generation - Zoning and access

### 1 General

The general rules for zoning and access are given at [Chap 3.4](#).

### 2 Zoning

#### 2.1 Example of zoning a land vehicle

##### 2.1.1 Major zones

Major zones must be allocated to major physical structures, bulkheads, etc, and numbered using the left hand digit of the zone identification number (100, 200, 300, etc) as illustrated in the example at [Table 2](#) and [Fig 1](#) and [Fig 2](#), below:

*Table 2 Major zone identification numbers*

Major zone	Area
100	Turret
200	Elevating mass assembly
300	Hull aft of fighting compartment bulkhead
400	Hull fwd of fighting compartment bulkhead
500	Left track, drive and suspension
600	Right track, drive and suspension

## 2.2

### 2.2.1

## Example of zoning a ground based facility

### Major zones

Major zones must be allocated to major physical structures, buildings, etc, and numbered using the left hand digit of the zone identification number (100, 200, 300, etc) as detailed in [Table 5](#) and [Fig 5](#).

Table 5 Major zone identification number

Major zone	Area
100	Antenna
200	Transmit subsystem cabin
300	Receive subsystem cabin
400	Communications subsystem cabin

ICN-AE-A-030400-A-U8025-00005-A-01-1

*Fig 5 Example of zoning a satellite communications facility (major zones)*

### 2.2.2

#### **Sub-zones**

Major zone areas must be subdivided into sub-zones using the second digit of the allotted zone number as detailed in the example at [Table 6](#) and [Fig 6](#).

*Table 6 Sub-zone identification number*

Major zone	Sub-zone	Area
400		Communications subsystem cabin
	410	Equipment suite 1
	420	Equipment suite 2

ICN-AE-A-030400-A-U8025-00006-A-02-1

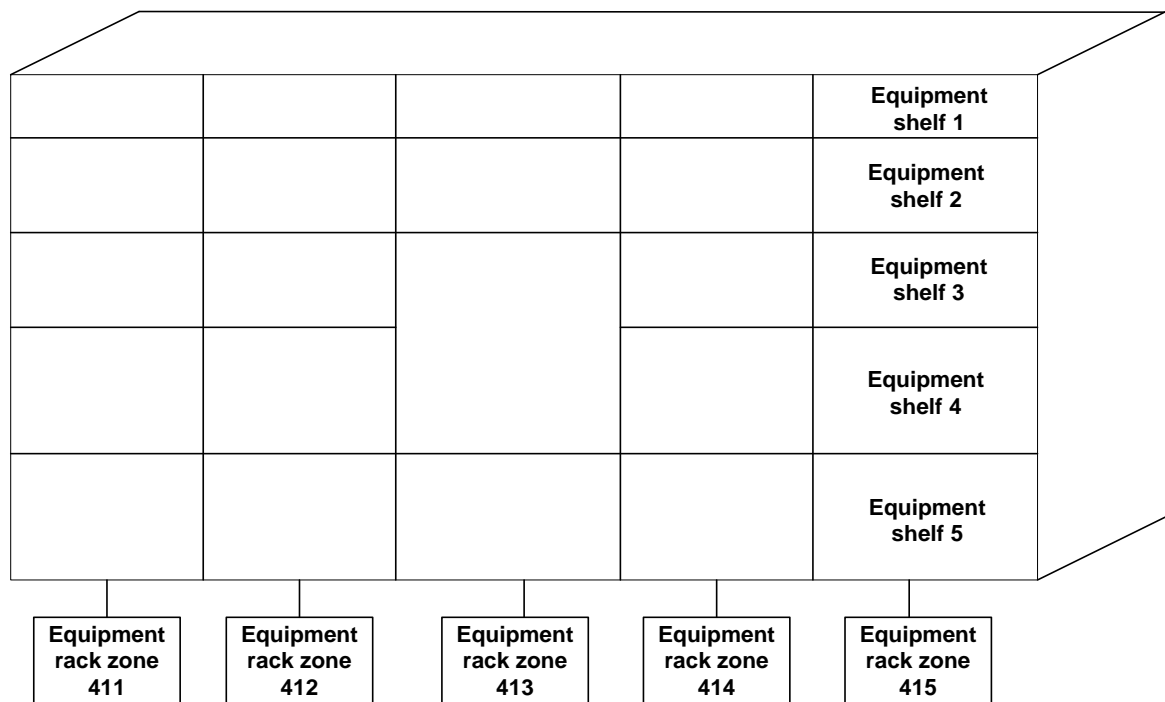

*Fig 6 Example of zoning a satellite communications facility (sub-zones)*

### 2.2.3 Zones

Sub-zone areas, where necessary, must be further subdivided into zones using the first digit of the allotted zone number (1000, 2000, 3000, etc) as shown in [Table 7](#) and [Fig 7](#).

*Table 7 Zone Identification Numbers*

Sub-zone	Zone No.	Area
410		
	411	Equipment suite 1, rack 1
	412	Equipment suite 1, rack 2
	413	Equipment suite 1, rack 3
	414	Equipment suite 1, rack 4
	415	Equipment suite 1, rack 5

ICN-AE-A-030400-A-U8025-00007-A-01-1

*Fig 7 Example of zoning a satellite communications facility (zones)*

## 2.3 Identification of access points

### 2.3.1 General

Typical access points are: doors, panels, hatches, fillets, fairings, internal floor and ceiling panels, cargo hold linings, etc. If an access point has an identifier on it, this must be used to identify it in data modules.

#### Note

Not all Products have identifiers on the actual access points. If not, they must be assigned a number in data modules.

### 2.3.2 Diagrams and tables

Access identification diagrams must be given in the data modules, which clearly illustrate the position of access points on the Product. Associated tables giving the access point identifier (cross-referenced to the access diagram), and the Product indicate an access point that gives access to (if applicable), can also be a requirement. These tables can be prepared using the descriptive data module type.

### 2.3.3 Access points numbering requirements

Access points must be numbered in association with the Product zoning system.

Letters I and O must not be used in letter suffix or preceding letter coding sequence.

Blow out doors and tank vents are not normally assigned specific access points identifiers.

Access points in the fuselage center line must be coded with left hand designators.

Access points in vertical stabilizer or rudder must be coded from bottom to top.

Access points which are situated in more than one zone must be allocated the zone number of the lowest zone involved.

If a small access point is located in a larger access point, the larger point must be coded first.

An access point on a zone boundary (eg, a bulkhead must be allocated the zone number of the side of the bulkhead from which the door or panel is removed).

Access points must be numbered in association with the zoning system detailed above. The access point identifier must consist of the three-digit zone number followed by a three-letter access reference (letters I and O must not be used).

### 2.3.4 Access identifier

The access identifier must comprise up to three characters to indicate primary, secondary and minor access points. Each character of the access reference number must be allocated in a logical sequence (eg, front to back, left to right, clockwise), beginning with "A" in each zone to identify discrete access points. The first character must indicate main or primary access points/panels. Where a secondary access panel is mounted within a primary access panel, it must be designated using the second character of the access reference number. Minor access points within a secondary access panel must be indicated using the third character of the access identifier. An example of the application of access codes is shown at [Fig 8](#).

ICN-AE-A-000304-A-U8025-00008-A-01-1

*Fig 8 Example of access codes for a combat vehicle*

### 2.3.5 Location references

Location references such as "left", "right", "clockwise", "upper", etc, must apply to the system, as viewed from the rear of the platform, in the normal direction of travel. The position of mounted equipment/items, etc must be identified by location and "clock position" (eg, crank case, three o'clock).

### 2.3.6 Example of access for a ground based facility

#### 2.3.6.1 Access

For electronic installations and assemblies (eg, radio room, computer center, portable radio), access points must be numbered in association with the zoning system detailed above. The access point identifier must consist of the zone number followed by a three-letter access reference (letters I and O must not be used). For smaller electronic assemblies (eg, circuit boards), the access code can be used to provide a location matrix, with the horizontal axis numbered from 1 to 99 as the first two characters of the location code and the vertical axis lettered from A to Z as the third character of the access code.

#### 2.3.6.2 Location reference

Location references such as "left", "right", "clockwise", "upper" must be applied as viewed from the front of the system, from an operator's viewpoint. For large fixed systems, location references must use points of the compass (eg, South west) and floors (eg, Ground floor). Positioning of mounted equipment/items, etc, can be identified by location and "clock position" (eg, on/off switch, four o'clock). For location references on circuit boards and diagrams, the representation must be such that the main signal/data flow is from left to right.

<a href="#">Chap 3.4.3.1</a>	Sea systems - Surface ships
<a href="#">Chap 3.4.3.2</a>	Sea systems - Submarines

## 1 General

The general rules for zoning and access are given in [Chap 3.4](#).

There are significant differences between the zoning and access identification systems to be used on surface ships and submarines.

The rules for zoning and access for surface ships are given at [Chap 3.4.3.1](#).

The rules for zoning and access for submarines are given at [Chap 3.4.3.2](#).

The specific method of applying zoning and access to surface ships and submarines must be decided on an individual platform basis, following these general rules.

## 2 Zoning and access

Separate systems for zoning and access allocations must be used for surface ships and submarines.

### 2.1 Surface ships

On surface ships, the term zoning must be associated with the Nuclear, Biological, Chemical Damage (NBCD) control function where areas are defined and equipped during the ship build

---

stage to limit the effects of fire, flooding, contamination or other damage. The aim is to divide the ship into self-contained survival zones.

## 2.2 Submarines

In submarines, the term zoning must associated with the Damage Control Headquarters (DCHQ) considerations used in the identification of compartments and access points. The aim is to divide the submarine into a number of zones with water-tight boundaries between them.

## 2.3 Location markings

In surface ships, a system of location markings based on three-dimensional geographic co-ordinates must be used to identify compartments and access arrangements. For submarines the location markings must be based on the deck, bulkhead and frame numbers, and on the names of the compartments.

## **1 General**

The general rules for zoning and access are given in [Chap 3.4](#).

The general rules for zoning and access for sea systems are given in [Chap 3.4.3](#).

## **2 Zoning and access - Surface ships**

### **2.1 Zoning**

Zoning is employed to help avoid the loss of an important system capability through the effects of fire, flooding, the spread of toxic gases or damage caused by a consequence of an attack resulting in the spread of primary and secondary weapon effects.

Zoning is achieved by selecting main transverse bulkheads which continue up beyond the weather-deck/forecastle/flight deck to the uppermost decks in the superstructure. These bulkheads must be designated zone boundaries and are coincident with the main watertight bulkheads (which reach up to No. 1 deck) and continue up through the superstructure as fire bulkheads.

In consideration of zoning for NBCD purposes, zones must be sufficiently self-contained to operate for continuous periods of up to 12 hours with the zone boundaries closed down. For this, each zone is normally provided with autonomous systems for the following:

- Electrical power generation (with fuel supply)
- Electrical power distribution
- Chilled water and weapon cooling systems
- Fire pumps and firefighting arrangements
- Flood and firefighting water removal and draining
- Internal communications
- Machinery and damage surveillance and control
- Smoke containment and removal
- Ventilation, air conditioning and a chilled water distribution system
- Collective NBCD protection and air filtration
- Emergency support for the crew
- Compressed air distribution

The number, autonomy, size and arrangement of zones in any ship, depends on operational, technical and financial considerations. At the design phase, the operational value of the greater degree of protection provided by a larger number of zones is balanced against the cost of the additional subdivision required to support them. The requirement for personnel and environment support systems to cross zone boundaries is also a factor in deciding how zoning must be arranged.

### **2.2 Access**

#### **2.2.1 Access points**

Access points on the hull of a vessel are, by their nature, limited and therefore do not need specific identification. Within the compartments of a vessel, equipment is not generally hidden behind panels and thus locations must be identified by their relation to appropriate Frame / Frames within a compartment.

### **2.3 Location markings**

Location markings must be used to uniquely identify all watertight compartments, trunks, doors and hatches and other fittings which can affect the watertight or gastight integrity of the ship. The marking system must include the non-watertight compartments that are important or are in frequent use.

Location markings must provide a means of indicating any position rapidly and without ambiguity. They must provide a system whereby the position of any incident, such as fire or

damage, can be accurately identified. The system shown in [Fig 1](#) thru [Fig 4](#) is logical and can be applied to any ship regardless of size and complexity of subdivision.

### 2.3.1 Deck numbering

The subdivision of a surface vessel must be achieved by the use of decks to divide the ship horizontally from the weather-deck/forecastle/flight deck (No. 1 deck) to the inner bottom and the superstructure. Main transverse bulkheads are used to divide the vessel lengthways into main sections. A main transverse bulkhead is defined as a bulkhead that is continuous from the keel to the underside of the weather-deck/forecastle/flight deck.

Decks must be numbered consecutively downwards to the outer bottom starting with the weather-deck/forecastle/flight deck as No. 1 deck. Decks above the weather-deck/forecastle/flight deck must be numbered commencing with No. 01, 02 and so on consecutively upwards.

### 2.3.2 Ship sections

Main sections formed by transverse watertight bulkheads must be identified by characters from the phonetic alphabet starting with A, B, C, etc, from forward to aft.

#### Note

To avoid confusion, I and O are not to be used.

Watertight compartments formed by transverse bulkheads within these main section compartments, must be given suffixes starting A, B, C, etc, from forward, or Z, Y, X, etc, from aft, as well as the marking of the main section.

### 2.3.3 Longitudinal bulkheads

Where longitudinal bulkheads divide a main section compartment, positions relative to the center line of the vessel must be identified using a numbering system from the center line outwards, with even numbers (2, 4, 6, etc) to port and odd numbers (1, 3, 5, etc) to starboard. Access points must also be identified in a manner which complements the location system.

### 2.3.4 Doors and hatches

Doors must generally bear the marking of the compartment to which they give access. Hatches must bear the numbers of the decks in which they are cut, followed by the horizontal co-ordinates of the compartments to which they give access (eg, Hatch 5DY is in deck No. 5 and gives access to compartment 6DY). Where two or more doors or hatches (cut in the same deck) give access to the same compartment they must be distinguished with the words PORT (or STARBOARD) and/or FORWARD (or AFT) in abbreviated form after the marking. As an example, hatch "5DY Stbd" is the starboard hatch of a pair giving access to compartment 6DY.

### 2.3.5 Coding of equipment items

Location coding of equipment items inside compartments must follow the practices described at [Para 2.3](#).

ICN-AE-A-000304-A-U8025-00009-A-01-1

Fig 4 Surface ships - Doors and hatches

## 2.4 Zoning and access marking examples

The following give examples of the rules and practices to be followed in marking the various types of zoning and access markings.

### 2.4.1 Compartment markings

[Fig 2](#) and [Fig 3](#) show typical identifications for various ships compartments. The specific rules to be followed are given below.

- Compartment location marking positions: These must be placed to be visible from all entrances. If this is not possible with a single mark, the marking must be repeated to enable identification from all entrances. The markings must be made up in accordance with the following rules.
- First character (Number): Deck number. Decks must be numbered 1, 2, 3, etc, downwards from No. 1 deck (forecastle, weather-deck or flight deck), and 01, 02, 03 decks above No. 1 deck.
- Second character (Letter): Section. Sections are the overall lengths between the main transverse bulkheads. They must be lettered A, B, C, etc, from forward to aft. (I and O are not to be used).
- Third character (Letter): Compartment, fwd/aft position. Compartments are the enclosed divisions within sections. They must be lettered A, B, C, etc, from the forward end of the section, or Z, Y, X, etc, from the aft end of the section. The size of the lettering must be reduced from the first two characters.
- Fourth character (Number): Compartment, athwart-ships position. Position of compartment from centerline. They must be numbered 1, 3, 5, etc, to starboard and 2, 4, 6, etc, to port. A compartment on the centerline must be numbered 0.
- Suffix (Numbers): Internal watertight compartments. Suffix -00 used for a single compartment. Suffixes -100, -200, etc, for two or more contained compartments. Odd numbers to starboard, even numbers to port.

Marking examples: 2BA3 indicates a compartment on No. 2 deck at the forward end of B section. It is the second compartment to starboard of the centerline. An internal watertight compartment inside the main compartment must be marked as 2BA3-00. Two internal compartments must be marked 2BA3-100 and 2BA3-200.

#### 2.4.2 Door markings

[Fig 4](#) shows the marking methods that must be used on doors. The specific rules that must be followed are given below.

- Door marking position: Both sides, upper corner or hinged edge.
- Door marking rules: Doors must bear the marking of the compartment to which they give access. If a compartment has two doors, they must be marked PORT, STBD or FWD, AFT as appropriate.
- Doors in main transverse bulkheads separating lettered sections: These must have the deck number and both section letters in alphabetical order.

Marking examples: Marking 2PB indicates a door giving access to compartment 2PB. Marking 2D/E indicates a door connecting D and E sections on No. 2 deck.

#### 2.4.3 Hatch markings

[Fig 4](#) shows the marking methods that must be used on hatches. The specific rules that must be followed are given below.

- Hatch marking position: Near corner on hinged side.
- First characters (Number): Deck in which hatch is cut.
- Remaining characters (letters and numbers): to give fore/aft and athwart-ships position of compartment to which the hatch gives access. The section letter must be the same size as the deck number. The remaining characters must be of reduced size.
- Where two hatches give access to the same compartment, the markings must be qualified by PORT/STBD or FWD/AFT.

Marking example: Marking 2DA1 indicates a hatch on No. 2 deck giving access to a No. 3 deck compartment in fore/aft section D and compartment co-ordinates A1.

#### 2.4.4 Fixed manholes

The marking must show the compartment to which a manhole gives access. Manholes in hatches must not be marked and must be referred to as Manhole in Hatch 6GZ4.

Marking example: Marking 6GZ4 indicates a manhole giving access to compartment 6GZ4.

#### 2.4.5 Trunks

Trunks must be marked on each separate section of the trunk.

The trunk must carry the deck number of the top hatch or door, plus the marking of the compartment at the bottom of the trunk.

Each hatch in a trunk and each intermediate door must have its own deck number, plus the marking of the compartment at the bottom of the trunk. The word TRUNK must be marked on all hatches and doors giving access to the trunk.

Marking example: Marking 1/5DA indicates a trunk running from No. 1 deck thru No. 5 deck, compartment 5DA.

#### 2.4.6 Frame station numbers

Frame stations must be numbered at main transverse bulkheads and also must be marked as needed in conspicuous positions on bulkheads.

Marking example: 17 indicates a main transverse bulkhead at the seventeenth frame section from the foremost frame.

**2.4.7 Other side markings**

Must be marked on bulkheads forming perimeter of dangerous compartments (eg, magazines, machinery spaces and flammable stores). Also, in multiple section ships, these must be marked on the main bulkheads below the lowest communications deck.

Marking example: MAGAZINE OS indicates a bulkhead surrounding a compartment containing a magazine.

**2.4.8 Compartments below**

Must be marked as needed above hatchways to indicate compartments gained thereby. Instead of the marking COMPARTMENTS BELOW, an arrow can be used if desired.

Marking example: COMPARTMENTS BELOW.

**2.4.9 Temperature monitoring marks**

Marking must be applied to external boundaries of high-risk (fire, explosion, etc) compartments.

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.4</a>	Information generation - Zoning and access
<a href="#">Chap 3.4.3</a>	Zoning and access - Sea systems

## 1 General

The general rules for zoning and access are given in [Chap 3.4](#).

The general rules for zoning and access for sea systems are given in [Chap 3.4.3](#).

## 2 Zoning and access

### 2.1 Zoning

Submarines must be subdivided into a number of zones with water-tight boundaries between them. The following rules must be applied:

- Smoke-tight boundaries must be positioned between each high fire risk area and each high value compartment (eg, operations rooms, computer rooms, navigational equipment compartments).
- Decks must be continuous to smoke-tight boundaries.
- Where smoke-tight boundaries cross passageways, smoke curtains must be fitted.
- Where a hatch or main watertight door forms part of a smoke-tight boundary, a smoke curtain must be fitted to allow a fire to be fought with an open door/hatch.

## 2.2 Access

Access points on the hull of a submarine are by their nature limited and therefore do not need specific identification. Within the compartments of a submarine, equipment is not generally hidden behind panels and thus locations must be identified by their relation to appropriate frame numbers within a compartment.

## 2.3 Location markings

The identification of locations in submarines is necessarily different to that of surface vessels, mainly due to their design and size. The training programs for submarine crews differ from surface ship practice to accommodate this. Submarines do not have the NBCD requirements that apply to surface vessels, and zoning must be determined around the DCHQ practices. Also, stability considerations mean that submarines do not have watertight longitudinal divisions.

The system of determining and identifying compartment and access point locations in submarines must be defined by the deck, bulkhead, frame-numbers, and whether the location is to port or starboard of, or on the centerline of the submarine.

Physical markings other than for bulkheads and frames must not be made within submarines. A location defined from bulkheads and frames must guide personnel to close proximity of a specified location. To support this, submarine training requires that crews have a degree of familiarity with the layout of a submarine in order that they are able to determine their position from their surroundings and are able to identify which compartments surround their present position.

For equipment items location coding inside compartments must follow these rules.

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 3.9.5.2.1.1</a>	Common constructs - Change marking
<a href="#">Chap 4.13.2</a>	Optimizing and reuse - Incremental update of CIR data modules

## 1 General

There are rules governing the information required to update and release data modules. Different methods are used to indicate the different types of update. Apart from new data modules, there are five different types of update given in the attribute `issueType`:

- status
- changed
- revised
- deleted
- reinstated, of which there are three types:
  - status
  - changed
  - revised

#### Note

The rules in this chapter also apply to publication modules and SCORM content package modules.

## 2 Updating data modules

### 2.1 Reasons

Data modules can be updated because of for example:

- information not available at the initial issue of the data modules
- use of new items
- use of new consumables
- new information gained thru operational experience
- changes resulting from technical publications improvement reports
- changes to software
- modifications/alterations, service bulletins, special technical instructions and similar documents
- changes as a result of QA checks
- changes as a result of the electronic review function
- other data needing to be added or revised

For a detailed explanation of how the use of Common Information Repository (CIR) data modules affect the update process of data modules, refer to [Chap 4.13.2](#).

### 2.2 Use of change marks and highlights

Data modules that are of type "changed" (refer to [Para 2.5](#)) or "reinstated and changed" (refer to [Para 2.8](#)) have changes marked with change mark elements and attributes. Refer to [Chap 3.9.5.2.1.1](#).

Changes that change the content of elements use the change markup within those elements. Refer to [Chap 3.9.5.2.1.1](#).

For the detailed descriptions of and rules for the use of the elements and attributes that indicate changes, refer to [Chap 3.9.5.2.1.1](#).

The reasons for any changes to a data module are summarized and recorded in the identification and status section. This text is used for creation of the front matter data module called Highlights.

### 2.3 Use of issue and inwork numbers

#### 2.3.1 Issue numbers

For every release of a data module, the issue number (attribute `issueNumber`) must be incremented by one. For a detailed description of the elements and attributes for issue information. Refer to [Chap 3.9.5.1](#).

#### 2.3.2 Inwork numbers

The ability to track drafting of changed information during the information generation process is facilitated by the use of an inwork number (attribute `inWork`). The process of drafting is indicated by incrementing the inwork number. For a detailed description of the elements and attributes for issue information. Refer to [Chap 3.9.5.1](#).

#### 2.3.3 Issue type

Each issue of a data module is assigned an issue type (attribute `issueType`). Refer to [Chap 3.9.5.1](#).

##### 2.3.3.1 New data modules

New data modules must have their issue set to an integer and inwork number set to "00". Refer to [Chap 3.9.5.1](#).

- 
- 2.3.3.2      **Changed data modules**  
A change is that form of updating a data module which affects only parts of an existing data module. A change can affect the content section or can be required solely to update an element or attribute in the identification and status section (eg, the applicability or to give the new QA status).
- 2.3.3.3      **Revised data modules**  
A revised data module is one which has been completely reworked.
- 2.3.3.4      **Deleted data modules**  
A deletion of a data module may be necessary (eg, whenever a described configuration no longer exists). In such case the data module is retained in the CSDB and marked as deleted, rather than physically being deleted.
- 2.3.3.5      **Reinstated data modules**  
Reinstating a data module is the action of restoring a deleted data module and making it available for use. If a data module is reinstated, the issue number at the time of deletion must be incremented by one at the time of release.

<a href="#">Chap 6</a>	Information presentation and use
C-M(2002)49	NATO Security Policy (Security within the North Atlantic Treaty Organisation)

---

## **1 General**

Data modules include four types of information relating to security. These are classification, caveats, instructions and information.

## **2 Security and data restrictions**

### **2.1 Security**

#### **2.1.1 Security classification**

Classifications include restrictive and commercial markings. A classification is a category, class or grade assigned to defense information or material, in relation to the degree of danger to security that would result from its unauthorized disclosure, excluding restrictive markings.

##### **2.1.1.1 International defense organization classifications**

International defense organizations can have their own definitions for security classifications. The security classifications for the North Atlantic Treaty Organization (NATO) are defined in Security Policy (C-M(2002)49).

##### **2.1.1.2 National classifications**

National classifications will be specified by the policy for each nation. How security classifications will be used and marked will be determined by the project.

#### **2.1.2 National caveats**

A national caveat is a restrictive marking (eg, UK/US EYES ONLY) or security code word that is applied to complement an appropriate security classification which is normally not lower than confidential.

Data modules/technical publications which require national caveats are permitted. The national caveat is normally used to restrict the data modules/technical publications to named persons or authorized nominees.

#### **2.1.3 Commercial security classification**

A commercial security classification is a category or grade, such as "Commercial In Confidence", assigned to company or government department information or material to indicate the degree of danger to the company or government department security that would result from its unauthorized disclosure. It also an indication of the standard of protection required to guard against unauthorized disclosure, excluding restrictive markings. A commercial security classification is normally used by a company to protect information or material relating to government contracts which have not been awarded.

Whilst these classifications would not normally be used for data modules/technical publications there can be occasions where, at the start of a project, data modules are produced and given commercial security classifications before a NATO/national security classification has been allocated by the project or organization. The originator of the data module should take advice from either the project or organization security instructions or the company security controller on the use of the particular commercial security classification and the precautions to be taken with the information and material. As soon as a government contract has been agreed to, the NATO or national security classification becomes effective.

The retention of this classification within a data module, throughout its life is to be determined by the project or organization.

#### **2.1.4 Restrictive markings**

Restrictive markings are additions to the security classification of data modules/technical publications. The restrictive markings that are available for data modules are national caveats (including international defense organization markings), commercial markings and export controls, distribution, handling and destruction. The markings are used to indicate that the handling and distribution of the data module/technical publication is restricted to those

categories of persons authorized to have access to the information contained therein. The security markings on data modules/technical publications are always a combination of the security classification and any restrictive marking.

Security code words must be defined within the project.

**Business rule decision point BRDP-S1-00016 - Marking security classifications:**

- Decide on how the security classifications will be marked and/or indicated.

## **2.2 Instructions**

This information type gives specific instructions relating to the data module.

### **2.2.1 Distribution**

The distribution requirements, including export control notices, which apply to a data module, dependent on its security classification and user rights must be recorded within the data module. The distribution is recorded and approval for copying and must be obtained from either the originator or the company security controller.

### **2.2.2 Export control**

The project or organization security instructions will normally give the instructions for the control of export of data modules. Where appropriate, these are recorded in the data module. If there are no project security instructions, the company security controller should be contacted for advice.

### **2.2.3 Handling**

The project or organization security instructions will normally give the instructions for handling, including storage, of classified data modules/technical publications. If there are no project security instructions, the company security controller should be contacted for advice.

### **2.2.4 Destruction**

The project or organization security instructions will normally give instructions on how to destroy classified data modules/technical publications when they are no longer required. If there are no project security instructions, the company security controller should be contacted for advice. Paper classified data modules/technical publications (including drafts, spoilt work, etc) are normally destroyed by either shredding or burning. Unwanted copies of classified data modules/technical publications must be given the appropriate security protection until they are destroyed; once they are destroyed, certificates are signed and retained.

### **2.2.5 Use or disclosure**

The project or organization security instructions will normally give the instructions for the intended use or disclosure of the data module.

### **2.2.6 Supersedure**

The project or organization security instructions will normally give the instructions for notices that the data module or publication supersedes other data modules or publications.

## **2.3 Information**

This information includes copyright, policy reference and conditions that can apply to a data module.

### **2.3.1 Copyright**

A marking that is used to give copyright information like the copyright mark [©] followed by the year, or years, and the copyright holder.

### **2.3.2 Policy reference**

This is a reference to the appropriate security policy documentation.

### 2.3.3 Conditions

These are any specific conditions that can apply such as changing security classifications as a result of aggregation of data.

## 2.4 Classifying data modules/technical publications

It is the responsibility of the originator to classify the data module/technical publication according to the total content, (ie, classified according to the highest classified information or material they contain). For example, a data module/technical publication containing information or material classified between restricted and secret must be classified as secret.

Persons who reproduce, extract, or summarize classified information, or who apply classification markings derived from source material or as directed by a classification guide, need not possess originator classification authority. Persons who apply these derivative classification markings must be identified by name and position, or by personal identifier, in a manner that is immediately apparent for each derivative classification action. They must observe and respect original classification decisions and carry forward to any newly created documents the pertinent classification markings.

Normally the originator of the data module/technical publication would classify data module/technical publications according to the security classification of the source data used in their production. If the originator or derivative classifier is in doubt as to the correct security classification, advice should be sought from either the project or organization security instructions or the company security controller. Some projects can stipulate a maximum security classification for the data modules/technical publications. It is the responsibility of the originator or derivative classifier to make sure that this maximum security requirement is not exceeded.

#### **Business rule decision point BRDP-S1-00013 – Use and markings of security classifications (attribute securityClassification):**

- Determine how the security classifications will be used.

#### **Business rule decision point BRDP-S1-00014 - Application of caveats:**

- Determine if the policies that apply to security marking, instructions, etc, and decide how those markings are required to be applied within the given project.

## 2.5 Changes in security classification

Although data modules/technical publications would have been given a correct security classification when originated, they can require changes for a number of reasons:

- The result of a security review their security classification can be downgraded
- The result of adding new classified information, data modules/technical publications can require their security classification upgraded
- The classification of data modules can also be affected by the aggregation of data modules into a CSDB

It is the responsibility of the originator or derivative classifier of the data module/technical publication to upgrade or downgrade data module/technical publications according to their new content. Advice can be taken from either the project or organization security instructions or the company security controller. When changing the security classification of data modules/technical publications, the originator must always take into account the maximum security requirement for the project or organization. Refer to [Para 2.1.4](#) and [Para 2.2](#). Changes to the security classification of data modules are considered a status change to the data module and is to be recorded within the data module in accordance with [Chap 3.5](#).

#### **Business rule decision point BRDP-S1-00015 - Retention of security classification changes:**

- Decide on the retention of security classification changes.

---

**Business rule decision point BRDP-S1-00553 - Retention of derivative classifications changes:**

- Decide on the retention of derivative classifications changes.

**2.6 Presentation**

Refer to [Chap 6](#) for the presentation of security markings, data restrictions and derivative classifications in technical publications.

**2.7 Control**

The project or organization security instructions will normally give the instructions for the control of classified data modules/technical publications. If there are no project security instructions, the company security controller should be contacted for advice. Examples of the control of classified data modules/technical publications are:

- Classified data modules/technical publications should be seen only by authorized persons who have a need to see them. Control of classified data modules/technical publications helps to:
  - reduce the risk of breaches of security, either by deliberate action or carelessness
  - assist in investigations into breaches of security
  - reinforce the "need to know" principle
- All classified data modules/technical publications should be accountable; a system should be adopted which makes sure that all classified data modules/technical publications do not go astray and that a designated person is responsible for their inception or receipt until their destruction
- At set periodicities, spot/total checks of classified data modules/technical publications should be carried out

**2.8 Common source database**

The classification of data modules when aggregated into a CSDB would normally be as high as the highest security classified data module. However, there are occasions where the aggregation of data modules requires that the security classification is, in fact, higher than the highest classification. Projects should refer to project security instructions on this matter. If there are no project security instructions the company security controller should be consulted.

**2.9 Emergency planning**

It is recommended that plans be developed for the protection, removal, or destruction of classified material in case of fire, natural disaster, civil disturbance, terrorist activities, or enemy action, to minimize the risk of its compromise. The level of detail and amount of testing and rehearsal of these plans should be determined by an assessment of the risk of hostile action, natural disaster, or terrorist activity that might place the information in jeopardy.

## **1 General**

The QA of data modules/technical publications is the collection of checking activities that are carried out to ensure that the contents are fit for purpose and technically accurate. These checking activities can vary, especially for aerospace systems between civil and military programs.

## **2 Quality assurance**

### **2.1 Quality assurance application**

**Business rule decision point BRDP-S1-00017 - Rules for quality assurance:**

- Identify the project quality assurance rules and how those rules affect the methods used to perform quality assurance of the data modules/technical publications.

#### **2.1.1 Quality assurance for air programs**

Military air QA differs from the civil air QA in that each of the military customers can set its own requirements which have to be complied with by the contractor/industry. Civil customers and civil aviation airworthiness authorities' requirements are, that the manufacturer's organization leads to the required quality of data modules/technical publications which must comply with acceptable rules such as those detailed in the ATA e-Business Program series of specifications.

In military projects, fitness for use checking is carried out by the contractor (first verification) and optionally by the customer (second verification) whereas in civil projects, this checking is the responsibility of the contractor.

#### **2.1.2 Quality assurance for land and sea systems**

The QA requirements for both military and civil programs in land and sea applications are defined by the customer. Therefore, the degree of the application of QA detailed in this chapter is to be decided by the project or organization.

#### **2.1.3 In-process review - Military**

An In-Process Review (IPR) is an optional review by the customer of data modules/technical publications that are being produced by the contractor for the Product. The main function of the in-process review is for the customer to give guidance to the contractor. Normally in-process review activities are initiated by the customer but they can also be requested by the contractor when assistance or clarification is required. The in-process review ensures that the data modules/technical publications are being prepared to the required scope, depth and timescale in accordance with the contract and the applicable specifications.

#### **2.1.4 First QA review - Civil**

First QA review is the process by which the contractor's QA organization verifies that the produced output adequately and accurately complies with the requirements set by the rules of the project or organization and the applicable specifications.

#### **2.1.5 First verification - Civil and military**

First verification (sometimes known as validation) is the process by which the contractor validates that the data modules/technical publications are:

- the correct data modules/technical publications
- fit for purpose
- adequately describe the Product
- technically accurate
- safe to use by the customer

First verification is certified by the contractor for all military programs. For civil aerospace programs, the first verification must satisfy the civil aviation airworthiness authority of the contractor.

### 2.1.6 Second verification - Military

Second verification is the optional process by which the customer carries out a practical demonstration of the data modules/technical publications, supplied by the contractor, to make sure that the technical information is adequate to permit the efficient and safe use of the Product. Responsibility for the technical accuracy of the information remains with the contractor.

## 2.2 The quality assurance process

To ensure that the data modules/technical publications are produced in accordance with the customer's requirements, the contractor must include in his production procedures the appropriate control of quality. The assurance of quality must be substantiated by evidence that the quality control is maintained and that "in-house" checks and first verification have been carried out. As part of this QA, the customer can review the contractor's quality control, including the "in-house" checks and first verification, to ensure that the required quality is achieved by the contractor.

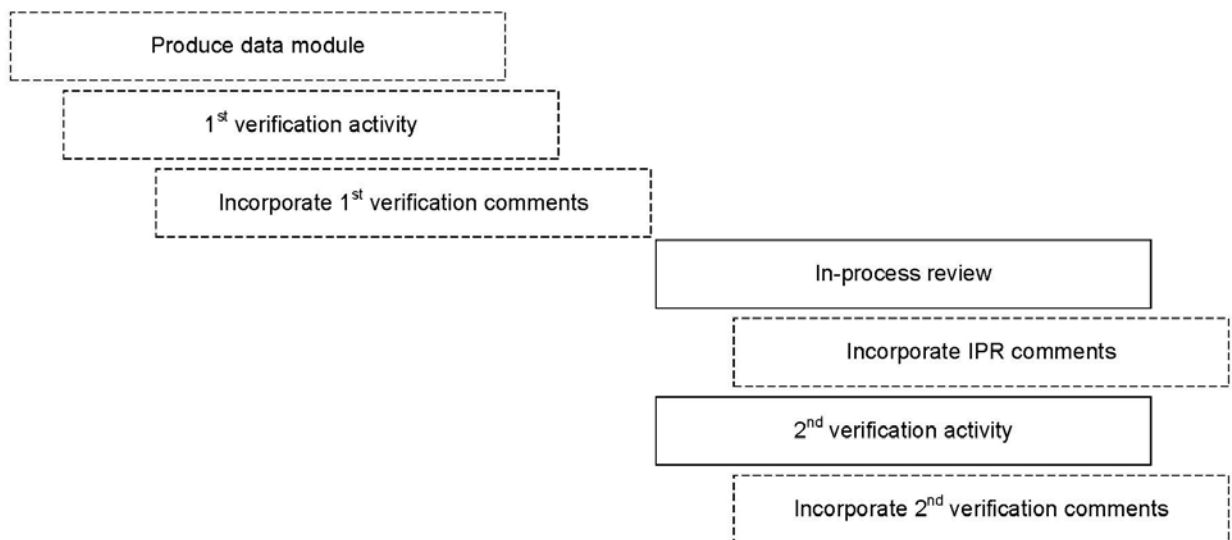

### 2.2.1 Quality assurance program

The contractor must produce and maintain a documented QA program for the technical information that is contracted for. The program must be reviewed as necessary to ensure that it remains effective and describes, in sufficient detail, the procedures that ensure that the data modules/technical publications that are being produced are technical accurate, safe to use and meet the requirements in terms of scope, depth and timescales.

The QA program should take into account such areas as:

- development, preparation, maintenance and distribution of procedures for the preparation, "in-house" checks and first verification of the data modules/technical publications
- co-ordination with design, production, product support and other such departments to ensure that the source data used to produce the data modules/technical publications is to the required standard
- the establishment and maintenance of a system for identifying the QA status and technical standard of the technical data being prepared for the data modules/technical publications during all preparation stages
- the establishment of first verification procedures and "in-house" checks to determine the adequacy and accuracy of the data modules/technical publications during the development stages
- formal in-process review (military) or first QA reviews (civil) to make sure that the data modules/technical publications are adequate and comply with the specifications for both content and production
- first verification of the data modules/technical publications. Refer to [Para 2.1.5](#)
- commenting, recording and reporting on issues raised during the production process and the in-service phase of the Product. This can be achieved by using the commenting process explained in [Chap 4.6](#)
- establishing the correct security classification for data modules in accordance with the project or organization security guidelines
- a detailed schedule that shows the timing and sequence of the various stages throughout the production and in-service phases. An outline example of such a schedule, for a project or an organization, is shown at [Fig 1](#), where the dotted line boxes indicate supplier activity and the solid line boxes indicate customer activity. In this example, the in-process review activity takes place after the first verification and the second verification takes place during the in-process review. Alternatively, the second verification activity could take place during first verification or after the in-process review.

ICN-AE-A-000307-A-U8025-00014-A-02-1

Fig 1 Outline schedule - Example

## 2.2.2 Implementation of the quality assurance program

The contractor must prepare a schedule which will permit the customer or the appropriate release authority to carry out in-process review (military) or QA checks (civil) of the data modules/technical publications. In-process review (military) or QA checks (civil) can also be requested by the contractor when assistance or clarification is required.

Data modules/technical publications produced for military programs by the contractor can be subject to second verification, either at the contractor's premises or the customer's premises. Second verification by the customer does not absolve the contractor from carrying out first verification and must not be used by the contractor as evidence of effective QA if done at the contractor's premises.

Data modules/technical publications can require second verification at the contractor's premises so as to prove practical applicability to the satisfaction of the appropriate release authority or the customer.

In certain cases, first and second verification can be combined into one process of technical verification, and can be applied to all data modules/technical publications, upon agreement between the contractor and the customer in these processes.

### Business rule decision point BRDP-S1-00018 - Rules for first and second verification:

- Decide on the rules for first and second verification. For example, such a rule might be that all data modules that have a safety related procedure must have first verification carried out "On object".

## 2.2.3 Methods of first verification

The method of first verification of draft data modules/technical publications depends on the type of technical information they contain. Some drafts can be checked against items of design documentation such as drawings, test schedules etc. This is known as "Table top" first verification. Other drafts, such as those containing procedural steps, can require a practical demonstration of the procedure. This is known as "On object" first verification. Other drafts can require that both types of first verification are carried out.

The contractor must use his engineering judgment in deciding which first verification method is to be used. The technical need for the type of first verification can have to be weighed against

economic considerations in respect of time, safety and other prevailing factors but in all cases, is to be carried out.

The contractor in military programs must submit his first verification proposals to the customer for agreement.

#### 2.2.4 Practical demonstration of first verification

A practical demonstration of first verification of a procedure must be carried out in sequence and under conditions that provide reasonable assurance of the suitability of the procedure under normal customer conditions. Use must be made of the appropriate approved tools/test equipment, if available.

The customer must be informed of any situations where a contractor in military programs is not able to carry out first verification because of the lack of facilities. This could occur, for example, when separately developed Product and test equipment come together for the first time after the Product has been delivered to the customer. In these cases, the first verification must be carried out as soon as possible.

For civil programs, data modules/technical publications containing procedural information for airborne equipment must be shop first verified. Should this not be possible before the issue of the data modules/technical publications to the customer, it is permissible to carry out the first verification by simulation. All procedures that have been first verified by simulation, however, must have a practical demonstration at the earliest possible time.

#### 2.2.5 Methods of second verification

The methods of second verification are table top, on object or both, in the same way as first verification. The application of these methods must be determined by the project or organization.

### 2.3 Indicating QA in data modules

As data modules progress through the production phase to the in-service phase their QA status is recorded. Whilst in production, the elements of QA are populated to indicate that a data module is:

- unverified which indicates that the data module is effectively in draft
- first verified with the type being set to one of:
  - table top
  - on object
  - table top and on object
- second verified with the type being set to one of:
  - table top
  - on object
  - table top and on object

When a data module is changed and, therefore requires re-verification, the QA status is set back to unverified.

Data modules that are changed between releases must have those changes tracked using the elements and attributes for issue information.

For a detailed explanation of the rules for the population of these elements and their attributes, refer to [Chap 3.9.5.1](#).

### 2.4 Review cycle examples

The nature of modern complex projects means that they also often have complex contractual arrangements. The examples given at [Para 2.4.1](#) and [Para 2.4.2](#), are intended as examples

only and that the project or the organization must establish and detail their own processes and procedures.

**Business rule decision point BRDP-S1-00019 - Review cycle process:**

- Decide on the review cycle processes and procedures.

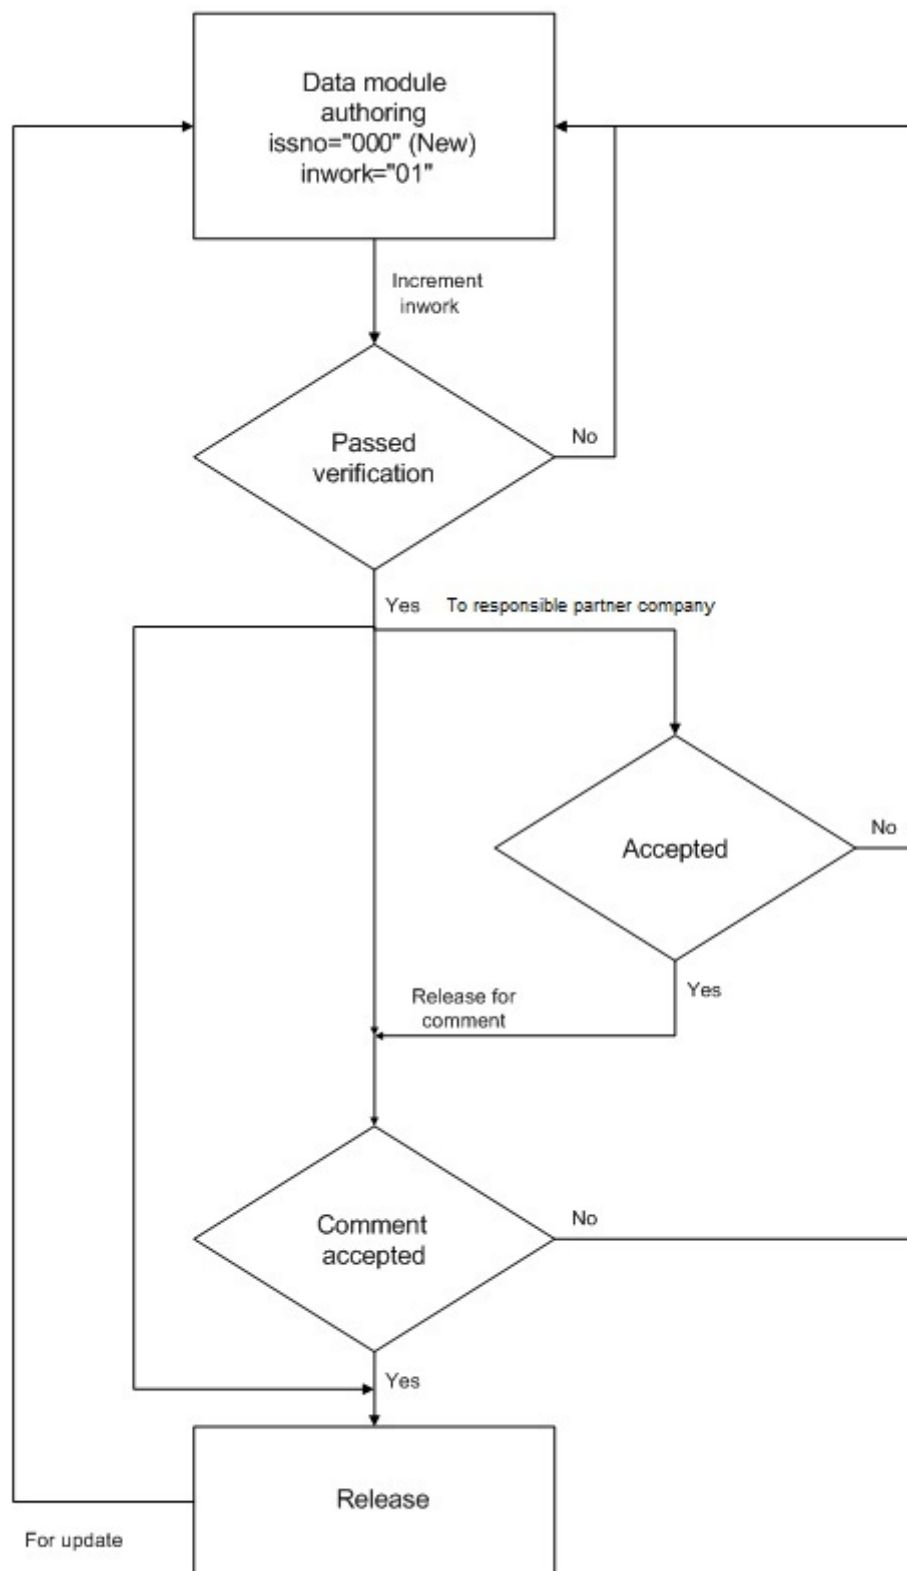

**2.4.1 Simple example**

In the case of the simple project that has one supplier, one customer and one Product, the review cycle is relatively simple as shown in [Fig 2](#).

**2.4.2 Complex example**

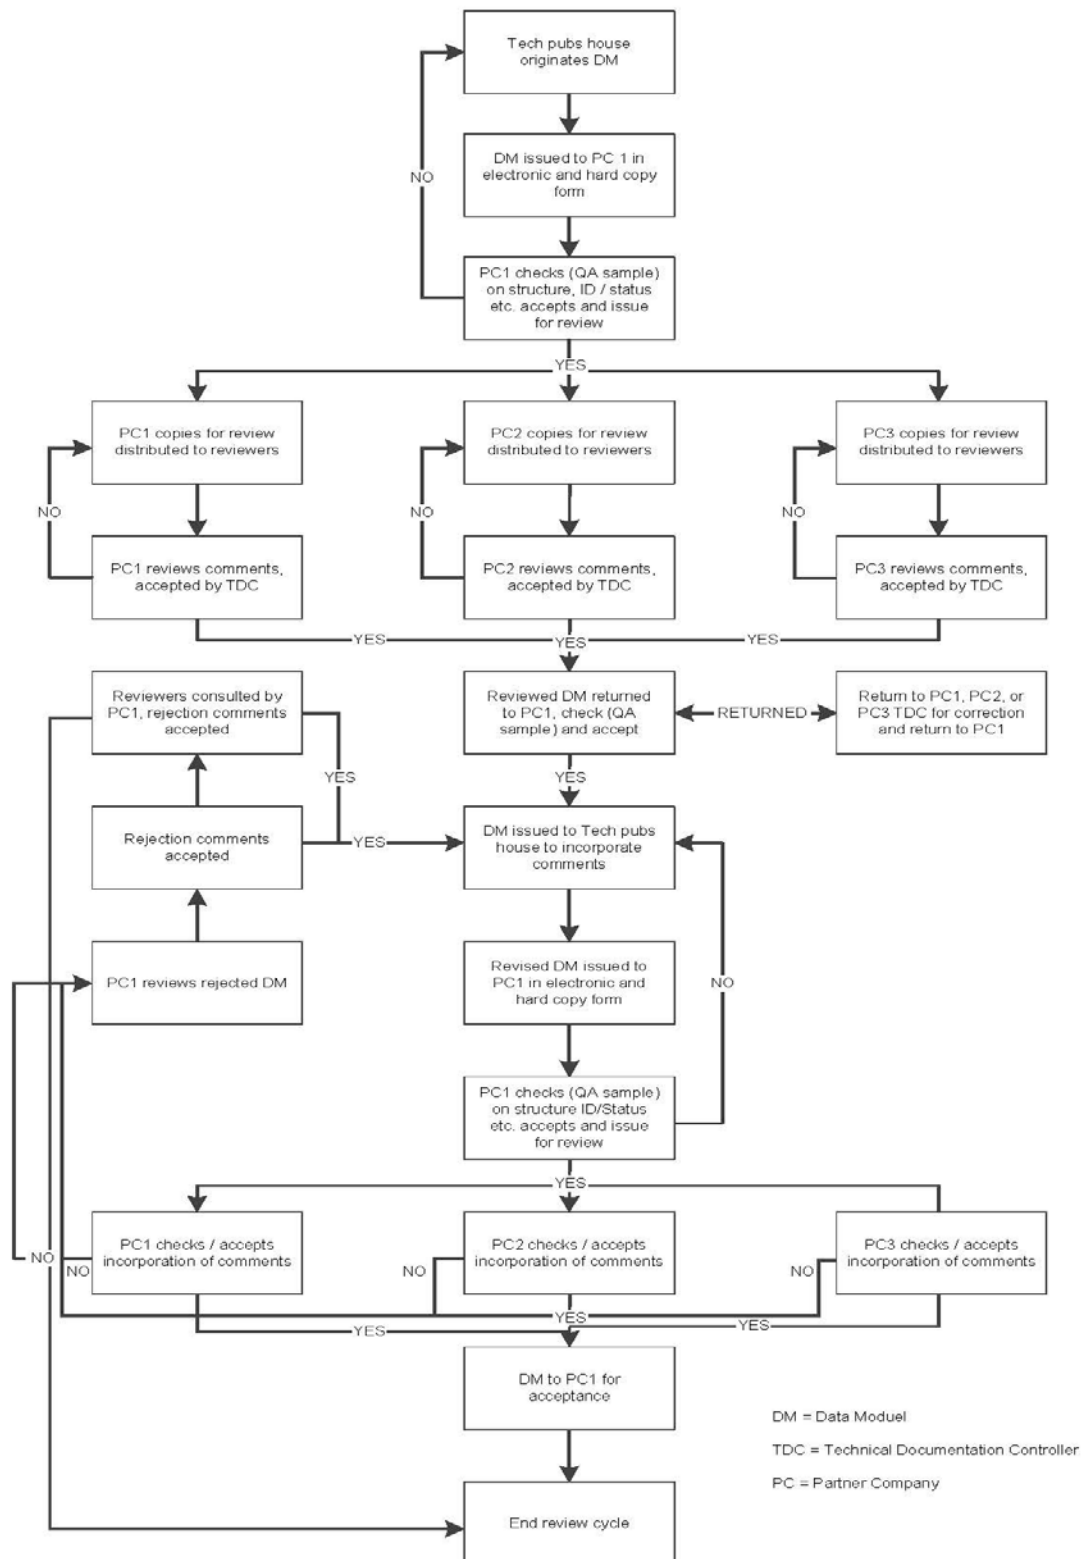

In more complex contractual arrangements, a consortium of companies could be responsible for the whole project. The example shown in [Fig 3](#) contains less detail than that of [Fig 2](#) as there are three partner companies who are each a design authority for a contributing part of the Product and one of them, in this example Partner Company 1 (PC1), has the lead function for technical publications. This lead company has decided to outsource the production of data modules to a “Tech pubs house”.

As lead technical publications function, PC1 has the responsibility to the project for the QA aspects of all data modules that are produced in support of all three contributing companies. Therefore, it is PC1 who must ensure that all three contributing companies (PC2 and PC3) become involved in validating that the correct data modules have been produced and that those that have been produced are technically accurate and safe to use.

### 1 General

The disassembly principles have a basic principle supported by three rules.

### 2 Disassembly principles

#### 2.1 Basic principle

The disassembling principle is based on the consecutive numbering of assemblies obtained during equipment disassembly and subsequent maintenance activities. The assemblies numbered are subsequently allocated their own set of data modules. The allocation of "00" is reserved for the complete equipment followed by sequential numbering in accordance with this chapter.

#### Note

The numbering sequence is not necessarily inline with any step by step maintenance task.

#### 2.2 Rules for numbering assemblies

Assemblies need to be numbered, using the disassembly code, only if one or more of the following three conditions apply:

##### 2.2.1 Rule No. 1

The first condition for numbering an assembly, using the disassembly code, is the performance of further maintenance actions on that assembly. If there are no maintenance actions performed on an assembly, that assembly will not be allocated a number or a set of data modules.

##### 2.2.2 Rule No. 2

The second condition for the allocation of a number, using the disassembly code, is the complexity of an assembly. Simple assemblies may not need data modules. This is to prevent unnecessary breakdown of maintenance information.

##### 2.2.3 Rule No. 3

In addition and to prevent unnecessary breakdown, a number is allocated, using the disassembly code, only in such cases where the volume of maintenance information relating to maintenance actions to be taken is sufficient to warrant an individual data module to be prepared.

#### 2.3 Assemblies and parts

As a rule disassembly generates parts, which happens when an assembly is disassembled. Since maintenance actions might sometimes be applicable to parts as well as assemblies, the following rule applies:

- If maintenance actions on parts need to be performed, the information must be included in the data module of the assembly to which the parts belong, unless the issue of separate data modules is justified. The same applies to those assemblies which are not allocated an individual number in accordance with rules No. 2 and No.3, above, despite maintenance actions being required.

## 2.4 Symbolic explanation

### 2.4.1 Simple example

A simple symbolic example is shown in [Fig 1](#). Based on the complete equipment, the process of disassembly into assemblies and parts is described. The following assemblies/parts are obtained during disassembly of the complete equipment (ie, the subject being disassembled (disassembly code = "00")):

- three assemblies, which are subject to further maintenance actions
- six assemblies/parts, which do not require maintenance

In this case, all of the three assemblies, which are subject to further maintenance actions, will be numbered in accordance with the three rules given in [Para 2.2](#). The disassembly code for these will be allocated the numeric characters "01", "02" and "03" and will thus be provided with a separate set of data modules each; the sets will be marked with the subjects of disassembly: "01", "02" or "03". Under the maintenance actions, these three subjects of disassembly will be further disassembled into assemblies/parts that do not require further maintenance actions.

Legend:

requiring  
maintenance  
actions

Any assembly or parts  
not requiring  
maintenance actions

ICN-S3627-S1000D0721-001-01

Fig 1 Disassembling principle - Simple example

#### 2.4.2 Complex example

A complex symbolic example is shown in [Fig 2](#). Based on the complete equipment (ie, the subject being disassembled (disassembly code = "00")) all pipes, hoses and cables will be removed during the first step of disassembly. In this case, they are not subject to further maintenance actions.

The equipment, less the pipes, hoses and cables (which have previously been removed) is subject to further maintenance actions and, therefore, the disassembly code is allocated the numeric characters "01". In accordance with the maintenance activity (as described in the set of data modules) another step of disassembly is undertaken; removal of accessories. The removal of the three accessories will generate four assemblies in total, all of which are subject to further maintenance actions and, therefore, have their disassembly codes allocated a number. The accessories will have their disassembly codes set to "02", "03" and "04", and the remaining assembly will have its disassembly code set to "05".

For each of the four assemblies, there is a separate set of data modules which will be identified with the appropriate setting of disassembly code to "02", "03", "04" and "05", as appropriate. Under the appropriate maintenance actions, accessories are further disassembled as shown, that is, into assemblies/parts that do not require further maintenance actions.

The subject of disassembly, "05", is more complex in structure. Under maintenance actions, it is further disassembled into three subassemblies which in turn are subject to maintenance actions. This gives further data modules with their of disassembly codes set to "06", "07" and "08", respectively, to support each of the disassembled items.

The subjects of disassembly, "06" and "07", are further disassembled under the appropriate maintenance actions, with an additional assembly requiring maintenance actions resulting in each case, (ie, subjects of disassembly "09" and "10").

There is no need to disassemble subject of disassembly "08" any further for the maintenance actions. There is, however, a requirement for a set of data modules as the assembly requires maintenance actions.

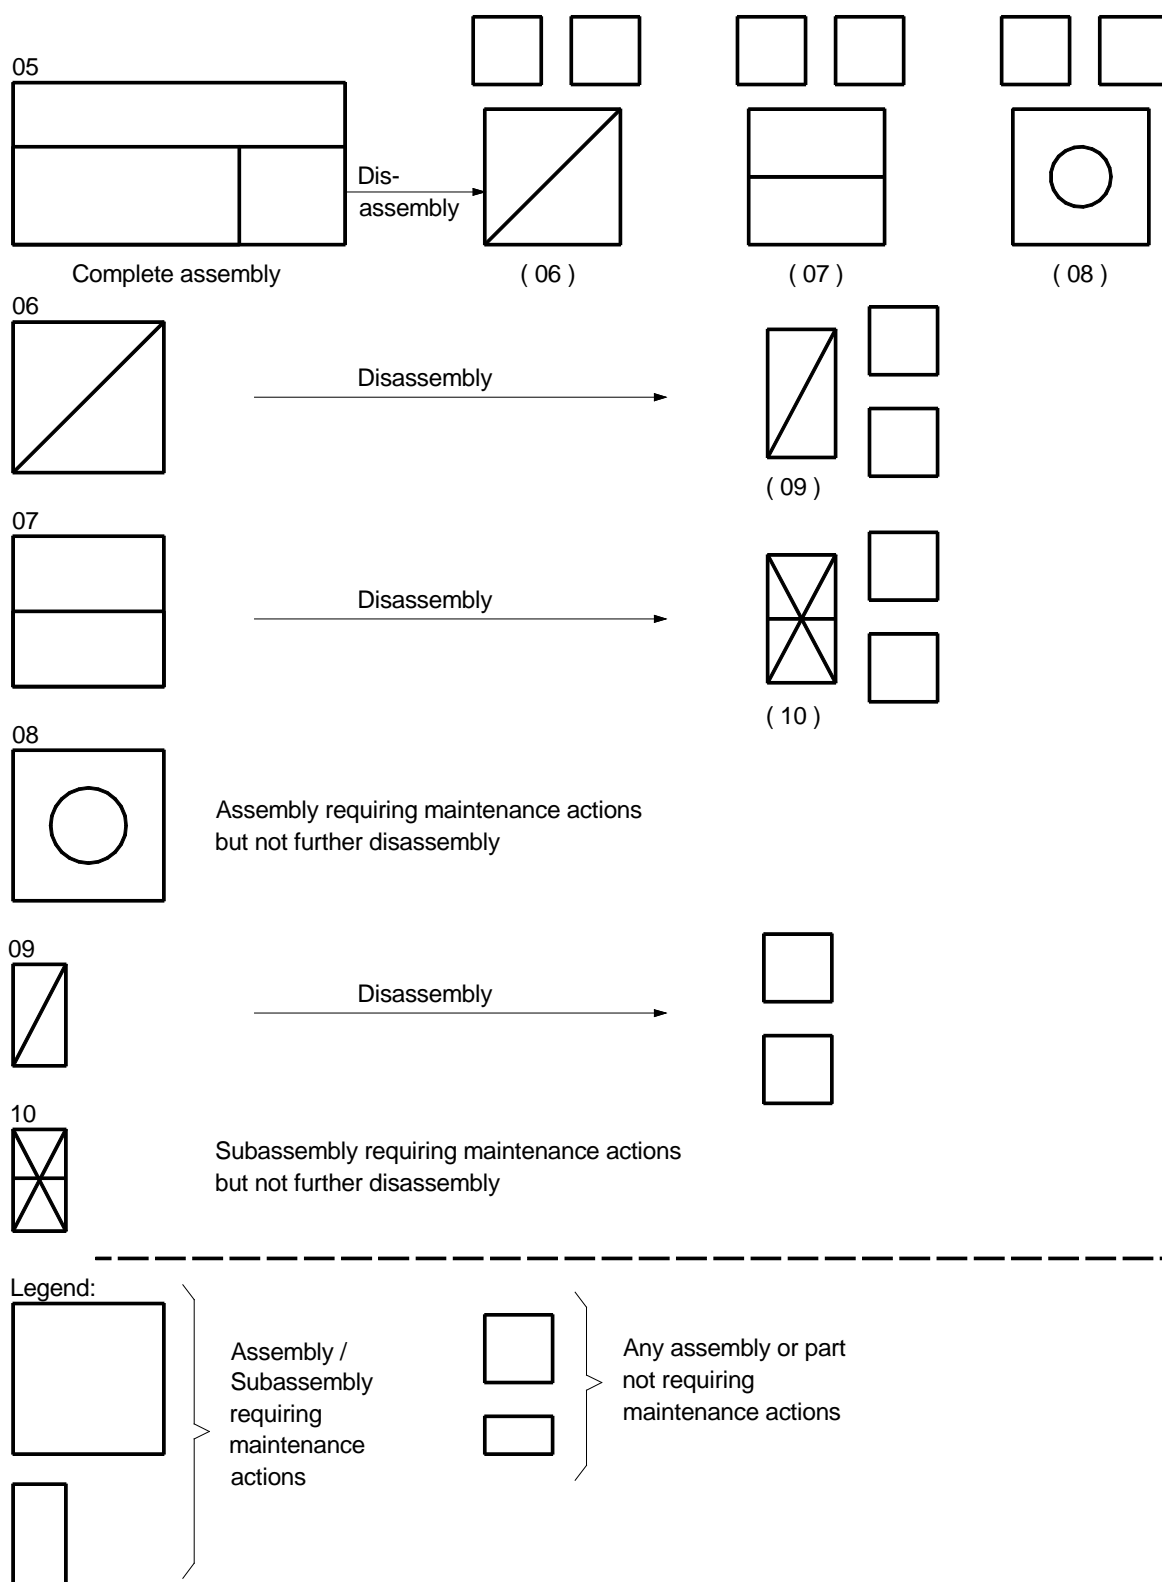

Finally, the subject of disassembly "09" is subjected to final disassembly within the scope of the appropriate set of data modules. The subject of disassembly "10" is not disassembled further but is itself subject to maintenance actions.

## 2.5 Examples

### 2.5.1 Example 1 - Hydraulic assembly

All information (ie, the supporting set of data modules) relating to the complete hydraulic assembly has its disassembly code set to "00" in accordance with the rules for the subject of disassembling as shown in [Fig 3](#). The assignment of further disassembly codes in support of items further disassembled, for example, can be found under Information Code "041" (constructional description, refer to [Fig 4](#)).

In this case, assemblies without a number require no further maintenance actions. The number of further disassembled subjects is, therefore, seven ("01" thru "07"). The disassembling of the hydraulic assembly itself is also a maintenance action which relates to the complete equipment and will, therefore, be coded using disassembly code "00" as shown in [Fig 5](#).

The disassembled subjects "01" thru "07" are allocated their own set of data modules, each of which is coded using the respective disassembly code setting ("01" thru "07"). In this example, the disassembled subjects "01" thru "07" are further disassembled within the scope of maintenance actions. The pertinent figures and data module codes for these disassembly actions are shown in [Fig 6](#) thru [Fig 12](#).

### 2.5.2 Example 2 - AFDS computer

The removed complete computer, (disassembly code "00"), is shown in [Fig 13](#). [Fig 14](#) shows further disassembled subjects.

As a particular feature of this example, assembly "01" is disassembled into two further subassemblies, "14" and "15" as shown in [Fig 14](#). Both subassemblies are subject to maintenance actions.

The disassembly of the complete computer into its assemblies is as shown in [Fig 15](#), and the disassembly of the subject with the disassembly code set to "01" is shown in [Fig 16](#). Further disassembly of subjects with disassembly codes set to "02" and "03", are shown in [Fig 17](#) and [Fig 18](#), respectively.

## 1 General

To assist with authoring in a CSDB environment general guidance is given. Authoring in this environment is fundamentally different from traditional processes. There are rules, which are generic and applied to all data module types. There are other rules that are applied to specific data module types.

### 1.1 Purpose

The purpose of this chapter is to introduce the rules for authoring.

### 1.2 Scope

All authoring aspects for all data module types are covered in the subchapters of this chapter. In most cases there are business rules decision points associated with the data modules types on

which the project or the organization will have to make a decision. [Chap 2.5](#) gives guidance on business rules.

## 2 Authoring

The rules and guidance for authoring are given in the following chapters:

- [Chap 3.9.1](#) provides the general writing rules to be followed in the preparation of text. The rules set out the guidance for the preparation of operator and maintenance information.
- Illustrations are prepared to help the reader's understanding of the text, by amplifying and clarifying it and avoiding lengthy explanations. The rules for illustrations are detailed in [Chap 3.9.2](#).
- Definitions, creation and use of warnings, cautions and notes are given in [Chap 3.9.3](#).
- [Chap 3.9.4](#) gives the rules for the creation of front matter data modules.
- [Chap 3.9.5](#) explains markup including the basic XML terms and definitions.
- Definitions, creation, use and rules for the elements and attributes for the identification and status section are given in [Chap 3.9.5.1](#).
- All the rules for the different data module types are given in [Chap 3.9.5.2](#).

ISO 6093	Information processing - Representation of numerical values in character strings for information interchange

Chap No./Document No.	Title
ISO/IEC 80000-2	Quantities and units - Part 2. Mathematical signs and symbols to be used in the natural sciences and technology

## 1 General

There are three methods of producing data modules:

- document production using traditional editing or What You See Is What You Get (WYSIWYG) systems
- XML production
- database driven production

The traditional production requires the author to manually enter most of the information, including titles/headings, etc. Headers and footers, table of contents and other introductory lists are typed or auto-generated by the system. The author also selects the right element in the template (style sheet) to get the correct presentation.

By using an XML based editor, the author can concentrate on the content of the information, within the bounds of the structure. The presentation (including headers, footers, introductory lists, if page-oriented presentation) is delegated to the production and presentation application.

S1000D facilitates the first two production methods for all types of data modules. However, the third method can be used for the production of any non-text oriented data modules, (ie, IPD, wiring data and maintenance planning data, fault, common information repository data).

[Chap 3.2](#) and [Chap 3.9.5](#) define the structures available to the author when creating a document. [Chap 6.2](#) provides the detailed rules and examples of S1000D standard presentations for page-oriented publications. [Chap 6.3](#) provides basic rules for look and feeling of IETP.

This chapter describes the basic writing rules for creating information in data modules.

### Note

[Chap 6.2](#) shows the presentation of page-oriented publications. However the structure (the use of text and graphics components) explained in this chapter are valid and independent of the presentation form.

## 2 General writing rules

### 2.1 Language

The project or the organization must specify the language in which the data modules are written. If that language is English, then it is recommended to use the writing rules and vocabulary in ASD Simplified Technical English, ASD-STE100® (formerly known as AECMA Simplified English, AECMA Document No. PSC-85-16598).

#### Business rule decision point BRDP-S1-00020 - Specify the language:

- Decide which language to use for producing data modules.

#### Business rule decision point BRDP-S1-00021 - Use of ASD-STE100®:

- When producing data modules in English, decide whether to use ASD-STE100®.

A standard dictionary must also be designated by the project or the organization. If the maintenance data for the data modules is required in the English language, it is recommended that the Merriam-Webster's Dictionary be used as the standard.

**Business rule decision point BRDP-S1-00022 - Standard dictionary:**

- Decide which standard dictionary to use for producing data modules.

If specific maintenance terminology is required, it is recommended that either a terminology database, or project glossary of such terminology is produced or cross-references are made to existing glossaries/specifications. It is essential that the maintenance terminology be agreed to, by all disciplines within the project. Ideally, this will include the Product names and task short descriptions.

**Business rule decision point BRDP-S1-00023 - Use of a terminology database or glossary:**

- Decide whether to use a terminology database or a glossary. If used, agree on its content and management.

## 2.2 Abbreviations

An abbreviation is a shortened form of a word, expression or phrase and is used to conserve space and time. To ensure consistency throughout all the project documentation (including data modules), it is recommended that either a standard list of abbreviations be produced at the start of the project or existing abbreviation standards used both of which can be included in the project terminology database. Some suggested general rules on the use of abbreviations are given below:

- only use an abbreviation when its meaning will be clear to the reader. When in doubt spell it out.
- wherever possible, use abbreviations that conform to a recognized standard used by, or made available to, the customer
- abbreviations not in common use, or not to a recognized standard, but which are used frequently, can be put in brackets after the word, expression or phrase, when used for the first time. Thereafter the abbreviation can be used.
- use the same abbreviation for the singular and plural
- do not use full stops [.] in abbreviations except for where their omission would create ambiguity (eg, "No." for number and "in." for inch to avoid confusion with "no" and "in"). Stops are also not required for contractions (eg, "Mk" for a specific mark) or for shortened identifications, acronyms, (eg, "North Atlantic Treaty Organization (NATO)" for the North Atlantic Treaty organization and "STN" for Special Technical Notice).
- avoid the use of abbreviations in contents lists, titles etc wherever possible (eg, "Operation of the HLWSCU" is meaningless unless you know that the HLWSCU is the High Lift Wing Sweep Control Unit). However, for air systems SNS 24-20 in this specification, use "Alternating Current (AC) Generation", and this abbreviation must be used.
- abbreviations used on placards, labels and signs must be replicated in data modules, even though they may not conform to recognized standards or these suggested rules. If the text given on placards, labels and signs is shown in uppercase letters, then the text must be written in uppercase letters in the related text in the data module (eg, "Put the warning placard DO NOT OPERATE THE LANDING GEAR on the landing gear handle", "Connect the ground electrical connector to the OUTLET SUPPLY receptacle on the leak test set"). This does not apply to the text that is given on tools.
- a list of all non common abbreviations, which are not among the recognized standards required by the customer, can be included in the data module (Information code "005" can be used to list abbreviations)

**Business rule decision point BRDP-S1-00024 - Use of a standard list of abbreviations:**

- Decide whether to use a standard list of abbreviations. If used, agree on its content and management.

## 2.3 Information affected by modification

Information must be provided on any changes introduced by modification to the build standard of the Product. Data modules affected by such information must be arranged so that, when all Products are modified, non-applicable information can be removed without an entire rewrite of the data modules.

## 2.4 Numeric values

### 2.4.1 General

Wherever possible, the rules concerning the expression of numerical values must be in compliance with International Standards Organization (ISO) 6093 Information processing - Representation of numerical values in character strings for information interchange.

Unless otherwise stated, all numeric values (eg, speeds, Mach numbers, accelerations, temperatures, altitudes) quoted must be as indicated on the equipment.

When a range of values is associated with a unit, the unit symbol must be repeated after each number (eg, "2,3 mm to 7,8 mm"). When a value followed by a tolerance is expressed, both must be in the same units, but the unit need only be placed after the complete expression. The mathematical presentation (eg, "12 ± 1 mm") is the preferred one. However, if this is not possible, the complete expression (eg, "12 plus or minus 1 mm") can also be used.

Numbers from one to nine normally must be expressed as words when used in text, except when used in a dimensional sense or for reference purposes. Numbers of 10 and over must be expressed in Arabic numerals except where ambiguity might otherwise result (eg, "two hundred and fifty 27 mm cartridges").

### 2.4.2 Fractions

The use of a fraction can be avoided, by using decimal notation or words, except where indicators or controls are marked in vulgar fractions. Fractions must be presented in text using the slash [/] character, with one space separating a whole number from a fraction (eg, 1 1/2). When super- and sub-script are used, then there must be no space between the whole number and the fraction (eg, 1½).

### 2.4.3 Separators

The decimal separator is a comma [,] in compliance with ISO/IEC 80000-2 (Quantities and units - Part 2. Mathematical signs and symbols to be used in the natural sciences and technology). This separator must be used together with International System (SI) units, refer to [Para 2.5](#). A dot [.] must be used as the decimal separator for Imperial or United States (US) units.

- SI-units comma [,]
- Imperial-US/units dot [.]

Numbers less than unity have their decimal separator preceded by a zero in all cases (eg, 0,012).

Very large or very small numbers expressed to a reasonably small number of significant figures, can be conveniently set out when written manually as multiples of a power of ten to simplify their presentation.

Examples:

- 2998000000 becomes 2,998 x 10<sup>9</sup>

or

- 0,00000000006624 becomes 6,624 x 10<sup>-12</sup>

Presentation of numbers generated from, for example, a database, can vary according to the system being used.

## 2.5 Unit of measure

Projects must determine the standard of measurement used (eg, International System (SI) units, Imperial units, or US customary units). The standard of measurement selected (the primary units) must be used consistently throughout all data modules for a given project. If the equipment, instrument, or tool, etc, is calibrated in alternate units, these must be presented as the primary units.

### Business rule decision point BRDP-S1-00025 - Unit of measure:

- Identify the standard to use for both primary and secondary units of measure.

If an additional unit of measure is selected by the project, the primary units must be followed by the secondary unit conversion in brackets [ ( ) ] unless the equipment, instrument, or tool, etc, is calibrated in the secondary units. In that case, the equipment-specific units must be presented first, followed by the primary units in brackets.

Any conversion necessary is to be rounded up or down to a corresponding number of significant figures. The one exception to this rule is the case of nautical miles.

General rules for presenting unit symbols are:

- when in doubt, spell the name of the unit out (use the spelling meter and liter)
- do not use the point after the unit symbol (use for example A = Ampere, mm = millimeter)
- do not use an "s" for plurals
- put a one-character space between the unit quantity and the unit symbol
- use the units given on gauges, indicators, etc, as the primary unit
- the rules for separators given in [Para 2.4.3](#) must be followed

### Note

In Europe the EU Council Directive 99/103/EEC and its updates must be followed.

## 2.6 Names

To ensure consistency throughout all project documentation, including data modules, it is recommended that standard names (for products, equipment, components, assemblies, parts, etc) be used throughout all disciplines of the project. Normally, engineering drawings are the source data for names. The drawings are used as the verified source data to produce, for example, the IPD data modules.

Markings on controls must be quoted as marked. Where a control selection exists but is not actually marked, it must be described fully.

Consistency of names must always be maintained between text and illustrations in data modules. Terminology that conveys the purpose, function, or nature of an item irrelevant to a procedure requirement should not be used. For example, the spoiler center wing input quadrant need not be called such in a procedural step to insert a rig pin. The presence of an illustration showing the location of the quadrant enables the step to be written simply (eg, "Insert the rig pin in the quadrant" or "Insert the rig pin") when there is only one quadrant and one rig pin. Modifiers are only necessary when more than one item of the same name is acted upon in the same procedure.

## 2.7 Basic punctuation rules

ASD-STE100® is recommended as a guide for the use of punctuation marks in maintenance data. ASD-STE100® states that semicolon [;] is not permitted. Specific rules for lists are given in [Chap 3.9.5.2.1.3](#) and for titles in [Chap 3.9.5.2.1.5](#).

## 2.8 Use of uppercase

All text including all titles must be written in sentence case (only the first letter in a sentence is given in uppercase). Sentence case or, where appropriate, all uppercase must be used for

specific abbreviations, acronyms or expressions within the title or sentence. The following examples are specific expressions:

- Chap, Para, Fig, Table, WARNING, CAUTION and Note
- titles with a "hyphen" must use an initial uppercase after the dash (eg, "Corrosion control - Rudder")
- titles with a "slash" [/] must use an initial uppercase after the slash if it is the first set of words in a sentence (eg, "Crew/Operator must ...")
- titles of an information set or a publication must be written with initial uppercase (eg, Weapon loading, Description and operation). Refer to [Chap 5](#).
- when explaining an acronym the first time in a data module the corresponding initials must be in uppercase (eg, CPF)

Placards, labels and signs must be replicated, including uppercase, when referenced in data modules. Refer to [Para 2.2](#).

## 2.9 Highlighted text

To highlight a word, an expression or a sentence, bold text is the preferred method. Alternatively, the use of color is permitted. Uppercase, italic or underlining are not permitted to highlight text, except for legacy data.

### Note

Exceptions are the captions WARNING which are underlined and bold and CAUTION which are bold. Refer to [Chap 3.9.3](#).

### Business rule decision point BRDP-S1-00026 - Highlighting text:

- Decide which method to use to highlight text.

## 1 General

General guidance and rules on authoring illustrations and multimedia objects is addressed here. The rules are given in more detail in:

- [Chap 3.9.2.1](#) provides the primary rules for the creation of 2D illustrations with basic illustration examples.
- [Chap 3.9.2.2](#) defines and explains navigation and configuration of illustrations.

Applicable to: All

**S1000D-A-03-09-0200-00A-040A-A**

**Chap 3.9.2**

- [Chap 3.9.2.3](#) covers the use of color in illustrations and photographic images.
- [Chap 3.9.2.4](#) provides the primary rules and details the minimum standards for the creation of audio, video, animation 2D or 3D multimedia objects with basic examples provided.
- [Chap 3.9.2.5](#) covers 3D multimedia objects including dynamic and interactive technical content.
- [Chap 3.9.2.6](#) provides information on the acquisition and use of multimedia, e-learning, and SCORM data (available in future issues of this specification).

## 2 Project guidance

The delivery of many different media types with a wide range of project requirements in mind is addressed here. As a result, where this chapter cannot mandate output media types, it will give guidance and specifies minimum requirements. It is strongly recommended that projects use open specifications when delivering multimedia. Proprietary types are discouraged as a media object types (refer to [Chap 7.3.3](#)). It is also essential that project business rules governing the delivery of media object types are in agreement with exchange and maintenance strategies in place and specified in the configuration file.

### 2.1 Illustration rules - Introduction

Illustrations must be prepared to amplify and clarify the text and to avoid lengthy explanations. They must be located as close as possible to the related portions of the text.

#### 2.1.1 Legacy illustrations

It is the intent of S1000D to maintain as much commonality among illustrations as possible. Consistent positioning, rendering, navigation and symbologies will assist in the understanding of illustration and text information in an efficient manner.

These rules have been developed primarily for use on new projects/programs but illustrations that conform to previous S1000D and ATA e-Business Program illustration rules can, on the discretion of the illustration originator, be used to support reuse and/or for cost reasons. However, the principles of the primary rules of illustrations given in [Chap 3.9.2.1](#) must be fulfilled.

#### 2.1.2 Printable data

Before the production of project documentation begins, the parts of the documentation which have to be printable must be defined. It must also be clarified if the customer is in a position to provide all end users with the technology to use electronic publication functionality such as color displays and color printing. When printing colored illustrations using black and white is required, the print medium must be able to handle the file content.

##### **Business rule decision point BRDP-S1-00027 - Need of printable data:**

- Decide which parts of the documentation (data modules and publications including IETP) need to be printable.

[Chap 3.9.2.1](#) gives rules and guidance for the production of illustrations which have to be presented on paper or on screen. The basic set of rules is common for both environments but specific rules also apply. The final requirements must be considered within the project business rules.

#### 2.1.3 IPD Illustrations

The rules applied to IPD illustrations can also be used for the production of illustrations during the initial provisioning process. Refer to [S2000M](#).

The illustrations used in the IPD publication are identified as "Figures". The purpose of these figures is to clearly depict the detailed parts in disassembly order. If one illustration page is insufficient for the presentation of an assembly, a figure is spread over several illustration sheets.

---

**2.2 Multimedia - Introduction**

The implementation of multimedia elements to projects requires testing in the role in which it will be used and support environment in which it will operate. Consideration must be given to display backgrounds, colors and presentation methods used. Working conditions such as lighting, weather and noise levels can have a major impact on the ability to use or understand the presentation. All media projects must be appropriately tested before delivery. Once all these factors have been considered and defined in the project requirements plan, agreement can then be reached on the user interface and delivery methods to be deployed.

## 1 General

Primary rules for the creation of 2D illustrations with basic illustration examples are provided below.

## 2 The primary rules of illustration

There are two basic principles regarding illustrations:

- Illustrations must communicate to the user in a simple, clear and economical way and visually enhance the technical information required by the user.
- Illustrations must be prepared in accordance with the text and other information in data modules, such that the end user receives the maximum amount of information (description of systems, components, operation, task execution, etc).

The following gives general guidance to help the illustrator and publication designer create illustrated information:

- The information given must provide the end user with the maximum information for the output media (on paper or IETP) used.
- Illustrations must be prepared to present the view and scale that is most favorable for the user.

- Illustrated parts must be clearly identifiable to the user and annotated appropriately. If required for clarification, use a location drawing (refer to [Chap 3.9.2.2](#)) and/or direction indicators.
- Location arrows, leader lines, annotations, etc, must be clearly shown and free from surrounding detail.
- Reusability and uniformity are of prime importance for clarity and the complete set of information. Uses of "typical" and "natural" views for similar equipment are important elements in a good illustration.
- The illustrations must be clear, showing only the detail required and what is being described to the user. The inclusion of unnecessary details, such as shaded areas, as well as the presentation of detailed parts not visible in the perspective view by using broken lines, must be avoided. [Fig 1](#), [Fig 2](#), [Fig 3](#), [Fig 4](#), [Fig 5](#), [Fig 6](#) and [Fig 7](#) give the general rules for the clarity of illustrations. The exact presentation of details, such as threads on screws or their head style, can be omitted. Limit the artistic effects, do not use shadow effects. The use of artistic embellishment must be limited and only used to add visual clarity for the user.
- The level of detail in the illustration must be measured, simple and relevant to the amount of information that the end user can process. Highly detailed source material like 3D Computer-Aided Design (CAD) data, digital mockups or 2D drawings can risk complex and unnecessary modifications.
- Always construct the layouts, building the illustrations logically and in sequence in accordance with [Chap 3.9.2.2](#).
- Graphics must be produced to a realistic and sensible size. Whenever the scale of a graphic does not allow small detail to be clearly shown, these details must be enlarged.
- Where the disassembly order or detail parts can be properly identified from the plan view representation of a production drawing, that representation must also be used in the illustration. This form is applicable to items such as hose assemblies, control rods, clamps, instrument panels, circuit boards or support equipment. Refer to [Fig 9](#), [Fig 10](#), [Fig 11](#) and [Fig 12](#).
- Do not overcrowd the illustration reproduction area.
- If several identical parts are used in the same assembly, only one of them needs to be illustrated if it is possible to positively allocate them to their respective location and/or orientation.
- Wiring or system diagrams, schematics or other charts where symbols are used are also acceptable as an illustration if they provide for the proper identification of the detail parts. Refer to the black and white example in [Chap 3.9.2.3](#).
- The project must decide if schematics derived from engineering drawings include the original drawing number and revision status within the illustration reproduction area.
- Present graphics in accordance with the output media.
- Consider final requirements within project business rules.

**Business rule decision point BRDP-S1-00028 - Engineering numbers and revision status within the illustration reproduction area:**

- Decide if schematics derived from engineering drawings include the original drawing number and revision status within the illustration reproduction area.

## 2.1 Mode of presentation

### 2.1.1 Specific rules and recommendations for illustrations in page-orientated publications

For ease of reading and cross-referencing, the preferred layout is portrait (IPD illustrations are always to be in portrait layout). Foldouts or landscape are only allowed as exceptions, as defined in the project business rules.

### 2.1.2 Specific rules and recommendations for IETP illustrations

In comparison to the page orientated (paper) documentation, the following deciding restrictions are no longer relevant or additional possibilities are available for screen presentation:

- Fundamentally, no constant, printable page layouts are required. Only the necessary illustration part is displayed on the screen in the required size. However, the need for printing of data module pages or the illustration itself must be considered.
- Objects are named to facilitate easy reference to multiple components of an illustration that have the same name. For example, graphic objects can be given a name applicable to a certain configuration with the same name. It can also be useful to name sets of hotspots that need to be turned on and off. Naming schemes and groupings must be coordinated.
- Information regarding graphic object identifiers, names or coordinates that will be referenced in an IETP must be documented and communicated in such a manner that hotspots can be defined.
- The use of color to show the clarity of important information has priority.
- All forms of picture presentation can be used, such as color photographs, bitmaps of 3D models and electronic legacy data providing that they are in accordance with the data format in this specification.

## 2.2

### 2.2.1

## Illustration sizes, line weights, typeface and type size

### Illustration sizes and orientation

The following illustration sizes can be used in data modules: full page, flexi height and landscape fold out. The final illustration reproduction areas are given in [Table 2](#). If scaling of an illustration is required to fit a legacy illustration into an S1000D illustration reproduction area, it must be scaled proportionally to preserve aspect ratios.

Table 2 Illustration reproduction areas

Page sizes	A4 and US A size publications	A5 publications	US 5 inch x 8 inch publications
Full page	170 mm x 222 mm <sup>1</sup>	120 mm x 157 mm	105 mm x 137 mm
Flexi height	170 mm x (45 mm thru 210 mm) <sup>2</sup>	120 mm x (30 mm thru 175 mm)	105 mm x (25 mm thru 137 mm)
Fold out	360 mm x 222 mm	254 mm x 157 mm	222 mm x 137 mm
1 Illustrations primarily to be used in illustrated parts data must always be full page A4 (ie, 170 mm x 222 mm).			
2 Using a height of 210 mm allows for a heading on the top of the page.			

For illustrations used as symbols in the text, the illustration reproduction area is the symbol size.

The preferred illustration reproduction area sizes, defined in [Table 2](#), are used as a guideline when producing IETP illustrations. The preferred orientation is portrait. However the final size and orientation of an illustration for an IETP must be designed and delivered in accordance with the individual project. The project or the organization must bear in mind the need for printouts from the IETP.

### 2.2.2

#### Line and text style

Line weights, typeface, type sizes, symbols in illustration representation and general standards are all defined in this chapter as they would appear at a scale of 1:1 in a page-oriented presentation.

#### 2.2.2.1

##### Line weights and line types

**Black and white illustrations.** Line weights and line types in illustrations must be prepared according to the rules shown in [Table 3](#), [Table 4](#) and [Fig 1](#).

**Color line illustrations.** Line weights and line types in illustrations must be prepared according to the rules shown in [Table 3](#), [Table 4](#) and [Fig 2](#) and/or [Fig 3](#). Illustration of items, leader lines and highlighted items will be black, but other line types can be dark blue. Refer to [Chap 3.9.2.3](#).

### Note

The dashed (170 mm x 222 mm) border line in [Fig 1](#), [Fig 2](#) and [Fig 3](#) gives the illustration reproduction area and can be used to check the scale.

The distance between two lines must at least be equal to the sum of the weights of these lines.

### Business rule decision point BRDP-S1-00029 - Use of color in the final deliverable:

- Decide whether to use color in the final deliverable.

[Table 3](#) gives a summary of line weights and best practice of their primary use.

*Table 3 Lines - Their primary use and weights*

Line weight use	Line weight	Remark	Line type
Illustration of items	0,18 mm <sup>1</sup> /0,35 mm <sup>2</sup>	Represents the primary objects.	Type 1
Reference structure/items	0,18 mm (or 0,25 mm)	Represents objects on the illustration which are reference to primary objects.	Type 1
Center/Projection lines	0,18 mm (or 0,25 mm)	Show the axial flow of part assemblies. Center/Projection lines must not cross other Center/Projection lines.	Type 4
Hidden lines	0,18 mm (or 0,25 mm)	Use Type 2 to represent objects in simplified form (obscured from view). Will only be used when clarification is required. Type 3 can be used when clarification is required on smaller objects when hidden lines are not appropriate.	Type 2 or Type 3
Leader lines	0,18 mm (or 0,25 mm)	Used to connect objects to the callout text.	Type 1
Highlighted item	0,5 mm		Type 1
Highlighted reference structure	0,5 mm		Type 1
1 0,18 mm applies to color illustrations using two line weights. Refer to <a href="#">Fig 1</a> .			
2 0,35 mm applies to color illustrations and black/white illustrations using three line weights. Refer to <a href="#">Fig 2</a> and <a href="#">Fig 3</a> respectively.			

*Table 4 Line type definition*

Line type	Definition
Type 1 - Solid	Solid
Type 2 - Dash	A segment = 1,0 mm. 3 On - 1 Off.
Type 3 - Dot	A segment = 0,5 mm. 2 On - 1 Off.
Type 4 - Dash-dot	A segment = 0,635 mm. 10 On -1 Off - 2 On - 1 Off.

Fig 3 Color illustrations - General rules, 2 line weights

2.2.2.2 Text style  
For text annotations, item numbers, etc, the font must be of Sanserif type (eg, Univers, Helvetica, Arial).

The preferred annotation specifics are defined in [Table 5](#).

The type sizes comparison between point size and cap-height is given in [Table 6](#).

The basic rules for use of capitals (upper case characters) and highlighting of text apply. Refer to [Chap 3.9.1](#).

**Business rule decision point BRDP-S1-00554 - Illustration annotations written in upper or sentence case:**

- Decide whether to write illustration annotations in upper or lower case.

*Table 5 Preferred annotation specifics*

Annotation category	Cap-height	Point size	Case	Style	Remark
Dimension	2,0/2,5 mm	8 pt/10 pt			Unit of measure
Callouts	2,0/2,5 mm	8 pt/10 pt	Upper/Sentence case. Use upper case letters for item number variants.		Nomenclature with leader line
Item numbers	2,0/2,5 mm	8 pt/10 pt			Item/Index numbers can include optional alpha characters.
Note	2,0/2,5 mm	8 pt/10 pt	Upper/Sentence case	Left justified. The word "Note" or "Notes" can be in bold.	Notes and general statements. Preferred method is to have the note title in 10 pt bold.
Legends	2,0/2,5 mm	8 pt/10 pt	Upper/Sentence case	Left justified. The word "Legend" can be in bold.	Explanation of parts on illustration (body text and/or graphical) Preferred method is to have the legend title in 10 pt bold.
Detail locators and section locators	3,5 mm	14 pt	Upper case	Bold	A letter associated with a detail by a leader or section. Referenced to the equivalent capital letter detail or section identifier for navigation between views, details or sections.

Annotation category	Cap-height	Point size	Case	Style	Remark
Detail identifiers and section identifiers	3,5/4,0 mm	14 pt/16 pt	Upper case	Bold	Positioned below the detail or section view
Titles/ Subtitles (identification of view)	2,0/2,5 mm	8 pt/10 pt	Upper case		Identification of a view or subtitle to a view with an identifier
Continuation reference (gotoref)	2,0/2,5 mm	8 pt/10 pt	Upper case		Continuation references that navigate through multiple sheets or within a sheet contain a single digit alpha or numeric.
Flagref	2,0/2,5 mm	8 pt/10 pt	Upper case		Multiple general notes, each preceded by a symbol containing a two digit numeric
Applicability	2,0/2,5 mm	8 pt/10 pt	Upper case only		Notes pertaining to applicability preceded by a symbol containing a two digit numeric

Warnings and cautions must not be given in any illustration. Refer to [Chap 3.9.3](#).

Exception is made for wiring diagrams or a similar situation where the text style is ruled by the settings in the diagram generating application.

Table 6 Point size vs cap-height

Size	Point size	Cap-height
Small	8 pt	2,0 mm
Medium	10 pt	2,5 mm
Large	14 pt	3,5 mm
Extra large	16 pt	4,0 mm

The point sizes are approximate and will vary based on the particular font that is used. It is best practice to use the cap-height dimensions.

## 2.3

### Symbols

The use of symbols must strive for consistency in line weight.

**2.3.1 International System of units (SI units) and symbols**

In general, the International System of Units (SI units) and International Organization for Standardization (ISO) standards apply as stated in the writing rules. Projects however, can specify additional standards.

**2.3.2 General symbols**

General symbols for illustrations and photographs (eg, arrows and direction indicators) must be prepared in accordance with the examples given in [Fig 4](#), [Fig 5](#), [Fig 6](#) and [Fig 7](#).

**2.3.2.1 Arrow heads**

It is recommended that arrow heads be drawn in accordance with ISO 129-1. Refer to [Fig 4](#) (Sheet 3 of 3).

**2.3.2.2 Brackets**

The legs on the brackets must be 2 mm in length for brackets that are 100 mm or less in length, and 5 mm for the longer brackets.

**2.4 Halo**

To clarify the readability of an illustration it is necessary to emphasize (eg, the path of a leader line to a component when they intersect other geometry inline drawings and photographs). This is achieved by the use of a halo:

- on each side of leader lines, hidden lines, center/projection lines and reference structure/item lines
- around dimension arrows, brackets, direction arrows, multipliers, etc

The halo must be approximately 1 mm on each side of the general symbols. Refer to [Fig 7](#).

## 2.5 Type of illustrations

Normally, illustrations are prepared as line drawings. Subject to agreement with the customer, full color illustrations, photographs and monochrome (half tones) can be used, provided they meet all requirements to show clear details. Again, cognizance must be taken of any project output requirements. The following types of drawings are used:

- **Isometric projection** (30°/30°, ellipse 35°) - This is the preferred 3-dimensional drawing method for detail, exploded views or larger installations and must remain in the classical LTF (left top forward) orientation. Refer to [Fig 1](#), [Fig 2](#) and [Fig 3](#).
- The **exploded view** of IPD illustrations must be shown in the correct disassembly order. If necessary, details can be shown in a different isometric orientation.
- As an alternative, **trimetric projection** can be used.
- **Perspective** - Normally used only for abnormally large components such as aircraft fuselage, wing sections and tail assemblies. Perspective can also be used for location drawings. For technical publications, the orientation of the mechanics viewpoint is permitted.
- **Orthographic projections** - These 2-dimensional illustrations are used each time this kind of presentation adequately serves the purpose.
- **Diagrams/Schematics** - This type of presentation is used to explain the operation of a system or a circuit.
- **Graphs** - This type of representation is used to explain the relation between various parameters.

## 2.6 Resolution for illustrations

The preferred resolution for illustrations is 300 dots per inch (dpi). The data standards definitions for the incorporation of images are described in [Chap 4.8](#).

## 2.7 Use of hatch styles, solids, raster and pattern fills

To highlight areas, show flows, or to differentiate materials, hatch styles, solid, raster or pattern fills are used. When using color fills, bear the output demands in mind.

The recommended hatch styles, solids, raster and pattern fills are given in [Fig 8](#).

**Hatches:** The CGM Version 3 "Hatch Style Definition" element allows for the definition of a hatch style and associates it with an index by which it can be used within the graphic.

The indexes are negative, to avoid conflict with standardized or registered values.

The duty cycle length settings, given in [Table 4](#), are based on a unit of 0,0254 mm. [Table 7](#) gives the hatch style definition settings.

At presentation, the scaling of hatch patterns must remain constant throughout enlargement/reduction to ensure the hatch pattern remain recognizable despite of the level of zoom employed.

**Solids:** This fill type allows for the use of color values to indicate filled areas.

**Raster:** This fill type allows for the use of a predefined raster to indicate filled areas.

**Pattern:** This fill type allows tiled designs represented as a bitmap. Standard pattern indexes have not been defined.

-16	Cross	0, 90	49 units	1	7	1

## 2.8 Information Control Number - ICN

Each illustration must be allocated an ICN.

In order to avoid redundancy, an illustration sheet can be referred to in different contexts. Thus, an illustration sheet can belong to different figures with different titles.

The ICN addresses an illustration sheet including its update status independently of the status of a data module or publication where it is used within a figure.

The details describing the use of the ICN and its breakdown are laid down in [Chap 4.4](#). Refer to [Chap 6.2.2](#) and [Chap 6.3.1](#) for ICN presentation rules.

**Business rule decision point BRDP-S1-00555 – Inclusion of the ICN in the illustration:**

- Decide whether to allow the ICN to be included in the illustration.

## 2.9 Reference illustrations/structure

Reference illustrations (phantom representation) of structure and assemblies which are not part of the assembly to be illustrated, but which show assembly relationship, must be shown using reference structure line weights or defined colors without item numbers and leader lines.

Wherever possible, reference illustrations are not itemized. Refer to [Fig 1](#), [Fig 2](#), [Fig 3](#) and [Fig 9](#) in [Chap 3.9.2.3](#).

ICN-C0419-S1000D0328-001-01

Fig 9 Item tabulation of similar content - Example

Applicable to: All

S1000D-A-03-09-0201-00A-040A-A

Chap 3.9.2.1

## 2.10

### 2.10.1

## Callouts and leader lines

### General

Callouts can be written as annotations (direct annotations) or as item numbers (indirect annotations). If item numbers are used, they must be explained in a legend within the illustration reproduction area or in the related text. The indirect method of annotations is preferred, especially if the data module or technical publication has to be translated. Refer to [Chap 3.9.2.2](#) and [Chap 3.9.2.3](#).

General guidelines for item numbers:

- Use a separate graphical text element (in a sensitive area) for each item number. This applies equally to tabulated items and multiple indexing (refer to [Fig 9](#) or [Fig 12](#)).
- Use three separate graphical text elements for mirrored items, the first for the opening bracket, the second for the item number and the third for the closing bracket (refer to [Chap 3.9.2.2](#)).
- Use upper case letters for item number variants. Refer to [Chap 3.9.2.2](#).

If it is necessary to quantify an item number (attaching parts), use lower case multiplier "x" as shown in [Chap 3.9.2.2](#).

General guidelines for multipliers:

- Put the multiplier and the appropriate quantity to the right of the respective item number.
- Leave a space between the item number and the multiplier information (eg, "1 x3").
- Use two separate graphical text elements (in sensitive areas) in the illustration.
- Do not use multipliers if an item is cross-referenced and shown more than once, regardless if the item number is the same or different.

Examples of multiplier presentations are shown in [Chap 3.9.2.2](#). For the text style of callouts refer to [Para 2.2.2.2](#) and [Fig 1](#), [Fig 2](#) and [Fig 3](#).

Leader lines must:

- be as short as practical
- be stopped with a dot when entering a part
- only have arrowheads in exceptional circumstances to promote clarity (eg, in graphs)
- be "laid free" (halo) to clarify the path to the component when they intersect other geometry.

It is preferred that leader lines touch the part. If the leader line does not touch the part a gap of 2x the line thickness must be used.

Avoid vertical and horizontal angles in orthographic views. Isometric angles must be avoided in isometric views to prevent confusion with object lines.

### 2.10.2

## Item numbers and leader lines in IPD illustrations

In addition to the above, the following rules apply for the annotation of IPD illustrations:

The number of locations shown in the illustration must correspond with the quantity per next higher assembly indicated in the text for the item. This requirement can be achieved by the following methods:

- by illustrating and separately referencing the different locations of an item. Refer to [Fig 13](#) [26].
- by the number of leader lines (more than one leader line pointing to the same item number). Refer to [Fig 13](#) [28].
- by the number of identical key characters (letters) if a detail illustration applies to more than one location. Refer to [Chap 3.9.2.2](#) and [Fig 13](#) [A].

- by using the multiplier "x" after the item number followed by the appropriate quantity. This procedure is permissible only if all locations cannot be shown (refer to [Fig 13 \[4\]](#)) or where, for practical and economic reasons, it is desirable to omit additional reference lines (eg, where installation locations are clearly identifiable but the extensive use of additional information such as repetitive item numbers, detail illustrations, etc, would make an illustration unnecessarily difficult to read). Refer to [Chap 3.9.2.2](#).

If hotspots are needed for the production of the IETP IPD information set, links between the illustration and the IPD data can be provided using the element `<hotspot>` in accordance with [Chap 3.9.5.2.1.8](#).

## 2.11 Center lines/projection lines

Center lines/projection lines are used in illustrations to indicate how detail parts and assemblies match.

The projection line must be routed through at least one hole, or to a prominent reference point of the detail part/assembly.

Projection and center lines must be "laid free" at the intersection with other geometry.

The center line represents the imaginary line through a center of an item/assembly.

If possible, projection lines/center lines must be without bends or 90° turns.

## 1 General

This chapter defines and explains navigation and configuration of illustrations. It must be used in conjunction with [Chap 3.9.2.1](#).

## 2 Navigation and configuration content

This chapter covers various aspects, production, and use of navigation symbols with rules and guidance for the configuration of illustrations.

### 2.1 Navigation rules

#### 2.1.1 Use of hotspots

Hotspots are sensitive areas in illustrations necessary for creation of links used to navigate within technical publications. This area can be activated by hyperlinks from:

- text in a data module to one area of an illustration
- text in a data module to several areas of an illustration
- one area of an illustration to the data module text
- one area of an illustration to another area of the same illustration
- one area of an illustration to an area of another illustration
- one area of an illustration to another data module
- one area of an illustration to parts information

The sensitive area can be represented by:

- callout numbers (can include the leader line)
- the itemized graphic elements or their surface
- callout numbers including leader lines and itemized graphic elements (or their surface)

Highlighting the sensitive area by touching with the cursor is a viewer constraint. Examples of sensitive areas and their presentation are given in [Fig 1](#).

Sensitive areas	Presentation	Type	Example given in
 21  x2	21 x2	Multiplier	Chap 3.9.2.1

 = Sensitive areas  = A distance of approximately one blank [ ] to separate the sensitive area from the multiplier or reference designator			

ICN-C0419-S1000D0334-001-01

*Fig 1 Sensitive areas and their presentation - Examples*

A hotspot can be turned on or off by changing the visibility of the sensitive area. A hotspot is considered visible unless the attribute `visibility` of element `<hotspot>` overrides the default.

To set up links between data module text and illustrations, or between illustrations, cross-reference identifiers are necessary. The required target address is the identifier of the hotspot within the illustration.

The sensitive area is defined by using the WebCGM Application Structure (APS) attribute `region`. The display area of the target in a graphic is defined by the WebCGM APS attribute `viewcontext`.

For the creation of hotspots and the control of dynamic behavior of the illustration, the S1000D CGM profile defined in [Chap 7.3.2](#) applies. The methods of implementing and using hotspots are given in [Chap 3.9.5.2.1.8](#).

### 2.1.2 Graphical access

The graphical access to information in an IETP can be achieved with illustrations and hotspots to relevant data modules. This is helpful if the user knows the item but not the name or naming conventions.

As well as using the table of contents via viewer to get access to the applicable part of the document, the user can also use illustrations in different detailed sections. This is achieved by the use of hotspot technology and the applicable detailed illustrations as described in [Chap 3.9.5.2.1.8](#). This chapter includes the concept of defining and accessing information about an illustration in addition to its visual image for the purpose of hyperlink and navigation.

## 2.2 Figure title and number

In order to establish the relationship to the text of a data module or publication, illustrations must be given figure numbers and titles. The figure number reflects the sequence in the data module or publication.

For IPD illustrations, the figure title must be identical with the description for part given against the item number "0" (zero) of the figure.

Figure titles are part of the data module or publication text.

Figure numbers must be generated on output only.

The figure number, followed by the title, must be centered below the illustration, outside the illustration reproduction area. The figure number and the title must be separated with two blanks. If an illustration requires several illustration sheets, the note (Sheet X of Y) must be added at the end of the title as shown in [Chap 3.9.2.1](#). Figure number, title, and note are not to exceed two lines.

Illustrations used as symbols (element `<symbol>`) are not to be given a figure number, figure title, nor have the ICN presented/printed.

As an alternative to the basic method:

- Fig 12 Navigation within IPD (Sheet 1 of 2) and Fig 12 Navigation within IPD (Sheet 2 of 2)

an individual figure number can be appended to each illustration sheet, eg:

- Fig 7.1 Computer (Sheet 1 of 2) and Fig 7.2 Computer (Sheet 2 of 2)
- Fig 2 Pump (ACDC) (Sheet 1 of 2) and Fig 3 Pump (ACDC) (Sheet 2 of 2)

**Note**

Both methods are used in this specification.

## 2.3 Location drawings

The location drawing normally appears in the upper left corner of the illustration. It shows the position of the assembly relative to the vehicle/equipment/assembly and represents the view most favorable for the illustration. In the case of airframes and engines, this can be supplemented by adding stations (STA), zones (Z), or frame (FR) areas.

The part to be pointed out in a location illustration or photograph can be identified by darkening the outlines, blackening or standard blue or using tints. Location illustrations are not required where the illustrated system or assembly can be positively located. Refer to [Fig 2](#).

If a detail part can be properly identified in an overall view, the illustration of the part does not need to be exploded. Refer to [Chap 3.9.2.1](#).

Examples are shown on [Fig 3](#), [Fig 4](#), [Fig 5](#), [Fig 7](#), [Fig 8](#) and in [Chap 3.9.2.1](#) and [Chap 3.9.2.3](#).

## 2.4 Illustration of views, details and sections

### 2.4.1 General

If a display of enlarged views, details, and sections is required, they must be located on the illustration in alphabetic order. It is preferable to start in the top right corner of the illustration with View A/Detail A/Section A-A (whichever applies) and proceed, if possible, in a clockwise mode locating as necessary.

Section cut-lines and section arrows must conform to the perspective of the view.

For location of hidden details not visible on main views, use broken locating arrows.

Use general symbols for presentation in accordance with [Chap 3.9.2.1](#).

Examples are shown on [Fig 3](#), [Fig 4](#), [Fig 5](#) and [Fig 7](#).

### 2.4.2 IPD illustrations

The allocation of the capital letter identifying the "assembled item" is necessary where the "assembled items" cannot be shown in the main illustration (either they have a single collective part number, and therefore attract an item number, or not).

A location drawing refers out by means of an arrowhead and capital letter to a detailed illustration of an assembly (refer to [Para 2.3](#)). This assembly also has its own part number and therefore an item number, both, the capital letter and the item number will appear as shown in [Chap 3.9.2.1](#).

If several separate detail part illustrations are necessary within the same figure, they must be initially identified on the first illustration sheet of the figure (ie in the main illustration). The detail part illustrations can then appear on additional illustration sheets, if necessary.

## **2.5 Identification of electrical and electronic components**

### **2.5.1 General**

If electrical or electronic components require identification by circuit reference designators, the designators must either be included in a legend and/or within the associated text, but not included within the illustration itself.

In the case of orthographic illustrations (eg, a printed-circuit board) item numbers applied within the boundary of the component or by leader lines can be used. Examples are shown in [Fig 6](#), [Fig 8](#) and [Fig 9](#).

### **2.5.2 IPD illustrations**

Electrical components in IPD illustrations must not be referred to in a legend or associated text. If annotations of the reference designators make an illustration difficult to read because of the congestion of annotations, an illustration must be repeated on several illustration sheets. Each sheet will identify a different range of the total number of components.

In an isometric view, the reference designator must be positioned near the item number of the relevant component.

If the illustrated size of components is insufficient for each to be annotated, the reference designators can be assigned to the components by the use of reference lines or by arranging them besides the component in such a way that their relationship to the component is clearly recognizable.

The use of reference designators does not replace the need for item numbers. Refer to [Fig 10](#).

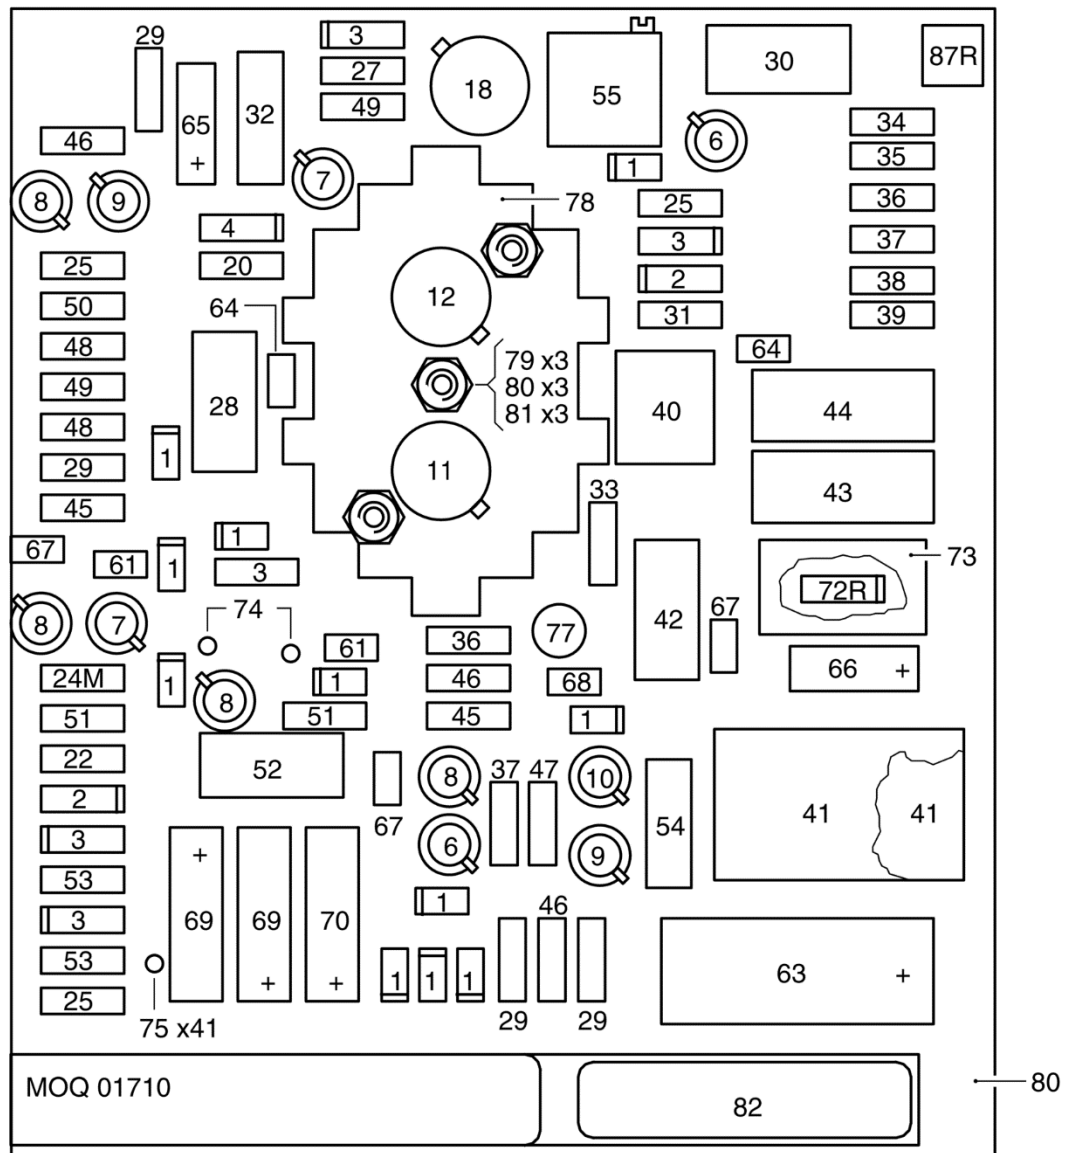

ICN-C0419-S1000D0343-001-01

Fig 9 Identification of components on simple circuit board - Example

Applicable to: All

S1000D-A-03-09-0202-00A-040A-A

Chap 3.9.2.2

Fig 10 Identification of components on complex circuit board using direct method - Example

ICN-C0419-S1000D0345-001-01

Fig 11 Reference designator and item number- IPD example

## 2.6 Mirrored items

Illustrate the Left Hand (LH)/Top (TOP)/Forward (FWD) part only. If item numbers of the part not shown are different, then they can be contained within brackets below or above the item number of the illustrated part. The leader line must go to the item number of the part which is illustrated.

A deviation from this rule is permitted if the mirrored parts differ in detail or if for evaluation, it is preferable to illustrate another part (eg, a right-hand part).

Appropriate references to the detail parts of a mirrored item, such as "LH only", "Right Hand (RH) only", "LH shown", "RH shown", can be included in the illustration. An example is given in [Fig 2](#).

## 2.7 Illustration of different configurations

Illustrated configuration deviations normally record the appropriate Usable on Code Assembly (UCA), or Usable on Code Equipment (UCE) next to the detail part concerned. Refer to [Fig 12](#) and also [S2000M](#).

ICN-C0419-S1000D0346-001-01

Fig 12 Different configurations - Example

## 2.8 Item tabulation

In cases where visually similar components appear at a number of different locations within one figure, it is permissible to illustrate them only once. The locations and the item numbers can be indicated by multiple indexing or tabulation on the illustration. Refer to [Chap 3.9.2.1](#).

## 2.9 Attaching parts (IPD illustrations)

If a number of identical attaching parts is used for a detail part or assembly, the installation locations of all attaching parts must be identified in accordance with [Para 2.3](#).

If the order of sequence of the attaching parts cannot be discerned from the illustration - but if it is absolutely necessary for comprehension - a breakdown example in the sequence of removal must be given.

Where identical attaching parts are fitted at several locations, but the orientation differs, the illustrations must be annotated to show the correct orientation at each fitment point.

Plate nuts must not be illustrated, but the bore must indicate their location and rivet holes on the respective component.

## 1 General

The electronic environment presents opportunities for the enhancement of graphical technical data by introducing color and photographic images. This chapter contains the required information and rules to produce and deliver color illustrations and photographic images to visually improve the users' interpretations of technical data.

## 2 Use of color and photographs

### 2.1 Rules and recommendations for color illustrations

The introduction of color has a profound effect in the way in which we can deliver technical information to the user. However, along with all the benefits it brings, caution must be used in the application of color in critical information situations. The following rules and recommendations must be used:

- In critical information situations, colors must be supported with another method of identification, distinctive symbols, markings, banding or wording. Refer to [Fig 7](#), [Fig 10](#) and [Chap 3.9.2.1](#).
- If color is used and assigned a unique meaning to perform a described procedure then no more than six colors must be used. More than six and the user will experience difficulty remembering the entire assigned color scheme and this is detrimental to carrying out the described task. However this does not mean that only six colors can be used in any one project, it means that careful consideration must be given when assigning specific colors and meaning to a task. Refer to [Table 2](#) and [Fig 1](#).
- The cultural color conventions must not be disobeyed, red is for danger, yellow for warning and green for safe or exit. Red and yellow must be reserved for alerts, warnings and selective highlighting. Refer to [Table 3](#).
- Color must be used consistently throughout an IETP and in printed material preserving conventional practices and arrangements
- Where color is used in unusual environments, (eg, artificial illumination, night vision goggles, red lighting and emergency situations) the ability to display correctly as intended or appear as designed in printed material must be ensured
- The implementation of color requires testing in the role in which it must be used and support in the environment in which it will operate. Consideration must be given to backgrounds used, or which colors are positioned next to each other. Colors will appear different, lighter or darker, because of effects on color hue.
- For aircrew publications, the illustrations must use the appropriate color if the use of color on the displays has a semantic meaning. Refer to [Fig 3](#).
- If appropriate, consideration must be given to the visual compatibility and color accuracy with operational equipment or controls with the color information contained in IETP illustrations

- If line drawings are produced from 3D engineering drawings, they are only modified to show important details more clearly. Different thickness of lines is not necessary in an IETP. The difference between the reference structure and callout parts must be presented by the different colors in the illustrations and defined in the project business rules.

### 2.1.1 Photographs

Photographs are still raster images, generated through one of the following methods:

- film or digital photography
- digital scanning
- nondestructive test methods
- computer generation

Photographs include photo-realistic computer generated images. Refer to [Fig 2](#), [Fig 3](#) and [Fig 4](#).

Photographs can be used equivalent to line art illustrations, if the creation is more economic and applicable for:

- aged illustrated parts documentation
- maintenance tasks of crowded compartments
- training documentation
- documentation of non-destructive test results

## 2.2 Use of color

The prime objective of this section is to define the use of color, ensure uniformity and to deliver color accuracy in displayed and printed technical publications. However, this section cannot define a "fits all" easy solution to color by assigning a unique or tight inflexible meaning to a whole spectrum of colors. This is unwise following careful research into color use and the resulting complexities of color behavior in unusual or special lighting environments.

Therefore with due consideration of too many factors, the following eleven color specification and guidance was produced. Refer to [Fig 1](#).

### 2.2.1 The S1000D standard color palette

[Table 2](#) gives the recommended S1000D standard color palette defined in Red/Green/Blue (RGB), Pantone and Cyan/Magenta/Yellow/Key (CMYK) values. The use of these colors is subject to the same guidelines and considerations as given in [Para 2.1](#).

Table 2 The S1000D standard color palette

Color	RGB value	Pantone value <sup>1</sup>	CMYK value <sup>1</sup>			
Red	R255	Red 032	C 0%	M 100%	Y 100%	K 0%
Yellow	R255 G255	Yellow	C 0%	M 0%	Y 100%	K 0%
Blue	B255	300	C 100%	M 43%	Y 0%	K 0%
Green	G255	375	C 43%	M 0%	Y 79%	K 0%
Orange <sup>2</sup>	R255 G102	1585	C 0%	M 60%	Y 94%	K 0%
Amber <sup>2</sup>	R255 G153	1385	C 0%	M 38%	Y 94%	K 0%
Cyan	G255 B255	304	C 31%	M 0%	Y 6%	K 0%
Magenta	R255 B255	238	C 18%	M 83%	Y 0%	K 0%
Light blue	R204 G255 B255	566	C 23%	M 0%	Y 10%	K 0%

Color	RGB value	Pantone value <sup>1</sup>	CMYK value <sup>1</sup>
Light yellow	R255 G255 B204	600	C 0% M 0% Y 20% K 0%
Light grey	R204 G204 B204	420	C 23% M 17% Y 17% K 0%

1 The Pantone and CMYK values are currently only a suggestion

2 It is recommended that orange and amber are not used together. In grayscale, amber appears as a darker grey than light blue or light grey. Refer to [Fig 7](#) and [Fig 10](#).

As appropriate, colors introduced into projects must be prepared according to the rules in [Para 2.2.2](#) and as detailed in the standard color palette detailed above in [Table 2](#). Refer also to the illustration examples shown in [Fig 5](#), [Fig 6](#) and [Fig 7](#). The use of this color palette can also be applied to legacy projects.

[Table 3](#) provides guidance for selecting colors.

		RGB			CMYK				Pantone
Magenta		255	0	255	18	83	0	0	238
Red		255	0	0	0	100	100	0	Red 032 or BS381C Number 537
Orange		255	102	0	0	60	94	0	1585 or BS381C Number 557
Amber		255	153	0	0	38	94	0	1385 or BS381C Number 568
Yellow		255	255	0	0	0	100	0	Yellow or BS381C Number 309
Green		0	255	0	43	0	79	0	375 or BS381C Number 262
Cyan		0	255	255	31	0	6	0	309
Blue		0	0	255	100	43	0	0	300 or BS381C Number 108
Light yellow		255	255	204	0	0	20	0	600
Light blue		204	255	255	23	0	10	0	566
Light grey		204	204	204	23	17	17	0	420 or BS381C Number 627

ICN-C0419-S1000D0347-001-01

Applicable to: All

S1000D-A-03-09-0203-00A-040A-A

Chap 3.9.2.3

### 2.2.2 The use of fill color to represent a hierarchy of structure

If fill color is used, it must represent the following hierarchy of structure. This means that colors used for an individual part will change between detail views, in accordance with its status within that view.

Refer to [Fig 6](#) and [Fig 7](#), where a part that is removed in a particular view will, along with its attaching parts, be light blue. Other parts within the main assembly can be removed in subsequent views and these will be highlighted in light grey.

Along with the appropriate navigational symbols, this will guide the user to the relevant detail view. In this view, the items to be removed and their attaching parts are now colored light blue. The original light blue assembly now represents background structure and is therefore shown in light yellow. This process can be repeated as necessary until the required stratum of information is attained.

If a project adopts hierarchical color representation for structure, then this process must be maintained throughout the life of that project.

*Table 3 Use of fill color*

Color	Used for
Red	The color red is used for critical alerts, emergency information, warnings (fuel, danger areas, conflict alert, compressed gas, locked or guard levers). Use this color sparingly. Refer to <a href="#">Para 2.1</a> and <a href="#">Fig 7</a> .
Yellow	The color yellow is used for warnings, cautions and emergency rescue points (emergency controls: yellow used with diagonal black bands).
Blue	The color blue is used for referencing, navigation and special symbols (associated system colors: Hydraulics, Hydraulic power). Refer to <a href="#">Fig 8</a> .
Green	Safe and Exit (associated system colors: Power plant, breathing oxygen)
Orange	The color orange is used for warnings and danger areas (associated system colors: Pneumatics, Electrical and lubrication)
Amber	The color amber is used for flight control warnings, cautions for heavy, hot, fragile items and tools. Amber is also used to indicate tools that must be removed before returning to service (associated system colors: Electrical power). Refer to <a href="#">Fig 7</a> .
Cyan	The color cyan is used for hidden lines (associated system colors: Flight controls)
Magenta	The color magenta is used to highlight parts or zones on the main locator view and frames sections. It is applied as line art, outlining the subject items using a 0,50 mm line weight. It is only used on the initial locator view as a starting point for subsequent navigation through a figure and frames sections (associated system colors: Oxygen). Refer to <a href="#">Fig 9</a> .
Light blue	The color light blue is used for all detail items and attaching parts and is applied as a fill to the relevant parts/area and represents the final stage of the navigation process where the parts is called out for identification or a removal/installation procedure. Refer to <a href="#">Fig 9</a> .
Light yellow	The color light yellow is used for all reference items and structure, locator views and peripheral information. It is applied as a "fill" to the relevant parts/area and is used to differentiate background information from detail. Refer to <a href="#">Fig 6</a> and <a href="#">Fig 9</a> .

Color	Used for
Light grey	The color light grey is used for main subjects on the locator view and on any intermediate sub-locator views. It is applied as a "fill" to the relevant parts/area that, combined with the relevant navigation symbols, guides the user to the appropriate detail views. Refer to <a href="#">Fig 6</a> and <a href="#">Fig 9</a> .
Black	The color black is used for all line art on detail parts and reference items, leader lines, hatching, dimensioning and text (in a hierarchical structure).

### 2.2.3 The use of color line art

The basic color for line art is black. A project can choose to use other line colors to represent things such as hidden lines, or objects that require attention. A project or an organization must define the semantics of the line colors and must use them consistently throughout the life of a project.

#### Business rule decision point BRDP-S1-00556 - Use color line art:

- Decide whether to allow the use of color line art.

### 2.2.4 The use of non-standard colors

The application of non-standard colors must be used in accordance with the rules given in [Para 2.1](#). Careful consideration must be given to maintaining sufficient color variance between details in multi-colored illustrations, wiring diagrams, maps and flow diagrams requiring an extended range of colors.

## 2.3 Use of photographs

Photographs and photo-realistic computer generated images can be used provided they meet all requirements given in [Chap 7.3.2](#) and the primary illustration rules given in [Chap 3.9.2](#). The following rules also apply:

- Text, annotations and symbology overlaid on photographs must be kept to a minimum and important consideration must be given to potential changes.
- If text is required to be within the photographic image, then it must be placed in a white box and existing illustration rules apply. Refer to examples in [Fig 2](#).
- Photo manipulation, highlighting and masking to show only the detail required or what is being described to the user can be used. The image must be prepared with its proportions constrained and present a view and scale that is most favorable for the user. Line illustration and color rules still apply.
- Hotspots can be used in photographic images to create links used to navigate within technical publications. This area can be activated by hyperlinks, refer to [Chap 3.9.2.2](#).

For the use of leader lines, refer to [Chap 3.9.2.2](#).

Careful consideration must also be given to the file sizes of photographic images within paper and IETP deliverables. If the final publication, including the photographic images, must be printed then the original images in question must be saved and stored in accordance with the industry standards. This ensures that a quality image is printed and delivered to the customer and also allows future manipulation and amendments to be easily made.

Photographic images used in the production of an IETP must also be maintained as stated above, however the final delivery to the customer is at screen resolution. For further guidance refer to the examples given in [Fig 2](#).

### 2.3.1 Embedding of color photographs or color line artwork

The location photograph example image (top left) is 276 kilobytes in size and displayed at 72 dots per inch (dpi). Refer to [Fig 2](#). The main image on the page is 546 kilobytes at 72 dpi and

both images are linked and not embedded in the original file to assist smoother and quicker handling. A design for print A4 version including both images at 300 dpi of [Fig 2](#) has a delivered file size of 20 megabytes.

## 2.4 Use of color in 3D content

The following applies and gives guidance in the use of color, control within a 3D multimedia scene or presentation. As the production of 3D content frequently consists of using engineering 3D models with close ties to the manufacturing process, source models may not be compliant or fully conform to the use of color in the IETP. The expense associated with re-coloring to conform to a projects business rules can be mitigated using techniques which assign consistent color schemes automatically to 3D objects. This problem exists throughout the life-cycle, whenever a product modification is implemented; it is therefore recommended that projects define a color scheme to be used across the whole program.

It is recommended that where applicable, the following rules are applied to all 3D objects and all color applied to their surfaces. These color rules are not applicable to video images of equipment or parts, however any superimposed items, such as highlighting or navigation symbols must be in accordance with these rules.

- projects or organizations need to agree on hardware, viewers, and devices displaying colored 3D objects
- each color device has a finite color capability. Therefore projects or organizations must consider both the capabilities of the hardware and software when implementing a color scheme.
- color must be used consistently throughout the 3D presentations
- for animated 2D color illustrations, the colors must be in accordance with the 2D color section of this chapter. Refer to [Para 2.2](#).
- color gamut differences must be tested within the project use environment
- red must be avoided unless it means danger. Any parts that would pose a danger or hazard to the user must be colored red, with the appropriate warning attached. Refer to [Para 2.2.2](#).
- amber must be avoided unless it means caution. Any parts that would cause a danger or hazard to the equipment must be colored amber, with the appropriate caution attached. Refer to [Para 2.2.2](#).
- for realistic rendered surfaces of equipment or parts, the color rules generally do not apply. All color applied to 3D objects must add value to the user's visual interpretation.

The 3D environment background color is a project or organization decision. However it is recommended that the chosen color is used consistently and be of a neutral light shade that does not interfere with the application of the above rules, default black or a gradient background.

If a project or an organization has a requirement to print a 3D scene then due consideration must be given to the choice of color and background when printing. For example, it can be expedient to turn off the background and switch the view to illustration mode to print.

### 2.4.1 Gradient background for 3D environment

Using gradient backgrounds in a 3D environment gives the advantage that the background color varies, which gives depth to the scene and helps illustrate opacity (colors, shadows, and highlights) in the 3D content. This gives the feeling of a much more realistic environment, since normal radiosity comes from the ground as well as the sky. Gradient backgrounds may also be used to give a situational feel to the 3D content, such as; sunrise, blue sky, or greenery on the ground, without the cost of building a 3D scene. Many 3D software packages have a built-in gradient backdrop option.

### 2.4.2 Color and lighting

Within a 3D environment, color is the visual interpretation of the various wavelengths of reflected or refracted light, and the color of an object is dependent on the position of that object

within a given light source. Refer to lighting in [Chap 3.9.2.5](#). Color can be precisely measured and accurately reproduced. However the type of light, its position in relationship to the object, and the reflective index of the surface material affect the final color. These variations must be controlled when using colored 3D objects and creating virtual environments. Readability, identifiable objects and clear user understanding of a single scene or sequences must not be lost because of poor color presentation.

#### **2.4.3 Color and critical information**

In critical information situations, colors can be supported with another method of identification; distinctive symbols, markings, banding or wording within the 3D content.

## 1 General

Multimedia objects and their presentation are used in support of technical textual data. They must be considered secondary and not used in place of verified text. All multimedia insertions must go through the formal S1000D verification process.

## 2 Rules and general practices

Refer to [Chap 6.3.1](#) for additional guidance when building project or organization requirements for the inclusion of multimedia objects in an IETP in accordance with the following principles:

- All multimedia objects must be developed and produced from a validated source of technical information. Individual multimedia objects must be validated before delivery in accordance with the project or organization business rules.
- Multimedia objects must be developed and produced for the chosen viewer or display platforms used.
- International copyright and intellectual property laws must not be infringed.
- Requirements for media element support, ie, plug-ins and viewers, must be defined in the project or organization specific rules for non-textual data.
- The original source data used to construct the multimedia and any native files must be maintained for reusability.
- An indication that the media is loading and its progress must be visible to the user.

It is also recommended that:

- all multimedia objects obey the color conventions. Refer to [Chap 3.9.2.3](#).
- consistency in the use of color be applied across a project or an organization
- all multimedia objects are built in individual parts. A portion of a media object that carries out a specific function (eg, sounds, images, action codes or video sections) can be used alone or combined with the other parts.
- embedded multimedia objects are designed to display within the main content area as described in [Chap 6.3.1](#). This chapter must also be applied to standalone full screen media objects.

### 2.1 Types of media

The range of media types considered suitable for incorporation into IETP systems includes:

- audio
- video
- animation
- 3D content

**2.1.1 Audio**

Audio can be a sound track, audible effect or a pure narrative that is heard to support, warn or clarify a procedure, diagnosis steps and/or actions. All three of these audio objects can be embedded or externally linked with displayed media.

The recommended uses of audio are:

- natural sounds to clarify the result of actions
- audio that will enhance video, adding information required in performing the displayed actions
- user controlled audio narration from validated technical documentation to enhance user understanding
- aural warnings and audible alarms heard such as, on the flight deck or procedural queue to an action.

**2.1.2 Video**

The term video in this case means real life moving images of equipment actions, procedural steps or a captured live event. These clips can include audio narration or a sound track. It is recommended that video objects are linked to and not embedded within other media objects.

The recommended uses of video are:

- real images to clarify a complex or rarely required maintenance procedure
- demonstrations
- embedded training
- presentations

**2.1.3 Animation**

Animation is a result of the change in an object's behavior within a 2D or 3D scene. This can be a result of user interaction or running a predetermined script. Animated 2D and 3D objects, where appropriate, must comply with [Chap 3.9.2](#).

**2.1.3.1 Object behavior**

Object behavior is defined as the set of functions, methods, or actions an object can perform. Changes in object behavior result from being called by a parameter, another media object or by being directly touched with the cursor. This can visually change the object's appearance in the user view context, animate the object or play other media objects. There are two types, dynamic and pre-scripted. These types of interactivity or actions can be handled by the application or the specified viewer. The following are examples of object behavior:

- Display a text string, screen tips.
- Display other menu options.
- Swap image or restore original image.
- Start and stop object animations.
- Play audio, beep or start or stop audio files.
- Control and perform object or media transitions.
- Using an object as the target of an action.
- Linking to frames, views or other objects.

**2.1.3.1.1 Dynamic behavior**

Dynamic behavior is when a user or other external data source provides input that will modify the course of events and change an object's behavior within a multimedia presentation sequence. Some examples are:

- the user-selected movement of media elements to clarify a complex disassembly or assembly procedure
- the assisted equipment or system navigation using multiple objects or active areas
- the movement around or positioning of equipment with hidden or difficult component views

- the life-like kinematic simulation of assemblies moving together based on user input
- the selection of one or more logical paths within the multimedia presentation by the user

#### 2.1.3.1.2 *Pre-scripted behavior*

Pre-scripted behavior is when a user offers no input to changes in object behavior within a multimedia presentation sequence. The behavior happens much like a movie. These are the visualization and interactive emulation of user equipment using pre-determined or animated illustrations. Some examples are:

- the movement of media elements to clarify a complex disassembly or assembly procedure (without user interaction)
- the illustration of equipment movement and linkage or electrical and liquid flow processes
- the demonstration of the principles of science and the states of transition
- the illustration of change over a timeline

The following rules and techniques are for the production of pre-scripted behaviors:

- Equipment visualization must be an accurate representation of user equipment.
- Views and scale must be typical and natural.
- Interactive actions and operation sequences must be logical and accurate.
- when audio objects are used for pre-scripted behaviors. Refer to [Para 2.2.](#)
- must be simple, built in a modular form and tested thoroughly before inclusion
- must correctly mimic the operational equipment

#### 2.1.4 **3D content**

Three-dimensional (3D) content is multimedia that presents the user with 3D views of the data, which can include animation. Refer to [Chap 3.9.2.5.](#)

## 2.2 **Producing audio**

The following rules and techniques are for the production of sound tracks, audible effects and audio narration.

The following basic set of rules is common for all three cases but specific rules apply:

- International copyright and intellectual property laws must not be infringed on sound tracks or audio effects, or use copyright free where possible.
- Users must be made aware that audible warnings are contained within media projects.
- Single audio tracks or multi tracked sounds must be preserved in their native form and remain separated from visual media.
- Master recordings must be managed in accordance with [Para 2.2.2.](#)
- Media projects must determine whether a sound is internally placed or linked for final delivery. It is recommended that small audio files frequently recurring are handled internally, example beeps or clicks; larger sound tracks or short voice instructions are linked and placed externally. Each method has advantages for different situations and requires testing before the final build and delivery.
- All voice-overs and emulated warnings must maintain accurate diction and natural recognition during loading and streaming. Voice processing must be avoided.
- It is recommended that Simplified Technical English® ([ASD-STE100](#)) is used for all narrations or the appropriate technical language.
- Slang must not be used and strong dialects are to be avoided.
- Audio synchronizing with visual media must be automatic with cue points embedded corresponding with text or action being displayed.
- Audio production and technical capture settings must be noted and documented.
- The higher the sample rate of audio the better the quality and the lower the audio data noise.

### 2.2.1 Audio capture - Two channel or stereo

All recording must be made taking the modulation up to as near the operating level as possible, ie, zero = 0 dB (digital system) or zero volume unit meter, 100 % (on combined or analogue systems). This will avoid clipping/distortion (eg, sound too quiet or too loud). All subsequent audio editing or processing must be carried out on the system that preserves the quality set by the master recording with a production master being produced at the same quality as the master.

The peak program meter can be set for a particular arrangement, but must reflect a fully modulated recording, ie, modulation taken up to the full operating level of the sound equipment:

- Audio master voice recording must be recorded in an acoustically inert environment which causes little or no coloration to the narrator's voice and is sound proofed against extraneous noise.
- Steps must be taken to ensure sound purity, by using an appropriate microphone to suit the narrator's voice. It is vital that these constants are adhered to, so that retakes recorded at a later date will seamlessly match the master recording.
- Audio mastering minimum standard (origination) to be compatible with video standards or audio for CD disc. For video this must be recorded on a system (capture) capable of a sample rate of 48 kHz at 16 bit (dual channel).
- Mastering for CD music disc only must be carried out on a system recording at 44 kHz at 16 bit CD audio encoding file.
- Care must be taken at post production stage when using both audio and video within the same project. Different embedded sampling rates may not be compatible within certain applications.
- Changing from one sample rate to another must be avoided as this needs to be carried out via a process that will anti-alias the sound, and changing file formats causes problems of subtle distortion.
- It is recommended that all stages of the electronic equipment chain and media do not introduce more than 0,1 % total harmonic distortion, collectively.
- It is recommended that audio master recording editing objects for short voice instructions are prepared according to the business rules and to the multimedia example set.
- Archiving of master recording and publication module must be maintained and it is recommended that compression is applied to a copy of the publication module in accordance with the requirements of the project or the organization.
- Short audio compressed objects for short voice instructions must be prepared according to the project or organization business rules.
- The minimum compression rate with the appropriate encoding/codec for narrowband or broadband audio material must be used to maintain accurate diction and natural sound recognition. Refer to [Chap 7.3.3](#).
- It is recommended that a free or an open source codec is used.

### 2.2.2 Bandwidth

For minimum and maximum streaming bit rates for audio files hosted on a network refer to [Chap 7.3.3](#).

### 2.2.3 Audio required noise levels

Audio levels must be recorded (captured) at the maximum levels possible without being over-recorded (clipping). It is recommended to control set levels when recording multi-narrator sessions to stop peak overload on one voice which might result in under-recording others.

The maximum system noise within a master recording must be better than -65 dB and a post-production master a minimum of -60 dB to reduce "hissing".

Noise reduction system (Dolby) encoded information must not be included in the master recording, or any other media.

It is vital that all steps be taken to limit voice "messaging" and transient noises (door bang) to have as "soft an edge" as possible so that quantization noise is not a factor when subsequent compression is applied, as this will result in distortion.

It is also important to minimize room acoustic from being recorded by using "close mic-ing" techniques, when not using sound booths, but by using this technique, all "wind pop" must be eliminated. "Close proximity bass effect" must be controlled, typically 12 dB/octave roll off at 80 Hz on the microphone or at the recording chain input.

All steps must be taken to minimize "noises off", background sounds on location, thus saving corrective editing.

General sound coloration must be controlled, for example, no sound like "it's coming up a drain". The use of lip microphones is only permitted in high ambient conditions and where it is part of the production.

## 2.3 Producing video

The following rules and techniques are for the production of video objects which also can include narration and or sound tracks. The following basic set of rules is common for both cases but specific rules apply.

To be effective, a video object for technical publications must be produced in accordance with the following principles:

- International copyright and intellectual property laws must not be infringed on sound tracks or audio effects.
- Lighting and picture quality must maintain natural color representation throughout the presentation.
- The use of artificial lighting in the production of video presentations must not, where color is of technical relevance, display incorrectly and its natural appearance must be ensured.
- The location and parts must be clearly identifiable to the user. If required for clarification, a location or positioning video image and/or direction indicators must be used.
- Video images must be prepared to represent the natural view and scale that is realistic to the user. Different angles or cut-away views must be explained to the user.
- Individual video objects must be produced in parallel with textual instruction to complement each other.
- Textual technical data is to be avoided and not embedded in video objects or referenced outside the file.
- Artistic fades, blends or graphical effects must be avoided unless they contribute to the technical content of the multimedia. Technical clips or training video productions must only use simple cuts, standard fades and basic blend.
- It is recommended that the use of freeze frames or mixing live actions with animated objects within video presentations is limited and only used to add visual clarity and value for the user.
- If suitable, a video object can serve more than one purpose (eg, assembly/dismantling).
- Captured images must be stable and free from rapid movements that may cause blurring of the image.

### 2.3.1 Video capture

It is recommended that a digital uncompressed video source is used and captured at the rates detailed in [Chap 7.3.3](#) and that audio to be two channels set to 48 kHz 16 bit fully modulated, with a compression ratio of no greater than 5:1.

### 2.3.2 Low bandwidth network streaming

For on-demand narrowband video streams, it is recommended that:

- the maximum bit rate defined in [Chap 7.3.3](#) is not exceeded
- higher bit rates are only used for two minutes or less video clips

- a 34 kbps stream as a minimum is used, which can include other streams up to the maximum bit rate if multi-bit rate streaming. The maximum bit rate must not be exceeded.

### 2.3.3 Broad bandwidth network streaming

The following restrictions are recommended for on-demand high bandwidth video streams:

- Maximum bit rate as defined in [Chap 7.3.3](#) is not exceeded.

### 2.3.4 Video picture output

A digital platform is recommended for the production master output, MiniDV - MPEG-2 MP@ML profile as minimum is required. Once mastered, a copy of the video can be compressed to the customer requirement, hence made ready for the appropriate network.

The following video output sizes are recommended:

- Individual video objects, steps or scenes do not exceed two minutes.
- Masters are produced at the highest possible resolution and quality to enable output appropriate to the delivery device and to support further editing or modification and eliminate the need for up-scaling, while future proofing for further delivery developments that permit higher resolution delivery.

It is recommended that all outputs be set to a variable bit rate and tailored to project delivery.

### 2.3.5 Controlling video objects

User control of interactive video objects can be achieved using the agreed media player or interface specified in the project or organization business rules.

## 2.4 Producing animation

The following rules and techniques are for the production of animated objects. Animation is the S1000D preferred option to deliver an extended range of multimedia objects to the user. User control of object behaviors must be achieved using the agreed media player or interface specified in the project or organization business rules.

Object behaviors in animations must be prepared in accordance with the business rules and the multimedia example set. To be effective, animations for technical publications must be produced in accordance with the recommended principles below:

- Color illustrated animated assembly sequences must comply with the agreed color convention. During animated sequences callouts must remain static and not interfere with the animated sequence.
- Common symbols, buttons, transitions and action scripts must be maintained in layers and stored in module form for reusability.
- Asset libraries must be used to assist global changes or updates.
- Shared object libraries must be used.
- Textual objects must be 12 pt with fonts embedded for better anti-aliasing.

## 2.5 Media labeling

Standalone media must be authored in accordance with the general rules for multimedia. Delivery must be in accordance with the rules for interchange. Any introductory details and naming convention requirements must be defined. Refer to [Chap 7.5.1](#).

Media labeling must:

- include a title, conventional naming, contact, authority, security caveat, expires date stamped
- include an introductory page to contain a description of the content
- have a table of contents that contains hypertext links to all references

- have permissions and releases for persons presented in media productions, in accordance with the applicable laws of the country or states in which the media was developed
- have any reusable objects defined with tailored metadata

The principles for creating a user interface are given in the following paragraphs.

### 2.5.1 User interface visual structure ("look and feel")

The following rules and techniques are for the production of a user interface, whether external to, or embedded within the IETP. The interface must be produced in accordance with [Chap 6.3.1](#), taking into account the items listed below. For information on viewer controls and controls within textual information, refer to [Chap 6.3.1](#). A user interface must:

- have OK or Start buttons as required
- use standard objects and icons
- have a clear start or user launched point for all media objects
- provide control within the media window or by external means
- have set screen sizes or frame sizes throughout
- have standardized navigational information (eg, the same order and the same position throughout)
- have consistent layout and structures (eg, in order of the basic functions or maintenance task (with no buttons))
- have consistent buttons with an alternative text tag
- have textual information or lettering that is minimum of 12 pt and is in accordance with [Chap 3.9.2.1](#)
- have descriptive alternative text for images (eg, ALT tags in web deliverables)
- use color and backgrounds in accordance with [Chap 3.9.2.3](#)
- have Exit, Stop and Pause buttons as required
- ensure that callouts, nomenclature, symbols, etc, remain readable during all animated sequences
- ensure that callouts, nomenclature, symbols, etc, appear in the last frame of the sequence to simplify locations and ensure legibility when content is rotated, moved, or the camera moved

### 2.5.2 Production guidelines

These guidelines will assist the multimedia designer to maintain a consistent user interface for data presentation. It is recommended that the designer adopt the following techniques:

- Automatic definition of the size and position of the windows.
- Use of a symbolic map to show "where you are" and the route taken.
- Provision of pictorial access (a graphical menu) to the product system structure and data.
- Ensure consistency in the use.
- Establish a consistent substructure or series of templates.
- Appropriate user interfaces and skill levels for users with creditable use cases and scenarios.

### 2.5.3 User interfaces

User interfaces must be appropriate to the scenario and the user's skill level.

All multimedia must incorporate methods of navigation, either within the multimedia, or as a viewer function. The nature and content of each application will dictate the navigation features provided. The project or the organization can choose to hide these controls in some scenarios. The basic (minimum) navigation functions are:

- Frame forward/backward.
- Start/Stop and Pause.
- Home, Quit or Exit and Menu.
- Volume controls - On/Off.

#### 2.5.4 Warnings and cautions

The presentation of warnings and cautions must conform to the general requirements as given in [Chap 6.2](#) and [Chap 6.3.1](#).

#### 2.6 Using color in multimedia

The rules and techniques for the use of color in all visual multimedia objects are detailed in [Chap 3.9.2.3](#).

#### 2.7 Using multimedia for navigation

The following rules and techniques are for the production of parameters, scripted actions and object behavior within media presentations. This paragraph must be used in conjunction with [Chap 3.9.5.2.1.8](#), [Chap 6.3.1](#) and [Chap 7.3.3](#) to build project or organization requirements for image or object driven navigation of content, or actions within multimedia presentations.

##### 2.7.1 Using parameters

Within multimedia, the element `<parameter>` is used to fulfil a similar function to that of the element `<hotspot>` within a graphic. The element `<parameter>` can be used to control the behavior of objects that may or may not be displayed on the screen. For example, it is not possible to use hotspots to control a sound file, which obviously does not appear on the screen. A hotspot is, by definition, a sensitive area on the screen, and whereas the element `<parameter>` can be utilized to use sensitive areas, it can also be used for other purposes such as changing views, running sequences, and controlling object behaviors. For further guidance on the use of the element `<parameter>`, refer to [Chap 3.9.5.2.1.8](#).

##### 2.7.2 Scripted actions

Scripted actions add interactivity to multimedia presentations. They are generated and embedded by the production application and used by the specified viewer. The uses of these scripts are essential and control a media object in response to specified user situations or interactive conditions. Scripted actions can generate or control object behavior as described in [Para 2.7.3](#). They must be simple, built in a modular form and tested thoroughly before inclusion.

##### 2.7.3 Object behavior

Object behavior is a result of a call from another media object or being directly touched with the cursor. This can visually change the object's appearance in the user view context, animate the object or play other media objects. These types of interactivity or actions can be handled by the application or specified viewer. The following object behaviors are allowed:

- Display a text string, screen tips.
- Display other menu options.
- Swap image or restore original image.
- Start and stop object animations.
- Play audio, beep or start or stop audio files.
- Control and perform object or media transitions.
- Using an object as the target of an action.
- Linking to frames, views or other objects.

## 1 General

Basic requirements for the use and production of interactive three-dimensional (3D) technical content are given here. Multimedia elements and presentations produced in accordance with this chapter can be used in support of textual technical data.

### 1.1 Purpose

The specification does not impose or recommend any specific data format for 3D. The purpose of this chapter is to deliver advice on the use of 3D technical publications. Projects must define the technical solution for 3D and any associated processes, taking into account that these will have to be maintained throughout the life-cycle of the Product. This chapter is to be used in conjunction with [Chap 3.9.2.3](#), [Chap 3.9.2.4](#), [Chap 3.9.5.2.1.8](#), [Chap 6.3.1](#) and [Chap 7.3.3](#) to formulate project requirements for inclusion of 3D content into an IETP. The basic principles are:

- 3D content must be developed and produced from source information that reflects the equipment build standard.
- The production and delivery processes must be in accordance with the business rules.
- 3D content must be developed and produced to function on the specific viewer or display platforms (eg, embedded equipment display system used on the project).
- The presentation and interaction of 2D and 3D is allowed.
- The requirements for media element support and viewers must be defined in the project specific rules for non-textual data.
- Color in 3D data must be in accordance with the rules described in [Chap 3.9.2.3](#).

## 2 3D content

3D content is defined as 3D data generated from validated 3D models. The content is considered interactive when a user is allowed controlled movements, and/or changing one or more of the viewing parameters (eg, scale/rotate and the control of levels of detail). Projects are advised that 3D data, which can include all the viewable detail, can be tailored to the project requirements and/or the environment in which it is used. 3D content can contain Product manufacturing information associated with the 3D geometry, and Product structure that defines the relationship of individual 3D objects. (eg, textual information, part numbers and clickable events).

The recommended use of 3D content is:

- to provide the user a richer sense of the relationships of assembled parts to one another
- to enable the movement or positioning of equipment to show hidden or difficult component views
- to enable partial viewing of a large assembly

## 2.1 Rules and general practices

This chapter is to be used in conjunction with [Chap 3.9.2.4](#) and [Chap 6.3.1](#) to build project requirements for the inclusion of interactive 3D content in an IETP and in accordance with the principles below:

- All interactive 3D content or technical media must be developed and produced from a validated source of technical information. The production and delivery processes must be validated in accordance with the project rules.
- All interactive 3D content must be developed and produced for the chosen project viewer or display platforms used.
- The requirements for media element support and viewers must be defined in the project specific rules for non-textual data.
- All interactive 3D content must obey color conventions in accordance with [Chap 3.9.2.3](#).
- All interactive 3D content or technical media must be produced in accordance with the multimedia example set.

## 3 Production of 3D content

Specialized authoring software is necessary for 3D content production. Its primary function is to produce 3D content in accordance with the project business rules. It is anticipated that most projects will use such software to transform original CAD and PLM data, and add information to 3D content.

The consistency of production and viewing specifications is paramount. Production of 3D content has to ensure that the content will contain the information needed to implement the project requirements for end user viewing. While the choice of an end user viewer is formally an IETP issue, it is driven by the end user functions requirement and the chosen 3D format. It must be noted that 3D content can contain more information than is actually delivered to the end user. For example, PLM information or attributes that exist in source data cannot be displayable with the chosen viewing software, but must be retained in the 3D data for future use.

The data format defined for delivery to the CSDB is not necessarily the data format used for end user display. The 3D data can be converted to the required format during the publishing process, however it must be noted that these conversions might remove advanced functionalities, and can unintentionally modify the intent of the author. It therefore follows that the choice of 3D format limits, and in some cases defines, the choice for authoring and end user viewing software.

### 3.1 Technical solution

S1000D does not recommend any specific technical solution, however it does advise that the chosen technical solution is defined in the project business rules. It is the project's responsibility to define the technical solution. A technical solution is the association of:

- 3D format or formats, which will be supported by the project's IETP and other systems
- a precise technical specification of the requirements for 3D objects to be delivered to the CSDB
- 3D objects delivered to the CSDB, to be compliant with the project's allowed formats
- the specification of end user functions, to be implemented by the viewing software (3D viewer)
- the publishing process

When taking into account the entire lifecycle of 3D data, the choice of the supported format, or formats, is the most important decision regarding 3D implementation. It is recommended that the project makes the choice and documents the complete technical solution, as well as deciding on the IETP viewing software, before commencing production of any 3D content. The main criteria which must be taken into account when making this choice are:

- long-term support of the data format, authoring and viewing software
- compatibility with the PLM and CAD used in the project
- compatibility with expected viewing resources on the end user client side
- update and configuration management methodology

### 3.2 3D scene

The production of 3D content creates 3D multimedia objects, which must be compliant with the project's allowed formats. A 3D multimedia object represents a 3D scene, as defined formally in most 3D graphic libraries and software. A 3D scene is primarily defined as a set of 3D objects. Each 3D scene must also contain a set of observational conditions, such as viewpoint and lighting conditions, although observational conditions might be modified by the user using the viewer capabilities. This set of observational conditions must contain at least the initial condition which will be used for the initial display of the scene to ensure the correct display of the scene, and to ensure the delivery of any mandatory information to the user. The 3D scene can also include complementary information, dependent on the 3D format specifications:

- viewpoints
- lights
- alternative positions
- movement path
- kinematics
- animations
- etc

### 3.3 Implementation

Currently, 3D is delivered in the same manner as 2D (ie, using a single file for each use instance). Future developments might address the issue of providing parts geometry across multiple use instances. Projects are advised to consider this when developing the project's multimedia solution, particularly when looking at web delivery.

There are two major steps in 3D production. The first step is gathering or making available the 3D elements with their geometry and attributes, the subset of the Product to be displayed, in general an assembly of parts. This is done by an extraction of the 3D data, CAD or digital mockup, and if required, tooling can be added. The second step is creating the 3D scene (eg, a view that the user will actually see) that is the initial and alternative observation conditions such as viewpoint, field of view, and lighting. It includes static information such as the position of parts, dynamic information or scenario, such as part animation (path, visibility, transparency, etc) and includes any object behavior. This data can usually be modified by the end user using viewer capabilities, which provide control of the basic 3D functions.

It is recommended that existing 3D source data be used to generate 3D content. The content must be visually representative in scale to other visible objects, yet not necessarily dimensionally accurate to manufacturing specifications. The following rules apply:

- Textual information and callouts in a 3D environment must remain horizontal and facing the user.
- Animated removal or tool actions must appear realistic when viewed by the user.
- Animated moving parts or actions that represent a danger and/or hazard to the maintainer must display warnings and cautions in accordance with [Chap 6.3.1](#). Textual data can also be used to warn the user.

- Projects must agree to the levels of detail and accuracy of the 3D content, bearing in mind copyright and intellectual property right issues.
- Considerations must be given to the consistency of the behavior of any parts removed.

### 3.4 Detail in 3D content

The level of detail used on 3D object surfaces must be measured, simple and relevant to the amount of information that the end user requires. 3D objects must be clearly presented to the user while omitting unnecessary detail. The inclusion of unnecessary 3D objects and higher than necessary levels of details on objects must be avoided, while striking a balance with the effort and cost of removing the detail. Examples of this include 3D objects such as standard rivets, the number of screw threads, or their head style, which might be omitted, or limited and only used to add visual clarity.

### 3.5 Lifecycle of 3D data

3D data is the basis of modern engineering and manufacturing, therefore the integration of CAD or digital mockup data into the technical publications process as 3D content is essential. This integration means that the data will influence the process of 3D content creation throughout the lifecycle of technical publications. Basic or raw 3D data objects are generally not sufficient for use in technical publications and will usually require automated and/or manual transformations.

Further to this, the update from source data to existing content cannot always be fully automated. Manual rework of content during updates can seldom be avoided. For example, if a locator has been added to the 3D content, or a color scheme has been applied to the content, this will invariably be lost during any automated update process.

It is recommended that projects clearly define usage and delivery, and control the creation process and all transformation processes. Regular verification of these processes must be conducted to ensure that 3D data remains valid throughout the lifecycle of the Product.

Projects and organizations must be aware of the differences between the as designed, as built, and as maintained data to ensure that processes are clearly defined for timely and accurate configuration control of both the source data and the 3D content. It is therefore essential that business rules are put in place prior to the commencement of any project to cover both the automated and manual processes.

## 4 Reference structure and assembly tree

Reference information and callouts in 3D can be used to provide the user context as to location and position of the presentation subject. The use of locators, reference structure, highlights and transparency of objects can also be used to provide context.

### 4.1 Locators

3D globally changes the viewing paradigm and offers new capabilities and viewing functionalities, which enable the user to understand easily the location of the 3D content within the equipment or system. Locators can be used to inform the user of the location of the 3D content within the equipment or system and can also be used to show the view or location when navigating that content. Projects must decide on the use and style of locators.

Locators can be provided, in association with a 3D content, to inform the user of content location, even when 3D functions are not available, for example, when users print the documentation.

3D locators are typically smaller, simplified, separate views than that of the 3D content, designed to show the location of the 3D content in relation to its higher assemblies. 3D locator views are solely for the purpose of orienting the user and must rotate with the view where the viewer supports that function.

## 4.2 Reference structure

A reference structure can be utilized to give context to the location of the presentation, but only those items that are necessary to give context and/or location are required. Reference structure is secondary information to that of the 3D content within the 3D scene. It is not usually shown in its entirety and is less detailed. Reference structure is the “surrounding” information and is designed to show the access and detailed location of the 3D content in relation to its higher assemblies.

## 4.3 Assembly tree

Assembly trees can be utilized to navigate the 3D content and give context to an assembly or parts location within the content. The tree can also be used to toggle visibility and highlight specific parts and assemblies, zoom to a part and provide information about the model. The attributes attached to each node can be utilized, to better define the parts (ie, number of children, part number, name, bill of materials ID, etc) and/or provide a source or target for hyperlinks.

# 5 Rendering

Rendering is the process of applying surface textures and lighting effects to the 3D content. It is important that the graphics card used by the project's hardware supports the display rendering technologies that the project's chosen software might use. All project requirements for functional controls including rendering, viewing, lighting and transparency need to be supported by the viewer software. It is therefore important that projects consider the hardware and software before implementing the use of any 3D content.

## 5.1 Rendering principles

The realism of a 3D scene depends on the lighting, shading and texturing of the 3D content's rendering software. The basic functions of lighting and shading as implemented in currently available rendering software are generally well suited for technical publication purposes. The core functions, such as geometric transformations and pixel computation, are implemented using specific hardware and the graphic card of the computer. It also enables polygon based rendering software to provide a high performance display on standard computers, even for complex scenes.

Lighting functions simulate different types of lights:

- Ambient light has no position or direction. It illuminates equally on all the surfaces, regardless of orientation.
- Directional light represents positioned light sources. Each light source illuminates each point of a surface taking into account the relative direction of incident lighting and the vector normal to the surface at the considered point. Multiples and different light sources can be present in the 3D scene.
- Emissive lighting is light associated to the object. It enables the simulation of glowing objects, but is seldom used.

Lighting data including light sources and their properties are associated to the scene as viewpoint default values, and are always provided to ensure the scene will be displayed correctly. In most viewers, lighting data can be changed by the end user from the menus provided. Projects must decide if this feature is available to users in individual scenarios, however to achieve this, the viewer must support the displaying and hiding of menus.

Projects can add additional lights to the 3D content file in object-based viewing software, however to guarantee consistency of lighting and shadow, it is recommended that the software's own standard lighting is used. Display performance will be affected with the introduction of user controlled lighting options. Therefore it is recommended to avoid this. To support or assist in low lighting, at night, or very bright environments, control of the lighting scheme can be used.

## 5.2 Visual attributes of the objects

The properties of objects are defined during the authoring of 3D content. Usually these properties cannot be changed by the end user of technical publications. The main considerations for lighting on 3D surfaces are how much light is reflected or absorbed. Shading defines how light is reflected by the object surface, while surface color, texture, diffusion, specularity and glossiness are all important factors. Flat shading applies a constant color to each polygon, while smooth shading interpolates illumination variations. This enables representation of smooth surfaces with a limited number of polygons. If a project uses realistic photorealism object surface rendering, then the lighting scheme must maintain readability within the scene and throughout all sequences.

For a higher level of realism, specific properties of a material can be simulated by using specific algorithms. Examples of these include diffuse reflection, specular reflection for shiny surfaces, light emission, or transparency.

## 5.3 Realistic mapping, texture and materials

Texture mapping allows the possibility of increasing the realism of a 3D scene. This technique applies images on polygons, providing a much higher level of detail, without requiring more processing resources for geometric computation. This will, however, require more resources for pixel computation (shading). If an even higher level of realism is required, specific rendering software can be used. If texture maps are applied, it is recommended to use formats that create the smallest file size.

Software providing extremely good levels of realism is now widely available. Projects must be aware that high rendering functions use more sophisticated algorithms, data structure, and computing resources on the client side. Therefore this level of requirement is not recommended for technical publications. It can slow down the viewer performance and increase download times, and must therefore be used sparingly, especially if the product is a web deliverable. Projects must therefore exercise care when choosing a viewer as many file formats support only standard and multi/sub-object materials. With regard to the treatment of object surfaces, only the following are to be controllable:

- diffuse, ambient, and specular lighting
- one texture map per object, which must be in the diffuse channel
- transparency
- reflectiveness, but not reflectiveness strength

The project must ensure that all delivered lighting types are supported by the viewing software.

## 5.4 Transparency

Transparency is a basic rendering function, supported by almost all 3D formats and associated viewers. In terms of 3D content production it is a specific visual attribute of the material. Its usage provides realism of rendering of objects which are actually transparent.

Transparency can also be used dynamically during viewing. The viewer has the capability to change the transparency of objects in the scene on given criteria, for example, to provide to the user a view of the context of the presentation subject. This usage of transparency and its specifications is a viewer issue and does not impact on production.

Transparent objects can be selected by the user or during an animated presentation, only if required. Semi-transparent objects are also allowed and are used in the same way. Levels of invisibility, transparency and applied color must be tested especially when being displayed in unusual environments. Examples of this include artificial illumination, views through night vision goggles, under red lighting, and/or other emergency lighting and shadow situations.

## 6 3D environments

For consistency, it is recommended that projects specify how equipment, assemblies and parts are arranged in the following environments:

- training
- maintenance
- parts
- operator support

Parts and assemblies relevant to a particular equipment configuration or procedural steps must be identified and associated within the current definition of the equipment configuration. The use case and quality of the project's 3D data, along with the tools used, will ultimately determine the level of detail and how the 3D content is presented in each hardware and software environment.

## 7 Defined view modes

Control of camera positions on objects, predefined user views and representation of geometry are the key to adding value to any 3D content. Rules and guidance on these topics is given here. To ensure consistency of presentations, projects must agree on standard levels of object detail and representation (eg, opaque, semi-transparent, surface mapping, etc). The initial type of view mode used must be appropriate to the task requirement and the user's visual needs. The type of view selected and the navigation aids must be clearly displayed within the project's viewer.

The views defined below set the minimum requirements detailing the initial camera position(s) and angle(s), clipping distance, and the representation of objects. The selection by the user highlighting a part, parts or assembly within a tree structure or in the viewing screen must enable the selected objects to be used as a reference point for view transformations. Views must reflect the intended view of the author and be appropriate to the task being presented.

### 7.1 Standard views

The following standard views are recommended to assist navigation and equipment orientation:

- isometric
- front
- back
- top
- left
- right

The default standard representation of the 3D objects must be appropriate to the environment it is displayed in, and must be defined in the project business rules. Other standard viewing functionality which can be applied by a project includes:

- the ability to fit selected equipment into the viewing screen
- the ability to reset the view, thus enabling the user to re-orientate and return to the original view or initial presentation of the selected objects or parts

#### 7.1.1 Isometric view

This is the preferred 3D content viewing method and must remain in the left, top and forward orientation, unless it is more beneficial to show from the user's point of view (access view) or otherwise determined by the project.

### 7.2 Access view

This is the initial view or normal object or equipment orientation to the user with a realistic viewpoint presented. This position must be the first camera position before commencing step

through procedures. Objects and parts must have solid surfaces and colored in accordance with [Chap 3.9.2.3](#). It is recommended that all equipment access points have predefined views.

### 7.3 Disassembly view

In 3D, new functions can be easily implemented, enabling the user to manipulate parts, but generally, these functions do not grant that disassembly order will be correct. Reference disassemblies have to be produced as needed to provide the user reliable information. Depending on functional capabilities of the technical solution, multiple disassembly views and disassembly animation can be provided for better understanding.

For each view, parts are moved manually, and relative positions of parts are stored in a specific data structure. Software functions which automate the disassembly can also be used, if the result is satisfactory.

Projects must consider print requirements when implementing IPD figures, and must ensure that an illustration view is available for printing.

## 8 Control of 3D behavior

While embedding 3D behavior in the 3D content does remove the requirement for external controlling scripts, the use of external scripts will facilitate reuse. Ultimately it is the used hardware and software that will determine the method of behavior control. Projects must therefore determine the functionality of the software and the use of behavior for the manipulation of parts and assemblies. Inclusion of 3D behavior gives projects greater latitude in developing object or frame based functionality within a presentation.

### 8.1 3D content control

All 3D content must incorporate methods of control. Project viewers will dictate the control features provided. Basic suggested functional controls are:

- step forward/backward
- start/stop and pause
- fit to screen
- reset global default viewing settings
- restart, quit or exit

Other examples of optional controls are:

- sequence rotation, automatically
- user controlled rotation or action
- auto repeat of rotations and/or sequences
- removal and parking of objects, while parts and assemblies must be identifiable and must have unique identification within the 3D environment
- introduction of object tools to demonstrate adjustment, disassembly and assembly of equipment parts
- additional information selection (optional)

### 8.2 Warnings and cautions

If warnings and cautions are required in 3D content they must conform to the requirements for presentation. Refer to [Chap 6.2](#) and [Chap 6.3.1](#). Warnings and cautions used and appearing in or with 3D content must be displayed, but can be acknowledged by the user in accordance with project requirements. All warnings and cautions being displayed must appear clearly in the field of view of the user. It is recommended that warnings and cautions are addressable objects.

#### Note

Some 3D content and viewers might be unable to support the acknowledgment and display of warnings and cautions. Where this occurs, textual warnings and cautions must be used.

### 8.3 Navigation and linking

Navigation within 3D content can be achieved by creating sensitive objects or defined shapes using a series of nodes or addressable groups.

Specific shapes, objects or parts build inline within an equipment structure can be addressed and given a link to navigate. Sensitive specific shapes, objects or parts can also be used to control animated step procedures or predetermined movement within technical publications.

These objects can be activated by hyperlinks from:

- text in a data module to one area of an object
- text in a data module to several areas of an object
- one area of an object to the data module text
- one area of an object to another area of the same object
- one area or object of a multimedia scene to another object of a multimedia scene, data module, or any valid reference that can be in a data module
- one area or object to another object in the same multimedia scene

The sensitive area can be represented by:

- visible image region (or invisible before a cursor event)
- color objects used in accordance with [Chap 3.9.2.3](#)
- navigation symbols or callout numbers, can include the leader line
- buttons with or without text objects
- itemized objects or their surfaces

Sensitive areas can be turned on or off by changing the visibility of the sensitive area. For further information on the use of sensitive areas and for linking by using the element parameter and its attributes, refer to [Chap 3.9.5.2.1.8](#).

## 9 Textual information

Text can be used within the 3D viewer or window. Depending on the project requirements, examples of text within the 3D viewer or window are:

- text labels using text leaders
- mouseovers
- watermarks or background text
- text for information, instructions, warnings and cautions
- user inputted comments or notes

Text must be bill boarded (always facing the user), and the text size must remain constant whenever user zooms in or out of the 3D scene. The text leader line width must remain constant during the zooming process. Text must be a vector element, so that it will remain clear. The use of bitmaps for text is not recommended. Text must not overlap or cover up other text in the default view of 3D content, however, if a user rotates a 3D object, text can cover other text when the scene is being rotated or objects are moved, but must not cover other text when static.

It is recommended that text is not hard coded and is structured such that it can be externally updated, or database driven to support future updating. This also applies to text displayed as the result of mouseovers. It is recommended that projects consider allowing users to turn the display text on or off where it is practicable to do so, while also considering the use of mouseovers as substitute text labels when the text labels are turned off. Text labels can be displayed outside of the 3D viewer or window to supplement text labels or mouseovers within the 3D viewer or window.

---

Textual technical descriptions and procedures within the 3D content must be avoided and must be referenced from outside the 3D content via a sensitive object or shape. Any textual information included or referenced from outside the 3D content must remain in a facing plane.

## 1 General

In order to allow proper management of illustrations and multimedia objects in the CSDB there is a possibility to store and exchange metadata information about an ICN object, ie an illustration or a multimedia object, in an ICN metadata file.

The ICN metadata file is connected to its corresponding ICN object by the identity, which is derived from the ICN concerned.

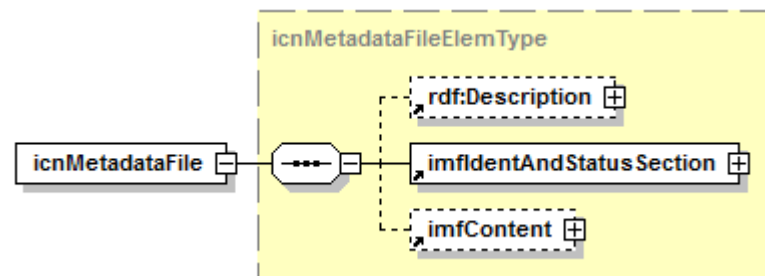

## 2 ICN metadata file

The ICN metadata file contains metadata related to an ICN object, ie, illustration or multimedia object. For information about coding of the file, refer to [Para 2.3](#)

**Description:** The element `<icnMetadataFile>` contains the whole ICN metadata file. The ICN metadata file is not a data module so it has its own definition. Like data modules, the ICN metadata file is split into two parts:

- the identification and status section
- the content

**Markup element:** `<icnMetadataFile>`

ICN-SYU52-AASER00010-001-01

Fig 1 Element `<icnMetadataFile>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<rdf:description>`
- `<imfIdentAndStatusSection>`. Refer to [Para 2.1](#).
- `<imfContent>`. Refer to [Para 2.2](#).

### 2.1 ICN metadata file identification and status section

**Description:** The element `<imfIdentAndStatusSection>` contains the identification elements of the ICN metadata file and its status information.

Markup element: `<imfIdentAndStatusSection>`

ICN-SYU52-AASER00011-001-01

Fig 2 Element `<imfIdentAndStatusSection>`

**Attributes:**

- None

**Child elements:**

- `<imfAddress>`. Refer to [Para 2.1.1](#).
- `<imfStatus>`. Refer to [Para 2.1.2](#).

## 2.1.1 ICN metadata file address

**Description:** The element `<imfAddress>` contains the information needed to identify the ICN metadata file.

Markup element: `<imfAddress>`

ICN-SYU52-AASER00012-001-01

Fig 3 Element `<imfAddress>`

**Attributes:**

- None

**Child elements:**

- `<imfIdent>`. Refer to [Para 2.1.1.1](#).
- `<imfAddressItems>`. Refer to [Para 2.1.1.3](#).

### 2.1.1.1 ICN metadata file identification

**Description:** The element `<imfIdent>` contains the unique identification of the ICN metadata file.

Markup element: `<imfIdent>`

ICN-SYU52-AASER00013-001-01

Fig 4 Element `<imfIdent>`

**Attributes:**

- None

**Child elements:**

- `<imfCode>`. Refer to [Para 2.1.1.2](#).
- `<issueInfo>`, the issue information of the ICN metadata file itself, which can differ from the issue number contained in the information control number of the multimedia or graphic object. Refer to [Chap 3.9.5.1](#).

2.1.1.2 ICN metadata file code

**Description:** The element `<imfCode>` contains the core items of the ICN metadata file identification.

Markup element: `<imfCode>`

**Attributes:**

- `imfIdentIcn` (M), the ICN of the multimedia object or graphic object to which the metadata apply, the prefix "ICN-" excluded.

**Child elements:**

- None

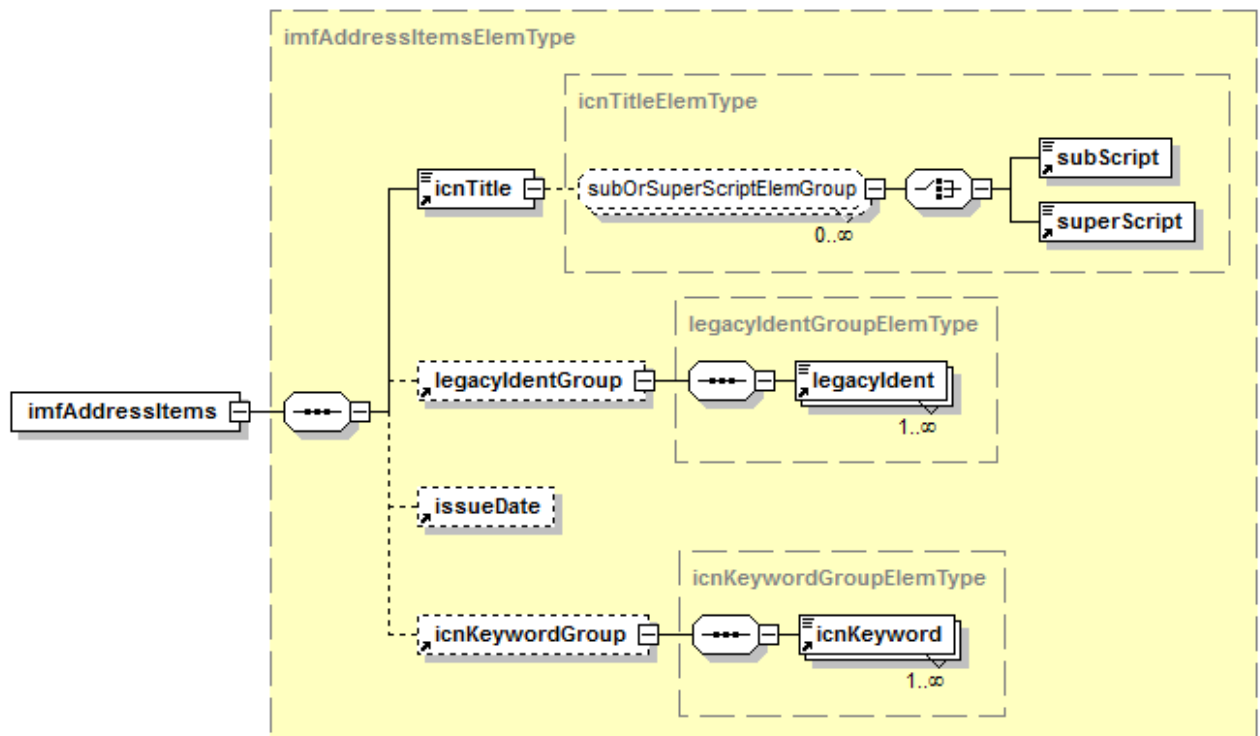

**Markup example:**

```
<imfCode imfIdentIcn="YY-Y-YYYYYY-Y-YYYYY-YYYYY-A-XXX-XX" />
```

2.1.1.3 ICN metadata file supplementary address items

**Description:** The element `<imfAddressItems>` contains information that is supplementary to the ICN metadata file identification, but not part of the unique identifier.

Markup element: `<imfAddressItems>`

ICN-SYU52-AASER00014-001-01

Fig 5 Element `<imfAddressItems>`

#### Attributes:

- None

#### Child elements:

- `<icnTitle>`. Refer to [Para 2.1.1.3.1](#).
- `<legacyIdentGroup>` Refer to [Para 2.1.1.3.2](#).
- `<issueDate>`. Refer to [Chap 3.9.5.1](#).
- `<icnKeywordGroup>` Refer to [Para 2.1.1.3.4](#).

#### 2.1.1.3.1 ICN title

**Description:** The element `<icnTitle>` contains the title of the ICN object to which the ICN metadata file is related. This title is a generic title of the ICN object aimed to support management of the object. It is not necessarily relevant in any specific context where the ICN object is used, such as in the element `<figure>`.

Markup element: `<icnTitle>`

#### Attributes:

- None

#### Child elements:

- `<subscript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superscript>`. Refer to [Chap 3.9.5.2.1.10](#).

## Business rule decision point BRDP-S1-00557 - Reuse of the generic ICN title in data modules

- Decide if the generic ICN title given in the ICN metadata file can be used to populate figure and multimedia titles in data modules.

### Markup example:

```
<icnTitle>Engine X<subScript>5</subScript></icnTitle>
```

#### 2.1.1.3.2 Legacy identifications of ICN

**Description:** The element `<legacyIdentGroup>` contains legacy identifications of the ICN when such exist.

**Markup element:** `<legacyIdentGroup>`

#### Attributes:

- None

#### Child elements:

- `<legacyIdent>`. Refer to [Para 2.1.1.3.3](#).

#### 2.1.1.3.3 Legacy ICN identification

**Description:** The element `<legacyIdent>` contains one legacy identity of the ICN.

**Markup element:** `<legacyIdent>`

#### Attributes:

- `legacyOrigin (O)`, an annotation indicating from where the legacy identification originates.

#### Child elements:

- None

### Markup example:

```
<legacyIdent legacyOrigin="ILLDB">Ill-2014-08-04_12345</legacyIdent>
```

#### 2.1.1.3.4 List of ICN keywords

**Description:** The element `<icnKeywordGroup>` contains one or several keywords that classify the ICN object in various respects. The keywords can be used for characterizing the ICN object in order to facilitate efficient searching for it in a CSDB.

**Markup element:** `<icnKeywordGroup>`

#### Child elements:

- `<icnKeyword>`. Refer to [Para 2.1.1.3.5](#).

#### 2.1.1.3.5 ICN keyword

**Description:** The element `<icnKeyword>` contains a single keyword that classifies the ICN object in various respects and can be used to find the object when it is stored in a repository of ICN objects.

**Markup element:** `<icnKeyword>`

**Attributes:**

- None

**Child elements:**

- None

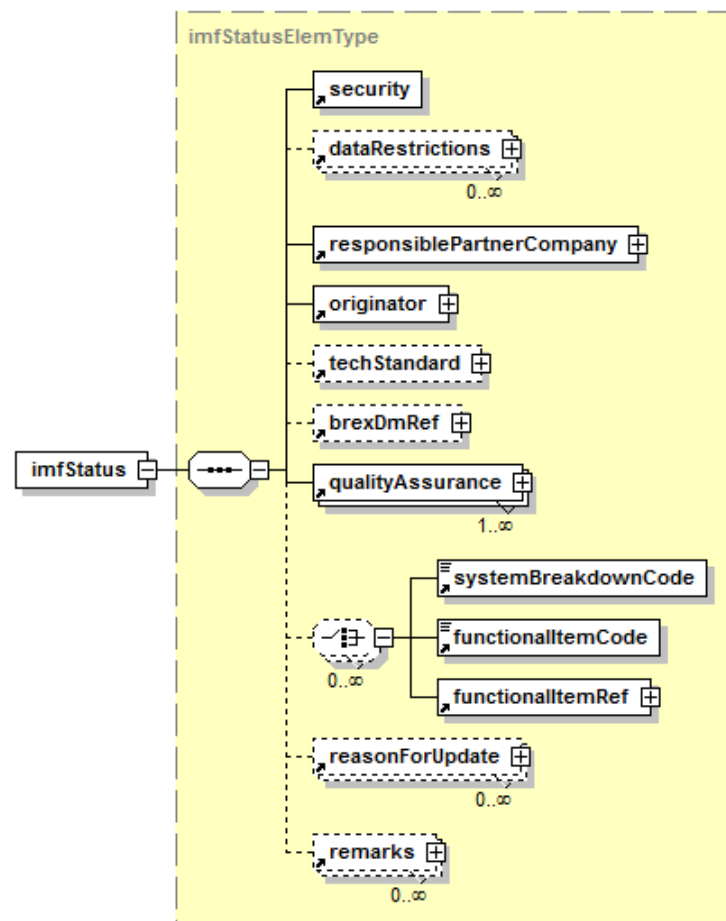

**Markup example:**

```
<icnKeywordGroup>
<icnKeyword>Hawk</icnKeyword>
<icnKeyword>Cockpit</icnKeyword>
</icnKeywordGroup>
```

### 2.1.2 ICN metadata file status section

**Description:** The element `<imfStatus>` contains the status information pertinent to the ICN object. It is understood that these metadata are similarly valid for the ICN metadata file. This implies, for example, that if an ICN object is classified, then the metadata contained in a corresponding ICN metadata file must also be regarded classified.

**Markup element:** `<imfStatus>`

ICN-SYU52-AASER00015-001-01

Fig 6 Element `<imfStatus>`

**Attributes:**

- None

**Child elements:**

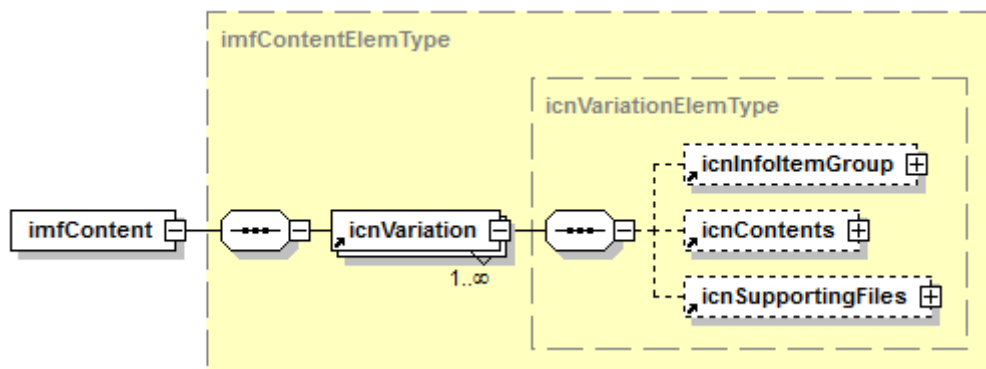

- `<security>`. Refer to [Chap 3.9.5.1](#).
- `<dataRestrictions>`. Refer to [Chap 3.9.5.1](#).
- `<responsiblePartnerCompany>`. Refer to [Chap 3.9.5.1](#).
- `<originator>`. Refer to [Chap 3.9.5.1](#).
- `<techStandard>`. Refer to [Chap 3.9.5.1](#).
- `<brexDmRef>`. Refer to [Chap 3.9.5.1](#).
- `<qualityAssurance>`. Refer to [Chap 3.9.5.1](#).
- `<systemBreakdownCode>`. Refer to [Chap 3.9.5.1](#).
- `<functionalItemCode>`. Refer to [Chap 3.9.5.1](#).
- `<functionalItemRef>`. Refer to [Chap 3.9.5.1](#).
- `<reasonForUpdate>`. Refer to [Chap 3.9.5.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

## 2.2 ICN metadata file content

**Description:** The element `<imfContent>` contains the metadata supporting invocation and use of the ICN object in various contexts.

One and the same ICN object can exist in different formats/notations, usually because different presentation media raise different requirements. This can be reflected by use of several occurrences of the child element.

**Markup element:** `<imfContent>`

ICN-SYU52-AASER00016-001-01

Fig 7 Element `<imfContent>`

**Attributes:**

- None

**Child elements:**

- `<icnVariation>`. Refer to [Para 2.2.1](#).

### 2.2.1 ICN metadata covering all applied formats

**Description:** The element `<icnVariation>` contains the metadata for one specific format/notation of an ICN object.

**Markup element:** `<icnVariation>`

**Attributes:**

- `fileExtension` (O), the file extension of the format/notation to which the contained set of metadata relates. If the attribute is not used, the metadata will be considered generally valid for the ICN file. Metadata given for a specific format/notation will override any corresponding generally given metadata. Refer to [Chap 4.8](#) for more details about formats/notations.

**Child elements:**

- `<icnInfoItemGroup>`. Refer to [Para 2.2.1.1](#).
- `<icnContents>`. Refer to [Para 2.2.1.2](#).
- `<icnSupportingFiles>`. Refer to [Para 2.2.1.3](#).

**Markup example:**

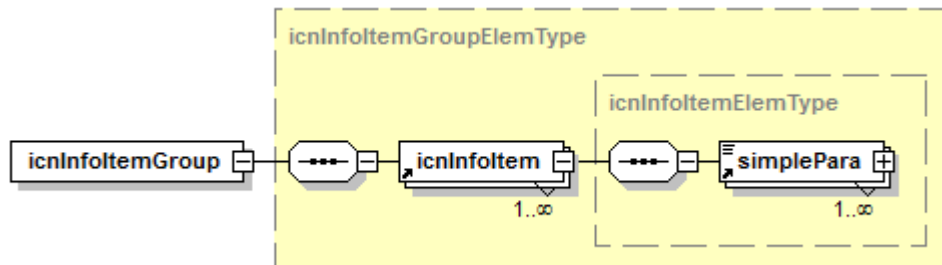

```
<imfContent>
<!-- Generally applicable metadata -->
<icnVariation>...</icnVariation>
<!-- Metadata only applicable to the tif variant -->
<icnVariation fileExtension="tif">...</icnVariation>
</imfContent>
```

#### 2.2.1.1

ICN metadata item information

**Description:** The element `<icnInfoItemGroup>` contains the various types of metadata items that are useful to identify and manage the ICN.

**Markup element:** `<icnInfoItemGroup>`

ICN-SYU52-AASER00017-001-01

Fig 8 Element `<icnInfoItemGroup>`

**Attributes:**

- None

**Child elements:**

`<icnInfoItem>`. Refer to [Para 2.2.1.1.1](#).

#### 2.2.1.1.1

ICN metadata item

**Description:** The element `<icnInfoItem>` contains one metadata item associated to the ICN.

**Markup element:** `<icnInfoItem>`

**Attributes:**

- `icnInfoItemType` (M), the type of metadata item that is contained in the element. The attribute can have one of the following values:
  - `"iiit01"` thru `"iiit99"`. Refer to [Chap 3.9.6.1](#).

**Child elements:**

<[simplePara](#)>. Refer to [Chap 3.9.5.2.1.10](#).

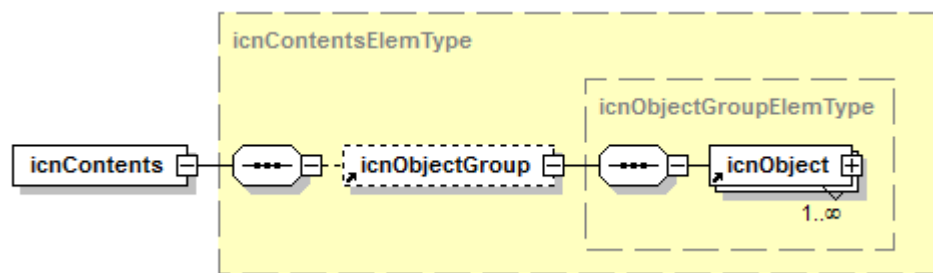

**Markup example:**

```
<icnInfoItem
icnInfoItemType="iiit02"><simplePara>100Mb</simplePara></icnInfoItem>
```

## 2.2.1.2 ICN object contents

**Description:** The element <[icnContents](#)> contains metadata related to the ICN object to enable it to be invoked and presented in a specific context (eg, in a data module).

**Markup element:** <[icnContents](#)>

ICN-SYU52-AASER00018-001-01

Fig 9 Element <[icnContent](#)>

**Attributes:**

- None

**Child elements:**

- <[icnObjectGroup](#)>, contains specification of identifiable objects within the content of a multimedia/graphics file. Refer to [Para 2.2.1.2.1](#).

## 2.2.1.2.1 Multimedia or graphics objects in the ICN file

**Description:** The element <[icnObjectGroup](#)> identifies the objects in the multimedia or graphics information as needed to achieve an intended interaction between the ICN file content and the XML in which it is invoked.

**Markup element:** <[icnObjectGroup](#)>

**Attributes:**

- None

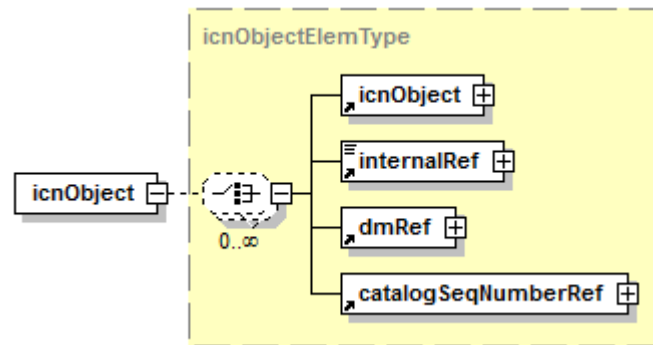

**Child elements:**

- <[icnObject](#)>, information about one specified object within a multimedia or graphic file. Refer to [Para 2.2.1.2.2](#).

### 2.2.1.2.2 ICN object description

**Description:** The element `<icnObject>` contains the description of one identifiable object in multimedia or graphics information. This description can be recursive, specifying that one object is hierarchically related to other objects.

**Markup element:** `<icnObject>`

ICN-SYU52-AASER00019-001-01

Fig 10 Element `<icnObject>`

#### Attributes:

- `id` (O), the identifier of the element `<icnObject>`. Refer to [Chap 3.9.5.2.1.2](#).
- `icnObjectIdent` (O), the identity by which the object is identified within the multimedia or graphics file.
- `icnObjectName` (O), the name that has been assigned to the object within the multimedia or graphics file.
- `icnObjectType` (O), can be used to assign a classification to the ICN object.
- `icnObjectTitle` (O), can be used to assign a title to the ICN object (eg, to be used as tool tip on mouse-over).
- `objectDescr` (O), can be used to provide description of the object (eg, indicating what it is and/or for what it is relevant, similar to how the attribute is used in a hotspot, refer to [Chap 3.9.5.2.1.8](#)).
- `objectCoordinates` (O), is used to hold the coordinates of a region in 2D defined by a closed polygon represented by a comma separated list of coordinates in the form "x1, y1, ..., xn, yn" where each (x,y)-pair defines a point of the closed polygon in absolute pixel coordinates. In 3D a solid is represented by a closed set of surfaces where each surface is defined by a closed polygon/region in 3D space, given in the form "x1, y1, z1,..., xn, yn, zn" where each (x,y,z)-triple defines a point of the closed polygon. All surfaces must be defined such that they share every boundary segment with one other surface.

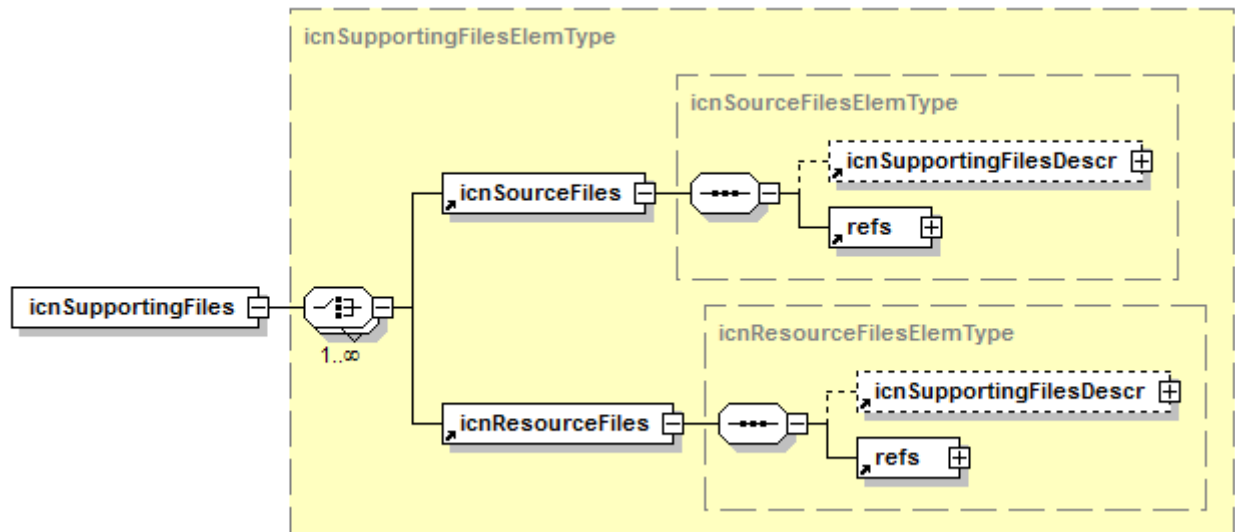

#### Child elements:

- `<icnObject>`, used to specify a hierarchy of objects contained in objects.
- `<internalRef>`, used to establish relations between different objects in an graphic object or multimedia object (eg, to allow that clicking one object will result in the referenced object to be highlighted or the current view to change). Refer to [Chap 3.9.5.2.1.2](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<catalogSeqNumberRef>`. Refer to [Chap 3.9.5.2.7](#).

### 2.2.1.3 Files supporting the ICN

**Description:** The element `<icnSupportingFiles>` enables source and/or resource files to be referenced and associated with the ICN when the ICN content is processed and/or presented.

Markup element: `<icnSupportingFiles>`

ICN-SYU52-AASER00020-001-01

Fig 11 Element `<icnSupportingFiles>`

**Attributes:**

- None

**Child elements:**

- `<icnSourceFiles>`, enables references to the additional resource files associated with the ICN, making it a complete unit.. Refer to [Para 2.2.1.3.1](#).
- `<icnResourceFiles>`, enables references to the additional source files associated with the ICN, making it a complete unit. Refer to [Para 2.2.1.3.2](#).

2.2.1.3.1 Associated source files

**Description:** This element `<icnSourceFiles>` enables additional source files associated with the ICN to be referenced, making it a complete unit.

Markup element: `<icnSourceFiles>`

**Attributes:**

- `icnSourceFileType` (M), the type of source files concerned. The attribute is project configurable. Refer to [Chap 3.9.6.1](#).

**Child elements:**

- `<icnSupportingFilesDescr>`, the description of the supporting files. Refer to [Para 2.2.1.3.3](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

2.2.1.3.2 Associated resource files

**Description:** The element `<icnResourceFiles>` enables associated resource files to be referenced when the ICN content is presented or used.

Markup element: `<icnResourceFiles>`

**Attributes:**

- `icnResourceFileType` (M), the type of resource files concerned. The attribute is project configurable. Refer to [Chap 3.9.6.1](#).

**Child elements:**

- `<icnSupportingFilesDescr>`, the description of the supporting files. Refer to [Para 2.2.1.3.3](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

### 2.2.1.3.3 Description of supporting files

**Description:** The element `<icnSupportingFilesDescr>` contains a description of a collection of files associated to an ICN.

**Markup element:** `<icnSupportingFilesDescr>`

ICN-SYU52-AASER00021-001-01

Fig 12 Element `<icnSupportingFilesDescr>`

**Attributes:**

- None

**Child elements:**

- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).

## 2.3 ICN metadata file coding

The ICN metadata file identification is derived from the corresponding ICN object identification. It also allows for its own revision marking, that does not necessarily have to be synchronous with the issue marking of the ICN object itself. Thus, the identity consists of:

- the prefix "IMF", followed by a hyphen
- the ICN, except the prefix "ICN-" and the extension annotation, followed by an underscore
- the issue number of the ICN metadata file, followed by a hyphen
- the inwork number of the ICN metadata file
- the extension code, ie, ".xml" since the metadata file is an xml file

**Examples:**

The ICN metadata file name for an object with the CAGE code based identity ICN-YYYYY-YYYYY-XXX-XX is:

- IMF-YYYYY-YYYYY-XXX-XX\_JJJ-WW.XML

where JJJ is the issue number of the file and WW is the inwork number.

Correspondingly, the ICN metadata file name for an object with the model identification based identity ICN-YY-Y-YYYYYY-Y-YYYYY-YYYYY-A-XXX-XX is:

- IMF-YY-Y-YYYYYY-Y-YYYYY-YYYYY-A-XXX-XX\_JJJ-WW.XML

## 1 General

Definitions and rules for warnings, cautions and notes are given here.

### 1.1 Warnings

Warnings are used in data modules and technical publications to alert the user that possible hazards are associated with the materials/processes/procedures/limits. These can cause death or injury in any form if the instructions in the operational or procedural task are not followed precisely. Warnings describe the hazards and the possible impact.

## 1.2 Cautions

Cautions are used in data modules and technical publications to alert the user that damage to the Product is possible if the instructions in the operational or procedural task are not followed precisely. Cautions describe the hazards and possible impact.

## 1.3 Notes

Notes are used in data modules and technical publications to provide the user with additional information, which is helpful but does not belong to the immediate subject. Operational and procedural tasks can be made easier by the use of notes, but when used, they do not take the place of operational or procedural information.

## 1.4 Safety conditions

Warnings and cautions that apply to the whole instruction must be contained or referenced in the Preliminary requirements - Safety conditions. Refer to [Chap 3.9.5.2.1.9](#).

Warnings must precede cautions, and cautions must precede notes.

## 1.5 General warnings, cautions and notes

Warnings, cautions and notes that apply to the Product or part thereof can be captured in descriptive data modules using the information code 012 (General warnings and cautions and related safety data).

## 1.6 Presentation

Examples of the presentation of warnings, cautions and notes are given in [Chap 6.2.2](#).

# 2 Content

Warnings and cautions can be located:

- in one or more separate descriptive data modules using the information code 012 in the data module code. Refer to [Para 1.5](#).
- in Preliminary requirements (element [<preliminaryRqmts>](#)) - Safety conditions (element [<reqSafety>](#)) of a procedural data module. Refer to [Para 1.4](#).
- within operational and maintenance procedures at the element level of a data module. Warnings and cautions must be placed directly preceding the paragraph to which they pertain.
- in an internal collection (within the data module using the element [<warningsAndCautions>](#)) or in an external collection (referring to a common information repository using the element [<warningsAndCautionsRef>](#)). Refer to [Para 2.4](#).

Notes can be placed either before or after the paragraph to which they pertain or in the Preliminary requirements - Safety conditions of a procedural data module. Refer to [Para 1.4](#).

### Business rule decision point BRDP-S1-00030 - Use of general warnings, cautions and notes as separate data modules:

- Decide whether to produce general warnings, cautions and notes in separate descriptive data modules.

### Business rule decision point BRDP-S1-00031 - Use of warning and/or caution collections:

- Decide whether to use warning and/or caution collections, internal or external.

## 2.1 Warnings

**Description:** The element [<warning>](#) is used to contain hazard information that can cause personal injury or death.

Warnings in data modules must always precede the text where the hazard arises (for details see below) and must always precede cautions and notes.

Warnings of a general nature which are applicable throughout a procedure can precede the instruction to save repeating the warning before each of the individual steps of the maintenance task where the hazard arises. Refer to [Para 2.1.2](#).

The default heading **WARNING** must begin the warning followed by symbols, if any. Refer to [Chap 6.2.2](#) for examples.

#### Note

The default heading **WARNING** is not entered in the data modules when data modules are written in an XML editor or a What You See Is What You Get (WYSIWYG)-editor with an automatic function for presentation of legends. If not, the author must make sure that the default heading is included.

Warnings must not be numbered. Warnings must be the first item within that step/para.

#### Note

There are two methods to present warnings. Refer to [Chap 6.2.2](#).

#### Note

Warnings must not be used for purely descriptive information (eg, data modules with information code 040). This does not prohibit the use of warnings in a descriptive data module for the production of content such as a summary of warnings.

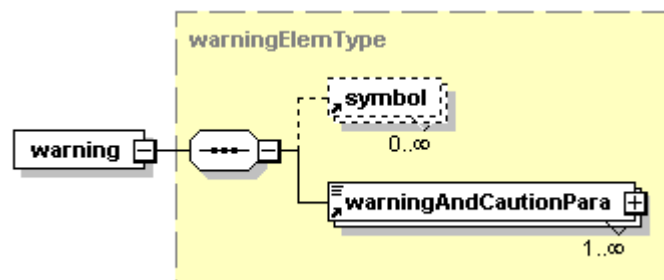

#### Note

Warnings in business rules document data modules are strongly discouraged. The attribute `brSeverityLevel` must be used instead.

The following rule must be followed:

- Warnings that pertain to parent elements are also applicable to all of their child elements.

**Markup element:** `<warning>`

ICN-S3627-S1000D0567-001-01

Fig 1 Element `<warning>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Note

The attribute `id` is required when authoring a warning and caution collection. Refer to [Para 2.4](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- warningType (O), the type of warning (eg, Electric shock, Chemical substance)
- internalRefId (O), the target id. Refer to [Chap 3.9.5.2.1.2](#).
- vitalWarningFlag (O), the indicator whether the warning is vital. The attribute vitalWarningFlag can have one of the following values:
  - "0" - a non-vital warning
  - "1" - a vital warning

#### Note

If the attribute vitalWarningFlag is used, the meaning of value "1" must be clearly stated. Compliance with country legislation and rules must be ensured.

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <symbol>. Refer to [Chap 3.9.5.2.1.10](#).
- <warningAndCautionPara> . Refer to [Para 2.1.2](#).

#### Business rule decision point BRDP-S1-00032 - Use of the attribute vitalWarningFlag:

- Decide whether and how to use the attribute vitalWarningFlag.

#### Business rule decision point BRDP-S1-00033 - Use of the attribute warningType:

- Decide whether and how to use the attribute warningType.

#### Markup example:

```
<warning>
<warningAndCautionPara>Do not ride with a cracked
stem.</warningAndCautionPara>
</warning>
```

### 2.1.1 Symbol

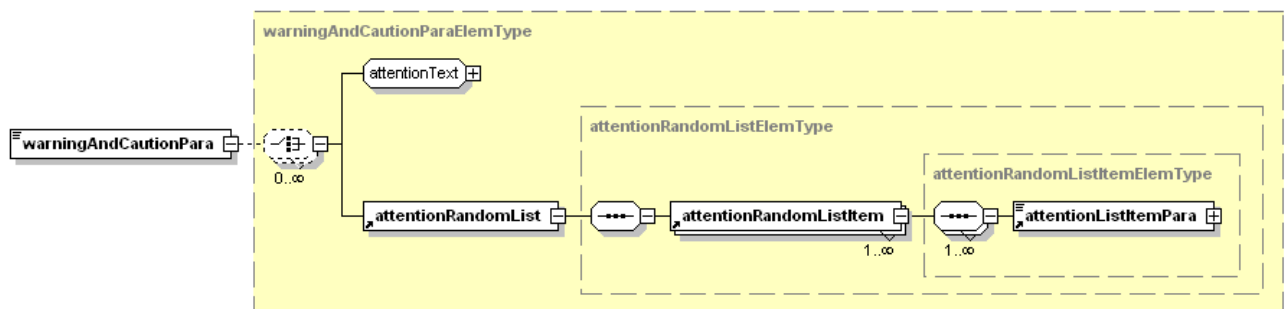

The element <symbol> must be populated in accordance with [Chap 3.9.5.2.1.10](#).

Warnings and cautions can be emphasized with one or more symbols using the element <symbol>. It is recommended to use International Organization for Standardization (ISO) pictograms.

### 2.1.2 Warning and caution para

**Description:** The element <warningAndCautionPara> contains the warning or caution text.

**Markup element:** <warningAndCautionPara>

ICN-S3627-S1000D0525-001-01

Fig 2 Element `<warningAndCautionPara>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Note

The attribute `id` is required when authoring a warning and caution collection. Refer to [Para 2.4](#).

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

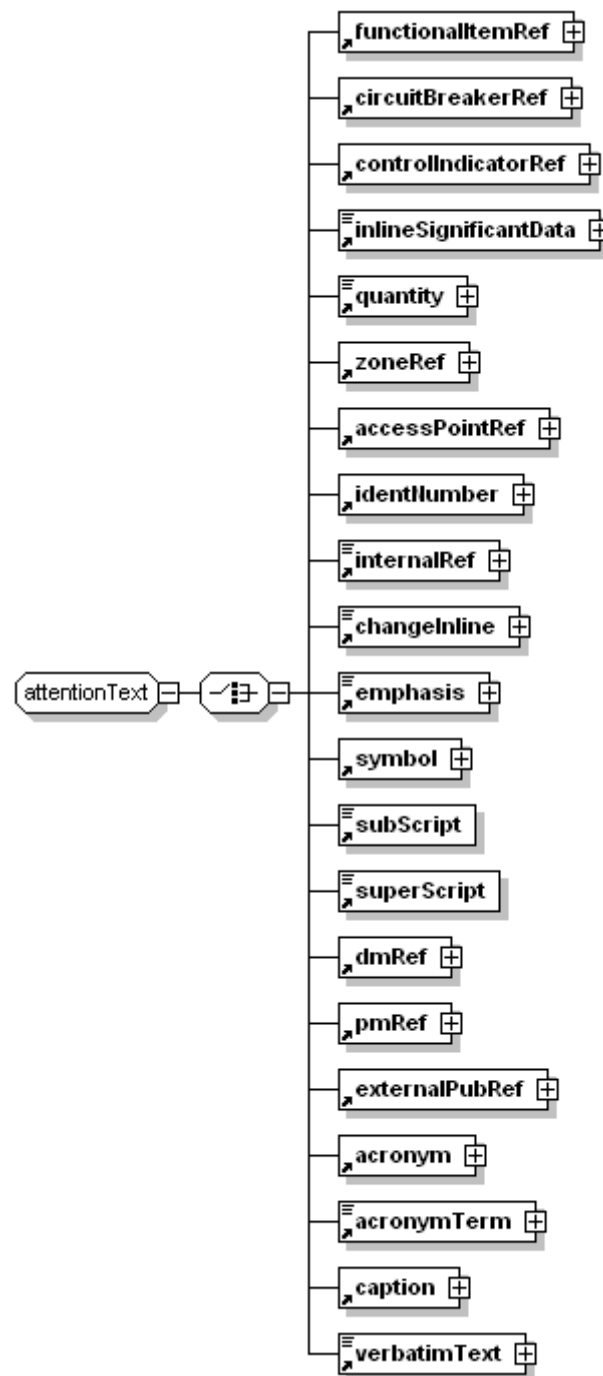

- `<attentionRandomList>`. Refer to [Para 2.1.2.2](#).
- The child elements of the group `attentionText` applicable to the actual data module type. Refer to [Para 2.1.2.1](#).

#### Markup example:

```
<warningAndCautionPara>If you operate the front brake without
the rear brake you can cause a crash.</warningAndCautionPara>
```

#### 2.1.2.1 The group `attentionText`

The content of the group `attentionText` varies depending on the data module type, but the name of the group is the same for all data module types. The full (maximum) content of the group `attentionText` is shown in [Fig 3](#).

ICN-S3627-S1000D0545-001-01

Fig 3 The group *attentionText*

The content of the three different warning/caution/note paragraph types are detailed in [Fig 4](#). The figure provides the element name, which data module types the element is available in, and which child elements are available in that context.

The description of the content of the child elements is given in [Chap 3.9.5.2.1.10](#).

Element [group]	Data module type (Schema) in which the element occurs	Available child elements (grey indicates available)

ICN-S3627-S1000D0546-005-01

Fig 4 Paragraph models and available child elements

### 2.1.2.2 Attention random list

**Description:** The element <attentionRandomList> contains the list items.

There are two types of attention random lists:

- simple - recognized by the value "pf01" of the attribute listItemPrefix giving just an indented item without a prefix
- unordered - the lists recognized by the value "pf03" or "pf07" of the attribute listItemPrefix giving the following prefix: [-] or [•], respectively

The difference between a simple random list and an unordered random list becomes visible when presented. Refer to [Chap 6.2.2](#).

Only one level of attention random lists is allowed.

**Markup element:** <attentionRandomList>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- listItemPrefix (O), the indicator whether the list is a simple list or an unordered list, thus giving the prefix for presentation. Refer to [Chap 3.9.6.1](#). The attribute listItemPrefix can have one of the following values:
  - "pf01" - no prefix (just an indenture)
  - "pf03" - prefix [-] used in notes only
  - "pf07" - prefix [●] used in warnings and cautions only

#### Note

One of the prefix values "pf01", "pf03" or "pf07" must be chosen instead of the default prefix value "pf02".

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <attentionRandomListItem>. Refer to [Para 2.1.2.2.1](#).

#### 2.1.2.2.1 Attention random list item

**Description:** The element <attentionRandomListItem> contains one list item of an attention random list.

Each list item can consist of one or more paragraphs.

#### Note

To enable more than one paragraph, the Schema allows a list item to contain one or more paragraphs. Use the child element <attentionListItemPara> if your list item has more than one paragraph.

**Markup element:** <attentionRandomListItem>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <attentionListItemPara>. Refer to [Para 2.1.2.2.2](#).

#### 2.1.2.2.2 Attention list item para

**Description:** The element `<attentionListItemPara>` contains the list item paragraphs.

**Markup element:** `<attentionListItemPara>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- Includes the child elements of the group `attentionText` applicable to the actual data module type. Refer to [Para 2.1.2.1](#).

**Markup example:**

```
<attentionRandomList listItemPrefix="pf07">
<attentionRandomListItem>
<attentionListItemPara>First attention random list bullit first
paragraph</attentionListItemPara>
<attentionListItemPara>First attention random list bullit second
paragraph</attentionListItemPara>
</attentionRandomListItem>
<attentionRandomListItem>
<attentionListItemPara>Second attention random list bullit first
paragraph.</attentionListItemPara>
</attentionRandomListItem>
</attentionRandomList>
```

## 2.2 Cautions

**Description:** The element `<caution>` contains hazard information that can cause damage to the Product.

Cautions in data modules must always precede the text where the hazard arises and must always precede notes.

Cautions of a general nature, however, which are applicable throughout an instruction, can precede the instruction to save repeating the caution before each of the individual steps of the maintenance task where the hazard arises. Refer to [Para 2.1.2](#).

The default heading **CAUTION** must begin the caution followed by symbols, if any. Refer to [Chap 6.2.2](#) for examples.

**Note**

The default heading **CAUTION** is not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation of legends. If not, the author must make sure that the default heading is included.

Cautions must not be numbered. Cautions must be the first item within that step/para if there are no warnings, because warnings must always precede cautions.

The scope of cautions follows the same rules as for warnings. Refer to [Para 2.1](#).

#### Note

There are two methods to present cautions. Refer to [Chap 6.2.2](#).

#### Note

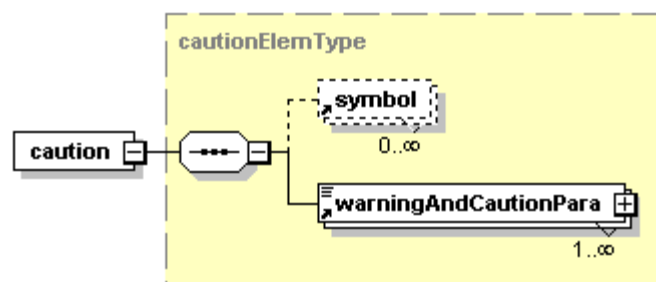

Cautions must not be used for purely descriptive information (eg, data modules with information code 040). This does not prohibit the use of cautions in a descriptive data module for the production of content such as a summary of cautions.

#### Note

Cautions in business rules document data modules are strongly discouraged. The attribute `brSeverityLevel` must be used instead.

The content of the element `<caution>` is given by a combination of the same child elements and attributes as used by the element `<warning>`, except for the absence of the attribute `vitalWarningFlag`. Refer to [Para 2.1](#).

**Markup element:** `<caution>`

ICN-S3627-S1000D0568-001-01

Fig 5 Element `<caution>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Note

The attribute `id` is required when authoring a warning and caution collection. Refer to [Para 2.4](#).

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `cautionType` (O), the type of caution
- `internalRefId` (O), the target id. Refer to [Chap 3.9.5.2.1.2](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<warningAndCautionPara>`. Refer to [Para 2.1.2](#).

**Business rule decision point BRDP-S1-00034 - Use of the attribute `cautionType`:**

- Decide whether and how to use the attribute `cautionType`.

**Markup example:**

```
<caution>
<warningAndCautionPara>Do not use a
<internalRef internalRefId="seq-0001"
internalRefTargetType="irtt05"></internalRef>
  that has high pressure. A water hose that has high pressure can
  cause some parts to become loose or full of
  water.</warningAndCautionPara>
</caution>
```

**2.3****Notes**

**Description:** The element `<note>` contains additional information that can be useful to the user.

Normally, notes in data modules must follow the text to which they refer. In certain circumstances, it can be necessary to allow for notes to precede the text to which they refer to. In this case, projects must declare the use of notes in their business rules.

Notes must always follow warnings and cautions.

Notes of a general nature, which are applicable throughout an instruction, can precede the instruction to save repeating the note throughout the instruction.

The production of notes as individual data modules is not recommended.

The default heading **Note** must begin the note. If the notes are numbered then the default heading **Note X** must begin the note. Refer to examples in [Chap 6.2.2](#).

**Note**

The default heading **Note** is not entered in the data modules when data modules are written in an XML editor or a WYSIWYG-editor with an automatic function for presentation of legends. If not, the author must make sure that the default heading is included.

If there is more than one note they can, by project decision, be numbered to enable cross-references to be made to them within the text.

A note can comprise of:

- symbols
- one or more paragraphs
- one or more random (unordered) lists at one level only
- one sequential (ordered) list at one level only

It is however recommended to keep notes as simple as possible.

The use of attention sequential lists and attention random lists is discouraged. Refer to [Para 2.3.2](#) and [Para 2.1.2.2](#).

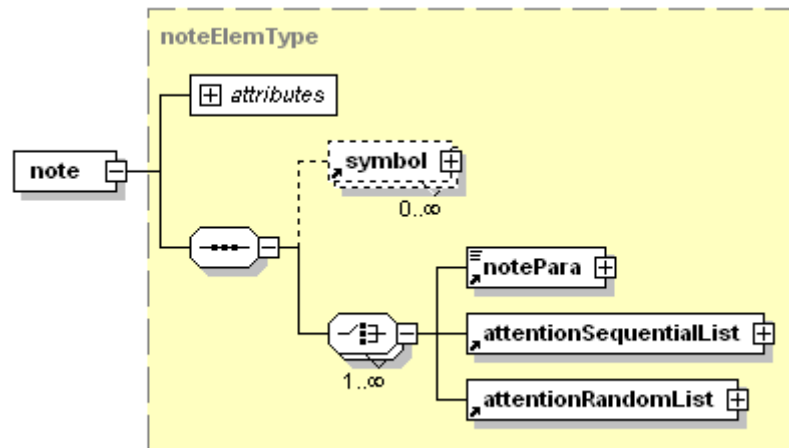

There can be instances where notes are applicable to complete steps/paras or substeps/subparas, including their substeps/subparas. In those circumstances, notes must be

the first item within that step/para provided there are no warnings or cautions. Otherwise warnings and cautions take precedence. Notes must follow the step/para number and title, if any, and precede any text.

The scope of notes follows the same rules as for warnings. Refer to [Para 2.1](#).

The content of the element `<note>` is given by a combination of the same child elements and attributes as for the element `<warning>` (refer to [Para 2.1](#)), except for the absence of the attribute `vitalWarningFlag` and the addition of sequential lists.

**Markup element:** `<note>`

ICN-S3627-S1000D0547-001-01

Fig 6 Element `<note>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `noteType` (O), the type of note
- `internalRefId` (O), the target id of the note. Refer to [Chap 3.9.5.2.1.2](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).

and one of the following is required:

- `<notePara>`. Refer to [Para 2.3.1](#).
- `<attentionSequentialList>`. Refer to [Para 2.3.2](#).
- `<attentionRandomList>`. Refer to [Para 2.1.2.2](#).

## Business rule decision point BRDP-S1-00035 - Use of the attribute noteType:

- Decide whether and how to use the attribute noteType.

### Markup example:

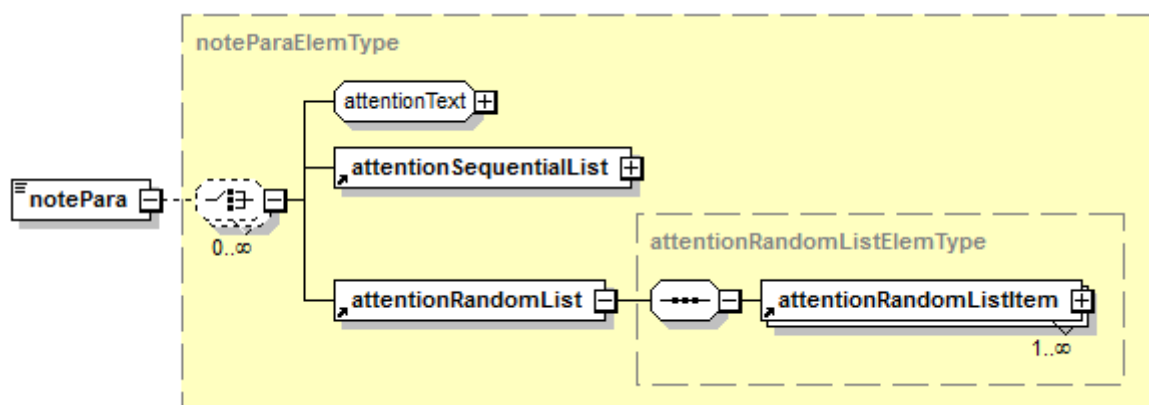

```
<note>
<notePara>The stem must point forward in alignment with the
wheel.</notePara>
</note>
```

### 2.3.1

#### Note para

**Description:** The element `<notePara>` contains the note text.

**Markup element:** `<notePara>`

ICN-S3627-S1000D0549-003-01

Fig 7 Element `<notePara>`

#### Attributes:

- Includes the same set of attributes as the element `<attentionListItemPara>`. Refer to [Para 2.1.2.2.2](#).

#### Child elements:

- `<attentionSequentialList>`. Refer to [Para 2.3.2](#).
- `<attentionRandomList>`. Refer to [Para 2.1.2.2](#).
- The child elements of the group `attentionText` applicable to the actual data module type. Refer to [Para 2.1.2.1](#).

### Markup example:

```
<notePara>It is not necessary to remove the handlebar for this
procedure.</notePara>
```

### 2.3.2

#### Attention sequential list

**Description:** The element `<attentionSequentialList>` contains an attention sequential (ordered) list in a note. An attention sequential list, when presented, has numbers before the list items. Refer to [Chap 6.2.2](#).

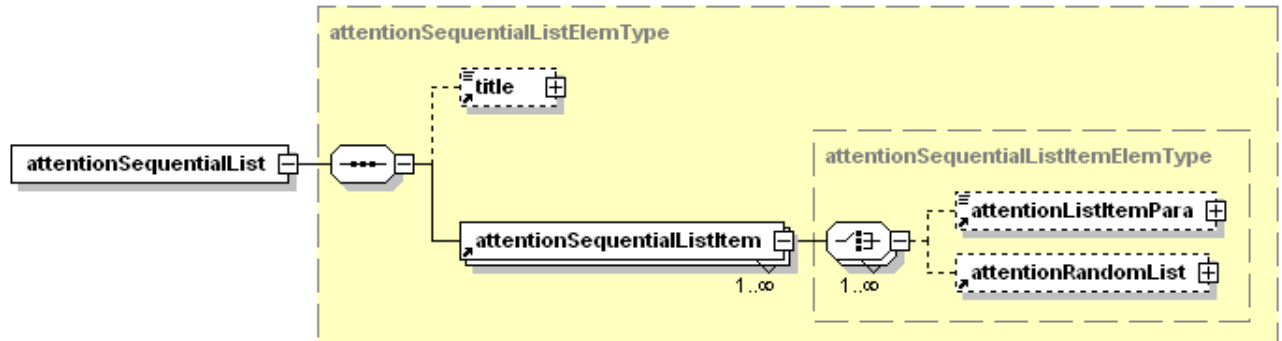

In the attention sequential list, a list item can consist of one or more paragraphs.

A sequential list, when presented, is numbered with arabic numerals. Refer to [Chap 6.2.2](#).

Only one attention sequential list is allowed in a Note.

Attention sequential lists are limited to one level.

**Markup element:** `<attentionSequentialList>`

ICN-S3627-S1000D0548-001-01

Fig 8 Element `<attentionSequentialList>`

**Attributes:**

- Includes the same set of attributes as the element `<attentionListItemPara>`. Refer to [Para 2.1.2.2.2](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<attentionSequentialListItem>`. Refer to [Para 2.3.2.1](#).

### 2.3.2.1 Attention sequential list item

**Description:** The element `<attentionSequentialListItem>` contains one list item of an attention sequential list item and can consist of one or more paragraphs.

**Markup element:** `<attentionSequentialListItem>`

**Attributes:**

- Includes the same set of attributes as the element `<attentionRandomListItem>`. Refer to [Para 2.1.2.2.1](#).

**Child elements:**

- `<attentionListItemPara>`. Refer to [Para 2.1.2.2.2](#).
- `<attentionRandomList>`. Refer to [Para 2.1.2.2](#).

**Markup example:**

```
<attentionSequentialList>
<attentionSequentialListItem>
<attentionListItemPara>First list item
paragraph</attentionListItemPara>
</attentionSequentialListItem>
<attentionSequentialListItem>
<attentionListItemPara>Second list item
paragraph.</attentionListItemPara>
```

```
</attentionSequentialListItem>
</attentionSequentialList>
```

## 2.4 Warning and caution collections

Warnings and cautions can be collected within the data module where they are used (refer to [Para 2.4.1](#)) or within a warning or a caution common information repository in case of warning and caution externalization (refer to [Para 2.4.2](#)).

### 2.4.1 Internal collection

When collected within the data module where the warnings and cautions occur, the element `<warningsAndCautions>` must be used.

**Description:** The element `<warningsAndCautions>` contains the collection of warnings and cautions used within a data module. Each warning or caution is authored separately within the element `<warningsAndCautions>`. Warnings and cautions can thus be authored once in a data module and then referenced as needed.

The collection (element `<warningsAndCautions>`) must not include warnings or cautions that are not at all occur within the data module.

#### Note

The collection can be used in combination with warnings and cautions that are authored individually at the element level of a data module. The collection is useful to store common (or multi-use) alerts while local (or single-use) alerts can be authored as needed.

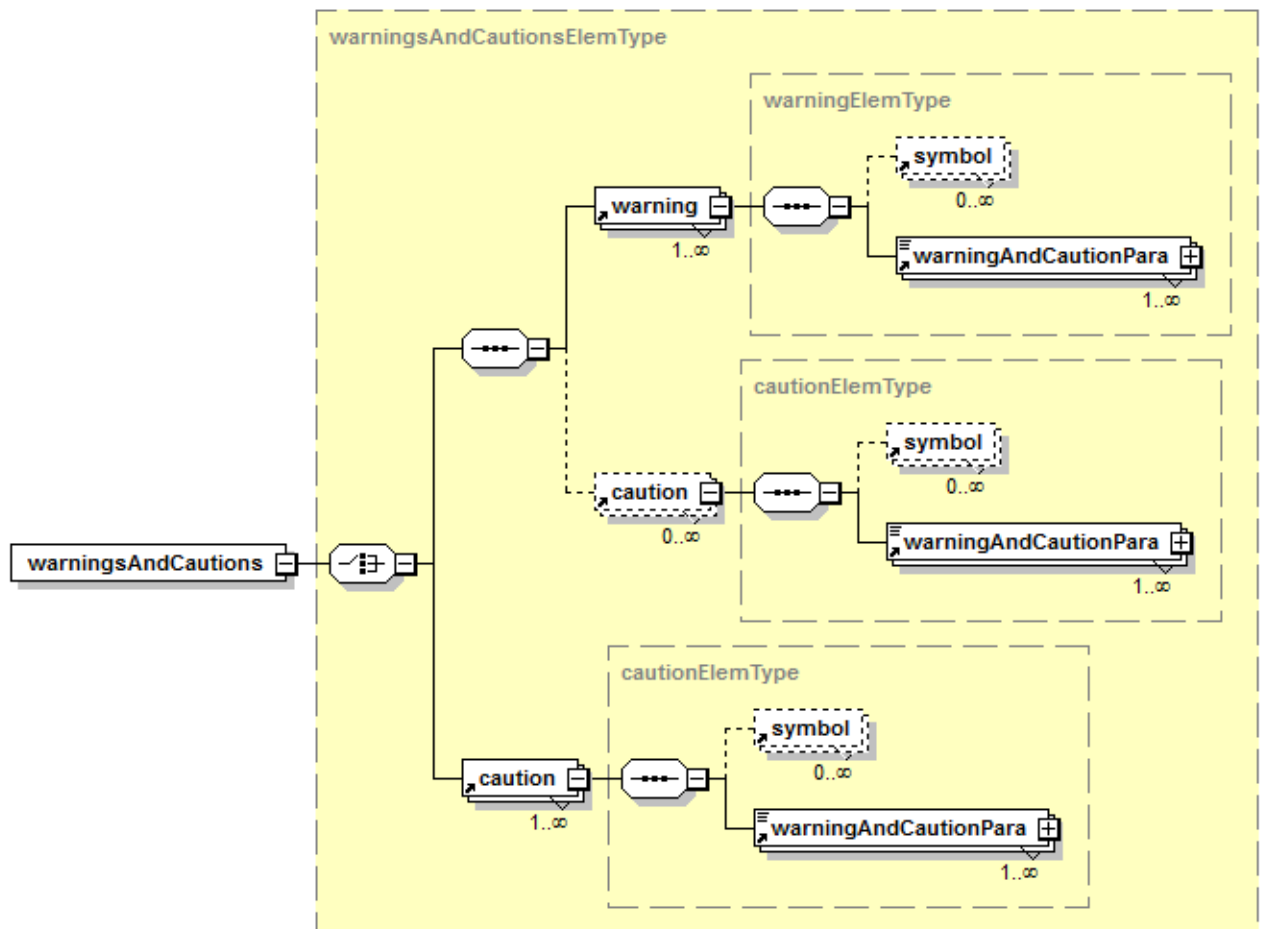

The collection of warnings and cautions is referenced by the use of the attributes `warningRefs` or `cautionRefs`, respectively, which are permitted on the following elements:

- `<brLevelledPara>`. Refer to [Chap 4.10.1](#)
- `<crewDrill>`. Refer to [Chap 3.9.5.2.6](#).
- `<crewDrillStep>`. Refer to [Chap 3.9.5.2.6](#).
- `<crewRefCard>`. Refer to [Chap 3.9.5.2.6](#).
- `<checkListPara>`. Refer to [Chap 3.9.5.2.14](#).
- `<checkListStep>`. Refer to [Chap 3.9.5.2.14](#).
- `<commonInfoDescrPara>`. Refer to [Chap 3.9.5.2.1.12](#).
- `<descrCrew>`. Refer to [Chap 3.9.5.2.6](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<entry>`. Refer to [Chap 3.9.5.2.1.6](#).
- `<isolationProcedureEnd>`. Refer to [Chap 3.9.5.2.4](#).
- `<isolationStep>`. Refer to [Chap 3.9.5.2.4](#).
- `<levelledPara>`. Refer to [Chap 3.9.5.2.2](#).
- `<proceduralStep>`. Refer to [Chap 3.9.5.2.3](#).
- `<safetyRqmts>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<sb>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbTopicContent>`. Refer to [Chap 3.9.5.2.15](#).
- `<scoContent>`. Refer to [Chap 3.9.5.2.17](#).

The attribute `warningRefs` is populated with the identification (attribute `id`) assigned to the applicable warning within the collection (element `<warningsAndCautions>`).

The attribute `cautionRefs` is populated with the identification (attribute `id`) assigned to the applicable caution within the collection (element `<warningsAndCautions>`).

ICN-S3627-S1000D0550-002-01

Fig 9 Element &lt;warningsAndCautions&gt;

**Markup element:** <warningsAndCautions>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <warning>, whose attribute id must be used when authored within the collection. Refer to [Para 2.1](#).
- <caution>, whose attribute id must be used when authored within the collection. Refer to [Para 2.2](#).

**Markup example:**

```
<warningsAndCautions>
<warning id="warn-0001">
<warningAndCautionPara>The first warning in the collection of
```

```

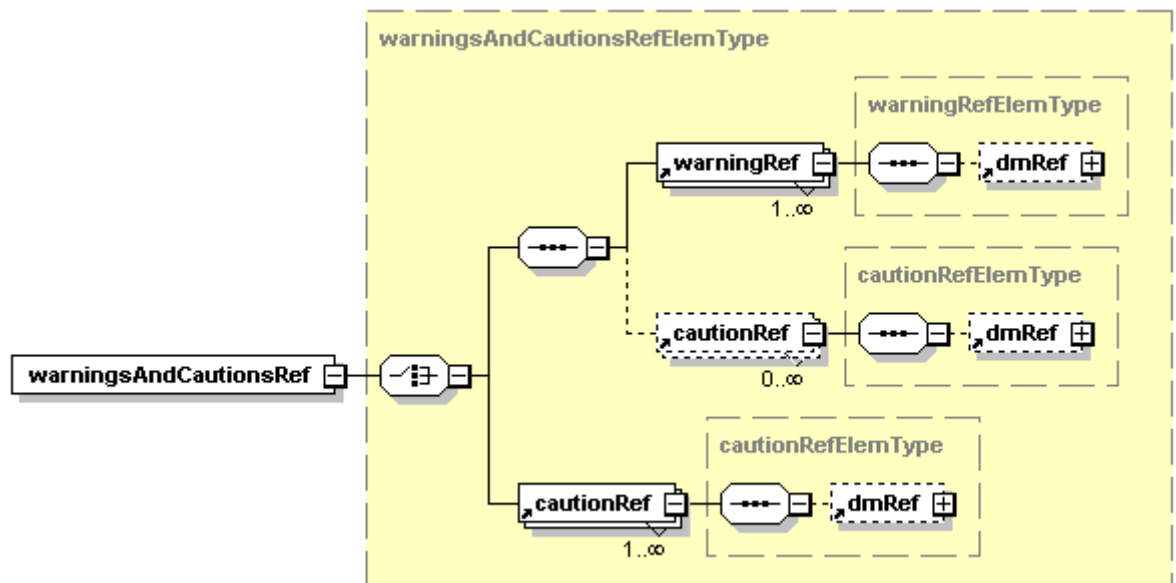

warnings and cautions, used multiple times within the data
module.</warningAndCautionPara>
</warning>
<warning id="warn-0002">
<warningAndCautionPara>The second warning in the collection of
warnings and cautions, used multiple times within the data
module.</warningAndCautionPara>
</warning>
<caution id="caut-0001">
<warningAndCautionPara>The first caution in the collection of
warnings and cautions, used multiple times within the data
module.</warningAndCautionPara>
</caution>
</warningsAndCautions>
...
<reqSafety>
<safetyRqmts warningRefs="warn-0001" cautionRefs="caut-0001">
<warning>
<warningAndCautionPara>Some other warning, not included in the
collection.</warningAndCautionPara>
</warning>
</safetyRqmts>
</reqSafety>
...
<table>
<tgroup cols="2">
<tbody>
<row>
<entry warningRefs="warn-0001 warn-0002" cautionRefs="caut-
0001"></entry>
<entry>
<caution>
<warningAndCautionPara>A caution that is used only once and
authored in the applicable table entry.</warningAndCautionPara>
</caution>
</entry>
</row>
</tbody>
</tgroup>
</table>

```

#### 2.4.2 External collection

When collected into a warning and/or caution common information repository, the element [<warningsAndCautionsRef>](#) must be used.

**Description:** The element [<warningsAndCautionsRef>](#) contains the references to the warnings or cautions, which are valid for this data module and stored externally into a warning and/or caution common information repository.

ICN-S3627-S1000D0566-001-01

Fig 10 Element `<warningsAndCautionsRef>`

**Markup element:** `<warningsAndCautionsRef>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<warningRef>`, references a warning stored in a warning common information repository. Refer to [Chap 3.9.5.2.1.13](#).
- `<cautionRef>`, references a caution stored in a caution common information repository. Refer to [Chap 3.9.5.2.1.13](#).

**Markup example:**

The following example shows the element `<warningsAndCautionsRef>` in a procedural data module and the accompanying warning and caution common information repositories.

The procedural data module:

```
<content>
<warningsAndCautionsRef>
<warningRef id="warn-0001" warningIdentifier="warning-001">
<dmRef><dmRefIdentifier><dmCode modelIdentifier="S1000DLIGHTING"
systemDiffCode="AAA" systemCode="D00" subsystemCode="0"
subSubsystemCode="0" assyCode="00" disassyCode="01"
disassyCodeVariant="AA" infoCode="012" infoCodeVariant="A"
itemLocationCode="A"/></dmRefIdentifier></dmRef></warningRef>
```

```
<cautionRef id="caut-0001" cautionIdentifier="caution-001">
<dmRef><dmRefId><dmCode modelIdentifier="S1000DLIGHTING"
systemDiffCode="AAA" systemCode="D00" subSystemCode="0"
subSubSystemCode="0" assyCode="00" disassyCode="02"
disassyCodeVariant="AA" infoCode="012" infoCodeVariant="A"
itemLocationCode="A"/></dmRefId></dmRef></cautionRef>
<cautionRef id="caut-0002" cautionIdentifier="caution-002">
<dmRef><dmRefId><dmCode modelIdentifier="S1000DLIGHTING"
systemDiffCode="AAA" systemCode="D00" subSystemCode="0"
subSubSystemCode="0" assyCode="00" disassyCode="02"
disassyCodeVariant="AA" infoCode="012" infoCodeVariant="A"
itemLocationCode="A"/></dmRefId></dmRef></cautionRef>
</warningsAndCautionsRef>
<procedure>
<preliminaryRqmts>
...
<safetyRqmts cautionRefs="caut-0001 caut-0002"
warningRefs="warn-0001"></safetyRqmts>
```

The warning common information repository data module:

```
<content>
<commonRepository>
<warningRepository>
<warningSpec>
<warningIdent warningIdentifier="warning-001"></warningIdent>
<warningAndCautionPara>Make sure that the bulb is cool before
you replace it.</warningAndCautionPara>
</warningSpec>
<warningSpec>
<warningIdent warningIdentifier="warning-002"></warningIdent>
<warningAndCautionPara>Make sure the light glass is not broken
before handling it.</warningAndCautionPara>
</warningSpec>
...
</warningRepository>
</commonRepository>
</content>
```

The caution common information repository data module:

```
<content>
<commonRepository>
<cautionRepository>
<cautionSpec>
<cautionIdent cautionIdentifier="caution-001"></cautionIdent>
<warningAndCautionPara>Do not touch the glass of the
bulb.</warningAndCautionPara>
</cautionSpec>
<cautionSpec>
<cautionIdent cautionIdentifier="caution-002"></cautionIdent>
<warningAndCautionPara>Make sure that the glass is clean before
installing it on the light.</warningAndCautionPara>
</cautionSpec>
```

```
...  
</cautionRepository>  
</commonRepository>  
</content>
```

## 1 General

This chapter contains the basic rules and guidance for authoring front matter in a data module environment. Front matter data modules can be created automatically or manually by an author, or by a mix of automation and authoring. By using the dedicated Front matter Schema the below listed front matter data modules can be automatically created.

The detailed rules and guidance for using the Front matter Schema are given in [Chap 3.9.5.2.16](#). The Front matter Schema is currently designed for:

- Title page - TITLE
- Table of contents - TOC
- List of effective pages - LOEP
- List of effective data modules - LOEDM
- Highlights - HIGH with or without updating instructions

The remaining front matter data modules must use the Descriptive Schema except for Applicability Cross-reference Table (ACT), Conditions Cross-reference Table (CCT) and Products Cross-reference Table (PCT) which have their own Schemas.

Each publication or volume thereof can have a set of front matter as given in [Chap 5.3.1.1](#). Refer to BRDP-S1-00460.

Examples for page-oriented front matter are given in [Chap 6.2.3.1](#) if not otherwise stated.

Issue number and date must be the same for the publication and all new or re-issued front matter data modules.

## 2 Front matter

### 2.1 Title page

The title page contains, if applicable, the following information:

- Product, project or any commercial name (optional). This information must be agreed upon between the publication producer and the customer.
- publication title/volume
- publication module code
- page identification = data module code
- issue number and issue date of the publication
- project's logotype (optional)
- security classification
- restriction instructions (optional)
- barcode (optional)
- publisher (publishing authority)
- manufacturer's information (optional)

The Front matter Schema allows for capturing more information than listed above, which by project decision can be presented on the title page or be available for interactive presentation. Refer to [Chap 3.9.5.2.16](#).

Issue date of the publication (issue date of the title page data module) and security markings follow the rules for page layout. Refer to [Chap 6.2.1](#).

The security marking must represent the highest classified information in the publication or volume.

The title page must be reissued with each issue.

## 2.2 List of effective pages

The List of Effective Pages (LOEP), if used, identifies each page in the page-oriented publication contents by giving the:

- data module code
- page number
- issue date and/or issue number
- applicability (optional)

All new (additional) or changed pages must be marked with:

- N = New page
- C = Changed page

Where:

"N" indicates a new page. This means that this page is an additional page compared with the last issue of the publication.

"C" indicates a changed page. This means that this page has some form of technical or editorial (including layout and new date) change compared with the last issue of the publication.

The LOEP must present the issue number and date of the actual publication.

If a project decides to use LOEP instead of List of Effective Data Modules (LOEDM), the LOEP must be reissued with each issue of the publication.

## 2.3 List of effective data modules

The LOEDM must list all data modules included in the publication by giving the:

- data module title (<techName> - <infoName>)
- data module code
- issue date and/or issue number
- number of pages (optional)
- applicability (optional)

All new (additional) or changed data modules must be marked with:

- N = New data module
- C = Changed or revised data module

Where:

"N" indicates a new data module. This means that this data module is an additional data module compared with the last issue of the publication.

"C" indicates a changed or revised data module. This means that this data module has some form of technical or editorial (including layout and new date) change compared with the last issue of the publication.

#### Note

N and C must be considered from a publication issue view.

The entries must be listed in the order in which they appear in the publication.

The LOEDM must present the issue number and date of the actual publication.

The LOEDM must be reissued with each issue. By project decision the LOEDM can be replaced by an LOEP.

#### Business rule decision point BRDP-S1-00037 - Use of LOEP or LOEDM:

- Decide whether to use the LOEP or the LOEDM.

## 2.4 Change record

The change record is intended to provide a continuous record of the state of each individual copy of the publication. The change record must only be reissued when all of the initial change record predefined issues are filled in.

## 2.5 Highlights

### 2.5.1 General

The highlights give the reasons for the changes of the data modules in each issue, using the content of the elements `<reasonForUpdate>`. The highlights must give the:

- data module code
- reason for change

The highlights must not list the changes in:

- Title page
- List of effective pages
- List of effective data modules
- Change record
- Table of contents

The entries must be listed in the order in which they appear in the publication.

The highlights data module must present the issue number and date of the actual publication.

When used, the highlights is issued with each issue of the publication or volume.

#### Note

The initial issue (first issue) of a publication does not need a highlight data module.

### 2.5.2 Highlights with updating instructions

A variant of a highlights data module is a "highlights with updating instructions" data module for paper publications. This variant includes instructions for the updating of the publication. In addition to the list of highlights (refer to [Para 2.5.1](#)), a table giving the following information must be added:

- data module code
- data module title (`<techName>` - `<infoName>`)
- issue date or issue number
- number of pages (optional)
- applicability (optional)

All data modules which are removed from previous issue and to be inserted in the new issue must be marked:

- R = Remove data module

- I = Insert data module

**Business rule decision point BRDP-S1-00042 - Use of Highlights with updating instructions:**

- Decide whether to use Highlights with updating instructions.

## 2.6 Access illustration

Access illustrations are a set of illustrations that can be included to support the navigation of the publication. Access illustrations must be used in an IETP only.

## 2.7 List of abbreviations

The List of Abbreviations (LOA) lists the non-standard abbreviations used in a publication. An example of a LOA is given in [Chap 5.2.1.18](#).

## 2.8 List of terms

The List of Terms (LOT) lists the non-standard terms used in a publication. An example of a LOT is given in [Chap 5.2.1.18](#).

## 2.9 List of symbols

The List of Symbols (LOS) lists the non-standard symbols used in a publication. An example of a LOS is given in [Chap 5.2.1.18](#).

## 2.10 Technical standard record

Incorporated technical changes can be presented in a Technical Standard Record (TSR). The list is presented as an informal table.

TSR must not be used in the IPD.

## 2.11 Table of contents

The Table of Contents (TOC) must list all data modules and publications included in the publication by giving the:

- data module/publication module/external publication title (<techName> - <infoName>/<pmTitle>/<externalPubTitle>)
- data module/publication module/external publication code
- issue date and/or issue number
- number of pages (optional)
- applicability (optional)

The entries must be presented in the order in which they appear in the publication.

The TOC must not include the front matter data modules Title page, LOEDM, LOEP, Change Record (CR) or TOC itself.

The entries in the TOC can be hierarchically subdivided. Refer to [Chap 3.9.5.2.16](#).

If the publication is divided with tab dividers a TOC also can be given to each chapter or part.

**Recommendation:** It is recommended to prepare and include a Table of contents data module in the publication when a LOEP is used.

**Business rule decision point BRDP-S1-00046 - Use of linear or hierarchically subdivided Table of contents:**

- Decide whether to use a linear or a hierarchically subdivided Table of contents.

**Business rule decision point BRDP-S1-00305 - Data modules within a publication listed in the Table of contents:**

- Decide whether the listed publications within the Table of contents also have to be listed by their individual data modules.

**Business rule decision point BRDP-S1-00307 - Inclusion of the number of pages in the Table of contents:**

- Decide whether to include the number of pages in the Table of contents entries.

## **2.12 List of applicable specifications and documentation**

Specifications and documents which are necessary to read or follow when using the publication can be presented in a List of Applicable Specifications and Documentation (LOASD). An example of a LOASD is given in [Chap 5.2.1.18](#).

LOASD must not be used in the IPD.

## **2.13 List of support equipment**

The List of Support Equipment (LOSE) lists the required support equipment necessary to perform the tasks described in the publication.

LOSE must not be used in the IPD.

## **2.14 List of supplies**

The List of Supplies (LOSU) lists the required supplies necessary to perform the tasks described in the publication.

LOSU must not be used in the IPD.

## **2.15 List of spares**

The List of Spares (LOSP) lists the required spares necessary to perform the tasks described in the publication.

LOSP must not be used in the IPD.

## **2.16 List of illustrations**

The List of Illustrations (LOI) lists all illustrations contained in the publication and includes:

- ICN
- Title

## **2.17 Product cross-reference table**

The Product Cross-reference Table (PCT) lists the products concerned by the publication. Each product is associated with the corresponding product sets and other data related to the operation of the product.

The general mechanisms of the PCT are described in [Chap 4.14.3](#).

There is a dedicated data module Schema for the PCT. Refer to [Chap 3.9.5.3.3](#).

A display example is available in [Chap 6.2.3.1](#).

## **2.18 Conditions cross-reference table**

The Conditions Cross-reference Table (CCT) lists the technical conditions impacting the publication. Each technical condition is associated with a status according to products and other data related to the technical condition itself.

The general mechanisms of the CCT are described in [Chap 4.14.2](#).

---

There is a dedicated data module Schema for the CCT. Refer to [Chap 3.9.5.3.2](#).

A display example is available in [Chap 6.2.3.1](#).

## 2.19 **Applicability cross-reference table**

The general mechanisms of the Applicability Cross-reference Table (ACT) are described in [Chap 4.14.1](#).

There is a dedicated data module Schema for the ACT. Refer to [Chap 3.9.5.3.1](#). A display example is available in [Chap 6.2.3.1](#).

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 3.9.5.2</a>	Data modules - Content section
<a href="#">Chap 3.9.5.3</a>	Data modules - Applicability
<a href="#">REC-xml-20081126</a>	W3C Recommendation: Extensible Markup Language (XML) 1.0 (Fifth Edition) Version 1.0, 2008

## 1 General

This chapter gives the user brief definitions to some of the most common XML terms used in this specification. The markup examples that are included in the chapter are XML markup

examples. For the terminology, definitions and the use of XML, refer to REC-xml-20081126 W3C Recommendation: XML 1.0 (Fifth Edition).

The chapter is further broken down to give definitions and guidance on using the XML to create data modules.

[Chap 3.9.5.1](#) gives the definitions and guidance for the identification and status section of all types of data modules.

The definitions and guidance for the common constructs and information types are given in [Chap 3.9.5.2](#).

[Chap 3.9.5.3](#) gives the rules for applicability.

Throughout these chapters, attributes are marked as mandatory or optional. The definitions for these are:

- mandatory (M) if the attribute must be included in the context concerned, as enforced by the Schema structure or otherwise
- optional (O) if the attribute is not enforced by the Schema structure, (ie, can be omitted in the context concerned)

XML **elements** are written in **Courier New 12** in blue within brackets preceded by the word "element", (eg, element `<applic>`).

**Attributes** are written in **Courier New 12** in black without quotation marks and brackets preceded by the word "attribute", (eg, attribute `internalRefId`).

**Values** given in the text are written in **Courier New 12** in blue within quotation marks preceded by the word "value", (eg, value `"Value_1"`).

XML **examples** are written in **Courier New 11** in black.

Example:

```
<language languageIsoCode="sx" countryIsoCode="US"/>
<language languageIsoCode="de" countryIsoCode="AT"/>
<reasonForUpdate id="rfu-001" updateHighlight="1"
updateReasonType="urt02"><simpleRefPara>The tool set is
changed.</simpleRefPara></reasonForUpdate>
```

## 2 XML terminology and definitions

### 2.1 Element

An element is a component of an XML instance, defined by the Schema and is identified in the document by descriptive markup, usually a start-tag and end-tag.

For example: `<para>...</para>`. There is also a type of element called an empty element which does not comprise an end-tag.

Example:

```
<security securityClassification="01"/>.
```

### 2.2 Generic identifier

A generic identifier is a name of an element or "tag-name".

Example: The generic identifier of the element `<para>` is para.

### 2.3 Attribute

An attribute is a value that can be applied to an element.

Example: The values for day, month and year are numeric attributes of the `<issueDate>` element `<issueDate day="30" month="07" year="2000"/>`.

Attributes are either mandatory (they must be given a value) or optional. Some attributes require a typed value, while other attribute values are selectable from a list. Certain attributes have a default value which is applied automatically if a value for the attribute is not specified.

In most cases attributes can have only one allowable value at a time. However, there are a few attributes that can have one or more allowable values at the same time. When more than one value is given, the values must be separated by space characters

Example: Attribute `itemCharacteristic` can have one value defining the parent element as related to electrostatic discharge:

```
<proceduralStep itemCharacteristic="ic02">... text
...</proceduralStep>
```

Example: Attribute `itemCharacteristic` can also have two values defining the parent element as related to electrostatic discharge and with a quality assurance effect:

```
<proceduralStep itemCharacteristic="ic02 ic03">... text
...</proceduralStep>
```

## 2.4 Tag

The start of an element is marked by a start-tag and the end by an end-tag (unless the element is an empty element). An element start-tag is comprised of a less-than sign [`<`], then the generic identifier, then, if required, a set of attributes followed by a greater-than sign [`>`].

Example: The start-tag of a paragraph is `<para>`.

An element end-tag is comprised of a less-than sign [`<`] followed by a slash [`/`], then the generic identifier and finally a greater-than sign [`>`].

Example: The end-tag of a paragraph is `</para>`.

In XML markup empty tags are represented like this `<security securityClassification="01"/>` or like this `<unverified></unverified>`.

## 2.5 XML Schemas

The XML Schema controls which elements can appear in an XML instance and in which order. The Schema also defines the rules for attributes and entities and provides data type constraints which describe valid units of data.

## 2.6 Data type string

String data is any character(s) entered between the start-tag and end-tag of an element (plain text) and characters between quotes that make up the value of an attribute.

Example: `<para>This is plain text data.</para>`.

## 2.7 Entity

An entity is a character string which, in the final data module output, will be replaced by a character, symbol or an external file.

### 2.7.1 Character entities

Some characters required for data modules are not available on a computer keyboard, for example, degrees, fractions and Greek letters. These characters are made available on XML

systems by substituting a character entity for the required character. Most XML systems allow an inserted character entity to be displayed on the screen as it will appear to the reader. When entering a character entity, it must be preceded by [&] and followed by [;], for example, in XML, the characters inserted for degrees [°] will be &deg;.

It is important to remember that, in XML, character entities are case sensitive, so using an initial uppercase letter will affect the final character shown in the data module.

Example: &Sigma; (uppercase S) =  $\Sigma$ , and &sigma; (lowercase letter s) =  $\sigma$ .

[Table 2](#) details some of the more common character entities currently in use. For a complete list, refer to the S1000D data module Schemas.

Table 2 Commonly used character entities - Example

Entity	Character	XML	Ent file	Entity	Character	XML	Ent file
alpha	$\alpha$	&#x03B1;	ISOgrk3	micro	$\mu$	&#x00B5;	ISOnum
amp	&	&#38;#38;	ISOnum	mu	$\mu$	&#x03BC;	ISOgrk3
beta	$\beta$	&#x03B2;	ISOgrk3	ndash	—	&#x2013;	ISOpub
bull	•	&#x2022;	ISOpub	ne	$\neq$	&#x2260;	ISotech
deg	°	&#x00B0;	ISOnum	ohm	$\Omega$	&#x2126;	ISOnum
Delta	$\Delta$	&#x0394;	ISOgrk3	Omega	$\Omega$	&#x03A9;	ISOgrk3
delta	$\delta$	&#x03B4;	ISOgrk3	percnt	%	&#x0025;	ISOnum
divide	÷	&#x00F7;	ISOnum	Phi	$\Phi$	&#x03A6;	ISOgrk3
epsis	$\epsilon$	&#x220A;	ISOgrk3	phis	$\varphi$	&#x03C6;	ISOgrk3
eta	$\eta$	&#x03B7;	ISOgrk3	pi	$\pi$	&#x03C0;	ISOgrk3
equiv	≡	&#x2261;	ISotech	plusmn	$\pm$	&#x00B1;	ISOnum
gamma	$\gamma$	&#x03B3;	ISOgrk3	prop	$\propto$	&#x221D;	ISotech
ge	$\geq$	&#x2265;	ISotech	psi	$\psi$	&#x03C8;	ISOgrk3
gt	>	&#x003E;	ISOnum	quot	"	&#x0022;	ISOnum
infin	$\infty$	&#x221E;	ISotech	radic	$\sqrt{\phantom{x}}$	&#x221A;	ISotech
Lambda	$\Lambda$	&#x039B;	ISOgrk3	rho	$\rho$	&#x03C1;	ISOgrk3
lambda	$\lambda$	&#x03BB;	ISOgrk3	Sigma	$\Sigma$	&#x03A3;	ISOgrk3
le	$\leq$	&#x2264;	ISotech	sigma	$\sigma$	&#x03C3;	ISOgrk3
lt	<	&#38;#60;	ISOnum	Theta	$\Theta$	&#x0398;	ISOgrk3
mdash	—	&#x2014;	ISOpub	theta	$\theta$	&#x03B8;	ISOgrk3

### 2.7.2 External system entities

For illustrations and symbols, a system entity is inserted into the XML instance normally carried out by the system.

## 2.8 Use of some special characters

The following rules apply:

- Hyphen [-] is used in the data module code, ICN, publication module code, CSN and as a separator in normal text, (eg, between the element <techName> and the element <infoName> on data module titles).
- Vertical bar [|] is used in the markup to separate values and intervals in, for example, the attribute applicPropertyValues
- Tilde [~] is used in the markup to separate values within a range in, for example, the attribute applicPropertyValues
- Space [ ] is used as a single space character (using spacebar on the keyboard) to substitute numbers in, for example, the CSN (Space = ASCII 32 (hexadecimal code 20)).

### Note

These special characters are normally inserted by the formatting application and must not to be entered by the author.

### Note

For the entry of XML elements and attributes which can be used as hyperlinks in the IETP (eg, CSN, part numbers, NSN), any spaces must be entered from the keyboard using the spacebar. Do not use XML character entities for these elements and attributes.

## 2.9 Constraints

There are elements in the Schemas that are used under constraints that are described by the content of their attributes.

### Constrained element

A constrained element has an attribute, or attributes, that has a value, or combination of values, which must be unique within the data module. The constraint indicates which attribute, or combination of attributes, contain the unique value.

### Constrained attribute

An attribute, or attributes, that have a value, or combination of values, which must be unique within the data module.

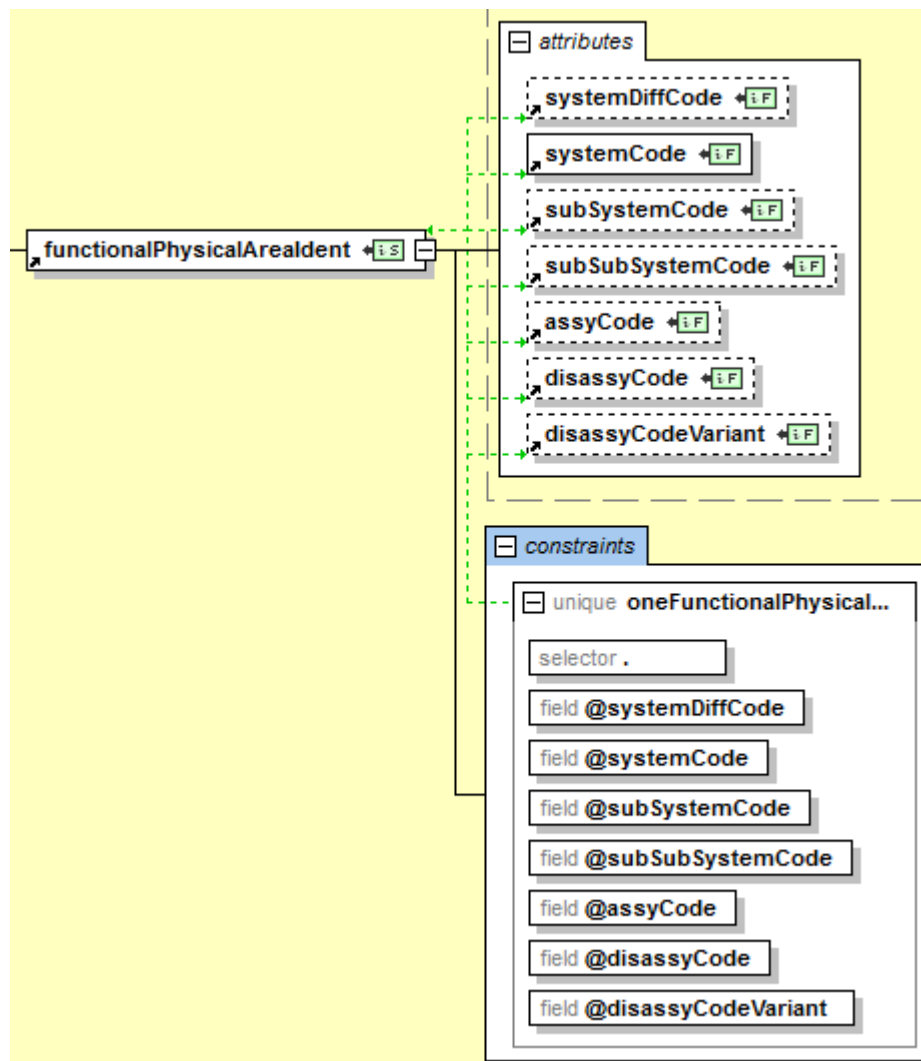

### Constraint

The constraints indicate which attribute, or combination of attributes, must contain the unique value.

Example of a constrained element:

The element <functionalPhysicalAreIdent> has attributes systemDiffCode, systemCode, subSystemCode, subSubSystemCode, assyCode, disassyCode and disassyCodeVariant, the combination of which must be unique within the data module. Refer to [Fig 1](#).

ICN-83007-S1000D0001-001-01

Fig 1 Constrained element - Example

## 2.10 XML Schema representation

In S1000D some chapters include graphical representations of the XML Schemas fragments. This method allows the author to learn the schema structure of S1000D progressively.

When reading the graphical representations it is important that the reader understands that an element can be mandatory when its optional parent element is used.

### Element structure

An element that must be included in the markup

An element that the Schema allows but does not mandate

### Element content

Element with textual content (the "paragraph" symbol in the upper left of the element box indicates that it is either a pure textual element or a mixed content element).

Empty element

Element occurrence indicators

Element with subelements indicated by the "+" symbol. Subelements can be presented in another figure.

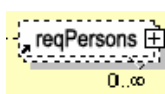

Required (M) and non-repeatable, (once and only once)

Optional (O) and non-repeatable, (zero or one time)

Required and repeatable (one or more times)

Optional and repeatable (zero or more times)

Connectors

Sequence of branches, mandatory. The contained elements (if present) must be in the order listed in the branches of the connector.

Sequence of branches, optional and repeatable. The contained branches (if present) must be in the order listed in the branches of the connector.

Choice of branches, mandatory. One and only branch is allowed from the defined branches of the choice.

Choice of branches, optional and repeatable. Zero to many branches in any order is allowed from the defined branches of the choice.

Choice of branches, mandatory and repeatable. One to many branches in any order is allowed from the defined branches of the choice.

Groups (do not appear in an XML instance)

Group of elements. Used in maintaining the Schemas.

## 1 General

The identification and status section gives all the identification elements required to address and control the data module. It also provides the status elements for information on the security, quality and technical status together with the applicability of the overall data module content.

## 2 Identification and status section

**Description:** The element [<identAndStatusSection>](#) contains the identification and status of a data module, which are captured in the two parts, identification and status.

**Markup element:** [<identAndStatusSection>](#)

ICN-83007-0000000025-001-01

Fig 1 Element [<identAndStatusSection>](#)

**Attributes:**

- None

#### Child elements:

- `<dmAddress>`. Refer to [Para 2.1](#).
- `<dmStatus>`. Refer to [Para 2.2](#).

## 2.1 Identification part

**Description:** The element `<dmAddress>` contains the unique identification and additional information supporting the data module.

**Markup element:** `<dmAddress>`

ICN-83007-0000000026-002-01

Fig 2 Element `<dmAddress>`

#### Attributes:

- None

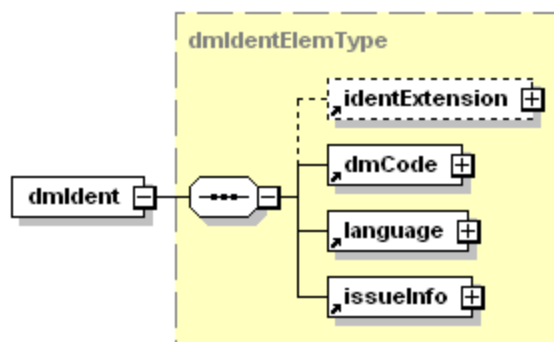

#### Child elements:

- `<dmIdent>`. Refer to [Para 2.1.1](#).
- `<dmAddressItems>`. Refer to [Para 2.1.2](#).

### 2.1.1 Data module identification

**Description:** The element `<dmIdent>` contains the unique identification of the data module.

**Markup element:** `<dmIdent>`

ICN-83007-0000000027-002-01

Fig 3 Element `<dmIdent>`

#### Attributes:

- None

#### Child elements:

- `<identExtension>`, the additional parameters establish a unique identification of a data module in those cases when data module code, issue and inwork numbers together with the language and country are insufficient to form a universally unique identity. The element establishes a producer unique subdomain for identification. Refer to [Chap 4.12](#).
- `<dmCode>`. Refer to [Para 2.1.1.1](#).
- `<language>`. Refer to [Para 2.1.1.2](#).
- `<issueInfo>`. Refer to [Para 2.1.1.3](#).

#### 2.1.1.1 Data module code

**Description:** The element `<dmCode>` contains the data module code and forms part of the unique identifier of a data module. All data modules are allocated a data module code.

The data module code provides four top level pieces of information:

- The identification of the Product, or part of the Product, about which the data module has been written, using the model identifier, the system difference code, the standard numbering system, the disassembly code and the disassembly code variant
- The identification of the information type, using the information code and the information code variant
- The identification of the location at which the information in the data module is appropriate, using the item location code
- The identification of the type of learning content in learning data modules. Refer to [Chap 4.3](#).

Establishing the data module code requires a data module coding strategy. Refer to [Chap 4.3](#).

**Markup element:** `<dmCode>`

#### Attributes:

- `modelIdentCode` (M), the model identifier or project name. Refer to [Chap 4.3.1](#).
- `systemDiffCode` (M), the system difference code. Refer to [Chap 4.3.2](#).
- `systemCode` (M), the system code (part of the SNS). Refer to [Chap 4.3.3](#).
- `subSystemCode` (M), the subsystem code (part of the SNS). Refer to [Chap 4.3.3](#).
- `subSubSystemCode` (M), the sub-subsystem code (part of the SNS). Refer to [Chap 4.3.3](#).
- `assyCode` (M), the assembly code (part of the SNS). Refer to [Chap 4.3.3](#).
- `disassyCode` (M), the disassembly code. Refer to [Chap 3.8](#) and [Chap 4.3.4](#).
- `disassyCodeVariant` (M), the disassembly code variant. Refer to [Chap 4.3.5](#).
- `infoCode` (M), the information code. Refer to [Chap 4.3.6](#).
- `infoCodeVariant` (M), the information code variant. Refer to [Chap 4.3.7](#).
- `itemLocationCode` (M), the item location code. Refer to [Chap 4.3.8](#).
- `learnCode` (O), the learn code. Refer to [Chap 4.3.9](#) and [Chap 8.5](#).
- `learnEventCode` (O), the learn event code. Refer to [Chap 3.9.5.2.13](#) and [Chap 4.3.10](#).

#### Child elements:

- None

### Markup example:

Markup example for maintenance data modules:

```
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
```

Markup example for training data modules:

```
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"
learnCode="T12" learnEventCode="C"/>
```

#### 2.1.1.2 Language

**Description:** The element `<language>` is used to describe the language in which the data module is written.

**Markup element:** `<language>`

#### Attributes:

- `languageIsoCode` (M), the two alpha characters from International Standards Organization (ISO) 639. Simplified languages are coded by using additional codes similar to, and not in conflict with, ISO 639 codes. For example, `languageIsoCode="sx"` means a Simplified Technical English® (ASD-STE100) data module and `languageIsoCode="ra"` means a rationalized French data module.
- `countryIsoCode` (M), the two alpha characters from ISO 3166 to denote the country where the language is spoken

#### Child elements:

- None

#### Markup examples:

The following example is for a data module written in the default language:

```
<language languageIsoCode="sx" countryIsoCode="US"/>
```

The following example is for a data module written in Simplified Technical English with Oxford English spelling:

```
<language languageIsoCode="sx" countryIsoCode="GB"/>
```

The following example is for a data module written in French:

```
<language languageIsoCode="fr" countryIsoCode="FR"/>
```

The following example is for a data module written in German:

```
<language languageIsoCode="de" countryIsoCode="DE"/>
```

The following example is for a data module written in German for an Austrian end user:

```
<language languageIsoCode="de" countryIsoCode="AT"/>
```

## 2.1.1.3

## Issue information

**Description:** The element `<issueInfo>` contains the issue number of the data module. Refer to [Chap 4.7](#).

**Markup element:** `<issueInfo>`

**Attributes:**

- `issueNumber` (M), the issue number of the data module. Every approved issue of a data module must be allocated an incremented issue number which, with the data module code, uniquely identifies that instance of the data module. The initial issue must be numbered with the value "001", which must be incremented with every approved release of a data module.
- `inWork` (M), the "inwork" number of the unreleased data module. It can be used for monitoring and control of intermediate drafts within a project. The initial inwork number is set to the value "01", and is incremented with every change to the unreleased data module.

**Child elements:**

- None

**Markup examples:**

These examples show the use of the attribute `inWork`.

**Note**

For each of these, set the value of the attribute `issueType` of the element `<dmStatus>` accordingly.

A data module that is in work, where this is the second draft.

```
<issueInfo issueNumber="000" inWork="02"/>
```

A data module that is released for the first time

```
<issueInfo issueNumber="001" inWork="00"/>
```

A data module that is the subject of a first change to the content section and is in work

```
<issueInfo issueNumber="001" inWork="01"/>
```

A data module that has been changed and released for the second time

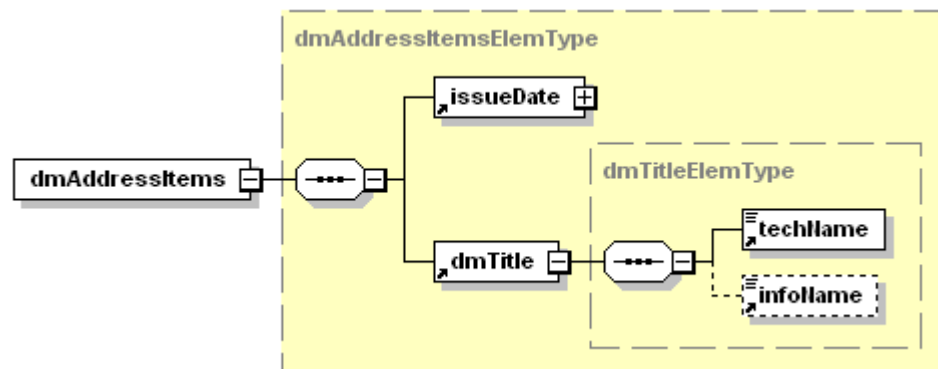

```
<issueInfo issueNumber="002" inWork="00"/>
```

## 2.1.2

**Data module address items**

**Description:** The element `<dmAddressItems>` contains information that is supplementary to the data module identification but not part of the unique identifier.

**Markup element:** `<dmAddressItems>`

ICN-83007-0000000028-002-01

Fig 4 Element `<dmAddressItems>`

#### Attributes:

- None

#### Child elements:

- `<issueDate>`. Refer to [Para 2.1.2.1](#).
- `<dmTitle>`. Refer to [Para 2.1.2.2](#).

#### 2.1.2.1 Issue date

**Description:** The element `<issueDate>` contains the data module's date of issue, which must be defined. This can be, for example, the input date (ie, the release to CSDB date), or the cut-off date for the delivery, etc. Every issue of a data module whether initially written, completely revised or updated by changes, must be allocated an ISO 8601 calendar date in the form YYYY-MM-DD.

**Markup element:** `<issueDate>`

#### Attributes:

- year (M), the year of issue given as a four digit number
- month (M), the month of issue given as a two digit number
- day (M), the day of issue given as a two digit number

#### Child elements:

- None

#### Business rule decision point BRDP-S1-00049 - Definition of the issue date:

- Decide on the definition of the issue date.

#### 2.1.2.2 Data module title

**Description:** The element `<dmTitle>` contains the title of the data module. The data module title must give meaning to the Product identification and action elements of the data module code. Refer to [Chap 3.9.5.2.1.5](#).

**Markup element:** `<dmTitle>`

**Attributes:**

- None

**Child elements:**

- [<techName>](#). Refer to [Para 2.1.2.2.1](#).
- [<infoName>](#). Refer to [Para 2.1.2.2.2](#).

#### 2.1.2.2.1 *Technical name*

**Description:** The element [<techName>](#) content must reflect the name of the hardware or function. That is, it must reflect the system, subsystem or sub-subsystem concerned based on the Product breakdown.

Examples:

- Aircraft
- Landing gear system
- Hydraulic accumulator No. 2
- Three axes trim actuator
- Servicing

**Markup element:** [<techName>](#)

**Attributes:**

- `securityClassification`. Refer to [Para 2.2.3](#).

**Child elements:**

- None

**Markup example:**

```
<techName securityClassification="01">Steering</techName>
```

#### 2.1.2.2.2 *Information name*

**Description:** The element [<infoName>](#) contains the information name describing the type of information related to the Product about which the data module has been written. It is recommended that the element is populated with the information code short definition (corresponding to the attribute `infoCode` in the element [<dmCode>](#), refer to [Para 2.1.1.1](#)). Refer to [Chap 8.4.1](#).

Projects can decide to modify (or extend) the information name to one that is more suitable, provided the sense of the information code is maintained. If there is a variation indicated by the information code variant (the attribute `infoCodeVariant` in the element [<dmCode>](#), refer to [Para 2.1.1.1](#)), the information name can be extended to describe this variation.

**Example**

The short definition of IC 258 is “Other procedure to clean”. A project can have a data module that tells the reader how to clean with water. Another data module could tell the reader how to clean with air. In both cases, the information name can be extended from “Other procedure to clean” (normally IC 258A) to “Other procedure to clean, Clean with air” (can be IC 258B) and “Other procedure to clean, Clean with water” (can be IC 258C).

#### Note

Not all information codes within S1000D will apply to a project. Further, there can be some that are defined by the project and some that can be modified. Where this is the case, it is recommended that the project compiles a list containing the list of information codes and variants that can be used, together with their information names.

Examples:

- Description of how it is made (IC 041)
- Functional test (IC 340)
- Remove procedure (Vertical) (IC 520 variant B)
- Remove procedure (Horizontal) (IC 520 variant C)

The information code is set to "000" when the SNS gives the function.

Examples:

- Product, General maintenance
- Safety and protective devices
- Fatigue index calculations
- Time limits
- Principal dimensions
- Recovering
- Static stability
- Mass and balance data
- Weigh
- Level
- Handling
- Scheduled servicing
- Product safety

**Markup element:** `<infoName>`

**Attributes:**

- `securityClassification`. Refer to [Para 2.2.3](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00052 - Allocation of the information codes and the information names:**

- Decide which information codes and associated information names will be used.

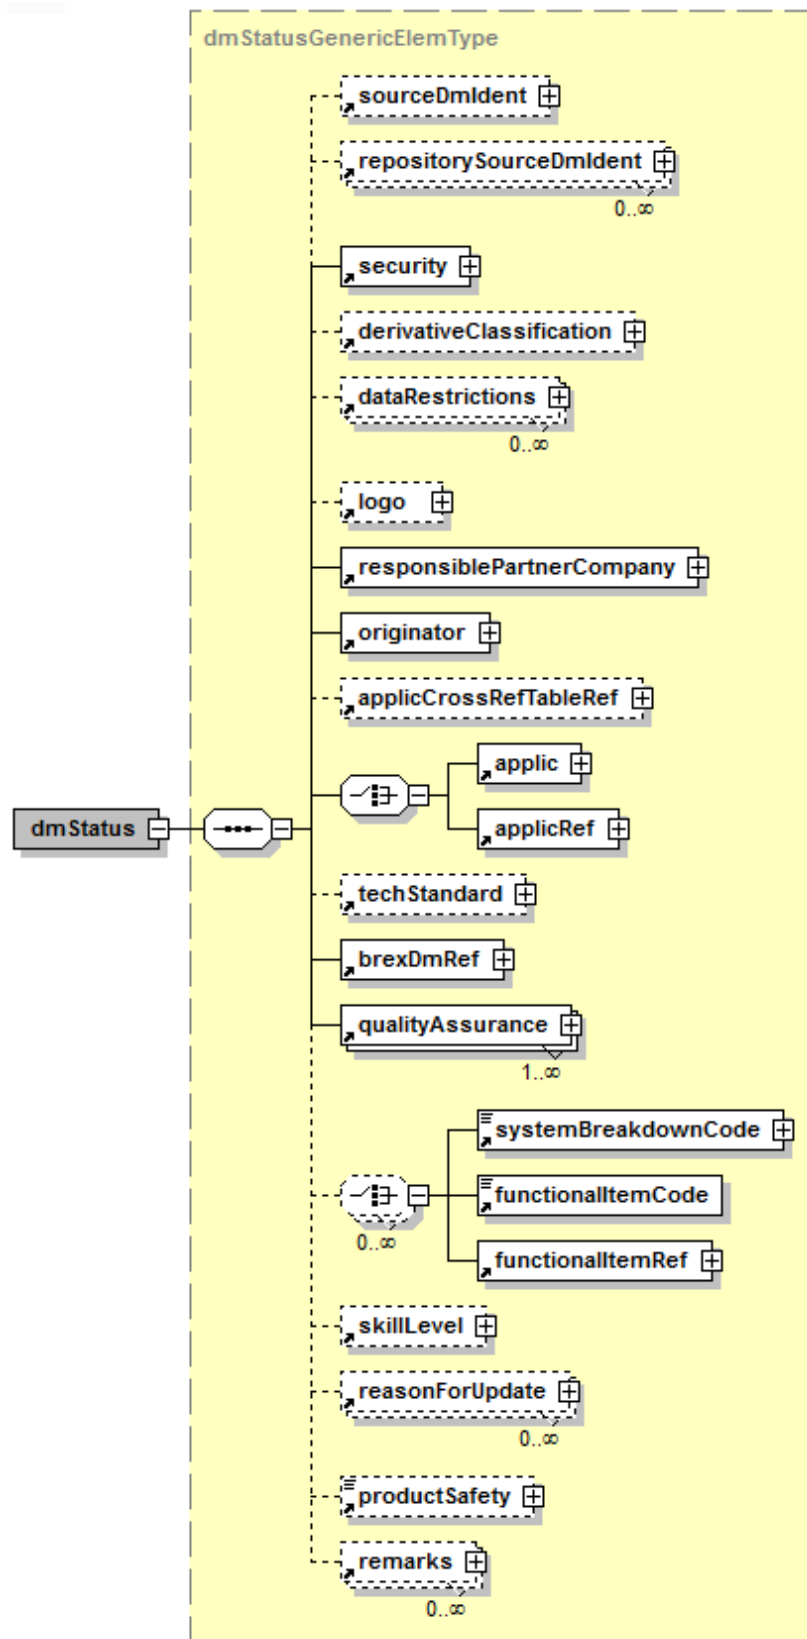

**Markup example:**

```
<infoName securityClassification="01">Description of how it is
made</infoName>
```

## 2.2 Status part

**Description:** The element `<dmStatus>` contains information about the status of the data module.

**Markup element:** `<dmStatus>`

ICN-83007-0000000029-003-01

Fig 5 Element <dmStatus>

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `issueType` (O), the issue status of the data module. There are eight values that can be used:
  - `"new"` - data modules up to and including the initial issue of the approved release must have the attribute `issueNumber` set to the value `"000"` for inwork versions or value `"001"` for the initial issue and have the attribute `issueType` set to the value `"new"`. Refer to default BREX rule BREX-S1-00030.
  - `"changed"` - data modules that have been changed and have the changes indicated within the data module using change elements and/or attributes, must have the attribute `issueType` set to the value `"changed"`. Refer to default BREX rule BREX-S1-00032.
  - `"deleted"` - deletion of data modules is treated as a special case of update. The data module itself is not physically deleted from the CSDB but marked as deleted by setting the attribute `issueType` to the value `"deleted"`. Refer to default BREX rule BREX-S1-00031.
  - `"revised"` - data modules that have been revised and that contain no change elements or attributes must have the attribute `issueType` set to the value `"revised"`. Refer to default BREX rule BREX-S1-00033.
  - `"status"` - data modules that have had their identification and status information updated must have the attribute `issueType` set to the value `"status"`. Refer to default BREX rule BREX-S1-00034.
  - `"rinstat-status"` - data modules that have been reinstated from a previously deleted data module and have only the status information changed must have the attribute `issueType` set to the value `"rinstat-status"`. In the simplest case, this status change must require setting the attribute `issueType` to the value `"rinstat-status"`. Refer to default BREX rule BREX-S1-00034.
  - `"rinstat-changed"` - data modules that have been reinstated from a previously deleted data module and have the changes indicated by change elements or attributes, must have the attribute `issueType` set to the value `"rinstat-changed"`. Refer to default BREX rule BREX-S1-00032.
  - `"rinstat-revised"` - data modules that have been reinstated from a previously deleted data module and have the changes not indicated by change elements and attributes, must have the attribute `issueType` set to the value `"rinstat-revised"`. Refer to default BREX rule BREX-S1-00033.

[Table 2](#) shows the permitted values of the attribute `issueType`, where "X" shows that the value is permitted.

*Table 2 Values of the issue type attribute*

Current issue	Next issue of data module					
	new	changed	deleted	revised	status	rinstat-x
New		X	X	X	X	
changed		X	X	X	X	
deleted						X
revised		X	X	X	X	

Current issue	Next issue of data module					
	new	changed	deleted	revised	status	rinstate-x
status		X	X	X	X	
rinstate-x		X	X	X	X	

When work first starts on a data module, the attribute `issueType` is set to the value "new", while the issue number is set to the value "000" and inwork number to "01", using the attribute `issueNumber` and attribute `inWork` of element `<issueInfo>`. Then, when the data module is released, the attribute `inWork` is reset to the value "00", and the issue number incremented to indicate approved release of that instance of the data module. From issue "002" onwards the attribute `issueType` must not be set to the value "new" but is to reflect the release status of the instance of the data module. Examples are shown in [Table 3](#).

Table 3 Rules for the attributes `issueNumber`, `inWork`, and `issueType`

Numbering	Rule	Attribute value
000-01	new data module, first inwork version, status attribute <code>issueType="new"</code>	<code>inWork="01"</code> <code>issueNumber="000"</code> <code>issueType="new"</code>
000-02	new data module, second inwork version, status attribute <code>issueType="new"</code>	<code>inWork="02"</code> <code>issueNumber="000"</code> <code>issueType="new"</code>
000-NN	new data module, inwork version "NN", status attribute <code>issueType="new"</code>	<code>inWork="NN"</code> <code>issueNumber="000"</code> <code>issueType="new"</code>
001-00	first issue of data module, status attribute <code>issueType="new"</code>	<code>inWork="00"</code> <code>issueNumber="001"</code> <code>issueType="new"</code>
001-01	first issue of data module, first inwork version, status attribute <code>issueType="new"</code>	<code>inWork="01"</code> <code>issueNumber="001"</code> <code>issueType="new"</code>
001-02	first issue of data module, second inwork version, status attribute <code>issueType="new"</code>	<code>inWork="02"</code> <code>issueNumber="001"</code> <code>issueType="new"</code>
001-NN	first issue of data module, inwork version "NN", status attribute <code>issueType="new"</code>	<code>inWork="NN"</code> <code>issueNumber="001"</code> <code>issueType="new"</code>
002-00	second issue of data module, status attribute (for example) <code>issueType="changed"</code>	<code>inWork="00"</code> <code>issueNumber="002"</code> <code>issueType="changed"</code>

Numbering	Rule	Attribute value
NNN.00	issue "NNN" of data module, status attribute (for example) issueType="revised"	inWork="00" issueNumber="NNN" issueType="revised"

#### Child elements:

- [<sourceDmIdent>](#). Refer to [Para 2.2.1](#).
- [<repositorySourceDmIdent>](#). Refer to [Para 2.2.2](#).
- [<security>](#). Refer to [Para 2.2.3](#).
- [<derivativeClassification>](#). Refer to [Para 2.2.4](#).
- [<dataRestrictions>](#). Refer to [Para 2.2.5](#).
- [<logo>](#). Refer to [Para 2.2.6](#).
- [<responsiblePartnerCompany>](#). Refer to [Para 2.2.7](#).
- [<originator>](#). Refer to [Para 2.2.8](#).
- [<applicCrossRefTableRef>](#). Refer to [Para 2.2.9](#).
- [<applic>](#). Refer to [Chap 3.9.5.3](#).
- [<applicRef>](#). Refer to [Chap 3.9.5.2.1.13](#).
- [<techStandard>](#). Refer to [Para 2.2.10](#).
- [<brexDmRef>](#). Refer to [Para 2.2.11](#).
- [<qualityAssurance>](#). Refer to [Para 2.2.12](#).
- [<systemBreakdownCode>](#). Refer to [Para 2.2.13](#).
- [<functionalItemCode>](#). Refer to [Para 2.2.14](#).
- [<functionalItemRef>](#). Refer to [Para 2.2.15](#).
- [<skillLevel>](#). Refer to [Para 2.2.16](#).
- [<reasonForUpdate>](#). Refer to [Chap 3.9.5.2.1.1](#).
- [<productSafety>](#). Refer to [Para 2.2.17](#).
- [<remarks>](#). Refer to [Para 2.2.18](#).

#### Business rule decision point BRDP-S1-00053 - Data module change/revised ratio:

- Decide on the threshold that a data module is considered revised rather than changed.

### 2.2.1 Source data module identification

**Description:** The element [<sourceDmIdent>](#) contains the identification of the source data module on which the current data module instance is based.

**Markup element:** [<sourceDmIdent>](#)

#### Attributes:

- None

#### Child elements:

- [<identExtension>](#). Refer to [Chap 4.12](#).
- [<dmCode>](#). Refer to [Para 2.1.1.1](#).
- [<language>](#). Refer to [Para 2.1.1.2](#).
- [<issueInfo>](#). Refer to [Para 2.1.1.3](#).

#### Markup example:

```
<sourceDmIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="131" infoCodeVariant="A" itemLocationCode="A"/>
<language languageIsoCode="en" countryIsoCode="US"/>
<issueInfo issueNumber="004" inWork="00"/>
</sourceDmIdent>
```

### 2.2.2 Repository source data module identification

**Description:** The element [<repositorySourceDmIdent>](#) contains the identifiers for additional Common Information Repository (CIR) data modules. It must be used when retrieving a self-contained data module from a CIR dependent data module and the associated CIR data module. Refer to [Chap 4.13.2](#).

**Markup element:** [<repositorySourceDmIdent>](#)

#### Attributes:

- None

#### Child elements:

- [<identExtension>](#). Refer to [Chap 4.12](#).
- [<dmCode>](#). Refer to [Para 2.1.1.1](#).
- [<language>](#). Refer to [Para 2.1.1.2](#).
- [<issueInfo>](#). Refer to [Para 2.1.1.3](#).

#### Markup example:

```
<repositorySourceDmIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00E" infoCodeVariant="A" itemLocationCode="A"/>
<language languageIsoCode="sx" countryIsoCode="US"/>
<issueInfo inWork="00" issueNumber="004"/>
</repositorySourceDmIdent>
```

### 2.2.3 Security classification

**Description:** The element [<security>](#) contains the security classification and restrictive marking of the complete data module and its contained or associated illustrations. For the permissible values for the attributes of the element [<security>](#), refer to [Chap 3.9.6.1](#).

**Markup element:** [<security>](#)

#### Attributes:

- [securityClassification](#) (M), [commercialClassification](#) (O), [caveat](#) (O) and [derivativeClassificationRefId](#) (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Business rule decision point BRDP-S1-00054 - Use and definitions of the attributes **commercialClassification** and **caveat**:

- Decide on the use and definitions of the attributes **commercialClassification** and **caveat**.

#### Business rule decision point BRDP-S1-00055 - Priorities and relationships of the security attributes **securityClassification**, **commercialClassification** and **caveat**:

- Decide on the priorities and relationships between the attributes **securityClassification**, **commercialClassification** and **caveat** if they are used.

#### Markup example:

The following is an example of a data module that has the value of the attribute **securityClassification** set to "04", which has been defined as secret, with a commercial classification of Commercial in Confidence and a caveat of United Kingdom (UK) Eyes Only.

```
<security securityClassification="04"
commercialClassification="cc51" caveat="cv51" />
```

The following shows a data module that has the lowest possible security classification.

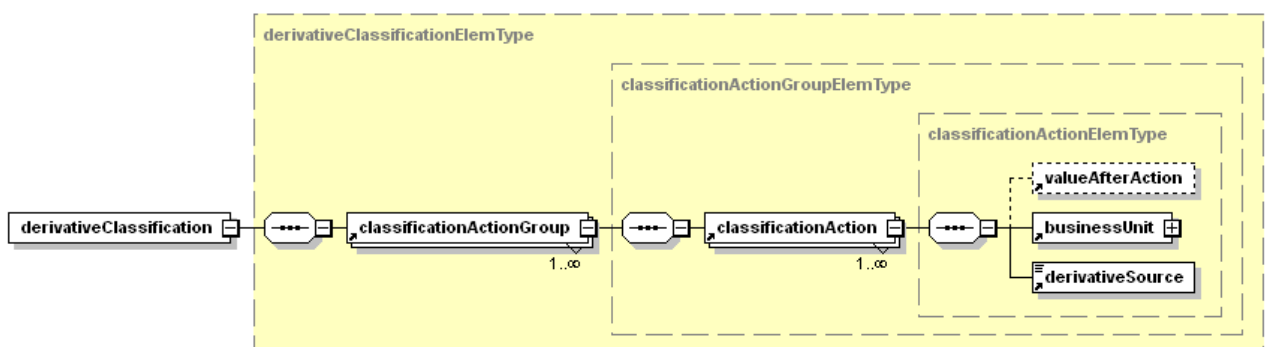

```
<security securityClassification="01" />
```

## 2.2.4

### Derivative classification

**Description:** The element [<derivativeClassification>](#) contains all derivative classification actions taken (eg, source material, date of action, action type) to the information in the complete publication.

**Markup element:** [<derivativeClassification>](#)

ICN-83007-0000000125-001-01

Fig 6 Element [<derivativeClassification>](#)

#### Attributes:

- None

#### Child elements:

- `<classificationActionGroup>`. Refer to [Para 2.2.4.1](#).

#### Business rule decision point BRDP-S1-00558 – Use of the element `<derivativeClassification>` within data modules:

- Decide whether and how to use the element `<derivativeClassification>`.

#### Markup example:

```
<derivativeClassification>
<classificationActionGroup id="dcg-001">
<classificationAction year="2012" month="03" day="15"
actionIdentType="ai01">
<businessUnit>
<businessUnitName>ASD Couriers</businessUnitName>
<contactPerson><lastName>Clifford</lastName></contactPerson>
</businessUnit>
<derivativeSource>Bike security guidance book
1</derivativeSource>
</classificationAction>
<classificationAction year="2012" month="11" day="02"
actionIdentType="ai09">
<valueAfterAction year="2013" month="03" day="15"
actionIdentType="ai02"/>    <businessUnit>
<businessUnitName>ASD Couriers</businessUnitName>
<contactPerson><lastName>Wink</lastName></contactPerson>
</businessUnit>
<derivativeSource>Bike security guidance book 2
</derivativeSource>
</classificationAction>
</classificationActionGroup>
</derivativeClassification>
```

The associated markup in the content section of the same data module is:

```
<para securityClassification="03" caveat="cv55"
derivativeClassificationRefId="dcg-001">The lighting system is
faulty and will be replaced by 2013-03-15.</para>
```

Setting the value of the attribute `derivativeClassificationRefId` to "[dcg-001](#)" provides the linking mechanism to the derivative classification information in the element `<classificationActionGroup>`, with the value of its attribute `id` also being set to "[dcg-001](#)".

The markup above results in setting up the derivative classifications and shows that the contents of the element `<para>` in the content section of the data module was:

- Classified by Clifford (ASD Couriers) on 2012-03-15 per Bike security guidance book 1.
- Upgrade to Security classification 04 per Wink (ASD Couriers) on 2012-11-02 per Bike security guidance book 1.
- Declassify per Wink (ASD Couriers) on 2013-03-15 per Bike security guidance book 2.

#### 2.2.4.1 Classification action group

**Description:** The element `<classificationActionGroup>` contains the set of classification actions that can be referred to using the attribute `derivativeClassificationRefId` within the element `<businessUnit>`.

**Attributes:**

`id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child element:**

`<classificationAction>`

#### 2.2.4.2 Classification action

**Description:** The element `<classificationAction>` contains the classification action.

**Attributes:**

- `actionIdentType` (M), the classification action. Refer to [Chap 3.9.6.1](#).
- `year` (M), the year of issue given as a four digit number
- `month` (M), the month of issue given as a two digit number
- `day` (M), the day of issue given as a two digit number

**Child elements:**

- `<valueAfterAction>`. Refer to [Para 2.2.4.2.1](#).
- `<businessUnit>`. Refer to [Chap 3.9.5.2.11.6](#).
- `<derivativeSource>`. Refer to [Para 2.2.4.2.2](#).

##### 2.2.4.2.1 Value after action

**Description:** The element `<valueAfterAction>` contains a secondary classification action to occur on secondary date.

**Attributes:**

- `actionIdentType` (M), the classification action. Refer to [Chap 3.9.6.1](#).
- `year` (M), the year of issue given as a four digit number
- `month` (M), the month of issue given as a two digit number
- `day` (M), the day of issue given as a two digit number

**Child elements:**

- None

##### 2.2.4.2.2 Derivative source

**Description:** The element `<derivativeSource>` contains a string that identifies the material from which the classification is derived.

**Attributes:**

- None

**Child elements:**

- None

## 2.2.5 Data restrictions

**Description:** The element `<dataRestrictions>` contains the instructions and information, applicable to the data module, that relate to the use, storage and handling. This element can contain applicability information. Projects must ensure the all data restriction information and information is in line with the project requirements.

**Markup element:** `<dataRestrictions>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

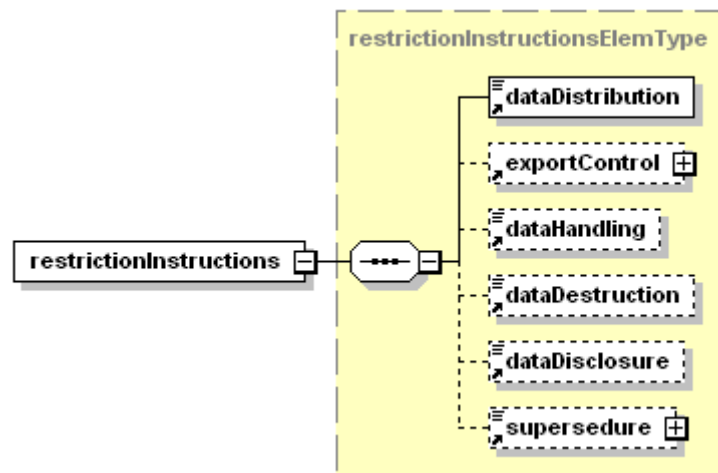

**Child elements:**

- `<restrictionInstructions>`. Refer to [Para 2.2.5.1](#).
- `<restrictionInfo>`. Refer to [Para 2.2.5.2](#).

### 2.2.5.1 Restriction instructions

**Description:** The element `<restrictionInstructions>` contains the instructions that must be followed when data restrictions apply.

**Markup element:** `<restrictionInstructions>`

ICN-83007-0000000030-002-01

Fig 7 Element `<restrictionInstructions>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<dataDistribution>`. Refer to [Para 2.2.5.1.1](#).
- `<exportControl>`. Refer to [Para 2.2.5.1.2](#).
- `<dataHandling>`. Refer to [Para 2.2.5.1.3](#).
- `<dataDestruction>`. Refer to [Para 2.2.5.1.4](#).
- `<dataDisclosure>`. Refer to [Para 2.2.5.1.5](#).
- `<supersedure>`. Refer to [Para 2.2.5.1.6](#).

**2.2.5.1.1 Data distribution**

**Description:** The element `<dataDistribution>` contains the instructions for distribution of a data module.

**Markup element:** `<dataDistribution>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**2.2.5.1.2 Export control**

**Description:** The element `<exportControl>` contains the information regarding export control of the data module. Refer to [Chap 3.9.5.1.1](#).

**2.2.5.1.3 Data handling**

**Description:** The element `<dataHandling>` contains any handling instructions, including storage, that are specific to the data module.

**Markup element:** `<dataHandling>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**2.2.5.1.4** *Data destruction*

**Description:** The element `<dataDestruction>` contains any destruction instructions that are specific to the data module and that must be applied.

**Markup element:** `<dataDestruction>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**2.2.5.1.5** *Data disclosure*

**Description:** The element `<dataDisclosure>` contains any special instructions with regard to the dissemination and disclose of the data module.

**Markup element:** `<dataDisclosure>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**2.2.5.1.6** *Supersedure*

**Description:** The element `<supersedure>` contains a notice that the data module supersedes other data modules. For example, the requirements that must be applied to a data module with regard to supersedure notices.

**Markup element:** `<supersedure>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- textual characters. Refer to [Chap 3.9.1](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.2.5.2

#### Restriction information

**Description:** The element `<restrictionInfo>` contains any other information that is related to data restrictions, such as copyright information, policy references and other conditions, for example, the content and extent of restriction information to include in a data module.

**Markup element:** `<restrictionInfo>`

ICN-83007-0000000031-002-01

Fig 8 Element `<restrictionInfo>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<copyright>`. Refer to [Para 2.2.5.2.1](#).
- `<policyStatement>`. Refer to [Para 2.2.5.2.3](#).
- `<dataConds>`. Refer to [Para 2.2.5.2.4](#).

#### 2.2.5.2.1

#### Copyright

**Description:** The element `<copyright>` contains the copyright information.

There are two methods for populating copyright information for a particular data module. These are:

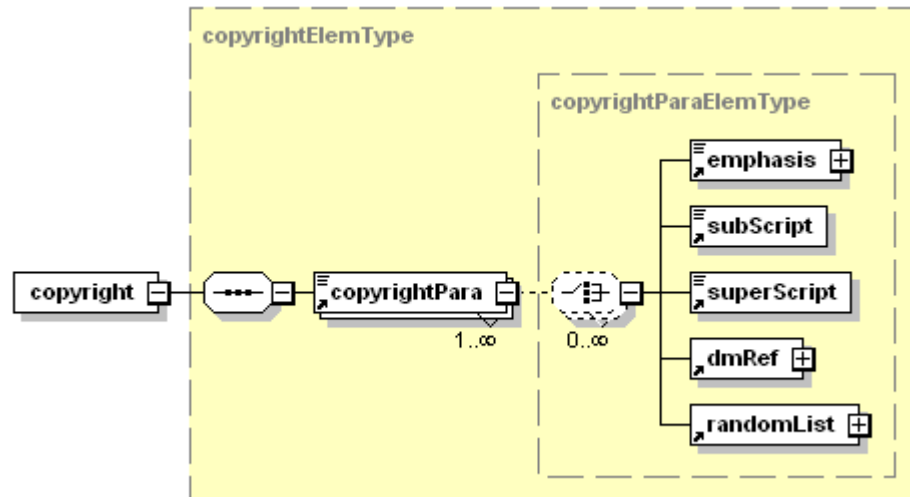

- by including the copyright information directly in data modules
- by reference to a specific data module that contains the copyright information

Both methods are permitted.

**Note**

When deciding on which method to use when there are likely to be changes to copyright information, using a single copyright data module means any changes would be made in one place.

**Markup element:** `<copyright>`

ICN-83007-0000000044-002-01

Fig 9 Element `<copyright>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<copyrightPara>`. Refer to [Para 2.2.5.2.2](#).

**Business rule decision point BRDP-S1-00065 - Use of the element `<copyright>` and source of copyright information:**

- Decide whether and how to use the element `<copyright>`. Any copyright information must be obtained from the relevant authority.

**Business rule decision point BRDP-S1-00066 - Method of populating copyright information (in each data module or in a consolidated data module):**

- Decide whether to populate copyright information in each data module or whether to cross-reference to a copyright data module.

**Note**

While choosing the population method, assess the impact of changes to copyright information on updating of data modules.

### Markup example:

Method 1: Recording copyright information directly in a data module. Note the use of the copyright character entity &copy; to get the required symbol "©".

```
<copyrightPara>
<emphasis>Copyright (C) 2016</emphasis> by each of the following
organizations:
<randomList>
<listItem>
<para>AeroSpace and Defence Industries Associations of Europe -
ASD.</para>
</listItem>
<listItem>
<para>Ministries of Defence of the member countries of
ASD.</para>
</listItem>
</randomList>
</copyrightPara>
```

Method 2: Reference to a specific copyright data module(s):

```
<copyright>
<copyrightPara>For Copyright information, refer to
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="A"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="021" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef> and
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="A"
systemCode="00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="01" disassyCodeVariant="A"
infoCode="021" infoCodeVariant="A" itemLocationCode="D" />
</dmRefIdent>
</dmRef>
</copyrightPara>
</copyright>
```

#### 2.2.5.2.2 Copyright paragraph

**Description:** The element `<copyrightPara>` contains the copyright statement itself or provides a cross-reference to another data module that contains the statement.

**Markup element:** `<copyrightPara>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- textual characters. Refer to [Chap 3.9.1](#).
- `<emphasis>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<randomList>`. Refer to [Chap 3.9.5.2.1.3](#).

#### 2.2.5.2.3 Policy reference

**Description:** The element `<policyStatement>` contains the reference to the security policy information.

**Markup element:** `<policyStatement>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### 2.2.5.2.4 Data conditions

**Description:** The element `<dataConds>` contains any information on any special conditions that can apply to the data module. For example, the security classification of a data module can be required to be changed when aggregated with other data modules with similar conditions.

**Markup element:** `<dataConds>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

### 2.2.6 Logo

**Description:** The element `<logo>` contains the reference to the manufacturer's, project's or sponsor's logotype.

Markup element: `<logo>`

Attributes:

- None

Child elements:

- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).

## 2.2.7 Responsible partner company

**Description:** The element `<responsiblePartnerCompany>` contains the company, organization or authority responsible for the data module. Only one entry is permitted.

The responsible partner company must indicate the company or organization responsible for the data module. In many projects there can be two or more partner companies and, in these cases, the organization must designate which company is the responsible for which data modules. Only the responsible partner company is indicated within the data module.

### Note

A responsible partner company can be defined as one of the companies or organization making up a consortium pursuing a common project. Each of these partner companies is responsible for a certain share of the total project effort, however, only one is designated as responsible for the population of the CSDB.

This company or organization must be indicated by either the name of the company and/or the company's CAGE code, which is the preferred method. For information control numbers that are not CAGE code based, and the SNS for non-characterized parts data modules, a project specific single alphanumeric character code as defined in [Chap 4.4](#). However, if a responsible partner company has an enterprise code, then that code must be used. Refer to default BREX rule BREX-S1-00035.

Markup element: `<responsiblePartnerCompany>`

Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `enterpriseCode` (O), containing the CAGE code of the enterprise.

Child elements:

- `<enterpriseName>`, string with the enterprise name.

### Business rule decision point BRDP-S1-00070 - Use of the element

`<enterpriseName>` and/or the attribute `enterpriseCode` for the responsible partner company:

- Decide whether to use the element `<enterpriseName>` and/or the attribute `enterpriseCode` to capture the name and CAGE code, respectively, of the responsible partner company. If the name is used it must be done consistently and be mandatory for the project.

## 2.2.8 Originator

**Description:** The element `<originator>` contains the identifier of the originating company or organization responsible for the production of the data module. The originator's code is indicated with the company name, the CAGE code, which is the preferred method, or both. Normally, the originator is defined as the designated design authority of the Product. However,

projects must nominate the originators. If a responsible partner company has an enterprise code, then that code must be used.

**Markup element:** `<originator>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `enterpriseCode` (O), containing the CAGE code of the enterprise. Refer to [Para 2.2.7](#).

**Child elements:**

- `<enterpriseName>` string with the enterprise name.

**Business rule decision point BRDP-S1-00071 - Use of the element**

**`<enterpriseName>` and/or the attribute `enterpriseCode` for the originator:**

- Decide whether to use the element `<enterpriseName>` and/or the attribute `enterpriseCode` to capture the name and CAGE code respectively, of the originator. If the name is used it must be done consistently and be mandatory for the project.

## 2.2.9 Applicability cross-reference table reference

**Description:** The element `<applicCrossRefTableRef>` contains a pointer to the Applicability Cross-reference Table (ACT) data module that applies to the data module. Refer to [Chap 3.9.5.3.1](#), [Chap 4.14](#), and [Chap 7.8](#).

**Markup element:** `<applicCrossRefTableRef>`

**Attributes:**

- None

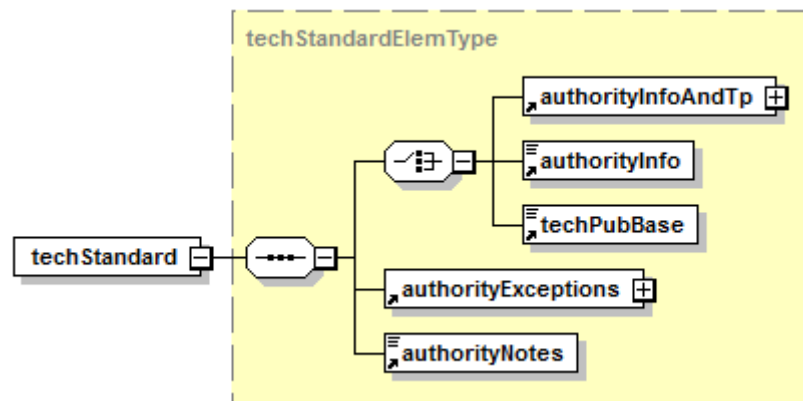

**Child elements:**

- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).

## 2.2.10 Technical standard

**Description:** The element `<techStandard>` contains the authorized technical standard and associated data to be entered, describing the information basis used to write the data module. The information basis can be described by giving, for example, the modification or drawing standard including amendments, alterations, etc, or a publication baseline. Technical standard, in this context, is defined as the technical design and development level of the technical information of the Product, on which the data module has been based. This element contains authority block or technical publications baseline number or both.

**Markup element:** `<techStandard>`

ICN-83007-0000000032-001-01

Fig 10 Element &lt;techStandard&gt;

#### Attributes:

- None

#### Child elements:

- <authorityInfoAndTp>. Refer to [Para 2.2.10.1](#).
- <authorityInfo>. Refer to [Para 2.2.10.2](#).
- <techPubBase>. Refer to [Para 2.2.10.3](#).
- <authorityExceptions>. Refer to [Para 2.2.10.4](#).
- <authorityNotes>. Refer to [Para 2.2.10.5](#).

#### 2.2.10.1 Authority block and technical publications information

**Description:** The element <authorityInfoAndTp> contains both the authority block information and the technical publications baseline when it is appropriate to use both.

**Markup element:** <authorityInfoAndTp>

#### Attributes:

- None

#### Child elements:

- <authorityInfo>. Refer to [Para 2.2.10.2](#).
- <techPubBase>. Refer to [Para 2.2.10.3](#).

#### 2.2.10.2 Authority information

**Description:** The element <authorityInfo> contains the authority that owns the source data from which the data module is written. If codes are used, they are determined by the project.

**Markup element:** <authorityInfo>

#### Attributes:

- None

#### Child elements:

- None

#### 2.2.10.3 Publication baseline number

**Description:** The element <techPubBase> contains the technical publication baseline to which the data module is written. The publication baseline number represents the technical build standard of the Product, which defines the technical standard by reference to a certain point in time. This is achieved by declaring a "Cut-off date" or milestone and listing the drawing set standard, relevant modification documents, etc, issued prior to the Cut-off or milestone date and used as source material for the production of data modules. The technical standard so defined, ensures that all data modules are to the same standard. Projects can also decide to use this element to record the delivery number of the Logistics Support Analysis Record (LSAR) to which the data module is written.

**Markup element:** <techPubBase>

#### Attributes:

- None

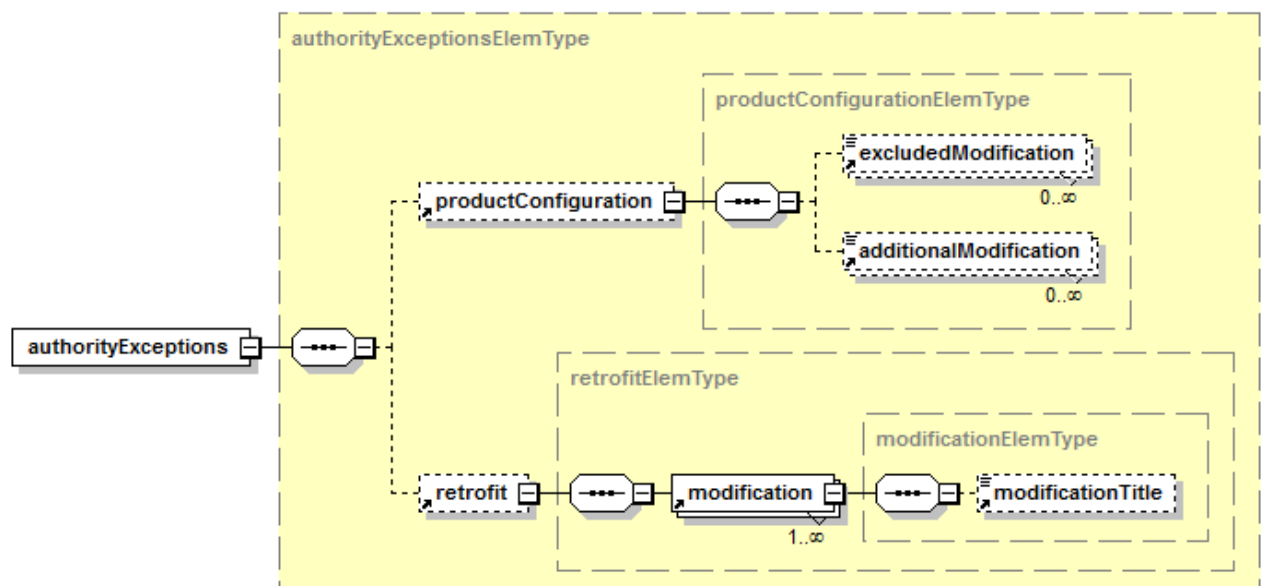

#### Child elements:

- None

#### 2.2.10.4 Authority exceptions

**Description:** The element <authorityExceptions> contains deviations of the data module content from the standard given in the authority block for configurations.

**Markup element:** <authorityExceptions>

ICN-83007-0000000123-001-01

Fig 11 Element <authorityExceptions>

#### Attributes:

- None

**Child elements:**

- `<productConfiguration>`. Refer to [Para 2.2.10.4.1](#).
- `<retrofit>`. Refer to [Para 2.2.10.4.4](#).

**2.2.10.4.1** *Product configuration*

**Description:** The element `<productConfiguration>` contains a reference to the Product configuration as defined for production in the authority block. Any deviation from that configuration or standard is shown by inserting the modification number.

**Markup element:** `<productConfiguration>`

**Attributes:**

- None

**Child elements:**

- `<excludedModification>`. Refer to [Para 2.2.10.4.2](#).
- `<additionalModification>`. Refer to [Para 2.2.10.4.3](#).

**2.2.10.4.2** *Excluded modification*

**Description:** The element `<excludedModification>` contains an indication that the modification is not covered even though it was actually required.

**Markup element:** `<excludedModification>`

**Attributes:**

- None

**Child elements:**

- None

**2.2.10.4.3** *Additional modification*

**Description:** The element `<additionalModification>` contains an indication that a modification is additionally covered.

**Markup element:** `<additionalModification>`

**Attributes:**

- None

**Child elements:**

- None

**2.2.10.4.4** *Retrofit*

**Description:** The element `<retrofit>` contains a reference to post-delivery changes that are usually performed in accordance with a retrofit order, (eg, pre- or post-modification).

**Markup element:** `<retrofit>`

**Attributes:**

- None

#### Child elements:

- [<modification>](#). Refer to [Para 2.2.10.4.5](#).

#### 2.2.10.4.5 Modification

**Description:** The element [<modification>](#) contains the identification of the retrofit order.

**Markup element:** [<modification>](#)

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `modificationType` (M), the type of modification in terms of pre, post and pre and post. The attribute can have one of the following values:
  - `"post"` (D) - indicates that the data is to a standard that is after the modification given
  - `"pre"` - indicates that the data is the initial standard, or to a previous modification standard than the one given
  - `"prandpo"` - indicates that the data is to a standard that satisfies both a standard before and after the modification given
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<modificationTitle>](#). Refer to [Para 2.2.10.4.6](#).

#### 2.2.10.4.6 Modification title

**Description:** The element [<modificationTitle>](#) contains the title of the modification.

**Markup element:** [<modificationTitle>](#)

#### Attributes:

- None

#### Child elements:

- None

#### 2.2.10.5 Authority notes

**Description:** The element [<authorityNotes>](#) contains additional information that can be necessary to explain preceding entries. Whenever a data module is only applicable to one or a range of serial numbers, this is stated here. It is recommended that, where applicable, the titles of documents be given under authority exceptions. The notes are also used for recording deficiency reports, special technical orders, service bulletins, explanations of excluded and additional modifications, and similar documents.

**Markup element:** [<authorityNotes>](#)

**Attributes:**

- None

**Child elements:**

- None

**2.2.11 Business rules reference**

**Description:** The element `<brexDmRef>` contains a pointer to the business rules data module (BREX data module) that applies to the data module. For a detailed description of the BREX module and related aspects, refer to [Chap 4.10](#).

**Markup element:** `<brexDmRef>`

**Attributes:**

- None

**Child elements:**

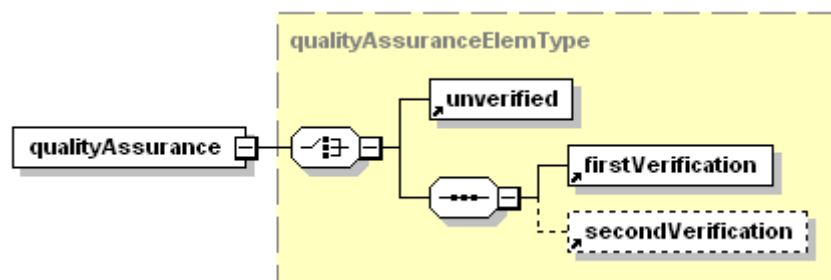

- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).

**2.2.12 Quality assurance**

**Description:** The element `<qualityAssurance>` contains details of the status of the QA process as required by the project. The data module must be identified as either being unverified or verified. This element can contain applicability information to indicate the applicability of the QA information. This applicability information must be a subset of the mandatory applicability settings for the complete data module. This applies equally to the element `<qualityAssurance>` and all its subelements.

The element `<qualityAssurance>` enables applicability filtering of the data upon publication. When there is more than one occurrence of the element `<qualityAssurance>`, each must have different applicability statements to enable applicability filtering of the data upon publication.

**Markup element:** `<qualityAssurance>`

ICN-83007-0000000033-002-01

Fig 12 Element `<qualityAssurance>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

**Child elements:**

- <unverified>. Refer to [Para 2.2.12.1](#).
- <firstVerification>. Refer to [Para 2.2.12.2](#).
- <secondVerification>. Refer to [Para 2.2.12.3](#).

## 2.2.12.1 Unverified

**Description:** The element <unverified> identifies that the data module has not yet been first verified.

**Markup element:** <unverified>

**Attributes:**

- None

**Child elements:**

- None

**Business rule decision point BRDP-S1-00077 - Exchange of draft data modules:**

- Decide whether the project will allow the exchange of draft data modules.

**Markup example:**

```
<qualityAssurance>
<unverified/>
</qualityAssurance>
```

## 2.2.12.2 First verification

**Description:** The element <firstVerification> identifies a data module which has been first verified. Refer to [Chap 3.7](#).

**Markup element:** <firstVerification>

**Attributes:**

- verificationType (M). The attribute can have one of the following values:
  - "tabtop" - used to indicate that the first verification was carried out on a desktop
  - "onobject" - used to indicate that the first verification was carried out at the Product
  - "ttandoo" - used to indicate that the first verification was carried out at the Product and on a desktop

**Child elements:**

- None

## 2.2.12.3 Second verification

**Description:** The element <secondVerification> identifies a data module which has been second verified. Data modules cannot be only second verified. They must also be first verified. Refer to [Chap 3.7](#).

**Markup element:** `<secondVerification>`

**Attributes:**

- `verificationType` (M). The attribute can have one of the following values:
  - `"tabtop"` - used to indicate that the second verification was carried out on a desktop
  - `"onobject"` - used to indicate that the second verification was carried out at the Product
  - `"ttandoo"` - used to indicate that the second verification was carried out at the Product and on a desktop

**Child elements:**

- None

**Markup example:**

```
<qualityAssurance>
<firstVerification verificationType="onobject"/>
<secondVerification verificationType="ttandoo"/>
</qualityAssurance>
```

### 2.2.13 System breakdown code

**Description:** The element `<systemBreakdownCode>` contains a code that captures the physical breakdown for those projects that are producing data modules that are in line with some logistic databases.

**Markup element:** `<systemBreakdownCode>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- None

### 2.2.14 Functional item code

**Description:** The element `<functionalItemCode>` contains a code that represents the functional breakdown.

**Markup element:** `<functionalItemCode>`

**Attributes:**

- None

**Child elements:**

- None

### 2.2.15 Functional item reference

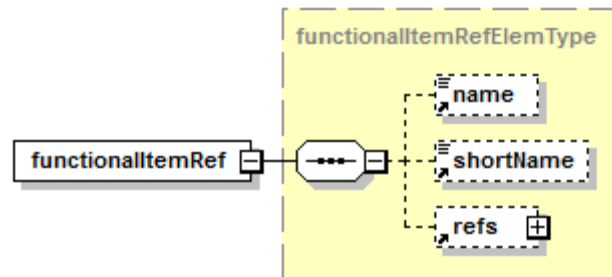

**Description:** The element `<functionalItemRef>` contains a reference to the functional item's CIR data module.

A functional item can be used to uniquely identify an item that performs a function, in a system that is part of a Product.

For example a functional item can be the third pump in a hydraulic system of a Product. Depending on the Product instance, this functional item can be mechanical or electrical, and so, can perform the function of a hydraulic pump.

The functional item is also known as the reference designator.

**Markup element:** `<functionalItemRef>`

ICN-83007-0000000124-001-01

Fig 13 Element `<functionalItemRef>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `functionalItemNumber` (M), the functional item number identifier. Refer to [Chap 3.9.5.2.7](#).
- `functionalItemType` (O), the functional item type. The attribute can have one of the following values:
  - "fit01" thru "fit99". Refer to [Chap 3.9.6.1](#).
- `installationIdent` (O), the installation identifier.
- `contextIdent` (O), the context identification (eg, the vendor's part number allocated to a next higher assembly). This identifier is used in combination with the attribute `manufacturerCodeValue` to ensure the uniqueness of the manufacturer's equipment data.
- `manufacturerCodeValue` (O), the CAGE code of the functional item designer. Since there is no standardized method for assigning functional item numbers, the CAGE code of the functional item designer ensures the uniqueness of a functional item number.
- `itemOriginator` (O), the originator of the functional item. This is used to indicate the origin of the equipment (eg, if the equipment is an aircraft manufacturer equipment).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<name>` (O), gives the name of the functional item. Refer to [Chap 3.9.5.2.1.10](#).
- `<shortName>` (O). Refer to [Chap 3.9.5.2.1.10](#).
- `<refs>` (O), references providing a link to the functional item. Refer to [Chap 3.9.5.2.1.2](#).

**2.2.16**
**Skill level**

**Description:** The element `<skillLevel>` contains the skill level to which the data module has been written.

**Markup element:** `<skillLevel>`

**Attributes:**

- `skillLevelCode` (M), the actual code. The attribute can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**2.2.17**
**Product safety**

**Description:** The element `<productSafety>` contains an indication when a data module is transmitting information that affects the safety of the Product's users. The element `<productSafety>` can be empty or can contain textual information describing the urgency for processing the information in the data module and handling of the data module when third parties now operate the Product.

**Markup element:** `<productSafety>`

**Attributes:**

- `safetyLabel` (M), contains a short description of the type of safety issue or a category selected from industry standard safety labels.

**Child elements:**

- None

**2.2.18**
**Remarks**

**Description:** The element `<remarks>` can contain general remarks.

**Markup element:** `<remarks>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

**Child elements:**

- `<simplePara>` (O). Refer to [Chap 3.9.5.2.1.10](#).

## 1 General

This chapter contains information and guidance on the use of export controls. These controls are required to contain a statement regarding the regulations that apply to the data contained within a data module. The controls also contain an indicator that shows which government gives authority to the regulations defined. This information can be required by companies, government departments and their delivery systems to control the release of data to authorized users. In addition, it can be required by authorized users so they can further control transmittal and use of the data, as required by many export control regulations.

When using export controls, projects must consider the statutory requirements of their government and the end data users and their data management requirements. Other items to consider are the display of this data within the user interface. Projects are responsible to ensure that the export controls applied are correct for the data content and that they comply with the relevant regulations pertaining to export controls.

## 2 Export control

**Description:** The element <[exportControl](#)> is used to define any government regulations concerning access to the data module.

**Markup element:** `<exportControl>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `exportRegulationType` (O), the identification of the regulation type that governs the use of the data contained in the data module
- `governmentAuthority` (O), the identification of the government that controls the use of the data contained in the data module. It is recommended to use the two character country code as defined in International Standards Organisation (ISO) 3166-1.
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<exportRegistrationStmt>`. Refer to [Para 2.1](#).
- `<exportRegistrationCode>`. Refer to [Para 2.2](#).

## 2.1 Export registration statement

**Description:** The element `<exportRegistrationStmt>` is used to specify either a full or a partial export registration statement describing the export status of the data module content.

**Markup element:** `<exportRegistrationStmt>`

**Attributes:**

- `exportRole` (O), the description of whether this statement is a full statement or a partial statement. Valid values are:
  - `"full"`
  - `"partial"`

**Child elements:**

- `<simplePara>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).

**Note**

The content of the statement is made up of a choice of a combination of multiple instances of the child elements.

## 2.2 Export registration code

**Description:** The element `<exportRegistrationCode>` is used to indicate a coded value representing an export control property that applies to the content of the data module.

**Markup element:** `<exportRegistrationCode>`

**Attributes:**

- `exportRegulationCodeType` (O), the type of the regulation code. In the case of Export Administration Regulations (EAR), the value of the attribute can be "ECCN". In the case of International Traffic in Arms Regulations (ITAR), the value can be a program code related to the Project.

**Child elements:**

- None

### 3 Example

The following example shows an export control statement:

```
<exportControl exportRegulationType="EAR">
  <exportRegistrationStmt exportRole="partial"><simplePara>This
    information contains technology controlled under EAR. Transfer
    of this data to a foreign person without export approval is
    expressly prohibited.</simplePara></exportRegistrationStmt>
  <exportRegistrationStmt exportRole="full"><simplePara>Export of
    this technology is controlled under the United States Export
    Administration Regulations (EAR) (15 CFR 730-774). An export
    license may be required before it is used for development,
    production or use by foreign persons from specific countries.
    The controller of this data has the individual responsibility to
    abide by all export laws.</simplePara></exportRegistrationStmt>
  <exportRegistrationCode
    exportRegulationCodeType="ECCN">1E001</exportRegistrationCode>
  <exportRegistrationCode
    exportRegulationCodeType="ECCN">5A101</exportRegistrationCode>
  <exportRegistrationCode
    exportRegulationCodeType="ECCN">9A991</exportRegistrationCode>
</exportControl>
```

---

## **1 General**

The S1000D Schemas provide the capability to capture operator, maintenance and training content.

## **2 Content section**

The content section of a data module must be structured in accordance with one of the following information types:

- Descriptive information, refer to [Chap 3.9.5.2.2](#)
- Procedural information, refer to [Chap 3.9.5.2.3](#)
- Fault isolation information, refer to [Chap 3.9.5.2.4](#)
- Maintenance planning information, refer to [Chap 3.9.5.2.5](#)
- Crew/Operator information, refer to [Chap 3.9.5.2.6](#)
- IPD information, refer to [Chap 3.9.5.2.7](#)
- Battle damage assessment and repair information (to be included in a future change), refer to [Chap 3.9.5.2.8](#)
- Wiring data, refer to [Chap 3.9.5.2.9](#)
- Process data module, refer to [Chap 3.9.5.2.10](#)
- Common information repository data module, refer to [Chap 3.9.5.2.11](#)
- Container data module, refer to [Chap 3.9.5.2.12](#)
- Learning data module, refer to [Chap 3.9.5.2.13](#)
- Maintenance checklists and inspections, refer to [Chap 3.9.5.2.14](#)
- Service bulletins, refer to [Chap 3.9.5.2.15](#)
- Front matter, refer to [Chap 3.9.5.2.16](#)
- Shareable content objects (SCO), refer to [Chap 3.9.5.2.17](#)

Among these information types there are many common constructs. These are described in [Chap 3.9.5.2.1](#).

## 1 General

The content of a data module must be structured in accordance with the appropriate Schema and must be authored in line with the requirements given in the following:

- warnings cautions and notes (refer to [Chap 3.9.3](#))
- security classification (refer to [Chap 3.9.5.1](#))
- change marking (refer to [Chap 3.9.5.2.1.1](#))
- referencing (refer to [Chap 3.9.5.2.1.2](#))
- lists (refer to [Chap 3.9.5.2.1.3](#))
- captions (refer to [Chap 3.9.5.2.1.4](#))
- titles (refer to [Chap 3.9.5.2.1.5](#))
- tables (refer to [Chap 3.9.5.2.1.6](#))
- figures, multimedia and foldouts (refer to [Chap 3.9.5.2.1.7](#))
- hotspots (refer to [Chap 3.9.5.2.1.8](#))
- preliminary requirements (refer to [Chap 3.9.5.2.1.9](#))
- paragraphs (refer to [Chap 3.9.5.2.1.10](#))
- simple paragraphs (refer to [Chap 3.9.5.2.1.10](#))
- controlled content (refer to [Chap 3.9.5.2.1.11](#))
- common information (refer to [Chap 3.9.5.2.1.12](#))
- externalization (refer to [Chap 3.9.5.2.1.13](#))
- descriptive information (refer to [Chap 3.9.5.2.2](#))
- procedural information (refer to [Chap 3.9.5.2.3](#))
- fault information (refer to [Chap 3.9.5.2.4](#))
- maintenance planning information (refer to [Chap 3.9.5.2.5](#))
- crew/operator information (refer to [Chap 3.9.5.2.6](#))
- parts information (refer to [Chap 3.9.5.2.7](#))

Applicable to: All

S1000D-A-03-09-0502-01A-040A-A

Chap 3.9.5.2.1

- battle damage assessment and repair information (refer to [Chap 3.9.5.2.8](#))
- wiring information (refer to [Chap 3.9.5.2.9](#))
- process data module (refer to [Chap 3.9.5.2.10](#))
- common information repository data module (refer to [Chap 3.9.5.2.11](#))
- container data module (refer to [Chap 3.9.5.2.12](#))
- learning data module (refer to [Chap 3.9.5.2.13](#))

## 1 General

Indicating changes to CSDB objects is achieved by using the change markup provided by the Schemas. The types of changes are insertions, deletions and modifications for elements and/or text.

Tables, figures and warnings and cautions have special rules. Refer to [Para 2.5](#), [Para 2.6](#) and [Para 2.7](#), respectively.

### Note

The Data Dispatch Note (DDN) and Comment (COM) Schemas include the change markup only within the identification and status section.

With the exception of the DDN and COM, each CSDB object records the reasons for the changes in their identification and status section. Since reasons for changes are included in all the explanations of change in this chapter, the subject is explained first. Refer to [Para 2.2](#).

## 2 Using change markup

### 2.1 General rules

#### 2.1.1 Use limitations

The use of the change markup is limited to indicate technical changes only. Change markup must only be used to indicate changes since the previous issue of a data module and not between increments of the attribute `inwork`. Any changes indicated in the previous issue must be deleted for the upissue.

### Note

The previous issue of the data module remains stored in the CSDB with the change markup at that issue.

Editorial changes must not use change markup. Refer to default BREX rule BREX-S1-00044.

Data modules that have the value of the attribute `issueNumber` of the element `<issueInfo>` set to “001” and the value of the attribute `issueType` of the element `<dmStatus>` set to “new” must not use change markup. Refer to default BREX rule BREX-S1-00013 and BREX-S1-00036.

Generated TOC, LOT, LOF and references must not have changes applied or indicated.

### 2.1.2 Recording reasons for change

All elements that contain the change markup use a reason for update. Refer to [Para 2.2](#) and default BREX rules BREX-S1-00037 and BREX-S1-00038. However, graphics and multimedia can also use a reason for amendment. Refer to [Para 2.3](#).

### 2.1.3 Linking reasons for update

The details of the changes made within the content section of a data module are recorded in the identification and status section. Linking the change to the reason for change is achieved by using the attribute `reasonForUpdateRefIds` of the element that is changed and the attribute `id` of the element `<reasonForUpdate>`.

When the content of an element is changed, the value of its attribute `reasonForUpdateRefIds` is set to the same value as the attribute `id` of the element `<reasonForUpdate>`.

When the content of more than one element are affected by the same change, the value for each of the elements' attribute `reasonForUpdateRefIds` are set to the same value as the attribute `id` of the element `<reasonForUpdate>`.

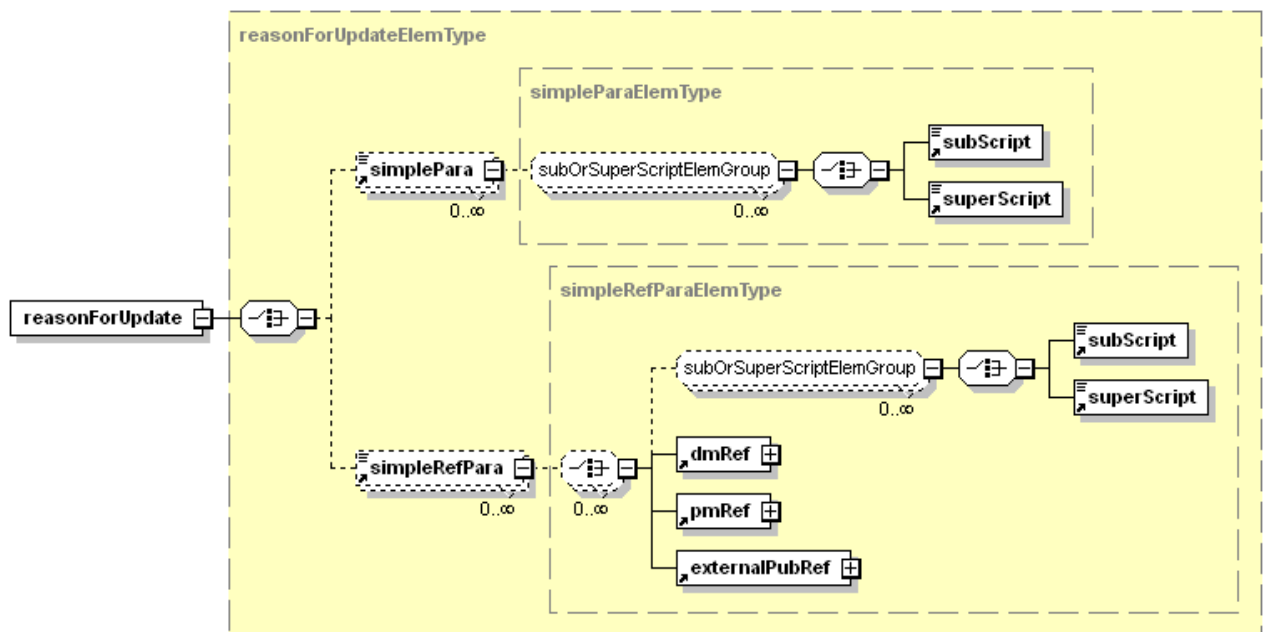

When the content of more than one element is affected by different changes, the elements affected by one change have the value for each of those elements' attribute `reasonForUpdateRefIds` set to the same value as the attribute `id` of one occurrence of the element `<reasonForUpdate>`. The elements affected by a different change have the value for each of those elements' attribute `reasonForUpdateRefIds` set to the same value as the attribute `id` of a separate occurrence of the element `<reasonForUpdate>`.

## 2.2 Reason for update

**Description:** The element `<reasonForUpdate>`, within the identification and status section, records the reasons for developing and issuing the data module (issue number 001) or the changes made to the data module since previous issue (ie, issue number 002 upwards). The element `<reasonForUpdate>` in data modules can be used to generate the highlights data module. Examples of highlight statements are:

- New. Developed to support situation X
- Revised to incorporate modification XYZ
- Deleted. Data module no longer required

**Markup element:** `<reasonForUpdate>`

ICN-83007-0000000072-002-01

Fig 1 Element `<reasonForUpdate>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `updateReasonType` (O), indicates the type of the reason for update that it applies to, and is configurable. Refer to [Chap 3.9.6.1](#). If this attribute is not used, a technical change is implied. The attribute can have one of the following values:
  - `"urt01"` - the changes are editorial (and therefore there must be no change markers in the data module that relate to this reason for update). There must be no technical changes in an element that relate to this reason for update.
  - `"urt02"` - the changes are technical. Provided that the data module is not revised, there must be change markers that relate to this reason for update.
  - `"urt03"` - the changes are related to markup only. If these changes affect the technical content of the data module, and the data module is of issue type changed, the changes that relate to this reason for update must be marked.
  - `"urt04"` - the changes are to applicability markings only. If these changes do not affect the technical content (or the issue type is other than changed), there must be no change markings in the data module that relate to this reason for update.
  - `"urt05"` - the changes are to referencing markings only. If these changes do not affect the technical content (or the issue type is other than changed), there must be no change markings in the data module that relate to this reason for update.
- `updateHighlight` (O), indicates whether the reason for update must appear in the highlights data module. The attribute can have one of the following values:
  - `"1"` - Yes, the reason for update must appear in the highlights data module
  - `"0"` - No, the reason for update must not appear in the highlights data module

Refer to default BREX rule BREX-S1-00039.

#### Child elements:

- <simplePara>. Refer to [Chap 3.9.5.2.1.10](#).
- <simpleRefPara>. Refer to [Chap 3.9.5.2.1.10](#).

#### Note

Both these elements are used to record the details of the change. Multiple occurrences of this element in a single occurrence of <reasonForUpdate> are not used to record individual changes made within the data module.

#### Business rule decision point BRDP-S1-00089 - Standard sentences for reasons for update:

- Decide whether standard sentences for reasons for update are to be used.

#### Business rule decision point BRDP-S1-00090 - Use of reason for update in conjunction with the production process:

- Decide whether the element <reasonForUpdate> is used during the production process.

#### Business rule decision point BRDP-S1-00091 - Use of applicability information:

- Decide whether it is permissible to differentiate reasons for update based on Product configuration.

## 2.3

### Reason for amendment

**Description:** When the element <reasonForAmendment> is used, it records the reason for the amendment to either a complete figure, or of individual illustration sheets of a multi-sheet figure. The element can contain free text and/or its child elements to record the reason.

If the change markup is used on the element <figure> then the change attributes on the element <graphic> of multi-sheet figures must not be used. Refer to default BREX rule BREX-S1-00043. This does not prevent the use of the element <reasonForAmendment> on a single illustration sheet of multi-sheet figures to indicate changes in the illustration itself.

If change marking indication is required on individual illustration sheets of a multi-sheet figure, then the appropriate change markup must be applied to the element <graphic>, and the change markup on the element <figure> must not be used.

A single occurrence of the element <reasonForAmendment> is used for each individual change.

The element <reasonForUpdate> that is referenced by the element <figure> or the element <graphic> is used as described in [Para 2.2](#), and contains general reasons why the figure (or illustration sheet) has been added, modified or deleted.

**Mark up element:** <reasonForAmendment>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).

#### Child elements:

- <functionalItemRef>. Refer to [Chap 3.9.5.1](#).
- <circuitBreakerRef>. Refer to [Chap 3.9.5.2.1.10](#).

- `<controlIndicatorRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<inlineSignificantData>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<quantity>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<zoneRef>*`. Refer to [Chap 3.9.5.2.1.10](#).

- `<pmRef>*`. Refer to [Chap 3.9.5.2.1.2](#).
- `<externalPubRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<footnote>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<footnoteRef>*`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<caption>*`. Refer to [Chap 3.9.5.2.1.4](#).
- `<captionGroup>*`. Refer to [Chap 3.9.5.2.1.4](#).
- `<verbatimText>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<sequentialList>`. Refer to [Chap 3.9.5.2.1.3](#).
- `<randomList>`. Refer to [Chap 3.9.5.2.1.3](#).
- `<definitionList>`. Refer to [Chap 3.9.5.2.1.3](#).

#### Note

The elements marked with an asterisk (\*) are not available in all data modules. Refer to [Chap 3.9.5.2.1.10](#).

## 2.4 Making changes to text

Text can be changed by changing a complete element or by changing the text within the element, which is known as inline change. In both cases, the attribute `issueType` of the element `<dmStatus>` is set to the value "[changed](#)".

### 2.4.1 Changing a complete element

When an element is added, modified or deleted, its change marking attribute values are set to indicate the display requirements and the type of change.

#### Markup element:

All elements that contain the following attributes:

#### Attributes:

- `changeMark` (O), indicates whether the display of a change bar, mark or other visual indication next to the entire content of an element being added, deleted or modified is intended. The attribute can have one of the following values:
  - "1" - Yes, the display of a change bar, mark or other visual indication is intended
  - "0" - No, the display of a change bar, mark or other visual indication is not intended

**Note**

If the attribute `changeMark` is not used, then there is no display of a change bar, mark or other visual indication intended.

- `changeType` (O), the type of the change. The attribute can have one of the following values:
  - `"add"` - the element is added
  - `"modify"` - the element is changed
  - `"delete"` - the element is deleted

**Note**

The attribute `changeType` can apply to any element and not especially to the element where the change occurs. Depending on the type of the change, propagation rules defining the change marking inheritance from the upper element to the lower can differ:

- Elements marked with the value `"modify"` are allowed to contain elements marked with values `"add"`, `"modify"` or `"delete"`
- Elements marked with the value `"delete"`: There is no need to set the change attributes on the element's children because this is implied. Any change markings on child elements are ignored by the presentation system.
- Elements marked with value `"add"`: There is no need to set the change attributes on the element's children because this is implied. Any change markings on child elements are ignored by the presentation system.

**Note**

If this attribute is not used, and the attribute `changeMark` is used, the change is assumed to be an addition.

- `reasonForUpdateRefIds` (O), this attribute is used to link to the appropriate occurrence of the element `<reasonForUpdate>`. Refer to [Para 2.1.3](#).

**Note**

When deleting an element, authors must ensure that any references to that element are not adversely affected by the deletion. Refer to default BREX rules BREX-S1-00041 and BREX-S1-00042.

**Markup example:**

```
<proceduralStep changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0005">
<para>Remove the four bolts
(<internalRef internalRefId="spa-0023"
internalRefTargetType="irtt06"/>).</para>
</proceduralStep>
```

The change markup shows that the element is added and a change bar, mark or other visual indication is intended to be displayed. The corresponding reason for update would be:

```
<reasonForUpdate id="rfu-0005" updateReasonType="urt02"
updateHighlight="1">
<simplePara>Updated to include the requirements of Brook Trekker
Modification PO-RT1/ON (extended length bottom-bracket shaft
bolts).</simplePara>
</reasonForUpdate>
```

The example shows that the reason for update indicates a technical change, because the attribute `updateReasonType` is set to the value "urt02". It is also intended that the reason for update appears in the highlights data module, because the attribute `updateHighlight` is set to the value "1".

#### Note

There is no need to set the change attributes on the element's child because this is implied. Any change markings on child elements are ignored by the presentation system.

### 2.4.2

#### Changing text inline

**Description:** The element `<changeInline>` must be used for changed data modules when changing parts of text within elements. The element `<changeInline>` must not be used to indicate that a complete element has been added, modified or deleted. Refer to default BREX rule BREX-S1-00040.

**Markup element:** `<changeInline>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Para 2.4.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<functionalItemRef>`. Refer to [Chap 3.9.5.1](#).
- `<circuitBreakerRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<controlIndicatorRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<inlineSignificantData>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<quantity>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<zoneRef>*`. Refer to [Chap 3.9.5.2.1.10](#).
- `<accessPointRef>*`. Refer to [Chap 3.9.5.2.1.10](#).
- `<identNumber>*`. Refer to [Chap 3.9.5.2.1.9](#).
- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<indexFlag>*`. Refer to [Chap 3.9.5.2.1.10](#).
- `<changeInline>`. Refer to [Para 2.4.2](#).
- `<emphasis>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<pmRef>*`. Refer to [Chap 3.9.5.2.1.2](#).
- `<externalPubRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<footnote>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<footnoteRef>*`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<caption>*`. Refer to [Chap 3.9.5.2.1.4](#).
- `<captionGroup>*`. Refer to [Chap 3.9.5.2.1.4](#).

- `<verbatimText>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<sequentialList>`. Refer to [Chap 3.9.5.2.1.3](#).
- `<randomList>`. Refer to [Chap 3.9.5.2.1.3](#).
- `<definitionList>`. Refer to [Chap 3.9.5.2.1.3](#).

#### Note

The elements marked with an asterisk (\*) are not available in all data modules. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<proceduralStep>
<para>Use the
<internalRef internalRefId="seq-0001"
internalRefTargetType="irtt05">wrench</internalRef>
to tighten the bolts to
<changeInline changeType="add" reasonForUpdateRefIds="rfu-0007"
changeMark="1">16 lb/in<sup>2</sup></changeInline>.</para>
</proceduralStep>
```

The change markup shows that the text "16 lb/in<sup>2</sup>" has been added. It is also intended that the change is indicated by displaying a change bar, mark or other visual indication. The corresponding reason for update would be:

```
<reasonForUpdate id="rfu-0007" updateReasonType="urt02"
updateHighlight="1">
<simplePara>The torque value is added</simplePara>
</reasonForUpdate>
```

The change markup shows that the reason for update indicates a technical change, because the attribute `updateReasonType` is set to the value "urt02". It is also intended that the reason for update appears in the highlights data module, because the attribute `updateHighlight` is set to the value "1".

## 2.5 Special rules for marking changes in tables

There are five ways to change mark a table. By marking the individual elements, the project gets flexibility at presentation. For the presentation of changes to tables, refer to [Chap 6.2.2](#). Tables can be change marked on:

- the complete table only and not the table title. Refer to [Para 2.5.1](#).
- the title of a table only. Refer to [Para 2.5.2](#).
- the complete table and the table title. Refer to [Para 2.5.3](#).
- individual rows only within a table. Refer to [Para 2.5.4](#).
- individual rows and the table title. Refer to [Para 2.5.5](#).

#### Business rule decision point BRDP-S1-00092 - Use of change marks for tables:

- Decide whether and how to use change marks for tables.

### 2.5.1 Marking only the complete table

Marking the complete table supports the standard page-oriented presentation. An alternative is to mark the table title line only. Refer to [Para 2.5.2](#).

- 2.5.1.1 Adding  
When a complete table is added, set appropriate values to the attributes of the element `<table>`.

**Markup example:**

```
<table id="tab-0003" changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0001">
<title>Title</title>
...
</table>
```

- 2.5.1.2 Modifying  
When a complete table is modified, set appropriate values to the attributes of the element `<table>`.

**Markup example:**

```
<table id="tab-0003" changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0002">
<title>Title</title>
...
</table>
```

- 2.5.1.3 Deleting  
When a complete table is deleted, set appropriate values to the attributes of the element `<table>`.

**Markup example:**

```
<table id="tab-0003" changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0003">
<title>Title</title>
...
</table>
```

- 2.5.2 Marking only the table title**  
Marking only the table title line supports the standard page-oriented presentation. An alternative is to mark the complete table. Refer to [Para 2.5.1](#).

- 2.5.2.1 Adding  
When only a table title is added, set appropriate values to the attributes of the element `<title>` within the element `<table>`.

**Markup example:**

```
<table id="tab-0004">
<title changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0004">Title added</title>
...
</table>
```

- 2.5.2.2 Modifying  
When only a table title is modified, set appropriate values to the attributes of the element `<title>` within the element `<table>`.

**Markup example:**

```
<table id="tab-0004">
<title changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0005">Title modified</title>
...
</table>
```

### 2.5.2.3 Deleting

When only a table title is deleted, set appropriate values to the attributes of the element `<title>` within the element `<table>`.

#### Markup example:

```
<table id="tab-0004">
<title changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0006">Title</title>
...
</table>
```

## 2.5.3 Marking a complete table and the table title

### 2.5.3.1 Adding

When a whole table and its title are added, set appropriate values to the attributes of the element `<table>`.

#### Markup example:

```
<table id="tab-0005" changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0007">
<title>Title added</title>
...
</table>
```

### 2.5.3.2 Modifying

Tables and their titles can be modified for the same reason or for different reasons.

#### 2.5.3.2.1 Same reason

When a table and its title are modified for the same reason, set appropriate values to the attributes of the element `<table>`.

#### Markup example:

```
<table id="tab-0005" changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0008">
<title>Title modified</title>
...
</table>
```

#### 2.5.3.2.2 Different reasons

When a table and its title are modified for different reasons, set appropriate values to the attributes of the element `<table>` and the element `<title>`.

#### Markup example:

```
<table id="tab-0005" changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0009">
<title changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0010">Title modified</title>
...
</table>
```

2.5.3.3 Deleting  
When a whole table and its title are deleted, set appropriate values to the attributes of the element `<table>`. Refer to [Para 2.5.1.3](#).

## 2.5.4 Marking only individual rows within a table

2.5.4.1 Adding  
When a row is added, set appropriate values to the attributes of the element `<row>`.

### Markup example:

```
<table id="tab-0006">
<title>Title</title>
<tgroup cols="3">
<tbody>
<row changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0011">
<entry><para>This paragraph has been added.</para></entry>
...
</row>
...
</tbody>
</tgroup>
</table>
```

2.5.4.2 Modifying  
When a row is modified, set appropriate values to the attributes of the element `<row>`.

### Markup example:

```
<table id="tab-0006">
<title>Title</title>
<tgroup cols="3">
<tbody>
<row changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0012">
<entry><para>This paragraph has been modified.</para></entry>
...
</row>
...
</tbody>
</tgroup>
</table>
```

2.5.4.3 Deleting  
When a row is deleted, set appropriate values to the attributes of the element `<row>`.

### Markup example:

```
<table id="tab-0006">
<title>Title</title>
<tgroup cols="3">
<tbody>
<row changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0013">
<entry><para>This paragraph has been deleted.</para></entry>
...
</row>
...
</tbody>
</tgroup>
</table>
```

```

</row>
...
</tbody>
</tgroup>
</table>

```

## 2.5.5 Marking individual rows within a table and the table title

### 2.5.5.1 Adding

When an individual row and the table title are added, set appropriate values to the attributes of the element `<title>` and the element `<row>`.

#### Markup example:

```

<table id="tab-0007">
<title changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0014">Title added</title>
<tgroup cols="4">
<tbody>
<row changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0015">
<entry><para>This paragraph has been added.</para></entry>
...
</row>
...
</tbody>
</tgroup>
</table>

```

### 2.5.5.2 Modifying

When a row and the table title are modified, set appropriate values to the attributes of the element `<title>` and the element `<row>`.

#### Markup example:

```

<table id="tab-0007">
<title changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0016">Title modified</title>
<tgroup cols="4">
<tbody>
<row changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0017">
<entry><para>This paragraph has been modified.</para></entry>
...
</row>
...
</tbody>
</tgroup>
</table>

```

### 2.5.5.3 Deleting

When a row and the table title are deleted, set appropriate values to the attributes of the element `<title>` and the element `<row>`.

#### Markup example:

```
<table id="tab-0007">
<title changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0018">Title deleted</title>
<tgroup cols="4">
<tbody>
<row changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0019">
<entry><para>This paragraph has been deleted.</para></entry>
...
</row>
...
</tbody>
</tgroup>
</table>
```

## 2.6 Special rules for marking change in figures

There are three ways to change mark a figure. By marking the individual elements, the project gets flexibility at presentation. For the presentation of changes to figures, refer to [Chap 6.2.2](#). Figures can be change marked on:

- the figure only. Refer to [Para 2.6.1](#).
- the title of a figure only. Refer to [Para 2.6.2](#).
- the figure and the figure title. Refer to [Para 2.6.3](#).

### Business rule decision point BRDP-S1-00093 - Use of change marks for figures:

- Decide whether and how to use change marks for figures.

### 2.6.1 Marking the complete figure only

#### 2.6.1.1

##### Adding

When a figure is added, its title is also added, because the element `<title>` is mandatory within the element `<figure>`. Set appropriate values to the attributes of the element `<figure>`.

##### Markup example:

```
<figure id="fig-0003" changeType="add" changeMark="1"
reasonForUpdateRefIds="rfu-0001">
<title>Title</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-001-01"/>
</figure>
```

#### 2.6.1.2

##### Modifying

When a figure only is modified, set appropriate values to the attributes of the element `<figure>`.

##### Markup example:

```
<figure id="fig-0003">
<title>Title</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-002-01"
changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0002"/>
</figure>
```

- 2.6.1.3 Deleting  
When a whole figure is deleted, set appropriate values to the attributes of the element `<figure>`.

**Markup example:**

```
<figure id="fig-0003" changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0003">
<title>Title</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-003-01" />
</figure>
```

**Note**

The graphic is still upissued.

- 2.6.2 Marking only the figure title**  
Marking only the figure title will support the standard page-oriented presentation.

- 2.6.2.1 Adding  
Figure titles are mandatory within the element `<figure>` and can only be added with the figure. Refer to [Para 2.6.1.1](#).
- 2.6.2.2 Modifying  
When a figure title is modified, set appropriate values to the attributes of the element `<title>` within the element `<figure>`.

**Markup example:**

```
<figure id="fig-0003">
<title changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0004">Title modified</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-003-01" />
</figure>
```

- 2.6.2.3 Deleting  
Figure titles cannot be deleted without deleting the complete figure. Refer to [Para 2.6.1.3](#).

**2.6.3 Marking complete figures**

- 2.6.3.1 Adding  
When the figure is added, its title is also added, because the element `<title>` is mandatory within the element `<figure>`. Refer to [Para 2.6.1.1](#).
- 2.6.3.2 Modifying  
Figures and their titles can be modified for the same reason or for different reasons.
- 2.6.3.2.1 *Same reason*  
When a figure and its title are modified for the same reason, set appropriate values to the attributes of the element `<figure>`.

**Markup example:**

```
<figure id="fig-0007" changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0005">
<title>Title modified</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-003-01">
</figure>
```

#### 2.6.3.2.2 *Different reasons*

When a figure and its title are modified for different reasons, set appropriate values to the attributes of the element `<figure>` and the element `<title>`.

##### **Markup example:**

```
<figure id="fig-0007" changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0006">
<title changeType="modify" changeMark="1"
reasonForUpdateRefIds="rfu-0007">Title modified</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-003-01"/>
</figure>
```

#### 2.6.3.3 Deleting

When a figure and its title are deleted, set appropriate values to the attributes of the element `<figure>`.

##### **Markup example:**

```
<figure id="fig-0007" changeType="delete" changeMark="1"
reasonForUpdateRefIds="rfu-0008">
<title>Title</title>
<graphic infoEntityIdent="ICN-S3627-S1000D0800-004-01"/>
</figure>
```

##### **Note**

The graphic is still upissued.

#### 2.6.4 **Marking sheets in a multisheet figure**

When a sheet (or sheets) of a figure are changed, values for the attributes of the element `<graphic>` that contain the sheet are set in the same way as the element `<figure>`.

### 2.7 **Special rules for indicating changes in warnings and cautions**

It is essential that the user reads a complete warning and caution when performing the maintenance task. Therefore, change marks must be applied to the complete warning or caution and not to individual words or paragraphs that they contain.

##### **Markup example:**

The following example shows how to markup a warning that has changed.

```
<warning changeMark="1" changeType="modify"
reasonForUpdateRefIds="rfu-0022">
<warningAndCautionPara>Do not drink the oil or allow it to spill
on your skin. It can kill you.</warningAndCautionPara>
</warning>
```

The change markup shows that the element has been modified and a change bar, mark or other visual indication is intended to be displayed. The corresponding reason for update would be:

```
<reasonForUpdate id="rfu-0022" updateHighlight="1"
updateReasonType="urt02">
<simplePara>Warning changed in accordance with the new
requirements of HAZMAT001.</simplePara>
</reasonForUpdate>
```

The change markup shows that the reason for update indicates a technical change because the attribute `updateReasonType` is set to the value `urt02`. It is also intended that the reason for update appears in the highlights data module, because the attribute `updateHighlight` is set to the value `1`.

## 1 General

The rules, definitions and handling of references and cross-references from an author's point of view are given below. Details about the available elements and attributes and how to use and populate them are also given.

The rules for the presentation of references and cross-references in page-oriented publications and IETP are given in [Chap 6.2](#) and in [Chap 6.3](#), respectively.

References are used to direct the reader to another document or to a certain place within the document. Thus, there are two types of references used in S1000D:

- Cross-references - Internal references (eg, to other places within the same data module). Refer to [Para 2.1](#).
- References - External references:

- Refer to [Para 2.2](#) for a general description of the references to other data modules.
- Refer to [Para 2.3](#) for a general description of the references from SCO content data modules to portions of a destination data module.
- Refer to [Para 2.4](#) for a general description of references to publication modules.
- Refer to [Para 2.5](#) for a general description of references to other external documents.
- Refer to [Para 2.6](#) for rules regarding the presentation of references in the reference table of the data module.
- Refer to [Para 2.7](#) for rules regarding the use of "inline" references to other documents.

In IETP, references and cross-references are usually realized as links. To support establishment of such links, the reference elements are provided with five XLink attributes. These attributes are not aimed to be manually populated by an author. For guidance and examples, refer to [Chap 7.7.4](#).

References given in the SCO content data modules (using the SCO content Schema) include an XPath linking mechanism. For guidance and examples, refer to [Chap 7.7.5](#).

## 2 Use of references

### 2.1 Cross-references within a data module

**Description:** The element `<internalRef>` is used to markup a cross-reference from one point in a data module to another point in the same data module. This is achieved by linking the attribute `internalRefId` to the target attribute `id`, refer to [Para 2.1.1](#).

The identification of cross-references is described in [Para 2.1.1](#), and the linking mechanism is described in [Chap 7.7.4](#).

**Markup element:** `<internalRef>`

ICN-S3627-S1000D0570-001-01

Fig 1 Element `<internalRef>`

Hotspot areas within graphics can also be cross-referenced from within a data module and back by using the element `<internalRef>`. A graphical hotspot can also point at another graphical hotspot within the same graphic. Refer to [Chap 3.9.5.2.1.8](#) for details.

Cross-references can be made to any element that has its attribute `id` populated.

When cross-referring to an alternate element (`<figureAlts>`, `<levelledParaAlts>`, etc), use the attribute `id` of this element rather than its child element (`<figure>`, `<levelledPara>`, etc).

This chapter gives the rules for coding cross-references to:

- figures
- tables
- multimedia
- supplies
- support equipment
- spares

- material set lists
- paragraphs
- steps in procedures, fault isolation, etc
- graphics (sheets)
- multimedia objects
- hotspots
- parameters
- work locations
- single material or material sets
- access points
- zones.

Cross-references to paragraphs, steps, figures, sheets, hotspots, multimedia, multimedia objects and tables must be preceded with the prefixes "Para", "Step", "Fig", "Fig, Sheet", "Fig [ ]", "Fig, Object" and "Table", respectively, when presented. The prefix must include the number of the target, for example, the paragraph, step or figure number. These cross-references can be followed by a title by project decision.

#### Note

The prefixes are normally not entered in the data modules when data modules are written, since many tools automatically generate the prefixes, either by analyzing the reference or by using the attribute `internalRefTargetType`. Also refer to the business rule decision points below.

There are several methods that can be used to include and present the title or other supporting information for the cross-reference:

- Include the information as textual content in the element `<internalRef>`.

#### Note

The element `<internalRef>` can have textual content including subscripts and superscripts.

- Include the information in the attribute `targetTitle`.

The title of the target, if given, in the element `<title>` in `<levelledPara>`, `<proceduralStep>`, `<figure>`, `<multimedia>` or `<table>`, or in the attribute `hotspotTitle` can also be used for presentation.

#### Note

Presentation of the titles (by project decision) depends on the presentation system and its settings.

For all the methods listed above, the following rules apply:

- Any textual content of the element `<internalRef>` must be presented. Any information given in the attribute `targetTitle` is disregarded in a page-oriented presentation, but can be used as a tooltip in a viewer application.
- Cross-references to supplies, support equipment, spares, material sets and zones must be presented by the textual content of the target child element `<shortName>` or, if there is no element `<shortName>`, by the textual content of the element `<name>`. For an alternative presentation of zones, refer to [Chap 6.2.2](#).

If the project has decided to use and present any of the "identifiers" given in the elements `<reqSupplies>`, `<reqSupportEquips>` and `<reqSpares>`, respectively, (eg, the NATO stock number, the functional item number, or the CSN), the identifier must be

included in the textual content of the element `<internalRef>` in the delivered data modules. The "identifiers" can be derived from the content of these three elements.

When the element `<internalRef>` is populated, **only** the textual content of this element is presented, not the content of the element `<shortName>` or the element `<name>`.

**Note**

Any information given in the attribute `targetTitle` can be used as a tooltip in a viewer application.

- Cross-references to parameters, work locations and access points must be presented by the textual content of the child elements `<parameterName>`, `<workArea>` and `<name>`, respectively. For an alternative presentation of access points, refer to [Chap 6.2.2](#).

If the project has decided to use and present any of the "identifiers" given in the element `<workLocation>` (eg, the installation location, the coordinates on the Product, or an item on the Product), the identifier must be included in the textual content of the element `<internalRef>` in the delivered data modules. The "identifiers" can be derived from the content of the element `<workLocation>`.

When the element `<internalRef>` is populated, **only** the textual content of this element is presented. Refer to [Chap 6.2.2](#) for details.

**Note**

Make sure that either the element `<workArea>` or the element `<internalRef>` is populated.

**Note**

Any information given in the attribute `targetTitle` can be used as a tooltip in a viewer application.

- Cross-references to hotspots must be presented by the value of the attribute `referredFragment` of the element `<internalRef>`, or by the value of the target attribute `applicationStructureName` if there is no attribute `referredFragment`.

When the element `<internalRef>` is populated, **only** the textual content of this element is presented. Refer to [Chap 6.2.2](#) for details.

**Note**

Any information given in the target hotspot attribute `hotspotTitle` can be used as a tooltip in a viewer application.

For details on presentation of cross-references using target types "irtt01" thru "irtt17", refer to [Chap 6.2.2](#).

The author must in all cases enter all "separators" like comma [,], spaces [ ], parenthesis [(, )], "and" and "or".

Table 2 Cross-references - Examples

Cross-reference to	Method of presentation	Note
Para <levelledPara>	Para 3.2.1 (for <levelledPara> at third level)	This method is the usual method in documents using side heads.
A number of paragraphs	Para 2.1 and Para 3.4	
Table	Table 3	
Figure as a whole	Fig 1	
A number of figures as a whole	Fig 1, Fig 3 and Fig 5	
Illustration sheet of a multi-sheet figure	Fig 2, Sheet 3	An alternative method of presenting the cross-reference is Fig 2.3.
Cross-reference to a callout in a figure (hotspot)	Fig 1 [2]	Callout (Item) 2 in Fig 1
Cross-reference to several callouts in the same figure	Fig 6 [1], Fig 6 [3], Fig 6 [5]	

#### Attributes:

- internalRefId (O), the target id. Refer to [Para 2.1.1](#).
- internalRefTargetType (O), the type of destination of the reference. The attribute internalRefTargetType can have one of the following values:
  - "irtt01" thru "irtt99". Refer to [Chap 3.9.6.1](#). Refer to default BREX rules BREX-S1-00045 thru BREX-S1-00060.
- referredFragment (O), the cross-reference to an item number of a hotspot in an illustration within the data module. Refer to [Chap 3.9.5.2.1.8](#).
- targetTitle (O), a human-readable tooltip to be displayed when for instance the cursor is hovering over the target identifier in a viewer application. For details, refer to the rules given above.
- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Note

The element <internalRef> also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- <subScript>. Refer to [Chap 3.9.5.2.1](#).
- <superScript>. Refer to [Chap 3.9.5.2.1](#).

**Business rule decision point BRDP-S1-00094 - Extent of cross-referencing:**

- Decide on the extent of cross-referencing within data modules and the methods used for populating the various attributes.

**Business rule decision point BRDP-S1-00095 - Use of the element `<internalRef>` in titles:**

- Use of the element `<internalRef>` in titles is strongly discouraged. However, decide whether to use cross-references in titles.

**Business rule decision point BRDP-S1-00096 - Use of the attribute `targetTitle`:**

- Decide whether to use the attribute `targetTitle`. When used (populated), it is a tooltip in a viewer application.

**Business rule decision point BRDP-S1-00098 - Use of the textual content of the element `<internalRef>` in cross-references:**

- Decide whether to use the textual content of the element `<internalRef>`. When used (populated), it must be presented.

**Business rule decision point BRDP-S1-00099 - Use of the "identifiers" given in the elements `<reqSupportEquips>`, `<reqSupplies>`, `<reqSpares>` or `<workLocation>`:**

- Decide whether to use any of the "identifiers" given in the elements `<reqSupportEquips>`, `<reqSupplies>`, `<reqSpares>` or `<workLocation>` as the presented link (textual content of the element `<internalRef>`), or as a tooltip in a viewer application (value of the attribute `targetTitle`).

**Note**

The "identifiers" can be derived from the content of the child elements or the attributes of the four elements.

**Business rule decision point BRDP-S1-00100 - Use of the attribute `internalRefTargetType`:**

- Decide whether to use the attribute `internalRefTargetType`, which values to use and allocate suitable definitions to the values. Refer to [Chap 3.9.6.1](#).

**Markup examples:**

Example 1: Cross-reference to a levelled paragraph in a descriptive data module. The element `<internalRef>` is empty, and the value of the attribute `internalRefTargetType` is "irtt07". The project has decided **not** to present any titles for paragraph cross-references.

```
<para>For more information, refer to <internalRef
internalRefId="par-0074"
internalRefTargetType="irtt07"/>.</para>
```

- Presentation - Page-oriented:  
"For more information, refer to [Para 3](#)."
- Comment: The building of the link, the generation of the prefix "Para", together with the relevant paragraph number "3", is defined by the stylesheet". The attribute `targetTitle` is not populated.

Example 2: Cross-reference to a levelled paragraph in a descriptive data module. The element `<internalRef>` is empty, and the value of the attribute `internalRefTargetType` is "irtt07". The project has decided to present titles for paragraph cross-references.

```
<para>For more information, refer to <internalRef
internalRefId="par-0074"
internalRefTargetType="irtt07"/>.</para>
```

- Presentation - Page-oriented:

"For more information, refer to [Para 3](#) - All you need to know about cross-references."

- Comment: The building of the link, the generation of the prefix "Para", together with the relevant paragraph number "3", is defined by the stylesheet. The title of the target element ("All you need to know about cross-references") is derived from the target element and presented after the prefix (preceded by a space). The attribute `targetTitle` is not populated.

#### Note

Presentation of the title is dependent on the presentation system.

Example 3: Cross-reference to a table. The element `<internalRef>` is empty, and the attribute value is "irtt02". The project has decided not to present any titles for table cross-references.

```
<para>To get the latest time table for the express trains to
Linkoepping, refer to <internalRef internalRefId="tab-4711"
internalRefTargetType="irtt02"/>.</para>
```

- Presentation - Page-oriented:

"To get the latest time table for the express trains to Linkoepping, refer to [Table 7](#)."

- Comment: The building of the link, the generation of the prefix "Table ", together with the relevant table number "7", is defined by the stylesheet. The attribute `targetTitle` is not populated.

Example 4: Cross-reference to a table in a descriptive data module. The element `<internalRef>` has content and the attribute `internalRefTargetType` is not given.

```
<para>To identify power supply leads, refer to <internalRef
internalRefId="tab-0081">Power supply lead
identification</internalRef>.</para>
```

- Presentation - Page-oriented:

"To identify power supply leads, refer to [Table 6 Power supply lead identification](#)."

- Comment: The building of the link, the generation of the prefix "Table ", together with the relevant table number "6" is defined by the stylesheet. There is textual content ("Power supply lead identification") in the element `<internalRef>` which must be presented (after the prefix). The attribute `internalRefTargetType` is not populated, but the presentation system has to recognize the target type based on the target element.

Example 5: Cross-reference to a levelled paragraph in a descriptive data module. The attribute `targetTitle` has content, and the value of the attribute `internalRefTargetType` is "irtt07".

```
<para>All necessary information related to the weight variants,
their maximum weights and the modifications associated with the
aircraft type is given in <internalRef internalRefId="par-0123"
internalRefTargetType="irtt07" targetTitle="Weight variant
information list"/>.</para>
```

- Presentation - Page-oriented:  
"All necessary information related to the weight variants, their maximum weights and the modifications associated with the aircraft type is given in [Para 4](#)."
- Comment: The building of the link, the generation of the prefix "Para ", together with the relevant paragraph number "4", is defined by the stylesheet. The attribute `targetTitle` is populated, but is not shown in a page-oriented presentation. The value of the attribute `targetTitle` can be used as a tooltip in a viewer application.

Example 6: Cross-reference to a figure. The attribute `targetTitle` has content, and the value of the attribute `internalRefTargetType` is `"irtt01"`.

```
<para>Refer to <internalRef internalRefId="fig-0084"
internalRefTargetType="irtt01" targetTitle="Wing rib
stations"/>.</para>
```

- Presentation - Page-oriented:  
"Refer to [Fig 5](#)."
- Comment: The building of the link, the generation of the prefix "Fig", together with the figure number "5", is defined by the stylesheet. The attribute `targetTitle` is populated, but is not shown in a page-oriented presentation. The value of the attribute `targetTitle` can be used as a tooltip in a viewer application.

Example 7: Cross-reference to a hotspot. The element `<internalRef>` is empty, and the value of the attribute `internalRefTargetType` is `"irtt11"`. The attribute `referredFragment` is not populated.

```
<para>Tighten the nut <internalRef internalRefId="fig-1234-hot-
0935" internalRefTargetType="irtt11"/>.</para>
```

- Presentation - Page-oriented:  
"Tighten the nut, [Fig 6 \[25\]](#)".
- Comment: The building of the link, the generation of the prefix "Fig", together with the figure number "6", and the value of the target attribute `applicationStructureName` within square brackets "[25]" is defined by the stylesheet.

The attribute `targetTitle` is not populated. The markup of the destination for the internal reference contains:

```
<hotspot id="fig-1234-hot-0935"
applicationStructureIdent="hot0935"
applicationStructureName="25" hotspotType="CALLOUT"
hotspotTitle="25 - Under cover lock"></hotspot>
```

For more markup examples of hotspot linking, refer to [Chap 3.9.5.2.1.8](#).

Example 8: Cross-reference to a single sheet of a multi-sheet figure. The element `<internalRef>` is empty, and the value of the attribute `internalRefTargetType` is "irtt09". The project has decided to present titles for figure cross-references.

```
<para>Refer to <internalRef internalRefId="gra-1245"
internalRefTargetType="irtt09"/>.</para>
```

- Presentation - Page-oriented:

"Refer to [Fig 7, Sheet 2 The eminent Publishing WG in action.](#)"

- Comment: The building of the link, the generation of the prefix "Fig", together with the figure number "7", the word "Sheet" and the relevant target sheet number is defined by the stylesheet.

The project has decided to present the titles for figure cross-references. The attribute `targetTitle` is not populated. The figure title "The eminent Publishing WG in action" is derived from the child element `<title>` of the element `<figure>`, and is presented after the prefix (preceded by a space) as decided by the project.

Example 9: Cross-reference to support equipment. The short name "Voltmeter" is given in the preliminary requirements. The author has included a tooltip.

```
<para>Connect a <internalRef internalRefId="seq-2435"
internalRefTargetType="irtt05" targetTitle="Voltmeter (range 0-
100V)"/> to pin 34 and pin 38.</para>
```

- Presentation - Page-oriented:

"Connect a Voltmeter to pin 34 and pin 38."

- Comment: The `<shortName>` ("Voltmeter") given in the table Support equipment (in the element `<reqSupportEquips>`) is presented. The information given in the element `<targetTitle>` ("Voltmeter (range 0-100V)") can be used as a tooltip in a viewer application.

Example 10: Cross-reference to special support equipment. The element `<shortName>` is not given.

```
<para>In the cockpit, on the center pedestal, install the
<internalRef internalRefId="seq-1867"
internalRefTargetType="irtt05"/> on the slat/flap control
lever.</para>
```

- Presentation - Page-oriented:

"In the cockpit, on the center pedestal, install the Locking tool-flap slat control lever (98L27801001000) on the slat/flap control lever."

- Comment: The project follows the default rules and presents the name as given in the element `<name>` ("Locking tool-flap slat control lever (98L27801001000)") within the table Support equipment (in the element `<reqSupportEquips>`) of the preliminary requirements.

Example 11: Cross-reference to a supply. The element `<shortName>` is populated.

```
<para>Lightly lubricate with <internalRef internalRefId="sup-
3010" internalRefTargetType="irtt04"/>.</para>
```

- Presentation - Page-oriented:

"Lightly lubricate with Common grease Type 1."

- Comment: The project follows the default rules and presents the name ("Common grease Type 1") given in the element <shortName> within the table Consumables, materials and expendables (in the element <reqSupplies>).

Example 12: Cross-reference to an access point. The project has decided to present the content of the attributes accessPointNumber and accessPointTypeValue. The element <name> is not populated.

```
<para>Open <internalRef internalRefId="acp-0122"
internalRefTargetType="irtt16"/>.</para>
```

- Presentation - Page-oriented:  
"Open Access Panel 521 AT."
- Comment: As there is no value given in the element <name>, the alternate rules are used, and the content of the attribute accessPointTypeValue (value "accpn102" = Panel) followed by the content of the attribute accessPointNumber (value "521 AT") is presented after the prefix "Access ".

### 2.1.1 Identification of internal references (cross-references)

Usually, in an IETP a cross-reference will appear as a link, as described in [Para 2.1](#). However, there is also a number of possible implicit links in a data module which are not explicitly authored as cross-references. Examples are references from some content location to an applicability annotation located in the status section, or a reference from some content location to a change note in the element <reasonForUpdate>, also located in the status section.

To enable these references/links within the data module, the targets of the links must be uniquely identified which is achieved by providing the possible target elements with dedicated identification attributes. These are always named id. To establish a link, the element from where the link starts (source element) is provided with a corresponding attribute which is populated with the identity given by the attribute id of the target element. Link source attributes have names like xxxRefId.

In most implementations of S1000D, population of the element identities (ie, the id attributes) is cared for automatically.

**Business rule decision point BRDP-S1-00101 - Define the format of the cross-reference attributes id and internalRefId:**

- Decide whether the values of the cross-reference attributes id and internalRefId must be prefixed by alpha characters that identify the type of the target element. Example:
  - Structure: Prefix followed by a hyphen and a four digit number to make it unique within the data module (eg, "par-0001")
  - Prefixes:
    - "fig" for figures and alternates
    - "tab" for tables
    - "mma" for multimedia and alternates
    - "sup" for supplies
    - "seq" for support equipment
    - "spa" for spares
    - "par" for levelled paragraphs and alternates

- "stp" for steps of procedure, fault isolation, etc, and alternates
- "gra" for graphics (multiple sheets)
- "mmo" for multimedia objects
- "hot" for hotspots (eg, "fig-0001-hot-0002")
- "pme" for parameters
- "zon" for zones
- "wla" for work locations
- "mat" for single material or material sets
- "msl" for material set lists
- "acp" for access points

#### Note

The four digit number has no connection to, for example, the figure or table number which is generated for data module presentation. For example, the value of the attribute `id` can be "fig-0345" for "Fig 1". Refer to [Para 2.1](#).

#### Note

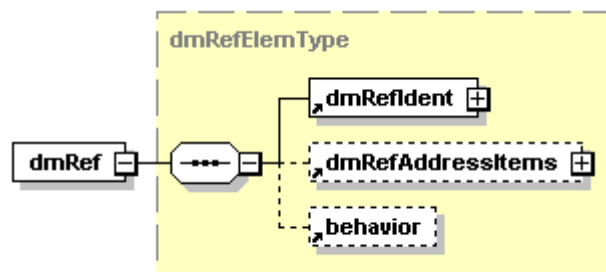

Refer to [Chap 3.9.5.2.1.10](#) for the equivalent business rule decision point regarding footnotes. Example: "ftn-0001".

## 2.2

### References to data modules

**Description:** The element `<dmRef>` contains the necessary information items to build a link to a destination data module. It contains the identification of the destination data module as well as information to control presentation and behavior of the reference/link to the data module or a fragment of the data module.

**Markup element:** `<dmRef>`

ICN-S3627-S1000D0571-001-01

Fig 2 Element `<dmRef>`

#### Attributes:

- `referredFragment` (O), the identification of an exact target within a data module when a reference addresses a specific location within another data module rather than the whole data module. The target must be an element in the destination data module, and the target identification is the value of the attribute `id` of the target element.
- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Para 2.1.1](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#)

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Note

The element `<dmRef>` also includes five attributes, normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<dmRefIdent>`, the items forming a unique identification of a destination data module. Refer to [Para 2.2.1](#).
- `<dmRefAddressItems>`, the additional information about the destination data module. Refer to [Para 2.2.2](#).
- `<behavior>`, the appearance/behavior of the destination data module or a fragment of the destination data module. Refer to [Para 2.2.3](#).

#### Markup example:

The following example shows a reference to another data module including its title and issue number (child elements are described below):

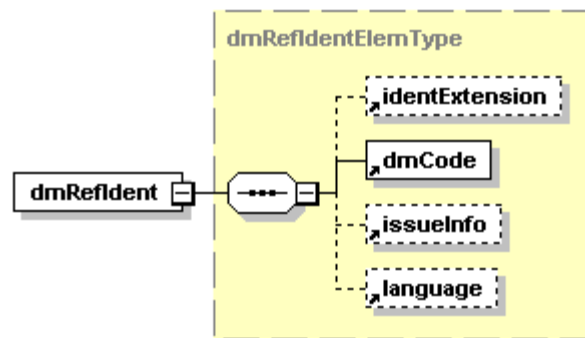

```
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Handlebar</techName>
<infoName>Remove procedures</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
```

### 2.2.1 Identification of a referred data module

**Description:** The element `<dmRefIdent>` contains the items forming a unique identification of the destination data module.

The project or the organization must be aware of the implications of using issue and inwork numbers as well as language and country codes of the destination data module when referenced data modules are updated.

**Markup element:** `<dmRefIdent>`

ICN-S3627-S1000D0572-001-01

Fig 3 Element `<dmRefIdent>`
**Attributes:**

- None

**Child elements:**

- `<identExtension>`, the additional parameters needed to establish a unique identification of a data module in those cases when data module code, issue and inwork numbers together with the language and country codes are insufficient to form a universally unique identity. The element `<identExtension>` establishes a producer unique subdomain for identification. Refer to [Chap 4.12](#).
- `<dmCode>`, the data module code of the destination data module. Refer to [Chap 3.9.5.1](#) and [Chap 4.3](#).
- `<issueInfo>`, the issue information needed to address a particular issue of the destination data module. Refer to [Chap 3.9.5.1](#).
- `<language>`, the language of the destination data module. Refer to [Chap 3.9.5.1](#).

**Markup examples:**

Reference to a data module with DMC:

```
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
```

Reference to a data module instance with DME:

```
<dmRefIdent>
<identExtension extensionProducer="SF518"
extensionCode="ABC00231"/>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
```

### 2.2.2 Complementary identifying information for a data module

**Description:** The element `<dmRefAddressItems>` contains additional identifying information about the destination data module.

The project or the organization must be aware of the implications of using the title and the issue date of the destination data module when referenced data modules are updated.

**Markup element:** `<dmRefAddressItems>`

ICN-S3627-S1000D0573-001-01

Fig 4 Element `<dmRefAddressItems>`

#### Attributes:

- None

#### Child elements:

- `<dmTitle>`, the data module title of the destination data module. Refer to [Chap 3.9.5.1](#).
- `<issueDate>`, the issue date of the destination data module. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<dmRefAddressItems>
<dmTitle>
<techName>Handlebar</techName>
<infoName>Remove procedures</infoName>
</dmTitle>
</dmRefAddressItems>
```

### 2.2.3 Link behavior information

**Description:** The element `<behavior>` contains the appearance (behavior) of the destination data module or a fragment of the destination data module.

**Markup element:** `<behavior>`

#### Attributes:

- `linkShow` (O), the link appearance, if an XLink link is established. Refer to [Chap 7.7.4](#). The attribute `linkShow` can have one of the following values:
  - `"newPane"` - show the referred context in a new pane
  - `"embedInContext"` - embed the referred context in the current context
  - `"replaceAndReturnToSource"` - show the referred context instead of the current context, and return automatically to the current context when the referred context has been viewed
  - `"replaceAndNoReturn"` - show the referred context instead of the current context, but do not automatically return to the current context when the referred context has been viewed.

- `linkActuate` (O), the link behavior, if an XLink link is established. Refer to [Chap 7.7.4](#). The attribute `linkActuate` can have one of the following values:
  - `"onLoad"` - present the referred context automatically when the link is loaded (ie, when the link appears in the currently viewed context)
  - `"onRequest"` - present the referred context on user request only

#### Child elements:

- None

#### Markup example:

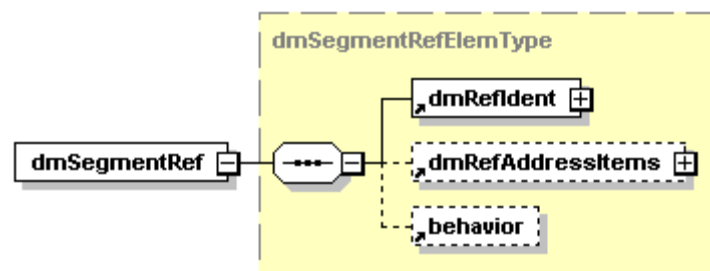

The following example illustrates how to markup a reference/link that will cause the reference target to show in a separate pane on the screen as soon as the link appears in the viewing context.

```
<behavior linkShow="newPane" linkActuate="onLoad"/>
```

## 2.3 References to portions of a data module from a SCO content data module

**Description:** The element `<dmSegmentRef>` contains all necessary details to constitute a reference from some context, such as a data module or a publication module, to portions of a destination data module by the use of an XPath expression.

**Markup element:** `<dmSegmentRef>`

ICN-S3627-S1000D0574-001-01

Fig 5 Element `<dmSegmentRef>`

#### Attributes:

- `targetPath` (M), the identification of the portion of a destination data module addressed by the reference. The portion is identified by the use of an XPath expression. For guidance and examples, refer to [Chap 7.7.5](#).
- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Para 2.1.1](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Note

The element `<dmSegmentRef>` also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<dmRefIdent>`, the items forming the unique identification of a destination data module. Refer to [Para 2.1.1](#).
- `<dmRefAddressItems>`, additional information about the destination data module. Refer to [Para 2.2.1](#).
- `<behavior>`, the appearance/behavior of the destination data module or a fragment of the destination data module. Refer to [Para 2.2.3](#).

#### Markup example:

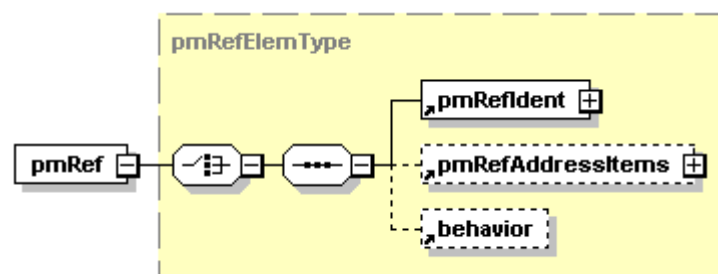

The following example shows a reference to another data module including its title and issue number:

```
<dmSegmentRef targetPath="//mainProcedure">
  <dmRefIdent>
    <dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
      systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
      assyCode="00" disassyCode="00" disassyCodeVariant="AA"
      infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
    <issueInfo issueNumber="007" inWork="00"/>
  </dmRefIdent>
  <dmRefAddressItems>
    <dmTitle>
      <techName>Handlebar</techName>
      <infoName>Remove procedures</infoName>
    </dmTitle>
  </dmRefAddressItems>
</dmSegmentRef>
```

## 2.4 References to publications

**Description:** The element `<pmRef>` contains details of the destination publication module that is referred from some other S1000D context, such as a data module or another publication module.

**Markup element:** `<pmRef>`

ICN-S3627-S1000D0575-001-01

Fig 6 Element `<pmRef>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Para 2.1.1](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

**Note**

The element `<pmRef>` also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

**Child elements:**

- `<pmRefIdent>`, the items forming a unique identification of a destination publication module. Refer to [Para 2.4.1](#).
- `<pmRefAddressItems>`, additional information about the destination publication module. Refer to [Para 2.4.2](#).
- `<behavior>`, the appearance/behavior of the destination publication module. Refer to [Para 2.2.3](#).

**Markup example:**

The following example shows a reference to an S1000D publication by using the elements `<pmRefIdent>` and `<pmRefAddressItems>` (child elements are described below):

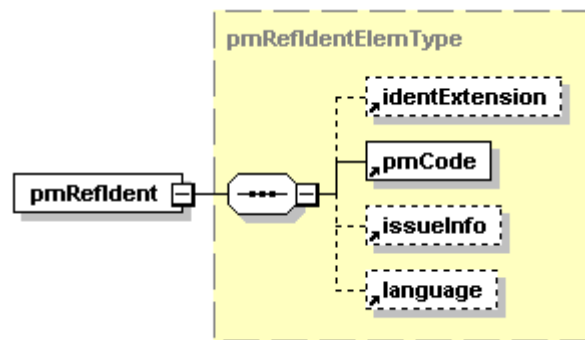

```
<pmRef>
<pmRefIdent>
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00"/>
</pmRefIdent>
<pmRefAddressItems>
<pmTitle>Bike manuals</pmTitle>
<issueDate year="2007" month="02" day="28"/>
</pmRefAddressItems>
</pmRef>
```

**2.4.1 Identification of a referred publication module**

**Description:** The element `<pmRefIdent>` contains the items forming a unique identification of the destination publication module.

The project or the organization must be aware of the implications of using issue and inwork numbers as well as language and country codes of the destination publication module when referenced publication modules are updated.

**Markup element:** `<pmRefIdent>`

ICN-S3627-S1000D0576-001-01

Fig 7 Element `<pmRefIdent>`

#### Attributes:

- None

#### Child elements:

- `<identExtension>`, the additional parameters needed to establish a unique identification of a publication module in those cases where the publication module code, the issue and inwork numbers together with the language and country are insufficient to form a universally unique identity. The element `<identExtension>` establishes a producer unique subdomain for identification. Refer to [Chap 4.12](#).
- `<pmCode>`, the publication module code of the destination publication module. Refer to [Chap 4.9.2](#).
- `<issueInfo>`, the issue information needed to address a particular destination publication module issue. Refer to [Chap 3.9.5.1](#).
- `<language>`, the language of the destination publication module. Refer to [Chap 3.9.5.1](#).

#### Markup examples:

Reference to a publication module with PMC:

```
<pmRefIdent>
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00" />
</pmRefIdent>
```

Reference to a publication module instance with PME:

```
<pmRefIdent>
<identExtension extensionProducer="SF518"
extensionCode="ABC00231" />
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00" />
</pmRefIdent>
```

## 2.4.2

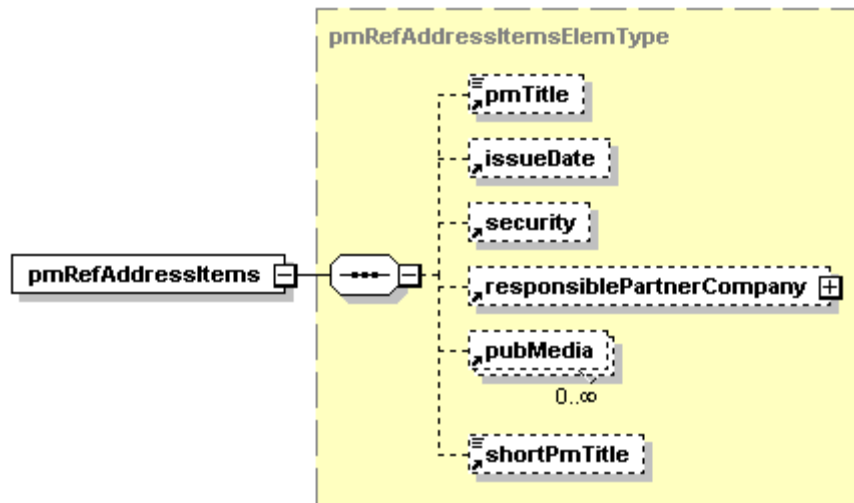

### Complementary identifying information for a publication module

**Description:** The element `<pmRefAddressItems>` contains additional identifying information about the destination publication module.

#### Note

Only the publication module code, the publication module title, and the issue number will be presented in page-oriented publications. Refer to [Chap 6.2.2](#).

Markup element: `<pmRefAddressItems>`

ICN-S3627-S1000D0577-001-01

Fig 8 Element `<pmRefAddressItems>`

#### Attributes:

- None

#### Note

The element `<pmRefAddressItems>` also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<pmTitle>`, the publication module title of the destination publication module. Refer to [Chap 4.9.1](#).
- `<issueDate>`, the issue date of the destination publication module. Refer to [Chap 3.9.5.1](#).
- `<security>`, the publication module security classification as described in [Chap 3.9.5.1](#).
- `<responsiblePartnerCompany>`, the responsible partner company of the publication module as described in [Chap 3.9.5.1](#).
- `<pubMedia>`, the media of the publication module as described in [Chap 4.9.1](#).
- `<shortPmTitle>`, the abbreviated alternate publication module title corresponding to the element `<pmTitle>`. This short form for the publication module title is meant to be presented in the narrative of the publication module to make the reading easier. Refer to [Chap 6.2.2](#) for presentation.

#### Markup example:

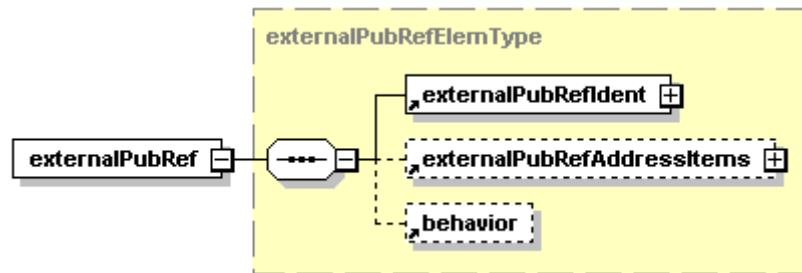

```
<pmRefAddressItems>
  <pmTitle>Bike manuals</pmTitle>
  <issueDate year="2007" month="02" day="28"/>
</pmRefAddressItems>
```

## 2.5 References to external documents

**Description:** The element `<externalPubRef>` contains the identification of a referenced non-S1000D publication or document.

Markup element: `<externalPubRef>`

ICN-S3627-S1000D0569-001-01

Fig 9 Element `<externalPubRef>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Para 2.1.1](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Note

The element `<externalPubRef>` also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<externalPubRefIdent>`, the identification of the non-S1000D publication or document. Refer to [Para 2.5.1](#).
- `<externalPubRefAddressItems>`, additional information about the non-S1000D destination publication or document. Refer to [Para 2.5.2](#).
- `<behavior>`, the appearance/behavior of the non-S1000D destination publication or document. Refer to [Para 2.2.3](#).

#### Markup example:

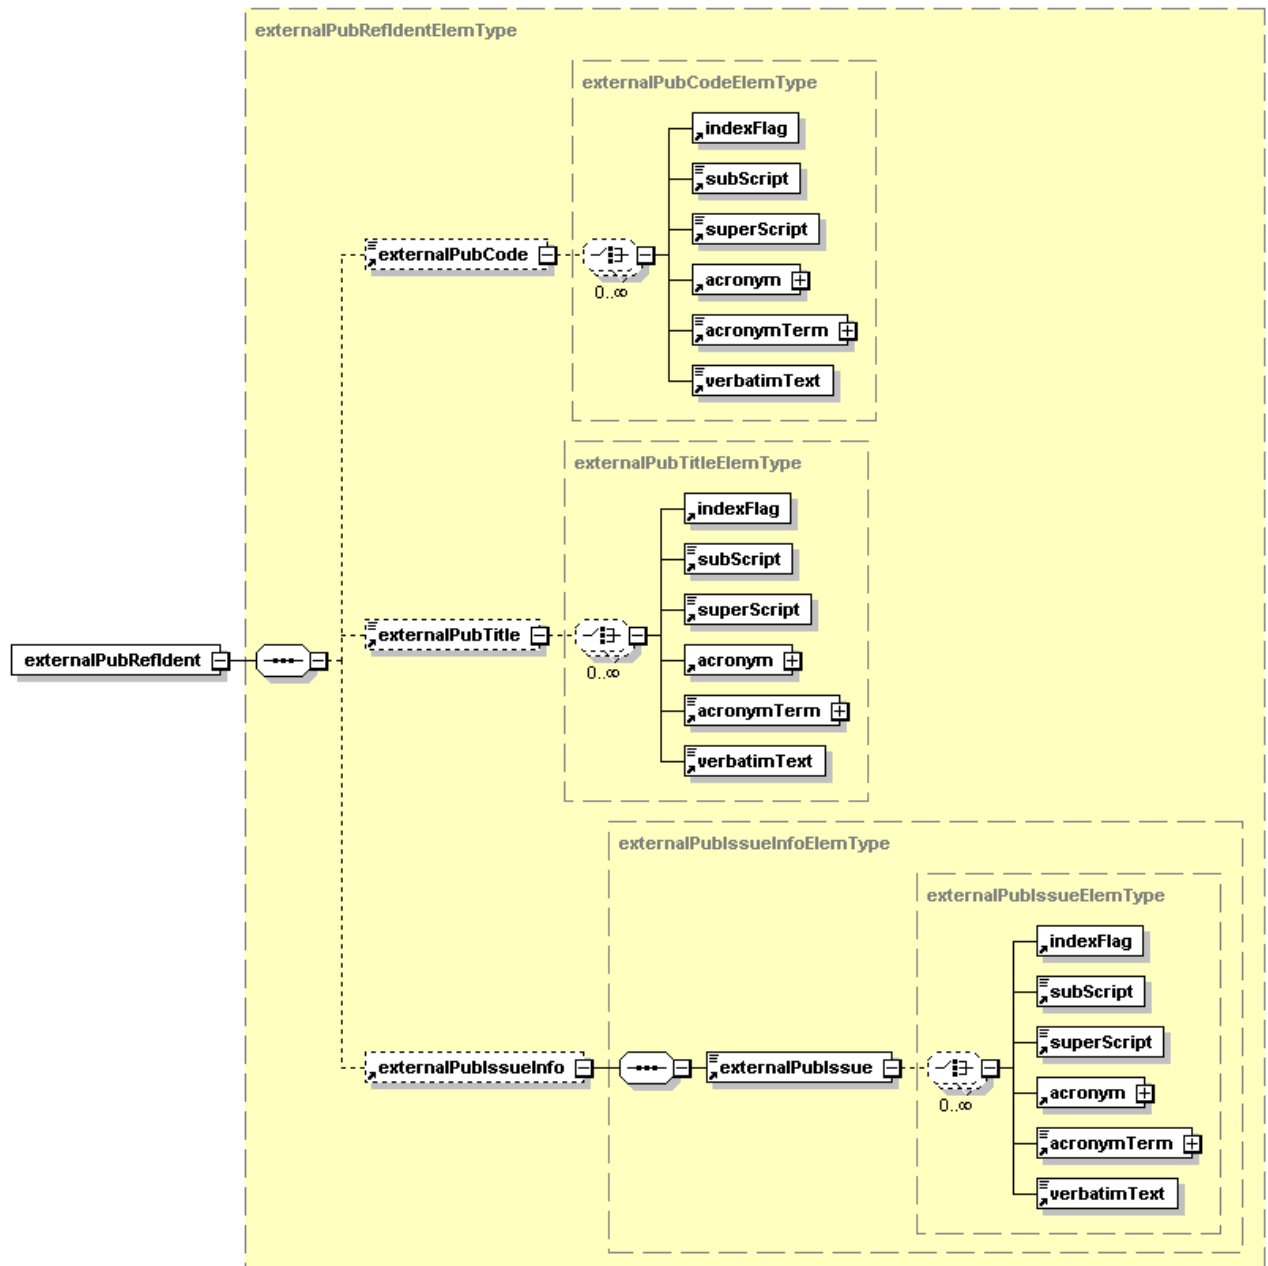

The following example shows a reference to another technical publication by using the element `<externalPubCode>` as free text:

```
<externalPubRef>
<externalPubRefIdent>
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
<externalPubTitle>Effective Cycling</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
```

### 2.5.1 Identification of an external document

**Description:** The element `<externalPubRefIdent>` contains the identification of a non-S1000D publication or document.

Markup element: `<externalPubRefIdent>`

ICN-S3627-S1000D0578-001-01

Fig 10 Element `<externalPubRefIdent>`

**Attributes:**

- None

**Child elements:**

- `<externalPubCode>`. Refer to [Para 2.5.1.1](#).
- `<externalPubTitle>`. Refer to [Para 2.5.1.2](#).
- `<externalPubIssueInfo>`. Refer to [Para 2.5.1.3](#).

**Markup example:**

```
<externalPubRefIdent>
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
<externalPubTitle>Effective Cycling</externalPubTitle>
</externalPubRefIdent>
```

## 2.5.1.1 Identifying code of an external document

**Description:** The element `<externalPubCode>` contains, as textual content, a code that identifies a publication or document by a non-S1000D identity, such as an ISBN code or similar.

**Markup element:** `<externalPubCode>`

**Attributes:**

- `pubCodingScheme` (O). Provides a reference to specification of the syntax of the identity given, such as "ISBN".

**Child elements:**

- `<indexFlag>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<verbatimText>`. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
```

## 2.5.1.2 Title of an external document

**Description:** The element `<externalPubTitle>` contains, as textual content, the title of a non-S1000D publication or document.

**Markup element:** `<externalPubTitle>`

**Attributes:**

- None

**Child elements:**

- `<indexFlag>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<verbatimText>`. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<externalPubTitle>Effective Cycling</externalPubTitle>
```

### 2.5.1.3 Issue information of an external document

**Description:** The element `<externalPubIssueInfo>` contains issue information concerning the referred non-S1000D publication or document.

**Markup element:** `<externalPubIssueInfo>`

**Attributes:**

- None

**Child elements:**

- `<externalPubIssue>`. Refer to [Para 2.5.1.3.1](#).

**Markup example:**

```
<externalPubIssueInfo>
<externalPubIssue>Issue B</externalPubIssue>
</externalPubIssueInfo>
```

### 2.5.1.3.1 Issue information of an external document

**Description:** The element `<externalPubIssue>` contains, as text content, issue identification of a non-S1000D publication or document.

**Markup element:** `<externalPubIssue>`

**Attributes:**

- None

**Child elements:**

- `<indexFlag>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<verbatimText>`. Refer to [Chap 3.9.5.2.1.10](#).

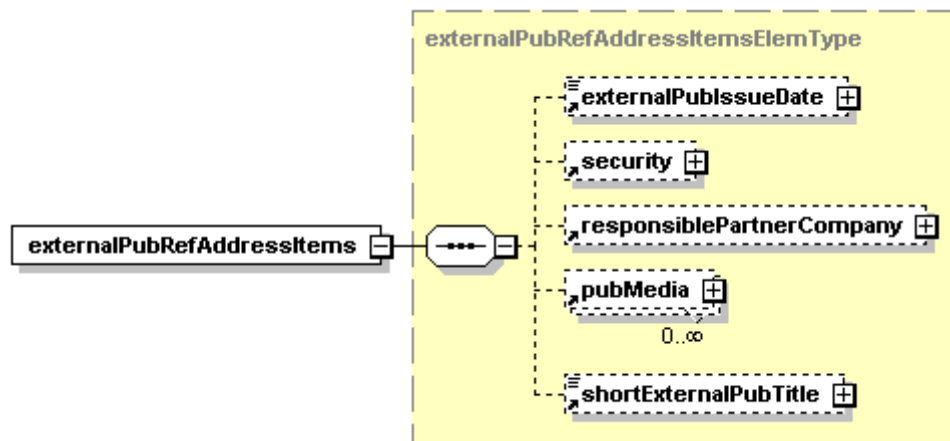

## 2.5.2 Complementary identifying information for an external document

**Description:** The element `<externalPubRefAddressItems>` contains, as textual content, additional information potentially useful to identify the non-S1000D destination publication or document.

**Note**

Only the publication code, title and date will be presented in page-oriented publications.  
Refer to [Chap 6.2.2](#).

**Markup element:** `<externalPubRefAddressItems>`

ICN-S3627-S1000D0579-001-01

Fig 11 Element `<externalPubRefAddressItems>`

#### Attributes:

- None

#### Child elements:

- `<externalPubIssueDate>`, the date given to the non-S1000D publication or document. Refer to [Para 2.5.2.1](#).
- `<security>`, the security of the non-S1000D publication or document. Refer to [Chap 3.9.5.1](#).
- `<responsiblePartnerCompany>`, the responsible partner company of the non-S1000D publication or document. Refer to [Chap 3.9.5.1](#).
- `<pubMedia>`, the media of the non-S1000D publication or document. Refer to [Chap 4.9.1](#).
- `<shortExternalPubTitle>`, an abbreviated alternate title (of the non-S1000D publication or document) corresponding to the element `<externalPubTitle>`. This short form for the publication title is meant to be presented in the narrative of the data module to make the reading easier. Refer to [Chap 6.2.2](#) for presentation.

#### 2.5.2.1 Issue date of an external publication

**Description:** The element `<externalPubIssueDate>` contains date information about the referenced publication.

If the `<externalPubIssueDate>` contains a date in textual form, then that text will be displayed to the user. If only the attributes are provided, then it must be displayed in the ISO 8601 calendar date format YYYY-MM or YYYY-MM-DD. If the attribute `month` of `<externalPubIssueDate>` is populated then the attribute `year` must also be populated. If the attribute `day` is populated then the attribute `month` must also be populated. Refer to default BREX rule BREX-S1-00061.

#### Attributes:

- `year` (O), the year of issue given as a four digit number
- `month` (O), the month of issue given as a two digit number
- `day` (O), the day of issue given as a two digit number.

### Markup example:

```
<externalPubRefAddressItems>
<externalPubIssueDate month="01" year="2010">January
2010</externalPubIssueDate>
</externalPubRefAddressItems>
```

## 2.6 References presented in the reference table of a data module

**Description:** The element `<refs>` contains all references to data modules, publication modules and to non-S1000D publications or documents given in the data module. It is used to populate the standardized tabular list "Table 1 References". This paragraph gives the rules and recommendations for inclusion of the standardized tabular list "Table 1 References" at the beginning of the data module content section.

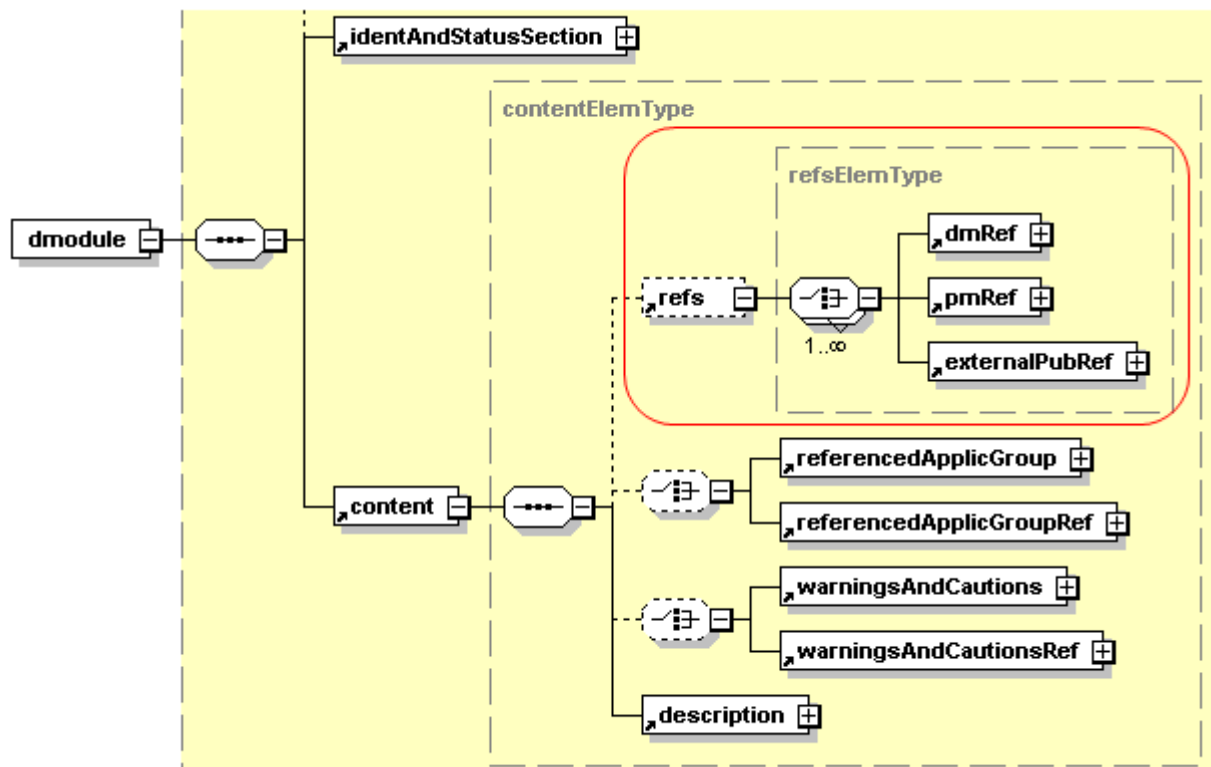

### Note

The element `<refs>` is also used to group the three child elements on a "lower level" within several types of Schema. Refer to [Para 2.7](#).

### Note

The element `<refs>`, to be presented in "Table 1 References", is either "authored" (in a "manual" authoring environment) or automatically populated before delivery of the self-contained data module by analyzing the inline references (refer to [Para 2.7](#)) in the data module.

Markup element: `<refs>`

ICN-S3627-S1000D0580-001-01

Fig 12 Element `<refs>`

Absence of the element `<refs>` indicates that there are no references to other data modules or technical publications.

**Note**

The absence of the element `<refs>` will be presented in the standardized table References with "None" in the left hand column. Refer to [Chap 6.2.2](#) for presentation rules and examples.

When the element `<refs>` is used, the referenced data modules, publication modules and non-S1000D publications or documents, must be listed in lexical order, with data modules first, publication modules second and non-S1000D publications or documents last.

Each referenced data module, document or other publication, must be listed only once in the element `<refs>`.

References must only be given to complete documents or to complete publications.

When referring to documents or publications without a data module code or without a publication module code, the reference must give an appropriate identification of the referred document or publication.

**Attributes:**

- None

**Child elements:**

- `<dmRef>`. Refer to [Para 2.2](#).
- `<pmRef>`. Refer to [Para 2.3](#).
- `<externalPubRef>`. Refer to [Para 2.5](#).

**Business rule decision point BRDP-S1-00106 - Population of the element `<refs>`:**

- Decide if and how the element `<refs>` is populated. If populated, the order of items in the list must be specified.

**Markup example:**

The following example shows a reference table including a reference to a data module, a publication module and to two non-S1000D documents of which one is identified by an ISBN code:

```
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A" />
<issueInfo issueNumber="002" inWork="00" />
</dmRefIdent>
<dmRefAddressItems>
<dmTitle><techName>Handlebar</techName>
<infoName>Remove procedures</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
<pmRef>
```

```

<pmRefId>
<pmCode modelIdentCode="S1000DBIKE" pmIssuer="SF518"
pmNumber="00003" pmVolume="00"/>
</pmRefId>
<pmRefAddressItems>
<pmTitle>Bike manuals</pmTitle>
<issueDate year="2007" month="02" day="28"/>
</pmRefAddressItems>
</pmRef>
<externalPubRef>
<externalPubRefId>
<externalPubTitle>Local Disposal Procedures</externalPubTitle>
</externalPubRefId>
</externalPubRef>
<externalPubRef>
<externalPubRefId>
<externalPubCode pubCodingScheme="ISBN">9999999999
</externalPubCode>
<externalPubTitle>Effective Cycling</externalPubTitle>
</externalPubRefId>
</externalPubRef>
</refs>

```

## 2.7 Inline use of references to other documents

**Description:** This paragraph gives the rules and recommendations for use of the elements [<dmRef>](#), [<pmRef>](#) and [<externalPubRef>](#) when they are used inline.

Referring to information not contained in the current context is achieved by using the element [<dmRef>](#) for data modules, the element [<pmRef>](#) for publication modules, or the element [<externalPubRef>](#) for non-S1000D publications or documents. The elements [<dmRef>](#), [<pmRef>](#) and [<externalPubRef>](#) must be populated as described in [Para 2.2](#), [Para 2.4](#) and [Para 2.5](#), respectively.

References can be made to a part of a data module using the attribute `referredFragment` of the element [<dmRef>](#). However, references to a part of a data module are only allowed into the following data modules:

- descriptive
- IPD
- schedules
- Service bulletins - only from procedures to material data sets in a Service bulletin
- common information repositories as described in [Chap 4.13.1](#). Refer to default BREX rules BREX-S1-00062 and BREX-S1-00063.
- procedural data modules from training data modules - only when the safety case is taken into account. Refer to [Chap 3.9.7](#) and [Chap 5.2.1.19](#).

Refer to the markup example below.

### Note

Only the data module code and the issue number will be presented in page-oriented publications. Refer to [Chap 6.2.2](#).

### Note

Only the publication module code (element [<pmCode>](#)) will be presented in page-oriented publications. Refer to [Chap 6.2.2](#).

Excessive linking, by references to data modules without real content apart from just another element `<dmRef>`, must be avoided.

The system must not generate the pre and post text (ie, the words before and after the referenced item), as this can interfere with authored text, prevents presentation in a different presentation system, and hinders information sharing between projects.

**Business rule decision point BRDP-S1-00107 - Define the words before and after the reference elements:**

- Define the words before and after the elements `<dmRef>`, `<pmRef>` and `<externalPubRef>`. This is important as it has implications on the stylesheets used. Example: For one implementation, the stylesheet can automatically generate the words "Refer to data module: "when it recognizes the element `<dmRef>`. This will cause problems if the author has written "Refer to" within the paragraph before the element `<dmRef>`.

**Markup example:**

The following example shows a reference to another data module without including the issue number and title.

```
... Refer to
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
for a functional ...
```

The following example shows a reference to a data module including the issue number and title.

```
... as described in
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA3" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="007" inWork="00"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Frame</techName>
<infoName>Description of how it is made</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
...
```

The following example shows a reference to a paragraph in another data module, without including the issue number and title.

```
<proceduralStep>
<para>Use the
<internalRef internalRefId="seq-0002"
internalRefTargetType="irtt05"/>
from the
<internalRef internalRefId="seq-0001"
internalRefTargetType="irtt05"/>
and attach the new
<internalRef internalRefId="spa-0001"
internalRefTargetType="irtt06"/>
to the wheel. Refer to
<dmRef referredFragment="par-0003">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="1" subSubSystemCode="0"
assyCode="20" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>.</para>
</proceduralStep>
```

## 1 General

This chapter contains the definition and handling of lists from an author's point of view. It gives details about the available elements and attributes for:

- sequential lists
- random lists
- definition lists

ICN-S3627-S1000D0541-001-01

Fig 1 The *listElementGroup*

Lists consist of two main parts, a title and the list items. The title is optional.

There must be no full stops after any list items if the items are not full sentences.

## 2 Lists

### 2.1 Sequential lists

**Description:** The element `<sequentialList>` contains sequential lists, which are also known as ordered lists. It can contain applicability information, a title and the list items themselves.

In a sequential list, a list item can consist of one or more paragraphs. A sequential list, when formatted, is numbered with Arabic numerals. Refer to [Chap 6.2.2](#).

Sequential lists must not be used to provide procedural step information. Refer to default BREX rule BREX-S1-00065.

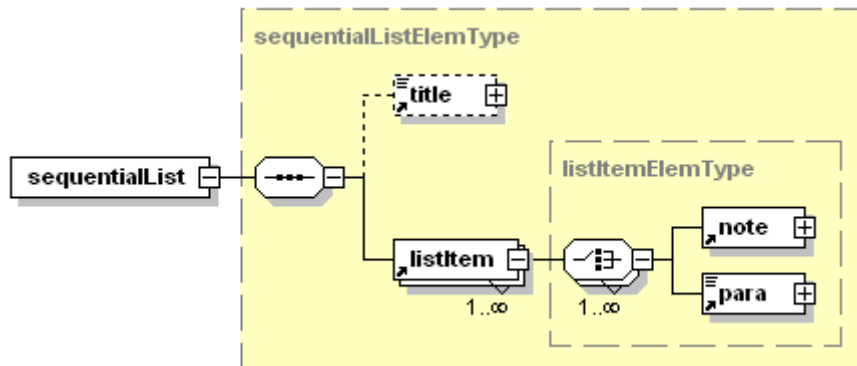

Only one sequential (ordered) list must be placed under a numbered title or paragraph (subheading). Refer to default BREX rule BREX-S1-00066.

Sequential lists are limited to a maximum of two levels. Refer to default BREX rule BREX-S1-00064.

**Note**

Sequential lists are not available in warnings and cautions. Refer to [Chap 3.9.3](#).

**Markup element:** `<sequentialList>`

ICN-S3627-S1000D0542-001-01

Fig 2 Element `<sequentialList>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<listItem>`. Refer to [Para 2.1.1](#).

**Markup example:**

Refer to [Para 3.1](#).

**2.1.1**
**List items**

**Description:** The element `<listItem>` contains a list item which can contain notes and paragraphs.

**Markup element:** `<listItem>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<note>`. Refer to [Chap 3.9.3](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).

### 2.1.2 Sequential lists in warnings and cautions

Refer to [Chap 3.9.3](#) for details concerning the element `<attentionSequentialList>`.

## 2.2 Random list

**Description:** The element `<randomList>` contains random lists. It can contain applicability information, a title and the list items themselves.

There are two types of random lists:

- simple - recognized by the value "pf01" of the attribute `listItemPrefix`
- unordered - recognized by the default value "pf02" of the attribute `listItemPrefix` giving the following default sequence of prefix: [-][●][-]

The difference between a simple random list and an unordered random list becomes visible when presented. Refer to [Chap 6.2.2](#).

Each list item, on any level, can consist of one or more paragraphs.

The use of the element `<randomList>` within the element `<action>` (in the fault Schema) is limited to one level. Refer to default BREX rule BREX-S1-00067.

**Markup element:** `<randomList>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `listItemPrefix` (O), the indicator whether the list is a simple list or an unordered list. The attribute can have one of the following values:
  - "pf01" thru "pf99". The default value is "pf02". Refer to [Chap 3.9.6.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<listItem>`. Refer to [Para 2.1.1](#).

#### Markup example:

Refer to [Para 3.2](#).

### 2.2.1 Random list in warnings and cautions

Refer to [Chap 3.9.3](#) for details of the element `<attentionRandomList>`.

### 2.2.2 Random lists in notes

Refer to [Chap 3.9.3](#) for details of the element `<attentionRandomList>`.

## 2.3 Definition list

**Description:** The element `<definitionList>` contains a list of terms and definitions. It can contain applicability information, a title and a definition list header. The body of the definition list comprises one or more definition list items, each containing a term and its definition.

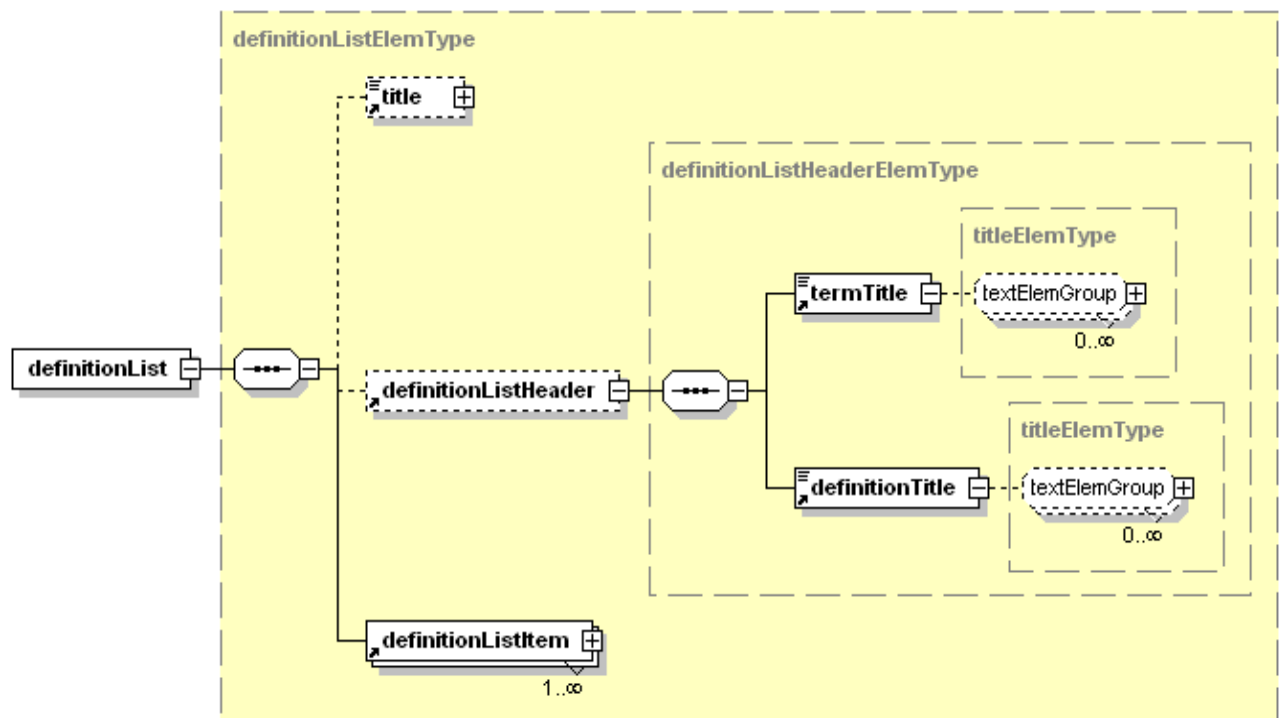

It is possible to have more than one paragraph in a definition.

The definition list is presented as a two column table that contains terms and definitions. Examples for use are the definition of terms and legends. Refer to [Chap 6.2.2](#).

### Note

Definition lists are not available in warnings, cautions and notes. Refer to [Chap 3.9.3](#).

**Markup element:** `<definitionList>`

ICN-S3627-S1000D0543-001-01

Fig 3 Element `<definitionList>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <definitionListHeader>. Refer to [Para 2.3.1](#).
- <definitionListItem>. Refer to [Para 2.3.2](#).

**Markup example:**

Refer to [Para 3.3](#).

## 2.3.1 Definition list headers

**Description:** The element <definitionListHeader> contains the column headers of the definition list. It can contain the term title and the definition title.

**Markup element:** <definitionListHeader>

**Attributes:**

- None

**Child elements:**

- <termTitle>. The column title for the terms. Refer to [Para 2.3.1.1](#).
- <definitionTitle>. The column title for the definitions. Refer to [Para 2.3.1.2](#).

### 2.3.1.1 Term title

**Description:** The element <termTitle> contains the column title for the terms.

**Markup element:** <termTitle>

**Attributes:**

- securityClassification (O), commercialClassification (O), and caveat (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- Includes the same set of child elements as the [textElementGroup](#) applicable to the actual data module type. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<termTitle>Attribute</termTitle>
```

### 2.3.1.2 Definition title

**Description:** The element <definitionTitle> contains the column title for the definitions.

**Markup element:** <definitionTitle>

**Attributes:**

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- Includes the same set of child elements as the [textElementGroup](#) applicable to the actual data module type. Refer to [Chap 3.9.5.2.1.10](#).

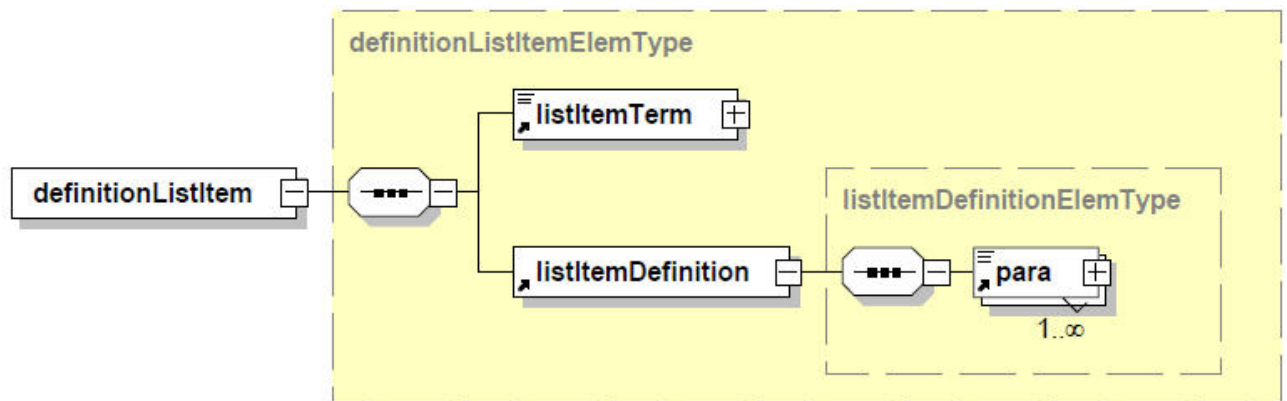

**Markup example:**

```
<definitionTitle>Value</definitionTitle>
```

**2.3.2**
**Definition list item**

**Description:** The element [<definitionListItem>](#) contains a definition list item.

**Markup element:** [<definitionListItem>](#)

ICN-S3627-S1000D0544-002-01

Fig 4 Element [<definitionListItem>](#)

**Attributes:**

- Includes the same set of attributes as the element [<sequentialList>](#). Refer to [Para 2.1](#).

**Child elements:**

- [<listItemTerm>](#). Refer to [Para 2.3.2.1](#).
- [<listItemDefinition>](#). Refer to [Para 2.3.2.2](#).

**2.3.2.1**
**List item term**

**Description:** The element [<listItemTerm>](#) contains the term to be defined.

**Markup element:** [<listItemTerm>](#)

**Attributes:**

- Includes the same set of attributes as the element [<sequentialList>](#). Refer to [Para 2.1](#).

**Child elements:**

- Includes the same set of child elements as the [textElementGroup](#) applicable to the actual data module type. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<listItemTerm>em01</listItemTerm>
```

### 2.3.2.2 List item definition

**Description:** The element `<listItemDefinition>` contains the definition of the term. It can contain one or more paragraphs.

**Markup element:** `<listItemDefinition>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<listItemDefinition><para>Bold</para></listItemDefinition>
```

## 3 Examples

### 3.1 Sequential lists

The following example shows a sequential list.

```
<para>This is an example of a sequential list with two items:
<sequentialList>
<listItem><para>This is the first list item.</para></listItem>
<listItem><para>This is the second list item.</para></listItem>
</sequentialList>
</para>
```

### 3.2 Random list

#### 3.2.1 Unordered

The following example shows an unordered random list.

```
<para>This is an example of an unordered random list with two
items:
<randomList listItemPrefix="pf02">
<listItem><para>This is the first list item.</para></listItem>
<listItem><para>This is the second list item.</para></listItem>
</randomList>
</para>
```

#### 3.2.2 Simple

The following shows a simple random list.

```
<randomList listItemPrefix="pf01">
<listItem><para>This is the first item.</para></listItem>
<listItem>
<para>This is the second item with two paras.</para>
<para>This is the second para of the second item.</para>
```

```
</listItem>
</randomList>
```

### 3.3 Definition list

The following is an example of a definition list.

```
<definitionList>
<definitionListItem>
<listItemTerm>Frame</listItemTerm>
<listItemDefinition><para>The frame is the skeleton of the
bicycle.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>Wheel</listItemTerm>
<listItemDefinition><para>The wheel is the point of contact
between the bicycle and the road for the bicycle to have
movement.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>Spokes</listItemTerm>
<listItemDefinition><para>The spokes are thick wires with
tension applied that connect the hub to the rim. You can adjust
the tension with the nipple on the rim
side.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>Hub</listItemTerm>
<listItemDefinition><para>The hub attaches to the center of the
wheel where the axle and the bearings
are.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>Metal rim</listItemTerm>
<listItemDefinition><para>The metal rim is a metal ring that has
a U-shaped cross section to hold the spokes on the inner side
and the tire on the outer
side.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>Seat</listItemTerm>
<listItemDefinition><para>The Seat, which is also known as the
'saddle', is used as the support platform for the person to sit
on the bicycle.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>Seat post</listItemTerm>
<listItemDefinition><para>The Seat post is used as a support
post for the seat and to change the height of the seat for the
rider.</para></listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>...</listItemTerm>
<listItemDefinition><para>...</para></listItemDefinition>
</definitionListItem>
</definitionList>
```

**Chap 3.9.5.2.1.4**

## 1 General

In some situations it is convenient for the reader of the data module to find a warning light, push button, annunciator or a block of warning lights, etc, within the text flow instead of referring to an illustration. This can be achieved by using captions and caption groups which are created by the author using XML markup as defined below.

**Caption** is a stylized representation of a single illuminated warning light, push button or annunciator to be presented inline within the text flow.

**Caption group** is a block of captions to be presented within the text flow.

There is no standardized style guide for presenting captions and caption groups. Each project has to agree and set up a style guide including, for example, basic font, font size, font style, font color, line style and line weight. The only control mechanism to deviate from the basic style guide values is by using the configurable attribute `color` which can be used to restyle, for example, the caption fill, font, font size, font style, font color, line style and line weight. Refer to [Para 2.2.1](#).

**Business rule decision point BRDP-S1-00559 - Caption style guide:**

- Decide on a project style guide to be used for captions.

## 2 Caption groups and captions

### 2.1 Caption groups

#### 2.1.1 Caption group

**Description:** The element `<captionGroup>` represents a block of illuminated warning lights, push buttons, annunciators, or display captions. The `<captionGroup>` structure has been designed to provide some basic control of formatting. By using the element it is possible to create caption groups that are visually similar to the real object.

#### Note

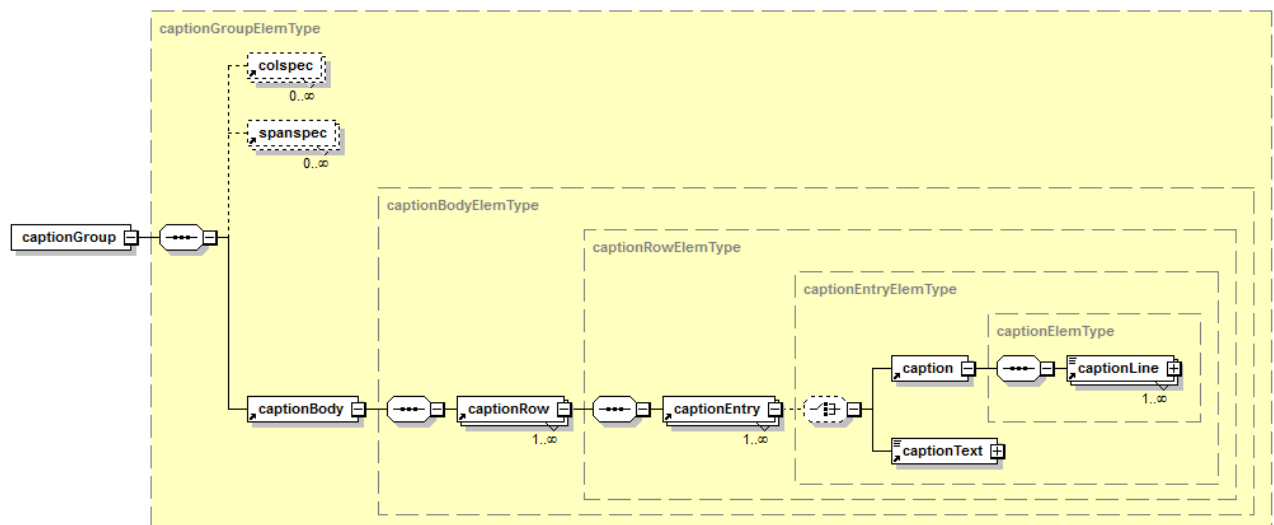

The element `<captionGroup>` structure is based on the Continuous Acquisition and Life-cycle Support (CALS) table model with similar element names and attributes. Refer to [Chap 3.9.5.2.1.6](#).

A caption group is best used as the only content of an element `<para>` which makes it appear as paragraph of its own and not inline within the text flow in a paragraph.

The block of illuminated warning lights above is an example of a caption group.

**Markup element:** `<captionGroup>`

ICN-83007-0000000128-001-01

Fig 1 Element `<captionGroup>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
  - `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
  - `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
  - `cols` (M), the number of columns in the element `<captionGroup>` table. The attribute must have a numeric value, greater than "0".
  - `alignCaption` (O), the horizontal alignment of the text content of each element `<captionEntry>` unless overridden by the attribute `align` of the elements `<colspec>`, `<spanspec>`, `<caption>` or `<captionText>`. The attribute can have one of the following values:
    - `"left"` (D) - the text is left justified (quad flush left)
    - `"right"` - the text is right justified (quad flush right)
    - `"center"` - the text is center justified (text is centered around the middle of the column)
  - `tableOfContentType` (O), a classification of captions to be used in the publishing process to group captions in specific tables or indexes. The attribute can have one of the following values:
    - `"none"` (D) - do not include in any caption table
    - `"redtoc"` - to be included in the red caption table
    - `"comdtoc"` - to be included in a combined caption table
    - `"ambertoc"` - to be included in the amber caption table
    - `"greentoc"` - to be included in the green caption table
    - `"yellowtoc"` - to be included in the yellow caption table
- Refer to [Fig 2](#).
- `colsep` (O), defines the column separator settings. A non-zero value for this attribute will draw a rule to the right of each element `<captionEntry>` to which it applies. If the

<captionEntry> is in the first column a rule will also be drawn on the left side. If the attribute is zero, then no column ruling will appear on either side of the <captionEntry> to which it applies. If the attribute colsep is not used, this implies that a column ruling will not be drawn for the applicable column. To set the column rulings for the complete column, set the attribute colsep on the element <colspec> that represents the column. Any values that are given in the <captionEntry> within a column will override the values given in element <colspec> or the element <captionGroup>.

- rowsep (O), defines the row separator settings. A non-zero value for this attribute will draw a rule below each element <captionEntry> to which it applies. If the <captionEntry> is in the first <captionRow> a rule will also be drawn above. If the attribute is zero, then no row ruling will appear below the entries to which it applies. If the attribute rowsep is not used, this implies that a row rule will not be drawn for the applicable row. To set the row rulings for the complete row, set the attribute rowsep on the element <captionRow> that represents the row. Any values that are given in the entries of the row will override the values given in the element <captionRow> or <captionGroup>.
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

Table 4 Red caption index		
Caption	Location	Action
FIRE 1 ENG	Para 2.1	...
FIRE 2 ENG	Para 2.1	...
LOW PRESSURE CABIN	Para 3.2	...
LOW PRESSURE STORE 1	Para 4.2	...

ICN-S3627-S1000D0795-001-01

Fig 2 Table/Index of captions - Example

#### Child elements:

- <colspec> Refer to [Chap 3.9.5.2.1.6](#).
- <spanspec> Refer to [Chap 3.9.5.2.1.6](#).
- <captionBody> Refer to [Para 2.1.2](#).

### 2.1.2

#### Caption body

**Description:** The element <captionBody> is equivalent to the table element <tbody>. Refer to [Chap 3.9.5.2.1.6](#).

**Markup element:** <captionBody>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- valign (O), the vertical alignment of the contents of each occurrence of the element <captionEntry>, unless overridden by the attribute valign of the element

Applicable to: All

S1000D-A-03-09-0502-01E-040A-A

Chap 3.9.5.2.1.4

<captionEntry>. The value of the attribute valign defines the vertical position of a caption within its <captionEntry>, it does not affect the alignment of the text within a caption. The attribute can have one of the following values:

- "top" (D)
- "bottom"
- "middle"

#### Child elements:

- <captionRow> Refer to [Para 2.1.3](#).

### 2.1.3

#### Caption row

**Description:** The element <captionRow> represents a caption table row and is equivalent to the table element <row>. Refer to [Chap 3.9.5.2.1.6](#).

**Markup element:** <captionRow>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- rowsep (O), defines the row separator settings. A non-zero value for this attribute will draw a rule. If the attribute rowsep is not used, it implies that a row rule will be drawn. Refer to [Para 2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <captionEntry> Refer to [Para 2.1.4](#).

### 2.1.4

#### Caption entry

**Description:** The element <captionEntry> represents a table cell that contain the captions or caption text and is equivalent to the table element <entry>. Refer to [Chap 3.9.5.2.1.6](#).

**Markup element:** <captionEntry>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- colname (O), relates the element <captionEntry> to its column definition in the element <colspec>. The width of each element <captionEntry> can only be defined in the element <colspec>. If this attribute is missing, the column width must be wide enough to contain the contents of any child caption element. The value is the name of a column defined in element <colspec> in the current element <captionGroup>.
- namest (O), locally defines the start column of a horizontal span of merged occurrences of the element <captionEntry>. The value must be the name of a column defined in the element <colspec> in the current element <captionGroup>.

- nameend (O), locally defines the end column of a horizontal span of merged occurrences of the element `<captionEntry>`. The value must be the name of a column defined in the element `<colspec>` in the current element `<captionGroup>`.
- spanname (O), a named, reusable span specification for merged occurrences of the element `<captionEntry>`. The value must be the name of a span defined in the element `<spanspec>` in the current element `<captionGroup>`.
- morerows (O), locally defines the number of additional rows in a vertical span of merged occurrences of the element `<captionEntry>`. The value must be the number of spanned rows minus 1.
- colsep (O), defines the column separator settings. It is used to display rules to the right of the column to which it applies. An attribute `colsep` that is set on an element `<captionEntry>` will determine if a rule is drawn for the height of the entry only. A non-zero value for this attribute will draw a rule. If the attribute `colsep` is not used, it implies that a row rule will not be drawn. Refer to [Para 2.1.1](#).
- rowsep (O), defines the row separator settings. It is used to display rules below the row to which it applies. An attribute `rowsep` that is set on the element `<captionEntry>` determines if a rule is drawn for the width of the entry only. A non-zero value for this attribute will draw a rule. If the attribute `rowsep` is not used, it implies that a column rule will not be drawn. Refer to [Para 2.1.1](#).
- valign (O), the vertical alignment of the contents of each occurrence of the element `<captionEntry>` in the row, unless overridden by the attribute `valign` of the element `<captionEntry>`. The value of the attribute `valign` defines the vertical position of a caption within its element `<captionEntry>`, it does not affect the alignment of the text within a caption. The attribute can have one of the following values:
  - "top"
  - "bottom"
  - "middle"
- alignCaptionEntry (O), the horizontal alignment of each element `<caption>`. The attribute's value defines the horizontal position of a caption within its element `<captionEntry>`, it does not affect the alignment of the text within a caption. The attribute can have one of the following values:
  - "left"
  - "right"
  - "center".

#### Child elements:

- `<caption>` Refer to [Para 2.2.1](#).
- `<captionText>` Refer to [Para 2.1.5](#).

### 2.1.5

#### Caption text

**Description:** The element `<captionText>` contains the text to be added to a `<captionGroup>`.

**Markup element:** `<captionText>`

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

The element can contain text mixed with the following elements:

- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<indexFlag>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<changeInline>`. Refer to [Chap 3.9.5.2.1.1](#).
- `<emphasis>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.1](#).
- `<pmRef>`. Refer to [Chap 3.9.5.2.1.1](#).
- `<externalPubRef>`. Refer to [Chap 3.9.5.2.1.1](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).

### Markup example:

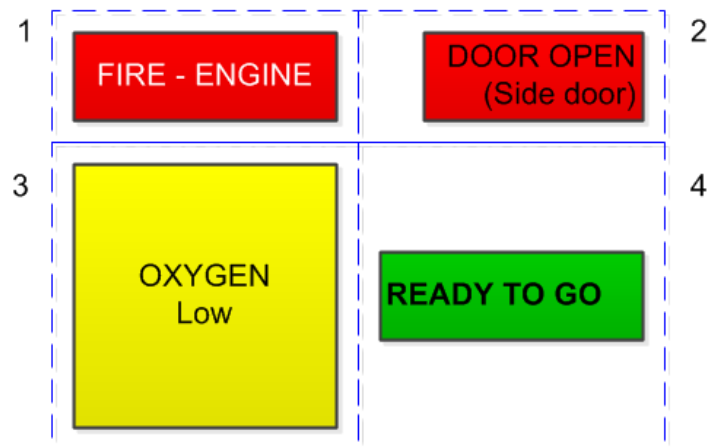

The markup of the caption group above is as follows:

```
<para><captionGroup cols="3" colsep="1" rowsep="1">
<colspec colnum="1" colname="col1" colwidth="25mm"/>
<colspec colnum="2" colname="col2" colwidth="10mm" colsep="0"
rowsep="0"/>
<colspec colnum="3" colname="col3" colwidth="25mm"/>
<captionBody>
<captionRow>
<captionEntry colname="col1" alignCaptionEntry="center"
valign="middle">
<caption color="co02" captionWidth="20mm" captionHeight="10mm">
<captionLine>L FUEL</captionLine>
</caption>
</captionEntry>
<captionEntry colname="col2" alignCaptionEntry="center"
valign="middle">
<captionText>or</captionText>
</captionEntry>
<captionEntry colname="col3" alignCaptionEntry="center"
valign="middle">
<caption color="co02" captionWidth="20mm" captionHeight="10mm">
<captionLine>R FUEL</captionLine>
</caption>
</captionEntry>
</captionRow>
</captionBody>
</captionGroup>
</para>
```

### 2.1.6 Formatting options

The effect of the formatting attributes is shown in [Fig 3](#), with the markup for each occurrence of the element `<captionEntry>` given in [Table 2](#).

ICN-S3627-S1000D0796-001-01

Fig 3 `<captionGroup>` formatting

The four element `<captionEntry>` table cells in Fig 3 are formatted as shown in Table 2 . The blue dashed cell borders simply show the outline of each occurrence of the element `<captionEntry>`, but would not be visible in the output.

Table 2 `<captionGroup>` formatting example

<code>&lt;captionEntry&gt;</code>		Formatting attribute settings
1	Width 30 mm Height 10 mm Align center Vertical align middle Color red <sup>1</sup> Text <sup>1</sup> - white - center	<pre> &lt;captionEntry colname="col1" alignCaptionEntry="center" valign="middle"&gt;   &lt;caption color="co51" captionWidth="30mm" captionHeight="10mm"&gt;     &lt;captionLine&gt;FIRE - ENGINE&lt;/captionLine&gt;   &lt;/caption&gt; &lt;/captionEntry&gt; </pre>

## 2.2

## Captions

### 2.2.1

### Caption

**Description:** The element <caption> contains a caption representing a single illuminated warning light, push button, annunciator, or display caption. It can be used inline within text content elements such as the element <para>, or grouped within the element <captionGroup> structure as given in [Para 2.1](#).

Each caption can contain lines of text in individual occurrences of the element <captionLine>.

**Markup element:** <caption>

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- color (O), the colors of the caption. A project can decide to use project specific values that represent not only caption fill color, but also, for example, font, font size, font style, font color, line style and line weight. The attribute can have one of the following values:
  - "co00" thru "co99". The default value is "co09". Refer to [Chap 3.9.6.1](#).

#### Note

The project must for each attribute value define the style guide settings/values, like fill color, font, font size, font style, font color, line style and line weight.

**Recommendation:** It is recommended to the use color value definitions from the S1000D standard color palette given in [Chap 3.9.2.3](#) when defining the style guide settings/values.

- `captionWidth` (O), the width of the caption. The value must be a positive number, plus a unit of measure. Column width can be specified as a proportional measure, a fixed measure, or a mixed measure. Refer to [Chap 3.9.5.2.1.6](#) (attribute `colwidth`).
- `captionHeight` (O), the height of the caption. The value must be a positive number, plus a unit of measure. Column height can be specified as a proportional measure, a fixed measure, or a mixed measure. Refer to [Chap 3.9.5.2.1.6](#) (attribute `colheight`).
- `systemIdentCode` (O), the system identification code as defined by the project
- `alignCaption` (O), the horizontal alignment of the text content of the child elements `<captionLine>`. The attribute can have one of the following values:
  - `"left"` (D) - the text is left aligned
  - `"right"` - the text is right aligned
  - `"center"` - the text is centered around the middle of the caption
- `tableOfContentType` (O), a classification of captions to be used in the publishing process to group captions in specific caption tables or indexes. Refer to [Para 2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<captionLine>` Refer to [Para 2.2.2](#).

#### Business rule decision point BRDP-S1-00117 - Inline use of captions:

- Decide whether inline captions affect the text line spacing and how this is defined.

#### Markup example:

The following markup example shows the coding behind a caption presented in inline within the text flow:

The following markup example shows the coding behind the two captions below, to be presented in inline within the text flow:

"The fuel system control panel includes a set of warning and control lamps. The most important

control lamps shows the

fuel levels in the left and right

tanks, respectively. If they turn to red, the situation becomes critical. Try to find a gas station."

```
<para>"The fuel system control panel includes a set of warning and
control lamps. The most important control lamps shows the fuel levels
in the
<caption color="co02" captionWidth="20mm"
captionHeight="10mm"><captionLine>L FUEL</captionLine></caption> or
<caption color="co02" captionWidth="20mm"
captionHeight="10mm"><captionLine>R FUEL</captionLine></caption> left
and right tanks, respectively. If they turn to red, the situation
becomes critical. Try to find a gas station."
</para>
```

### 2.2.2 Caption line

**Description:** The element `<captionLine>` represents a single line of text, so its text content should not wrap to second or subsequent lines.

**Markup element:** `<captionLine>`

**Attributes:**

- None

**Child elements:**

The element can contain text mixed with the element

- `<acronymTerm>` Refer to [Chap 3.9.5.2.1.10](#).

### 3

## Example

The following markup example shows the coding behind the caption group presented in [Fig 3](#):

```
<para>
<captionGroup cols="2" colsep="1" rowsep="1">
<colspec colnum="1" colname="col1" colwidth="40mm"/>
<colspec colnum="2" colname="col2" colwidth="40mm"/>
<captionBody>
<captionRow>
<captionEntry colname="col1" alignCaptionEntry="center"
valign="middle">
<caption color="co51" captionWidth="30mm" captionHeight="10mm">
<captionLine>FIRE - ENGINE</captionLine>
</caption>
</captionEntry>
<captionEntry colname="col2" alignCaptionEntry="right"
valign="middle">
<caption color="co04" captionWidth="25mm" captionHeight="10mm"
alignCaption="right">
<captionLine>DOOR OPEN</captionLine>
<captionLine>(Side door)</captionLine>
</caption>
</captionEntry>
</captionRow>
<captionRow>
<captionEntry colname="col1" alignCaptionEntry="center"
valign="middle">
<caption color="co03" captionWidth="30mm" captionHeight="30mm">
<captionLine>OXYGEN</captionLine>
<captionLine>Low</captionLine>
</caption>
</captionEntry>
<captionEntry colname="col2" alignCaptionEntry="center"
valign="middle">
<caption color="co52" captionWidth="30mm" captionHeight="10mm"
alignCaption="left">
<captionLine>READY TO GO</captionLine>
</caption>
</captionEntry>
</captionRow>
</captionBody>
</captionGroup>
</para>
```

## 1 General

This chapter contains the definition and use of titles from an author's point of view.

## 2 Titles

**Description:** The element `<title>` contains the title for a paragraph, step, table or figure, etc. Titles can also be used in the preparation of Table of Contents (TOC). Doing this enables the level of indenture in the TOC to be controlled.

In descriptive data modules, titles can be included for the element `<levelledPara>` from sublevel one thru five, but must be included for element `<figure>` and element `<table>` for formal tables. Refer to [Chap 6.2.2](#).

In procedural, process, crew and fault data modules, titles must be included for `<figure>` and `<table>` for formal tables. Refer to default BREX rule BREX-S1-00068. Titles can also be included for the element `<proceduralStep>` from sublevel one thru five and for the element `<dmNode>`. Refer to [Chap 6.2.2](#).

All titles must be presented in sentence case. Refer to [Chap 3.9.1](#).

**Markup element:** `<title>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- Includes the same set of child elements as the `textElementGroup`, which can be different depending on the Schema type. Refer to [Chap 3.9.5.2.1.10](#).

**Business rule decision point BRDP-S1-00118 - Use of the element `<title>`:**

- Decide how to use the element `<title>` and on which elements.

**Business rule decision point BRDP-S1-00119 - Use of cross-references from titles:**

- Decide whether to allow cross-referencing from titles.

**Business rule decision point BRDP-S1-00120 - Use of titles for the elements `<levelledPara>` and `<proceduralStep>` from sublevel six thru eight for legacy data:**

- Decide whether titles can be included for the elements `<levelledPara>` and `<proceduralStep>` from sublevel six thru eight when converting legacy data to S1000D.

### 3 Example

```
<levelledPara>
<title>Brake system</title>
<para>The most important part of the bicycle is the brake
system. Only a minimum maintenance of the brake system is
necessary. But, when a problem does occur, make sure you
do the necessary maintenance as quickly as possible.
If you do not do this the bicycle will be dangerous to
use.</para>
<para>There are nine different types of brake systems. The
one found on most bicycles is the cantilever brake (refer to

## 1 General

This chapter contains the definition, rules and guidelines for handling tables from an author's point of view. It gives details about the available elements and attributes and how to use them to create tables in a data module. It also serves as a guide to stylesheet designers who will have to create the templates for presenting the tables in a page-oriented output or an IETP where a table must be presented by using the formatting information contained in the table's presentation attributes that have been set by the author.

The rules for the presentation of tables in page-oriented publications and IETP are given in [Chap 6.2.2](#) and [Chap 6.3.1](#), respectively.

Parts of this chapter have been derived from the Oasis information about the Continuous Acquisition and Life-cycle Support (CALS) table model which can be found at <http://www.oasis-open.org/specs/a502.htm>.

## 2 Tables

### 2.1 Definition

There are two types of tables:

- Formal
- Informal

A formal table consists of four parts: the table title, the table head, the optional table footer and the table body. Each of these parts contains the rows and entries that comprise the table.

An informal table is a short, simple table, which does not need a table title, table head and table footer. These tables are typically small and contain only a few columns and rows.

Table titles must be written in sentence case and have no period [.] at the end.

When formatted, table titles must not exceed two lines.

A formal table can be column-width or image-width. A column width table is one which starts at the left type limit (ie, taking into account any indents) and covers the remaining space available to the right type limit. An image width table starts at the left margin and covers the space up to the right margin. To define a column-width or image-width table, use the attribute `pgwide`. Refer to [Para 2.6](#). Tables must be located in the context where it is most convenient to the reader. If it is cross-referenced only once, the location is immediately after the paragraph, or major element, in which the reference occurred.

#### Note

For page-oriented publications, if it is not possible to fit a table into the full image width (170 mm), the table can be presented on a fold-out page (ie, by wrapping the element `<table>` in the element `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#)).

## 2.2 Specific tables

[Chap 6.2.2](#) details the required presentation for seven specific tables and each of these has its own markup element. The rest of this chapter discusses tables that are marked up using the element `<table>`. The seven specific tables are:

- References. Used in all data modules (element `<refs>`). Refer to [Chap 3.9.5.2.1.2](#).
- Required conditions. Used in procedural, schedule and fault isolation procedure data modules (element `<reqCondGroup>`). Refer to [Chap 3.9.5.2.1.9](#).
- Required persons. Used in procedural, schedule and fault isolation procedure data modules (element `<reqPersons>`). Refer to [Chap 3.9.5.2.1.9](#).
- Required technical information. Used in procedural, schedule and fault isolation procedure data modules (element `<reqTechInfoGroup>`). Refer to [Chap 3.9.5.2.1.9](#).
- Support equipment. Used in procedural, schedule and fault isolation data modules (element `<reqSupportEquips>`). Refer to [Chap 3.9.5.2.1.9](#).
- Consumables, materials and expendables. Used in procedural, schedule and fault isolation data modules (element `<reqSupplies>`). Refer to [Chap 3.9.5.2.1.9](#).
- Spares. Used in procedural, schedule and fault isolation data modules (element `<reqSpares>`). Refer to [Chap 3.9.5.2.1.9](#).
- Caption group. Used in all data modules. Refer to [Chap 3.9.5.2.1.4](#).

## 2.3 Project table types

A project can define a number of standard table types, and these can be any type of commonly used tables (for example, inspection and examination tables, tables of modification and repairs). Within the project it is good practice that these standard table types are be marked up in a consistent manner and contain consistent numbers of columns, widths and textual values for the table title and its header rows, etc, and these standard types and their properties can be documented in the project business rules.

When set to one of the project defined standard table values, the table attribute `tabstyle` can be used by an author to indicate that the table that follows is of a specific type, and therefore should comply to the table's presentation rules which will be defined in the table's presentation attributes, and other business rules that govern the textual values the table can contain. The setting of this attribute will then allow the table settings to be checked for compliance to the business rules.

Complex tables can have areas where the format of the rows and columns is different and the element `<tgroup>` can be used to mark up such table areas. Refer to [Para 2.6.1](#). There is an attribute `tgstyle` that can be used to define and check business rules that apply to these areas of the complex tables.

To illustrate how this is used, for example, when the value of attribute `tabstyle` is set to a project defined value of "examination", this could mean that the business rules are defined as follows:

- the table must always have a title of the form "component – examination"
- the table must always have one attribute `thead` row that contains the values "Component", "Maximum serviceable limits", "Maximum repairable limits", and "Description"
- the table must have four columns of widths 50mm, 25mm, 25mm and 70mm when the display width is 170mm
- it must use proportional spacing
- it must have attribute `frame` set to the value "topbot"
- it must have no column separators
- it must have a row separator after the attribute `thead` row, but nowhere else

The use of the attributes `tabstyle` and `tgstyle` must NOT mean that the author can omit the table's display attributes (eg, `frame`, `rowsep`, etc) on the assumption that they are inherited by the meaning of `tabstyle` and `tgstyle` for the given table type within the project. The reason for this is that the end user's application will have no knowledge of what those display properties should be, and the table will not display properly.

Note that the project specified standard tables must comply with the rules for formal and informal tables.

When a table is not a project standard table the fact that it is an informal or formal table can be recorded in the attribute `tabstyle` with the values "formal" and "informal", and this will allow the S1000D rules for these table types to be checked.

#### **Business rule decision point BRDP-S1-00121 - Use of standard table types:**

- Decide if a list of standard table types applies to the project (eg, inspection, examination) and define what the business rules are for these types in terms of their presentation requirements and certain textual values (eg, titles and heading row values). Each of these standard types must have a defined value that can be applied to the table's attribute `tabstyle`.

For complex standard tables that have more than one table group, decide how to use the element `<tggroup>` and define a list of project values for attribute `tgstyle`.

## **2.4 Tables as graphics**

Tables normally are marked up using the elements and attributes which define the table heading, the footer and the body which contain rows and entries. It is also possible to present a table using the graphic element (although this is discouraged).

#### **Business rule decision point BRDP-S1-00122 - Use of tables as graphics:**

- Decide if tables represented as graphics are allowed, and if they are, in what situations they can be used.

## **2.5 Attribute inheritance**

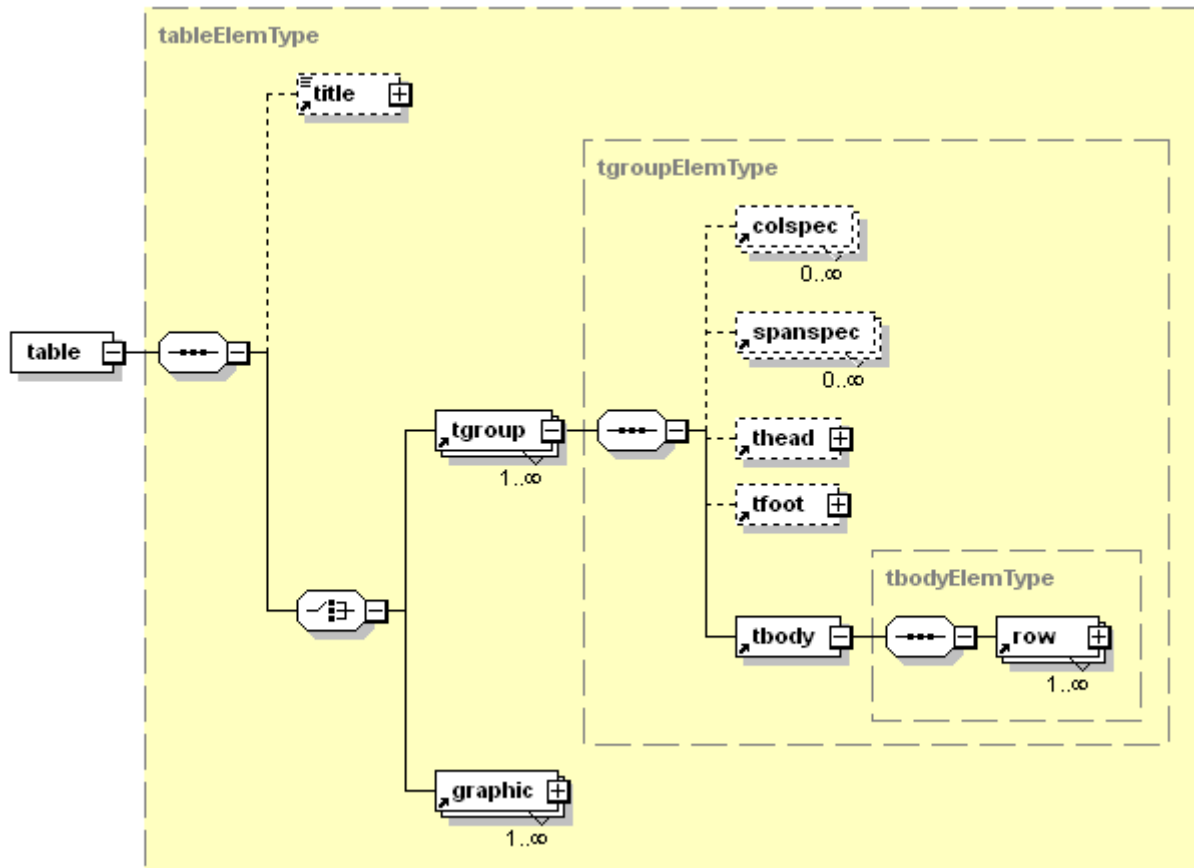

In order to understand the CALS table model, the concept of attribute inheritance needs to be explained. This applies to the table presentation attributes such as `rowsep` and `colsep` (which determine if table rulings are required) and alignments etc. Attributes on higher level elements set formatting defaults that can be overridden by the same attributes set on lower level elements. For example, a default row separation can be specified for the complete table on the `<table>` element, and this applies to the complete table, unless values are expressed on contained table groups, column specifications, rows, entries etc. A presentation attribute

value expressed at a level applies to that level and to its children (unless any child element's attributes override it). As an example, a `rowsep` value of "1" applies to all entries in the row, except any `<entry>` with a `rowsep` value specified.

## 2.6 Table markup

**Description:** The element `<table>` is used to contain information which is to be presented in a tabular form. The element is used for both formal and informal tables.

**Markup element:** `<table>`

ICN-83007-0000000087-001-01

Fig 1 Element `<table>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the table element. Refer to [Chap 3.9.5.2.1.2](#). It must only be used for tables that have a title (and hence have an enumerated table number).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `tabstyle` (O), defines a style for the table. Although the CALS table model allows the value of this attribute to determine the presentation style of the table (in terms of the table rulings, the frame, the orientation etc), S1000D mandates that the presentation attributes are populated with the correct values to make the table display correctly in any application. This attribute must not be used for tables that only contain a graphic. Refer to [Para 2.4](#). The

attribute `tabstyle` can be used by a project or organization to allow the definition and subsequent checking of business rules that apply standard project table. Refer to [Para 2.3](#).

- `tocentry` (O), determines whether the table will appear in the list of tables. If the value of this attribute is "0," the table's title will not appear in the automatically generated list of tables at the front of the data module. If the value is not "0," or the attribute is not used, and the table has a title, it will appear in the list of tables. If the table has a title and you do not wish it to appear in the list of tables, you must specify a `tocentry` value of "0".
- `frame` (O), defines the style of the outside rulings of the table. The attribute can have one of the following values:
  - "all" (D) - draws a rule above and below the table, and to the left and right
  - "sides" - draws a rule on the left and right of the table, but not on the top and bottom
  - "top" - draws a rule above the table, but not below, or to the left or right of the table
  - "topbot" - draws a rule above and below the table (this is the setting to be used for S1000D formal tables)
  - "bottom" - draws a rule below the table
  - "none" - indicates no rules will be drawn for the frame of the table

#### Note

If the attribute `frame` is not used, then this implies that all frame rulings will be drawn (ie, equivalent to the value "all"). It is important to set `frame="topbot"` for S1000D formal tables. This attribute must not be used for tables that only contain a graphic. Refer to [Para 2.4](#).

- `colsep` (O), defines the column separator setting. A non-zero value for this attribute will draw a rule to the right of the table entries to which it applies. If the attribute is zero, then no column ruling will appear to the right of the entries to which it applies. The value of `colsep` is ignored for the rightmost column because the rulings for this column are given by the setting of the frame attribute. If the attribute `colsep` is not used, this implies that a column rule will be drawn for the applicable columns. To set the column rulings for the complete column, set the attribute `colsep` on the element `<colspec>` that represents the column. Any values that are given in the entries of the column will override the values given in a `<colspec>` element. This attribute must not be used for tables that only contain a graphic. Refer to [Para 2.4](#).
- `rowsep` (O), defines the row separator setting. A non-zero value for this attribute will draw a rule below the table entries to which it applies. If the attribute is zero, then no row ruling will appear below the entries to which it applies. The value of `rowsep` is ignored for the last row because the rulings for this row are given by the setting of the frame attribute. If the `rowsep` attribute is not used, this implies that a row rule will be drawn for the applicable rows. To set the row rulings for the complete row, set the attribute `rowsep` on element the `<row>` that represents the row. Any values that are given in the entries of the row will override the values given in the element `<row>`. This attribute must not be used for tables that only contain a graphic. Refer to [Para 2.4](#).
- `orient` (O), defines the orientation of the table. The default setting (when the attribute is not used) is portrait. The attribute can contain the values "port" (representing a portrait orientation) or "land" (representing a landscape orientation). A landscape orientation is one that is 90 degrees counter-clockwise to the normal writing direction. This attribute must not be used for tables that only contain a graphic. Refer to [Para 2.4](#).
- `pgwide` (O), defines the width of the table relative to the page. A value other than zero for this attribute defines that the table is to span the width of the page (or the display area) and will ignore any indentation settings that can be in place where the table element appears. A value of 0 (or if the attribute is not used) means that the table will span the page but be

within the current indentation settings. The correct setting of this attribute for S1000D tables that are image-wide is a non-zero value. For column-wide tables, this attribute must not be used or set. This attribute must not be used for tables that only contain a graphic. Refer to [Para 2.4](#). The value of attribute `pgwide` is ignored if the orientation of the table is landscape (because landscape tables have an implied to be image-width).

- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O) `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. This element is mandatory for formal tables and optional for informal tables. Refer to [Chap 3.9.5.2.1.5](#).
- `<tgroup>`. Refer to [Para 2.6.1](#).
- `<graphic>`. Refer to [Chap 3.9.5.2.1.7](#).

#### Business rule decision point BRDP-S1-00123 - Use of applicability information of various table child elements - attribute `applicRefId` of the element `<table>`:

- Decide whether and how to use the attribute `applicRefId` of various `<table>` child elements. The child elements can be differentiated based on Product configuration.

#### Markup example:

The markup example shows a table that contains a graphic. Refer to [Para 2.4](#).

```
<table id="tab-0002">
<title>Widget - inspection limits</title>
<graphic infoEntityIdent="ICN-E2-A-723200-R-K0378-01234-A-01-1">
...
</graphic>
</table>
```

### 2.6.1 Table group

**Description:** A table can contain one or more table group `<tgroup>` elements. Normally, there will be one table group. Multiple table groups are used to define portions of the table that have different presentation requirements (eg, column and row specifications).

**Markup element:** `<tgroup>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `cols` (M), defines the number of columns in the table.
- `tgstyle` (O), the table group style. This defines that a specified style (eg, column and row specifications) is to be applied to the table group. Although the CALS table model allows the value of this attribute to determine the presentation style of the table (in terms of the table rulings, the frame, the orientation etc), S1000D mandates that the presentation attributes are populated with the correct values to make the table display correctly in any application. The attribute `tgstyle` can be used by a project or organization to allow the definition and subsequent checking of business rules that apply standard project table. Refer to [Para 2.3](#).

- `colsep` (O), the column separator default setting. Refer to [Para 2.6](#) for the description of `colsep` on `<table>`. In the context of `<tgroup>`, this is the default setting for column rulings for the table group and takes precedence over defaults set using `colsep` on `<table>`. A non-zero value means that column rulings will appear to the right of all columns of the table group unless there is a "0" value given in the child `<entry>` elements (which will override the settings for that entry only). A value of "0" means that there are to be no column rulings for the table group. If the attribute `colsep` is not specified for the table group, this implies that column rulings are required (unless `colsep` values on individual `<entry>` elements state otherwise).
- `rowsep` (O), the row separator default setting. Refer to [Para 2.6](#) for the description of `rowsep` on `<table>`. In the context of `<tgroup>`, this is the default setting for row rulings for the table group and takes precedence over defaults set using `rowsep` on `<table>`. A non-zero value means that row rulings will be appear beneath each row of the table group unless there are values given in the child `<entry>`. A value of "0" means that there will be no row rulings. If the attribute `rowsep` is not specified for the table group, this implies that row rulings are required (unless `rowsep` values on individual `<row>` elements state otherwise).
- `align` (O), alignment. This attribute provides the default alignment setting for the table group (which is the horizontal position of the text within the column) and applies to all entries in the table group that do not have an alignment specified by their own `align` attribute, or in their parent table element `<row>`. The attribute can have one of the following values:
  - "left" - the text is left justified (quad flush left)
  - "right" - the text is right justified (quad flush right)
  - "center" - the text is center justified (text is centered around the middle of the column)
  - "justify" - the text is justified (both quad left and right)
  - "char" - text is aligned to the leftmost occurrence of the value of the attribute `char` value. When the attribute `align` is set to "char", attributes `char` and `charoff` must be used. The attribute `char` is the single character that is used to align the text. The most common use is to align on a decimal separator [.] for decimal alignment of a column of numbers as shown in [Fig 2](#):

```

1002.23
    675.34
      0.002

```

ICN-83007-0000000062-001-01

*Fig 2 Example of "char" alignment*

This causes the text to range left or right around the fixed location of the decimal point.

The attribute `charoff` is used to position the alignment character within the width of the cell. This is given as a percentage of the cell width and must only be used when the value of attribute `align` is set to "char."

- `charoff` (O), the value is used when the value of the `align` attribute is "char". It is a number that represents the percentage of the column width to the left of the alignment

character specified in the attribute `char` and must only be used when the attribute `align` is set to "`char`".

- `char` (O), the value is used when the value of the `align` attribute is "`char`". The value is the single alignment character source for any implied "`char`" values and must only be used when the `align` attribute is set to "`char`".

#### Child elements:

- `<colspec>`. Refer to [Para 2.6.5](#).
- `<spanspec>`. Refer to [Para 2.6.6](#).
- `<thead>`, defines the header of the table in terms of its rows and entries. Refer to [Para 2.6.2](#). For page-oriented output, the header will be replicated on each page when the table spans multiple pages. S1000D formal tables must always have a table header.
- `<tfoot>`, contains the rows and entries (refer to [Para 2.6.3](#)) that define the footer of the table when one is needed.
- `<tbody>`, contains the rows and entries (refer to [Para 2.6.4](#)) that define the body of the table.

#### Markup example:

```
<tgroup cols="2">
<colspec colname="col1" colwidth="1*" />
<colspec colname="col2" colwidth="1*" />
<tbody>
<row>
<entry><para>row 1, column 1</para></entry>
<entry><para>row 1, column 2</para></entry>
</row>
<row>
<entry><para>row 2, column 1</para></entry>
<entry><para>row 2, column 2</para></entry>
</row>
</tbody>
</tgroup>
```

## 2.6.2 Table header

**Description:** The element `<thead>` (table header) contains the rows of the table that provide the column headings and is mandatory for S1000D formal tables. The table header is displayed in bold type face and, for page-oriented output, will be displayed at the top of each page on which the table appears. The table header must contain at least one table row. There is no need to use emphasis to make a table header bold.

**Markup element:** `<thead>`

#### Attributes:

- `valign` (O), specifies how the text is to be presented in each element `<entry>` that does not have its own attribute `valign` set. If the attribute is not used, the default setting is top. The value of attribute `valign` on the element `<thead>` supplies the default alignment for the entire table header. These values are overridden by values that are contained in the table header's entries (if they are present). The attribute can have one of the following values:
  - "`top`" (D) - for the text to be presented at the top of the element `<entry>`
  - "`middle`" - for the text to be presented in the middle of the element `<entry>`

- "bottom" - for the text to be presented at the bottom of the element `<entry>`

#### Child elements:

- `<colspec>`. Refer to [Para 2.6.5](#). This specifies the presentation information of each column in the table header and, if present, overrides any column specifications found in the table group. Refer to [Para 2.6.1](#).
- `<row>`. Refer to [Para 2.6.7](#). The table header must contain at least one row. For S1000D formal tables, the last row of the table header must have its attribute `rowsep` set to a non-zero value.

#### Markup example:

```
<thead>
<row rowsep="1">
<entry><para>Area</para></entry>
<entry><para>Maximum blend depth</para></entry>
<entry><para>Maximum blend length</para></entry>
<entry><para>Maximum blend width</para></entry>
<entry><para>Maximum number of blends</para></entry>
</row>
</thead>
```

### 2.6.3

#### Table footer

**Description:** The element `<tfoot>` (table footer) contains the rows and entries that represent the table footer. The table footer is to appear at the end of the table (ie, after the last table body row). For page-oriented publications, the table footer is to appear after the last row of each page on which the table appears.

**Markup element:** `<tfoot>`

#### Attributes:

- `valign` (O), specifies how the text is to be presented in each entry that does not have its own `valign` attribute set. The attribute can have one of the following values:
  - "top" (D) - the text is presented at the top of the element `<entry>`
  - "middle" - the text is presented in the middle of the element `<entry>`
  - "bottom" - the text is presented at the bottom of the element `<entry>`

#### Child elements:

- `<colspec>`. Refer to [Para 2.6.5](#). This specifies the presentation information of each column in the table footer and, if present, overrides any column specifications found in the table group. Refer to [Para 2.6.1](#).
- `<row>`. Refer to [Para 2.6.7](#). The table footer must contain at least one row.

#### Markup example:

```
<tfoot>
<row>
<entry spanname="all5"><para>Example footnote</para></entry>
</row>
</tfoot>
```

#### 2.6.4 Table body

**Description:** The element `<tbody>` (table body) contains the rows of the table that provide the primary content and is mandatory for all tables. The table body must contain at least one table row.

**Markup element:** `<tbody>`

**Attributes:**

- `valign` (O), specifies the default within the body of the table for how the text is to be presented in each element `<entry>` that does not have its own `valign` attribute set. If the attribute is not used, the default setting is top. The value of `valign` on the `<tbody>` element supplies the default alignment for the entire table body. These values are overridden by values that are contained in the table header's entries (if they are present). The attribute can have one of the following values:
  - `"top"` (D) - for the text to be presented at the top of the element `<entry>`
  - `"middle"` - for the text to be presented in the middle of the element `<entry>`
  - `"bottom"` - for the text to be presented at the bottom of the element `<entry>`

**Child elements:**

- `<row>`. Refer to [Para 2.6.7](#). The table header must contain at least one row. For S1000D formal tables, the last row of the table header must have its attribute `rowsep` set to a non-zero value.

**Markup example:**

```
<tbody>
<row>
<entry><para>row 1, column 1</para></entry>
<entry><para>row 1, column 2</para></entry>
</row>
<row>
<entry><para>row 2, column 1</para></entry>
<entry><para>row 2, column 2</para></entry>
</row>
</tbody>
```

#### 2.6.5 Column specification

**Description:** The element `<colspec>` (column specification) is used in the table group (`<tgroup>`, refer to [Para 2.6.1](#)) and can be overridden by the element `<colspec>` in the table header (`<thead>`, refer to [Para 2.6.2](#)), the table footer (`<tfoot>`, refer to [Para 2.6.3](#)) and the table body (`<tbody>`, refer to [Para 2.6.4](#)). When used in the table header, table footer and table body, the values specified override those that can be present on the table group and these values are in turn overridden by the settings of the same attributes on individual rows and entries.

**Markup element:** `<colspec>`

**Attributes:**

- `colnum` (O), represents the number of the column starting at 1 which represents the leftmost row. The column number is not used in any span specification (refer to [Para 2.6.6](#)) and simply serves as a consistency check for the authoring and / or software.

- `colname` (O), is the name of the column that is used to specify the position or horizontal span of columns in a row. It can also be used in the `<entry>` element (refer to [Para 2.6.8](#)) using the `colname`, or the `namest` with `nameend` attributes. It can also be used by the `<spanspec>` element in its attributes `namest` and `nameend`. Refer to [Para 2.6.6](#).
- `align` (O), is the default alignment for entries in the table body. Refer to [Para 2.6.1](#).
- `charoff` (O), is the default character offset for alignment of entries in the table body. Refer to [Para 2.6.1](#):
- `char` (O), is the character on which to align. Refer to [Para 2.6.1](#).
- `colwidth` (O), is the column width setting. Column width can be specified as a proportional measure, a fixed measure, or a mixed measure.
  - A proportional measure is of the form "number\*" (eg, "10\*"), and means that the column width is the number times the proportion.
  - A fixed measure is of the form number and unit (eg, "25pt", "25mm", "16.2in"). The units are case insensitive and can be "pt" (points), "cm" (centimeters), "mm" (millimeters), "pi" (picas), and "in" (inches). The default fixed unit must be "pt" if neither a proportion nor a fixed unit is specified. An example of a mixed measure is "10\*"+"3pt".
  - If no column width is specified for a column specification, this implies that the column has the proportional width "1\*", and hence, if no column widths are specified for any column, the column widths will be the same for each column and will be an equal proportion of the available width.
- `colsep` (O), is the column separator setting. Refer to [Para 2.6](#).
- `rowsep` (O), is the row separator setting. Refer to [Para 2.6](#).

#### Child elements:

- None

#### Markup example:

```
<colspec colname="col1" colwidth="1*" />
<colspec colname="col2" colwidth="1*" />
<colspec colname="col3" colwidth="1*" />
<colspec colname="col4" colwidth="1*" />
<colspec colname="col5" />
```

## 2.6.6

### Span specification

**Description:** The element `<spanspec>` (span specification) identifies a horizontal span of columns and associated attributes that can subsequently be referenced by its attribute `spanname` for repeated use in a table's `<entry>` elements. A `<spanspec>` uses column names from `<colspec>` elements defined in that context. It gets default values from the `<colspec>` that provides the `namest`. `namest` and `nameend` identify the first and last columns in increasing left-to-right order that identify the span. The reason `colname` is used rather than `colnum` in identifying `<spanspec>` is that the names are independent of revisions that can change the number of inserted/deleted columns, as long as `namest` remains to the left of (has a smaller column than) `nameend`. In a `<thead>` or `<tfoot>`, if any `<colspec>` are redefined, the `<tgroup>` `<spanspec>` elements are ignored in references to `spanname` from `<entry>` elements within this `<thead>` or `<tfoot>`. When such redefinition occurs, any spanning should be by the attributes `namest` and `nameend`.

**Markup element:** `<spanspec>`

**Attributes:**

- `namest` (M), contains the name of leftmost column of span (as defined in the column's `colname` attribute of its `<colspec>` element).
- `nameend` (M), contains the name of rightmost column of span (as defined in the column's `colname` attribute of its `<colspec>` element).
- `spanname` (M), uniquely identifies the span, and is the name that is applied in an `<entry>` element's `spanname` attribute (refer to [Para 2.6.8](#)).
- `align` (O), the alignment. Refer to [Para 2.6.1](#).
- `charoff` (O), the character offset. Refer to [Para 2.6.1](#).
- `char` (O), the character on which to align. Refer to [Para 2.6.1](#).
- `colsep` (O), determines if the columns covered by the span are to have column rulings This value is overridden by the `colsep` attribute on the `<entry>` elements if they are present. Refer to [Para 2.6.5](#).
- `rowsep` (O), determines if the rows covered by the span are to have row rulings This value is overridden by the attribute `rowsep` on the `<entry>` and on the `<row>` elements if they are present. Refer to [Para 2.6.7](#).

**Child elements:**

- None

**Markup example:**

```
<spanspec namest="col1" nameend="col2" spanname="col1-2" />
<spanspec namest="col1" nameend="col5" spanname="all5" />
```

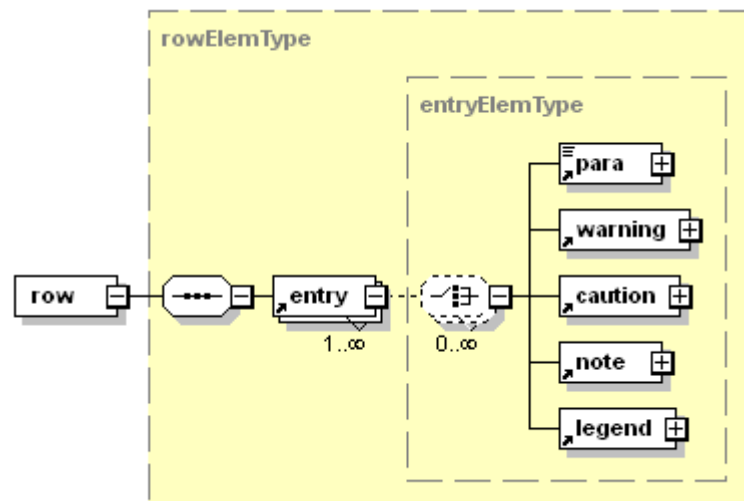

## 2.6.7

### Table row

**Description:** The element `<row>` (table row) represents a row in a table header (refer to [Para 2.6.2](#)), a table footer (refer to [Para 2.6.3](#)), or a table body (refer to [Para 2.6.4](#)). The table row contains at least one `<entry>`. Refer to [Para 2.6.8](#). The values specified for the attributes `rowsep` and `valign` override any values for these attributes given in a parent element. These values are also overridden by any settings applied to `<entry>` elements. Refer to [Fig 3](#).

**Markup element:** `<row>`

ICN-83007-0000000088-001-01

Fig 3 Element &lt;row&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the table element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- rowsep (O), the default row separator setting for the row. Refer to [Para 2.6.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O) caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <entry>. Refer to [Para 2.6.8](#).

#### Markup example:

```

<row>
<entry><para>row 1, column 1</para></entry>
<entry><para>row 1, column 2</para></entry>
</row>
  
```

### 2.6.8

#### Table entry

**Description:** The element <entry> (table entry) represents a table cell.

**Markup element:** <entry>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the table element. Refer to [Chap 3.9.5.2.1.2](#).

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- colname (O), is used to specify the column name for the <entry>. If this attribute is used, and there is also a spanname or namest value used, then the attribute is ignored. It is an error if a column name is specified that does not have a corresponding definition in a <colspec> element.
- namest (O), is used to define the start column of the entry for entries that are spanned across multiple columns (the nameend attribute defines the column in which the entry ends). The value entered in namest must have a corresponding column definition (<colspec>). If namest is specified with no nameend, then the entry will span a single column. Standard spans can also be defined by using the <spansec> element and referencing it using the attribute spanname. Refer to [Para 2.6.6](#).
- nameend (O), is used to define the end column for spanned entries.
- spanname (O), is used to apply a standard span to the entry that is defined in the corresponding element <spansec> . Refer to [Para 2.6.6](#).
- morerows (O), defines the vertical straddling of the entry (ie, the number of rows that the entry spans). For example, a morerows value of "1" means that the entry will straddle the current and the next row. There must be at least as many rows in the <tbody>, <thead> or <tfoot> to cover the number of rows straddled by the entry. If there is a rowsep attribute specified, it applies to the first row that is straddled by the entry.
- colsep (O), is the column separator setting for the entry. Refer to [Para 2.6](#).
- rowsep (O), is the row separator setting for the entry. Refer to [Para 2.6](#).
- rotate (O), can be zero or non-zero and is used to specify that the contents of the entry are to be rotated. If the value is "0", or the attribute is not used, then the text in the entry is presented in the orientation of the table (as set by the attribute orient. Refer to [Para 2.6](#)). If the orientation is landscape, and the value of the rotate attribute is "1", the resulting text is displayed upside-down to the page's headers and footers.
- valign (O), the vertical alignment of the entry. Refer to [Para 2.6.8](#).
- align (O), the horizontal alignment of the entry. Refer to [Para 2.6.1](#).
- charoff (O), the character offset. Refer to [Para 2.6.1](#).
- char (O), the character on which to align. Refer to [Para 2.6.1](#).

#### Child elements:

- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <legend>. Refer to [Chap 3.9.5.2.1.7](#).

#### Markup example:

```
<entry colsep="0"><para>25,00 mm</para></entry>
```

## 3

### Examples

The following example shows the markup of an S1000D formal table that has five columns and rules as defined in [Chap 6.2.2](#) and [Chap 6.3.1](#). Note that the attributes colsep and rowsep on the element <table> set the default rulings for the entire table (ie, no rulings). The

attribute frame value of "topbot" draws a rule above and below the table, and the rowsep value of "1" on the <row> of the table header draws a rule before after the header (if the table header contains more than one row, for S1000D formal tables, the rowsep must be on the last row of the table header only. This table will be numbered (because it has a title), and it will appear in the data module's list of tables (because the attribute tocentry is set to a non-zero value).

```
<table frame="topbot" id="tab-0001" colsep="0" rowsep="0"
tocentry="1">
<title>Ring, Bearing Inner (No. 1) - Repair Data</title>
<tgroup cols="5">
<colspec colname="col1" colwidth="1*" />
<colspec colname="col2" colwidth="1*" />
<colspec colname="col3" colwidth="1*" />
<colspec colname="col4" colwidth="1*" />
<colspec colname="col5" />
<thead>
<row rowsep="1">
<entry><para>Area</para></entry>
<entry><para>Maximum blend depth</para></entry>
<entry><para>Maximum blend length</para></entry>
<entry><para>Maximum blend width</para></entry>
<entry><para>Maximum number of blends</para></entry>
</row>
</thead>
<tbody>
<row>
<entry><para>All areas (unless specified differently)
</para></entry>
<entry><para>None</para></entry>
<entry><para>None</para></entry>
<entry><para>None</para></entry>
<entry colsep="0"><para>Blends are not permitted</para></entry>
</row>
<row rowsep="0">
<entry><para>A1</para></entry>
<entry><para>0,60 mm</para></entry>
<entry><para>10,00 mm</para></entry>
<entry><para>10,00 mm</para></entry>
<entry><para>Four</para></entry>
</row>
<row rowsep="0">
<entry><para>A2</para></entry>
<entry><para>1,00 mm</para></entry>
<entry colsep="0"><para>25,00 mm</para></entry>
<entry><para>17,00 mm</para></entry>
<entry><para>Six</para></entry>
</row>
</tbody>
</tgroup>
</table>
```

The example below shows the markup of a formal, image width table.

```

<table frame="topbot" pgwide="1" id="tab-0002">
<title>Ring, Bearing Inner (No. 1) - Repair Data</title>
<tgroup cols="5">
<colspec colname="col1"/>
<colspec colname="col2"/>
<colspec colname="col3"/>
<colspec colname="col4"/>
<colspec colname="col5"/>
<thead>
<row rowsep="1">
<entry colname="col1" colsep="0"><para>Area</para></entry>
<entry colname="col2" colsep="0"><para>Maximum blend

## 1 General

This chapter contains the definition and use of figures and foldouts from an author's point of view. It gives details about the available elements and attributes and how to use them to establish a connection between data module text and figures. Figures must be located in the context where it is most convenient to the reader. If it is cross-referenced only once, the location is immediately after the paragraph, or major element, in which the reference occurred.

## 2 Figures, multimedia and foldouts

### 2.1 General

The element group for figures, multimedia and foldouts also contains the alternates for figures and multimedia.

ICN-83007-0000000067-001-01

Fig 1 Element group *fmftElemGroup*

#### Child elements:

- `<figure>`. Refer to [Para 2.2.1](#).
- `<figureAlts>`. Refer to [Para 2.2.2](#).
- `<multimedia>`. Refer to [Para 2.3.1](#).
- `<multimediaAlts>`. Refer to [Para 2.3.2](#).
- `<foldout>`. Refer to [Para 2.4](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).

## 2.2 Figure and figure alternates

### 2.2.1 Figure

**Description:** This element contains the figure. The figure consists of a title and one or more illustrations sheets, using the element `<graphic>`, and a figure title. It can also contain a legend.

For specific rules and guidance for the preparation of illustrations, refer to [Chap 3.9.2](#).

In all cases, figures must be placed as near as possible to, and preferably immediately following, the related text.

Figure titles must be written in sentence case and must not have a period [.] at the end.

Figure titles must not exceed two lines.

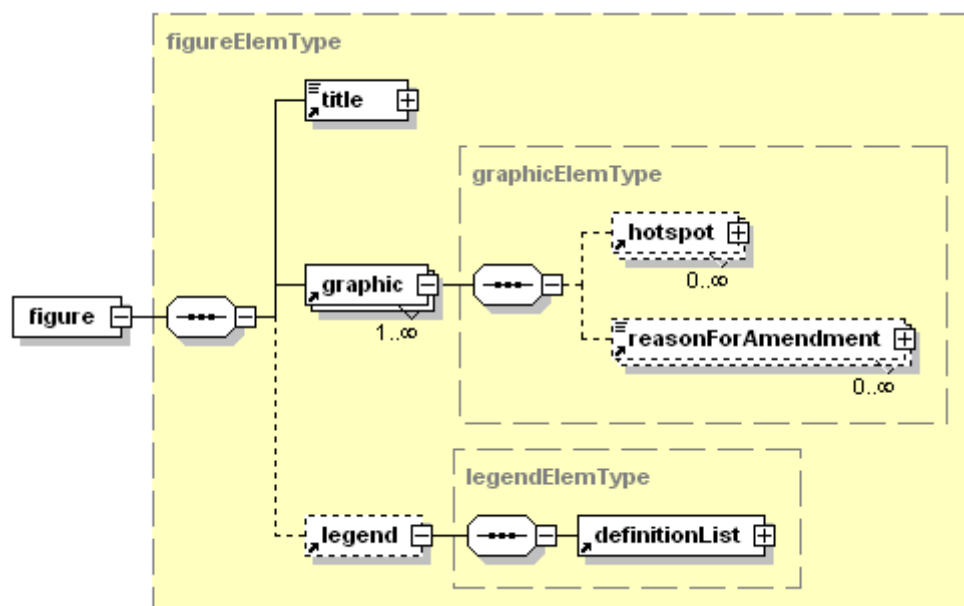

#### Note

For paper based publications and documents, which are produced from data modules, the placement of the figure is given in the data module. There must be no manual attempt to move the figure to another page due to an automatic page break.

An ICN is used to control the production and management of the illustration. This ICN is used within the data module to identify the associated graphic as described below. Refer to [Chap 4.4](#).

Where appropriate, figures can be divided over a number of illustration sheets. This is achieved using multiple occurrences of the element `<graphic>` within the element `<figure>`.

**Markup element:** `<figure>`

ICN-83007-0000000068-001-01

Fig 2 Element `<figure>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Note

When cross referring to an illustration or graphic in a data module, use this attribute id of the element `<figure>`, and not the attribute id of the element `<graphic>`.

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<graphic>`. Refer to [Para 2.2.1.1](#).
- `<legend>`, used to contain the legend information related to the figure. Refer to [Para 2.2.1.2](#).

## 2.2.1.1

### Graphic

**Description:** The element contains the external entity reference to the illustration file.

**Markup element:** `<graphic>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Note

An example value for the attribute `id`, when using the element `<graphic>` specifically for multiple sheets, is given in [Chap 3.9.5.2.1.2](#) ("`fig-NNNN-gra-NNNN`", where NNNN gives a unique figure and sheet number within the data module).

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `infoEntityIdent` (M), the link to the external entity declaration, which points to the illustration file. The population of this attribute must include the complete ICN with the prefix "`ICN-`".
- `reproductionWidth` (O), used to indicate the presentation width to the presentation system. The width measurement is of the form number and unit (eg, 25pt, 25mm, 16.2in). The units are case sensitive and can be "pt" (points 1/72"), "cm" (centimeters), "mm" (millimeters), "pi" (picas), and "in" (inches).
- `reproductionHeight` (O), used to indicate the presentation height to the presentation system. The height measurement is of the form number and unit (eg, 25pt, 25mm, 16.2in). The units are case sensitive and can be "pt" (points 1/72"), "cm" (centimeters), "mm" (millimeters), "pi" (picas), and "in" (inches).
- `reproductionScale` (O), used to indicate the presentation scale to the presentation system. The scale measurement is of the form "integer number" (eg, 70), and means that the scaled height and width is the percentage of the full size graphic (100 is full size).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#)

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Note

The element also includes five attributes normally populated by applications to make the use of W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<hotspot>`, used for hot spotting. Refer to [Chap 3.9.5.2.1.8](#).
- `<reasonForAmendment>`, used to contain the reason for amendment information. Refer to [Chap 3.9.5.2.1.1](#).

### 2.2.1.2 Legend

**Description:** The element `<legend>` contains the legend or explanatory list. The entries in the legend must be exactly as the items are presented in the text (eg, if the legend says "Bolt" any text paragraph referencing this item should be "Bolt" or "bolt" if it is in a middle of a sentence).

#### Note

In the case of multi-sheet illustrations, only one legend is permitted.

**Markup element:** `<legend>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<definitionList>`. Refer to [Chap 3.9.5.2.1.3](#).

#### Business rule decision point BRDP-S1-00128 - Types of legends:

- Decide on the strategy for legends, if used. Legends can appear as part of the illustration or as text using the element `<legend>`. The advantage of making the legend part of the text is that:
  - the same illustration can have different legends wherever it appears (eg, in multi-language projects)
  - the text of the element `<legend>` can be searched (this might not be the case if the legend is part of the illustration)
  - items in the illustration can be linked to the legend by the use of hotspots
  - the legend in the text can save space on the illustration (particularly when the legends are long)

### 2.2.2 Figure alternates

**Description:** The element `<figureAlts>` is an alternate group that provides the capability to group several alternatives to a figure. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** `<figureAlts>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <figure>. Refer to [Para 2.2.1](#).

## 2.3

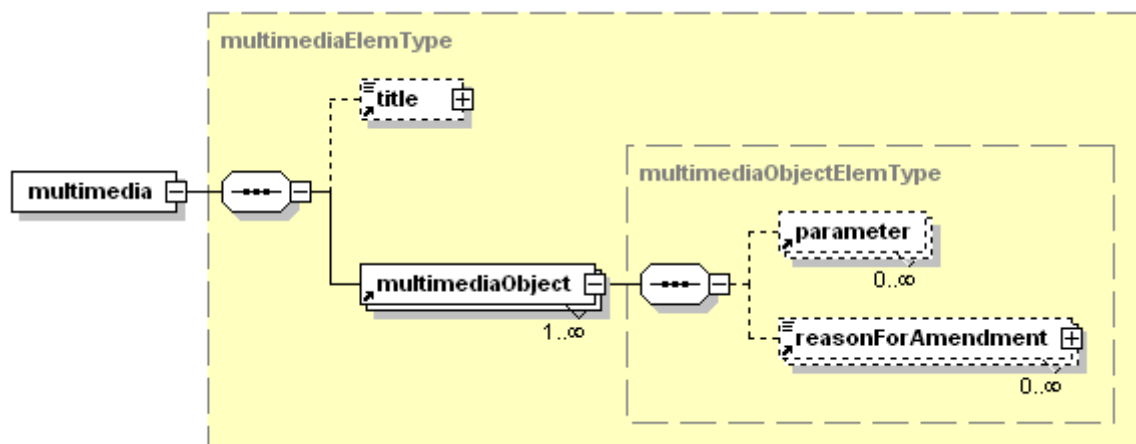

## Multimedia and multimedia alternates

### 2.3.1

#### Multimedia

**Description:** The element <multimedia> contains the multimedia content, which is used for marking up all multimedia content.

**Markup element:** <multimedia>

ICN-83007-0000000070-001-01

Fig 3 Element <multimedia>

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <multimediaObject>. Refer to [Para 2.3.2.1](#).

---

**Business rule decision point BRDP-S1-00129 - Suitability of multimedia use:**

- Decide whether using multimedia is suitable for the environment in which the project will operate.

**2.3.2 Multimedia alternates**

The element `<multimediaAlts>` contains the element `<multimedia>`. Refer to [Para 2.3.1](#).

**2.3.2.1 Multimedia object**

**Description:** The element `<multimediaObject>`, which contains parameter details of the multimedia objects.

**Markup element:** `<multimediaObject>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `autoPlay` (O), defines whether the object is automatically played on load or not (ie, wait for user interaction). The attribute can have one of the following values:
  - "0" - No, the object will not automatically play on load
  - "1" - Yes, the object will automatically play on load
- `fullScreen` (O), used to determine if the object will be viewed/played in full screen mode. This attribute can have one of the following values:
  - "0" - No, the object will not be viewed/played in full screen mode
  - "1" - Yes, the object will be viewed/played in full screen mode
- `infoEntityIdent` (M), a unique control number used to declare the entity name.
- `multimediaObjectHeight` (O), defines the display height of the object at run time if not full screen.
- `multimediaObjectWidth` (O), defines the display width of the object at run time if not full screen.
- `multimediaType` (M), used to denote the type of multimedia (eg, video, audio). The attribute can have one of the following values:
  - "3D" - to declare the multimedia object type as 3D
  - "audio" - to declare the multimedia object type as audio
  - "video" - to declare the multimedia object type as video
  - "other" - to declare the multimedia object type other than those defined above
- `runTimeDuration` (O), defines the objects run time (this can be necessary for text to sound synchronization, common in e-learning).
- `showPluginControls` (O), used to hide or show the third party software plug-in controls. The attribute can have one of the following values:
  - "hide" - to hide the plug-in controls
  - "show" - to show the plug-in controls

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Note

The element also includes five attributes normally populated by applications to make the use of W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<parameter>`. Refer to [Chap 3.9.5.2.1.8](#).
- `<reasonForAmendment>`. Refer to [Chap 3.9.5.2.1.1](#).

#### Business rules decision point BRDP-S1-00130 - Permitted types of multimedia:

- Decide what types of multimedia objects are permitted.

## 2.4

### Foldouts

**Description:** The element `<foldout>` is used to contain a figure, or table which is larger than the default size.

#### Note

Use of foldouts for tables is to be avoided.

**Markup element:** `<foldout>`

ICN-83007-0000000069-001-01

Fig 4 Element `<foldout>`

#### Attributes:

- None

#### Child elements:

- `<figure>`. Refer to [Para 2.1](#).
- `<figureAlts>`. Refer to [Para 2.2.2](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).

#### Business rule decision point BRDP-S1-00131 - Use of foldouts:

- Decide whether to use the element `<foldout>` and, if used, where its use is allowed (eg, within specific information sets).

#### Note

It is only used for page-oriented publications, as it will not have an effect in the screen view of an IETP.

### 3 Examples

#### 3.1 Single illustration

The following example shows the markup for a data module that contains a single CGM illustration using the complete ICN in the attribute `infoEntityIdent`.

```
<!DOCTYPE dmodule [
<!ENTITY ICN-S1000DBIKE-AAA-D000000-0-U8025-00536-A-04-1 SYSTEM
"../../../../illustrations/ICN-S1000DBIKE-AAA-D000000-0-U8025-
00536-A-04-1.CGM" NDATA cgm>
]>
...
<figure id="fig-0001">
<title>Complete bicycle</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-D000000-0-U8025-
00536-A-04-1">
</graphic>
</figure>
```

#### 3.2 Multiple illustrations

The following example shows the markup for a multiple illustration sheet figure:

```
<figure id="fig-0001">
<title>LP compressor - Removal</title>
<graphic id="fig-0001-gra-0001" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00232-A-01-1">
</graphic>
<graphic id="fig-0001-gra-0002" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00233-A-01-1">
</graphic>
</figure>
```

#### 3.3 Alternate illustration

The following example shows the markup for an alternate illustration:

```
<figureAlts id="fig-0001">
<figure id="fig-0002">
<title>LP compressor - Removal</title>
<graphic id="fig-0001-gra-0001" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00232-A-01-1">
</graphic>
<graphic id="fig-0001-gra-0002" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00233-A-01-1">
</graphic>
</figure>
</figureAlts>
```

#### 3.4 Legend

The following example shows the markup for a legend:

```
<figure id="fig-0001">
<title>LP compressor - Removal</title>
<graphic id="fig-0001-gra-0001" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00232-A-01-1">
```

```

</graphic>
<graphic id="fig-0001-gra-0002" infoEntityIdent="ICN-E2-A-
723200-R-K0378-00233-A-01-1">
</graphic>
<legend>
<definitionList>
<title>Legend for <internalRef internalRefId="fig-0001">
</internalRef>
</title>
<definitionListItem>
<listItemTerm>1</listItemTerm>
<listItemDefinition><para>Display</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>2</listItemTerm>
<listItemDefinition><para>Button</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>3</listItemTerm>
<listItemDefinition><para>Widget</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>4</listItemTerm>
<listItemDefinition><para>Adaptor</para></listItemDefinition>
</definitionListItem>
...
<definitionListItem>
<listItemTerm>102</listItemTerm>
<listItemDefinition><para>Retainer</para></listItemDefinition>
</definitionListItem>
</definitionList>
</legend>
</figure>

```

### 3.5 Multimedia

The multimedia element can be inserted into the data module at the same locations as a figure, foldout or table. An example of the inserted markup is as follows:

```

<multimedia id="mul-0001">
<multimediaObject autoPlay="0" infoEntityIdent="ICN-S1000DBIKE-
AAA-D000000-0-SF518-00538-A-001-01" multimediaType="3D"
showPluginControls="hide" fullScreen="0"
multimediaObjectHeight="300" multimediaObjectWidth="300">
</multimediaObject>
</multimedia>

```

To refer to an object inside the multimedia object the author must use the standard cross-reference element [<internalRef>](#). To enable this cross-referencing, additional values "multimedia", "multimediaObject" and "param" have been added to the attribute type within the element [<internalRef>](#).

An example of the markup for the cross-reference is as follows:

```
<internalRef internalRefTargetType="irrtt12" internalRefId="prm-0001"></internalRef>
```

The cross reference is linked by the element `<multimediaObject>` which lists the accessible objects in the multimedia object. An example of this markup is as follows:

```
<multimedia>
<multimediaObject autoPlay="0" infoEntityId="ICN-S1000DBIKE-
AAA-D000000-0-SF518-00538-A-001-01" multimediaType="3D"
showPluginControls="hide" fullScreen="0"
multimediaObjectHeight="300" multimediaObjectWidth="300">
<parameter id="prm-0001" parameterId="param001"
parameterName="cable"/>
</multimediaObject>
<multimediaObject autoPlay="0" infoEntityId="ICN-S1000DBIKE-
AAA-D000000-0-SF518-00538-A-001-01" multimediaType="3D"
showPluginControls="hide" fullScreen="0"
multimediaObjectHeight="300" multimediaObjectWidth="300">
<parameter id="prm-0002" parameterId="param002"
parameterName="lever"/>
</multimediaObject>
<multimediaObject autoPlay="0" infoEntityId="ICN-S1000DBIKE-
AAA-D000000-0-SF518-00538-A-001-01" multimediaType="3D"
showPluginControls="hide" fullScreen="0"
multimediaObjectHeight="300" multimediaObjectWidth="300">
<parameter id="prm-0003" parameterId="param003"
parameterName="guide"/>
</multimediaObject>
</multimedia>
```

In the example above, referencing the element `<parameter>` by its attribute `id` will highlight the object in the multimedia object that is identified thru the value `"param001"` of the attribute `parameterId` and the value `"cable"` of the attribute `parameterName` of the element `<parameter>`. For details on the element `<parameter>`, refer to [Chap 3.9.5.2.1.8](#).

### 3.6 Foldout

The following example shows the markup for a foldout illustration:

```
<foldout>
<figure id="fig-0001">
<title>LP compressor - Removal</title>
<graphic infoEntityId="ICN-E2-A-723200-R-K0378-00232-A-01-1">
</graphic>
<graphic infoEntityId="ICN-E2-A-723200-R-K0378-00233-A-01-1">
</graphic>
</figure>
</foldout>
```

## 1 General

The definition and the use of graphical hotspots including the use of multimedia parameters from an author's point of view is given here. The available elements and attributes, and how to use them to establish a connection between the data module text and objects within multimedia content is given in detail. S1000D does not mandate specific multimedia formats. It is up to the project or organization to specify which formats are to be used.

Information and guidance on how to prepare graphics for hyperlinking and navigation, is given in [Chap 7.3.2](#).

## 2 Content

### 2.1 Relationship to CGM V4

The content model of an S1000D CGM version 4 Application Structure (APS) can be described as a recursive definition of a CGM APS parameter type with value `<grobj>`.

#### Note

All attributes of the CGM APS type value `<grobj>` correspond to CGM APS attributes, except the CGM APS parameter `apsid`, which corresponds to the application structure identifier of the CGM APS itself. Refer to [Chap 7.3.2](#).

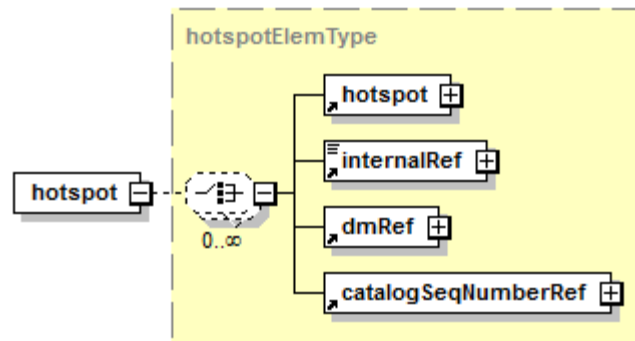

### 2.2 Relationship to multimedia content

The content model of an S1000D multimedia object or scene is dependent on the format of that object or scene. It is therefore not possible to describe the internal id mechanism of each multimedia type. Projects and organizations must ensure that the internal id mechanism for the specified format is clearly defined in the business rules.

### 2.3 Hotspot

**Description:** The element `<hotspot>` contains the definition of graphical regions in an illustration. It also contains information needed to navigate between graphical objects or between graphical objects and text. For the use of the element `<hotspot>` in the context of a learning assessment, refer to [Chap 3.9.5.2.13.5](#).

Markup element: `<hotspot>`

ICN-S3627-S1000D0628-001-01

Fig 1 Element `<hotspot>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `applicationStructureIdent` (O), the relationship between the hotspot and the graphical object in the illustration, associated with the CGM APS parameter `apsid`
- `applicationStructureName` (O), the alternate relationship between the hotspot and the graphical object in the illustration, associated with the CGM APS attribute `name`
- `hotspotType` (O), the classification of a graphical object. Example values are `"callout"` or `"detail"`.
- `hotspotTitle` (O), the context dependent human-readable label, such as a tool tip, that is displayed when the cursor passes over a graphical object
- `objectDescr` (O), the more detailed description of a graphical object
- `objectCoordinates` (O), the coordinates of the overlay region as a closed polygon, separated by commas in the form `"x1, y1,...,xn, yn"`, where each (x,y)-pair defines a vertex point of the closed region in absolute pixel coordinates. The coordinate system has its origin (0,0) at the top/left corner of the raster image with the x-axis pointing to the right and the y-axis pointing down.

#### Note

The word "closed" means that the last vertex point equals to the first one. Thus, a rectangular region is defined by five coordinate pairs. The attribute `objectCoordinates` is only needed for defining externally sensible regions applicable to raster graphics that are not embedded in CGM graphics.

- `visibility` (O), controls how the graphical region is presented. It is set to the value `"hidden"` to turn off any graphical region that is not to be displayed for the current use of a graphic. Otherwise the value `"visible"` is assumed, which means that the graphical region will be displayed.

#### Note

The attribute `visibility` of the element `<grobjct>` in the graphics companion file has three allowable values:

- `"on"` - the graphical region can be selected to be visible

- "off" - the graphical region cannot be selected to be visible
- "inherit" - the values "on" and "off" are inherited from the attribute `pictureVisibility` of the element `<webcgm>` in the graphics companion file, ie, "on" or "off"

The combination of the values for the attribute `visibility` of the element `<hotspot>` and the values for the attribute `visibility` of the element `<grobj>` provides the function of whether a graphical region can be selected for display or not. This combination has three allowable definitions:

- **visible, not selectable**, meaning one of the following:
  - Do not define in a hotspot (do nothing).
  - Define a hotspot without any internal references, data module references, or CSN references.
  - Define a hotspot without any internal references, data module references, or CSN references and set the value of the attribute `visibility` to "visible".
- **visible, selectable**, meaning one of the following:
  - Define a hotspot with at least one internal reference, data module reference, or CSN reference.
  - Define a hotspot with at least one internal reference, data module reference, or CSN reference and set the value of the attribute `visibility` to "visible".
- **not visible, not selectable**, meaning:
  - Define a hotspot with no internal reference, data module reference, or CSN reference and set the value of the attribute `visibility` to "hidden".

#### Note

The use of the definition, **not visible, selectable**, is disallowed.

- `securityClassification` (O), `commercialClassification` (O), and `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<hotspot>`. Refer to [Para 2.2](#).
- `<internalRef>`. Internal references must be populated in accordance with [Chap 3.9.5.2.1.2](#). Refer to default BREX rule BREX-S1-00060.
- `<dmRef>`. Data module references must be populated in accordance with [Chap 3.9.5.2.1.2](#).
- `<catalogSeqNumberRef>`. CSN references must be populated in accordance with [Chap 3.9.5.2.7](#).

#### Business rule decision point BRDP-S1-00132 - Use of hotspots:

- Decide whether and how to use hotspots as follows:
  - If hotspots are to be used, decide whether hotspots can be used to link to graphical objects from local text.
  - If hotspots are to be used, decide whether hotspots can be used to link from graphical objects to other graphical objects or local text.
  - If hotspots are to be used, decide whether hotspots can be used to link from graphical objects to other data modules.

## 2.4 Links to/from graphical objects

Graphical objects can be linked with text, other graphics or graphical objects, other data modules, and parts data in several ways. Links can originate from other objects referring to a graphical object. Links can also originate from graphical objects referring to other objects within the same data module (local), other data modules, or parts data.

If several links exist from the same object then the possible link destinations must be presented as a choice menu to the user when activating the object, for example, by clicking on it.

### 2.4.1 Links to graphical objects originating from local text

Graphical objects are addressed from within data module text by the use of the element `<internalRef>`. The content model of the element `<internalRef>` is described in [Chap 3.9.5.2.1.2](#).

#### Note

In order to allow more flexibility for the element `<internalRef>` in data module text, it can have textual content including subscripts and superscripts to highlight link anchors to the end user in viewer applications. This expansion is not required when using the element `<internalRef>` within the context of the element `<hotspot>`.

The attribute `internalRefId` is used in cases where the link can be expressed as a simple inherited XML link to a target identified by an id attribute in accordance with the W3C XLink mechanism. This applies to all "outbound" links from data module text to graphical objects, all "inbound" links from a graphical object back to data module text (into the same data module where the graphical object is defined), and all "third-party" links from one graphical object to another.

In cases where the attribute `internalRefId` cannot be used, the attribute `referredFragment` contains a Universal Resource Name (URN) reference (including a fragment identifier in the general case) which points to the destination of the link. An example of using the attribute `referredFragment` would be to point into an audio/video data stream at a specific location. In this case, the attribute `internalRefId` is not used.

The attribute `referredFragment` of the element `<internalRef>` also covers the possibility of simultaneously addressing all graphical objects within a (multi-sheet) figure with the same value of the attribute `applicationStructureName`. The attribute `applicationStructureName`, which is replicated in the attribute `referredFragment` of the element `<internalRef>`, can be used as a shorthand address for all graphical objects defined in a (multi-sheet) figure with that name. In this case, the attribute `internalRefId` contains the value of the attribute `id` of the corresponding element `<figure>`. This feature is especially useful in parts data modules by providing a link from the textual description of a part to each occurrence of that part in the figure.

The attribute `targetTitle` of the element `<internalRef>` can be used to provide a human-readable label for the link destination, which will be displayed when, for instance, the graphical object is activated (eg, by a mouse-down event). If the element `<internalRef>` is attached to a graphical object more than once, then the possible link destinations (ie, the values of the attribute `internalRefId` and/or the attribute `referredFragment` and/or the corresponding values of the attribute `targetTitle`) are presented as a choice menu to the user when activating the graphical object, for example, by clicking on it.

The value `"irtt11"` of the attribute `internalRefTargetType` is necessary to distinguish traditional references to a figure from references into it. Refer to default BREX rule BREX-S1-00060.

In case of multi-sheet figures, when cross-referencing to/into a single illustration sheet, the attribute `internalRefId` contains the value of the attribute `id` of the referenced element `<graphic>`.

**Note**

The attribute `internalRefTargetType` is not mandatory. If the application is able to retrieve the name of the link destination element, then it can perform proper actions based on this looked-up name instead of using the value of the attribute `internalRefTargetType`. In this case, the attribute `internalRefTargetType` does not need to be given.

**2.4.2 Links originating from graphical objects to local text or graphics**

Links from graphical objects to objects within the same data module are expressed by using the element `<internalRef>`. The links can be to data module text and/or to other graphic locations of a figure. The element `<internalRef>` is not used for references to another data module.

The use of the element `<internalRef>` follows the rules as described in [Para 2.4.1](#) with the exception that the attribute `internalRefTargetType` is not limited to the value `"irtt11"`. The value used accurately represents the type of the destination object.

In cases where the attribute `internalRefId` cannot be used, the attribute `referredFragment` will contain a URN reference (including a fragment identifier in the general case) pointing to the destination of the link. An example of using the attribute `referredFragment` is to point into an audio/video data stream at a specific location. In this case, the attribute `internalRefId` is not used.

**2.4.3 Links from graphical objects to other data modules**

Links from graphical objects to other data modules are expressed by using the element `<dmRef>`.

The use of the element `<dmRef>` follows the rules as described in [Chap 3.9.5.2.1.2](#).

The use of the attribute `referredFragment` of the element `<dmRef>` covers the possibility of referencing into a figure within a different data module. This can be used, for example, to provide a graphical navigation capability. Referencing into the middle of procedural data is strongly discouraged as critical warnings, cautions, and setup information can be skipped creating a hazardous condition for personnel and equipment. Refer to [Chap 3.9.5.2.1.2](#).

**2.4.4 Links from graphical objects to parts data**

Links from graphical objects to parts data are expressed by using the element `<catalogSeqNumberRef>`.

The element `<catalogSeqNumberRef>` is used to contain a reference to a parts catalog entry. Refer to [Chap 3.9.5.2.7](#).

**2.5 XML "authoring"**

The manual effort involved in authoring the definition of and the access to graphical objects within data modules and their associated illustrations can be minimized by the use of sufficiently powerful tools, both in the CGM graphics and the textual XML environment. An example would be an existing tool which automatically reads and transforms callout/item numbers/items in the graphic to addressable objects with names and unique identifiers. WebCGM 2.1 supports this approach through the Document Object Model (DOM) interface. Refer to [Chap 7.3.2](#).

## 2.6 Hotspot definition

In general, the major manual effort required to define hotspots must be spent in the graphics environment. Leaving out the simple example above of only defining callout/item numbers/items as graphical objects, the illustrator has to group graphic primitives, or has to define a geometric outline embracing them, and must associate address information (a unique identifier and possibly a name) to those potential hotspots.

Depending on the functionality of the CGM export facility in the graphics tool, this address information can be exposed to the textual XML environment for automated insertion of the element `<hotspot>` in data module text.

Some further information to be associated with hotspots can be automatically retrievable from within the data module text, such as the value of the attribute `hotspotTitle` of the element `<hotspot>` (eg, from the structural content of the element `<legend>`) or predetermined context-dependent link ends originating from that graphical object (eg, links back to part numbers in parts information data module text).

In the case of separate raster graphics (not embedded in CGM), the attribute `applicationStructureIdent` and the attribute `applicationStructureName` have no predefined meaning in the graphics environment. As described above, the attribute `objectCoordinates` of the element `<hotspot>` is used to hold the coordinates of a sensible overlay region associated with the raster image and serves as the "address" for linking into the graphics environment.

### Note

In the light of the possible multiple use of a graphic in different data modules, it has to be clearly stated that not every object (APS in case of CGM) defined in the graphical environment needs to be inserted as the element `<hotspot>` in a specific data module (ie, only those graphical objects which are addressed by the element `<internalRef>` in that specific data module must be defined therein). The graphic itself must not be copied and/or re-identified.

## 2.7 Cross-referencing

As opposed to the definition of hotspots, the insertion of cross-references cannot be automated to the same degree. Nevertheless, some support can be given to "link authors" by the XML editor or by a separate link tool.

### Note

If the identifiers are semantically meaningful within the data module content (eg, the attribute `id` of the element `<catalogSeqNumber>` in parts information data modules), then an automated cross-referencing process can be achieved.

## 2.8 Parameter

**Description:** The element `<parameter>` and its attributes are used for passing parameters to objects within the multimedia scene. These parameters can be used to control the behavior to or from objects and to capture click events.

The element `<parameter>` is a child of the element `<multimediaObject>`. Refer to [Chap 3.9.5.2.1.7](#).

### Note

Refer to [Chap 7.3.3](#) for guidance on the use of multimedia objects.

Parameters are id values and names that can be passed to and from multimedia objects, and can be used to link or pass values to create behaviors within a multimedia scene.

Some examples of their use are:

- text in a data module to one area of an object
- text in a data module to several areas of an object
- one area of an object to data module text
- one area of an object to another area of the same object
- one area or object of a multimedia scene to another object of a multimedia scene, data module, or any valid reference in a data module
- one area or object to another object in the same multimedia scene
- from an object in a multimedia resource to another multimedia type, data module, or any valid reference in a data module

**Markup element:** `<parameter>`

**Attributes:**

- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `parameterIdent` (O), the unique identifier in the multimedia object used to call a single element/object of the multimedia object, for example "Item 1" or "Step 1"
- `parameterValue` (O), an assigned value used as a method of passing a value to the object
- `parameterName` (O), the non-unique name used as a method of identifying an object or group of objects to pass a value to or from objects with the same name within the multimedia scene

**Child elements:**

- None

**Business rule decision point BRDP-S1-00133 - Use of the element `<parameter>`:**

- Decide whether to use the element `<parameter>` and how to use it. If used, specify the attributes to be used within the project or organization.

## 2.9 Defining sensitive areas

The author has to define a region, an object or objects, be that manual or automated, and must associate address information, a unique identifier and an optional name to those sensitive areas. The method of definition will be dependent on the content creation tools used and the specified formats.

Highlighting the sensitive area by interaction of the user is a viewer or application function. This can be handled within the multimedia environment as specified by the project or organization in the business rules.

To set up links between data module text and multimedia presentations or between multimedia objects, cross-reference identifiers are necessary. This also applies to defined regions and viewcontext attributes. The required target address of points and values are handled within the multimedia environment as specified by the project or organization. The sensitive area can be represented by:

- objects or their surfaces
- buttons with or without text objects
- navigation symbols or callout numbers, can include the leader line
- visible region (or invisible before a user interaction)

---

**3****Examples**

The examples given below demonstrate the use of graphical hotspots in the data module text and the CGM illustration. The illustrations shown are not to scale.

### 3.1 Illustration example

ICN-1B-B-291101-M-C0419-00571-A-01-1

Fig 2 Graphical hotspots - Example

Applicable to: All

S1000D-A-03-09-0502-01J-040A-A

Chap 3.9.5.2.1.8

### 3.2 CGM version 4 file

The following simple example is an extract from the CGM version 4 file of the illustration which shows the APS used to define the two occurrences of callout number "6" and the single occurrence of callout number "8" as graphical objects. The APS parameter id values are "hot001", "hot002" and "hot003". The optional object names are "6" for both occurrences of callout number "6", whereas "hot003" is not named, and there are optional picking/highlighting regions (a continuous polybezier and two rectangles) defined for the three graphical objects.

The effect when highlighting these graphical objects and bringing them into view (possibly by defining an APS attribute `viewcontext` in addition) by a CGM viewer application can be as shown in the following illustration extract:

ICN-1B-B-291101-M-C0419-00571-B-01-1

Fig 3 Highlighting graphical objects - Example

### 3.3 XML companion metadata

#### 3.3.1 Hotspot definition

The original XML data module fragment, which defines the figure that corresponds to the illustration example above, looks as follows:

```

<figure id="fig-0001">
<title>Removal of solenoid valve, pump no.&puncsp;1

```

```

(no.&puncsp;2)</title>
<graphic infoEntityIdent="ICN-1B-B-291101-M-C0419-00571-A-001-
01"></graphic>
<legend>
<definitionList>
<definitionListItem>
<listItemTerm>1</listItemTerm>
<listItemDefinition>
<para>Electrical plug 3MRa (5MRa)</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>2</listItemTerm>
<listItemDefinition><para>Screw</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>3</listItemTerm>
<listItemDefinition><para>Washer</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>4</listItemTerm>
<listItemDefinition><para>Solenoid valve</para>
</listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>5</listItemTerm>
<listItemDefinition>
<para>Locating pin</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-0001">6</listItemTerm>
<listItemDefinition><para>O-Ring</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>7</listItemTerm>
<listItemDefinition><para>O-Ring</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-0002">8</listItemTerm>
<listItemDefinition><para>Hydraulic pump</para>
</listItemDefinition></definitionListItem>
</definitionList></legend></figure>

```

After automated insertion of the potential hotspots, the XML data module fragment for the element **<graphic>** looks as follows, where the value "fig001" is the content of the attribute id of the parent single-sheet element **<figure>**:

```

<graphic id="fig-001-gra-0000" infoEntityIdent="ICN-1B-B-291101-
M-C0419-00571-A-001-01">
<hotspot id="fig-0001-gra-0000-hot-0001"
applicationStructureIdent="hot001" applicationStructureName="6"
hotspotTitle="O-Ring">
<internalRef internalRefId="fig-0001-trm-0001"
targetTitle="Explanation"
internalRefTargetType="irrtt13"></internalRef></hotspot>

```

```
<hotspot id="fig-0001-gra-0000-hot-0002"
applicationStructureIdent="hot002" applicationStructureName="6"
hotspotTitle="O-Ring">
<internalRef internalRefId="fig-0001-trm-0001"
targetTitle="Explanation"
internalRefTargetType="irtt13"></internalRef></hotspot>
<hotspot id="fig-0001-gra-0000-hot-0003"
applicationStructureIdent="hot003" hotspotTitle="Hydraulic
pump">
<internalRef internalRefId="fig-0001-trm-0002"
targetTitle="Explanation" internalRefTargetType="irtt13">
</internalRef></hotspot></graphic>
```

This initial definition step can be performed, to a certain degree, without manual intervention by extracting the values of the attribute `applicationStructureIdent` and the attribute `applicationStructureName` from the CGM environment, and inserting them in the XML instance.

In this example, the individual value of the attribute `hotspotTitle` of the element `<hotspot>` is retrieved from the element `<legend>`.

#### Note

The individual value of the attribute `internalRefId` is an XML identifier that points (back) from the graphical object to the proper location within the element `<legend>`.

### 3.3.2

#### Cross-referencing

For cross-referencing from within data module text to a single graphical object, the element `<internalRef>` can be used as follows:

```
<para>Refer to
<internalRef internalRefId="fig-0001-gra-0000-hot-0003"
internalRefTargetType="irtt11">item 8</internalRef></para>
```

In order to address both graphical objects named "6" at once, the attribute `target` of the element `<internalRef>` is used (in addition to the attribute `internalRefId` which points to the element `<figure>`) in the context of the element `<legend>` as follows:

```
<legend>
<definitionList>
<definitionListItem>
<listItemTerm>1</listItemTerm>
<listItemDefinition>
<para>Electrical plug 3MRa (5MRa)</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>2</listItemTerm>
<listItemDefinition><para>Screw</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>3</listItemTerm>
<listItemDefinition><para>Washer</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm>4</listItemTerm>
```

```

<listItemDefinition><para>Solenoid valve</para>
</listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>5</listItemTerm>
<listItemDefinition><para>Locating pin</para>
</listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-0001">6</listItemTerm>
<listItemDefinition>
<para><internalRef internalRefId="fig-0001" referredFragment="6"
internalRefTargetType="irttl1">O-Ring</internalRef></para>
</listItemDefinition></definitionListItem>
<definitionListItem>
<listItemTerm>7</listItemTerm>
<listItemDefinition><para>O-Ring</para></listItemDefinition>
</definitionListItem>
<definitionListItem>
<listItemTerm id="fig-0001-trm-0002">8</listItemTerm>
<listItemDefinition><para>Hydraulic pump</para>
</listItemDefinition></definitionListItem></definitionList>
</legend>

```

### 3.4 Separate raster graphics

In order to demonstrate the use of the attributes of the element `<hotspot>` in case of separate raster graphics (not embedded in CGM), it is assumed that the above illustration is only available as a TIF, CG4, GIF, PNG or JPG image file.

The XML data module fragment for the definition of the third element `<hotspot>` within the element `<graphic>` looks then as follows:

```

<hotspot id="fig-0001-gra-0000-hot-0003" hotspotTitle="Hydraulic
pump" objectCoordinates="134,48,134,52,136,52,136,48,134,48">
<internalRef internalRefId="fig-0001-trm-0002"
targetTitle="Explanation"
internalRefTargetType="irttl3"></internalRef></hotspot>

```

#### Note

The attribute `applicationStructureIdent` and the attribute `applicationStructureName` are not used in this example.

### 3.5 References between graphical objects

For cross-referencing from one graphical object to another, the element `<internalRef>` is used within the element `<hotspot>` as follows (building up on the example above):

```

<hotspot id="fig-0001-gra-0000-hot-0001"
applicationStructureIdent="hot001" applicationStructureName="6"
hotspotTitle="O-Ring">
<internalRef internalRefId="fig-0001-trm-0001"
targetTitle="Explanation"
internalRefTargetType="irttl3"></internalRef>
<internalRef internalRefId="fig-0001-gra-0000-hot-0002"
internalRefTargetType="irttl1" targetTitle="Second occurrence of
catalogItemNumber 6"></internalRef></hotspot>

```

In this example, the link from the first to the second occurrence of item number "6" is expressed by another child element `<internalRef>` of the element `<hotspot>`.

### 3.6 References from within illustration sheets to other data modules

For cross-referencing from one graphical object to the figure and the XML text of another data module and to parts data, the element `<internalRef>`, the element `<dmRef>` and the element `<catalogSeqNumberRef>` are used within the element `<hotspot>` as follows (building up on the example above):

```
<hotspot id="fig-0001-gra-0000-hot-0003"
applicationStructureId="hot003" hotspotTitle="Hydraulic
pump">
<internalRef internalRefId="fig-0001-trm-0002"
targetTitle="Explanation" internalRefTargetType="irtt13">
</internalRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B"
systemCode="24" subSystemCode="4" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="130" infoCodeVariant="B" itemLocationCode="A"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Disconnection of power supply</techName>
<infoName>Normal operation</infoName>
</dmTitle></dmRefAddressItems></dmRef>
<dmRef referredFragment="ICN-1B-B-244000-M-C0419-00123-A-001-
01">
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B"
systemCode="24" subSystemCode="4" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="130" infoCodeVariant="B" itemLocationCode="A"/>
</dmRefIdent></dmRef>
<catalogSeqNumberRef modelIdentCode="E2" systemDiffCode="A"
systemCode="53" subSystemCode="2" subSubSystemCode="5"
assyCode="10" figureNumber="01" item="001" itemLocationCode="D"
itemSeqNumberValue="00A"/></hotspot>
```

In this example, the second child element `<dmRef>` of the element `<hotspot>` demonstrates the possibility for link definitions from a graphical hotspot to another data module.

The third child element `<dmRef>` of the element `<hotspot>` demonstrates the possibility for link definitions from a graphical hotspot to other resources (ie, to another figure), external to the context of a specific data module. This is accomplished by using the attribute `referredFragment`.

The fourth child element `<catalogSeqNumberRef>` of the element `<hotspot>` demonstrates the possibility for link definitions from a graphical hotspot to a part within an IPD data module.

In this example, when the graphical hotspot is selected in an IETP, a list of four possible link destinations is presented:

- Explanation - Other
- Disconnection of power supply - Normal operation
- Disconnection of power supply - Figure
- Hydraulic pump XYZ - Parts data

## 1 General

This chapter contains the definition and handling of the sections "Preliminary requirements" and "Requirements after job completion" from an author's point of view. It gives details about the available elements and attributes and how to use them to populate Preliminary requirements and Requirements after job completion.

The rules for the presentation of Preliminary requirements and Requirements after job completion in page-oriented publications and IETP are given in [Chap 6.2.3.3](#) and [Chap 6.3.1](#), respectively.

Preliminary requirements, element [<preliminaryRqmts>](#) used in procedural, fault isolation, process and maintenance checklists and inspections data modules:

- lists (Required conditions) the tasks to be done or conditions that must be satisfied before the Main procedure, element [<mainProcedure>](#), for procedural data modules, elements [<faultReporting>](#) and [<faultIsolation>](#) for fault isolation data modules, [<checkList>](#) in the maintenance checklists and inspection data modules is started
- lists any personnel, required technical information, support equipment, supplies and spares that are needed to perform the Required conditions, Main procedure and Requirements after job completion. Resources given in referenced procedures (data modules, publication modules or non-S1000D publications or documents) must not be included.
- contains the safety conditions that apply to the Main procedure and the Requirements after job completion

Basic production maintenance data can be specified by using in the element [<productionMaintData>](#).

Requirements after job completion, element [<closeRqmts>](#), captures any actions that are required after the Main procedure is complete, to return the Product to a serviceable condition or the conditions that must be satisfied to have the Product in a serviceable condition.

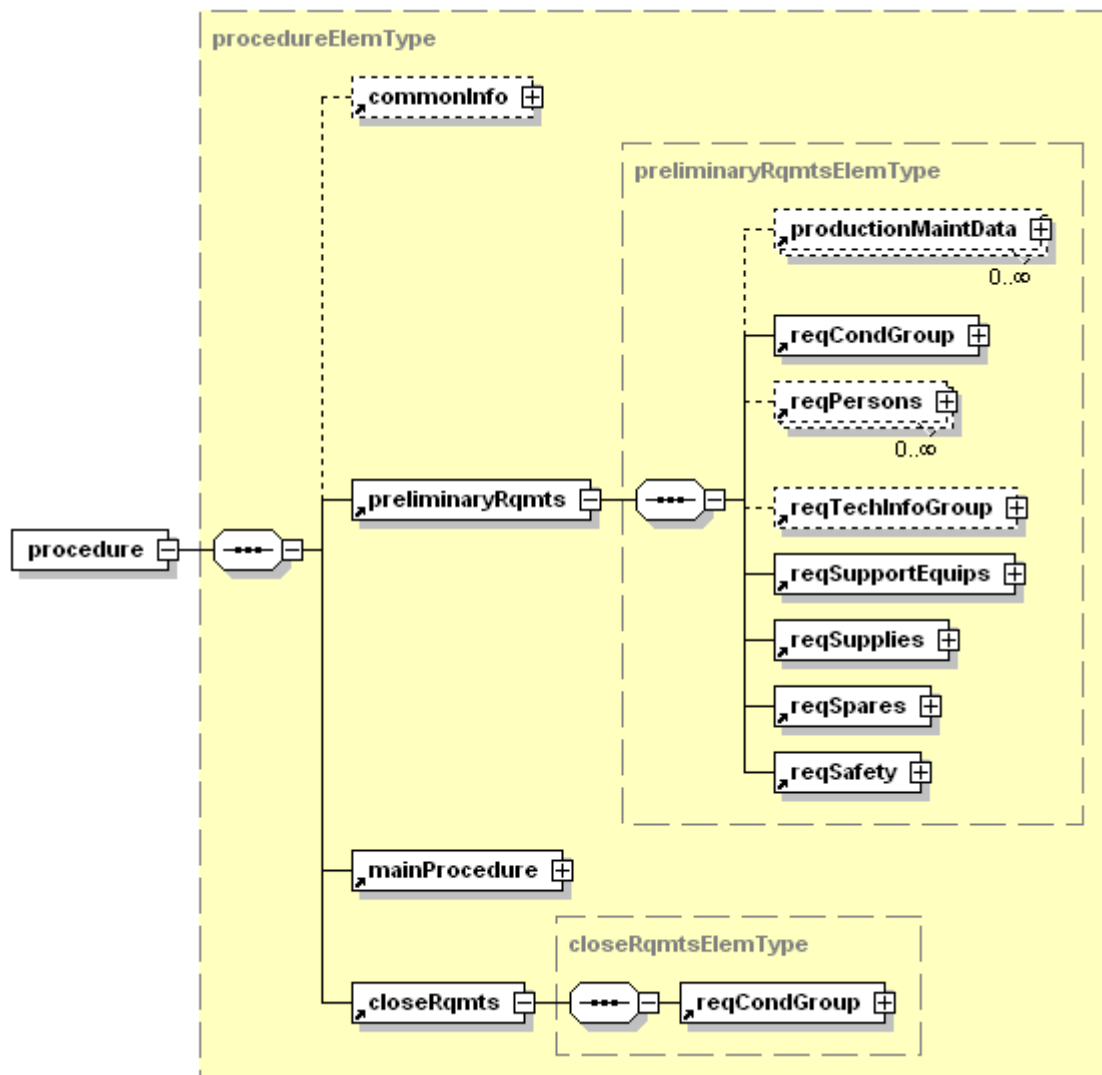

[Fig 1](#) shows the overall construct of the elements `<preliminaryRqmts>` and `<closeRqmts>` in procedural, fault isolation and process data modules. The maintenance planning and maintenance checklist data modules use only the element `<preliminaryRqmts>`.

It is recommended to give references to complete data modules only, in Required conditions, element `<reqCondGroup>`, and in Requirements after job completion, element `<closeRqmts>`. This enables an automatically preparation of situation adopted maintenance procedures, by compiling all the Preliminary requirements data and actions, and the Requirements after job completion data and actions, together with all Main procedures, consolidated into one complete sequence.

To prescribe a condition by giving an action in the elements `<preliminaryRqmts>` or `<closeRqmts>`, without a reference to a data module, can reduce the possibility for further automated preparation of situation adopted maintenance procedures. The same limitation appears where an action just refers to one or more steps in the referred data module or publication.

The markup examples given in this chapter are presented in [Chap 6.2.3.3](#) in the S1000D standard layout for page oriented presentation.

The graphical representation of the XML schema fragments use specific symbols which are explained in [Chap 3.9.5](#).

ICN-S3627-S1000D0442-001-01

Fig 1 Element `<preliminaryRqmts>` and element `<closeRqmts>` in a procedural data module

## 2 Preliminary requirements

**Description:** The element `<preliminaryRqmts>` contains all preliminary requirements for a procedure as described at [Para 2.2](#) through [Para 2.8](#).

**Markup element:** `<preliminaryRqmts>`

The element is mandatory in procedural and fault isolation data modules and optional in process and maintenance planning data modules.

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<productionMaintData>`, production management data. Refer to [Para 2.1](#).

- <reqCondGroup>, required conditions. Refer to [Para 2.2](#).
- <reqPersons>, required persons. Refer to [Para 2.3](#).
- <reqTechInfoGroup>, required technical information. Refer to [Para 2.4](#).
- <reqSupportEquips>, support equipment. Refer to [Para 2.5](#).
- <reqSupplies>, consumables, materials and expendables. Refer to [Para 2.6](#).
- <reqSpares>, spares. Refer to [Para 2.7](#).
- <reqSafety>, safety conditions. Refer to [Para 2.8](#).

**Business rule decision point BRDP-S1-00134 - Use of the element <preliminaryRqmts>:**

- Decide whether to use the element <preliminaryRqmts> in maintenance planning, fault isolation, maintenance checklist and/or process data modules.

**Markup example:**

```
<preliminaryRqmts>
<reqCondGroup>
<noConds/>
</reqCondGroup>
<reqPersons>
<person man="A">
<personCategory personCategoryCode="Basic user"/>
<trade>Operator</trade>
<estimatedTime unitOfMeasure="h">0,3</estimatedTime></person>
</reqPersons>
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0001">
<name>Tire pressure gauge</name>
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001-01</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
<supportEquipDescr id="seq-0002">
<name>Specialist toolset</name>
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>
<reqSupplies>
<supplyDescrGroup>
<supplyDescr id="sup-0001">
```

```

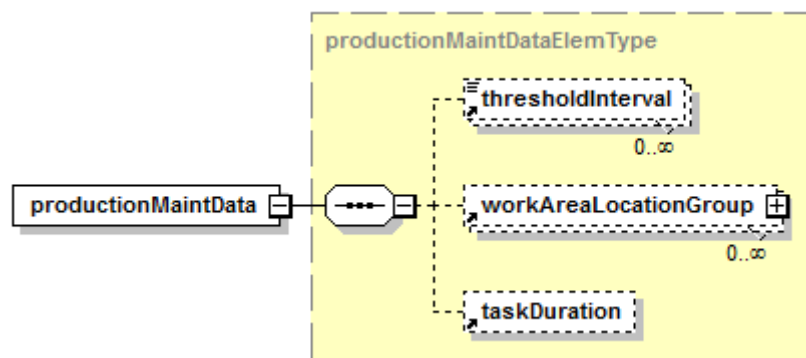

<name>General lubricant</name>
<identNumber>
<manufacturerCode>KZ222</manufacturerCode>
<partAndSerialNumber>
<partNumber>LL-001</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity>As required</reqQuantity>
</supplyDescr>
</supplyDescrGroup>
</reqSupplies>
<reqSpares>
<noSpares/>
</reqSpares>
<reqSafety>
<noSafety/>
</reqSafety>
</preliminaryRqmts>

```

## 2.1 Production maintenance data

**Description:** The element `<productionMaintData>` contains the basic information required for the planning and preparation of the task.

**Markup element:** `<productionMaintData>`

ICN-S3627-S1000D0443-002-01

Fig 2 Element `<productionMaintData>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

### Child elements:

- `<thresholdInterval>`, the threshold intervals. Refer to [Para 2.1.1](#).
- `<workAreaLocationGroup>`, the group of work area locations. Refer to [Para 2.1.2](#).
- `<taskDuration>`, the maintenance task duration. Refer to [Para 2.1.3](#).

### 2.1.1 Threshold interval

**Description:** The element `<thresholdInterval>` contains any (one or more) threshold interval information that is relevant to the task. It is populated in the format of threshold or threshold interval value. For example 25 followed by the value of the attribute `thresholdUnitOfMeasure` (eg, FH).

**Recommendation:** The use of the element `<thresholdInterval>` can conflict with the same data given in the maintenance planning information data modules. A close coordination must be taken if the same data is given in both the procedure and the maintenance planning information. It is recommended to use the maintenance planning information in preference of the element `<thresholdInterval>` in each procedural data module.

**Markup element:** `<thresholdInterval>`

**Attributes:**

- `thresholdUnitOfMeasure` (M), the unit of measure for the threshold interval. The attribute can have one of the following values:
  - "th01" thru "th99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Markup example:**

The following example is a threshold interval indicating 25 flight hours. The attribute `thresholdUnitOfMeasure` set to "th01" indicates flight hours as specified in [Chap 3.9.6.1](#).

```
<thresholdInterval
thresholdUnitOfMeasure="th01">25</thresholdInterval>
```

The following example is a threshold interval indicating 55 to 60 days. The attribute `thresholdUnitOfMeasure` set to "th06" indicates days as specified in [Chap 3.9.6.1](#).

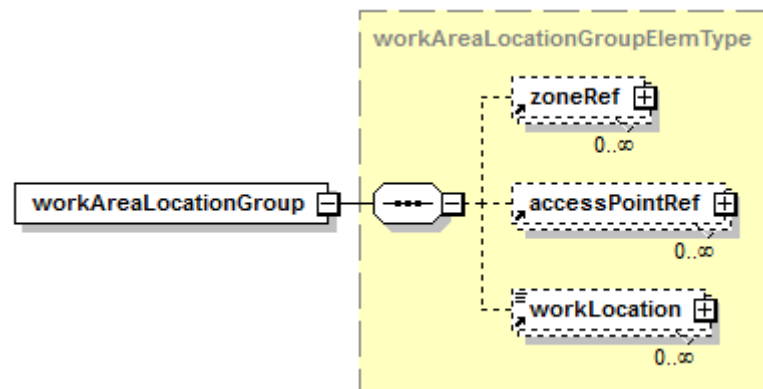

```
<thresholdInterval thresholdUnitOfMeasure="th06">55 to
60</thresholdInterval>
```

### 2.1.2 Work area location group

**Description:** The element `<workAreaLocationGroup>` contains the area where work must be done. This area is sorted by zone, access point and work location.

**Markup element:** `<workAreaLocationGroup>`

ICN-S3627-S1000D0626-001-01

Fig 3 Element `<workAreaLocationGroup>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<zoneRef>`, the references to the zones. Refer to [Chap 3.9.5.2.1.10](#).
- `<accessPointRef>`, the references to the access points. Refer to [Chap 3.9.5.2.1.10](#).
- `<workLocation>`, the description of the area where work is accomplished. Refer to [Para 2.1.2.1](#).

**Business rule decision point BRDP-S1-00135 - Use of the element**

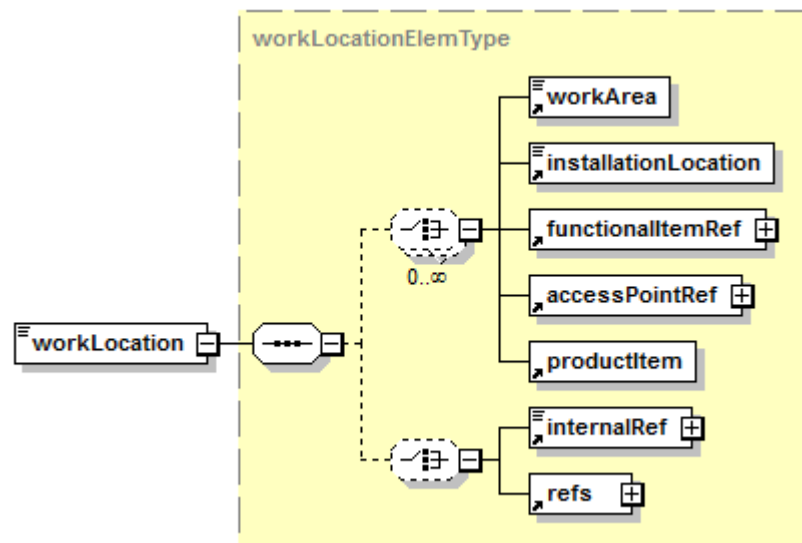

**`<workAreaLocationGroup>` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the element `<workAreaLocationGroup>`. The possibility of duplication and mismatch of data given in the maintenance planning information must be taken into account.

2.1.2.1 Work location

**Description:** The element `<workLocation>` contains the precise location where work must be done.

**Markup element:** `<workLocation>`

ICN-S3627-S1000D0627-001-01

Fig 4 Element `<workLocation>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

One or more of the following:

- `<workArea>`, the descriptive identifier of the area where work is accomplished that cannot be deduced from the names of the collection of zones. Refer to [Para 2.1.2.1.1](#).
- `<installationLocation>`, the installation location. Refer to [Para 2.1.2.1.2](#)
- `<functionalItemRef>`. Refer to [Chap 3.9.5.1](#).
- `<accessPointRef>`, the references to the access points. Refer to [Chap 3.9.5.2.1.10](#).
- `<productItem>`, the identifiers of structural parts. Refer to [Para 2.1.2.1.3](#).

and/or one or more of the following elements:

- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

**Business rule decision point BRDP-S1-00136 - Use of the element `<workLocation>` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the element `<workLocation>`. If used, decide the data module types with which it will be used.

#### 2.1.2.1.1 Work area

**Description:** The element `<workArea>` contains a descriptive identifier of the area where work is accomplished that cannot be deduced from the names of the collection of zones.

**Markup element:** `<workArea>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00137 - Use of the element `<workArea>` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the element `<workArea>`. If used, decide which data module types to use it.

**Markup example:**

```
<workArea>Nose cowl</workArea>
```

### 2.1.2.1.2 *Installation location*

**Description:** The element `<installationLocation>` contains the installation location information of the equipment instances.

**Markup element:** `<installationLocation>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the installation location if applicable for the installation location type
- `installationLocationType` (O), the type of the installation location information (eg, Section, Station). The attribute can have one of the following values:
  - `"instloctyp02"` thru `"instloctyp99"`. Refer to [Chap 3.9.6.1](#).

**Note**

When the installation location refers to a zone, the element `<zoneRef>` must be used. Refer to [Chap 3.9.5.2.1.10](#).

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00138 - Use of the element `<installationLocation>` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the element `<installationLocation>`. If used, decide which data module types to use it.

**Markup examples:**

Example 1 - Installation location in coded form

The following markup example shows an installation location in coded form, when the type is "Section".

```
<installationLocation installationLocationType="instloctyp02">
245</installationLocation>
```

### Example 2 - Installation location in clear text

The following markup example shows an installation location in clear text.

```
<installationLocation>Side console and rear pressure bulkhead
plug break RH (rear cockpit)</installationLocation>
```

### Example 3 - Installation location with dimensions

The following example shows the installation location of equipment by populating the element `<installationLocation>` with station, water line and buttock line information. The unit of measure is centimeter.

```
<installationLocation installationLocationType="instloctyp03"
unitOfMeasure="cm">199</installationLocation>
<installationLocation installationLocationType="instloctyp04"
unitOfMeasure="cm">170</installationLocation>
<installationLocation installationLocationType="instloctyp05"
unitOfMeasure="cm">57</installationLocation>
```

#### 2.1.2.1.3 Product item

**Description:** The element `<productItem>` is an identifier of structural part of a Product (eg, Frame, Rib, Stringer). It helps workers determining the exact position where a work must be done.

**Markup element:** `<productItem>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `productName` (O), contains the product item name.
- `productItemType` (O), contains the product item type (eg, Frame, Rib, Stringer). The attribute can have one of the following values:
  - `"pi01"` thru `"pi99"`. Refer to [Chap 3.9.6.1](#).

#### Child elements:

- None

**Business rule decision point BRDP-S1-00139 - Use of the element `<productItem>` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the element `<productItem>`. If used, decide which data module types to use it.

**Business rule decision point BRDP-S1-00140 - Use of the attribute `productName` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the attribute `productName`.

**Business rule decision point BRDP-S1-00141 - Use of the attribute `productItemType` in the element `<preliminaryRqmts>`:**

- Decide whether and how to use the attribute `productItemType`.

**Markup example:**

```
<workAreaLocationGroup>
<zoneRef zoneNumber="250" />
<zoneRef zoneNumber="260" />
<workLocation>
from <productItem productItemType="pi01" productItemName="62" />
to <productItem productItemType="pi01"
productItemName="63" /></workLocation>
</workAreaLocationGroup>
```

**Note**

"pi01" corresponds to a "frame" product item.

**2.1.3**
**Maintenance task duration**

**Description:** The element [<taskDuration>](#) contains the elapsed times for performing the actions specified in Preliminary requirements, the Main procedure and the Requirements after job completion which are necessary to achieve the complete maintenance action.

**Note**

All referenced actions must be included.

**Markup element:** [<taskDuration>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- unitOfMeasure (M), the unit of measure to be used are:
  - "d" - day
  - "h" - hour

Refer to default BREX rule BREX-S1-00071.

- startupDuration (M), the duration for performing the actions specified in the Preliminary requirements
- procedureDuration (M), the duration for performing the actions specified in the procedure
- closeupDuration (M), the duration for performing the actions specified in the Requirements after job completion

The task duration must be given in hours or days with maximum one decimal (eg, 12,5 h, 1,5 d). The three time values and unit of measure must be entered.

The total elapsed time for the maintenance task is built up by populating all three attributes startupDuration, procedureDuration and closeupDuration.

**Recommendation:** The use of the element [<taskDuration>](#) can interfere with the same data given in the maintenance planning information data modules. A close coordination must be taken if the same data is given in both the procedure and the maintenance planning information. It is recommended to use the maintenance planning information in preference of the element [<taskDuration>](#) in each procedural data module.

**Child elements:**

- None

## Business rule decision point BRDP-S1-00142 - Use of the element `<taskDuration>` in the element `<preliminaryRqmts>`

- Decide whether and how to use the element `<taskDuration>`. The possibility of duplication and mismatch of data given in the maintenance planning information must be taken into account.

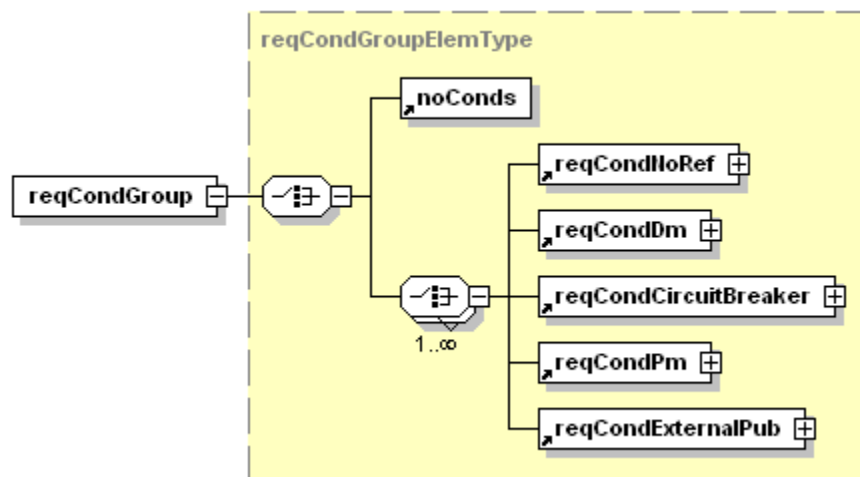

### Markup example:

```
<taskDuration closeupDuration="0.5" procedureDuration="3.0"
startupDuration="1.5" unitOfMeasure="h" />
```

## 2.2 Required conditions

**Description:** This element `<reqCondGroup>` contains any required conditions information. Required conditions are **actions to be done** and/or **conditions that must be satisfied** before the procedure which is the subject of the data module is started.

**Markup element:** `<reqCondGroup>`

ICN-S3627-S1000D0444-001-01

Fig 5 Element `<reqCondGroup>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<noConds>`. Refer to [Para 2.2.1](#).  
or one or more of the following:
- `<reqCondNoRef>`, any simple action/condition with no referenced data module or technical publication. Refer to [Para 2.2.2](#).
- `<reqCondDm>`, any actions/conditions referenced to a data module. Refer to [Para 2.2.3](#).
- `<reqCondCircuitBreaker>`, the circuit breaker actions/conditions. Refer to [Para 2.2.4](#).
- `<reqCondPm>`, any actions/conditions referenced to a publication module. Refer to [Para 2.2.5](#).

- `<reqCondExternalPub>`, any actions/conditions referenced to a non-S1000D publication. Refer to [Para 2.2.6](#).

In process data modules, each element can also include the element `<variablePostSet>` used to update the state information about the state of the Product. For example, if there were a required condition that "Door 12 is open", at some point an assertion can be made to the state information that "Door 12 is open", which can then impact maintenance instructions to follow. Refer to [Chap 3.9.5.2.10](#).

The required actions/conditions, including any circuit breaker actions/conditions, must be listed in the order that they must be carried out to accomplish the procedure.

#### Markup example:

```
<reqCondGroup>
<reqCondNoRef>
<reqCond>The bicycle is outdoors.</reqCond>
</reqCondNoRef>
</reqCondGroup>
```

### 2.2.1

#### No conditions

**Description:** The element `<noConds>` contains the "marker" for no required actions/conditions. If there are no required actions/conditions for the procedure then the element `<noConds>` must be used.

#### Note

When a data module is formatted, the element `<noConds>` generates the word "None" at presentation. For page-oriented presentation "None" is given in the title/condition column of the Required conditions table.

**Markup element:** `<noConds>`

#### Attributes:

- None

#### Child elements:

- None

#### Markup example:

```
<reqCondGroup>
<noConds/>
</reqCondGroup>
```

### 2.2.2

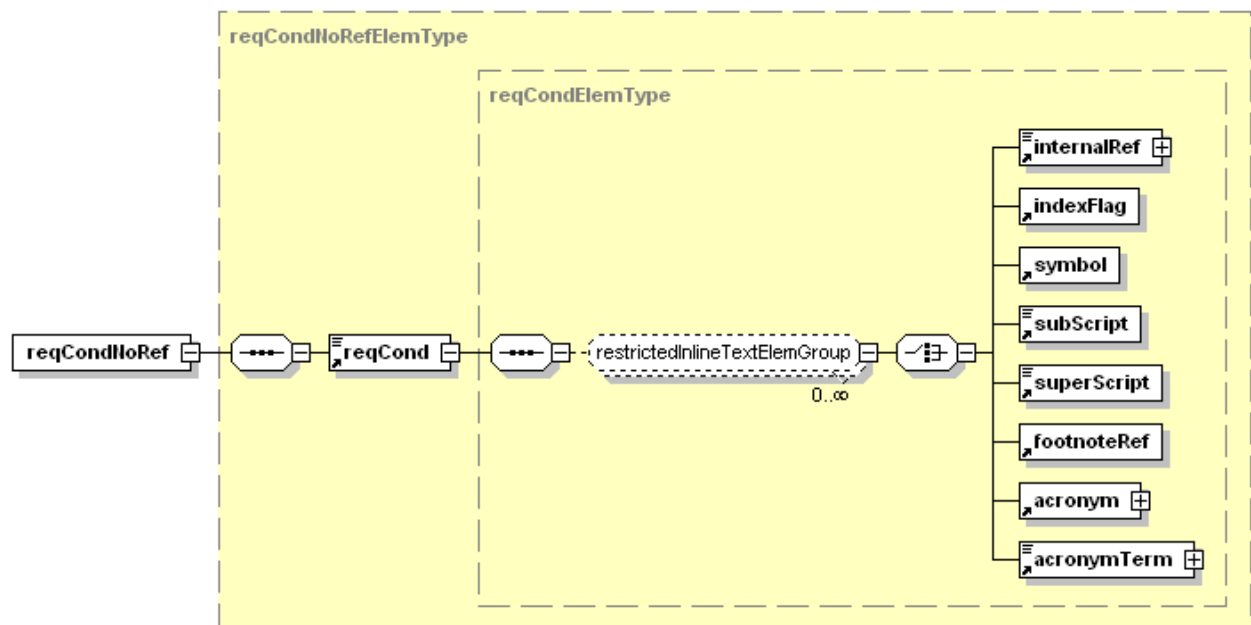

#### Required condition - simple action/condition

**Description:** The element `<reqCondNoRef>` contains the action/condition on its own with no referenced data module or technical publication to represent a simple one step action/condition that does not require further explanation.

The text of a **required action** must be written as an instruction that can be carried out, by a trained mechanic, without any additional information. For example, write "Remove the blanks from all orifices".

The text of a **required condition** must be written as a statement that can be evaluated true or false. For example, write "The blanks are removed from all orifices".

**Markup element:** `<reqCondNoRef>`

ICN-S3627-S1000D0526-001-01

Fig 6 Element &lt;reqCondNoRef&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <reqCond>. Refer to [Para 2.2.3.1](#).

#### Markup example:

```
<reqCondNoRef>
<reqCond>The bicycle is outdoors</reqCond>
</reqCondNoRef>
```

### 2.2.3 Required conditions - referenced data module

**Description:** The element <reqCondDm> contains the required action/condition when satisfied by completing a procedure that is described in a separate data module.

The element <reqCondDm> is used to describe the required action/condition and the element <dmRef> to contain the reference to the data module that contains the procedure to fulfill the condition.

The required action/condition must be equivalent to the full procedure in the referenced data module.

The text of a **required action** must be written as a statement that can be carried out, by a trained mechanic, with support of the referenced data module if needed. For example, write "Make the engine safe for maintenance".

The text of a **required condition** must be written as a statement that can be evaluated true or false with support of the referenced data module if needed. For example, write "The engine is safe for maintenance".

**Markup element:** `<reqCondDm>`

ICN-S3627-S1000D0527-001-01

Fig 7 Element `<reqCondDm>`

#### Attributes:

- Includes the same set of attributes as the element `<reqCondNoRef>`. Refer to [Para 2.2.2.](#)

#### Child elements:

- `<reqCond>`. Refer to [Para 2.2.3.1.](#)
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2.](#)

#### Markup example:

```
<reqCondDm>
<reqCond>The tire is removed.</reqCond>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="1" subSubSystemCode="0"
assyCode="20" disassyCode="00" disassyCodeVariant="AA"
infoCode="215" infoCodeVariant="A" itemLocationCode="A">
</dmCode>
</dmRefIdent>
</dmRef>
</reqCondDm>
```

#### 2.2.3.1 Required condition

**Description:** The element `<reqCond>` contains the required action/condition statement, such as "The tire is removed", "The engine is safe for maintenance", "Make the engine safe for maintenance", "Open the circuit breaker:" or "Make sure the circuit breaker is open, safetied/locked and tagged:" which might require a separate procedure.

**Markup element:** `<reqCond>`

#### Attributes:

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3.](#)

- reqCondCategory, the category of the condition (eg, special environmental conditions such as reduced lighting, ventilation, and temperature). The attribute can have one of the following values:
  - "rcc01" thru "rcc99". Refer to [Chap 3.9.6.1](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <internalRef> (O). Refer to [Chap 3.9.5.2.1.2](#).
- <indexFlag>(O). Refer to [Chap 3.9.5.2.1.10](#).
- <symbol>(O). Refer to [Chap 3.9.5.2.1.10](#).
- <subScript>(O). Refer to [Chap 3.9.5.2.1.10](#).
- <superScript>(O). Refer to [Chap 3.9.5.2.1.10](#).
- <footnoteRef> (O). Refer to [Chap 3.9.5.2.1.10](#).
- <acronym> (O). Refer to [Chap 3.9.5.2.1.10](#).
- <acronymTerm> (O). Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<reqCond>The tire is removed</reqCond>
```

## 2.2.4

### Required conditions - circuit breaker list

**Description:** The element <reqCondCircuitBreaker> contains a set of circuit breaker actions (open, close, open-order, close-order, check open or check closed) to be executed before the performance of the task. The circuit breaker actions must be marked up in the sequence they have to be performed.

**Markup element:** <reqCondCircuitBreaker>

ICN-S3627-S1000D0528-001-01

Fig 8 Element <reqCondCircuitBreaker>

#### Attributes:

- Includes the same set of attributes as the element <reqCondNoRef>. Refer to [Para 2.2.2](#).

#### Child elements:

- <reqCond>. Refer to [Para 2.2.3.1](#).
- <circuitBreakerDescrGroup>. Refer to [Para 2.2.4.1](#).

**Business rule decision point BRDP-S1-00143 - Inclusion of a circuit breaker list as part of the required conditions - (element <reqCondCircuitBreaker>):**

- Decide if circuit breaker lists are allowed in required conditions and thus the use of the element, or if all the circuit breaker settings must be part of the steps. In this latter case, the element <circuitBreakerDescrGroup> in steps content can be used.

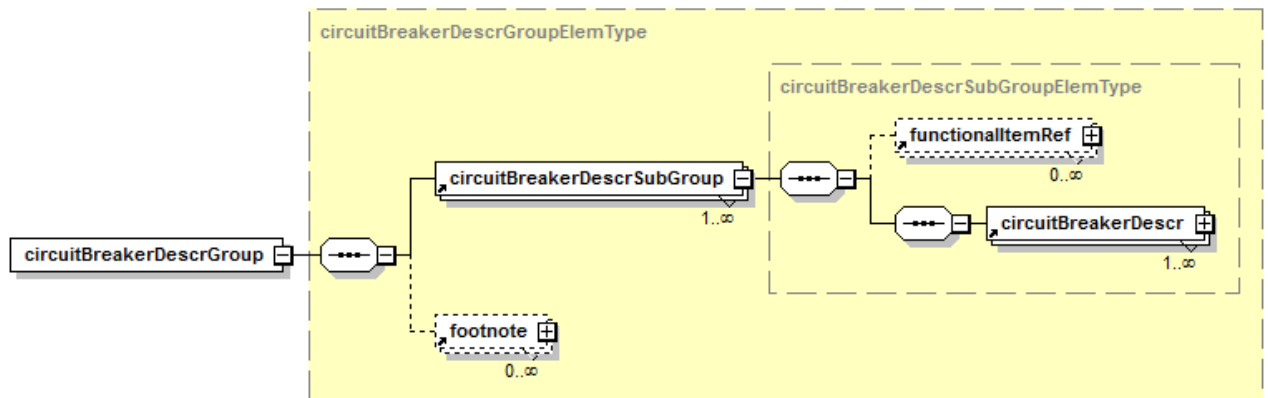

### Markup example:

```
<reqCondCircuitBreaker>
<reqCond>Make sure the circuit breaker is open, safetied/locked
and tagged.</reqCond>
...
</reqCondCircuitBreaker>
```

#### 2.2.4.1 Circuit breaker description group

**Description:** The element `<circuitBreakerDescrGroup>` contains the circuit breaker lists information.

**Markup element:** `<circuitBreakerDescrGroup>`

ICN-S3627-S1000D0445-002-01

Fig 9 Element `<circuitBreakerDescrGroup>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `circuitBreakerAction` (O), the action to perform on the whole set of circuit breaker described in the table. The attribute can have one of the following values:
  - `"open"` - the action "to open"
  - `"close"` - the action "to close"
  - `"verif-open"` - the check of the condition: "is open"
  - `"verif-close"` - the check of the condition: "is closed"
  - `"open-order"` - the action "to open" following the circuit breaker list sequence
  - `"close-order"` - the action "to close" following the circuit breaker list sequence
- `checksum` (O), the entered data which allows potential integrity verification
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <[circuitBreakerDescrSubGroup](#)>. Refer to [Para 2.2.4.1.1](#).
- <[footnote](#)>. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.2.4.1.1 Circuit breaker description subgroup

**Description:** The element <[circuitBreakerDescrSubGroup](#)> contains one or more sub circuit breaker lists.

**Markup element:** <[circuitBreakerDescrSubGroup](#)>

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- circuitBreakerAction (O). Refer to [Para 2.2.4.1](#).
- checksum (O), the entered data which allows potential integrity verification
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

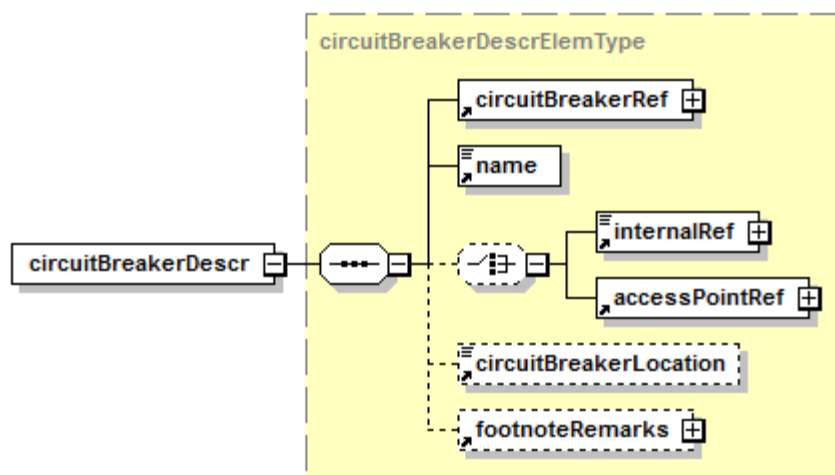

#### Child elements:

- <[functionalItemRef](#)>, contains the particular context for this set of circuit breakers as described in [Chap 3.9.5.1](#).
- <[circuitBreakerDescr](#)>, the description of the circuit breaker. Refer to [Para 2.2.4.1.2](#).

#### 2.2.4.1.2 Circuit breaker description

**Description:** The element <[circuitBreakerDescr](#)> contains the information on individual circuit breakers.

**Markup element:** <[circuitBreakerDescr](#)>

ICN-S3627-S1000D0529-002-01

Fig 10 Element <[circuitBreakerDescr](#)>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <circuitBreakerRef>, the circuit breaker number, circuit breaker action and circuit breaker type. Refer to [Chap 3.9.5.2.1.10](#).
- <name>, the name of the circuit breaker. Refer to [Chap 3.9.5.2.1.10](#).
- <internalRef>, the cross-reference to the access point introduced in the product management data, element <productionMaintData>
- <accessPointRef>, the identifier of the access point allowing manipulating the circuit breaker. Refer to [Chap 3.9.5.2.1.10](#).
- <circuitBreakerLocation>, the circuit breaker location in the circuit breaker panel by entering text. Refer to [Para 2.2.4.1.3](#).
- <footnoteRemarks>, contains textual remarks or reference to a footnote. Refer to [Para 2.5.1.6](#).

#### Markup examples:

Markup example 1 - <circuitBreakerRef>:

```
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="42RT"
circuitBreakerType="cbt02">
</circuitBreakerRef>
<name>MMR-1 (ILS+GPS)</name>
<circuitBreakerLocation>0867</circuitBreakerLocation>
</circuitBreakerDescr>
```

Markup example 2 - <internalRef> - Access point identifier given by element <internalRef> (to element <accessPointRef> within the element <productionMaintData>):

```
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerType="cbt02"
circuitBreakerNumber="44RT"/>
<name>MMR-2 (ILS+GPS)</name>
<internalRef internalRefTargetType="irtt13"
internalRefId="accpnl-0042"/>
<circuitBreakerLocation>0867</circuitBreakerLocation>
</circuitBreakerDescr>
```

Markup example 3 - Access point identifier given by element <accessPointRef>:

```
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerType="cbt02"
circuitBreakerNumber="800RT"/>
<name>GLIDE ANT2 SWGT RELAY</name>
<accessPointRef accessPointNumber="2502VU"
accessPointTypeValue="accpn102"/>
<circuitBreakerLocation>SSPC</circuitBreakerLocation>
</circuitBreakerDescr>
```

Markup example 4 - `<circuitBreakerLocation>`:

```
<circuitBreakerDescr>
<circuitBreakerRef circuitBreakerNumber="800RT"
circuitBreakerType="cbt02">
</circuitBreakerRef>
<name>GLIDE ANT2 SWGT RELAY</name>
<circuitBreakerLocation>SSPC</circuitBreakerLocation>
<footnoteRemarks><footnoteRef internalRefId ="ftn-
001"/></footnoteRemarks>
</circuitBreakerDescr>
```

#### 2.2.4.1.3 Circuit breaker location

**Description:** The element `<circuitBreakerLocation>` contains the textual description of the circuit breaker location in the circuit breaker panel.

**Markup element:** `<circuitBreakerLocation>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

#### 2.2.5 Required conditions - referenced publication module

**Description:** The element `<reqCondPm>` contains the required action/condition when they are contained in another publication module.

The element `<reqCond>` is used to describe the required action/condition and the element `<pmRef>` to contain the publication module identifier.

**Note**

The use of the element `<reqCondPm>` needs a clear reference to the procedure needed to do the action or fulfill the condition. A general reference to for example a component maintenance publication can hinder the mechanic to do the job and also the automated generation of situation adopted maintenance procedures.

**Markup element:** `<reqCondPm>`

ICN-S3627-S1000D0752-001-01

Fig 11 Element &lt;reqCondPm&gt;

#### Attributes:

- Includes the same set of attributes as the element <reqCondNoRef>. Refer to [Para 2.2.2](#).

#### Child elements:

- <reqCond>. Refer to [Para 2.2.3.1](#).
- <pmRef>. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<reqCondPm>
<reqCond>Gather the following publication.</reqCond>
<pmRef>
<pmRefIdent>
<pmCode modelIdentCode="FRIGATE124ALFA" pmIssuer="01233"
pmNumber="01234"
pmVolume="01" />
</pmRefIdent>
</pmRef>
</reqCondPm>
```

## 2.2.6

### Required conditions - referenced non-S1000D publication or document

**Description:** The element <reqCondExternalPub> contains the required action/condition when are contained in a non-S1000D publication or document.

The element <reqCond> is used to describe the required action/condition and the element <externalPubRef> to contain the publication or document identifier.

#### Note

The use of the element <reqCondExternalPub> needs a clear reference to the procedure needed to do the action or fulfill the condition. A general reference to for example a component maintenance publication can hinder the mechanic to do the job and also the automated generation of situation adopted maintenance procedures.

**Markup element:** <reqCondExternalPub>

ICN-S3627-S1000D0753-001-01

Fig 12 Element `<reqCondExternalPub>`

#### Attributes:

- Includes the same set of attributes as the element `<reqCondNoRef>`. Refer to [Para 2.2.2](#).

#### Child elements:

- `<reqCond>`. Refer to [Para 2.2.3.1](#).
- `<externalPubRef>`. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<reqCondExternalPub>
<reqCond>Safely discard the horn that you removed</reqCond>
<externalPubRef><externalPubRefId><externalPubTitle>Local
Disposal Procedures</externalPubTitle>
</externalPubRefId></externalPubRef>
</reqCondExternalPub>
```

## 2.2.7

### Required conditions - markup example

The presentation of the following example is shown in [Chap 6.2.3.3](#).

```
<preliminaryRqmts>
<reqCondGroup>

## 2.3 Required persons

**Description:** The element `<reqPersons>` contains the information on the required personnel for the task.

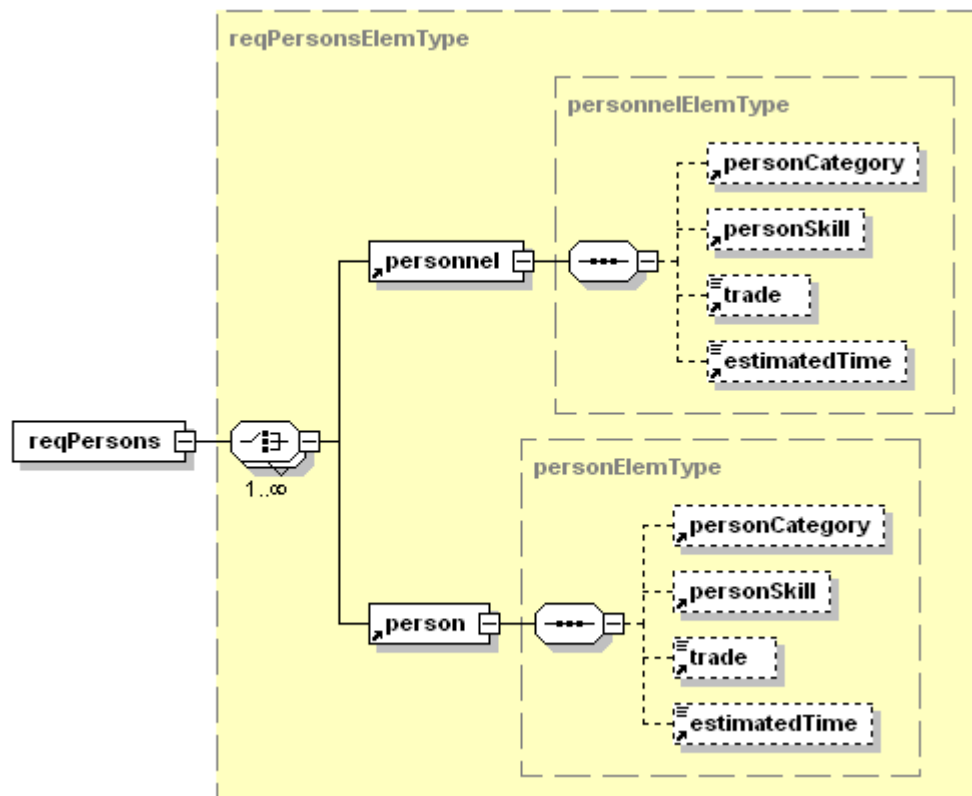

A program can choose to identify the number of a certain skill (category, skill level, trade) that is required. A program choosing this method must use the element `<personnel>` in conjunction with the attribute `numRequired`.

If there are requirements for a specific man, then the element `<person>` must be used. This element has the attribute `man`, which must be used to indicate the particular person (eg, `man="B"`). This method identifies each person required to do the procedure together with the appropriate information as defined by the project: category, skill level, trade/trade code and estimated time spent per person.

If none of the elements in the element `<reqPersons>` is used this will be regarded as "As required".

Required persons can be represented by a mix of populated the element `<personnel>` and the element `<person>`.

**Markup element:** `<reqPersons>`

ICN-S3627-S1000D0530-001-01

Fig 13 Element &lt;reqPersons&gt;

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <personnel>, the required personnel when the number of a certain skill is required. Refer to [Para 2.3.1](#).
- <person>, the required personnel when skill per individual is required. Refer to [Para 2.3.2](#).

**Business rule decision point BRDP-S1-00144 - Use of the element <reqPersons> in the element <preliminaryRqmts>:**

- Decide whether and how to use the element <reqPersons>. For example, use either the element <personnel> or <person> or use both elements.

### 2.3.1 Personnel

**Description:** The element `<personnel>` contains the information on the required personnel for the task by grouping the personnel by category, skill level and trade/trade code together with the number of personnel of a certain skill (category, skill level, trade).

If the number of personnel of a specific category, skill level or trade is not defined in the element `<personnel>` the absence of a specified quantity indicates as "As required".

#### Note

At page oriented presentation "As required" is given in the Person column of the "Required persons" table.

If the attribute `numRequired` is used, then the number required will be presented with the skill level in parentheses.

**Markup element:** `<personnel>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `numRequired` (O), the number of personnel for a certain combination of category, skill level and trade
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<personCategory>`. Refer to [Para 2.3.1.1](#).
- `<personSkill>`. Refer to [Para 2.3.1.2](#).
- `<trade>`. Refer to [Para 2.3.1.3](#).
- `<estimatedTime>`. Refer to [Para 2.3.1.4](#).

#### Markup example:

```
<personnel numRequired="2">
  <personCategory personCategoryCode="Electrician"/>
  <personSkill skillLevelCode="sk01"/>
  <trade>AF901</trade>
  <estimatedTime unitOfMeasure="h">1,5</estimatedTime>
</personnel>
```

#### 2.3.1.1 Category

**Description:** The element `<personCategory>` contains the required category of the person.

**Markup element:** `<personCategory>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `personCategoryCode` (M), the required skill category/type of the person who will perform the task (eg, Airframe, Electrical, Avionic, Engine). The attribute must have the

same values (the S1000D interpretation of the equivalent value of "stNN" as given in [Chap 3.9.6.1](#)) as the attribute `skillType` of the element `<taskDefinition>` in the schedule Schema if both are used. Refer to [Chap 3.9.5.2.5](#).

**Recommendation:** It is recommended to only populate the attribute `personCategoryCode` of the element `<personCategory>` when child element `<preliminaryRqmts>` of the element `<taskDefinition>` is used in the schedule Schema.

- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00145 - Values for the attribute `personCategoryCode` in the element `<preliminaryRqmts>`:**

- Define a list of skill categories/types (eg, Airframe, Electrical, Avionic, Engine).

**Markup example:**

```
<personCategory personCategoryCode="Electrical"/>
```

### 2.3.1.2 Skill level

**Description:** The element `<personSkill>` contains the required skill level of the person. This represents the skill level that the person must have attained to be able to perform his or her role in the procedure and is (eg, Basic, Intermediate, Advanced).

The element `<personSkill>` must have the same values (the S1000D interpretation of the equivalent value of "stNN" as given in [Chap 3.9.6.1](#)) as the attribute `skillLevelCode` in the task definition branch of the Schedule Schema, if both are used. Refer to [Chap 3.9.5.2.5](#).

**Markup element:** `<personSkill>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `skillLevelCode` (M), the skill level of the person. The attribute can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<personSkill skillLevelCode="sk01"/>
```

## 2.3.1.3 Trade/trade code

**Description:** The element `<trade>` contains the typed in required trade code of the person. Care must be taken when using this element when the product is, for example, multi-national or multi-customer. The trade or trade code or both is typed in.

**Markup element:** `<trade>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00146 - Values for the element `<trade>` in the context of the element `<preliminaryRqmts>`:**

- If trades are required, define a list of trades/trade codes.

**Markup example:**

```
<trade>AF901</trade>
```

## 2.3.1.4 Estimated time

**Description:** The element `<estimatedTime>` contains the estimate of aggregation of all the time that the person will be required to complete the task. The estimated time must be given in man-hours with maximum one decimal (eg, 2,4 h). The time and unit of measure must be entered.

**Markup element:** `<estimatedTime>`

**Attributes:**

- `unitOfMeasure` (C), the unit of measure to be used is
  - `"h"` - (man)hour
 Refer to default BREX rule BREX-S1-00072.
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<estimatedTime unitOfMeasure="h">1,5</estimatedTime>
```

### 2.3.2 Person

**Description:** The element `<person>` contains the skill information on the required personnel for the task when there are requirements to individually specify the personnel.

Each person must be given an identifier in the attribute `man`. For example, A, B and C to represent "Man A", "Man B" and "Man C" respectively.

#### Note

The use of the element `<person>` generates at presentation the word "Man" before the value of the attribute `man`. At page-oriented presentation "Man A", etc, is given in the Person column of the Required persons table.

#### Note

The procedure must be written from the point of view of "Man A".

**Markup element:** `<person>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `man` (M), the alphabetic identifier of the person, starting from A
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- Includes the same set of child elements as the element `<personnel>`. Refer to [Para 2.3.1](#).

#### Markup example:

```
<person man="A">
  <personCategory personCategoryCode="Electrician"/>
  <personSkill skillLevelCode="sk02"/>
  <trade>AF901</trade>
  <estimatedTime unitOfMeasure="h">1,5</estimatedTime>
</person>
```

### 2.3.3 Markup example - Required persons

Markup using the element `<reqPersons>` and the element `<person>`:

- In the following example, Man A is required for 1,5 hours and is an electrician (represented in this project by the category Electrician) of basic skill level (represented by the attribute value `"sk01"`). Electricians have the trade code AF901.
- Man B is a propulsion engineer (represented in this project by the category code PE) who is required for 2,5 hours. Man B must be of intermediate skill level (represented by the attribute value `"sk02"`). The trade code for propulsion engineers is AF903.
- Mechanics (as many as required to support Man A and Man B) are required. These can be of basic skill level. The trade code for these mechanics is AF902. They are needed for only 1 hour.
- A supervisor is required. This must be of advanced skill level (represented in this project by attribute value `"sk03"`). The trade code AF092 represents supervisors.

```

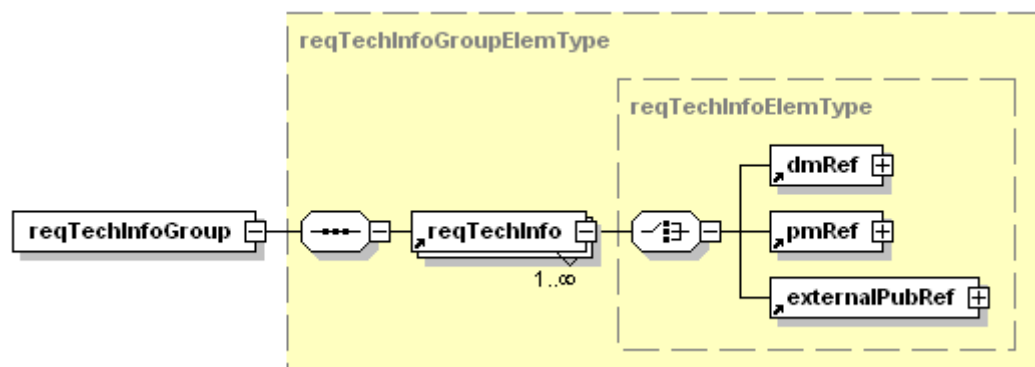

<reqPersons>
  <person man="A">
    <personCategory personCategoryCode="Electrician"/>
    <personSkill skillLevelCode="sk01"/>
    <trade>AF901</trade>
    <estimatedTime unitOfMeasure="h">1,5</estimatedTime>
  </person>
  <person man="B">
    <personCategory personCategoryCode="PE"/>
    <personSkill skillLevelCode="sk02"/>
    <trade>AF903</trade>
    <estimatedTime unitOfMeasure="h">2,5</estimatedTime>
  </person>
</reqPersons>
<personnel>
  <personCategory personCategoryCode="Mechanic"/>
  <personSkill skillLevelCode="sk01"/>
  <trade>AF999</trade>
  <estimatedTime unitOfMeasure="h">1</estimatedTime>
</personnel>
<personnel numRequired="1">
  <personCategory personCategoryCode="SPRVR"/>
  <personSkill skillLevelCode="sk03"/>
  <trade>AF092</trade>
</personnel>
</reqPersons>

```

## 2.4 Required technical information

**Description:** The element [<reqTechInfoGroup>](#) contains references to any technical documents that are required, in addition to the actual data module, for the maintainer to complete the procedure. The list is not a reference list but can be equated to a special tool that needs to be selected. For example, required technical information can be engineering drawings not included in the data module that the maintainer needs to check out of a drawing library in order to complete the maintenance tasks.

**Markup element:** [<reqTechInfoGroup>](#)

ICN-S3627-S1000D0531-001-01

Fig 14 Element [<reqTechInfoGroup>](#)

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- [<reqTechInfo>](#). Refer to [Para 2.4.1](#).

## 2.4.1 Required technical information

**Description:** The element [<reqTechInfo>](#) contains the content of [<reqTechInfoGroup>](#).

**Markup element:** [<reqTechInfo>](#)

**Attributes:**

- reqTechInfoCategory, (O), the type of information. The attribute can have one of the following values:
  - "ti01" thru "ti99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- [<dmRef>](#). Refer to [Chap 3.9.5.2.1.2](#).
- [<pmRef>](#). Refer to [Chap 3.9.5.2.1.2](#).
- [<externalPubRef>](#). Refer to [Chap 3.9.5.2.1.2](#).

**Business rule decision point BRDP-S1-00147 - Use of the element [<reqTechInfoGroup>](#) in the element [<preliminaryRqmts>](#):**

- Decide whether and how to use the element [<reqTechInfoGroup>](#).

**Markup example:**

```
<reqTechInfoGroup>
<reqTechInfo reqTechInfoCategory="ti04">
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>Power Supply Schematic
(132E470092)</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
</reqTechInfo>
</reqTechInfoGroup>
```

## 2.5 Required support equipment

**Description:** The element [<reqSupportEquips>](#) must contain information to list any support equipment including special tools, required to accomplish the procedure contained in the data module. Standard types of test equipment such as voltmeters, signal generators and continuity testers must be listed. Standard tools that are part of a tradesman standard tool kit must not be listed.

Support equipment must be identified by the name of the support equipment, identification and a quantity. As an identification number, the CSN/ISN identifier is recommended in order to provide a direct link to the IPD at the relevant location.

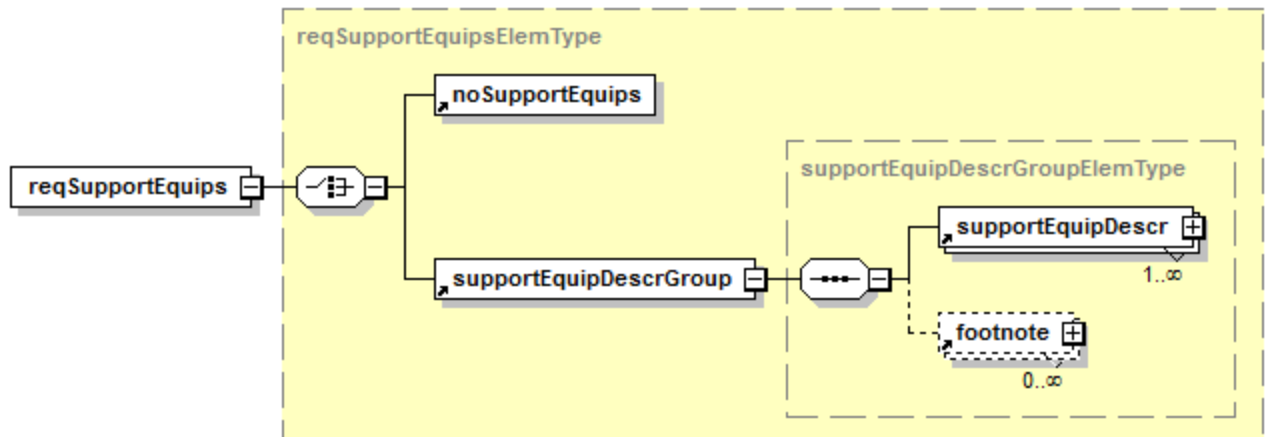

If there is no support equipment required, then the element [<noSupportEquips>](#) must be used.

#### Note

The use of the element `<noSupportEquips>` generates the word "None" at presentation. At page-oriented presentation "None" is given in the "Name" column of the "Support equipment" table.

If there is support equipment required, then the element `<supportEquipDescr>`, within the element `<supportEquipDescrGroup>`, must be used for each item of support equipment.

**Markup element:** `<reqSupportEquips>`

ICN-S3627-S1000D0447-002-01

Fig 15 Element `<reqSupportEquips>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<noSupportEquips>`, the indicator of no required support equipment as given in the description above
- `<supportEquipDecsrGroup>`, contains:
  - `<supportEquipDescr>`. Refer to [Para 2.5.1](#).
  - `<footnote>`. Refer to [Chap 3.9.5.2.1.10](#).

#### Business rule decision point BRDP-S1-00149 - Listing of standard tools in Preliminary requirements:

- Decide what types of standard tools or toolkits to be identified and listed in the table "Support equipment".

The Business rule decision points given for the element `<reqSupportEquips>` and its child elements are also applicable to the element `<reqSpares>` (refer to [Para 2.7](#)) and to the element `<reqSupplies>` (refer to [Para 2.6](#)).

#### Markup example:

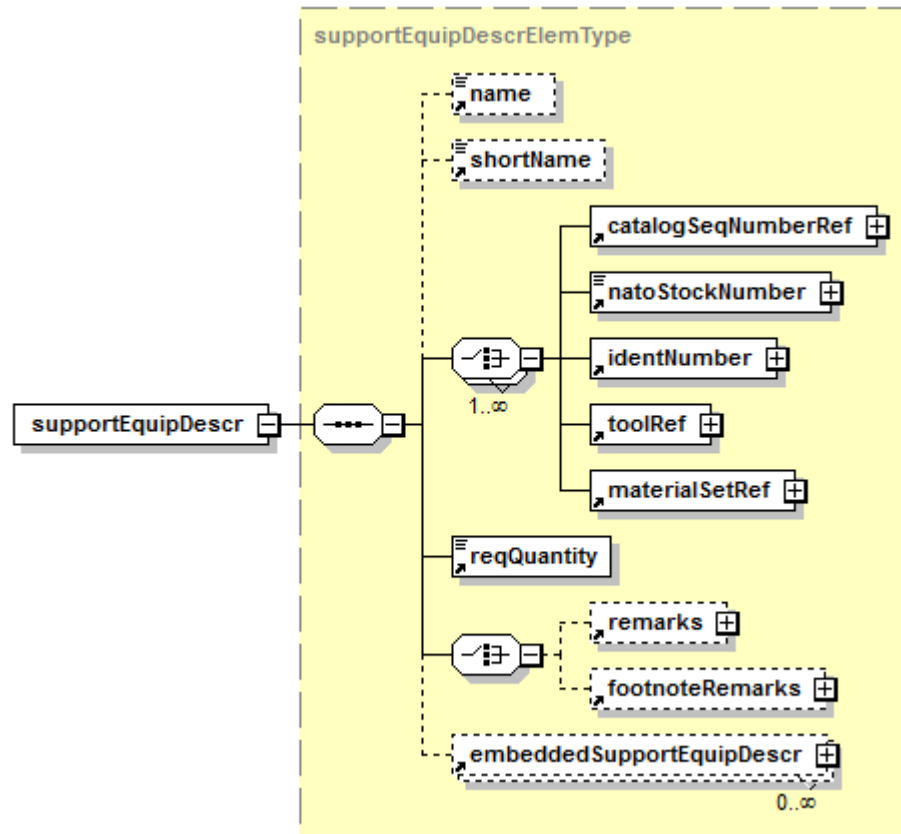

Refer to [Para 2.5.2](#).

### 2.5.1 Support equipment description

**Description:** The element `<supportEquipDescr>` contains the information on each item of support equipment.

The attribute `id` in the element `<supportEquipDescr>` can be applied so that the support equipment can be cross-referenced from the procedure.

**Markup element:** `<supportEquipDescr>`

ICN-S3627-S1000D0532-002-01

Fig 16 Element `<supportEquipDescr>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `materialUsage` (O), defines a material set of support equipment. The attribute can have one of the following values:

- "mu01" thru "mu99". Refer to [Chap 3.9.6.1](#) and default BREX rule BREX-S1-00073.

Use of the attribute `materialUsage`

- For support equipment needed from store and required to do the task, the attribute `materialUsage` is not used. It is used only for support equipment to define a material set (`materialUsage="mu05"`). Refer to [Chap 3.9.6.1](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>. Refer to [Para 2.5.1.1](#) and [Chap 3.9.5.2.1.10](#).
- <shortName>. Refer to [Para 2.5.1.2](#) and [Chap 3.9.5.2.1.10](#).
- The identification by one or more of the elements <catalogSeqNumberRef>, <natoStockNumber>, <identNumber>, <toolRef> and <materialSetRef>. Refer to [Para 2.5.1.3](#).
- <reqQuantity>. Refer to [Para 2.5.1.4](#).
- <remarks>. Refer to [Para 2.5.1.5](#).
- <footnoteRemarks>, contains textual remarks or reference to a footnote. Refer to [Para 2.5.1.6](#).
- <embeddedSupportEquipDescr>, defines one or several items if using a support equipment set. Refer to [Para 2.5.1.7](#).

#### Business rule decision point BRDP-S1-00150 - Use of the attribute id on the element <supportEquipDescr> in the element <preliminaryRqmts>:

- Decide whether to link from the body of the procedure to the support equipment listed in Preliminary requirements.

#### Note

The attribute id on the element <supportEquipDescr> is used to establish the link between the two and will guarantee consistent use of identification throughout the procedure. The use of cross-references is encouraged.

#### Business rule decision point BRDP-S1-00151 - Use of the attribute materialUsage in the element <supportEquipDescr>, the element <supplyDescr> and the element <spareDescr> context:

- Decide whether to use the attribute materialUsage in the elements <supportEquipDescr>, <supplyDescr> and <spareDescr> context and what values to be used.

#### Markup examples:

Example 1 - Support equipment from shop.

```
<supportEquipDescr id="seq-0001">
<name>Specialist toolset</name>
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
```

### Example 2 - Support equipment from tool kit

```
<supportEquipDescr id="seq-0001" materialUsage="mu05">
<name>Tool kit 578015T01</name>
<materialSetRef materialSetIdent="578015T01"
materialSetIssue="00"></materialSetRef>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
<embeddedSupportEquipDescr id="seq-0002">
<name>Screwdriver</name>
<toolRef toolNumber="BSK-SCRDV-001" specific="0"/>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</embeddedSupportEquipDescr>
</supportEquipDescr>
```

#### 2.5.1.1 Name of the support equipment element

**Description:** The element [<name>](#) contains the name of the support equipment (or supply or part). If a common information repository is used in the authoring process, the name of the support equipment is optional as it will be populated during the publication process. Refer to [Chap 3.9.5.2.1.10](#).

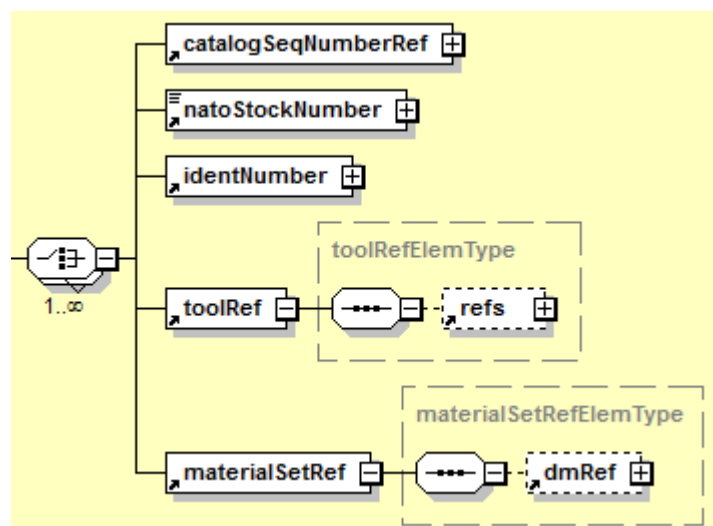

#### 2.5.1.2 Shortname

**Description:** The element [<shortName>](#) contains an abbreviated alternate name of the support equipment (or supply or part) corresponding to the element [<name>](#). This short form for the name of the part is meant to be presented in the narrative text of the data module to make the reading easier. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.5.1.3 Identification

One or more of the following elements can be used to identify the support equipment:

- [<catalogSeqNumberRef>](#), the CSN. Refer to [Chap 3.9.5.2.7](#).
- [<natoStockNumber>](#), the NATO stock number. Refer to [Chap 3.9.5.2.7](#).
- [<identNumber>](#), the identification number. Refer to [Para 2.5.1.3.1](#).
- [<toolRef>](#), the tool reference. Refer to [Para 2.5.1.3.6](#).
- [<materialSetRef>](#), the material set reference. Refer to [Para 2.5.1.3.7](#).

ICN-S3627-S1000D0533-004-01

Fig 17 Identification elements (Support equipment)

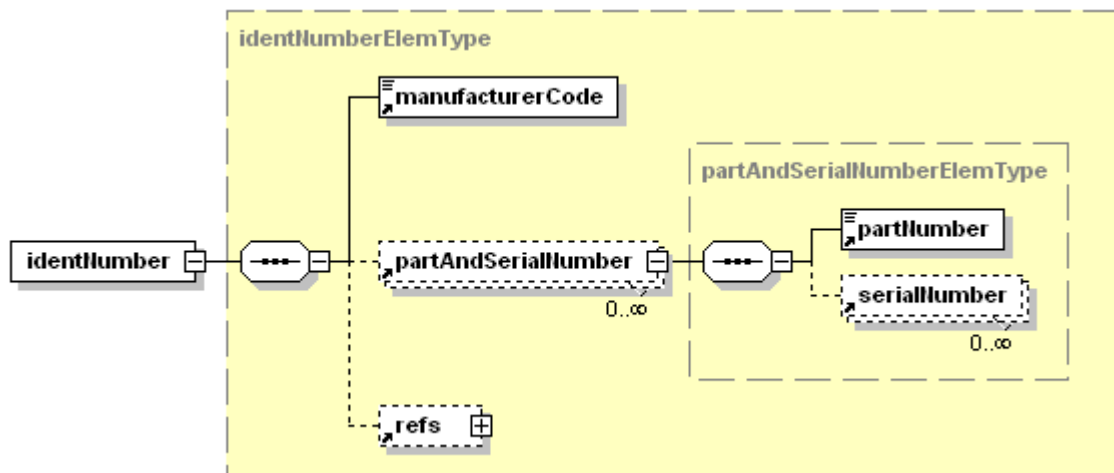

Business rule decision point BRDP-S1-00152 - Use of identification elements in the element **<supportEquipDescr>**, the element **<supplyDescr>** and the element **<spareDescr>** context:

- Decide which of the elements **<catalogSeqNumberRef>**, **<natoStockNumber>**, **<identNumber>**, **<toolRef>**, **<supplyRef>**, **<supplyRqmtRef>**, **<partRef>**, **<functionalItemRef>** and **<materialSetRef>** to use for identification and how to populate these elements.

#### 2.5.1.3.1 Identification number

**Description:** The element **<identNumber>** contains the manufacturer's identification information.

**Markup element:** **<identNumber>**

ICN-S3627-S1000D0534-001-01

Fig 18 Element **<identNumber>**

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <manufacturerCode>**. Refer to [Para 2.5.1.3.2](#).
- <partAndSerialNumber>**. Refer to [Para 2.5.1.3.3](#).
- <refs>**, the references to a document containing additional parts data related to the equipment concerned (ie, a data module or publication module or some non-S1000D publication). Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
```

#### 2.5.1.3.2 Manufacturer code

**Description:** The element `<manufacturerCode>` contains the manufacturer's code.

**Markup element:** `<manufacturerCode>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<manufacturerCode>KZ666</manufacturerCode>
```

#### 2.5.1.3.3 Part and serial number

**Description:** The element `<partAndSerialNumber>` contains parts and serial numbers.

**Markup element:** `<partAndSerialNumber>`

**Attributes:**

- None

**Child elements:**

- `<partNumber>`, the part number. Refer to [Para 2.5.1.3.4](#).
- `<serialNumber>`, the listing of a single serial number or a range. Refer to [Para 2.5.1.3.5](#).

**Markup example:**

```
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
```

#### 2.5.1.3.4 Part number

**Description:** The element `<partNumber>` contains the part number.

**Markup element:** `<partNumber>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
</identNumber>
```

2.5.1.3.5 *Serial number*

**Description:** The element `<serialNumber>` contains the listing of a single serial number or a range.

**Markup element:** `<serialNumber>`

**Attributes:**

- `serialNumberForm` (M), specifies if the serial number is a single value or a range of values. The attribute can have one of the following values:
  - `"single"` - specifies a single value
  - `"range"` - specifies a range of values
- `serialNumberValue` (M), the single value or the range of values. A tilde [~] is used to separate the two values. For example, LKJ123~LKJ777.

**Child elements:**

- None

**Markup example:**

```
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
<serialNumber serialNumberValue="LKJ123~LKJ777"
serialNumberForm="range" />
</partAndSerialNumber>
</identNumber>
```

2.5.1.3.6 *Tool reference*

**Description:** The element `<toolRef>` contains the reference to support equipment (standard tool, special tool or test equipment), for those projects that use a tool common information repository.

**Markup element:** `<toolRef>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `toolNumber` (M), the tool part number. Used together with the attribute `manufacturerCodeValue`, as the identifier of the tool, in the tool repository (implicit reference method). Refer to [Chap 3.9.5.2.11.9](#).
- `manufacturerCodeValue` (O), the CAGE code of the tool part manufacturer used, together with the attribute `toolNumber`, as the identifier of the tool in the tool repository.

- specific (O), the indicator if it is a standard or a special support equipment. The attribute can have one of the following values:
  - "1" (D) - a special support equipment including special tools. These support equipment must be presented in the table Support equipment in Preliminary requirements.
  - "0" - a standard support equipment including standard tool
- toolAltFlag (O) the indicator if the tool is an alternative of the previously described tool. The attribute can have one of the following values:
  - "0" (D) - indicates that it is not an alternate support equipment
  - "1" - indicates that it is an alternate support equipment
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <refs>, the explicit link to a tool in the tools common information repository data module (explicit reference method). Refer to [Chap 3.9.5.2.11.9](#).

#### Note

Refer to [Chap 4.13.1](#) for more information on referencing to common information repository data modules.

#### Markup example:

```
<supportEquipDescr>
<toolRef toolNumber="T123"></toolRef>
<reqQuantity>2</reqQuantity>
</supportEquipDescr>
```

#### 2.5.1.3.7 Material set reference

**Description:** The element <materialSetRef> contains the reference to a material set (kit), and its connection to the relevant service bulletin. Each support equipment, supply or spare included in the set is detailed by use of the element <embeddedSupportEquipDescr>, <embeddedSupplyDescr> and <embeddedSpareDescr>, respectively. These elements must be given together with the element <materialSetRef>. Refer to [Para 2.5.1.7](#), [Para 2.6.1.3](#) and [Para 2.7.1.3](#) and BREX-S1-00261, respectively.

The reference (<dmRef>) can be made either to:

- a material set in a dedicated data module with IC 934 when material information is externalized from service bulletin core data module

or

- a material set in the service bulletin core data module with IC 930 when material information is included in service bulletin core data module.

**Markup element:** <materialSetRef>

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).

- id (O), the identifier for the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- materialSetIdent (O), the material set identification. This attribute is used when the attribute materialUsage of the elements [<supportEquipDescr>](#), [<supplyDescr>](#) or [<spareDescr>](#) is set to "mu05".
- materialSetIssue (O), the material set issue

#### Child elements:

- [<dmRef>](#). Refer to [Chap 3.9.5.2.1.2](#).

#### 2.5.1.4 Quantity

**Description:** The element [<reqQuantity>](#) contains the quantity of the support equipment item.

For items of indeterminate quantity, "As required" must be entered as text in the element [<reqQuantity>](#) and no attribute [unitOfMeasure](#) value must be specified.

**Markup element:** [<reqQuantity>](#)

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- unitOfMeasure (O), the unit of measure. When the unit of measure is just the number of pieces, EA (= each) must be used.

#### Child elements:

- None

#### Markup example:

```
<reqQuantity>2</reqQuantity>
```

#### 2.5.1.5 Remarks

**Description:** The element [<remarks>](#) contains any additional information to support the identification or use of the support equipment. Refer to [Chap 3.9.5.1](#).

#### 2.5.1.6 Footnote remarks

**Description:** The element [<footnoteRemarks>](#) contains either textual content of remarks using the element [<simplePara>](#) or internal reference to footnotes using the element [<footnoteRef>](#). It allows internal references to a target element [<footnote>](#).

**Markup element:** [<footnoteRemarks>](#)

ICN-S3627-S1000D0754-001-01

Fig 19 Element [<footnoteRemark>](#)

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).

**Child elements:**

- <simplePara>. Refer to [Chap 3.9.5.2.1.10](#).
- <footnoteRef>. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<footnoteRemarks>
<simplePara>Incorporates repair instruction X15526172-A
</simplePara>

## 2.5.1.7 Embedded support equipment description

**Description:** The element <embeddedSupportEquipDescr> contains the information of each item included in a set of support equipment. In this case, the attribute materialUsage is set to "mu05" in the element <supportEquipDescr>.

The hierarchical relation between the element <supportEquipDescr> and the element <embeddedSupportEquipDescr> is the following:

- If the element <supportEquipDescr> is a tool kit, then the attribute materialUsage is set to "mu05" and the embedded support equipment are present in one or several elements <embeddedSupportEquipDescr>.
- Else the support equipment is a single tool and then the attribute materialUsage is not used and there is no element <embeddedSupportEquipDescr>.

**Markup element:** <embeddedSupportEquipDescr>

ICN-S3627-S1000D0611-001-01

Fig 20 Element `<embeddedSupportEquipDescr>`

#### Attributes:

The element `<embeddedSupportEquipDescr>` contains the same attributes as the element `<supportEquipDescr>`. Refer to [Para 2.5.1](#).

#### Child elements:

The element `<embeddedSupportEquipDescr>` contains the same elements as the element `<supportEquipDescr>` (refer to [Para 2.5.1](#)) with the following exceptions:

- The element `<materialSetRef>` is suppressed.
- The element `<embeddedSupportEquipDescr>` is suppressed.

### 2.5.2 Markup examples - Required support equipment

The presentation of the following examples is shown in [Chap 6.2.3.3](#).

#### Note

The color codes match the presentation of the example of the standard table "Support equipment".

#### Example 1 - Identification number reference

```
<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0001">
<name>Specialist toolset</name>
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>BSK-TLST-001</partNumber>
</partAndSerialNumber>
```

```

</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
<footnoteRemarks><footnoteRef internalRefId="ftn-
0001"></footnoteRef></footnoteRemarks>
</supportEquipDescr>
<footnote id="ftn-0001"><para>Make sure to use the good
tool.</para></footnote>
</supportEquipDescrGroup>
</reqSupportEquips>

```

**Example 2 - CSN reference. Two support equipment items that are required.**

```

<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0002">
<name>Extractor, Puller, Left-hand</name>
<catalogSeqNumberRef modelIdentCode="E2" systemDiffCode="A"
systemCode="11" subSystemCode="2" subSubSystemCode="2"
assyCode="33" figureNumber="01" item="002" itemVariant="A"
itemLocationCode="D"/>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
<supportEquipDescr id="seq-0015">
<name>Extractor, Puller, Right-hand</name>
<catalogSeqNumberRef modelIdentCode="E2" systemDiffCode="A"
systemCode="11" subSystemCode="2" subSubSystemCode="2"
assyCode="33" figureNumber="01" item="001" itemLocationCode="D"
itemSeqNumberValue="00A"/>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</supportEquipDescr>
</supportEquipDescrGroup>
</reqSupportEquips>

```

**Example 3 - NATO stock number identification broken into its constituent parts, together with a part number.**

```

<reqSupportEquips>
<supportEquipDescrGroup>
<supportEquipDescr id="seq-0212">
<name>Extractor, D-Puller, Left-hand</name>
<natoStockNumber natoSupplyClass="4920"
natoCodificationBureau="99" natoItemIdentNumberCore="1234567"/>
<identNumber> <manufacturerCode>K0378</manufacturerCode>

<partNumber>301.286.05</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="EA">2</reqQuantity>

```

```
</embeddedSupportEquipDescr>
</supportEquipDescr>
```

## 2.6 Required supplies

**Description:** The element `<reqSupplies>` contains information to list any required supplies (consumables (eg, oils, greases, locking wire), materials (eg, gasket sheet, sheet metal) and expendables (eg, O-rings, gaskets, tab washers)) required to accomplish the procedure contained in the data module.

Supplies must be identified by a name of the supply, identification and a quantity as applicable. As an identification number, the CSN/ISN identifier is recommended in order to provide a direct link to the IPD at the relevant location.

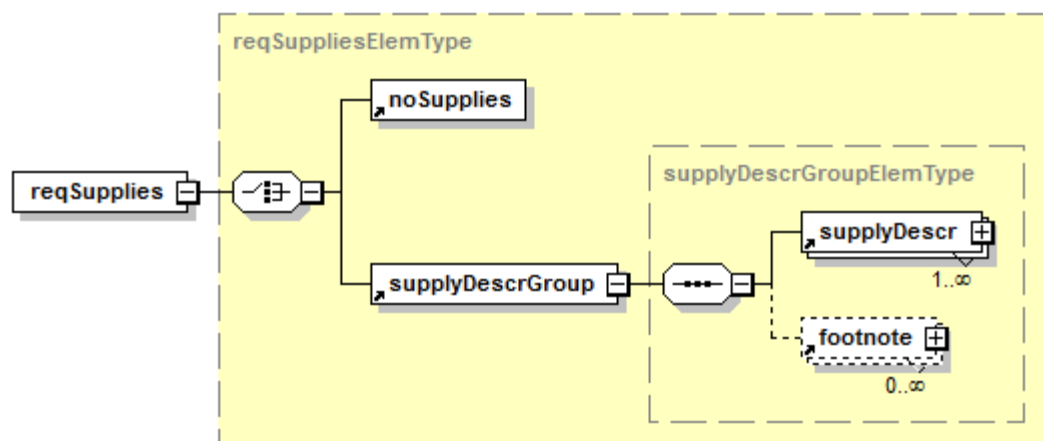

If there are no supplies required, then the element `<noSupplies>` must be used.

### Note

The use of the element `<noSupplies>` generates the word "None" at presentation. At page-oriented presentation "None" is given in the Name column of the Consumables, materials and expendables table.

If there are supplies required, then the element `<supplyDescr>`, within the element `<supplyDescrGroup>`, must be used for each consumable, material and expendable.

**Markup element:** `<reqSupplies>`

ICN-S3627-S1000D0448-002-01

Fig 21 Element `<reqSupplies>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<noSupplies>`, the indicator of no required supplies as given in the description above
- `<supplyDescrGroup>`, contains:
  - `<supplyDescr>`. Refer to [Para 2.6.1](#).
  - `<footnote>`. Refer to [Chap 3.9.5.2.1.10](#).

The Business rule decision points given for the element `<reqSupportEquips>` and its child elements are also applicable to the element `<reqSpares>`. Refer to [Para 2.5](#).

#### Markup example:

The following example shows that two liter of oil and 0,5 liter of grease are required for this procedure. Here a part number and manufacturer identify the supplies to be used:

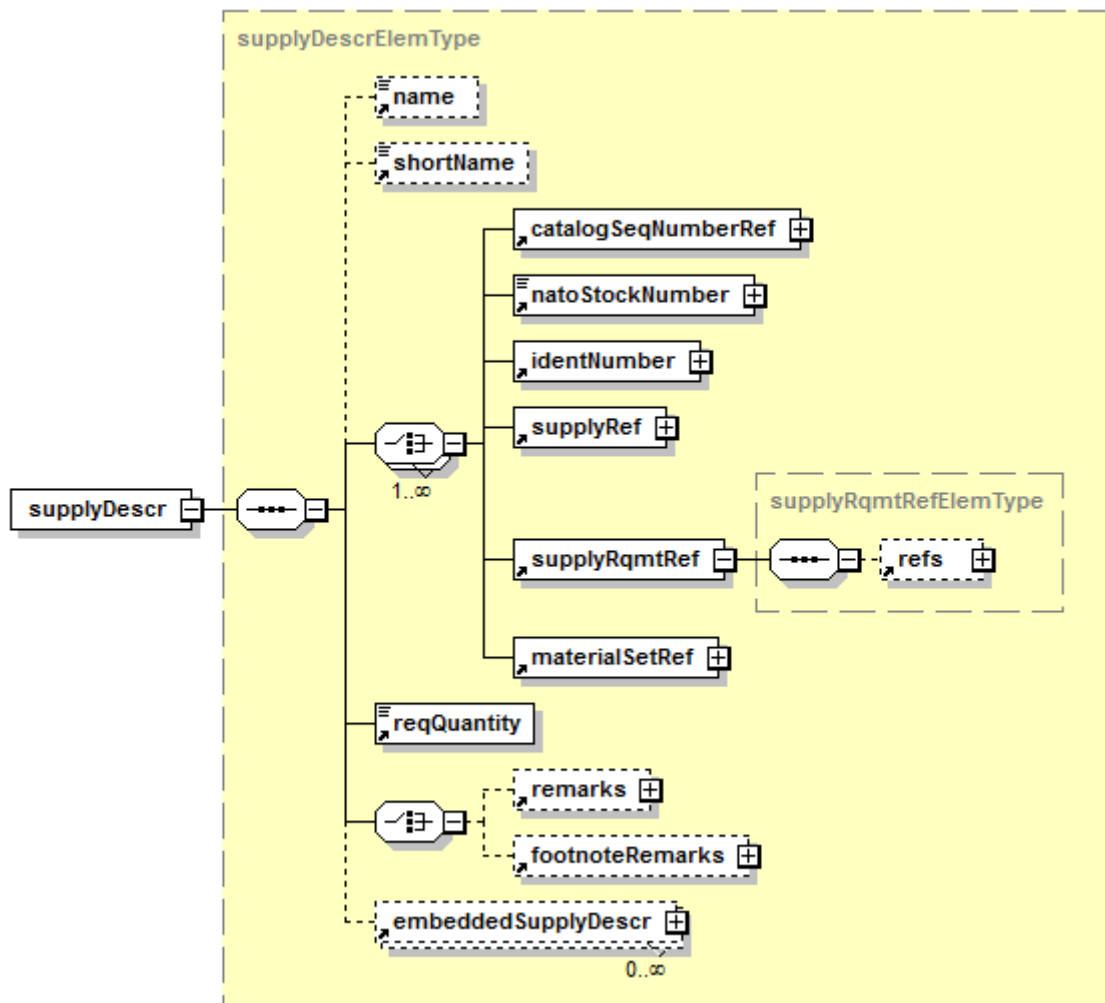

```
<reqSupplies>
<supplyDescrGroup>
<supplyDescr id="sup-0054">
<name>Oil, Engine, Gas turbine</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>OIL-HHGA</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="L">2,0</reqQuantity>
</supplyDescr>
<supplyDescr id="sup-0302">
<name>Grease, Lubricating</name>
<identNumber><manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>GRL-6726</partNumber>
</partAndSerialNumber></identNumber>
<reqQuantity unitOfMeasure="L">0,5</reqQuantity>
</supplyDescr>
</supplyDescrGroup>
</reqSupplies>
```

### 2.6.1 Supply description

**Description:** The element `<supplyDescr>` contains the information on each item of supply or set of supplies.

The attribute `id` in the element `<supplyDescr>` can be applied so that the supply can be cross-referenced from the procedure.

**Markup element:** `<supplyDescr>`

ICN-S3627-S1000D0612-002-01

Fig 22 Element &lt;supplyDescr&gt;

#### Attributes:

The element <supplyDescr> contains the same attributes as the element <supportEquipDescr> (refer to [Para 2.5.1](#)) with the different use for attribute:

- materialUsage (O), identifies retained and referenced supplies. It also identifies a material set of supplies. The attribute can have one of the following values:
  - "mu01" thru "mu99". Refer to [Chap 3.9.6.1](#) and default BREX rule BREX-S1-00074.

Use of the attribute materialUsage:

- For supplies needed from store and required to do the task, the attribute materialUsage is not used. It is used only for supplies removed from the Product or for supplies when used to define a material set (attribute materialUsage = "mu05"). Refer to [Chap 3.9.6.1](#).
- For supplies, the values "Discarded"(attribute materialUsage = "mu01") and "Modified from" (attribute materialUsage="mu03") must not be used.
- For supplies, the value "Retained" (attribute materialUsage = "mu02") must be used only in the context of a service bulletin.

### Child elements:

The element `<supplyDescr>` contains the same elements as the element `<supportEquipDescr>` (refer to [Para 2.5.1](#)) with the following exception:

- `<toolRef>` is substituted with the elements `<supplyRef>` and the element `<supplyRqmtRef>`. Refer to [Para 2.6.1.1](#) for details on the element `<supplyRef>`. Refer to [Para 2.6.1.2](#) for details on the element `<supplyRqmtRef>`.
- `<embeddedSupportEquipDescr>` is substituted with the element `<embeddedSupplyDescr>`. Refer to [Para 2.6.1.3](#).

### Business rule decision point BRDP-S1-00155 - Use of the attribute `id` on the element `<supplyDescr>` in the element `<preliminaryRqmts>`:

- Decide whether to use the attribute `id` to create cross-references from the procedure to the supplies listed in Preliminary requirements. The attribute `id` on the element `<supplyDescr>` is used to establish the link between the two and will guarantee consistent use of identification throughout the procedure. The use of cross-references is encouraged.

### Markup example:

Material set of supplies

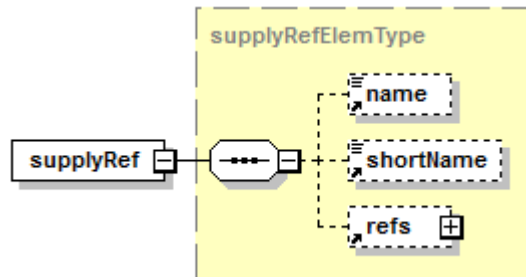

```
<reqSupplies>
<supplyDescrGroup>
<supplyDescr materialUsage="mu05" id="sup-0010">
<name>Consumable set</name>
<materialSetRef materialSetIdent="578015CML01"
materialSetIssue="01"/>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
<remarks><simplePara>Issue 1</simplePara></remarks>
<embeddedSupplyDescr id="sup-0054">
<name>Oil, Engine, Gas turbine</name>
<identNumber>
<manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>OIL-HHGA</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="L">2,0</reqQuantity>
</embeddedSupplyDescr>
<embeddedSupplyDescr id="sup-0302">
<name>Grease, Lubricating</name>
<identNumber>
<manufacturerCode>K0378</manufacturerCode>
<partAndSerialNumber><partNumber>GRL-6726</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity unitOfMeasure="L">0,5</reqQuantity>
</embeddedSupplyDescr>
</supplyDescr>
</supplyDescrGroup>
</reqSupplies>
```

## 2.6.1.1

## Supply reference

**Description:** The element <supplyRef> contains the references to a supply, for those projects that use a supplies common information repository. Refer to [Chap 3.9.5.2.11.8](#).

**Markup element:** <supplyRef>

ICN-S3627-S1000D0755-001-01

Fig 23 Element <supplyRef>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- supplyNumber (M), the supply number. A unique label set by the project (eg, the supply trade name, a specification number).
- supplyNumberType (M), contains the type of supply identification. Refer to [Chap 3.9.5.2.11.7](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <name>. Refer to [Para 2.5.1.1](#) and [Chap 3.9.5.2.1.10](#).
- <shortName>. Refer to [Para 2.5.1.2](#) and [Chap 3.9.5.2.1.10](#).
- <refs>, the explicit link to a supply in the supply common information repository data module (explicit reference method). Refer to [Chap 3.9.5.2.11.9](#).

## 2.6.1.2

## Supply requirement reference

**Description:** The element <supplyRqmtRef> contains the reference to a consumable, material and expendable for projects which manage a common information repository.

**Markup element:** <supplyRqmtRef>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- materialCategory (O), the nature of use of the supply requirement (eg, fuel, cleaning agent, lubricant). Refer to [Chap 3.9.5.2.11.8](#).
- vendorFlag (O), a flag to indicate if the supply requirement is defined by the Product manufacturer or by a supplier. The attribute can have one of the following values:
  - "0" - defined by the Product manufacturer

- "1" - defined by a supplier

- supplyRqmtNumber (M), identifies the consumable in the consumable requirement repository. Refer to [Chap 3.9.5.2.11.8](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <refs>, the link to the supplies requirement common information repository data module. Refer to [Chap 3.9.5.2.11.8](#).

#### Note

Refer to [Chap 4.13.1](#) for more information on referencing to common information repository data modules.

#### Markup example:

```
<supplyRqmtRef supplyRqmtNumber="sup-0002"></supplyRqmtRef>
```

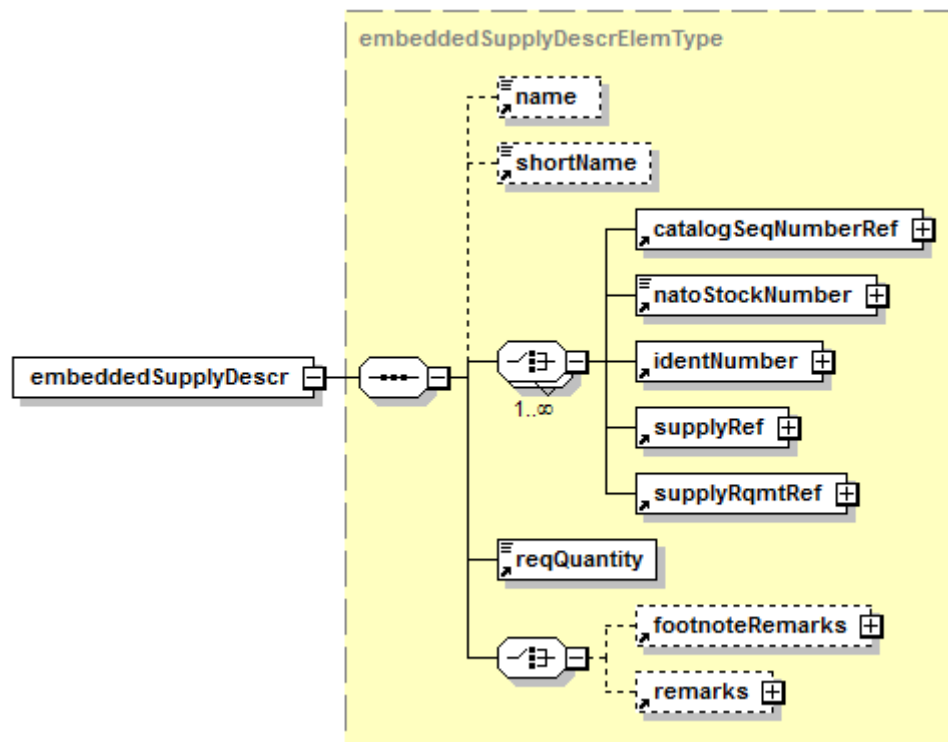

#### 2.6.1.3 Embedded supply description

**Description:** The element <embeddedSupplyDescr> contains the information of each item included in a supply set.

The hierarchical relation between the element <supplyDescr> and the element <embeddedSupplyDescr> is the following:

- If the element <supplyDescr> is a material set (supply kit), then the attribute materialUsage is set to "mu05" and the embedded supplies are present in one or several elements <embeddedSupplyDescr>.
- If the supply is a simple supply provided from the store or already present on the product then the attribute materialUsage follows the business rules described in [Para 2.6.1](#) and there is no element <embeddedSupplyDescr>.

**Markup element:** <embeddedSupplyDescr>

ICN-S3627-S1000D0613-001-01

Fig 24 Element `<embeddedSupplyDescr>`

#### Attributes:

The element `<embeddedSupplyDescr>` contains the same attributes as the element `<supplyDescr>`. Refer to [Para 2.6.1](#).

#### Child elements:

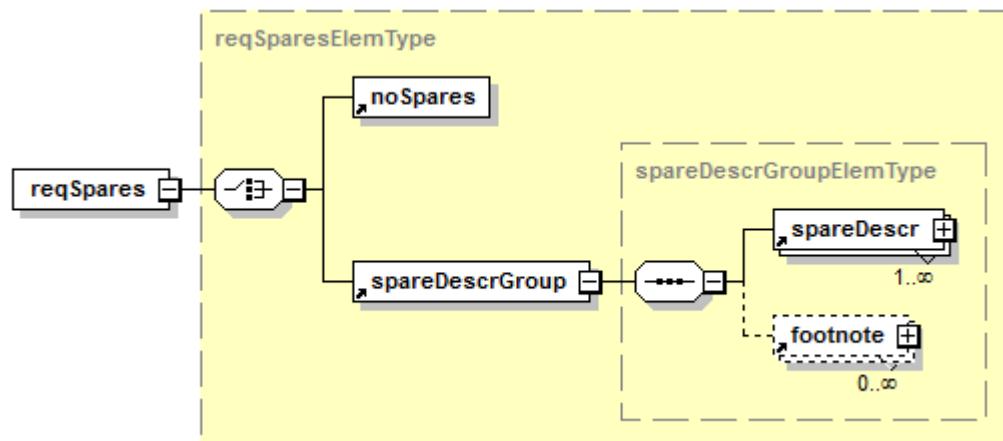

The element `<embeddedSupplyDescr>` contains the same elements as the element `<supplyDescr>` (refer to [Para 2.6.1](#)) with the following exceptions:

- The element `<materialSetRef>` is suppressed.
- The element `<embeddedSupplyDescr>` is suppressed.

## 2.7 Required spares

**Description:** The element `<reqSpares>` must contain information to list any spares required to accomplish the procedure contained in the data module. Parts which are attached to the product and are used during the accomplishment of the procedure can also be listed here. Spares must be identified by a name of the spare, identification and a quantity as applicable. As an identification number, the CSN/ISN identifier is recommended in order to provide a direct link to the IPD at the relevant location.

**Markup element:** `<reqSpares>`

ICN-S3627-S1000D0449-002-01

Fig 25 Element &lt;reqSpares&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <noSpares>, the indicator of no required supplies as given in the description above
- <spareDescrGroup>, contains:
  - <spareDescr>. Refer to [Para 2.7.1](#).
  - <footnote>. Refer to [Chap 3.9.5.2.1.10](#).

If there are no spares requirements, then the element <noSpares> must be used.

#### Note

The use of the element <noSpares> generates the word "None" at presentation. At page-oriented presentation "None" is given in the Name column of the Spares table.

If there are spares required, then the element <spareDescr>, within the element <spareDescrGroup>, must be used for each spare.

The Business rule decision points given for the element <reqSupportEquips> and its child elements are also applicable to the element <reqSupplies>. Refer to [Para 2.6](#).

#### Markup example:

```

<reqSpares>
<spareDescrGroup>
<spareDescr id="spa-0987">
<name>Blade, LP Compressor</name>
<natoStockNumber natoSupplyClass="2840"
natoCodificationBureau="99" natoItemIdentNumberCore="1234524"/>

<footnote id="ftn-0001"><para>Make sure that the blade is the
good one</para></footnote>
</spareDescrGroup>
</reqSpares>

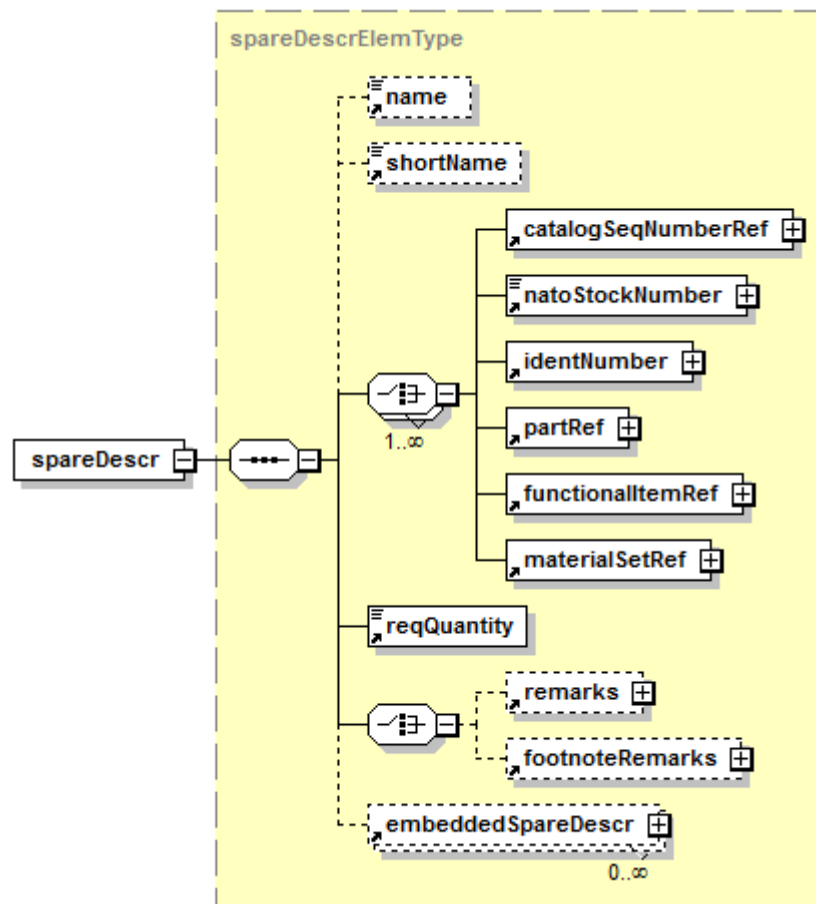

```

### 2.7.1 Spare description

**Description:** The element `<spareDescr>` contains the information on each item of spare or set of spares.

The attribute `id` in the element `<spareDescr>` can be applied so that the spares can be cross-referenced from the procedure.

**Markup element:** `<spareDescr>`

ICN-S3627-S1000D0614-001-01

Fig 26 Element *<spareDescr>*

#### Attributes:

The element *<spareDescr>* contains the same attributes as the element *<supportEquipDescr>* (refer to [Para 2.5.1](#)) with the different use for attribute:

- materialUsage (O), identifies discarded, retained, modified and referenced spares. It also identifies a material set of spares. The attribute can have one of the following values:

- "mu01" thru "mu99". Refer to [Chap 3.9.6.1](#).

Use of the attribute materialUsage

- For Spares needed from store and required to do the task, the attribute materialUsage is not used. It is used only for spares removed from the Product or for spares used to define a material set (attribute materialUsage = "mu05"). Refer to [Chap 3.9.6.1](#).
- For Spares, the values of "Discarded" (attribute materialUsage = "mu01") and "Retained" (attribute materialUsage = "mu02") is used only in the context of a service bulletin.
- The element *<reqQuantity>* must be populated with a hyphen [-] when the element *<spareDescr>* has the attribute materialUsage set to "mu04" (Referenced).

### Child elements:

The element `<spareDescr>` contains the same elements as the element `<supportEquipDescr>` (refer to [Para 2.5.1](#)) with the following exception:

- The element `<toolRef>` is substituted with the element `<partRef>` and the element `<functionalItemRef>`. Refer to [Para 2.7.1.1](#) for details on the element `<partRef>`. Refer to [Para 2.7.1.2](#) for details on the element `<functionalItemRef>`.
- The element `<embeddedSupportEquipDescr>` is substituted with the element `<embeddedSpareDescr>`. Refer to [Para 2.7.1.3](#).

### Business rule decision point BRDP-S1-00156 - Use of the attribute `id` on the element `<sparesDescr>` in the element `<preliminaryRqmts>`:

- Decide whether to use the attribute `id` to create cross-references from the procedure to the spares listed in Preliminary requirements. The attribute `id` on the element `<sparesDescr>` is used to establish the link between the two and will guarantee consistent identification throughout the procedure. The use of cross-references is encouraged.

### Markup example:

Two spares within a kit

```
<spareDescr id="spa-0002" materialUsage="mu05">
  <name>Blanking set</name>
  <materialSetRef materialSetIdent="578015B01"
materialSetIssue="01"/><catalogSeqNumberRef modelIdentCode="EP"

    <identNumber>
      <manufacturerCode>KZ777</manufacturerCode>
      <partAndSerialNumber><partNumber>P0RT-10N-B1-
12R</partNumber></partAndSerialNumber>
    </identNumber>
  </embeddedSpareDescr>
</spareDescr>
```

```

</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</embeddedSpareDescr>
<embeddedSpareDescr id="spa-0005">
...
</spareDescr>

```

#### 2.7.1.1 Part number reference

**Description:** The element `<partRef>` is used for projecANts using part number references. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.7.1.2 Functional item reference

**Description:** The element `<functionalItemRef>` is used for projects using functional item number. Refer to [Chap 3.9.5.1](#) for detail on population of the element `<functionalItemRef>`.

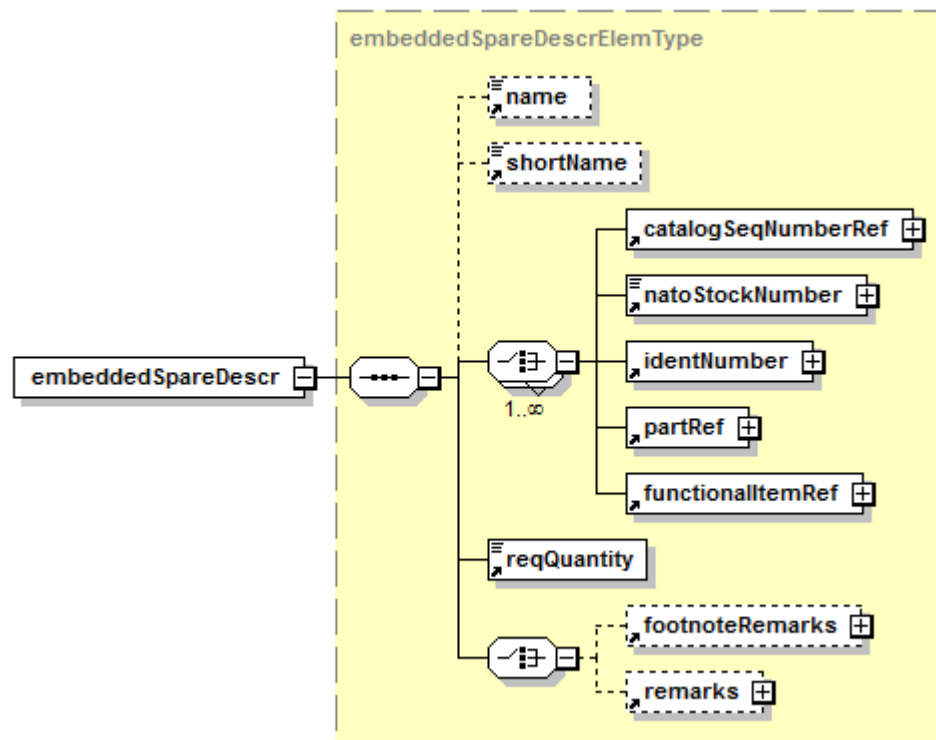

#### 2.7.1.3 Embedded spare description

**Description:** The element `<embeddedSpareDescr>` contains the information of each spare item when included in a spare material set or the information of the original spare when included in a modified spare `<spareDescr>`.

The hierarchical relation between `<spareDescr>` and `<embeddedSpareDescr>` is:

- If the element `<spareDescr>` is a material set, then its attribute `materialUsage` is set to "mu05" (Material set) and the embedded parts are present in one or several elements `<embeddedSpareDescr>`
- If the element `<spareDescr>` is a modified spare from a spare removed from the Product, then its attribute `materialUsage` is set to "mu03" (Modified from) and the element `<spareDescr>` contains one or several elements `<embeddedSpareDescr>` with the original spares removed from the Product
- If the element `<spareDescr>` is a simple spare provided from the store or already present on the product, then the attribute `materialUsage` follows the instantiation rules described in [Para 2.7.1](#) and there is no element `<embeddedSpareDescr>`

**Markup element:** `<embeddedSpareDescr>`

ICN-S3627-S1000D0615-001-01

Fig 27 Element `<embeddedSpareDescr>`

#### Attributes:

The element `<embeddedSpareDescr>` contains the same attributes as the element `<spareDescr>`. Refer to [Para 2.7.1](#).

#### Child elements:

The element `<embeddedSpareDescr>` contains the same elements as the element `<spareDescr>` (refer to [Para 2.7.1](#)) with the following exceptions:

- The element `<materialSetRef>` is suppressed.
- The element `<embeddedSpareDescr>` is suppressed.

## 2.8 Required safety

**Description:** The element `<reqSafety>` must contain information to list any safety requirements.

Any warnings, cautions and notes applicable to the procedure and the Requirements after job completion in the data module must be listed here.

If there are no safety requirements, then the element `<noSafety>` must be used.

#### Note

The use of the element `<noSafety>` generates the word "None" at presentation. At page-oriented presentation "None" is given as a text paragraph under the default heading "Safety conditions".

**Markup element:** `<reqSafety>`

ICN-S3627-S1000D0482-001-01

Fig 28 Element &lt;reqSafety&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <noSafety>, indicates that there are no required preliminary safety requirements
- <safetyRqmts>. Refer to [Para 2.8.1](#).

#### Markup example:

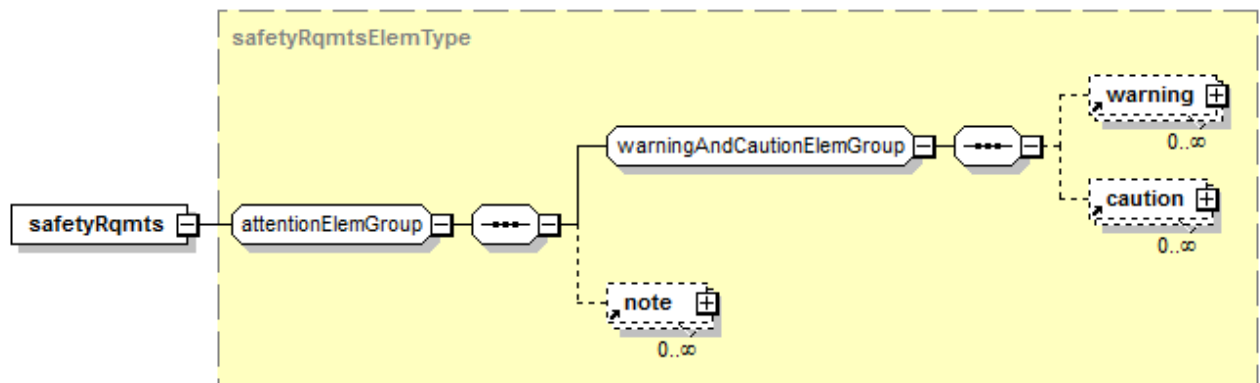

The following example shows two warnings in the Safety conditions:

```
<reqSafety>
<safetyRqmts>
<warning>
<warningAndCautionPara>Sellinium-X is corrosive. Do not get it
on your skin.
Do not drink it. Use it in a well ventilated
area.</warningAndCautionPara>
</warning>
<warning>
<warningAndCautionPara>Make sure you read the standard reqSafety
conditions

### 2.8.1 Safety requirements

**Description:** If there are any safety requirements, then the element <safetyRqmts> must be used. This element can be populated with the attribute warningRefs or the attribute cautionRefs, or the element <warning>, the element <caution>, or the element <note>, as described at [Chap 3.9.3](#).

Markup element: `<safetyRqmts>`

ICN-S3627-S1000D0625-001-01

Fig 29 Element `<safetyRqmts>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).

#### Child elements:

- `<warning>`. Refer to [Chap 3.9.3](#).
- `<caution>`. Refer to [Chap 3.9.3](#).
- `<note>`. Refer to [Chap 3.9.3](#).

#### Markup example:

```
<safetyRqmts>
<warning>
<warningAndCautionPara>Sellinium-X is corrosive. Do not get it
on your skin.
Do not drink it. Use it in a well ventilated
area.</warningAndCautionPara>
</warning>
<warning>
<warningAndCautionPara>Make sure you read the standard reqSafety
conditions
that are given in <dmRef>
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="012"
infoCodeVariant="A" itemLocationCode="D" modelIdentCode="AE"
subSubSystemCode="0"
subSystemCode="0" systemCode="00"
systemDiffCode="A"/></dmRefIdent>
</dmRef>.</warningAndCautionPara>
</warning>
</safetyRqmts>
```

## 2.9 Examples - Preliminary requirements

The following markup example gives the Preliminary requirements for S1000DBIKE-AAA-D00-00-00-00AA-258A-A. The presentation of the complete [content](#) of the data module is given in [Chap 6.2.3.3](#).

### 3 Requirements after job completion

#### 3.1 General

**Description:** The element `<closeRqmts>` contains any actions that are required after the procedure is complete.

**Markup element:** `<closeRqmts>`

ICN-S3627-S1000D0535-001-01

Fig 30 Element `<closeRqmts>`

The element is mandatory in procedural and fault isolation data modules, and optional in process data modules.

If there are no actions then the child element `<noConds>` must be used.

If there are actions, then the elements `<reqCondNoRef>`, `<reqCondDm>`, `<reqCondCircuitBreaker>`, `<reqCondPm>` or `<reqCondExternalPub>` must be used to give the close up requirement action in accordance with [Para 2.2](#).

The requirements can reference data modules, publication modules, non-S1000D publications or contain no reference at all. It is recommended that details for close up be given by only referring to complete data modules. The use of the element `<reqCond>` without a reference must be avoided. The requirements after job completion must be in the order that the requirements are satisfied.

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<recCondGroup>`. Refer to [Para 2.2](#).

**Business rule decision point BRDP-S1-00157 - Use of the element `<closeRqmts>` in the process data modules:**

- Decide whether to use the element `<closeRqmts>` in the process data modules.

## 3.2

### Examples - Requirements after job completion

Example 1 - This example shows markup if no close up requirements are needed:

```
<closeRqmts>
<reqCondGroup>
<noConds/>
</reqCondGroup>
</closeRqmts>
```

Example 2 - This example shows markup if there are close up requirements needed:

```
<closeRqmts>
<reqCondGroup>
<reqCondDm>
<reqCond>The access panel is closed.</reqCond>
<dmRef>
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="A"
infoCode="740" infoCodeVariant="A" itemLocationCode="D"
modelIdentCode="AE" subSubSystemCode="0" subSystemCode="0"
systemCode="10" systemDiffCode="A"/>
</dmRefIdent>
</dmRef>
</reqCondDm>
<!-- A reference to a non-S1000D publication -->
<reqCondExternalPub>
<reqCond>The access panel is closed.</reqCond>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>Component Maintenance
Manual</externalPubTitle>
</externalPubRefIdent>
```

```

</externalPubRef>
</reqCondExternalPub>
<!-- A required condition that has no reference -->
<reqCondNoRef>
<reqCond>The caps are installed on all orifices</reqCond>
</reqCondNoRef>
</reqCondGroup>
</closeRqmts>

```

### Example 3

```

<closeRqmts>
<reqCondGroup>
<reqCondNoRef>
<reqCond>Replace the tire.</reqCond>
</reqCondNoRef>
<reqCondDm>
<reqCond>Inflate the tire with air.</reqCond>
<dmRef xlink:type="simple" xlink:actuate="onRequest"

## 1 General

The paragraph elements are used to capture text. Several different paragraph models are available depending on which data module type is used and where the paragraph is used. The available elements for each paragraph model are tailored dependent on its use. For example, including a list within a paragraph is desirable in a procedural step (in the element `<para>`), but is not desirable in an applicability statement (in the element `<simplePara>`). The different models are detailed within this paragraph. Usage of the individual content elements is detailed in [Para 2](#).

This chapter also describes the three frequently used text elements:

- `<name>`. Refer to [Para 2.5.1](#).
- `<shortName>`. Refer to [Para 2.5.2](#).
- `<part>`. Refer to [Para 2.5.3](#).

The rules for presentation of text, including tables and figures are given in [Chap 6](#).

Care must be taken when authoring text and placing spaces around elements embedded within the element `<para>`. Ensure that spaces are inserted correctly in order to get the desired presentation result.

### Example:

```
<para>This is <emphasis emphasisType="em01">bold</emphasis>
text.</para>
```

The display of this markup is:

"This is **bold** text."

### 1.1 Paragraph models

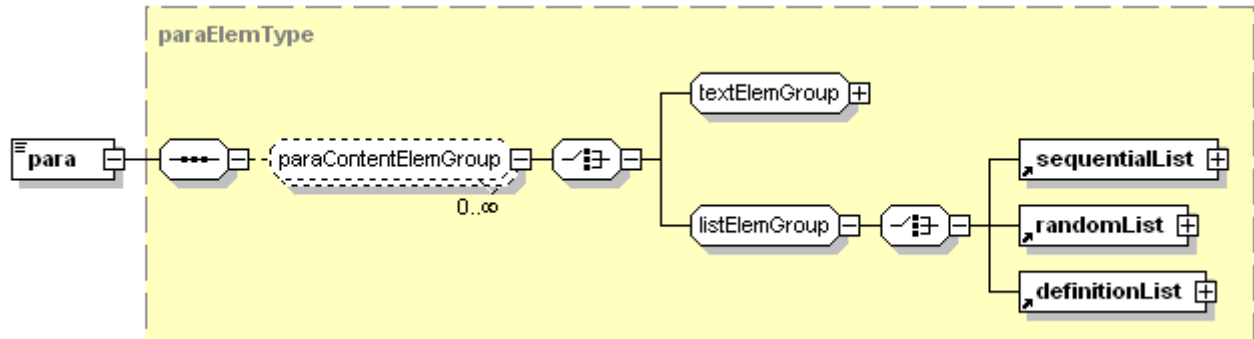

The paragraph model holds seven types of paragraph elements:

- `<para>`
- `<warningAndCautionPara>`. Refer to [Chap 3.9.3](#).
- `<attentionListItemPara>`. Refer to [Chap 3.9.3](#).
- `<notePara>`. Refer to [Chap 3.9.3](#).
- `<simplePara>`. Refer to [Para 2.2](#).
- `<simpleRefPara>`. Refer to [Para 2.3](#).
- `<reducedPara>`. Refer to [Para 2.4](#).
- `<copyrightPara>`. Refer to [Chap 3.9.5.1](#).

The element `<para>` consists of two groups of elements:

- `textElemGroup` which is detailed in this chapter. Refer to [Para 1.1.1](#) and [Para 2](#).
- `listElemGroup`. Refer to [Para 1.1.2](#) and [Chap 3.9.5.2.1.3](#).

ICN-S3627-S1000D0536-001-01

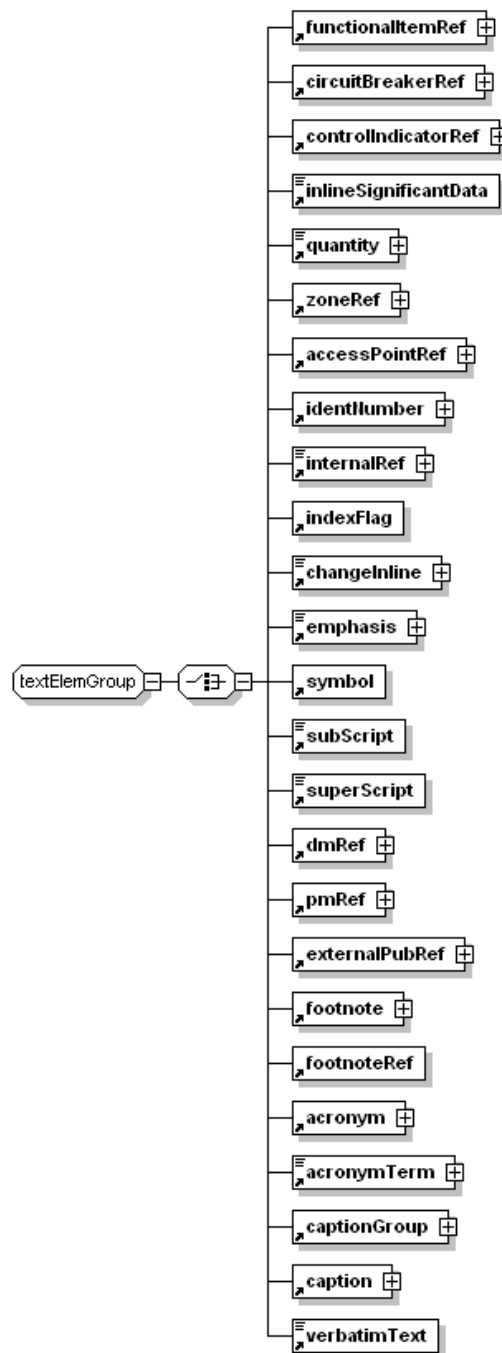

Fig 1 Element `<para>`

### 1.1.1 Text element group

The content of the `textElemGroup` varies depending on data module type but the name of the group is still the same for all data module types. The full (maximum) content of the `textElemGroup` is shown in [Fig 2](#).

#### Note

The `textElemGroup` is used by several other text elements (eg, by the element `<action>` in the fault isolation schema). The content of the `textElemGroup` is always the same within the same data module type, wherever it appears.

ICN-S3627-S1000D0537-001-01

Fig 2 The textElemGroup

The content of four<sup>1</sup> of the different paragraph types are detailed in [Fig 3](#). The figure provides the element name, which data module types the element is available in, and which child elements are available in that context.

<sup>1</sup> <warningAndCautionPara>, <attentionListItemPara> and <notePara>, refer to [Chap 3.9.3](#).

### Note

The `attentionText` group is detailed in [Chap 3.9.3](#).

### Note

The `reducedElemGroup` is detailed in [Chap 3.9.5.2.16](#).

Element [group]	Data module type (Schema) in which the element occurs	Available child elements (grey indicates available)																								
		functionalItemRef	circuitBreakerRef	controlIndicatorRef	inlineSignificantData	quantity	zoneRef	accessPointRef	identNumber	internalRef	indexFlag	changeInLine	emphasis	symbol	subScript	superScript	dmRef	pmRef	externalPubRef	footnote	footnoteRef	acronym	acronymTerm	captionGroup	caption	verbalImText

ICN-S3627-S1000D0538-007-01

Fig 3 Paragraph models and available child elements

### 1.1.2 List element group

The content of the `listElemGroup` is:

- sequential (ordered) lists
- random lists
- definition lists

For details of authoring lists, refer to [Chap 3.9.5.2.1.3](#).

## 2 Text elements

### 2.1 Available elements in the text element group

The complete list of possible elements in the `textElemGroup` is:

- content specific data, including:
  - elements with a dedicated common information repository:

- `<functionalItemRef>`, functional item number. Refer to [Chap 3.9.5.1](#).
- `<circuitBreakerRef>`, circuit breaker. Refer to [Para 2.1.1](#).
- `<controlIndicatorRef>`, control or indicator. Refer to [Para 2.1.2](#).
- `<zoneRef>`, zone. Refer to [Para 2.1.5](#).
- `<accessPointRef>`, access point. Refer to [Para 2.1.6](#).

#### Note

There are additional content specific data with a dedicated common information repository (eg, supplies and tools). Refer to [Chap 4.16](#).

- elements without a dedicated common information repository (paragraph significant data):
  - `<inlineSignificantData>`, paragraph significant data. Refer to [Para 2.1.3](#).
  - `<quantity>`, quantity data. Refer to [Para 2.1.4](#).
- `<identNumber>`, identification number (part/serial number and associated manufacturer code). Refer to [Chap 3.9.5.2.1.9](#).
- `<indexFlag>`, index. Refer to [Para 2.1.7](#).
- `<changeInline>`, inline change marking. Refer to [Chap 3.9.5.2.1.1](#).
- `<emphasis>`, emphasis. Refer to [Para 2.1.8](#).
- `<symbol>`, symbol. Refer to [Para 2.1.9](#).
- `<subScript>`, subscript. Refer to [Para 2.1.10](#).
- `<superScript>`, superscript. Refer to [Para 2.1.11](#).
- references, refer to [Chap 3.9.5.2.1.2](#), including:
  - `<internalRef>`, internal reference
  - `<dmRef>`, data module reference
  - `<pmRef>`, publication module reference
  - `<externalPubRef>`, external publication reference
- `<footnote>`, footnote. Refer to [Para 2.1.12](#).
- `<footnoteRef>`, footnote reference. Refer to [Para 2.1.13](#).
- `<acronym>`, acronym. Refer to [Para 2.1.14](#).
- `<acronymTerm>`, acronym term. Refer to [Para 2.1.14.1](#).
- `<captionGroup>` and `<caption>`, captions. Refer to [Chap 3.9.5.2.1.4](#).
- `<verbatimText>`, verbatim text. Refer to [Para 2.1.15](#).

### 2.1.1

#### Circuit breaker

**Description:** The element `<circuitBreakerRef>` contains the details about the circuit breaker (eg, number, circuit breaker action and circuit breaker type).

**Markup element:** `<circuitBreakerRef>`

ICN-S3627-S1000D0756-001-01

Fig 4 Element `<circuitBreakerRef>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `circuitBreakerNumber` (M), the circuit breaker identifier (number).
- `circuitBreakerType` (O), the circuit breaker type (electronic, electro-mechanic, or another type). The project or the organization is allowed to define its own circuit breaker types. The attribute can have one of the following values:
  - "cbt01" thru "cbt99". Refer to [Chap 3.9.6.1](#).
- `circuitBreakerAction` (O), contains the action to perform on the circuit breaker. The attribute can have one of the following values:
  - "open" - the action "to open"
  - "close" - the action "to close"
  - "verify-open" - the check of the condition: "is open"
  - "verify-close" - the check of the condition: "is closed"

#### Note

The values "open-order" and "close-order" are not allowed for the attribute `circuitBreakerAction` in the element `<circuitBreakerRef>`. Use the values "open" and "close". Refer to default BREX rule BREX-S1-00071.

- `checksum` (O), the entered data which allows potential integrity verification
- `installationIdent` (O), the installation identifier
- `contextIdent` (O), the context identification which is used in combination with the attribute `manufacturerCodeValue` to ensure the uniqueness of vendor equipment data. Context identification contains an identifier (eg, the part number of the next higher assembly that has been given to the assembly by the vendor).
- `manufacturerCodeValue` (O), the manufacturer CAGE code
- `itemOriginator` (O), the origin of the circuit breaker (eg, whether the circuit breaker has been defined by the Product manufacturer or by a supplier). The attribute can have one of the following values:
  - "orig01" thru "orig99". Refer to [Chap 3.9.6.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<name>`, the name of the circuit breaker. Refer to [Para 2.5.1](#).
- `<shortName>`. Refer to [Para 2.5.2](#).
- `<refs>`, references providing a link to the circuit breaker. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00158 - Use of the attribute `circuitBreakerAction` in text element `<circuitBreakerRef>`:

- Decide whether to use the attribute `circuitBreakerAction`. If used, establish writing rules to ensure that authors will be consistent in the paragraph text and the value of the attribute itself.

#### Business rule decision point BRDP-S1-00159 - Use of the attribute `checkSum` in text element `<circuitBreakerRef>`:

- Decide whether to use and how to populate the attribute `checkSum`.

#### Markup examples:

Circuit breaker type

```
<circuitBreakerRef circuitBreakerNumber="42RT"
circuitBreakerType="cbt02">
</circuitBreakerRef>
```

Circuit breaker action

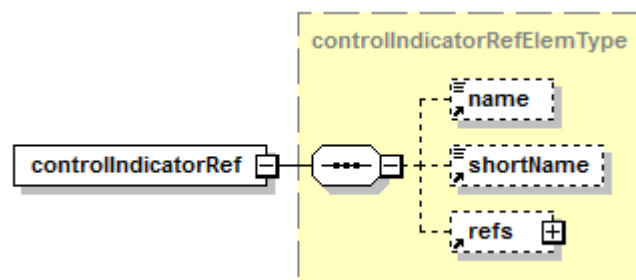

```
<circuitBreakerRef circuitBreakerNumber="809-VM"
circuitBreakerAction="open" checkSum="f9f62226"/>
```

## 2.1.2

### Controls and indicators

**Description:** The element `<controlIndicatorRef>` contains the number and name of the controls or indicators and the reference to the control and indicator repository data module.

**Markup element:** `<controlIndicatorRef>`

ICN-S3627-S1000D0757-001-01

Fig 5 Element `<controlIndicatorRef>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `controlIndicatorNumber` (O), the control or indicator number identified in the common information repository data module. Refer to [Chap 3.9.5.2.11.11](#) and [Chap 4.13.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the control or indicator. Refer to [Para 2.5.1](#).
- <shortName>. Refer to [Para 2.5.2](#).
- <refs>, provides a link to the control and indicator repository data module. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<controlIndicatorRef controlIndicatorNumber="ci-0001">
...
</controlIndicatorRef>
```

### 2.1.3 Paragraph significant data

**Description:** The element <inlineSignificantData> contains data with a significant meaning, such as a lubricant or manufacturer code.

**Markup element:** <inlineSignificantData>

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- significantParaDataType (M), the meaning of the data. The attribute can have one of the following values:
  - "psd01" thru "psd99". Refer to [Chap 3.9.6.1](#).

#### Child elements:

- None

**Business rule decision point BRDP-S1-00160 - Types of inline significant data to markup using the attribute significantParaDataType in the text element**

**<inlineSignificantData>:**

- Decide whether to use the attribute significantParaDataType and which types of data to mark up and in what contexts.

#### Note

It must also be considered that data modules can be less portable if the paragraph significant data types are extended in the BREX file past the standard types.

#### Markup example:

The following markup example illustrates the use of <inlineSignificantData>:

```
<para>Use lubricant
(<inlineSignificantData
significantParaDataType="psd03">1X234</inlineSignificantData>)
on threads...
</para>
```

The display of this markup can be as follows:

"Use lubricant (1X234) on threads..."

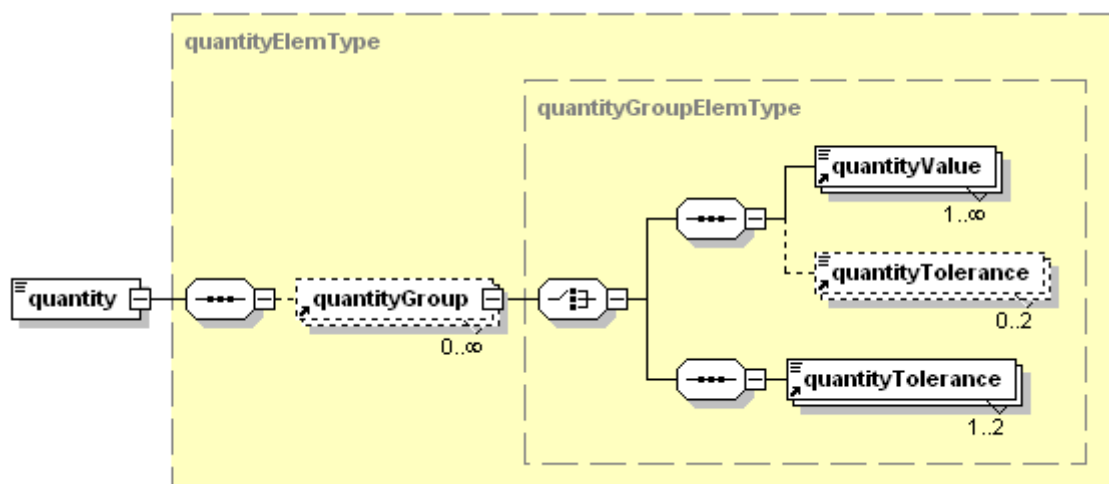

## 2.1.4 Quantity data

**Description:** The element `<quantity>` provides the capability to identify a portion of a paragraph that corresponds to a numeric value with a special meaning, such as a torque value. The exact meaning of the quantity data can be specified using a set of predefined S1000D values, or extended to support specific project or organization needs.

The quantity data provides the ability to define numerical values to a very precise level. Use of the quantity group structure within quantity data provides the following capabilities:

- Specify a decimal value that does not contain display format information (ie, adheres to the W3C XML standard for decimal numbers)
- Specify a unit of measure that applies to the value
- Group a value and a tolerance together
- Specify units of measure to the value/tolerance group or to value and tolerance individually
- Group multiple values and tolerances together, units can be apply to the group or individual values

**Markup element:** `<quantity>`

ICN-S3627-S1000D0539-001-01

Fig 6 Element `<quantity>`

### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `quantityType` (O), the type of quantity (eg, length, time). The attribute can have one of the following values:
  - "qty01" thru "qty99". Refer to [Chap 3.9.6.1](#).
- `quantityTypeSpecifics` (O), the currency code when the attribute `quantityType` is set to "qty02" (price). The attribute can have the values of any currency code as defined in ISO 4217. Refer to default BREX rules BREX-S1-00075 and BREX-S1-00076.

### Note

Consider that data modules can be less portable if the quantity data types are extended in the BREX file past the standard types.

- **Child elements:**
- `<quantityGroup>`. Refer to [Para 2.1.4.1](#).

#### Markup examples:

**Example 1:** Simple quantity markup using the attribute `quantityType`:

```
<para>Maximum torque not to exceed
<quantity quantityType="qty05">8 Nm</quantity>.
</para>
```

The display of this markup can be as follows:

"Maximum torque not to exceed 8 Nm."

**Example 2:** Quantity markup using the child element `<quantityGroup>`:

```
<para>Maximum torque not to exceed
<quantity quantityType="qty05">
<quantityGroup quantityGroupType="nominal">
<quantityValue quantityUnitOfMeasure="N.m">8</quantityValue>
</quantityGroup>
</quantity>
.</para>
```

The display of this markup can be as follows:

"Maximum torque not to exceed 8 Nm."

**Example 3:** Quantity markup using price and currency:

```
<para>The price of the kit is
<quantity quantityType="qty02" quantityTypeSpecifics="USD">1500
</quantity>
.</para>
```

The display of this markup can be as follows:

"The price of the kit is 1500 USD."

#### 2.1.4.1

##### Quantity group

**Description:** The element `<quantityGroup>` contains a group of values and tolerances and/or multiple values in the case where multiple units of measure are used (eg, 2 h 30 min).

**Markup element:** `<quantityGroup>`

#### Attributes:

- `quantityGroupType` (O). The attribute can have one of the following values:
  - `"nominal"` (D) - a single value
  - `"minimum"` - a "from" (beginning of a range) or "minimum" value
  - `"maximum"` - a "to" (end of a range) or "maximum" value
- `quantityUnitOfMeasure` (O), the unit of measure (eg, `"m"` for meter, `"kg"` for kilogram). Refer to [Chap 3.9.6.2](#) for an enumerated list of standard quantity units of measure. These can be extended using the standard BREX mechanism. The value within the attribute `quantityUnitOfMeasure` is a code specifying the exact unit of measure. A `quantityUnitOfMeasure` at this level indicates that the

quantityUnitOfMeasure applies to the entire group, possibly including several values and/or tolerances. The implication is that by default the unit of measure will be displayed once after the value/tolerance (eg, "0,250 + 0,003 - 0,000 in."), but other formats can be applied by stylesheets.

Refer to [Chap 3.9.1](#) for presentation rules for units of measure and fractions.

About units of measure:

- attribute quantityUnitOfMeasure not used at all indicates that no unit of measure must be displayed
- attribute quantityUnitOfMeasure on the element `<quantityValue>` and on the element `<quantityTolerance>` within the same element `<quantityGroup>` applies to each value or tolerance independent of the others
- attribute quantityUnitOfMeasure on two elements `<quantityValue>` within the same element `<quantityGroup>` applies to each value independent of the other or others

#### Note

In cases where the attribute quantityUnitOfMeasure is specified at both the element `<quantityGroup>` level and at the element `<quantityValue>` or element `<quantityTolerance>` level, the quantityUnitOfMeasure value from the lower level (element `<quantityValue>` or element `<quantityTolerance>`) must take precedence over the attribute quantityUnitOfMeasure value from the element `<quantityGroup>`.

#### Note

Due to the large number of units of measure, it is expected that a project or an organization will only use a small subset of the available units of measure. It must also be considered that data modules can be less portable if the units of measure types are extended by the BREX mechanism past the standard types.

**Child elements:**

- `<quantityValue>`, the value and an optional unit of measure. Refer to [Para 2.1.4.1.1](#).
- `<quantityTolerance>`, the tolerance value. Refer to [Para 2.1.4.1.2](#).

**Business rule decision point BRDP-S1-00163 - Use of the value (element `<quantityValue>`) and tolerance (element `<quantityTolerance>`) decomposition in the text element `<quantity>`:**

- Decide whether and how to use the element `<quantityValue>` and the element `<quantityTolerance>` decomposition.

**Business rule decision point BRDP-S1-00164 - Unit of measure to be used:**

- If using the value and tolerance decomposition, decide at which level of the markup the attribute quantityUnitOfMeasure must be included. Allowable locations are on the parent element `<quantityGroup>` which applies to all child elements or on the individual child elements `<quantityValue>` and `<quantityTolerance>`. A consistent usage of the attribute quantityUnitOfMeasure is required to produce a consistent display or printout to the user.

**Markup example:**

**Example 1:** Quantity group and is a simple quantity with value and unit of measure:

```
<para>The windshield assembly weighs approximately
<quantity>
<quantityGroup quantityGroupType="nominal">
<quantityValue quantityUnitOfMeasure="kg">40</quantityValue>
</quantityGroup>
</quantity>
and requires two persons ...
</para>
```

The display of this markup can be as follows:

"The windshield assembly weighs approximately 40 kg and requires two persons ..."

**Example 2:** Quantity where value and tolerance have the same unit of measure:

```
<para>If hole tolerance of
<quantity>
<quantityGroup quantityGroupType="nominal"
quantityUnitOfMeasure="mm">
<quantityValue>0.700</quantityValue>
<quantityTolerance
quantityToleranceType="plus">0.010</quantityTolerance>
<quantityTolerance
quantityToleranceType="minus">0.000</quantityTolerance>
</quantityGroup>
</quantity>
has been exceeded ...
</para>
```

The display of this markup can be as follows:

"If hole tolerance of 0,700 +0,010 -0,000 mm has been exceeded ..."

**Example 3:** Quantity with minimum/maximum values:

```
<para>Tighten fasteners
<quantity quantityType="qty05">
<quantityGroup quantityGroupType="minimum">
<quantityValue quantityUnitOfMeasure="N.m">18.0</quantityValue>
</quantityGroup>
<quantityGroup quantityGroupType="maximum">
<quantityValue quantityUnitOfMeasure="N.m">22.0</quantityValue>
</quantityGroup>
</quantity>
using torque wrench ...
</para>
```

The display of this markup can be as follows:

"Tighten fasteners from 18,0 Nm to 22,0 Nm using torque wrench ..."

#### 2.1.4.1.1 Value

**Description:** The element `<quantityValue>` contains a decimal value and an optional unit of measure. The value must conform to the W3C XML standard for decimal values which requires use a period [.] for the separator between the integral part and the fractional part, and no thousands separator. The display format is not specified in the XML code but, must conform

to program or country requirements at presentation. Refer to [Chap 3.9.1](#) for rules on presentation.

**Markup element:** `<quantityValue>`

**Attributes:**

- quantityUnitOfMeasure (O), the unit of measure. Refer to [Para 2.1.4.1](#).

**Child elements:**

- None

**Markup example:**

The following markup example illustrates the use of quantity group and is a simple quantity with value and unit of measure:

```
<quantityValue quantityUnitOfMeasure="kg">40</quantityValue>
```

#### 2.1.4.1.2 Tolerance

**Description:** The element `<quantityTolerance>` contains a decimal tolerance value, the type of tolerance, and an optional unit of measure. The tolerance value must conform to the W3C XML standard for decimal values which requires to use a period [.] for the separator between the integral part and the fractional part, and no thousands separator. The display format is not specified in the XML code, but must conform to program or country requirements at presentation. Refer to [Chap 3.9.1](#) for presentation rules.

**Markup element:** `<quantityTolerance>`

**Attributes:**

- quantityToleranceType (O), the type of tolerance with allowable values. The attribute can have one of the following values:
  - "plus" - the upper tolerance
  - "minus" - the lower tolerance
  - "plusorminus" - both the upper and the lower tolerance
- quantityUnitOfMeasure (O), the unit of measure. Refer to [Para 2.1.4.1](#).

**Child elements:**

- None

**Markup example:**

**Example 1:** Quantity with type, value, tolerance, and unit of measure:

```
<para>Holding nut, torque bolt to
<quantity quantityType="qty05">
<quantityGroup quantityGroupType="nominal" unitOfMeasure="N.m">
<quantityValue>20</quantityValue>
<quantityTolerance
quantityToleranceType="plusorminus">2</quantityTolerance>
</quantityGroup>
</quantity>
.</para>
```

The display of this markup can be as follows:

"Holding nut, torque bolt to 20 ± 2 Nm."

**Example 2:** Quantity with multiple value groups and value and tolerance with different units:

```
<para>Chamfer both sides of rib
<quantity>
<quantityGroup quantityGroupType="nominal">
<quantityValue>0.153</quantityValue>
<quantityTolerance
quantityToleranceType="plusorminus">0.005</quantityTolerance>
</quantityGroup>
x
<quantityGroup quantityGroupType="nominal">
<quantityValue quantityUnitOfMeasure="dega">45</quantityValue>
<quantityTolerance quantityToleranceType="plusorminus"
quantityUnitOfMeasure="mina">30
</quantityTolerance>
</quantityGroup>
</quantity>
.</para>
```

The display of this markup formatted for Système International d'Unites (SI) can be as follows:

"Chamfer both sides of rib 0,153 ± 0,005 × 45° ± 30'."

The display of this markup formatted for imperial can be as follows:

"Chamfer both sides of rib 0.153 ± 0.005 × 45° ± 30'."

**Example 3:** Quantity with tolerance only:

```
<para>Make sure that spacing is within
<quantity>
<quantityGroup quantityGroupType="nominal">
<quantityTolerance
quantityToleranceType="plusorminus">0.030</quantityTolerance>
</quantityGroup>
</quantity>
on each side ...
</para>
```

The display of this markup formatted for SI can be as follows (comma separator):

"Make sure that spacing is within ± 0,030 on each side ..."

The display of this markup formatted for imperial can be as follows (period separator):

"Make sure that spacing is within ± 0.030 on each side ..."

## 2.1.5 Zone

**Description:** The element [<zoneRef>](#) contains the zoning information (one or more), as described in [Chap 3.4](#). For the use of the element [<zoneRef>](#) in connection with common information repositories, refer to [Chap 4.13.1](#).

This element is available in the product management data within the element [<productionMaintData>](#) of preliminary requirements (refer to [Chap 3.9.5.2.1.9](#)) and within the element [<para>](#) of descriptive data modules.

**Markup element:** [<zoneRef>](#)

ICN-S3627-S1000D0758-001-01

Fig 7 Element <zoneRef>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- zoneNumber (O), the zone identifier
- lsarData (O), a flag to indicate if the reference is derived from a Logistics Support Analysis Record (LSAR) or not. The attribute can have one of the following values:
  - "0" (D) - No, when not derived from an LSAR
  - "1" - Yes, when derived from an LSAR
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the zone. Refer to [Para 2.5.1](#).
- <shortName>. Refer to [Para 2.5.2](#).
- <refs>. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00166 - Use of the element <zoneRef>:

- Decide whether and how to use the element <zoneRef>. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken.

#### Markup example:

**Example 1:** A zone with a name, zone number and indicating the use of LSAR data:

```
<zoneRef lsarData="1" zoneNumber="500">
  <name>Left wing</name>
</zoneRef>
```

**Example 2:** A zone with a zone identifier and a zone number:

```
<zoneRef id="zoneRef-210" zoneNumber="210"/>
```

### 2.1.6 Access point

**Description:** The element <accessPointRef> describe/identify any access points such as panels, doors and hatches. The identifier of the access point can be given either thru the

attribute `accessPointNumber` and/or the elements `<name>` and `<refs>`. For the use of the element `<accessPointRef>` in connection with common information repositories, refer to [Chap 4.13.1](#) and [Chap 3.9.5.2.11.5](#).

This element is available in the product management data within the element `<productionMaintData>` and `<reqCondCircuitBreaker>` of preliminary requirements (refer to [Chap 3.9.5.2.1.9](#)) and within the element `<para>` of descriptive data modules.

**Markup element:** `<accessPointRef>`

ICN-S3627-S1000D0759-001-01

Fig 8 Element `<accessPointRef>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `accessPointNumber` (O), the identifier of the access point
- `accessPointTypeValue` (O), the access point type. The attribute can have one of the following values:
  - "accpn101" thru "accpn199". Refer to [Chap 3.9.6.1](#).

#### Note

The use of the attribute supports the presentation, as its value can be presented in front of the value of the attribute value of `accessPointNumber`. Refer to [Chap 6.2.3.3](#) for examples.

- `lsarData` (O), a flag to indicate if the reference is derived from an LSAR or not. The attribute can have one of the following values:
  - "0" (D) - No, when not derived from an LSAR
  - "1" - Yes, when derived from an LSAR
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<name>`, the name of the access point. Refer to [Para 2.5.1](#).
- `<shortName>`. Refer to [Para 2.5.2](#).

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00167 - Use of the element

##### `<accessPointRef>`:

- Decide whether and how to use the element `<accessPointRef>`. Consideration for duplication and mismatch of data given in the maintenance planning information has to be taken.

##### Markup example:

**Example 1:** An access point with a name, access point number, and indicating the use of LSAR data:

```
<accessPointRef accessPointNumber="2514VU" lsarData="1">
<name>Panel A</name>
</accessPointRef>
```

##### Markup example:

**Example 2:** An access point with an identifier and an access point number:

```
<accessPointRef id="accessRef-210" accessPointNumber="210"/>
```

## 2.1.7

### Index

**Description:** The element `<indexFlag>` is used to contain the text of an item that is required to be included in an automatically generated index, usually arranged alphabetically, of the specific information in a data module or a publication. Such an index is usually an alphabetical listing of selected items/keywords and their location in a publication.

Example: The index of a book lists words or expressions and the pages of the book upon which they are to be found.

##### Markup element: `<indexFlag>`

##### Attributes:

- `indexLevelOne` (O), `indexLevelTwo` (O), `indexLevelThree` (O) and `indexLevelFour` (O), the indications of the four permissible levels of indexing

##### Child elements:

- None

#### Business rule decision point BRDP-S1-00169 - Use of the text element `<indexFlag>`:

- Decide whether a publishing index is required and to what index level.

##### Markup example:

```
<para>The most important part of the bicycle
<indexFlag indexLevelOne="bicycle"/> is the brake system
<indexFlag indexLevelTwo="brake system"/>. Only a minimum
maintenance of the brake system is necessary. But, when a
problem does occur, make sure you to do the necessary
maintenance as quickly as possible. If you do not do this the
bicycle
<indexFlag indexLevelOne="bicycle"/> will be dangerous to
use.</para>
<para>There are nine different types of brake systems. The one
```

```
found on most bicycles is the cantilever
<indexFlag indexLevelFour="cantilever"/> brake
<indexFlag indexLevelThree="brake"/>.</para>
```

This markup example can result in the following listing when published:

```
bicycle ..... 1, 2
  brake system ..... 1
    brake ..... 3
      cantilever ..... 3
```

### 2.1.8 Emphasis

**Description:** The element `<emphasis>` contains textual information (eg, a word, an expression or a sentence) to be highlighted.

To highlight a word, an expression or a sentence, bold text is the preferred method. Alternatively, the use of color is permitted. Capital (uppercase) letters, italics or underlining are not permitted to highlight text, except for legacy data. Refer to [Chap 3.9.1](#).

**Markup element:** `<emphasis>`

**Attributes:**

- `emphasisType` (O), the type of emphasis such as bold. The attribute can have one of the following values:
  - "em01" thru "em99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- Includes the same set of child elements as the `textElemGroup` applicable to the actual data module type. Refer to [Para 1.1.1](#).

**Markup example:**

**Example 1:** A paragraph with a highlighted word which is intended by the author to be presented in bold:

```
<para>This is some text which has the word <emphasis
emphasisType="em01">emphasis</emphasis> emphasized in
bold.</para>
```

**Example 2:** Use of the overline function for the signal name CONTROL:

```
<para>Pin 12 carries the negatively going signal <emphasis
emphasisType="em04">CONTROL</emphasis> which goes more negative
when active.</para>
```

### 2.1.9 Symbol

**Description:** The element `<symbol>` contains illustrations and graphics that are intended to be presented in line within the normal text. Symbols must be controlled using the ICN as described in [Chap 4.4](#). However, the ICN must not be presented.

**Markup element:** `<symbol>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- infoEntityIdent (M), the link to the external entity declaration which points to the illustration file. The population of this attribute must include the complete ICN with the prefix "ICN-".
- reproductionHeight (O), reproductionWidth (O), and reproductionScale (O), the presentation sizes and scaling for the presentation system
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

**Note**

The element `<symbol>` also includes five attributes normally populated by applications to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00171 - Use of the symbols:**

- Decide whether and how to use symbols using the text element `<symbol>`.

**Markup example:**

The following example shows a paragraph with a symbol which is intended to be displayed inline.

```
<para>When this condition occurs, the symbol
<symbol infoEntityIdent="ICN-S1000DBIKE-AAA-DA10000-0-U8025-
09999-A-01-1"></symbol> will show on the display.</para>
```

**2.1.10**
**Subscript**

**Description:** The element `<subScript>` contains the text that is intended to be presented subscripted.

**Markup element:** `<subScript>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following example shows a paragraph with text that is subscripted:

```
<para>The chemical symbol for water is H
<subScript>2</subScript>O.</para>
```

**2.1.11**
**Superscript**

**Description:** The element `<superScript>` contains the text that is intended to be presented superscripted.

**Note**

Superscript is the default value for inline and table footnotes.

**Markup element:** `<superScript>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following example shows a paragraph with text that is superscripted:

```
<para>The symbol for a square meter is m
<superScript>2</superScript>.</para>
```

## 2.1.12 Footnote

**Description:** The element `<footnote>` contains bibliographic references or explanations which would take too much space or in any other way would be annoying for the reader in the running text.

The element `<footnote>` is a wrapper around the contents of a footnote. The element `<footnote>` typically generates a marker (eg, a superscripted number) at the place in the flow of text where it occurs. The footnote itself is then generally presented at the bottom of the page or at the end of the table.

Footnotes are used in tables (table footnotes) or in regular text and titles (inline footnotes).

Footnotes must not

- be used for references and cross-references
- include footnotes

**Note**

Additional information that is useful for the user in understanding descriptive information (eg, to carry out an action) can be presented in notes. Refer to [Chap 3.9.3](#).

**Note**

The use of footnotes puts demands on the presentation of the footnote markers and the footnotes themselves. Project or organization decisions on the presentation have to be taken dependent on the publishing as page-oriented or IETP or both. Refer to [Chap 6.2](#) and [Chap 6.3](#).

**Markup element:** `<footnote>`

ICN-S3627-S1000D0760-001-01

Fig 9 Element `<footnote>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- footnoteMark (O), the type of footnote marker to identify a footnote. Only one type of footnote marker must be used for each of the table footnotes and inline footnotes throughout a data module. The attribute can have one of the following values:
  - "num" (D) - superscripted numbers will be used
  - "sym" - symbols such as asterisk (\*) and dagger (†) will be used
  - "alpha" - alpha characters will be used
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <para>, the footnote text. Refer to [Para 1.1](#).

#### Business rule decision point BRDP-S1-00172 - Use of footnotes:

- Decide whether and how to use the text element <footnote> and when used, decide whether the use of footnotes is limited to regular text and titles (inline) and/or to tables (table footnotes).

#### Business rule decision point BRDP-S1-00173 - Types of footnote markers:

- Decide on the types of footnote markers (attribute footnoteMark) to use. It is recommended to use:
  - only one type of footnote marker for each of the table footnotes and the inline footnotes throughout a project
  - superscripted numbers for both

#### Markup example:

##### Example 1: An inline page footnote:

```
<para>This paragraph includes a footnote. I would like to
further define a footnote<footnote id="ftn-1234"
footnoteMark="num"><para>A footnote is used to further define
information and it is printed at the bottom of the
page</para></footnote> and where the footnote is printed.
</para>
```

##### Example 2: Table footnotes:

```
<table frame="topbot">
<title>Example table with footnotes</title>

```

### 2.1.13 Footnote reference

**Description:** The element `<footnoteRef>` contains the link information to a previously defined footnote. This link information is used each time when referring to the same footnote.

**Markup element:** `<footnoteRef>`

**Attributes:**

- `internalRefId` (O), the target id of the footnote. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

The following markup example illustrates a footnote reference:

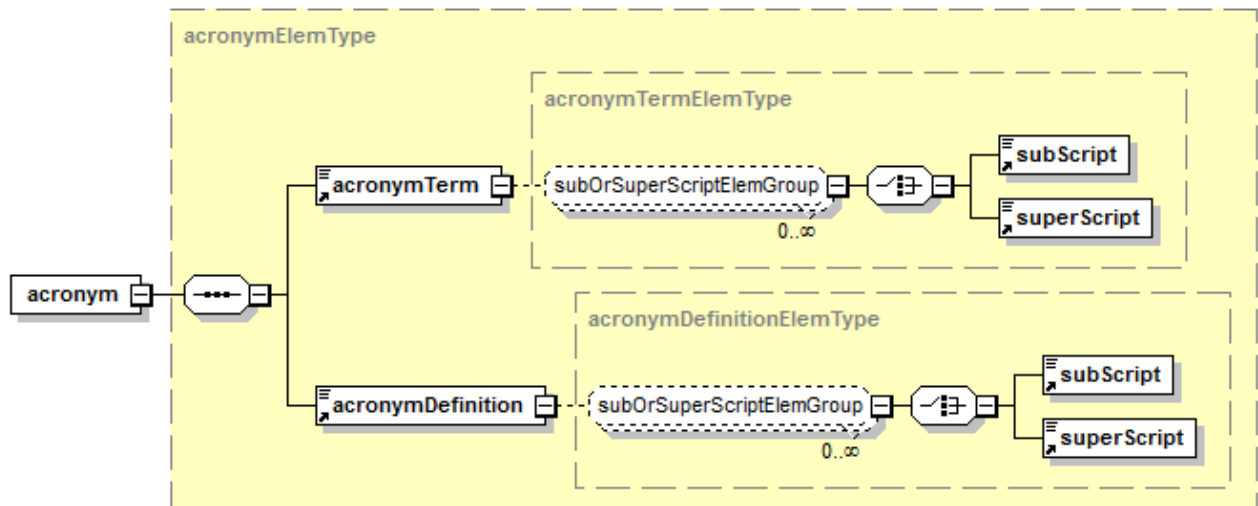

<para>This paragraph includes the same footnote<footnoteRef internalRefId="ftn-1234"/>given in the previous paragraph</para>

#### 2.1.14 Acronym

**Description:** The element <acronym> contains an acronym and its definition when the acronym is first introduced.

Once an acronym has been defined in text using the element <acronym>, it can be reused, and its definition be referred to, multiple times. Refer to [Para 2.1.14.1](#).

**Markup element:** <acronym>

ICN-S3627-S1000D0540-002-01

Fig 10 Element <acronym>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- acronymType (O), the type of acronym. The attribute can have one of the following values:
  - "at01" thru "at99". The default value is "at01". Refer to [Chap 3.9.6.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <acronymTerm>, the term of the acronym. Refer to [Para 2.1.14.1](#).
- <acronymDefinition>, the definition of the acronym when that acronym is first used. Refer to [Para 2.1.14.2](#).

**Markup example:**

```
<acronym>
<acronymTerm>ASD</acronymTerm>
<acronymDefinition id="acr-0001">AeroSpace and Defence
Industries Association of Europe</acronymDefinition>
</acronym>
```

## 2.1.14.1 Acronym term

**Description:** The element `<acronymTerm>` contains the acronym itself and a reference to its definition.

**Markup element:** `<acronymTerm>`

**Attributes:**

- `internalRefId` (O), the target id of the acronym definition. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<subScript>`, the items to be subscripted. Refer to [Para 2.1.10](#).
- `<superScript>`, the items to be superscripted. Refer to [Para 2.1.11](#).

**Markup example:**

The following example shows the markup of an acronym term with a reference to its definition (refer to the markup example in [Para 2.1.14](#)):

```
<acronymTerm internalRefId="acr-0001">ASD</acronymTerm>
```

## 2.1.14.2 Acronym definition

**Description:** The element `<acronymDefinition>` contains the definition of the acronym when that acronym is first used. The use of this element without its parent element `<acronym>` and its sibling element `<acronymTerm>` is not sensible.

**Markup element:** `<acronymDefinition>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<subScript>`, the items to be subscripted. Refer to [Para 2.1.10](#).
- `<superScript>`, the items to be superscripted. Refer to [Para 2.1.11](#).

## 2.1.15 Verbatim text

**Description:** The element `<verbatimText>` contains text that is supposed to be presented as is, without distorting the content. Typically, using the element `<verbatimText>`, the included text represents information such as computer program text or non-proportional display text.

When the element contains markup, the information must be entered in such a way that the marked up information does not interfere with the data module markup itself. One way to achieve this is to use a CDATA marked section for that information. This will also retain line feeds, etc.

**Markup element:** `<verbatimText>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `verbatimStyle` (O), the style of verbatim text in cases where there are more than one type of verbatim information, and the types must be recognized and/or presented differently. The attribute can have one of the following values:
  - `"vs01"` thru `"vs99"`. Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup examples:**

**Example 1:** A paragraph containing a command line sequence (used this way, line feeds will normally be dropped):

```
<para>
<verbatimText>
C:\>cd C:\BikeDS\the_text_xml

C:\BikeDS\the_text_xml>dir data module code-S1000DBIKE-AAA-DA0-
20*.* /b
data module code-S1000DBIKE-AAA-DA0-20-00-0000-412A-A_000-02.XML
data module code-S1000DBIKE-AAA-DA0-20-00-0000-520A-A_000-02.XML

C:\BikeDS\the_text_xml>
</verbatimText>
</para>
```

**Example 2:** The markup of the same paragraph as in Example 1 containing a command line sequence using a CDATA marked section (this way, line feeds will be retained.):

```
<para>
<verbatimText>
<![CDATA[
C:\>cd C:\BikeDS\the_text_xml

C:\BikeDS\the_text_xml>dir DMC-S1000DBIKE-AAA-DA0-20*.* /b
DMC-S1000DBIKE-AAA-DA0-20-00-0000-412A-A_000-02.XML
DMC-S1000DBIKE-AAA-DA0-20-00-0000-520A-A_000-02.XML

C:\BikeDS\the_text_xml>
]]>
```

```
</verbatimText>
</para>
```

**Example 3:** A paragraph of marked up text (such as XML) using a CDATA marked section:

```
<para>
<verbatimText>
<![CDATA[
<para>For a full description of the headset,
refer to <dmRef>
<dmRefIdent><dmCode modelIdentCode="S1000DBIKE"
systemDiffCode="AAA" systemCode="DA2" subSystemCode="3"
subSubSystemCode="0" assyCode="00" disassyCode="00"
disassyCodeVariant="AA" infoCode="041" infoCodeVariant="A"
itemLocationCode="A"/></dmRefIdent>
</dmRef>.</para>
]]>
</verbatimText>
</para>
```

**Example 4:** A paragraph of marked up text (such as XML) using character entities to avoid markup character conflicts (in this case line feeds will normally be dropped):

```
<para>
<verbatimText>
&lt;para&gt;For a full description of the headset,
refer to &lt;dmRef&gt;&lt;dmRefIdent&gt;&lt;dmCode
modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA2" subSystemCode="3" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A"
itemLocationCode="A"/&gt;&lt;/dmRefIdent&gt;&lt;/dmRef&gt;.&lt;/
para&gt;
</verbatimText>
</para>
```

**Example 5:** A paragraph of text containing an example of inline XML markup that has to be recognized in its context:

```
<para>This is a running text demonstrating how the attribute
<verbatimText verbatimStyle="vs01">verbatimStyle</verbatimText>
itself could be marked up in some context.</para>
```

This text would typically be presented as:

"This is a running text demonstrating how the attribute verbatimStyle itself could be marked up in some context."

## 2.2 Simple paragraph

**Description:** The element `<simplePara>` contains a minimum set of text elements. It is used where the full set of elements that are available in a full paragraph (in the element `<para>`) is not required. Simple paragraphs are used for example in the elements `<displayText>` and `<remarks>`.

**Markup element:** `<simplePara>`

ICN-S3627-S1000D0769-001-01

Fig 11 Element `<simplePara>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<subScript>`, the items to be subscripted. Refer to [Para 2.1.10](#).
- `<superScript>`, the items to be superscripted. Refer to [Para 2.1.11](#).

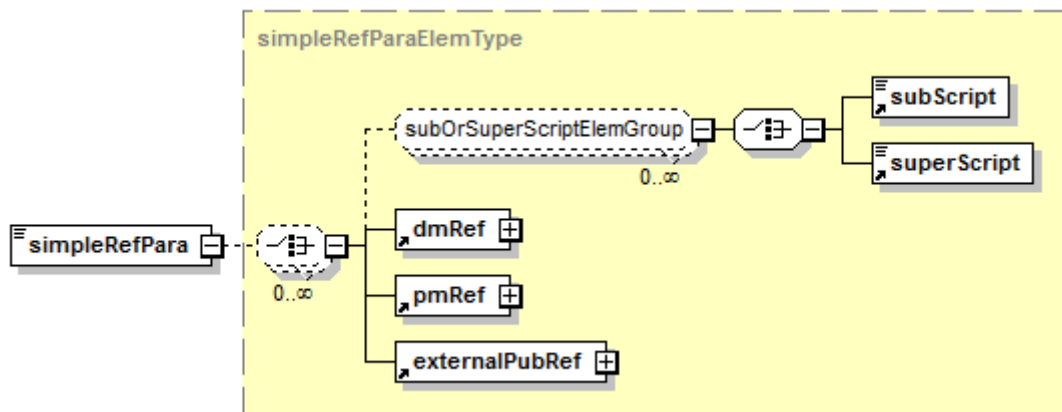

#### Markup example:

```
<remarks>
<simplePara>This data module was authored in line with Repair
scheme ME-BAB1EE.</simplePara>
</remarks>
```

## 2.3 Simple paragraph with reference

**Description:** The element `<simpleRefPara>` contains a minimum set of text elements. It is used where the full set of elements that are available in a full paragraph (in the element `<para>`) is not required, but a reference to a data module, a publication module or a non-S1000D publication required. Simple paragraphs with reference are used for example in the elements `<reasonForUpdate>`.

**Markup element:** `<simpleRefPara>`

ICN-S3627-S1000D0770-001-01

Fig 12 Element `<simpleRefPara>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<subScript>` (O), the items to be subscripted. Refer to [Para 2.1.10](#).
- `<superScript>` (O), the items to be superscripted. Refer to [Para 2.1.11](#).
- `<dmRef>` (O), a reference to a data module from the reason for update. Refer to [Chap 3.9.5.2.1.2](#).
- `<pmRef>` (O), a reference to a publication module from the reason for update. Refer to [Chap 3.9.5.2.1.2](#).
- `<externalPubRef>` (O), a reference to an external publication from the reason for update. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

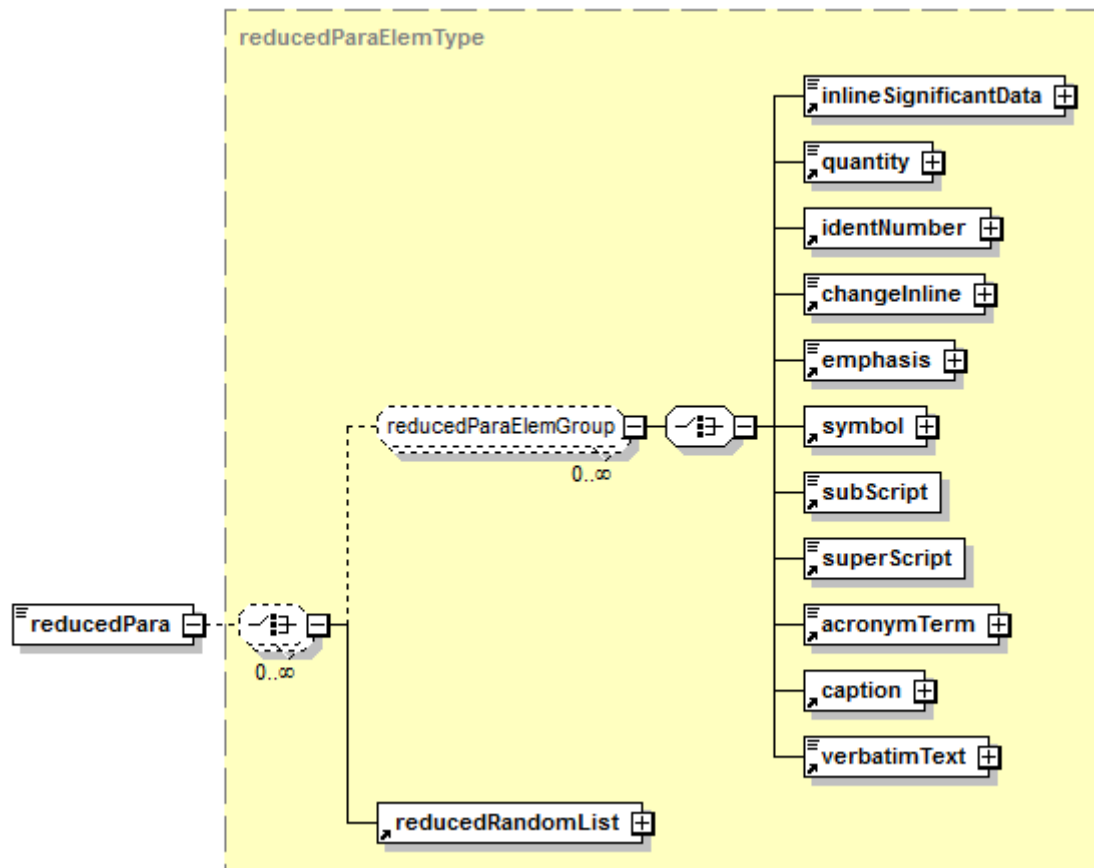

```
<reasonForUpdate>
<simpleRefPara id="rfu-001">Updated to include requirements of
<externalPubRef><externalPubRefId><externalPubCode>JSP-ORT-
10N</externalPubCode><externalPubTitle>Modification of handlebar
mountings to give extra strength in downhill
racing.</externalPubTitle></externalPubRefId></externalPubRef
>.
</simpleRefPara>
<simpleRefPara id="rfu-002">Updated to incorporate the scope of
data module <dmRef><dmRefId><dmCode modelIdCode="ME"
systemDiffCode="B" systemCode="34" subSystemCode="1"
subSubSystemCode="1" assyCode="00" disassyCode="00"
disassyCodeVariant="A" infoCode="251" infoCodeVariant="A"
itemLocationCode="C"/></dmRefId></dmRef>.
```

```
</simpleRefPara>
</reasonForUpdate>
```

## 2.4 Reduced paragraph

**Description:** The element `<reducedPara>` contains a reduced set of text elements. It is used where the full set of elements that are available in a full paragraph (in the element `<para>`) is not required. Reduced paragraphs are used for example in the elements `<frontMatterInfo>`.

**Markup element:** `<reducedPara>`

ICN-S3627-S1000D0562-001-01

Fig 13 Element `<reducedPara>`

### Attributes:

- None

### Child elements:

- `<reducedRandomList>`. Refer to [Para 2.4.2](#).
- The elements of the `reducedParaElemGroup`. Refer to [Para 2.4.1](#).

### 2.4.1 Reduced para element group

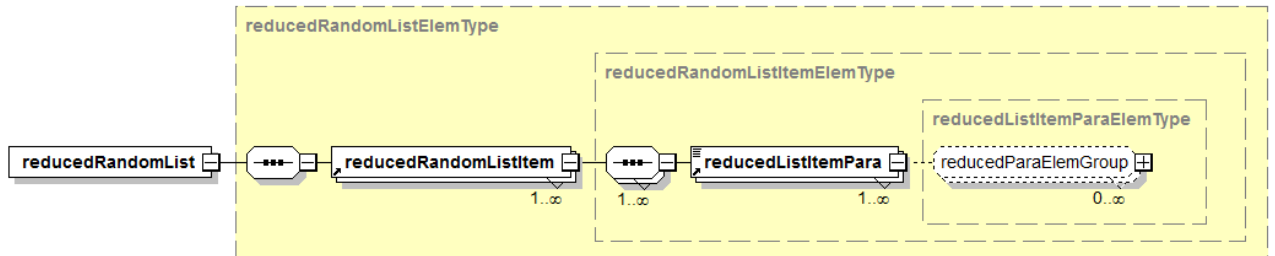

The `reducedParaElemGroup` contains the elements given in [Fig 13](#).

Description of these elements are given in [Para 2.1](#).

### 2.4.2 Reduced random list

**Description:** The element `<reducedRandomList>` contains any listing of information. The listing is limited to one level of random list.

**Markup element:** `<reducedRandomList>`

ICN-S3627-S1000D0563-001-01

Fig 14 Element `<reducedRandomList>`

#### Attributes:

- None of the attributes must be used except for the attribute `listItemPrefix` which is set to the value "pf03". Refer to default BREX rule BREX-S1-000117.

#### Child elements:

- `<reducedRandomListItem>`. Refer to [Para 2.4.3](#).

### 2.4.3 Reduced random list item

**Description:** The element `<reducedRandomListItem>` contains a random list item.

**Markup element:** `<reducedRandomListItem>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).
- `applicRefId`, `id`, `authorityName` and `authorityDocument` must not be used. Refer to default BREX rule BREX-S1-00118.

#### Child elements:

- `<reducedListItemPara>`. Refer to [Para 2.4.4](#).

### 2.4.4 Reduced list item para

**Description:** The element `<reducedListItemPara>` contains the random list items.

**Markup element:** `<reducedListItemPara>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

- applicRefId and id must not be used. Refer to default BREX rule BREX-S1-00119.

#### Child elements:

- Includes the elements of the reducedParaElemGroup. Refer to [Para 2.4.1](#).

## 2.5 Frequently used text elements

### 2.5.1 Name

**Description:** The element `<name>` contains, for example, the name of an enterprise, a function, a circuit breaker, a control and indicator, a zone or an access point. If common information repositories are used in the authoring process, the name is optional as it will be populated during the publication process.

**Markup element:** `<name>`

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- None

#### Mark-up examples:

```
<name>Fueltank sealant polysulfide</name>
```

```
<name>Fixative for placard installation</name>
```

### 2.5.2 Short name

**Description:** The element `<shortName>` contains an abbreviated alternate name of the corresponding element `<name>`. This short form of the name is meant to be presented in the narrative of the data module to make the reading easier.

The project or organization must make sure that any used short name is unique to avoid mistakes which could result in death or injuries to personnel, or damage to the Product.

**Markup element:** `<shortName>`

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- None

#### Mark-up examples:

```
<shortName>Sealant4EVER</shortName>
```

```
<shortName>FixativeFIXIT</shortName>
```

### 2.5.3 Part reference

**Description:** The element `<partRef>` is used to markup a part and allows reference to its position in the part common information repository.

**Markup element:** `<partRef>`

ICN-S3627-S1000D0761-001-01

Fig 15 Element `<partRef>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `partNumberValue` (M), the part number of an item which is allocated by the design authority of the equipment, or which is renamed by the OEM for use in technical publications.
- `manufacturerCodeValue` (M), the CAGE code of the manufacturer.
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Note

As there is no standardized rule to assign a part number, the CAGE code of the part manufacturer ensures the uniqueness of a part number.

#### Child elements:

- `<refs>`, the explicit reference (link) to a part in the part common information repository data module (explicit reference method, refer to [Chap 4.13.1](#)). For implicit references, the part semantic identifiers (part number and manufacturer code) are sufficient. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00560 - Identification of parts:

- Decide whether the project can use OEM renamed part numbers instead of part numbers allocated by the part design authority in the attribute `partNumberValue`.

#### Markup example:

```
<partRef partNumberValue="0-0204504-1"
manufacturerCodeValue="F0286"/>
```

## 1 General

Rules and guidance for marking controlled content within the content section of data modules is given below.

There are cases where data receivers are offered the opportunity to augment or modify technical content prior to its publication. This content is referred to as controlled content.

## 2 Controlled content

The attributes indicating that an element contains controlled content are present on many of the elements in the data module structures.

### **Business rule decision point BRDP-S1-00176 - Presentation of controlled content:**

- Decide how to present controlled content using the attributes `authorityName` and `authorityDocument`.

## 2.1 Controlled content requirements

The requirements for controlled content can be summarized as:

- Controlled content that is not originator content must be identified.
- Controlled content must identify the entity that controls the content, and optionally the related authority documentation.
- The identification of controlled content must remain persistent across revisions.
- The data receiver must be able to clearly identify controlled content.

## 2.2 Marking an element as controlled content

When applying a control over an element, the effect of the control propagates downwards and applies to all the children of that element. The attribute `authorityName` must be used to record the name of the authority that requires that an element's content be controlled.

Optionally, the attribute `authorityDocument` can be used to record the authoritative document that records the requirement for control.

### Attributes:

- `authorityName` (O) and `authorityDocument` (O), the controlled content indications

## 3 Examples

The following markup example shows that the second element `<proceduralStep>` is originated by the data receiver, identified by the value "xyz" of the attribute `authorityName`.

```
<proceduralStep>
<para>This is normal procedural step content</para>
<proceduralStep>
<para>This is normal originator owned content</para>
</proceduralStep>
<proceduralStep authorityName="xyz" authorityDocument="xyz-prod-1">
<para>This content is controlled by data receiver xyz</para>
</proceduralStep>
</proceduralStep>
```

## 1 General

This chapter contains the definition and handling of the element `<commonInfo>` from an author's point of view. It gives details about the available elements and attributes and how to use them to populate `<commonInfo>`.

Common information provides data to the user that applies to the entire data module. The information can contain a general description or introduction of the task or subtask contained in the data module. The element `<commonInfo>` must not contain procedural steps.

The element `<commonInfo>` is contained in the business rules exchange, procedural, process, fault, maintenance checklist, common repository, service bulletin and maintenance planning data modules.

## 2 Common information

ICN-07GB6-00020-002-01

Fig 1 Element `<commonInfo>`

### 2.1 Definition

**Description:** The element `<commonInfo>` contains descriptive information that applies to an entire data module.

**Markup element:** `<commonInfo>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).

- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<figureAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<note>`. Refer to [Chap 3.9.3](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<commonInfoDescrPara>`. Refer to [Para 2.1.1.1](#).
- `<commonInfoDescrParaAlts>`. Refer to [Para 2.1.1.3](#).

#### Business rule decision point BRDP-S1-00177 – Use of common information:

- Decide whether to use the element `<commonInfo>` in business rules exchange, common repositories, fault, maintenance checklist, maintenance planning, procedural, process, and service bulletin data modules. If decided to be used, then determine the circumstances for its use for each related data module type, and give guidance and rules that will make sure it is consistently used.

### 2.1.1 Paragraph text

#### 2.1.1.1 Definition

The common information text can be marked up using one of two methods. One method makes use of an optional element `<note>`, one or more element `<para>`, and optional and repeatable element `<commonInfoDescrPara>` (or optional and repeatable element `<commonInfoDescrParaAlts>`). The other method makes use of one or more element `<commonInfoDescrPara>` and/or one or more element `<commonInfoDescrParaAlts>`.

#### 2.1.1.2 Descriptive paragraph definition

**Description:** The element `<commonInfoDescrPara>` is used to contain text information.

**Markup element:** `<commonInfoDescrPara>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O) caveat (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<warning>`. Refer to [Chap 3.9.3](#).
- `<caution>`. Refer to [Chap 3.9.3](#).
- `<note>`. Refer to [Chap 3.9.3](#).
- `<circuitBreakerDescrGroup>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).

- `<figureAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimediaAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).
- `<commonInfoDescrPara>`
- `<commonInfoDescrParaAlts>`. Refer to [Para 2.1.1.3](#).

**Business rule decision point BRDP-S1-00178 - Markup method for common information text:**

- Decide which markup method to use for common information text:
  - the method containing `<note>`, `<para>` and `<commonInfoDescrPara>`
  - or
  - the method containing only `<commonInfoDescrPara>`

### 2.1.1.3 Descriptive paragraph alternates group definition

**Description:** The element `<commonInfoDescrParaAlts>` is an alternates group that provides the capability to group several alternate solutions of a descriptive text (`<commonInfoDescrPara>`). Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** `<commonInfoDescrParaAlts>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<commonInfoDescrPara>`. Refer to [Para 2.1.1.2](#).

## 3 Examples

The following markup examples show the use of the `<commonInfo>` element.

Example 1: The use of multiple `<commonInfoDescrPara>` elements:

```
<commonInfo>
<title>General Information</title>
<commonInfoDescrPara>
<title>Components Involved in an Accident</title>
<para>Any component removed for reason of accident shall be preserved
and shall be shipped in the same condition it was in after the
accident</para>
</commonInfoDescrPara>
</commonInfo>
```

```
<commonInfo>
<title>Special Instructions</title>
<commonInfoDescrPara>
<para>The columns headed I and P are used to indicate the requirements
for Intermediate and Periodic inspections respectively. When item is
required with a frequency other than that indicated by these column
headings, the proper frequency is indicated in the appropriate
column.</para>
</commonInfoDescrPara>
<commonInfoDescrPara>
<para>Work time requirements for individual items are stated in the
W/T column.</para>
</commonInfoDescrPara>
</commonInfo>
```

Example 2: The use of a single `<para>` element:

```
<commonInfo>
<title>Condition Inspection</title>
<para>Operators have periodically experienced frame vibration and have
had difficulty identifying the cause of vibration. Troubleshooting
frame vibration can consume a number of man-hours and cause
considerable amount of concern. This procedure provides a compilation
of known causes of frame vibration and the required corrective
action.</para>
</commonInfo>
```

Example 3: The use of `<commonInfoDescrParaAlts>`:

```
<commonInfo>
<title>Special Instructions</title>
<commonInfoDescrParaAlts>
<commonInfoDescrPara applicRefId="app-0001">
<para>The columns headed I and P are used to indicate the requirements
for Intermediate and Periodic inspections respectively. When item is
required with a frequency other than that indicated by these column
headings, the proper frequency is indicated in the appropriate
column.</para>
<para>Work time requirements for individual items are stated in the
W/T column.</para>
</commonInfoDescrPara>
<commonInfoDescrPara applicRefId="app-0002">
<para>The columns headed A and B are used to indicate the requirements
for Intermediate and Periodic inspections respectively. When item is
required with a frequency other than that indicated by these column
headings, the proper frequency is indicated in the appropriate
column.</para>
<para>Work time requirements for individual items are stated in the
W/T column.</para>
</commonInfoDescrPara>
</commonInfoDescrParaAlts>
</commonInfo>
```

<a href="#">Chap 4.13.1</a>	Optimizing and reuse - Common information repository concept

## 1 General

Specific information can be externalized into a dedicated Common Information Repository (CIR) data module in order to avoid duplication of data. This concerns applicability annotations, warnings and cautions. Refer to [Chap 4.13.1](#).

## 2 Reference to externalized data elements

### 2.1 References to externalized applicability annotations

**Description:** The element `<applicRef>` contains the reference to an applicability annotation in an applicability annotations CIR data module. It is used for externalizing applicability annotations. Refer to [Chap 3.9.5.2.11.12](#).

**Markup element:** `<applicRef>`

ICN-S1000D-A-03090502-A-FAPE3-00001-A-001-01

Fig 1 Element `<applicRef>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `applicIdentValue` (M), the unique identification of the externalized applicability annotation
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<dmRef>`, the data module reference. Refer to [Chap 3.9.5.2.1.2](#) and default BRES rule BRES-S1-00133.

#### Markup example:

```
<applicRef applicIdentValue="app-00000000AA056A-0000"/>
```

### 2.2 References to externalized warnings

**Description:** The element `<warningRef>` contains the reference to a warning in a warnings CIR data module. It is used for externalizing warnings. Refer to [Chap 3.9.5.2.11.13](#).

**Markup element:** `<warningRef>`

ICN-S1000D-A-03090502-A-FAPE3-00002-A-001-01

Fig 2 Element `<warningRef>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningIdentNumber` (M), the unique identification of the externalized warning

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<dmRef>](#), the data module reference. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<warningRef warningIdentNumber="warn-00000000AA056A-0001" />
```

## 2.3

### References to externalized cautions

**Description:** The element [<cautionRef>](#) contains the reference to a caution in a cautions CIR data module. It is used for externalizing cautions. Refer to [Chap 3.9.5.2.11.14](#).

**Markup element:** [<cautionRef>](#)

ICN-S1000D-A-03090502-A-FAPE3-00003-A-001-01

Fig 3 Element [<cautionRef>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- cautionIdentNumber (M), the unique identification of the externalized caution
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<dmRef>](#), the data module reference. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<cautionRef cautionIdentNumber="caut-00000000AA056A-0003" />
```

<a href="#">Chap 5.2.1.2</a>	Common information sets - Description and operation

## 1 General

The descriptive Schema is used to capture and represent descriptive information.

## 2 Descriptive information

### 2.1 Schema basic rules

The granularity of descriptive data modules must follow the breakdown reflected by the SNS providing descriptions at:

- system
- subsystem
- sub-subsystem levels

as required by the:

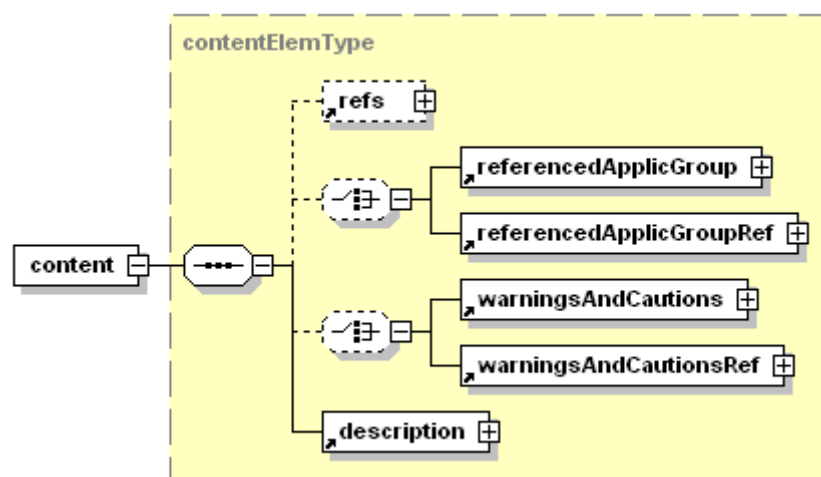

- maintenance philosophy
- scope of information required

For details on the scope of information, refer to [Chap 5.2.1.2](#).

### 2.2 Content

**Description:** This element contains all descriptive types of information.

**Markup element:** `<content>`

ICN-83007-0000000063-001-01

Fig 1 Major elements in description content

**Attributes:**

- `id` (O), the identifier of the `<content>` element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<warningsAndCautions>`. Refer to [Chap 3.9.3](#).
- `<warningsAndCautionsRef>`. Refer to [Chap 3.9.3](#).
- `<description>`. Refer to [Para 2.3](#).

## 2.3 Description

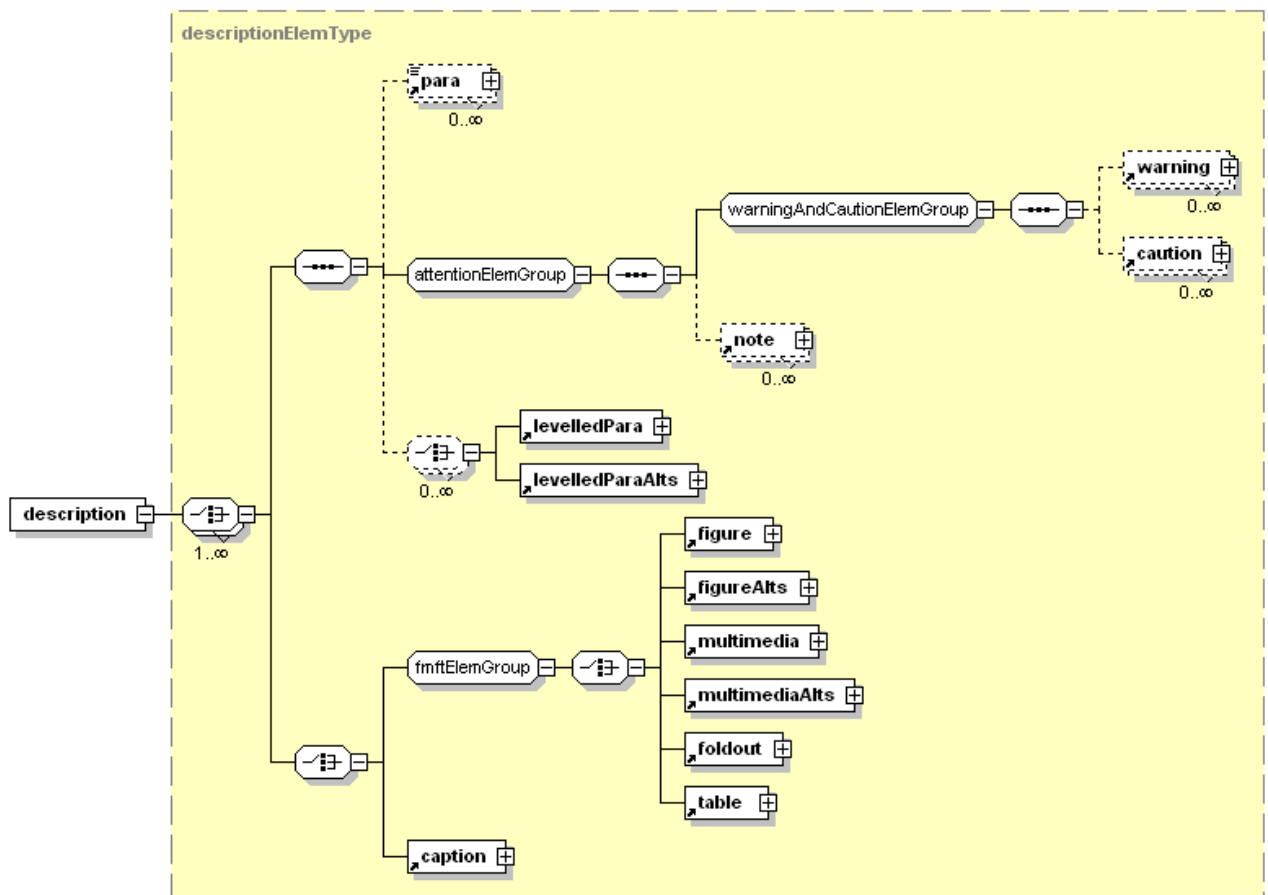

**Description:** The element `<description>` contains the descriptive information. Descriptive paragraphs can be broken down into subparagraphs, which can be broken down further into sub-subparagraphs and so on. Refer to [Para 2.4](#).

This element also contains the elements `<figure>`, `<figureAlts>`, `<multimedia>` and `<multimediaAlts>`.

**Note**

The descriptive data module uses common constructs. For the detailed explanations and rules for common constructs, refer to [Chap 3.9.5.2.1](#).

**Markup element:** `<description>`

ICN-83007-0000000054-002-01

Fig 2 Element &lt;description&gt;

#### Attributes:

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).

#### Child elements:

- <para>. Used for introductory unnumbered paragraphs before the description starts. Refer to [Chap 3.9.5.2.1.10](#).
- <warning>. The use of warnings in descriptive information is a project or an organization decision. Refer to [Chap 3.9.3](#).
- <caution>. The use of cautions in descriptive information is a project or an organization decision. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <levelledPara>. Used for breaking down the descriptive content into numbered paragraphs. Refer to [Para 2.4](#) and [Chap 3.9.5.2.1.10](#).
- <levelledParaAlts>. Refer to [Para 2.5](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).

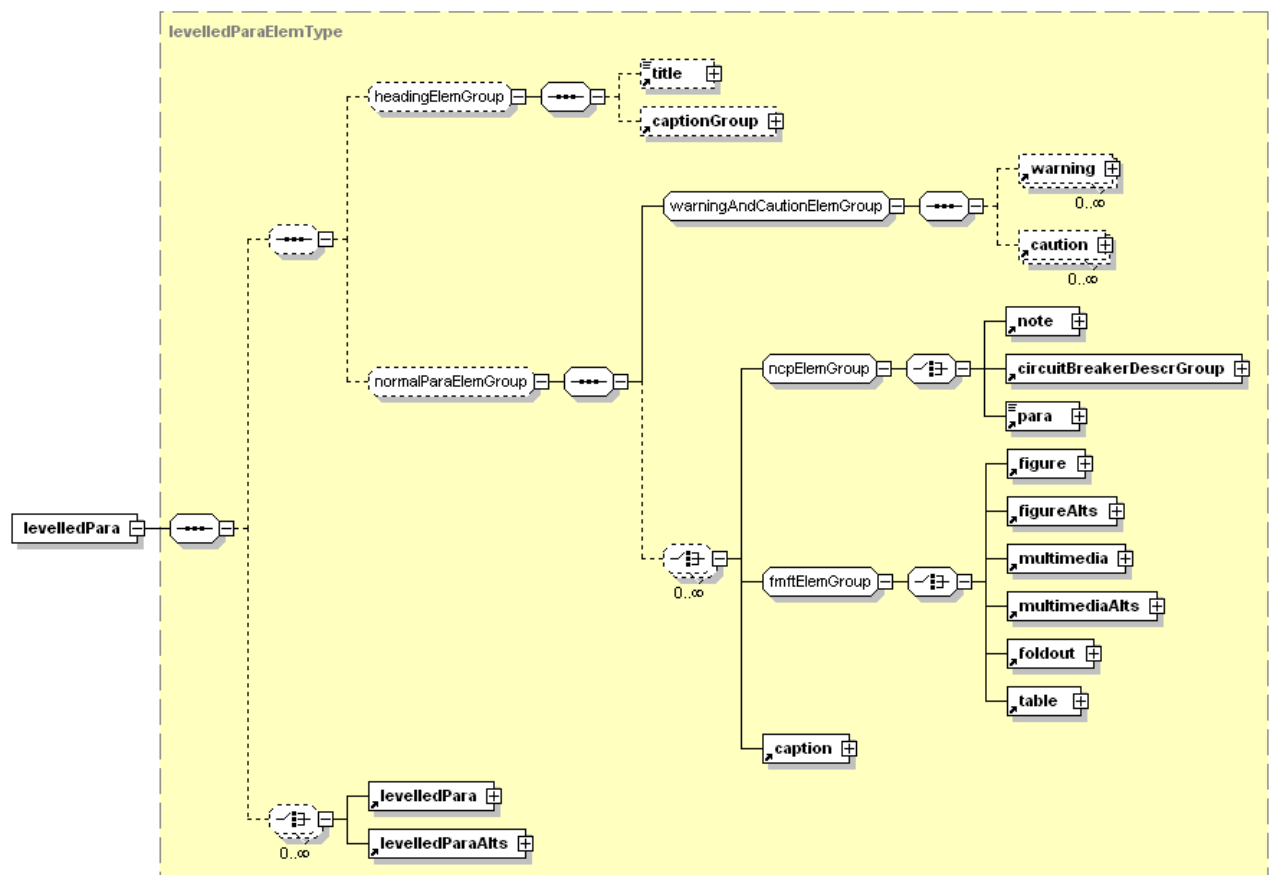

- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).
- `<caption>`. Refer to [Chap 3.9.5.2.1.4](#).

## 2.4 Levelled paragraphs

**Description:** The element `<levelledPara>` is the equivalent of a headed paragraph and subparagraphs. It can have one or more `<levelledPara>` elements nested within it and/or one or more `<levelledParaAlts>` elements. The depth of this structure is unlimited, however, it is recommended to not exceed five levels of depth. Refer to default BREX rule BREX-S1-00077.

When a `<levelledPara>` or `<levelledParaAlts>` contain nested `<levelledPara>` or `<levelledParaAlts>` children, it is recommended that the occurrence of these children be two or more. It is further recommended that additional levels only be used in a conversion effort, where existing data is authored to such a depth and restructuring of data is not feasible. In these cases, the structure must never exceed eight levels of depth. Refer to default BREX rule BREX-S1-00078.

**Markup element:** `<levelledPara>`

ICN-83007-0000000061-002-01

Fig 3 Element `<levelledPara>`

### Attributes:

- `applicRefId` (O), the applicability information referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2.](#)
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1.](#)
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3.](#)
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3.](#)
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11.](#)
- securityClassification (O), commercialClassification (O), caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6.](#)

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5.](#)
- <captionGroup>. Refer to [Chap 3.9.5.2.1.4.](#)
- <warning>. The use of warnings in descriptive information is a project or an organization decision. Refer to [Chap 3.9.3.](#)
- <caution>. The use of cautions in descriptive information is a project or an organization decision. Refer to [Chap 3.9.3.](#)
- <note>. Refer to [Chap 3.9.3.](#)
- <circuitBreakerDescrGroup>. Refer to [Chap 3.9.5.2.1.9.](#)
- <para>. Refer to [Chap 3.9.5.2.1.10.](#)
- <figure>. Refer to [Chap 3.9.5.2.1.7.](#)
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7.](#)
- <multimedia>. Refer to [Chap 3.9.5.2.1.7.](#)
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7.](#)
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6.](#)
- <table>. Refer to [Chap 3.9.5.2.1.6.](#)
- <caption>. Refer to [Chap 3.9.5.2.1.4.](#)
- <levelledPara>.
- <levelledParaAlts>. Refer to [Para 2.5.](#)

#### Business rule decision point BRDP-S1-00180 - Maximum number of subordinate levelled paragraphs in a descriptive data module:

- Decide on the maximum number of levelled paragraphs allowed in a descriptive data module. Exceeding five levels of depth is strongly discouraged in development of new data. It is recommended that additional levels are only used in a conversion effort where the existing data is authored to this depth (maximum eight levels) and restructuring of data is not feasible.

#### Business rule decision point BRDP-S1-00181 - Minimum levelled para occurrences:

- Decide whether to impose a minimum of two occurrences of child elements <levelledPara> and/or <levelledParaAlts>.

## 2.5 Levelled paragraphs alternates group

**Description:** The element <levelledParaAlts> is an alternates group that provides the capability to group several alternates to levelled paragraphs. The element <levelledParaAlts> can be used in conjunction with the element

<levelledPara>. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** <levelledParaAlts>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O) the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <levelledPara>

### 3

### Example

```
<levelledPara>
<title>The bicycle wheel</title>
<para>The wheel (refer to <internalRef internalRefId="fig-0001"
internalRefTargetType="irrtt01"></internalRef>) of a bicycle is a
complex structure. The wheel assembly has these parts:
<randomList listItemPrefix="pf01">
<listItem><para>the tire</para></listItem>
<listItem><para>the tube</para></listItem>
<listItem><para>the spokes</para></listItem>
<listItem><para>the spoke nipples</para></listItem>
<listItem><para>the valve</para></listItem>
<listItem><para>the hub</para></listItem>
</randomList>
On their own, the individual components are not very strong.
But, when they are installed together, the components make the
complete wheel (refer to <internalRef internalRefId="fig-0001"
internalRefTargetType="irrtt01"></internalRef>). The complete
wheel is resistant to almost any type of heavy loads and
operation.</para>
<figure id="fig-0001">
<title>Parts of the wheel</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-DA00000-0-U8025-
00504-A-03-1" reproductionWidth="510mm"></graphic>
</figure>
<levelledPara id="par-0001">
<title>Spokes</title>
<para>The spokes go out from the hub and go across and below
each other. The spoke nipples attach the spokes to the rim
with the threads on the end of the spokes. You can use the
spoke nipples to adjust the tension of the spokes.
The tension on each of the spokes must be equal.</para>
</levelledPara>
```

```

<levelledPara id="par-0002">
<title>Wheel rim</title>
<para>The rim (refer to <internalRef internalRefId="fig-0002"
internalRefTargetType="irtt01"></internalRef>) of the wheel has
a lining of rim tape. This tape protects the tube from damage
that the rough edges on the spoke nipples can cause.</para>
<figure id="fig-0002">
<title>The tire and rim</title>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-DA00000-0-U8025-
00504-B-03-1" reproductionWidth="510mm"></graphic>
</figure>
</levelledPara>
<levelledPara id="par-0003">
<title>Tube and tire</title>
<para>The tube and the tire install on the rim. The sidewalls of
the tire have markings on them. These which are used to indicate
the correct direction of rotation. The markings also make sure
the tire installs on the rim and that the directional arrows
points in the correct direction. You install the tube into the
tire before you inflate it. The tube has a valve (refer to
<internalRef internalRefId="fig-0003"
internalRefTargetType="irtt01"></internalRef>) which you put
through the hole in the rim. This valve (refer to <internalRef
internalRefId="fig-0003"
internalRefTargetType="irtt01"></internalRef>) is used to
inflate the tube and the tire to the correct pressure. A dust
cap installs on the valve (refer to <internalRef
internalRefId="fig-0003"
internalRefTargetType="irtt01"></internalRef>) to prevent damage
that dust and debris can cause.</para>
<figure id="fig-0003">
<title>Valve</title>

## 1 General

The procedural Schema is used to capture and represent procedural information. The granularity of maintenance procedural data modules must follow the breakdown reflected by the SNS and the information codes, and must reflect the tasks identified in the maintenance plan. The granularity of crew/operator procedural data modules must follow the breakdown reflected by the SNS and the information codes, and must reflect the operations identified. Common entities, elements and attributes must be used as detailed in [Chap 3.9.5.2.1](#).

## 2 Procedural information

### 2.1 Schema basic rules

The procedural Schema has structural elements that are used to provide a hierarchy of steps and substeps. Note that if a condition (eg, warning, caution and/or security) applies to a step or substep, then that condition also applies to all its substeps.

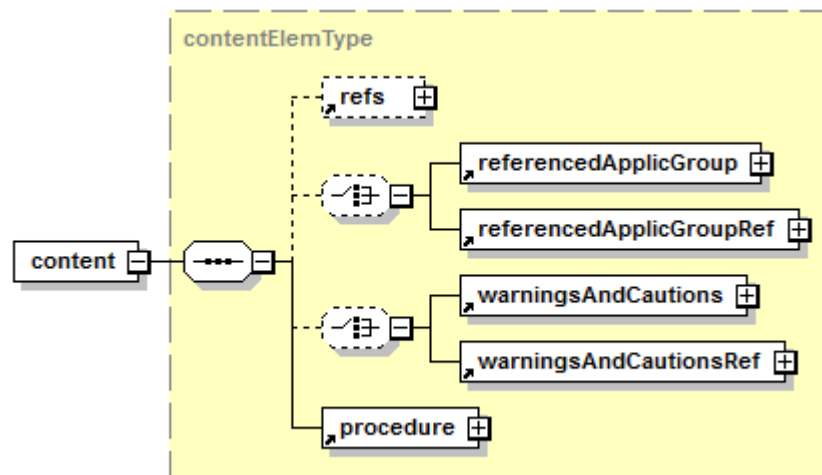

This Schema can be used for all types of information of procedural or instructional type (eg, for the technical content in maintenance procedures, refer to [Chap 5.2.1.3.1](#)).

This Schema contains alternates for various elements. For related business rule decisions, refer to [Chap 4.13.3](#).

### 2.2 Content

**Description:** The element `<content>` contains the content section of the procedural data module.

**Markup element:** `<content>`

ICN-S3627-S1000D0498-002-01

Fig 1 Major elements in procedural content

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

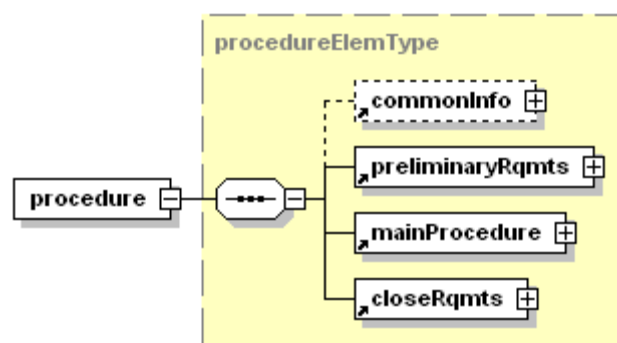

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<warningsAndCautions>`. Refer to [Chap 3.9.3](#).
- `<warningsAndCautionsRef>`. Refer to [Chap 3.9.3](#).
- `<procedure>`. Refer to [Para 2.3](#).

## 2.3

### Procedure

**Description:** The element `<procedure>` contains all information necessary to carry out the task or the main objective of the procedural information.

**Markup element:** `<procedure>`

ICN-S3627-S1000D0499-001-01

Fig 2 Element `<procedure>`

#### Attributes:

- None

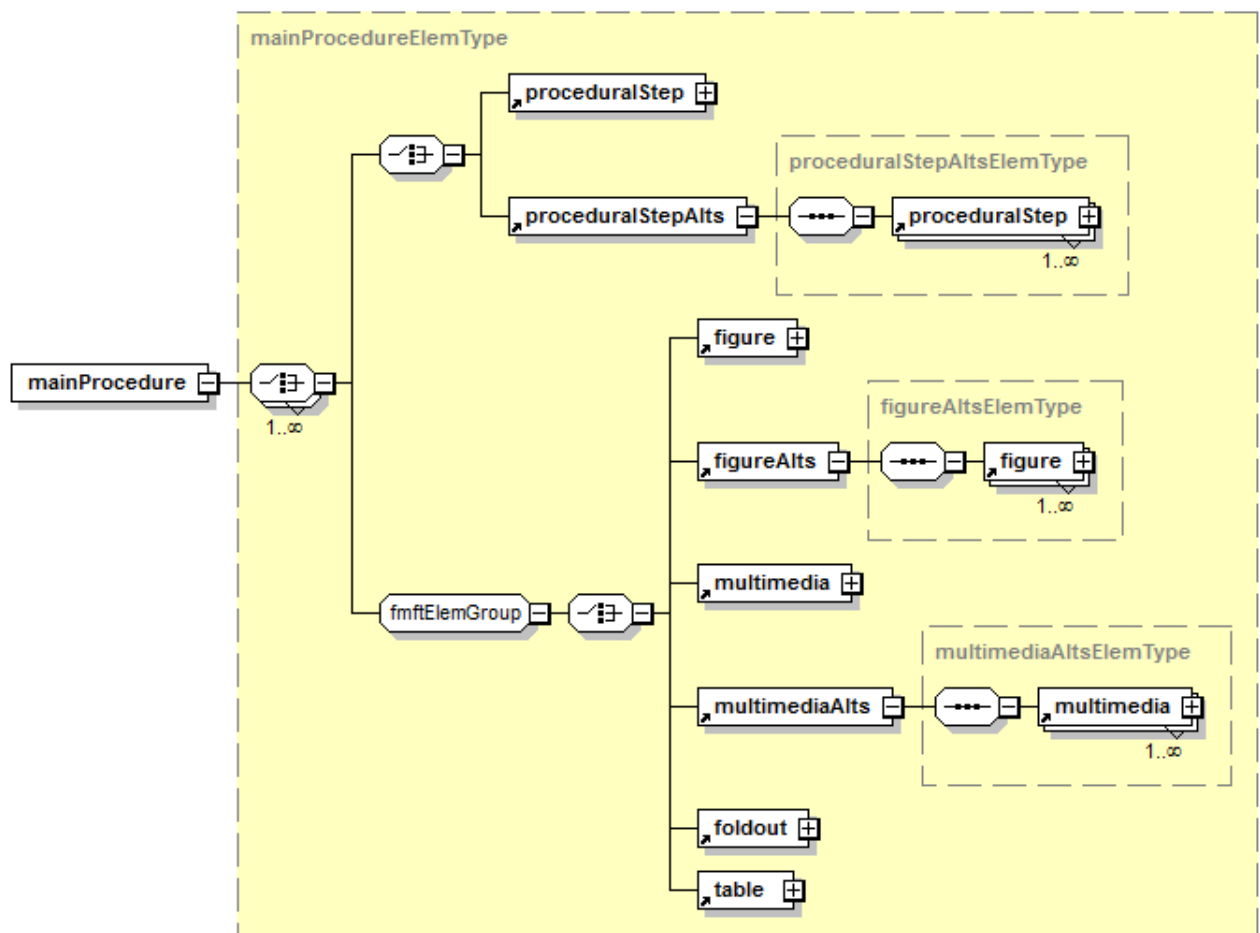

#### Child elements:

- <commonInfo> . Refer to [Chap 3.9.5.2.1.12](#).
- <preliminaryRqmts>. Refer to [Chap 3.9.5.2.1.9](#).
- <mainProcedure>. Refer to [Para 2.4](#).
- <closeRqmts>. Refer to [Chap 3.9.5.2.1.9](#).

## 2.4 Main procedure

**Description:** The element <mainProcedure> contains the detailed procedural steps to be done, properly supported by figures, multimedia, foldouts and tables.

**Markup element:** <mainProcedure>

ICN-S3627-S1000D0500-002-01

Fig 3 Element <mainProcedure>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- skillLevelCode (O), the skill level required for the complete procedure. Refer to [Chap 3.9.5.1](#). The attribute skillLevelCode can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).

- independentCheck (O), the complete procedure must be checked by a supervisor with a given qualification
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<proceduralStep>](#). Refer to [Para 2.4.1](#).
- [<proceduralStepAlts>](#). Refer to [Para 2.4.2](#).
- [<figure>](#). Refer to [Chap 3.9.5.2.1.7](#).
- [<figureAlts>](#). Refer to [Chap 3.9.5.2.1.7](#).
- [<multimedia>](#). Refer to [Chap 3.9.5.2.1.7](#).
- [<multimediaAlts>](#). Refer to [Chap 3.9.5.2.1.7](#).
- [<foldout>](#). Refer to [Chap 3.9.5.2.1.7](#).
- [<table>](#). Refer to [Chap 3.9.5.2.1.6](#).

**Business rule decision point BRDP-S1-00185 - Use of the alternates concept within the element [<mainProcedure>](#):**

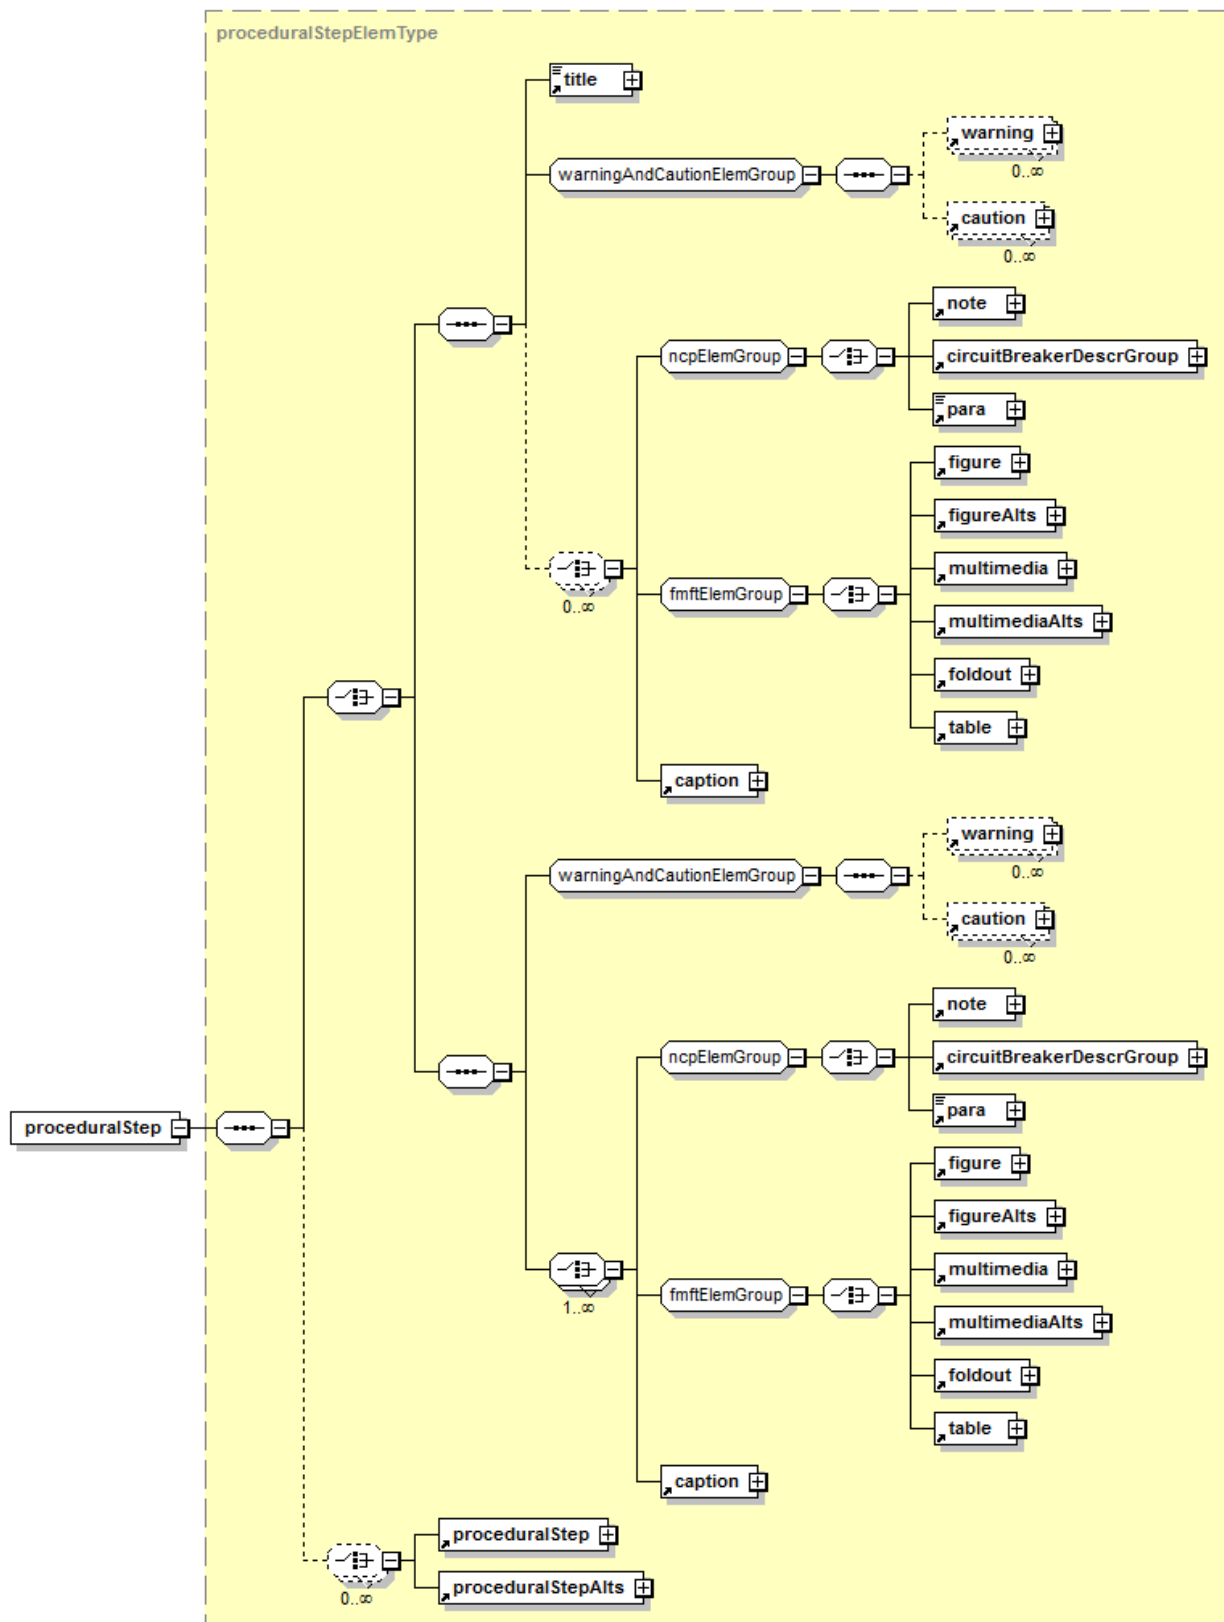

- Decide whether to use the alternates concept for steps, figures and multimedia within the element [<mainProcedure>](#). This concerns the child elements [<proceduralStepAlts>](#) (refer to [Para 2.4.2](#)), [<figureAlts>](#) (refer to [Chap 3.9.5.2.1.7](#)) and [<multimediaAlts>](#) (refer to [Chap 3.9.5.2.1.7](#)).

## 2.4.1

### Procedural step

**Description:** The element [<proceduralStep>](#) contains a step in the procedure. A step can be broken down into substeps by including another element [<proceduralStep>](#) (or [<proceduralStepAlts>](#)), which can itself be broken down further into substeps by including another element [<proceduralStep>](#) (or [<proceduralStepAlts>](#)), and so on. In this way, any depth of substep breakdown can be achieved. However, exceeding five levels of depth is strongly discouraged. Refer to default BREX rule BREX-S1-00079. The substep breakdown must never exceed eight levels of depth. Refer to default BREX rule BREX-S1-00080.

**Markup element:** [<proceduralStep>](#)

ICN-S3627-S1000D0501-002-01

Fig 4 Element <proceduralStep>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- independentCheck (O), the step must be checked (eg, by a supervisor with a given qualification).
- skillLevelCode (O), the skill level required for this procedural step. Refer to [Chap 3.9.5.1](#). The attribute skillLevelCode can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).
- keepWithNext (O), the indication whether a step is presented together with the next step, if possible. The attribute keepWithNext is intended for use only when absolutely necessary in a given situation (eg, where scrolling is not practical for the user or the viewing device does not allow scrolling). The attribute keepWithNext can have one of the following values:
  - "0" (D) - No, the step is not kept with the next sibling step
  - "1" - Yes, the step is kept with the next sibling step (if one exists) and therefore, all children of the element for which the attribute keepWithNext is set, must be kept together as well (if possible). The attribute keepWithNext has no meaning when placed on a final step.
- itemCharacteristic (O), used to indicate the characteristics of the item that is the subject of a given procedural step. If used, the attribute itemCharacteristic can have one or more of the following values:
  - "ic01" thru "ic99". Refer to [Chap 3.9.6.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Para 2.4.3](#) for the use of titles. Refer to [Chap 3.9.5.2.1.5](#) for general rules on titles.
- <warning>. Refer to [Para 2.4.4](#) for the validity of warnings. Refer to [Chap 3.9.3](#) for general rules on warnings.
- <caution>. Refer to [Para 2.4.4](#) for the validity of cautions. Refer to [Chap 3.9.3](#) for general rules on cautions.
- <note>. Refer to [Chap 3.9.3](#).
- <circuitBreakerDescrGroup>. Refer to [Chap 3.9.5.2.1.9](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).

- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7.](#)
- `<multimediaAlts>`. Refer to [Chap 3.9.5.2.1.7.](#)
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7.](#)
- `<table>`. Refer to [Chap 3.9.5.2.1.6.](#)
- `<caption>`. Refer to [Chap 3.9.5.2.1.4.](#)
- `<proceduralStep>`.
- `<proceduralStepAlts>`. Refer to [Para 2.4.2.](#)

**Business rule decision point BRDP-S1-00186 - Maximum number of step levels in a procedure:**

- Decide on the maximum number of step levels allowed in a procedure. Exceeding five levels of depth is strongly discouraged in development of new data. It is recommended that additional levels are only used in a conversion effort where the existing data is authored to this depth (maximum eight levels) and restructuring of data is not feasible.

**Business rule decision point BRDP-S1-00187 - Minimum number of substeps in a step:**

- Decide whether to allow for a single substep, or to insist on a minimum of two substeps in a step.

**Note**

The Schema allows for a single substep.

## 2.4.2 Procedural step alternates group

**Description:** The element `<proceduralStepAlts>` is an alternate group that provides the capability to group several alternatives of a step. Refer to [Chap 4.13.3](#) for information related to the use of alternate groups in data module content.

**Markup element:** `<proceduralStepAlts>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2.](#)
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1.](#)
- `altsName` (O), the name of the alternate group
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11.](#)
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6.](#)

## 2.4.3 Title

**Description:** The element `<title>` contains the title of a step or gives the title for a sequence of substeps. The element `<title>` must be used consistently in a procedure (refer to default BREX rule BREX-S1-00264). The following rules apply:

- 1 A step must have a title if any of its sibling steps have a title.
- 2 A substep can have a title only if its parent step has a title.

## 2.4.4 Warnings, cautions and notes

A warning, caution or note, or a warning or caution reference that is placed in a step (element `<proceduralStep>`) applies to all substeps (element `<proceduralStep>`).

### 3

## Examples

### 3.1

### Not using the alternates concept

The following is a markup example of a procedure not using the alternates concept.

```
<procedure>

<a href="#">Chap 5.2.1.3.2</a>	Maintenance information - Fault isolation

## 1 General

The fault Schema is used to capture and represent fault reporting, fault isolation and fault correlation information. The granularity of these data modules must follow the breakdown reflected by the SNS.

For details on the scope of the information, refer to [Chap 5.2.1.3.2](#).

The use of the common entities, elements and attributes is detailed in [Chap 3.9.5.2.1](#).

## 2 Fault information

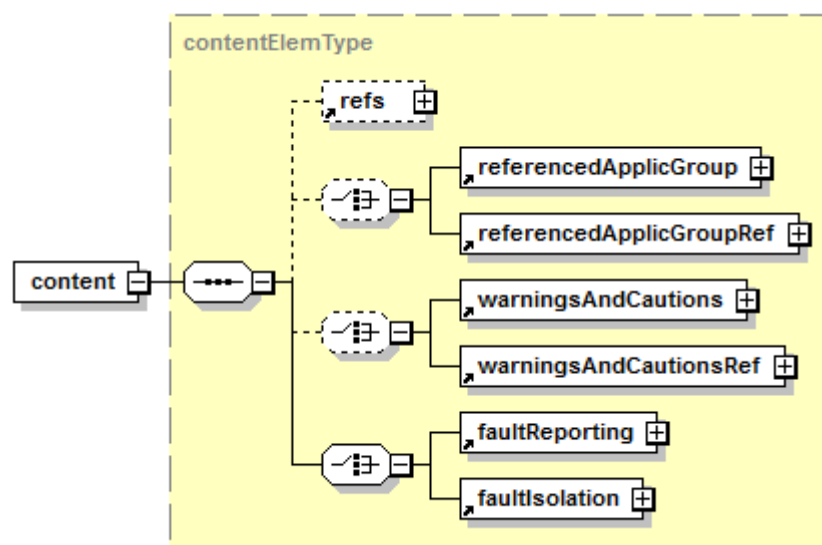

### 2.1 Schema basic rules

The fault Schema has structural elements that are used to support the build-up of the required fault information in the project. The fault Schema is used to structure fault reporting and fault isolation. The fault Schema is used to structure fault reporting and fault isolation where fault reporting includes isolated fault, detected fault, observed fault and correlated fault. Fault reporting includes fault isolation procedure.

### 2.2 Content

**Description:** The fault Schema allows for five types of fault information to be produced as individual data modules. These are fault reporting (in terms of isolated, detected, observed or correlated faults) or fault isolation. Refer to [Chap 5.2.1.3.2](#).

**Markup element:** `<content>`

ICN-S3627-S1000D0502-002-01

Fig 1 Major elements in fault content

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<warningsAndCautions>`. Refer to [Para 2.4](#).
- `<warningsAndCautionsRef>`. Refer to [Para 2.4](#).

and one of

- <[faultReporting](#)>. Refer to [Para 2.5](#).
- <[faultIsolation](#)>. Refer to [Para 2.6](#).

**Markup example:**

```
<content>
<faultReporting>
<isolatedFault id=flt-0003" faultCode="NYCJD03">
<faultDescr>
</faultDescr>
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
</faultReporting>
</content>
```

## 2.3 References

References (element <[refs](#)>) must be populated in accordance with [Chap 3.9.5.2.1.2](#).

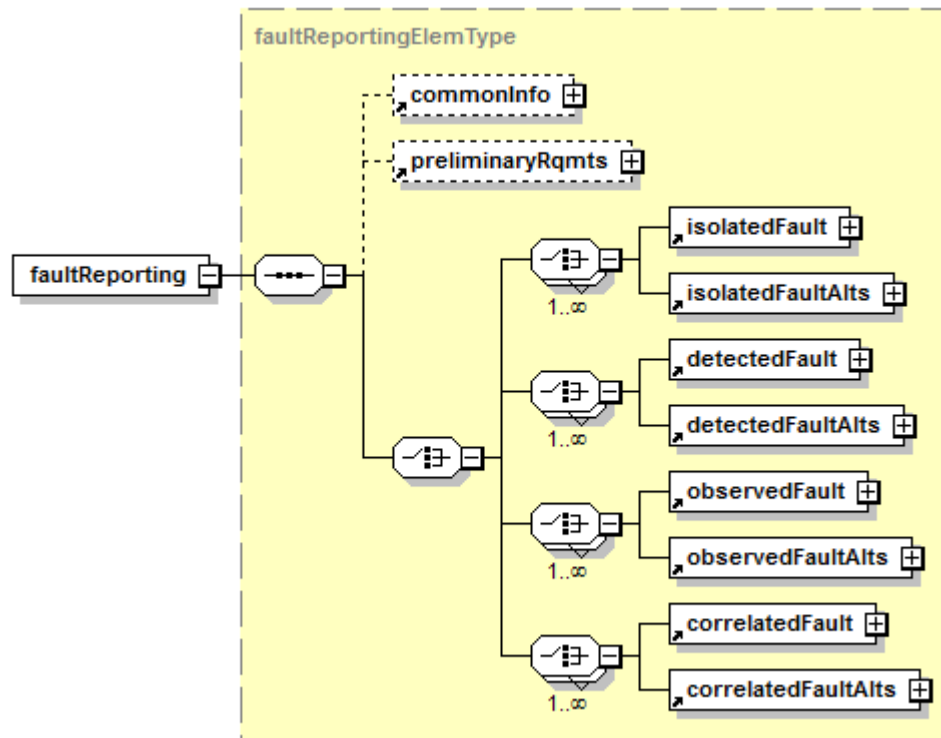

## 2.4 Warnings and cautions

There are two possibilities to collect warnings and cautions, either within the data module where they are used (element <[warningsAndCautions](#)>) or within a warning and caution common information repository (element <[warningsAndCautionsRef](#)>). Refer to [Chap 3.9.3](#).

## 2.5 Fault reporting

**Description:** The element <[faultReporting](#)> contains information to enable technician or computerized maintenance systems to indicate faults through data modules.

Markup element: `<faultReporting>`

ICN-S3627-S1000D0622-001-01

Fig 2 Element `<faultReporting>`

#### Attributes:

- None

#### Child elements:

- `<commonInfo>`. Refer to [Chap 3.9.5.2.1.12](#).
- `<preliminaryRqmts>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<isolatedFault>`. Refer to [Para 2.5.1](#).
- `<isolatedFaultAlts>`. Refer to [Para 2.5.2](#).
- `<detectedFault>`. Refer to [Para 2.5.3](#).
- `<detectedFaultAlts>`. Refer to [Para 2.5.4](#).
- `<observedFault>`. Refer to [Para 2.5.5](#).
- `<observedFaultAlts>`. Refer to [Para 2.5.6](#).
- `<correlatedFault>`. Refer to [Para 2.5.7](#).
- `<correlatedFaultAlts>`. Refer to [Para 2.5.8](#).

#### Markup example:

```
<faultReporting>
<isolatedFault id="flt-0003" faultCode="NYCJD03">
<faultDescr>
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine will not start.</faultMessageBody>
</detailedFaultDescr>
```

```

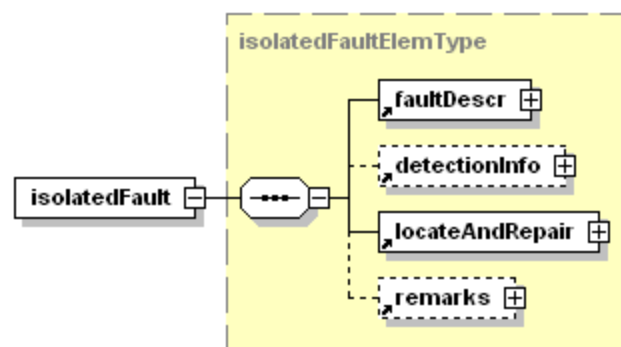

</faultDescr>
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
</faultReporting>

```

### 2.5.1 Isolated faults

**Description:** The element `<isolatedFault>` is used to capture isolated faults information.

**Markup element:** `<isolatedFault>`

ICN-S3627-S1000D0503-001-01

Fig 3 Element `<isolatedFault>`

#### Attributes:

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `faultCode` (M), the fault code that is allocated as part of a logistic analysis process
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Child elements:

- `<faultDescr>`. Refer to [Para 2.5.1.1](#).
- `<detectionInfo>`. Refer to [Para 2.5.1.3](#).
- `<locateAndRepair>`. Refer to [Para 2.5.1.4](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```

<isolatedFault id="flt-0003" faultCode="NYCJD03">
<faultDescr>
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine will not start.</faultMessageBody>
</detailedFaultDescr>
</faultDescr>

```

```

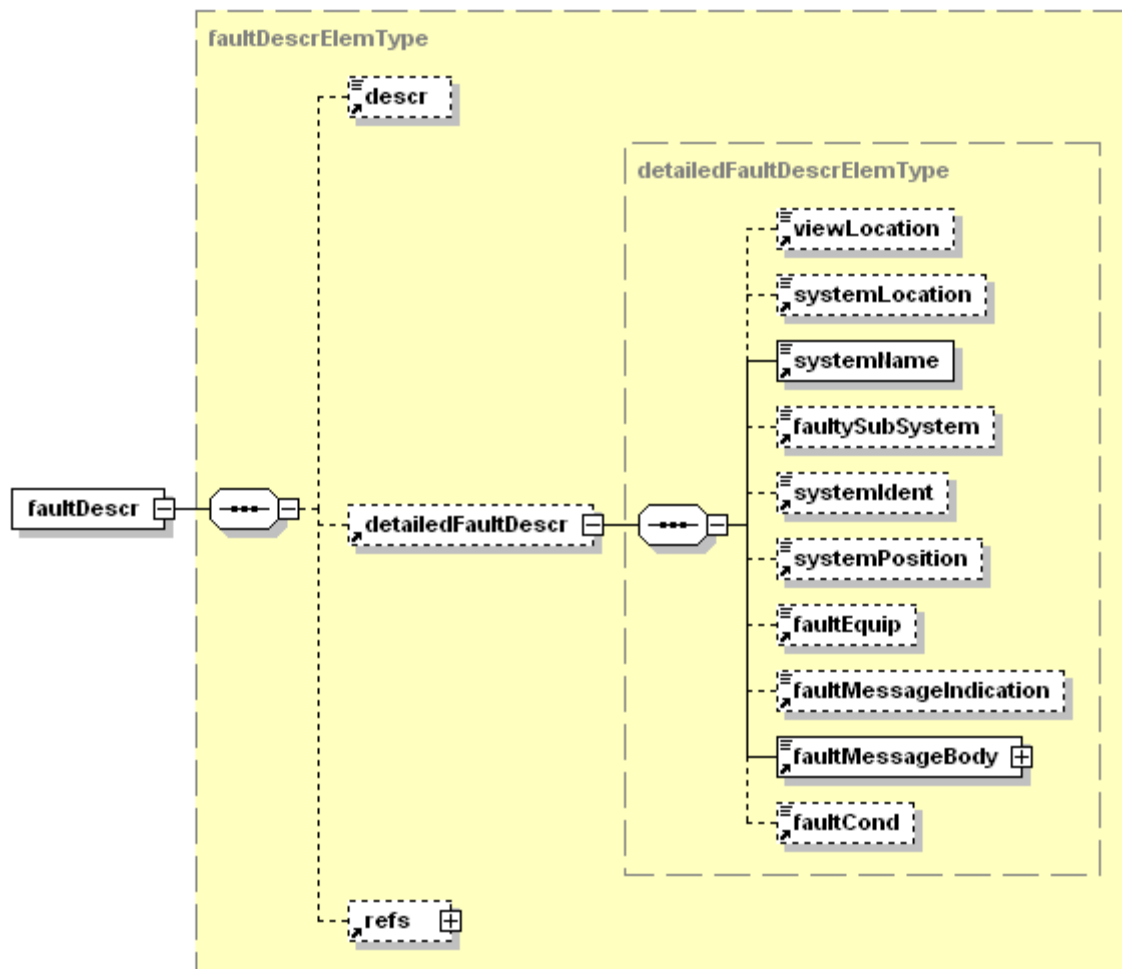

<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>

```

#### 2.5.1.1 Description of the isolated fault

**Description:** The element `<faultDescr>` contains the description of the isolated fault.

**Markup element:** `<faultDescr>`

ICN-S3627-S1000D0504-001-01

Fig 4 Element `<faultDescr>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<descr>`, the textual fault description by the message identification as it is displayed to the maintenance crew
- `<detailedFaultDescr>`. Refer to [Para 2.5.1.2](#).
- `<refs>`, the references to, if required, other data modules, publication modules or non S1000D publications to complete the description. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<faultDescr>
<descr>Horn failed</descr>
</faultDescr>
```

#### 2.5.1.2

Detailed description of the isolated fault

**Description:** The element `<detailedFaultDescr>` contains the detailed description of the isolated fault.

**Markup element:** `<detailedFaultDescr>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

All child elements can have a textual content and all have the same set of attributes as the element `<faultDescr>`.

- `<viewLocation>`, the location where the description of the fault is displayed
- `<systemLocation>`, the location or panel where the malfunction is shown
- `<systemName>`, the faulty system
- `<faultySubSystem>`, the faulty subsystem
- `<systemIdent>`, the discriminating identification information to identify the faulty system (eg, "yellow" for a hydraulic flag system)
- `<systemPosition>`, the discriminating identification information, position-oriented (eg, "left")
- `<faultEquip>`, the equipment involved in the malfunction
- `<faultMessageIndication>`, the indication part of the fault message (eg, "temperature")
- `<faultMessageBody>`, the main part of the fault message
- `<faultCond>`, the potential fault condition

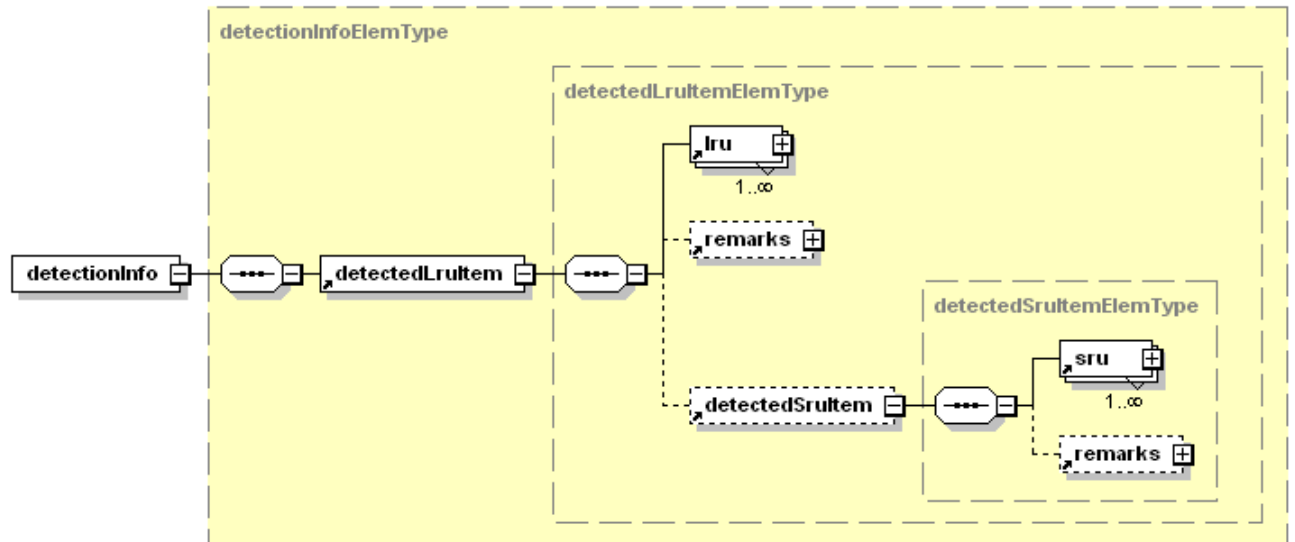

#### Markup example:

```
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine will not start.</faultMessageBody>
</detailedFaultDescr>
```

## 2.5.1.3 Fault detecting information

**Description:** The element `<detectationInfo>` contains the information for detecting the fault.

**Markup element:** `<detectationInfo>`

ICN-S3627-S1000D0505-002-01

Fig 5 Element `<detectationInfo>`
**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `detectionType` (O), the type of fault

**Child elements:**

- `<detectedLruItem>`. Refer to [Para 2.5.1.3.1](#).

**Markup example:**

```
<detectationInfo detectionType="Major">
  <detectedLruItem>
    <lru>
      <name>Tire</name>
      <identNumber>
        <manufacturerCode>KT666</manufacturerCode>
        <partAndSerialNumber>
          <partNumber>TIRES-010101</partNumber>
        </partAndSerialNumber>
      </identNumber>
    </lru>
  </detectedLruItem>
</detectationInfo>
```

## 2.5.1.3.1 Detected Line Replaceable Unit (LRU) item

**Description:** The element `<detectedLruItem>` contains the identification, name and abbreviation of the detected LRU.

**Markup element:** <detectedLruItem>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- faultProbability (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <lru>. Multiple <lru> elements must only contain LRU alternates. Refer to [Para 2.5.1.3.2](#).
- <remarks>. Refer to [Chap 3.9.5.1](#).
- <detectedSruItem>. Refer to [Para 2.5.1.3.3](#).

**Markup example:**

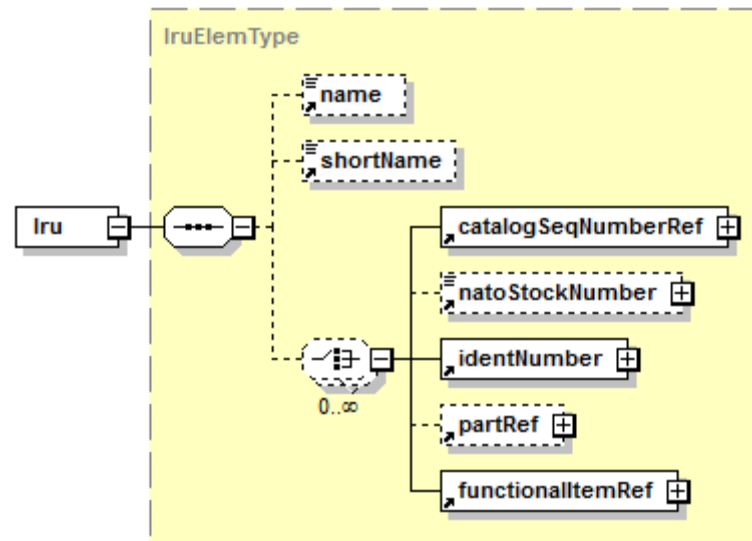

```
<detectedLruItem>
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</detectedLruItem>
```

#### 2.5.1.3.2 LRU identification

**Description:** The element <lru> contains a name, a short name and an identification of the LRU.

Markup element: <lru>

ICN-S3627-S1000D0506-002-01

Fig 6 Element <lru>

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the LRU. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>. Refer to [Chap 3.9.5.2.1.10](#).
- The identification by one or more of the elements <catalogSeqNumberRef> (refer to [Chap 3.9.5.2.7](#)), <natoStockNumber> (refer to [Chap 3.9.5.2.1.9](#)), <identNumber> (refer to [Chap 3.9.5.2.1.9](#)), <partRef> (refer to [Chap 3.9.5.2.1.10](#)) and <functionalItemRef> (refer to [Chap 3.9.5.1](#)).

#### Markup example:

```
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
```

### 2.5.1.3.3 *Detected Shop Replaceable Unit (SRU) item*

**Description:** The element `<detectedSruItem>` contains the identification, name, abbreviation and any remark information of the detected SRU.

**Markup element:** `<detectedSruItem>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `faultProbability` (O), the probability factor to indicate the likelihood that this particular SRU is faulty
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<sru>`. Multiple `<sru>` elements must only contain SRU alternates. Refer to [Para 2.5.1.3.4](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

**Markup example:**

```
<detectedSruItem>
<sru>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</sru>
</detectedSruItem>
```

### 2.5.1.3.4 *SRU identification*

**Description:** The element `<sru>` contains a name, a shortname and an identification of the SRU.

**Markup element:** `<sru>`

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<name>`, the name of the SRU. Refer to [Chap 3.9.5.2.1.10](#).
- `<shortName>`. Refer to [Chap 3.9.5.2.1.10](#).

- The identification by one or more of the elements `<catalogSeqNumberRef>` (refer to [Chap 3.9.5.2.7](#)), `<natoStockNumber>` (refer to [Chap 3.9.5.2.1.9](#)), `<identNumber>` (refer to [Chap 3.9.5.2.1.9](#)), `<partRef>` (refer to [Chap 3.9.5.2.1.10](#)) and `<functionalItemRef>` (refer to [Chap 3.9.5.1](#)).

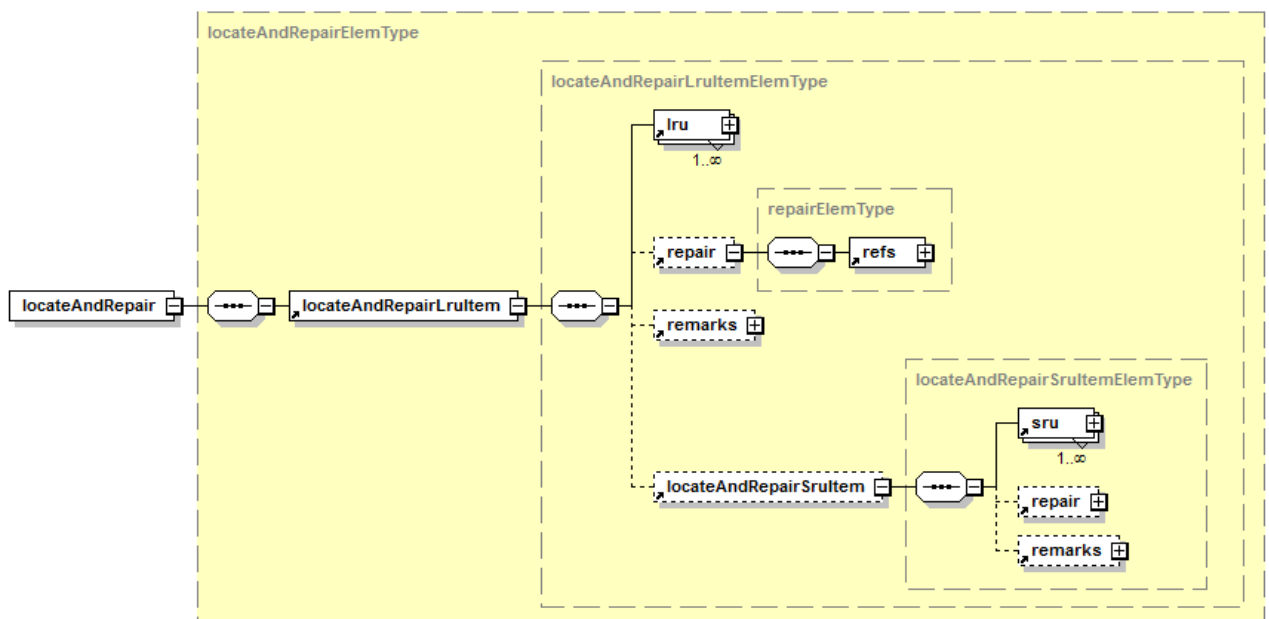

#### Markup example:

```
<sru>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</sru>
```

#### 2.5.1.4 Locate and repair/Locate and repair LRU

**Description:** The child element `<locateAndRepairLruItem>` of the element `<locateAndRepair>` contains any locating and repairing tasks and information on the faulty LRU.

**Markup element:** `<locateAndRepairLruItem>`

ICN-S3627-S1000D0507-003-01

Fig 7 Element `<locateAndRepair>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `faultProbability` (O), the probability factor to indicate the likelihood that this particular LRU is faulty

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<lru>`. Multiple `<lru>` elements must only contain LRU alternates. Refer to [Para 2.5.1.3.2](#).
- `<repair>`. Refer to [Para 2.5.1.4.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).
- `<locateAndRepairSruItem>`. Refer to [Para 2.5.1.4.2](#).

#### 2.5.1.4.1 *Repair*

**Description:** The element `<repair>` contains references to one or more repair procedures.

**Markup element:** `<repair>`

**Attributes:**

- None

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<repair>
<refs>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>External repair publication</externalPubTitle>
</externalPubRefIdent>
</externalPubRef>
</refs>
</repair>
```

#### 2.5.1.4.2 *Locate and repair SRU*

**Description:** The element `<locateAndRepairSruItem>` contains any locating and repairing tasks and information on the faulty SRU.

**Markup element:** `<locateAndRepairSruItem>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- faultProbability (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<sru>`. Multiple `<sru>` elements must only contain SRU alternates. Refer to [Para 2.5.1.3.4](#).

- <repair>. Refer to [Para 2.5.1.4.1](#).
- <remarks>. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<faultReporting>
<isolatedFault id="flt-0003" faultCode="NYCJD03">
<faultDescr>
<descr>Horn failed</descr>
</faultDescr>
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
<name>Horn</name>
<identNumber>
<manufacturerCode>KZ444</manufacturerCode>
<partAndSerialNumber>
<partNumber>Horn-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
<repair>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA3" subSystemCode="1" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="921" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</repair>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
</faultReporting>
```

## 2.5.2 Isolated faults alternates group

**Description:** The element <isolatedFaultAlts> is an alternates group that provides the capability to group several alternate solutions of the isolated faults. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** <isolatedFaultAlts>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<isolatedFault>](#). Refer to [Para 2.5.1](#).

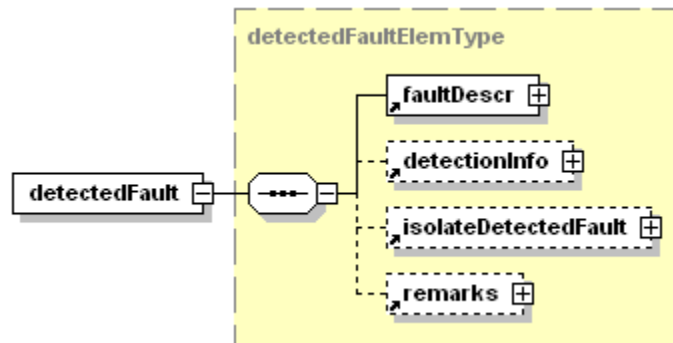

#### Markup example:

```
<isolatedFaultAlts id="flt-001">
<isolatedFault id="flt-0001" faultCode="NYCJD01">
<faultDescr>
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine 1 will not start.</faultMessageBody>
</detailedFaultDescr>
</faultDescr>
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
<isolatedFault id="flt-0002" faultCode="NYCJD02">
<faultDescr>
<detailedFaultDescr>
<systemName>Engine</systemName>
<faultMessageBody>Engine 2 will not start.</faultMessageBody>
</detailedFaultDescr>
</faultDescr>
<locateAndRepair>
<locateAndRepairLruItem>
<lru>
</lru>
</locateAndRepairLruItem>
</locateAndRepair>
</isolatedFault>
</isolatedFaultAlts>
```

### 2.5.3 Detected faults

**Description:** The element [<detectedFault>](#) contains information on detected faults.

Markup element: <detectedFault>

ICN-S3627-S1000D0508-001-01

Fig 8 Element <detectedFault>

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- faultCode (M), the fault code that is allocated as part of a logistic analysis process
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Child elements:

- <faultDescr>. Refer to [Para 2.5.1.1](#).
- <detectionInfo>. Refer to [Para 2.5.1.3](#).
- <isolateDetectedFault>. Refer to [Para 2.5.3.1](#).
- <remarks>. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<detectedFault id="flt-0002" faultCode="NYCJD00">
  <faultDescr>
    <descr>The rear wheel does not operate correctly</descr>
  </faultDescr>
  <detectionInfo detectionType="Major">
    <detectedLruItem>
      <lru>
        <name>Tire</name>
        <identNumber>
          <manufacturerCode>KT666</manufacturerCode>
          <partAndSerialNumber>
            <partNumber>TIRES-010101</partNumber>
          </partAndSerialNumber>
        </identNumber>
      </lru>
    </detectedLruItem>
  </detectionInfo>
  <isolateDetectedFault>
    <lruItem>
```

```

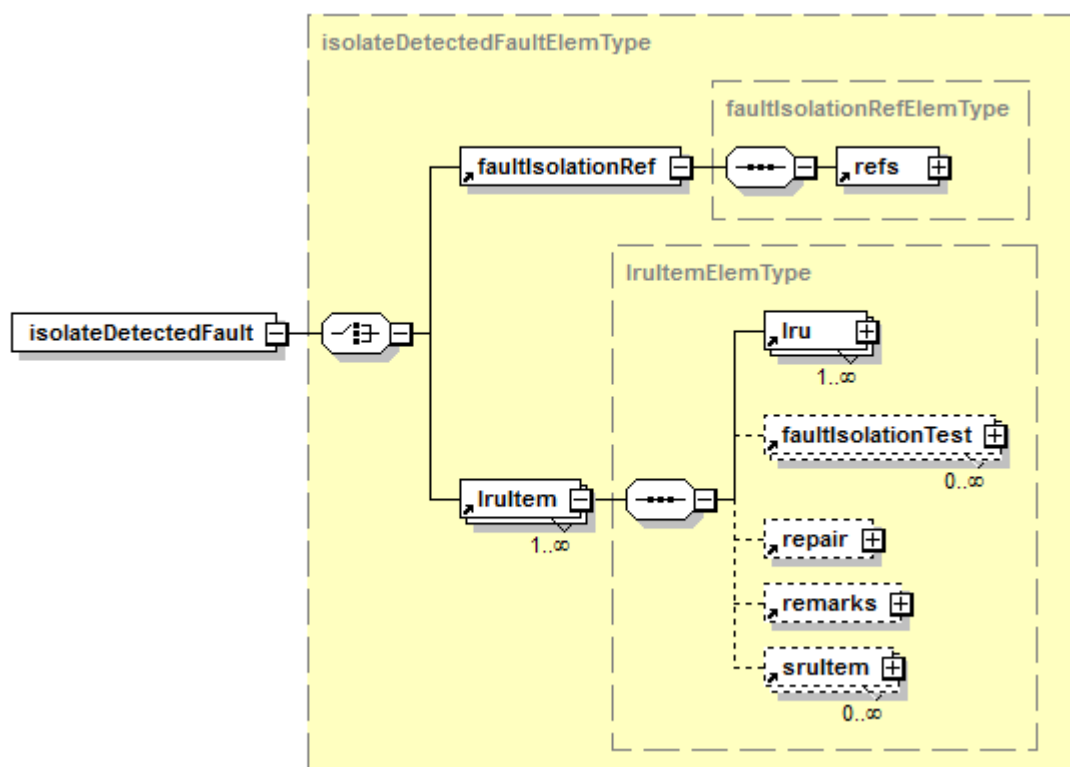

<lru>
<name>Rear wheel</name>
<identNumber>
<manufacturerCode>KZ333</manufacturerCode>
<partAndSerialNumber>
<partNumber>WH-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</lruItem>
</isolateDetectedFault>
<remarks><simplePara>Prepare the rear wheel for the removal of
the tire</simplePara></remarks>
</detectedFault>

```

### 2.5.3.1 Isolate detected faults

**Description:** The element `<isolateDetectedFault>` contains the information needed to isolate the detected fault to an LRU from amongst a list of suspected LRU. This is done by referring out to another data module through the element `<faultIsolationRef>` or by describing a test on these LRU using the element `<lruItem>`.

**Markup element:** `<isolateDetectedFault>`

ICN-S3627-S1000D0509-002-01

Fig 9 Element `<isolateDetectedFault>`

#### Attributes:

- None

**Child elements:**

- `<faultIsolationRef>`, the reference to information needed to isolate the detected fault
- `<lruItem>`. Refer to [Para 2.5.3.1.1](#).

**Markup example:**

```
<isolateDetectedFault>
<lruItem>
<lru>
<name>Rear wheel</name>
<identNumber>
<manufacturerCode>KZ333</manufacturerCode>
<partAndSerialNumber>
<partNumber>WH-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</lruItem>
</isolateDetectedFault>
```

#### 2.5.3.1.1 *Fault isolation test - LRU*

**Description:** The element `<lruItem>` contains the information needed to perform the test on the faulty LRU.

**Markup element:** `<lruItem>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `faultProbability` (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<lru>`. Multiple `<lru>` elements must only contain LRU alternates. Refer to [Para 2.5.1.3.2](#).
- `<faultIsolationTest>`. Refer to [Para 2.5.3.1.2](#).
- `<repair>`. Refer to [Para 2.5.1.4.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).
- `<sruItem>`. Refer to [Para 2.5.3.1.4](#).

**Markup example:**

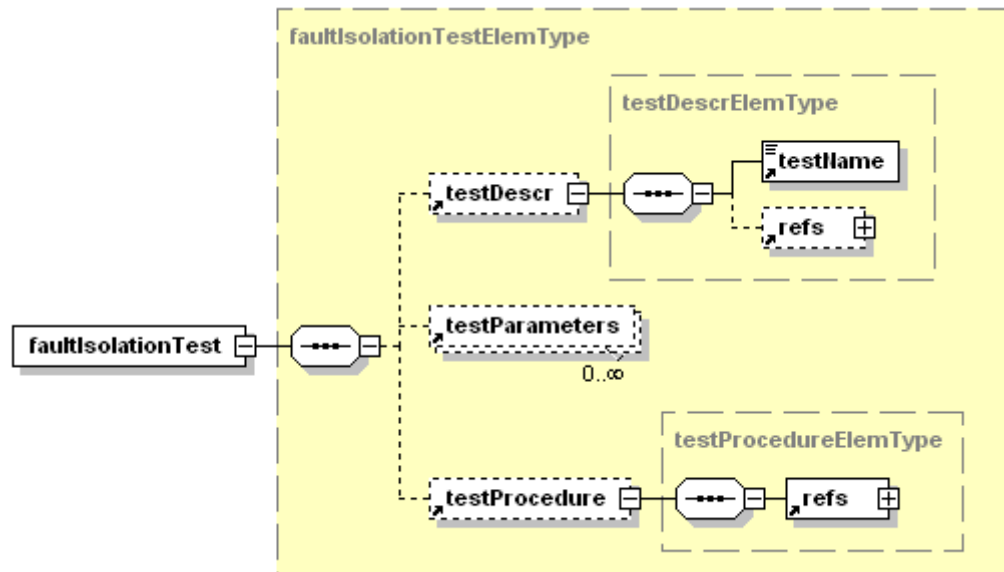

```
<lruItem>
<lru>
<name>Rear wheel</name>
<identNumber>
<manufacturerCode>KZ333</manufacturerCode>
<partAndSerialNumber>
```

```
<partNumber>WH-001</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</lruItem>
```

### 2.5.3.1.2 Fault isolation test performance

**Description:** The element `<faultIsolationTest>` contains the test description, test parameters and the test procedure.

**Markup element:** `<faultIsolationTest>`

ICN-S3627-S1000D0510-001-01

Fig 10 Element `<faultIsolationTest>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `testType` (M), the type of test
- `testCode` (M), the identifier of the test
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<testDescr>`, the name of the test and any reference to a test description
- `<testParameters>`. Refer to [Para 2.5.3.1.3](#).
- `<testProcedure>`, the reference to test procedures or any relevant information

#### Markup example:

```
<faultIsolationTest testCode="O-001" testType="Operation">
<testDescr>
<testName>Test the bulbs</testName>
```

```

</testDescr>
<testParameters from="1" to="1" unitOfMeasure="Days"/>
<testProcedure>
<refs>
<dmRef>
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="341" infoCodeVariant="A" itemLocationCode="A"
modelIdentCode="S1000DLIGHTING" subSubSystemCode="0"
subSystemCode="0" systemCode="D00" systemDiffCode="AAA"/>
</dmRefIdent>
</dmRef>
</refs>
</testProcedure>
</faultIsolationTest>

```

#### 2.5.3.1.3 Test parameters

**Description:** The element `<testParameters>` contains a set of attributes to capture parameters for the test.

**Markup element:** `<testParameters>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `from` (O), the start value for a range of values
- `to` (O), the end value for a range of values
- `unitOfMeasure` (O), the unit of measure for the values

**Child elements:**

- None

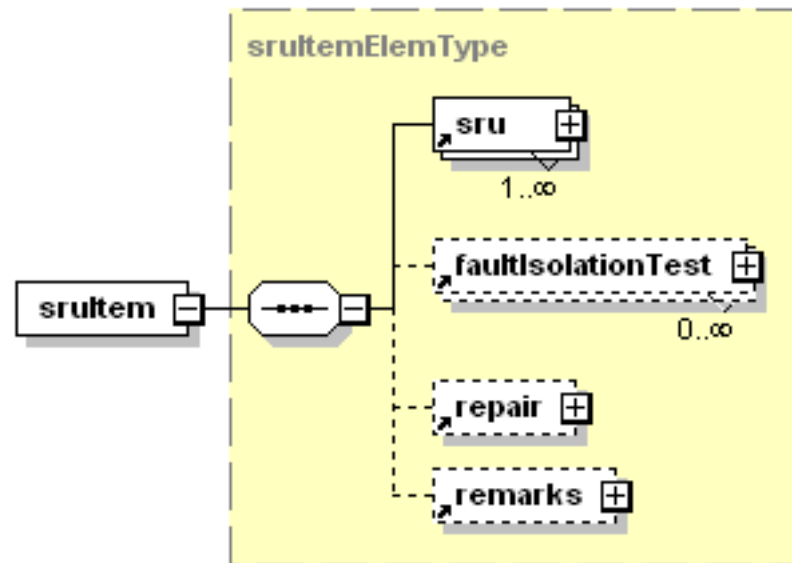

**Markup example:**

```
<testParameters from="1" to="1" unitOfMeasure="Days"/>
```

#### 2.5.3.1.4 Fault isolation test - SRU

**Description:** The element `<sruItem>` contains the information needed to perform the test on the faulty SRU.

Markup element: `<sruItem>`

ICN-S3627-S1000D0511-002-01

Fig 11 Element `<sruItem>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `faultProbability` (O), the probability factor to indicate the likelihood that this particular LRU is faulty
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<sru>`. Multiple `<sru>` elements must only contain SRU alternates. Refer to [Para 2.5.1.3.4](#).
- `<faultIsolationTest>`. Refer to [Para 2.5.3.1.2](#).
- `<repair>`. Refer to [Para 2.5.1.4.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<sruItem>
<sru><name>Shop unit</name></sru>
</sruItem>
```

### 2.5.4 Detected faults alternates group

**Description:** The element `<detectedFaultAlts>` is an alternates group that provides the capability to group several alternate solutions of a detected faults. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

Markup element: `<detectedFaultAlts>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

**Child elements:**

- `<detectedFault>`. Refer to [Para 2.5.3](#).

**Markup example:**

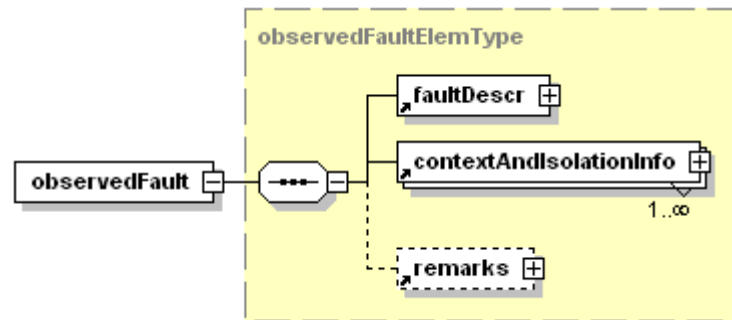

```
<detectedFaultAlts id="fltc-001">
<detectedFault id="flt-0001" faultCode="NYCJD00">
<faultDescr>
<descr>The rear wheel does not operate correctly</descr>
</faultDescr>
<detectionInfo detectionType="Major">
<detectedLruItem>
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</detectedLruItem>
</detectionInfo>
<!-- ... -->
</detectedFault>
<detectedFault id="flt-0002" faultCode="NYCJD01">
<faultDescr>
<descr>The front wheel does not operate correctly</descr>
</faultDescr>
<detectionInfo detectionType="Major">
<detectedLruItem>
<lru>
<name>Tire</name>
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</lru>
</detectedLruItem>
</detectionInfo>
<!-- ... -->
</detectedFault>
</detectedFaultAlts>
```

## 2.5.5 Observed faults

**Description:** The element `<observedFault>` contains information on observed faults but not detected by the computerized maintenance system.

The element has an attribute `faultCode`, which can be used to contain the fault code that is allocated as part of a logistic analysis process and an attribute `faultType` which can capture the type of fault.

**Markup element:** `<observedFault>`

ICN-S3627-S1000D0512-001-01

Fig 12 Element `<observedFault>`

### Attributes:

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `faultCode` (O), the fault code that is allocated as part of a logistic analysis process
- `faultType` (O), the fault type that is allocated as part of a logistic analysis process
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

### Child elements:

- `<faultDescr>`, the description of the isolated fault. Refer to [Para 2.5.1.1](#).
- `<contextAndIsolationInfo>`. Refer to [Para 2.5.5.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

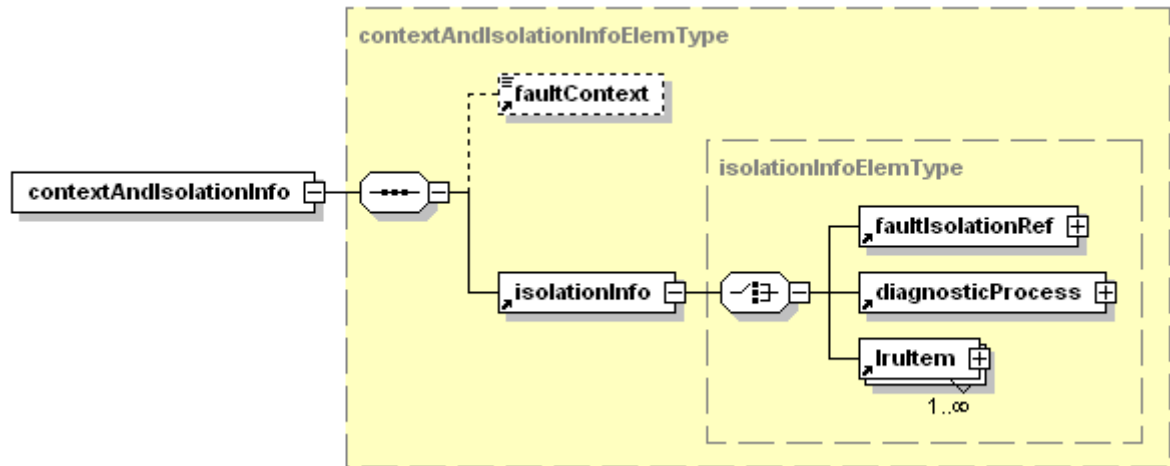

### Markup example:

```
<observedFault faultCode="NYCJD02" id="flt-0001">
  <faultDescr>
    <descr>The lights are set to the dim position.</descr>
  </faultDescr>
  <contextAndIsolationInfo>
    <isolationInfo>
      <lruItem>
        <lru></lru>
      </lruItem>
    </isolationInfo>
  </contextAndIsolationInfo>
</observedFault>
```

## 2.5.5.1 Context and isolation information

**Description:** The element `<contextAndIsolationInfo>` contains the description of the context in which the fault is observed and information needed to isolate the faulty item.

**Markup element:** `<contextAndIsolationInfo>`

ICN-S3627-S1000D0513-001-01

Fig 13 Element `<contextAndIsolationInfo>`

**Attributes:**

- None

**Child elements:**

- `<faultContext>`, the textual description of the context in which the fault is observed
- `<isolationInfo>`. Refer to [Para 2.5.5.2](#).

**Markup example:**

```
<observedFault faultCode="NYCJD02" id="flt-0001">
  <faultDescr>
    <descr>The lights are set to the dim position.</descr>
  </faultDescr>
  <contextAndIsolationInfo>
    <isolationInfo>
      <lruItem>
        <lru></lru>
      </lruItem>
    </isolationInfo>
  </contextAndIsolationInfo>
</observedFault>
```

## 2.5.5.2 Fault isolation information

**Description:** The element `<isolationInfo>` contains the diagnostic information for the observed fault. This is done by referring out using the element `<faultIsolationRef>` or by describing a diagnostic process using the element `<diagnosticProcess>` or simply testing the LRU using the element `<lruItem>`.

**Markup element:** `<isolationInfo>`

**Attributes:**

- None

**Child elements:**

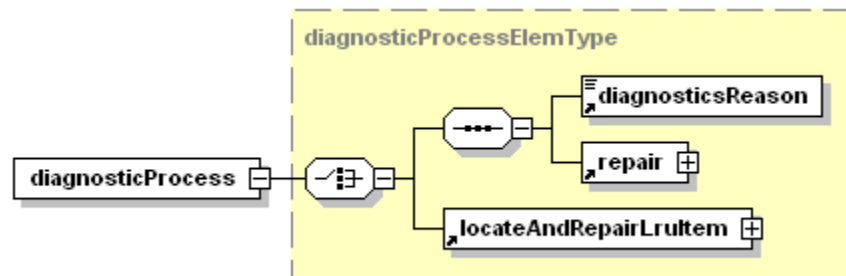

- [<faultIsolationRef>](#), the references to diagnostic information for the observed fault by using the element [<refs>](#). Refer to [Chap 3.9.5.2.1.2](#).
- [<diagnosticProcess>](#). Refer to [Para 2.5.5.3](#).
- [<lruItem>](#). Refer to [Para 2.5.3.1.1](#).

## 2.5.5.3

**Diagnostics**

**Description:** The element [<diagnosticProcess>](#) contains a textual description of the reason and a reference to a repair procedure or any locating and repairing tasks and information on the faulty LRU.

**Markup element:** [<diagnosticProcess>](#)

ICN-S3627-S1000D0514-001-01

Fig 14 Element [<diagnosticProcess>](#)

**Attributes:**

- None

**Child elements:**

- [<diagnosticsReason>](#), the textual description of the of the cause of the failure
- [<repair>](#). Refer to [Para 2.5.1.4.1](#).
- [<locateAndRepairLruItem>](#). Refer to [Para 2.5.1.4](#).

## 2.5.6

**Observed faults alternates group**

**Description:** The element [<observedFaultAlts>](#) is an alternates group that provides the capability to group alternates of the observed fault. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** [<observedFaultAlts>](#)

**Attributes:**

- [id \(O\)](#), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [changeType \(O\)](#), [changeMark \(O\)](#) and [reasonForUpdateRefIds \(O\)](#), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- [authorityName \(O\)](#) and [authorityDocument \(O\)](#), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<observedFault>](#). Refer to [Para 2.5.5](#).

#### Markup example:

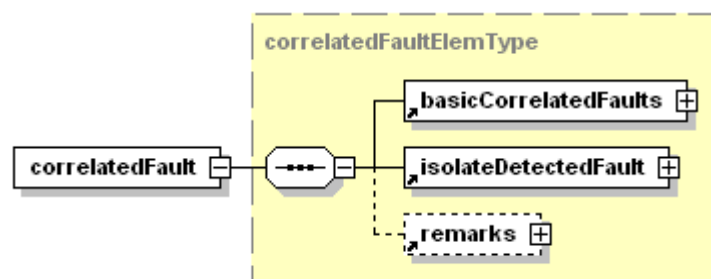

```
<observedFaultAlts id="ofc-001">
<observedFault faultCode="NYCJD01" id="flt-0001">
<faultDescr>
<descr>The lights are set to the dim position.</descr>
</faultDescr>
<contextAndIsolationInfo>
<isolationInfo>
<lruItem>
<lru></lru>
</lruItem>
</isolationInfo>
</contextAndIsolationInfo>
</observedFault>
<observedFault faultCode="NYCJD02" id="flt-0002">
<faultDescr>
<descr>The lights are set to the high position.</descr>
</faultDescr>
<contextAndIsolationInfo>
<isolationInfo>
<lruItem>
<lru></lru>
</lruItem>
</isolationInfo>
</contextAndIsolationInfo>
</observedFault>
</observedFaultAlts>
```

## 2.5.7

### Correlated faults

**Description:** The element [<correlatedFault>](#) contains the information on correlated faults.

**Markup element:** [<correlatedFault>](#)

ICN-S3627-S1000D0515-001-01

Fig 15 Element [<correlatedFault>](#)

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<basicCorrelatedFaults>](#), the descriptions of correlated messages and warnings/malfunctions. Refer to [Para 2.5.7.1](#).
- [<isolateDetectedFault>](#), the information for the correlated fault isolation. Refer to [Para 2.5.3.1](#).
- [<remarks>](#). Refer to [Chap 3.9.5.1](#).

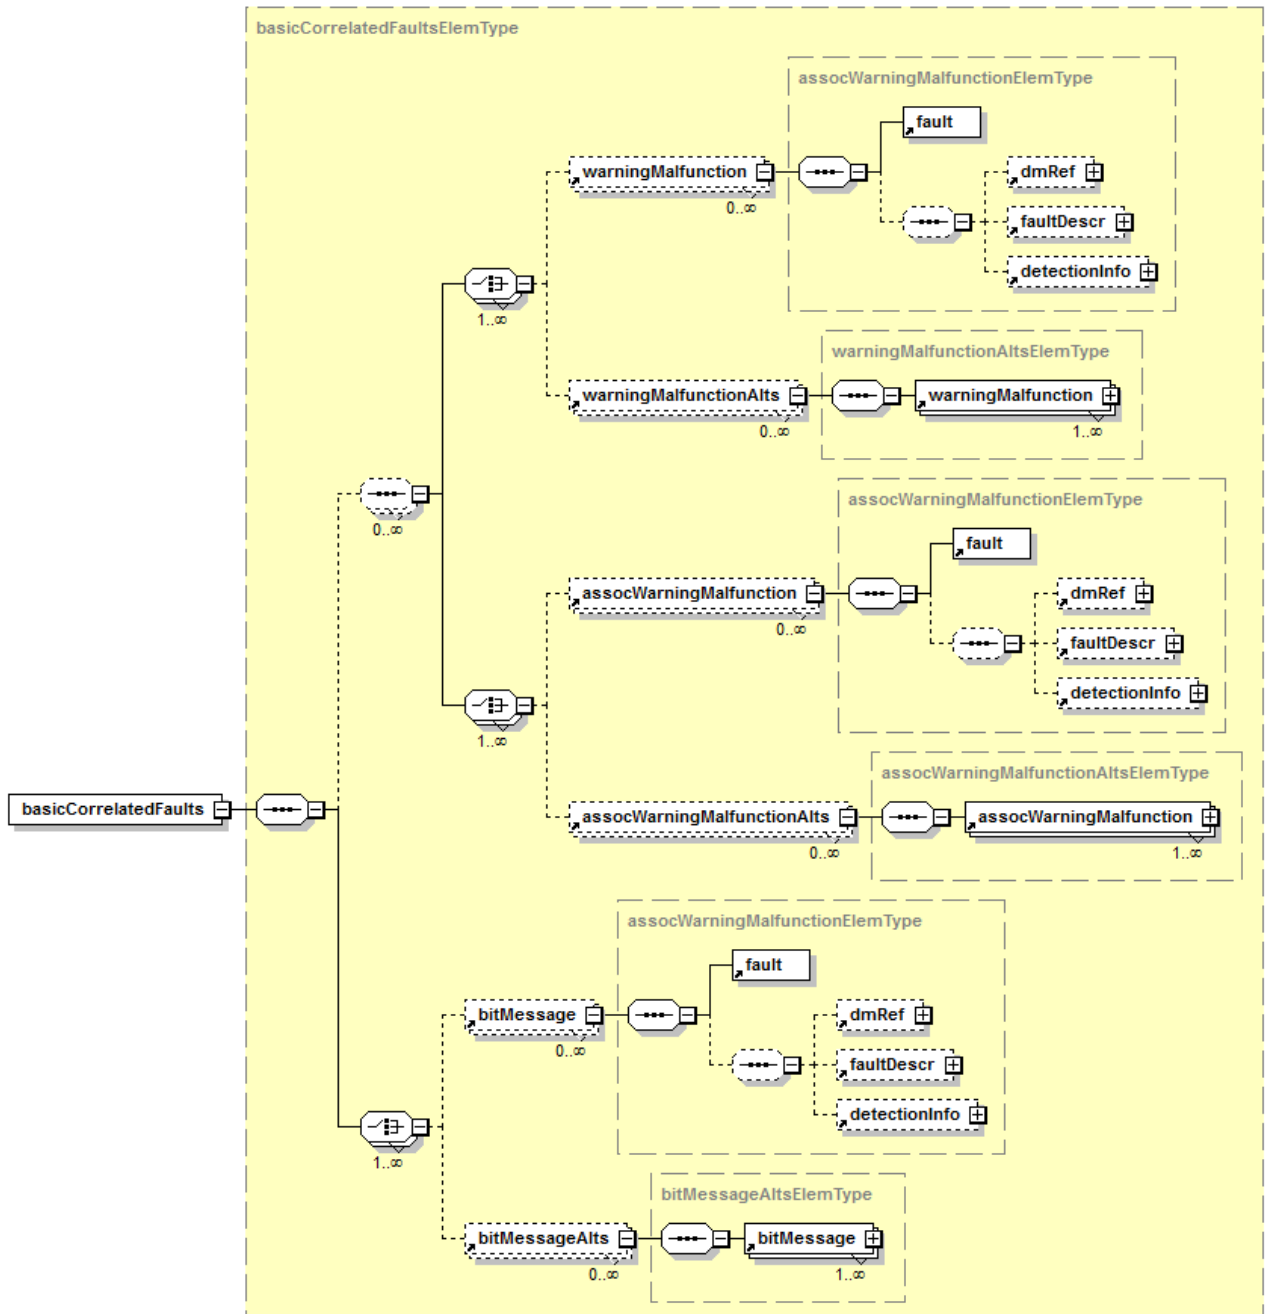

#### Markup example:

```
<correlatedFault id="CFS0001">
  <basicCorrelatedFaults>
    <bitMessage><fault faultCode="100FC01"/>
    <faultDescr>
      <descr>The pedal mechanism is jammed</descr>
    </faultDescr>
  </bitMessage>
    <bitMessage><fault faultCode="200FC01"/>
    <faultDescr>
      <descr>The derailleur is jammed</descr>
    </faultDescr>
  </bitMessage>
</basicCorrelatedFaults>
  <isolateDetectedFault>
    <lruItem>
      <lru>
        <name>Bicycle chain</name>
        <identNumber>
          <manufacturerCode>KZ120</manufacturerCode>
          <partAndSerialNumber>
            <partNumber>Tchain-120</partNumber>
          </partAndSerialNumber>
        </identNumber>
      </lru>
    </lruItem>
  </isolateDetectedFault>
  <remarks><simplePara>Prepare the derailleur to put transmission chain back on pedal mechanism.</simplePara></remarks>
</correlatedFault>
```

## 2.5.7.1 Messages and warnings

**Description:** The element `<basicCorrelatedFaults>` contains the list of basic faults (messages and/or warnings) that have been correlated.

**Markup element:** `<basicCorrelatedFaults>`

ICN-S3627-S1000D0516-002-01

Fig 16 Element `<basicCorrelatedFaults>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<warningMalfunction>`. Refer to [Para 2.5.7.1.1](#).
- `<warningMalfunctionAlts>`. Refer to [Para 2.5.7.1.2](#).
- `<assocWarningMalfunction>`. Refer to [Para 2.5.7.1.3](#).
- `<assocWarningMalfunctionAlts>`. Refer to [Para 2.5.7.1.4](#).
- `<bitMessage>`. Refer to [Para 2.5.7.1.5](#).
- `<bitMessageAlts>`. Refer to [Para 2.5.7.1.6](#).

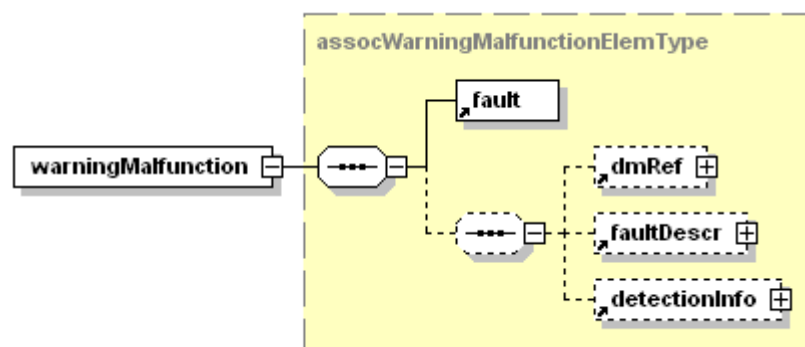

#### Markup example:

```
<basicCorrelatedFaults>
<bitMessage><fault faultCode="100FC01"/>
<faultDescr>
<descr>The pedal mechanism is jammed</descr>
</faultDescr>
</bitMessage>
<bitMessage><fault faultCode="200FC01"/>
<faultDescr>
<descr>The derailleur is jammed</descr>
</faultDescr>
</bitMessage>
</basicCorrelatedFaults>
```

#### 2.5.7.1.1 Warning or malfunction

**Description:** The basic fault (warning or malfunction) which is part of the current correlated fault.

**Markup element:** `<warningMalfunction>`

ICN-S3627-S1000D0517-001-01

Fig 17 Element `<warningMalfunction>`

**Attributes:**

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- faultPartCategory (O), the category of the fault part of the correlation
- subCategory (O), the subcategory of the fault part of the correlation
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <fault>, the basic fault presented through the attribute faultCode
- <dmRef>, an optional reference to the data module where the unitary fault has been introduced (eg, a reference to a "detected fault list" data module). Refer to [Chap 3.9.5.2.1.2](#).
- <faultDescr>. Refer to [Para 2.5.1.1](#).
- <detectionInfo>. Refer to [Para 2.5.1.3](#).

**Markup example:**

```
<warningMalfunction>
<fault faultCode="100FC01"/>
</warningMalfunction>
```

#### 2.5.7.1.2 *Warning or malfunction alternates group*

**Description:** The element <warningMalfunctionAlts> is an alternates group that provides the capability to group several alternate solutions of a basic fault (element <warningMalfunction>). Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** <warningMalfunctionAlts>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <warningMalfunction>. Refer to [Para 2.5.7.1.1](#).

**Markup example:**

```
<warningMalfunctionAlts>
<warningMalfunction id="warn1">
<fault faultCode="100FC01"/>
```

```

</warningMalfunction>
<warningMalfunction id="warn2">
<fault faultCode="100FC02"/>
</warningMalfunction>
</warningMalfunctionAlts>

```

#### 2.5.7.1.3 Associated warning or malfunction

**Description:** The associated fault (warning or malfunction) which is part of the current correlated fault.

**Markup element:** `<assocWarningMalfunction>`

##### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- faultPartCategory (O), the category of the fault part of the correlation
- subCategory (O), the subcategory of the fault part of the correlation
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<fault>`, the basic fault presented through the attribute faultCode
- `<dmRef>`, an optional reference to the data module where the unitary fault has been introduced (eg, a reference to a "detected fault list" data module). Refer to [Chap 3.9.5.2.1.2](#).
- `<faultDescr>`. Refer to [Para 2.5.1.1](#).
- `<detectionInfo>`. Refer to [Para 2.5.1.3](#).

##### Markup example:

```

<assocWarningMalfunction>
<fault faultCode="100FC01"/>
</assocWarningMalfunction>

```

#### 2.5.7.1.4 Associated warning or malfunction alternates group

**Description:** The element `<assocWarningMalfunctionAlts>` is an alternates group that provides the capability to group several alternate solutions of element `<assocWarningMalfunction>`. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** `<assocWarningMalfunctionAlts>`

##### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<assocWarningMalfunction>](#). Refer to [Para 2.5.7.1.3](#).

#### Markup example:

```
<assocWarningMalfunctionAlts>
<assocWarningMalfunction id="assocWarn1">
<fault faultCode="100FC01"/>
</assocWarningMalfunction>
<assocWarningMalfunction id="assocWarn2">
<fault faultCode="100FC02"/>
</assocWarningMalfunction>
</assocWarningMalfunctionAlts>
```

#### 2.5.7.1.5 Computerized message from built-in test equipment

**Description:** The basic fault (computerized message or warning/malfunction) which is part of the current correlated fault.

**Markup element:** [<bitMessage>](#)

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- faultPartCategory (O), the category of the fault part of the correlation
- subCategory (O), the subcategory of the fault part of the correlation
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<fault>](#), the basic fault presented through the attribute faultCode
- [<dmRef>](#), an optional reference to the data module where the unitary fault has been introduced (eg, a reference to a "detected fault list" data module). Refer to [Chap 3.9.5.2.1.2](#).
- [<faultDescr>](#). Refer to [Para 2.5.1.1](#).
- [<detectionInfo>](#). Refer to [Para 2.5.1.3](#).

#### Business rule decision point BRDP-S1-00192 - Use of correlation fault concept:

- Decide whether to use the correlated fault concept.

#### Business rule decision point BRDP-S1-00193 - Use of correlated fault messages and warnings:

- Decide how to populate the elements [<warningMalfunction>](#), [<assocWarningMalfunction>](#) and [<bitMessage>](#) when using the correlated fault concept.

## Business rule decision point BRDP-S1-00194 - Use of detection and description information elements:

- Decide whether the repetition of the detection and description information for the basic fault which has been correlated (elements [<faultDescr>](#) and [<detectionInfo>](#)) is used. Projects can consider that the detection and description information can for example be populated during IETP generation by picking up the information in the detected fault list data module describing the basic faults.

### Markup example:

```
<bitMessage>
<fault faultCode="100FC01"/>
<faultDescr>
<descr>The pedal mechanism is jammed</descr>
</faultDescr>
</bitMessage>
```

### 2.5.7.1.6 Computerized message from built-in test equipment alternates group

**Description:** The element [<bitMessageAlts>](#) is an alternates group that provides the capability to group several alternate solutions of element [<bitMessage>](#). Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** [<bitMessageAlts>](#)

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- [<bitMessage>](#). Refer to [Para 2.5.7.1.5](#).

### Markup example:

```
<bitMessageAlts>
<bitMessage><fault faultCode="100FC01"/>
<faultDescr>
<descr>The pedal mechanism is jammed</descr>
</faultDescr>
</bitMessage>
<bitMessage><fault faultCode="200FC01"/>
<faultDescr>
<descr>The derailleur is jammed</descr>
</faultDescr>
</bitMessage>
</bitMessageAlts>
```

## 2.5.8 Correlated faults alternates group

**Description:** The element `<correlatedFaultAlts>` is an alternates group that provides the capability to group several alternate solutions of a correlated fault. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** `<correlatedFaultAlts>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<correlatedFault>`. Refer to [Para 2.5.7](#).

### Markup example:

```
<correlatedFaultAlts id="fltc-001">
  <correlatedFault id="CFS0001">
    <basicCorrelatedFaults>
      <bitMessage><fault faultCode="100FC01"/>
      <faultDescr>
        <descr>The pedal mechanism is jammed</descr>
      </faultDescr>
    </bitMessage>
    <bitMessage><fault faultCode="200FC01"/>
    <faultDescr>
      <descr>The derailleur is jammed</descr>
    </faultDescr>
    </bitMessage>
  </basicCorrelatedFaults>
  <isolateDetectedFault>
    <lruItem>
      <lru></lru>
    </lruItem>
  </isolateDetectedFault></correlatedFault>
  <correlatedFault id="CFS0002">
    <basicCorrelatedFaults>
      <bitMessage><fault faultCode="100FC02"/>
      <faultDescr>
        <descr>The joystick mechanism is jammed</descr>
      </faultDescr>
    </bitMessage>
    <bitMessage><fault faultCode="200FC02"/>
    <faultDescr>
      <descr>The derailleur is jammed</descr>
    </faultDescr>
  </bitMessage>
</correlatedFaultAlts>
```

```

## 2.6 Fault isolation

**Description:** The fault isolation branch of the Schema identifies and describes the fault and gives the diagnostic path to isolate a faulty item.

**Markup element:** `<faultIsolation>`

ICN-S3627-S1000D0518-001-01

Fig 18 Element `<faultIsolation>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<commonInfo>`. Refer to [Chap 3.9.5.2.1.12](#).
- `<preliminaryRqmts>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<faultIsolationProcedure>`. Refer to [Para 2.6.1](#).

### Markup example:

```

## 2.6.1 Fault isolation procedure

**Description:** The element [<faultIsolationProcedure>](#) contains the detailed fault isolation procedure including fault code, fault description, and the possible causes of the malfunction that can be isolated through the fault isolation procedure.

Markup element: `<faultIsolationProcedure>`

ICN-S3627-S1000D0519-002-01

Fig 19 Element `<faultIsolationProcedure>`

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<fault>`, the basic fault presented through the attribute faultCode
- `<faultDescr>`. Refer to [Para 2.5.1.1](#).
- `<possibleCauseGroup>`. Refer to [Para 2.6.1.1](#).
- `<isolationProcedure>`. Refer to [Para 2.6.1.2](#).

#### Markup example:

```
<faultIsolationProcedure>
<fault faultCode="NYCJD04"/>
<faultDescr><descr>Tire does not function correctly</descr>
</faultDescr>
<isolationProcedure>

#### 2.6.1.1 List of possible causes

**Description:** The element [possibleCauseGroup](#) provides the list of all possible causes of the fault that can be isolated through a fault isolation procedure.

Markup element: `<possibleCauseGroup>`

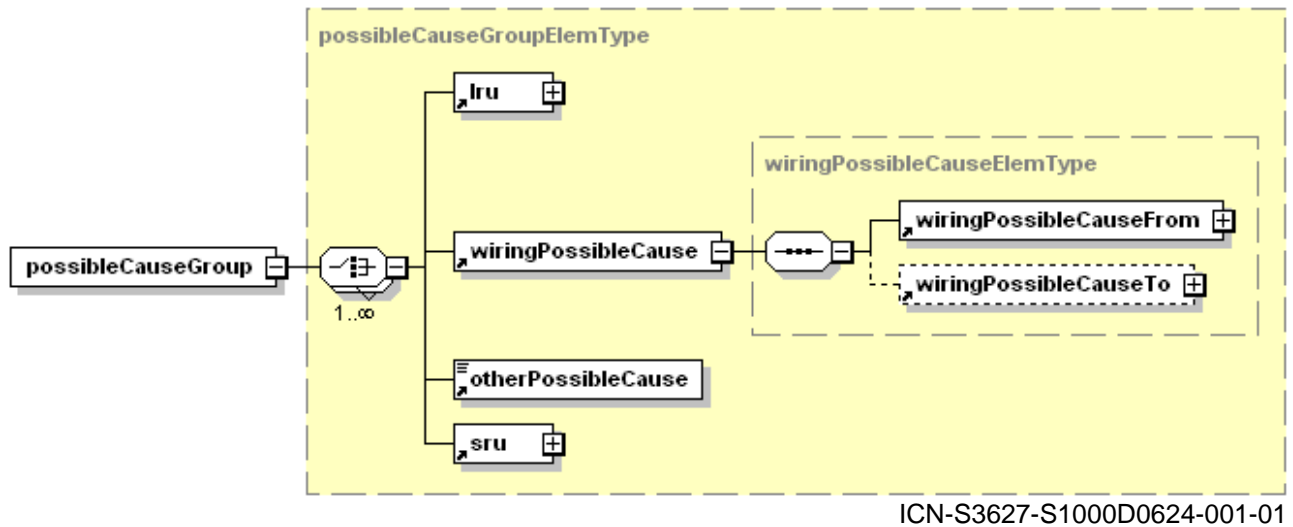

Fig 20 Element `<possibleCauseGroup>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<lru>`. LRU possible cause. Refer to [Para 2.5.1.3.2](#).
- `<wiringPossibleCause>`. Wiring path possible cause. Refer to [Para 2.6.1.1.1](#).
- `<otherPossibleCause>`. Other possible cause. Refer to [Para 2.6.1.1.4](#).
- `<sru>`. SRU possible cause. Refer to [Para 2.5.1.3.4](#).

#### Markup example:

```
<possibleCauseGroup>
<lru id="pc1">
<name>ACTUATOR-AIR INTAKE FLAP</name>
<functionalItemRef functionalItemNumber="516KB"/>
</lru>
<wiringPossibleCause id="pc2">
<wiringPossibleCauseFrom>
<functionalItemRef functionalItemNumber="4926VC"/>
<contactIdentification contactIdent="3"/>
</wiringPossibleCauseFrom>
<wiringPossibleCauseTo>
<name>ground point</name>
</wiringPossibleCauseTo>
</wiringPossibleCause>
<otherPossibleCause id="pc3">Lubrication of the
NLG</otherPossibleCause>
<sru id="pc4">
<identNumber>
<manufacturerCode>KT666</manufacturerCode>
```

```

<partAndSerialNumber>
<partNumber>TIRES-010101</partNumber>
</partAndSerialNumber>
</identNumber>
</sru>
</possibleCauseGroup>

```

#### 2.6.1.1.1 Wiring path possible cause

**Description:** The element `<wiringPossibleCause>` describes a wiring path that is a possible cause of a fault. It can also be used to identify a single electrical connection point. The element `<wiringPossibleCause>` contains the two ends of the wiring path.

**Markup element:** `<wiringPossibleCause>`

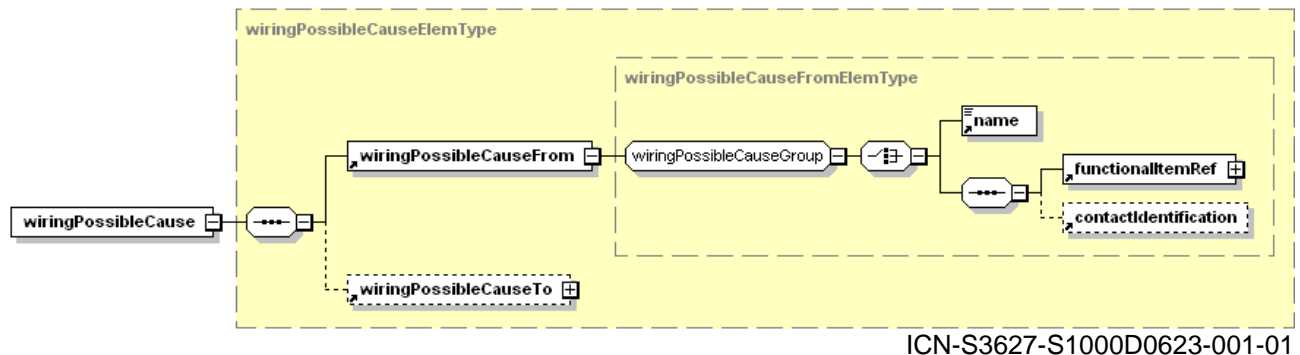

Fig 21 Element `<wiringPossibleCause>`

#### Attributes:

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<wiringPossibleCauseFrom>`, the "from" wiring path extremity. Refer to [Para 2.6.1.1.2](#).
- `<wiringPossibleCauseTo>`, the "to" wiring path extremity (not applicable if the possible cause is a single electrical connection point). Refer to [Para 2.6.1.1.2](#).

#### Markup example:

```

<wiringPossibleCause id="pc2">
<wiringPossibleCauseFrom>
<functionalItemRef functionalItemNumber="59KD">
<name>ECB-APU ELECTRONIC CONTROL BOX</name>
</functionalItemRef>
<contactIdentification contactIdent="AC/3"/>
</wiringPossibleCauseFrom>
<wiringPossibleCauseTo>
<functionalItemRef functionalItemNumber="4926VC"/>
<contactIdentification contactIdent="1"/>
</wiringPossibleCauseTo>
</wiringPossibleCause>

```

#### 2.6.1.1.2 *Wiring path extremities (from/to)*

**Description:** The wiring path extremity elements [<wiringPossibleCauseFrom>](#) and [<wiringPossibleCauseTo>](#) contain the wiring path connection information.

**Markup elements:** [<wiringPossibleCauseFrom>](#) and [<wiringPossibleCauseTo>](#)

**Attributes:**

- None

**Child elements:**

- [<name>](#), the wire extremity name (eg, "ground point", "next terminal block")
- [<functionalItemRef>](#), the equipment functional item reference
- [<contactIdentification>](#), the contact identification. Refer to [Para 2.6.1.1.3](#).

**Markup example:**

```
<wiringPossibleCause id="pc3">
  <wiringPossibleCauseFrom>
    <functionalItemRef functionalItemNumber="4926VC" />
    <contactIdentification contactIdent="3" />
  </wiringPossibleCauseFrom>
  <wiringPossibleCauseTo>
    <name>ground point</name>
  </wiringPossibleCauseTo>
</wiringPossibleCause>
```

#### 2.6.1.1.3 *Contact identification*

**Description:** The element [<contactIdentification>](#) contains the contact identification of a functional item.

**Attributes:**

- [contactIdent](#) (M), contains the identification of the contact, (eg, "A", "1")

**Child elements:**

- None

**Markup example:**

```
<contactIdentification contactIdent="1" />
```

#### 2.6.1.1.4 *Other possible causes*

**Description:** The element [<otherPossibleCause>](#) contains the textual description of any possible cause that is not an lru or a wiring path, such as an immaterial possible cause (eg, "MLG wheel balance", "Oil level of the MLG shock absorber").

**Markup element:** [<otherPossibleCause>](#)

**Attributes:**

- [applicRefId](#) (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- [id](#) (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [changeType](#) (O), [changeMark](#) (O) and [reasonForUpdateRefIds](#) (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

```
<otherPossibleCause id="pc3">Lubrication of the NLG
</otherPossibleCause>
```

## 2.6.1.2 Isolation procedure

**Description:** The element [<isolationProcedure>](#) contains the isolation procedure including preliminary and close-up requirements.

**Markup element:** [<isolationProcedure>](#)

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `independentCheck` (O), the complete core procedure must be checked by a supervisor with a given qualification
- `skillLevelCode` (O), the skill level to which the procedure has been written. Refer to [Chap 3.9.5.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<preliminaryRqmts>](#). Refer to [Chap 3.9.5.2.1.9](#).
- [<isolationMainProcedure>](#). Refer to [Para 2.6.1.3](#).
- [<closeRqmts>](#). Refer to [Para 2.6.1.8](#) and [Chap 3.9.5.2.1.9](#).

**Business rule decision point BRDP-S1-00195 - Use of the attribute `independentCheck` on the elements [<isolationProcedure>](#), [<isolationStep>](#) and [<isolationProcedureEnd>](#):**

- Decide whether to use the attribute `independentCheck`, which values to use and allocate suitable definitions.

**Markup example:**

```

## 2.6.1.4 Fault isolation step

**Description:** The element `<isolationStep>` contains the textual description of the action, the question and answer alternatives. It can also include a title, warnings, cautions and notes.

**Markup element:** `<isolationStep>`

ICN-S3627-S1000D0521-003-01

Fig 23 Element `<isolationStep>`

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `keepWithNext` (O), the indication whether a step must be presented together with the next step, if possible. The attribute `keepWithNext` is intended for use only when absolutely necessary in a situation where for instance scrolling is not practical for the user, or the viewing device does not allow scrolling. The attribute `keepWithNext` can have one of the following values:
  - "0" (D) - No, the step must not be kept with the next sibling step.
  - "1" - Yes, the step must be kept with the next sibling step (if one exists) and all children of the element for which the attribute is set should be kept together as well (if possible). The attribute `keepWithNext` has no meaning on a final step.

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- independentCheck (O), the isolation step must be checked by a supervisor with a given qualification
- skillLevelCode (O), the skill level to which the procedure has been written. Refer to [Chap 3.9.5.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

#### Child elements:

- <title>. Refer to [Para 2.6.1.4.1](#) for the use of titles. Refer to [Chap 3.9.5.2.1.5](#) for general rules.
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <action>. Refer to [Para 2.6.1.4.2](#).
- <actionAlts>. Refer to [Para 2.6.1.4.3](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).
- <isolationStepQuestion>, the textual question based on the corresponding action. Refer to [Para 2.6.1.4.4](#).
- <isolationStepAnswer>, the answers to the question. Refer to [Para 2.6.1.4.5](#).

#### 2.6.1.4.1 Title

**Description:** The element <title> contains the title of the step.

**Markup element:** <title>

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- All child text elements of the element <action> can be used. Refer to [Para 2.6.1.4.2](#) and [Chap 3.9.5.2.1.10](#).

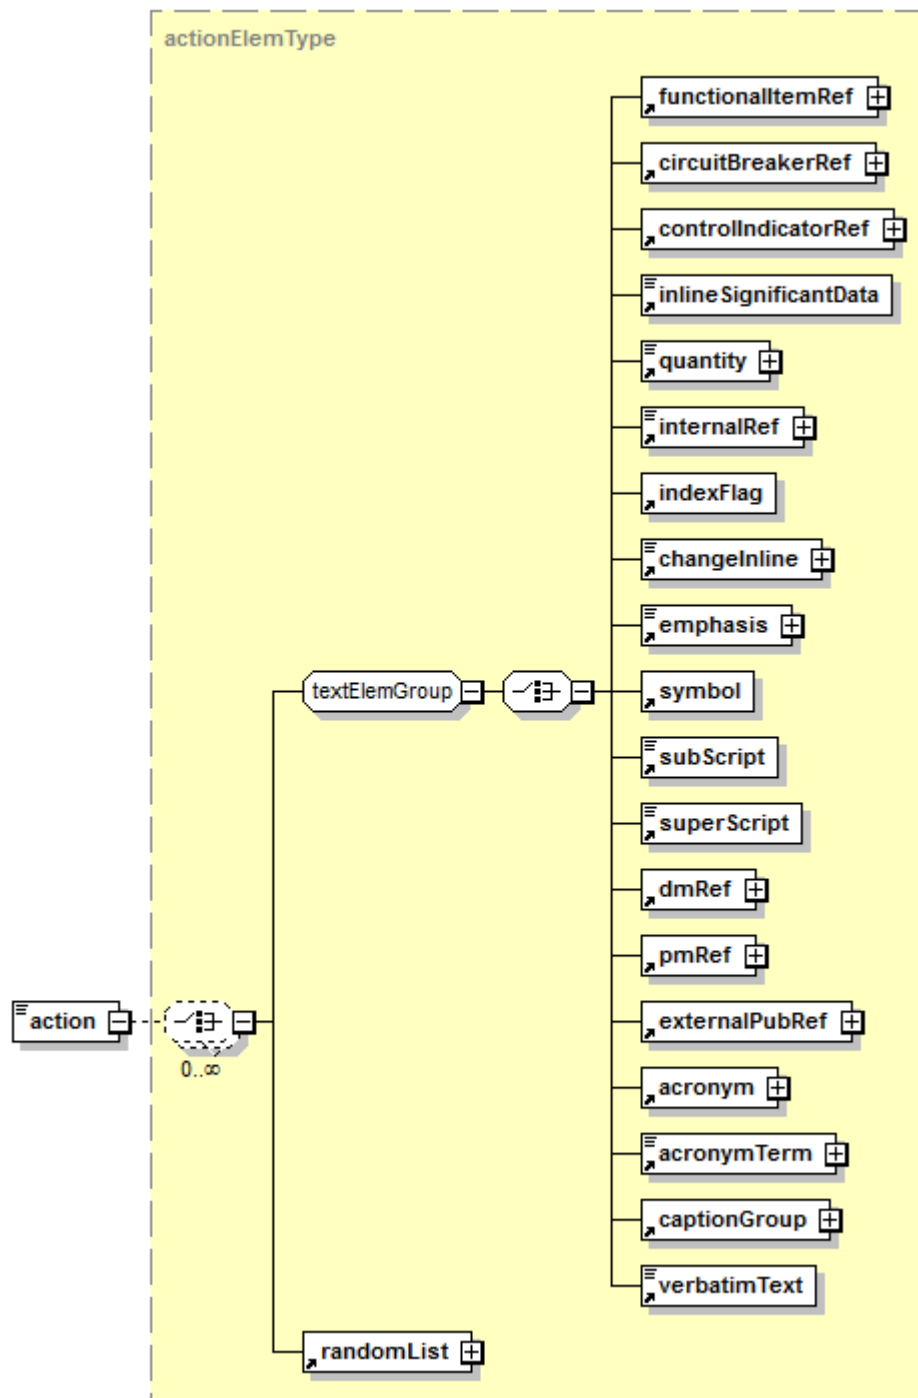

#### Markup example:

```
<title>Tire Pressure</title>
```

#### 2.6.1.4.2 Action

**Description:** The element <action> contains an action in the isolation procedure.

Markup element: `<action>`

ICN-S3627-S1000D0522-002-01

Fig 24 Element `<action>`

**Attributes:**

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- All text elements given in [Fig 24](#) can be used. Refer to [Chap 3.9.5.2.1.10](#).
- `<randomList>`. Refer to [Chap 3.9.5.2.1.3](#).

#### Markup example:

```
<action>Use the tire pressure gauge (<internalRef
internalRefId="seq-0001" internalRefTargetType="irtt05"/> to do
a check of the pressure</action>
```

#### 2.6.1.4.3 Action alternates group

Description: The element `<actionAlts>` is an alternates group that provides the capability to group several alternate solutions of the action. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

#### Markup element: `<actionAlts>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<action>`. Refer to [Para 2.6.1.4.2](#).

#### 2.6.1.4.4 Question

Description: The element `<isolationStepQuestion>` contains the question that is prompted by the action contained in the element `<action>`.

#### Markup element: `<isolationStepQuestion>`

ICN-C0419-S1000D0282-001-01

Fig 25 Element `<isolationStepQuestion>`

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- <subScript>. The items to be subscripted. Refer to [Chap 3.9.5.2.1.10](#).
- <superScript>. The items to be superscripted. Refer to [Chap 3.9.5.2.1.10](#).

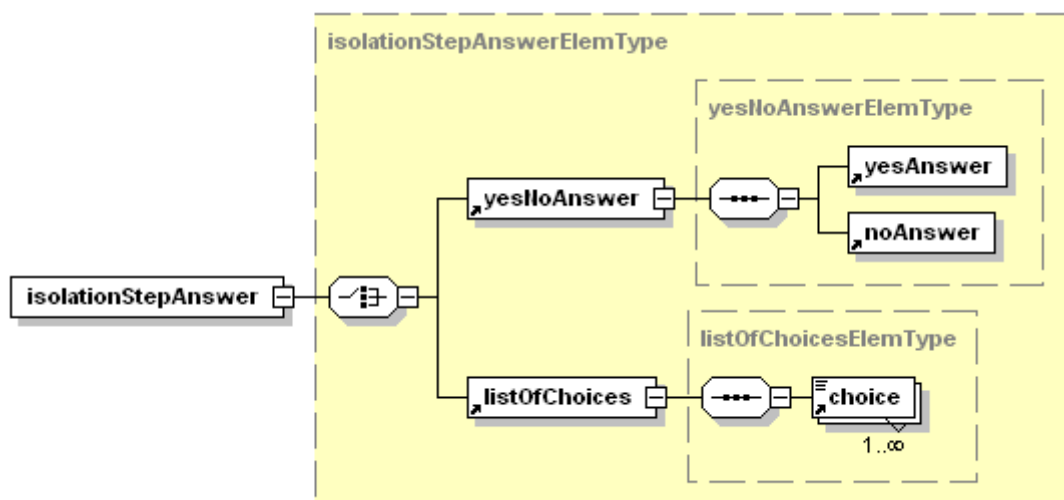

**Markup example:**

```
<isolationStepQuestion>What is the tire pressure reading?
</isolationStepQuestion>
```

## 2.6.1.4.5 Answer

**Description:** The element <isolationStepAnswer> contains the answers to the corresponding question (element <isolationStepQuestion>). The answers are given in the form of a reference to another action, to one or more final actions (element <isolationProcedureEnd>) or to close-up requirements (element <closeRqmts>).

**Markup element:** <isolationStepAnswer>

ICN-S3627-S1000D0523-001-01

Fig 26 Element <isolationStepAnswer>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <yesNoAnswer>. Refer to [Para 2.6.1.4.6](#).
- <listOfChoices>. Refer to [Para 2.6.1.4.9](#).

#### 2.6.1.4.6 Answers - Yes or No

**Description:** The element `<yesNoAnswer>` contains the selection of the two answers Yes (element `<yesAnswer>`) or No (element `<noAnswer>`).

**Markup element:** `<yesNoAnswer>`

**Attributes:**

- None

**Child elements:**

- `<yesAnswer>`, contains the action for a positive answer. Refer to [Para 2.6.1.4.7](#).
- `<noAnswer>`, contains the action for a negative answer. Refer to [Para 2.6.1.4.8](#).

#### 2.6.1.4.7 Yes answer

**Description:** The element `<yesAnswer>` provides the internal link to the next action related to a positive answer.

**Markup element:** `<yesAnswer>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `nextActionRefId` (M), the identifier for the next action

**Child elements:**

- None

#### 2.6.1.4.8 No answer

**Description:** The element `<noAnswer>` provides the internal link to the next action related to a negative answer.

**Markup element:** `<noAnswer>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `nextActionRefId` (M), the identifier for the next action

**Child elements:**

- None

#### 2.6.1.4.9 Answers - Selection of choices

**Description:** The element `<listOfChoices>` contains a selection of multiple (one or more) choices.

**Markup element:** `<listOfChoices>`

**Attributes:**

- None

**Child elements:**

- `<choice>`, a possible choice. Refer to [Para 2.6.1.4.10](#).

#### 2.6.1.4.10 Choice

**Description:** The element `<choice>` provides the internal link to the next action related to a selection from a choice of answers.

**Markup element:** `<choice>`

ICN-C0419-S1000D0283-001-01

Fig 27 Element `<choice>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `nextActionRefId` (M), the identifier for the next action

#### Child elements:

- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.6.1.5 Isolation step alternates group

**Description:** The element `<isolationStepAlts>` is an alternates group that provides the capability to group several alternate solutions of the fault isolation step. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** `<isolationStepAlts>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<isolationStep>`. Refer to [Para 2.6.1.4](#).

#### Markup example:

```
<isolationStepAlts id="stpc-0001">
<isolationStep id="stp-0001">
<action>To do a check of the tire for damage</action>
<isolationStepQuestion>Is there damage to the
tire?</isolationStepQuestion>
<isolationStepAnswer>
```

```

<yesNoAnswer>
<yesAnswer nextActionRefId="stp-0003"/>
<noAnswer nextActionRefId="stp-0004"/>
</yesNoAnswer>
</isolationStepAnswer>
</isolationStep>
<isolationStep id="stp-0002">
<action>To do a check of the wheel for damage</action>
<isolationStepQuestion>Is there damage to the
wheel?</isolationStepQuestion>
<isolationStepAnswer>
<yesNoAnswer>
<yesAnswer nextActionRefId="stp-0005"/>
<noAnswer nextActionRefId="stp-0006"/>
</yesNoAnswer>
</isolationStepAnswer>
</isolationStep>
</isolationStepAlts>

```

#### 2.6.1.6 Isolation procedure end

**Description:** The element `<isolationProcedureEnd>` contains further isolation actions (these are either within the data module or referenced out to another data module) or to the element `<closeRqmts>` containing a closeup procedure.

**Markup element:** `<isolationProcedureEnd>`

##### Attributes:

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `independentCheck` (O), the isolation step must be checked by a supervisor with a given qualification
- `skillLevelCode` (O), the skill level to which the procedure has been written. Refer to [Chap 3.9.5.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

##### Child elements:

- `<title>`. Refer to [Para 2.6.1.4.1](#) for the use of titles. Refer to [Chap 3.9.5.2.1.5](#) for general rules.
- `<warning>`. Refer to [Chap 3.9.3](#).
- `<caution>`. Refer to [Chap 3.9.3](#).
- `<note>`. Refer to [Chap 3.9.3](#).
- `<action>`. Refer to [Para 2.6.1.4.2](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<figureAlts>`. Refer to [Chap 3.9.5.2.1.7](#).

- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimediaAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).

#### Markup example:

```
<isolationProcedureEnd id="stp-0002">
<action>Deflate the tire until the pressure is 2700 hPa</action>
</isolationProcedureEnd>
```

#### 2.6.1.7 Isolation procedure end alternates group

**Description:** The element `<isolationProcedureEndAlts>` is an alternates group that provides the capability to group several alternate solutions of the isolation procedure end. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** `<isolationProcedureEndAlts>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<isolationProcedureEnd>`. Refer to [Para 2.6.1.6](#).

#### Markup example:

```
<isolationProcedureEndAlts id="ipe-0002">
<isolationProcedureEnd id="ipe-0002">
<action>Deflate the tire until the pressure is 2700 hPa</action>
</isolationProcedureEnd>
<isolationProcedureEnd id="ipe-0003">
<action>Inflate the tire as given in <dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="1" subSubSystemCode="0"
assyCode="20" disassyCode="00" disassyCodeVariant="AA"
infoCode="215" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</action>
</isolationProcedureEnd>
</isolationProcedureEndAlts>
```

## 2.6.1.8 Close-up requirements

**Description:** The element `<closeRqmts>` contains any actions/conditions that must be in place before the equipment, which was the object of the procedure, is returned to operation. Refer to [Chap 3.9.5.2.1.9](#).

**Markup element:** `<closeRqmts>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<reqCondGroup>`. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<faultIsolation>
<faultIsolationProcedure>
<fault faultCode="NYCJD04"/>
<faultDescr><descr>Tire does not function correctly</descr>
</faultDescr>
<isolationProcedure>
<preliminaryRqmts><reqCondGroup><noConds/></reqCondGroup>
<reqSupportEquips><supportEquipDescrGroup>

**Chap 3.9.5.2.5**

## 1 General

The maintenance planning ("schedule") Schema is used to capture and represent maintenance planning information in data modules.

## 2 Maintenance planning information

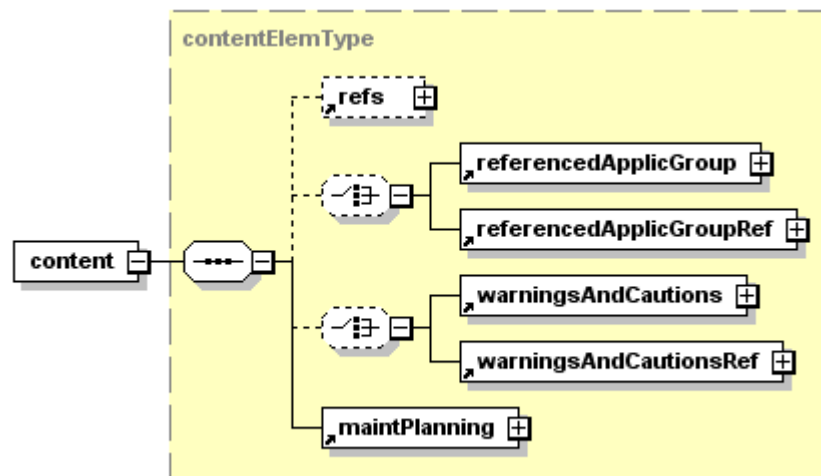

### 2.1 Schema basic rules

The granularity of these data modules is determined by the application of the SNS in accordance with [Chap 8.2.1](#) and the data module coding guidance given in [Chap 5.2.1.6](#).

### 2.2 Content

**Description:** The element `<content>` contains the content section of the maintenance planning data modules. The maintenance planning ("schedule") Schema can be used for several types of maintenance planning information.

**Markup element:** `<content>`

ICN-S1000D-A-030905-D-F6117-25006-A-001-01

Fig 1 Major elements in maintenance planning content

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<warningsAndCautions>`. Refer to [Chap 3.9.3](#).
- `<warningsAndCautionsRef>`. Refer to [Chap 3.9.3](#).
- `<maintPlanning>`, the collection of maintenance planning information. Refer to [Para 2.3](#).

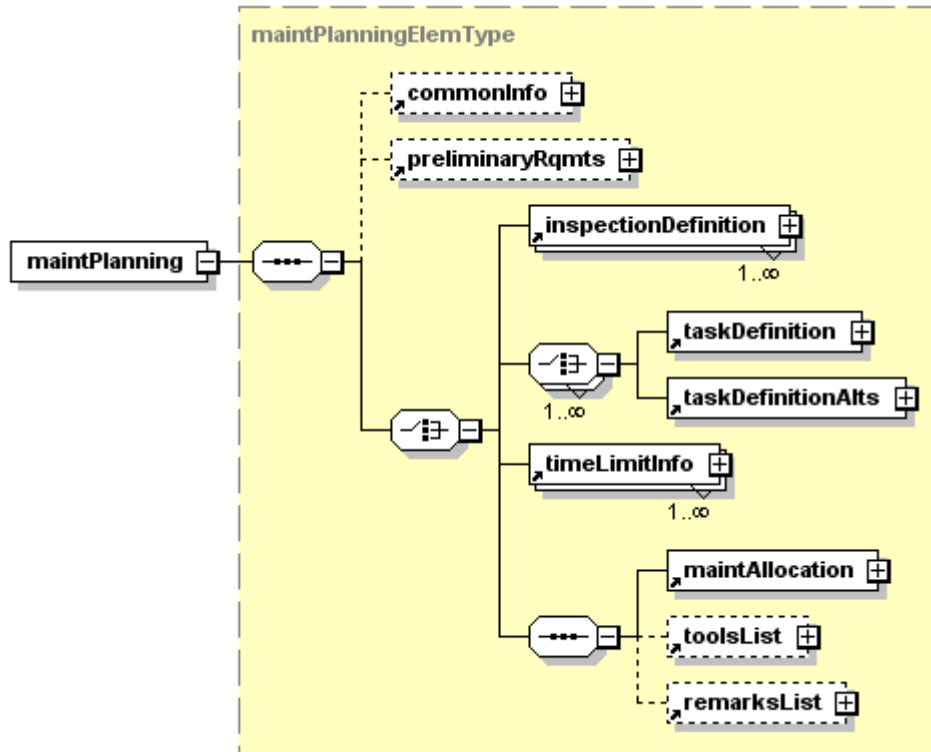

## 2.3 Maintenance planning

**Description:** The element `<maintPlanning>` contains maintenance planning information of four types:

- Time limits - Information about periodicities and life details for a system
- Task definitions - Information about individual tasks to be carried out on a system

- Inspection definitions - Groups of maintenance tasks or inspections
- Maintenance allocation - Collection of maintenance functions along with maintenance levels and time associated for each task

Markup element: `<maintPlanning>`

ICN-S1000D-A-030905-D-F6117-25001-A-002-01

Fig 2 Element `<maintPlanning>`

#### Attributes:

- `maintPlanningType` (O), the textual information used to classify the maintenance planning data

#### Child elements:

- `<commonInfo>`. Refer to [Chap 3.9.5.2.1.12](#).
- `<preliminaryRequirements>`. Refer to [Para 2.4](#) and [Chap 3.9.5.2.1.9](#).
- `<inspectionDefinition>`. Refer to [Para 2.5](#).
- `<taskDefinition>`. Refer to [Para 2.6](#).
- `<taskDefinitionAlts>`. Refer to [Para 2.7](#).
- `<timeLimitInfo>`. Refer to [Para 2.8](#).
- `<maintAllocation>`. Refer to [Para 2.9](#).
- `<toolsList>`. Refer to [Para 2.10](#).
- `<remarksList>`. Refer to [Para 2.11](#).

## 2.4

### Rolling-up preliminary requirements

The concept of roll-up is an important part of efficiency in preventive maintenance planning. It ensures that the right number of personnel, with the required skills and trade, are available to carry out the tasks at their allotted periodicity. In support of these tasks, it also ensures that the right numbers and types of technical information, support equipment and supplies are available.

The actual activity of rolling-up resources for the preliminary requirements of an inspection definition is carried out during the Logistics Support Analysis (LSA) process, and is typically carried out by the analyst and not the author. This preliminary requirements construct is for the author to record the results of that analysis for each inspection, should they become available.

Depending on the project or organization requirements and the availability of the data, the top level preliminary requirements are used when individual tasks belonging to the same inspection (eg, pre-flight) have different preliminary requirements that result in a collection of preliminary requirements which differs from each individual task's preliminary requirements.

If required by the project or the organization, the rolled up preliminary requirements data are the Maintenance Task Analysis (MTA) results from, for example, [S3000L](#). These are based on the results from preventive maintenance analysis from, for example, MSG-3, [S4000P](#).

#### 2.4.1 Example

A Product is comprised of two systems, an engine (SNS = 72-00-00) and a hydraulic system (SNS = 29). Preventive maintenance analysis has shown that the engine requires three preventive maintenance tasks to be carried out and that the hydraulic system requires two tasks.

##### 2.4.1.1 Task definition data module

In the task definition data module for the engine (SNS = 05-20-72), the three preventative maintenance tasks are:

- Task 1 is a daily task that requires a 13 mm wrench, which is listed in the Task 1 preliminary requirements in the required support equipment, using the element [<reqSupportEquips>](#) and its substructure.
- Task 2 is a bi-weekly task also requiring a 13 mm wrench, which is listed in the Task 2 preliminary requirements in the required support equipment, using the element [<reqSupportEquips>](#) and its substructure. Due to equipment availability, this task can only be carried out on the first and third Monday of each month.
- Task 3 is a three-monthly task also requiring a 13 mm wrench, which is listed in the Task 3 preliminary requirements in the required support equipment, using the element [<reqSupportEquips>](#) and its substructure. Due to equipment availability, this task can only be carried out on the last Friday of the month.

In this task definition data module, each task's preliminary requirements section lists a single 13 mm wrench. But the top level preliminary requirements roll these quantities up to three. This means that, for maintenance planning, three 13 mm wrenches are required to support the preventive maintenance tasks on the system indicated in the SNS.

In the task definition data module for the hydraulic power system (SNS = 05-20-29), the three preventive maintenance tasks are:

- Task A is a bi-weekly task also requiring a 13 mm wrench, which is listed in the Task A preliminary requirements in the required support equipment, using the element [<reqSupportEquips>](#) and its substructure. Due to equipment availability, this task can only be carried out on the second and fourth Monday of each month:

Therefore in the task definition data module for system 29, Task A has the single 13 mm wrench requirement in its own preliminary requirements and the top level preliminary requirements also records a single 13 mm wrench.

##### 2.4.1.2 Inspection data module

Inspection data modules list preventive maintenance tasks, grouped in some logical manner, where the tasks do not necessarily belong to one system. For the purpose of this example, the inspection includes tasks 1, 2 and 3 from the engine's task definition data module and a task (Task A) from a different system (eg, System 29 - Hydraulic power).

The inspection in this example comprises all four tasks from the system 29 and the system 72 task definitions. Looking at the top level preliminary requirements of the task definition for system 29, a single 13 mm wrench is required. The top level preliminary requirements of the task definition for system 72 show that three 13 mm wrenches are required. This would indicate that a total of four 13 mm wrenches are required.

However, because only Task 1 and Task A occur on the same day, the total number of 13 mm wrenches required for this inspection is two. This is recorded in the top level preliminary requirements using the element `<reqSupportEquips>` and its substructure.

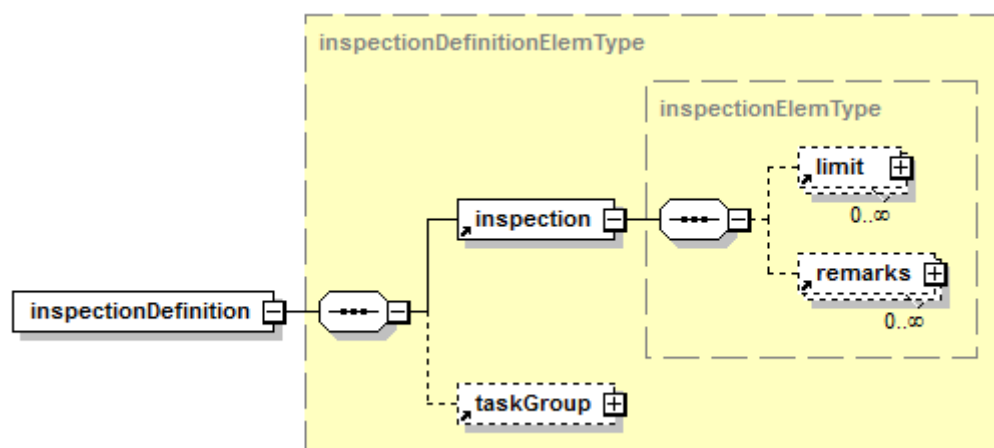

**Business rule decision point BRDP-S1-00562 - Use of the top level preliminary requirements construct for maintenance inspections:**

- Decide whether to use the top level preliminary requirements for maintenance inspections.

## 2.5 Inspection definition

**Description:** The element `<inspectionDefinition>` contains information about inspections. Inspections are a way to group tasks that are related to the topic or intent of the inspection. The element `<inspectionDefinition>` groups a set of tasks with the limit information associated, to perform the set of tasks.

**Markup element:** `<inspectionDefinition>`

ICN-S3627-S1000D0655-001-01

Fig 3 Element `<inspectionDefinition>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

**Child elements:**

- `<inspection>`, the inspection information. Refer to [Para 2.5.1](#).
- `<taskGroup>`, the list of tasks associated with the inspection. Refer to [Para 2.5.2](#).

### 2.5.1 Inspection information

**Description:** The element `<inspection>` groups the inspection limit information with the associated remark information.

**Markup element:** `<inspection>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

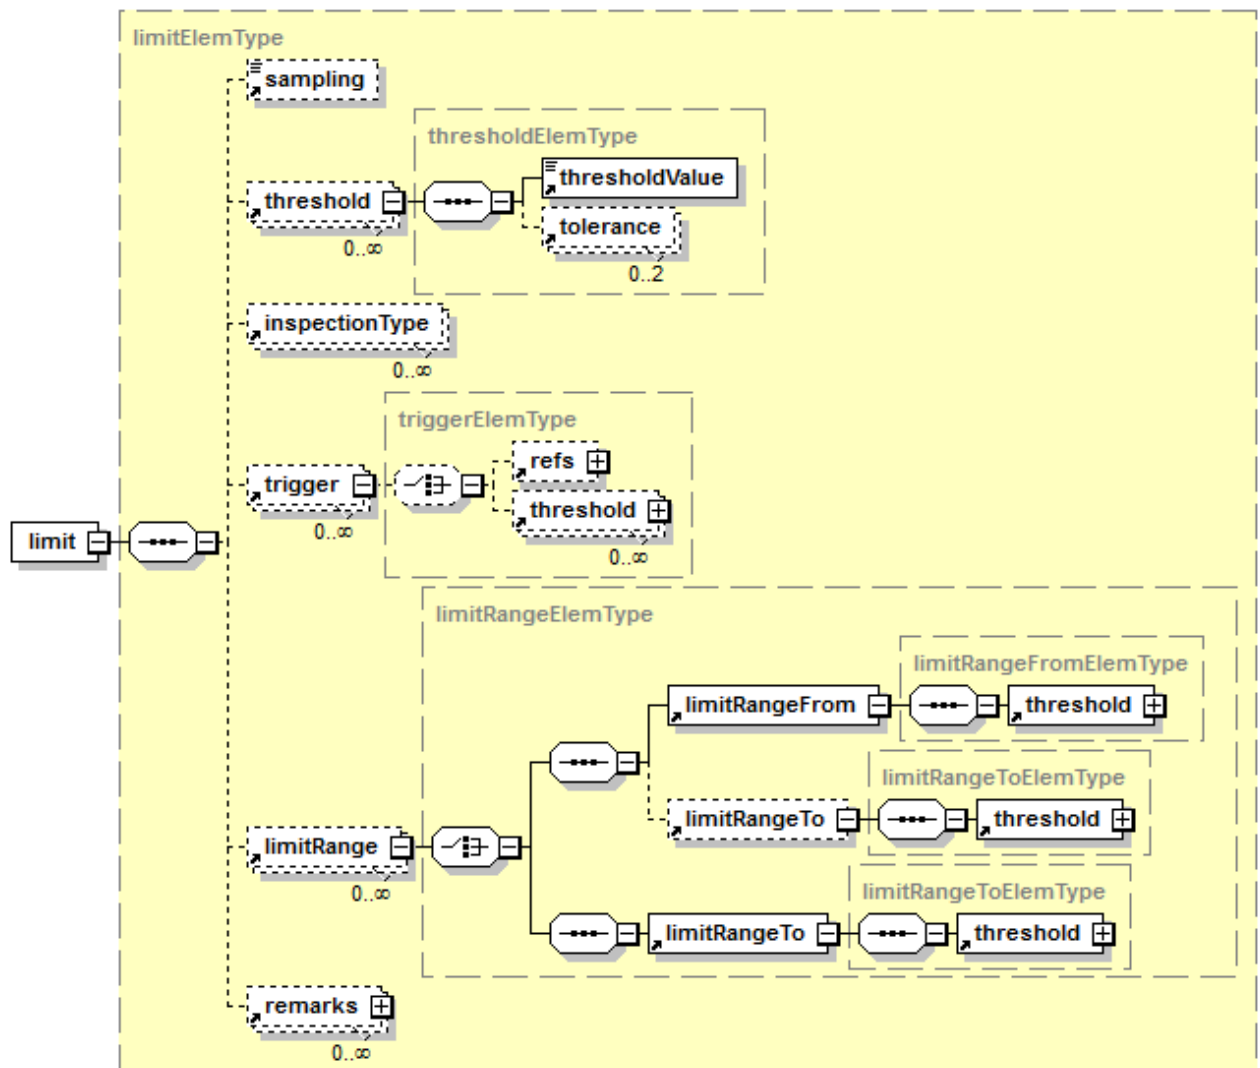

**Child elements:**

- `<limit>`, the interval between inspections, or the threshold before which an inspection must be performed. The limits can be associated with units of calendar time, number of events or with the occurrence of specific events. Refer to [Para 2.5.1.1](#).
- `<remarks>`, the textual comment giving further information about the inspection. Refer to [Chap 3.9.5.1](#).

## 2.5.1.1 Limit information

**Description:** The element `<limit>` contains the information required to determine when a task must be performed.

Markup element: `<limit>`

ICN-S3627-S1000D0656-001-02

Fig 4 Element `<limit>`

#### Attributes:

- applicRefId (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- limitTypeValue (O), the limit classification. If no value is specified, the default value "pe" is implied. The attribute limitTypeValue can have one of the following values:
  - "pe" (D) - perform periodically
  - "po" - perform once
  - "oc" - on condition
- limitCond (O), the condition type of the limit (eg, maritime flight, dirty conditions) used when the attribute limitTypeValue contains the value "oc"

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <sampling>. Refer to [Para 2.5.1.1.1](#).
- <threshold>. Refer to [Para 2.5.1.1.2](#).
- <inspectionType>. Refer to [Para 2.5.1.1.4](#).
- <trigger>. Refer to [Para 2.5.1.1.5](#).
- <limitRange>. Refer to [Para 2.5.1.1.6](#).
- <remarks>. Refer to [Para 2.5.1.2](#).

#### 2.5.1.1.1 Sampling

**Description:** The element <sampling> contains a description of the sampling being used as expressed in its attributes. It is a subset of the total number of product instances on which the inspection must be performed. The sampling can be given as a percentage, a fraction or as a textual description. The element <sampling> has only textual content and must be omitted if the inspection is performed on the full set of products.

**Markup element:** <sampling>

#### Attributes:

- samplingValue (O), the number of product instances
- samplingUnit (O), the product instance name
- samplingRatio (O), the percentage of product instances to be sampled

#### Child elements:

- None

#### 2.5.1.1.2 Threshold information

**Description:** The element <threshold> contains the limit information in terms of a value before which the inspection must be performed. The value can be given in calendar time or in other terms such as the number of hours a Product has been operating.

**Markup element:** <threshold>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- thresholdUnitOfMeasure (M), the unit of measure for the threshold. The attribute thresholdUnitOfMeasure can have one of the following values:
  - "th01" thru "th99". Refer to [Chap 3.9.6.1](#).
- thresholdType (O), the starting point of the threshold. The starting point can be "from the beginning of the maintenance program" or "from the last time the inspection was performed". The attribute thresholdType can have one of the following values:
  - "threshold" - the starting point is "from the beginning of the maintenance program"
  - "interval" - the starting point is "from the last time the inspection was performed"

**Child elements:**

- `<thresholdValue>`, the value before which the inspection must be performed. The element `<thresholdValue>` has only textual content.
- `<tolerance>`, the values that can be used to expand the threshold value into a range of acceptable values. Refer to [Para 2.5.1.1.3](#).

**Markup example:**

```
<threshold thresholdUnitOfMeasure="th01">
<thresholdValue>10</thresholdValue>
</threshold>
```

2.5.1.1.3 *Tolerance information*

**Description:** The element `<tolerance>` contains the threshold minimum and maximum values between which the inspection must be performed.

**Markup element:** `<tolerance>`

**Attributes:**

- `toleranceValue` (M), the value of the threshold
- `toleranceType` (O), the tolerance type that determines whether the value is related to the minimum value, the maximum value or both values. The attribute can have one of the following values:
  - `"plus"` - maximum value
  - `"minus"` - minimum value
  - `"plusorminus"` - plusminus value
- `thresholdUnitOfMeasure` (O), the unit of measure for the tolerance value. The attribute can have one of the following values:
  - `"th01"` thru `"th99"`. Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Markup example:**

```
<threshold thresholdUnitOfMeasure="th06">
<thresholdValue>5</thresholdValue>
<tolerance toleranceType="plus" toleranceValue="3"
thresholdUnitOfMeasure="th06"/>
<tolerance toleranceType="minus" toleranceValue="2"
thresholdUnitOfMeasure="th06"/>
</threshold>
```

2.5.1.1.4 *Inspection type*

**Description:** The element `<inspectionType>` contains the classification of maintenance into various types such as "systems", "structural" and "zonal".

**Markup element:** `<inspectionType>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- inspectionTypeCategory (M), the textual classification of the inspection. When limit is used at the task level, the attribute inspectionTypeCategory allows the author to refer to the inspection id.
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (M), commercialClassification (O) and caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#)

#### Child elements:

- None

#### Business rule decision point BRDP-S1-00197 - Values for the attribute inspectionTypeCategory:

- Decide which values to use for the attribute inspectionTypeCategory and allocate suitable definitions.

#### Markup example:

```
<inspectionType inspectionTypeCategory="Preflight"/>
```

#### 2.5.1.1.5 Trigger

**Description:** The element <trigger> contains the means to establish that the inspection must be performed after a task(s) or event(s).

**Markup element:** <trigger>

#### Attributes:

- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- occurrenceTrigger (O), the description and number of tasks or events that cause the trigger
- releaseEvent (O), the trigger event that determines whether an inspection must be done before, after, or with the trigger event. The attribute can have one of the following values:
  - "before"
  - "with"
  - "after"

#### Child elements:

- <refs>. Refer to [Chap 3.9.5.2.1.2](#).
- <threshold>, the threshold value, when reached, after which the inspection must be performed. Refer to [Para 2.5.1.1.2](#).

#### Markup example:

```
<trigger releaseEvent="after">
<threshold thresholdUnitOfMeasure="th01">
...
</threshold>
</trigger>
```

#### 2.5.1.1.6 Limit range

**Description:** The element `<limitRange>` contains the two values between which the inspection must be performed.

**Markup element:** `<limitRange>`

**Attributes:**

- None

**Child elements:**

- `<limitRangeFrom>`. Refer to [Para 2.5.1.1.7](#).
- `<limitRangeTo>`. Refer to [Para 2.5.1.1.8](#).

#### 2.5.1.1.7 Limit range start

**Description:** The element `<limitRangeFrom>` contains the starting limit for a limit range between which the inspection must be performed.

**Markup element:** `<limitRangeFrom>`

**Attributes:**

- None

**Child elements:**

- `<threshold>`, the threshold value after which the inspection must be performed. Refer to [Para 2.5.1.1.2](#).

**Markup example:**

If there is a task that must be repeated every 8000 flight cycles after the 8000<sup>th</sup> flight cycle until the 48000<sup>th</sup> flight cycle, then the element `<limitRangeFrom>` need not be used. The value "8000" would be held in the element `<thresholdValue>`. The markup would look like this:

```
<limit>
<threshold thresholdUnitOfMeasure="th02"
thresholdType="threshold">
<thresholdValue>8000</thresholdValue>
</threshold>
<limitRange>
<limitRangeTo>
<threshold thresholdUnitOfMeasure="th01"
thresholdType="interval">
<thresholdValue>48000</thresholdValue>
</threshold>
</limitRangeTo>
</limitRange>
</limit>
```

If there is a task that must be repeated after an earlier event, then the element `<limitRangeFrom>` would be used. For example carry out the task 8000 flight cycles after the first 400 flight hours and repeat this task every 8000 flight cycles until 48000 flight cycles. The markup for this would look like:

```
<limit>
<threshold thresholdUnitOfMeasure="th02"
```

```
thresholdType="threshold">
<thresholdValue>8000</thresholdValue>
</threshold>
<limitRange>
<limitRangeFrom>
<threshold thresholdUnitOfMeasure="th01"
thresholdType="interval">
<thresholdValue>400</thresholdValue>
</threshold>
</limitRangeFrom>
<limitRangeTo>
<threshold thresholdUnitOfMeasure="th01"
thresholdType="threshold">
<thresholdValue>48000</thresholdValue>
</threshold>
</limitRangeTo>
</limitRange>
</limit>
```

#### 2.5.1.1.8 *Limit range end*

**Description:** The element `<limitRangeTo>` contains the ending limit for a limit range between which the inspection must be performed.

**Markup element:** `<limitRangeTo>`

**Attributes:**

- None

**Child elements:**

- `<threshold>`, the threshold value before which the inspection must be performed. Refer to [Para 2.5.1.1.2](#).

#### 2.5.1.2 *Remarks*

**Description:** The element `<remarks>` contains further information about the limit. The element `<remarks>` provides the means to convey comments on the limit information or descriptions of limits that cannot be represented with the available elements.

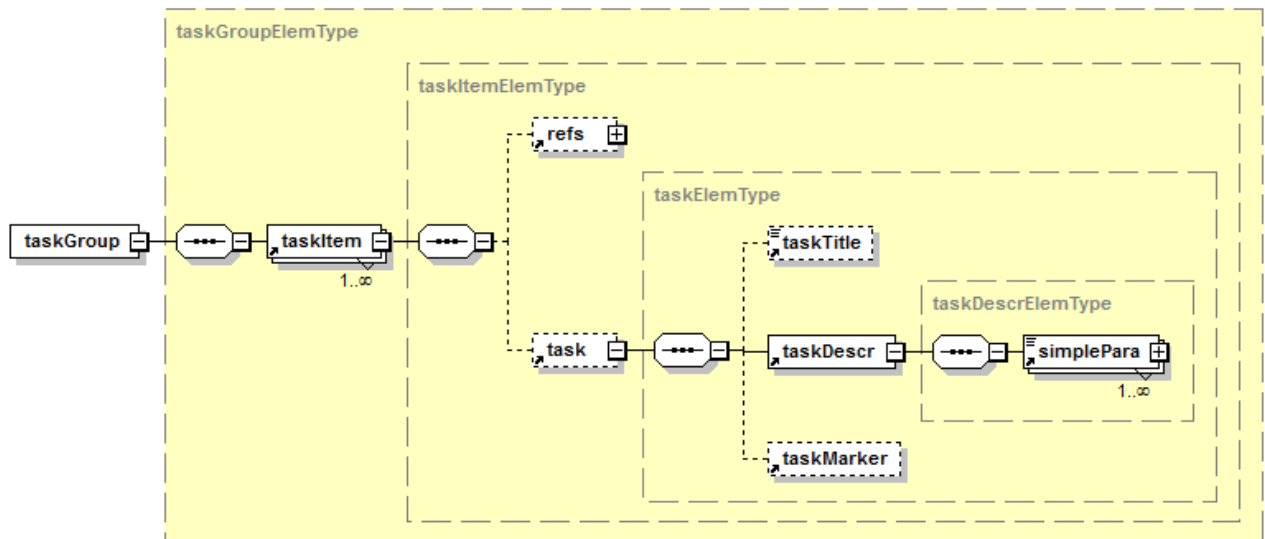

**Markup element:** `<remarks>`. Refer to [Chap 3.9.5.1](#).

### 2.5.2 **Task group**

**Description:** The element `<taskGroup>` contains a list of tasks that belong to the inspection. The element `<taskGroup>` facilitates production of a table of tasks in an inspection.

Markup element: `<taskGroup>`

ICN-S3627-S1000D0659-001-01

Fig 5 Element `<taskGroup>`

**Attributes:**

- None

**Child elements:**

- `<taskItem>`, the individual task in an inspection. Refer to [Para 2.5.2.1](#).

**Business rule decision point BRDP-S1-00198 - Methodology of assigning tasks into the element `<taskGroup>`:**

- Decide on a methodology of assigning tasks to groups.

2.5.2.1

Task item

**Description:** The element `<taskItem>` contains an individual task that belongs to an inspection.

Markup element: `<taskItem>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `taskSeqNumber` (M), the sequential position of the task within the inspection tasks group
- `taskName` (M), the textual identifier of the task
- `skillLevelCode` (O), the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

- `<task>`, the information that describes the task. Refer to [Para 2.5.2.1.1](#).

#### 2.5.2.1.1 Task

**Description:** The element `<task>` contains general data for a task that belongs to an inspection.

**Markup element:** `<task>`

**Attributes:**

- None

**Child elements:**

- `<taskTitle>`, the task title.
- `<taskDescr>`. Refer to [Para 2.5.2.1.2](#).
- `<taskMarker>`. Refer to [Para 2.5.2.1.3](#).

**Markup example:**

```
<taskItem taskSeqNumber="001" taskName="Nose landing gear
inspection">
<task>
<taskTitle>
General visual inspection of the landing gear
</taskTitle>
<taskDescr><simplePara>
This inspection of the landing gear covers all aspects including
wiring... </simplePara>
</taskDescr>
<taskMarker markerType="location"/>
</task>
</taskItem>
```

#### 2.5.2.1.2 Task description

**Description:** The element `<taskDescr>` contains the task description.

**Markup element:** `<taskDescr>`

**Attributes:**

- None

**Child elements:**

- `<simplePara>`. Contains the textual information of the task description. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.5.2.1.3 Task marker

**Description:** The element `<taskMarker>` contains the marker to separate an aggregation of text that came from regulatory sources into discretely classified textual items.

**Markup element:** `<taskMarker>`

**Attributes:**

- `markerType` (M), the nature of the data in the element `<taskDescr>`. The value of the attribute `markerType` can be used to indicate whether the task is performed internal or external to the Product.

#### Child elements:

- None

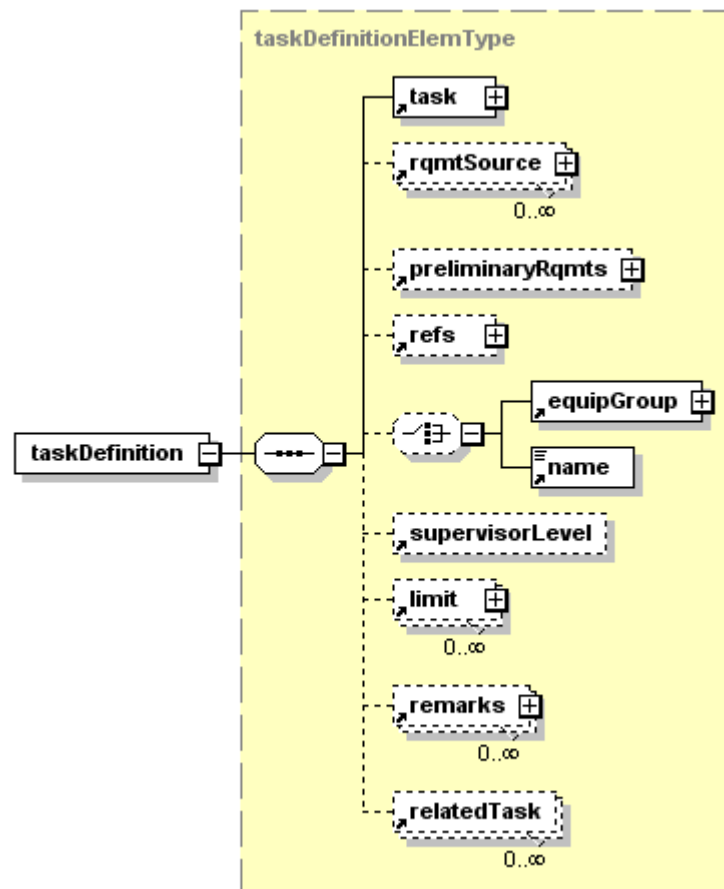

#### Business rule decision point BRDP-S1-00199 - Values for the attribute `markerType`:

- Decide which values to use for the attribute `markerType` and allocate suitable definitions.

## 2.6 Task definition

**Description:** The element `<taskDefinition>` contains the necessary information to define a planned maintenance task.

**Markup element:** `<taskDefinition>`

ICN-S1000D-A-030905-D-F6117-25003-A-001-01

Fig 6 Element `<taskDefinition>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `taskIdent` (M), the unique identifier for the list of tasks

- taskCode (O), the task category code. For example, a general visual inspection is a common category. The attribute taskCode can have one of the following values:
  - "taskcd01" thru "taskcdk99". Refer to [Chap 3.9.6.1](#).
- worthinessLimit (O), the indicator whether the performance of the tasks is mandatory or recommended which signifies whether the task is subject to worthiness limitations
- reducedMaint (O), used to indicate whether a task or step(s) that are not required to return the Product to a minimum mission capable operational condition can be omitted, deferred or reduced under certain circumstances (eg, when in deployed or extended operations). The attribute must give the reason, or the condition or the situation circumstances under which the maintenance task can be deviated from.
- skillLevelCode (O), the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).

The attribute skillLevelCode of the element <taskDefinition> must have the same value as the attribute skillLevelCode of the element <personSkill> of the element <preliminaryRqmts> in the <taskDefinition> branch of the maintenance planning ("schedule") Schema, if both attributes are used.

It is recommended to only populate the element <personSkill> when the element <preliminaryRqmts> is used.

- skillType (O), the required skill category of the person who will perform the task (eg, Airframe, Electrical, Avionic, Engine). The attribute skillType can have one of the following values:
  - "st01" thru "st99". Refer to [Chap 3.9.6.1](#).

The attribute skillType must have the same value as the attribute personCategoryCode of the element <preliminaryRqmts> in the <taskDefinition> branch of the maintenance planning ("schedule") Schema, if both attributes are used.

It is recommended to only populate the attribute personCategoryCode of the element <personCategory> when the child element <preliminaryRqmts> of the element <taskDefinition> is used.

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (M), commercialClassification (O) and caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#)

#### Child elements:

- <task>, the information used to describe the task. Refer to [Para 2.5.2.1.1](#).
- <rqmtSource>, the authority that established the requirement to do the task. Refer to [Para 2.6.1](#).
- <preliminaryRqmts>. Refer to [Para 2.6.2](#) and [Chap 3.9.5.2.1.9](#).
- <refs>. Refer to [Chap 3.9.5.2.1.2](#).
- <equipGroup>. Refer to [Para 2.6.3](#).
- <name>, the identifier that can be used instead of the element <equipGroup> for structural and other items that do not have a part number. Refer to [Chap 3.9.5.2.1.10](#).

- `<supervisorLevel>`, the level of supervision that is appropriate for the task. Refer to [Para 2.6.4](#).
- `<limit>`, the information required to determine when a task must be performed. Refer to [Para 2.5.1.1](#).
- `<remarks>`, the textual comment giving further information about the inspection. Refer to [Para 2.5.1.2](#).
- `<relatedTask>`. Refer to [Para 2.6.5](#).

#### Markup example:

The following example shows that by a business rule decision, a project has identified tasks by using the first four characters of the SNS (56-40, Windows and canopies - Inspection and observation) and the information code (250, Clean and apply surface protection). The attribute `taskCode` value "08" indicates that the task is a servicing task. The attribute `reducedMaint` indicates that the application of surface protection steps in the task is not required under crisis/war conditions.

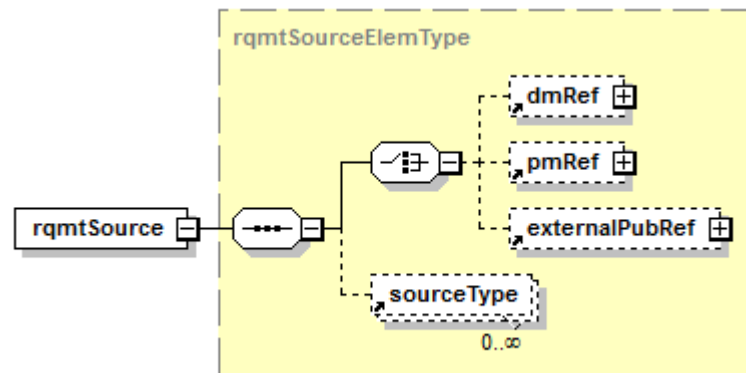

```
<taskDefinition taskId="56-40-250" taskCode="taskcd08"
reducedMaint="Application of surface protection is not required
under crisis/war conditions">
<task>
...
</task>
<relatedTask taskId="23-050-02" relatedTaskDescr="after"/>
</taskDefinition>
```

### 2.6.1

#### Requirement source

**Description:** The element `<rqmtSource>` contains the information to enable identification of the authority that is the source of the maintenance requirement.

**Markup element:** `<rqmtSource>`

ICN-S3627-S1000D0660-001-01

Fig 7 Element `<rqmtSource>`

#### Attributes:

- `sourceOfRqmt` (M), the code that indicates the origination of the requirement (eg, "MRB", "MPD" and "AD")
- `approval` (O), the level of approval of the source

#### Child elements:

- `<dmRef>`, the reference to the data module which is the source of the requirements. Refer to [Chap 3.9.5.2.1.2](#).
- `<pmRef>`, the reference to the publication module which is the source of the requirements. Refer to [Chap 3.9.5.2.1.2](#).
- `<externalPubRef>`, the reference to the non-S1000D document which is the source of the requirements. Refer to [Chap 3.9.5.2.1.2](#).
- `<sourceType>`. Refer to [Para 2.6.1.1](#).

#### Business rule decision point BRDP-S1-00202 - Values for the attribute `sourceOfRqmt`:

- Decide which values to use for the attribute `sourceOfRqmt` and allocate suitable definitions.

#### 2.6.1.1 Source type

**Description:** The element `<sourceType>` contains information of the source of the requirement. This gives the ability to include requirements such as failure effect category, failure effect code, Enhanced Zonal Analysis Program (EZAP), Lightning or High Intensity Radiated Field (LHIRF), CMR 1 star, CMR 2 star, and future regulatory sources.

#### Note

Maintenance requirements can have been developed as a result of the safety analysis for certification of civil aviation products. These tasks are called "Certification Maintenance Requirements" (CMR). The "star" categories identify whether the maintenance is to limit exposure to catastrophic versus hazardous failures.

**Markup element:** `<sourceType>`

#### Attributes:

- `sourceCriticality` (O), the impact of not complying with the requirement. The attribute `sourceCriticality` can have one of the following values:
  - "sc01" thru "sc99". Refer to [Chap 3.9.6.1](#).
- `sourceTypeCode` (O), the type of source. The attribute `sourceTypeCode` can have one of the following values:
  - "stc01" thru "stc99". Refer to [Chap 3.9.6.1](#).

Example of usage:

- "sc51" - no source criticality
- "sc52" - 1-star
- "sc55" - evident, safety

Example of usage:

- "stc51" - MSG-3 failure effect category
- "stc52" - enhanced zonal analysis program
- "stc53" - certification maintenance requirement

#### Child elements:

- None

## 2.6.2 Preliminary requirements

**Description:** The element `<preliminaryRqmts>` contains all information about resources that are required before the accomplishment of the task. Refer to [Chap 3.9.5.2.1.9](#).

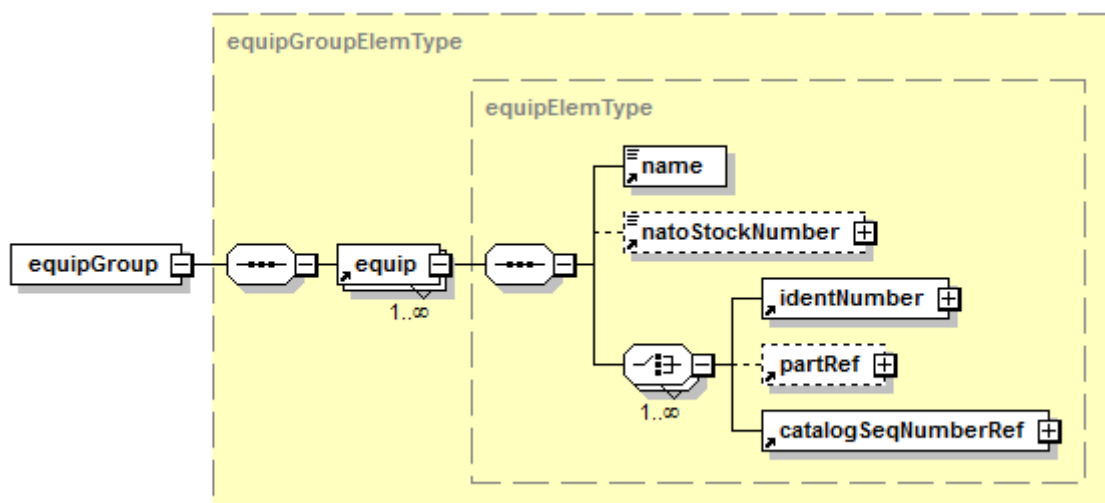

**Business rule decision point BRDP-S1-00204 - Use of the element `<preliminaryRqmts>` in the element `<taskDefinition>`:**

- Decide whether to use the element `<preliminaryRqmts>` in the context of task definition.

## 2.6.3 Equipment group

**Description:** The element `<equipGroup>` contains the grouping of the equipment that used in or associated with the task.

**Markup element:** `<equipGroup>`

ICN-S3627-S1000D0661-001-01

Fig 8 Element `<equipGroup>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (M), `commercialClassification` (O) and `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#)

### Child elements:

- `<equip>`. Refer to [Para 2.6.3.1](#).

## 2.6.3.1 Equipment

**Description:** The element `<equip>` contains the identification of an individual piece of equipment associated with the task.

**Markup element:** `<equip>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (M), commercialClassification (O) and caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#)

**Child elements:**

- <name>, the name of the equipment. Refer to [Chap 3.9.5.2.1.10](#).
- <natoStockNumber>. Refer to [Chap 3.9.5.2.7](#).
- <identNumber>. Refer to [Chap 3.9.5.2.1.9](#).
- <partRef>. Refer to [Chap 3.9.5.2.1.10](#).
- <catalogSeqNumberRef>, the reference to the IPD CSN that corresponds to the equipment. Refer to [Chap 3.9.5.2.7](#).

**2.6.4**
**Supervisor level**

**Description:** The element <supervisorLevel> contains the hierarchical level in the supervisory structure that explains if the supervisor must observe the task or inspect the results of the task.

**Markup element:** <supervisorLevel>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- supervisorLevelCode (O), the level of the supervisor who must observe the task or inspect the results of the task. The attribute supervisorLevelCode can have one of the following values:
  - "s101" thru "s199". Refer to [Chap 3.9.6.1](#).
- securityClassification (M), commercialClassification (O) and caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#)

**Child elements:**

- None

**2.6.5**
**Related task**

**Description:** The element <relatedTask> contains the relationship between two tasks.

**Markup element:** <relatedTask>

**Attributes:**

- taskIdent (M), the task identifier that has an association to the current task (via the attribute taskIdent of the related task)
- relatedTaskDescr (M), the nature of the association. The attribute relatedTaskDescr can have one of the following values:
  - "after" - perform maintenance requirement **after** the related requirement is started

- "before" - perform maintenance requirement **before** the related requirement
- "complied" - the maintenance requirement is **complied** with by the related requirement
- "finished" - cannot finish maintenance requirement until the related requirement is **finished**
- "precludes" - the maintenance requirement **precludes** the related requirement
- "started" - cannot finish the maintenance requirement until the related requirement is **started**
- "with" - perform maintenance requirement **with** the related requirement

#### Child elements:

- None

## 2.7 Task definition alternates group

**Description:** The element <taskDefinitionAlts> provides the capability to group several alternate solutions of the task information necessary to plan maintenance. Refer to [Chap 4.13.3](#) for information related to the use of alternates group in data module content.

**Markup element:** <taskDefinitionAlts>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <taskDefinition>. Refer to [Para 2.6](#).

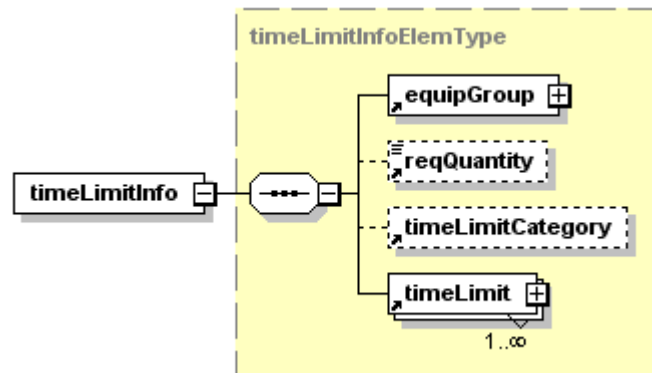

#### Markup example:

```
<taskDefinitionAlts>
<taskDefinition taskId="31-010-01" taskCode="taskcd01">
<task>
...
</task>
<relatedTask taskId="23-050-02" relatedTaskDescr="after"/>
</taskDefinition>
<taskDefinition taskId="31-010-02" taskCode="taskcd02">
<task>
...
</task>
<relatedTask taskId="23-060-02" relatedTaskDescr="before"/>
</taskDefinition>
</taskDefinitionAlts>
```

## 2.8 Time limit information

**Description:** The element `<timeLimitInfo>` contains time limits, periodicities and life details information relating to equipment or systems.

**Markup element:** `<timeLimitInfo>`

ICN-S1000D-A-030905-D-F6117-25004-A-001-01

Fig 9 Element `<timeLimitInfo>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `timeLimitIdent` (M), the identifier of the element `<timeLimit>`.
- `skillLevelCode` (O), the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).

### Child elements:

- `<equipGroup>`, the grouping of the equipment that is the subject to the time limit. Refer to [Para 2.6.3](#).
- `<reqQuantity>`, the quantity of items of equipment subject to the time limit. Refer to [Para 2.8.1](#).
- `<timeLimitCategory>`, the classification of the time limit. Refer to [Para 2.8.2](#).
- `<timeLimit>`, the threshold when a piece of equipment must be removed from service or storage. Refer to [Para 2.8.3](#).

### 2.8.1 Required quantity

**Description:** The element `<reqQuantity>` contains the number of equipment items that are subject to the time limit in the scope of the Product.

**Markup element:** `<reqQuantity>`

### Attributes:

- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `unitOfMeasure` (O), the unit of measure. Can be a text string giving the fundamental subdivision along the dimension to which the quantity applies. It can also give a name for a container of items (eg, "cases" as in "5 cases").

**Child elements:**

- None

**Markup example:**

```
<reqQuantity unitOfMeasure="boxes">6</reqQuantity>
```

**2.8.2 Time limit category**

**Description:** The element `<timeLimitCategory>` is used to classify the time limit.

**Markup element:** `<timeLimitCategory>`

**Attributes:**

- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `timeLimitCategoryValue` (M), an enumeration representing the categories of time limits. The attribute `timeLimitCategoryValue` can have one of the following values:

- "1" - safety related
- "2" - non-safety related

The interpretation of these values can be defined by a project or organization business rule. However, the default interpretation of the values is as given above.

**Child elements:**

- None

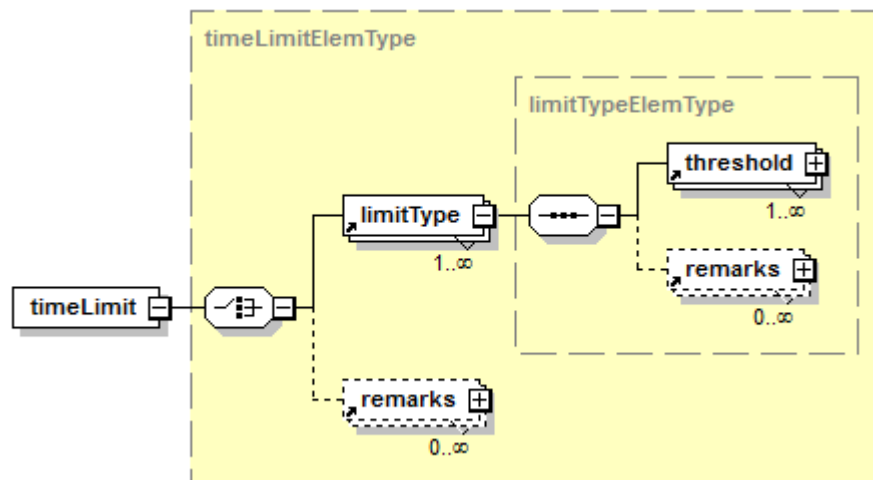

**Business rule decision point BRDP-S1-00563 - Use of the attribute `timeLimitCategoryValue`:**

- In case standard descriptions are not applicable, describe how the values "1" and "2", respectively, will be used for the attribute `timeLimitCategoryValue`.

**2.8.3 Time limit**

**Description:** The element `<timeLimit>` contains a time limit.

Markup element: `<timeLimit>`

ICN-S3627-S1000D0657-001-01

Fig 10 Element `<timeLimit>`

**Attributes:**

- None

**Child elements:**

- `<limitType>`. Refer to [Para 2.8.4](#).
- `<remarks>`, the textual comments to supplement the structured limit information. Refer to [Para 2.5.1.2](#).

## 2.8.4

### Limit type

**Description:** The element `<limitType>` contains the threshold values and units of the time limit.

Markup element: `<limitType>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `limitUnitType` (O), the enumeration representing the dimensional unit for the given time limit values. The attribute `limitUnitType` can have one of the following values:
  - "1t01" thru "1t99". Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<threshold>`, the threshold value for the inspection. Refer to [Para 2.5.1.1.2](#).

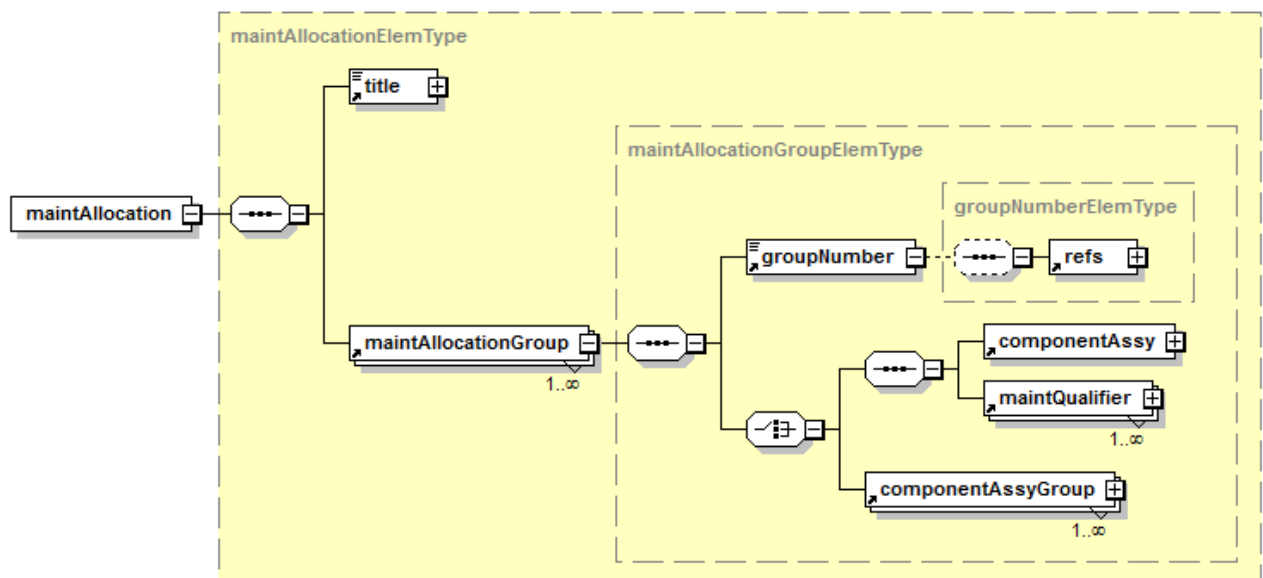

- [<remarks>](#), the textual comments to supplement the structured limit type information. Refer to [Para 2.5.1.2](#).

## 2.9 Maintenance allocation

**Description:** The element [<maintAllocation>](#) contains information about maintenance allocations. Maintenance allocations capture maintenance functions along with maintenance levels and time associated for each task. It is contained in the element [<maintPlanning>](#). Refer to [Para 2.3](#).

The maintenance allocation designates the overall authority and the responsibility for the performance of maintenance functions on the identified end item or component. The data lists maintenance functions along with maintenance levels, and the time associated for each task. These maintenance functions can also be grouped together. All the information required to build the maintenance allocation is included in the Logistics Support Analysis Record (LSAR). The element [<toolsList>](#) and the element [<remarksList>](#) are used to provide a list of support equipment (standard tools, special tools and test equipment) and remarks for referencing purposes.

**Markup element:** [<maintAllocation>](#)

ICN-S3627-S1000D0649-002-01

Fig 11 Element [<maintAllocation>](#)

### Attributes:

- None

### Child elements:

- [<title>](#), the title which describes the maintenance allocation. Refer to [Chap 3.9.5.2.1.5](#).
- [<maintAllocationGroup>](#). Refer to [Para 2.9.1](#).

### 2.9.1 Maintenance allocation group

**Description:** The element [<maintAllocationGroup>](#) contains groups of maintenance functional items.

**Markup element:** [<maintAllocationGroup>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- skillLevelCode (O), the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <groupNumber>. Refer to [Para 2.9.1.1](#).
- <componentAssy>. Refer to [Para 2.9.1.2](#).
- <maintQualifier>. Refer to [Para 2.9.1.3](#).
- <componentAssyGroup>. Refer to [Para 2.9.1.4](#).

## 2.9.1.1

## Maintenance allocation group number

**Description:** The element <groupNumber> contains a number or other identifier associated with major components, assemblies, and subassemblies that form functional groups. Subordinate, sub-functional groups or sub-subassemblies relate to the base group number (top position) in a sequential, next higher assembly (NHA) relationship (ie, top-down breakdown structure). The functional group applies to repairable assemblies and subassemblies, for example, spares (any repairable component required for the maintenance or repair of an end item), but not to repair parts (any consumable, non-repairable component required for the maintenance or repair of an end item).

**Markup element:** <groupNumber>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- skillLevelCode (O), the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <refs>. Refer to [Chap 3.9.5.2.1.2](#).

## 2.9.1.2

## Component assembly

**Description:** The element <componentAssy> contains the identification of the item (component assembly) by name (a basic name and a noun word or phrase modifier, for example, transformer). Parts that are not subject to maintenance must not be listed.

Markup element: `<componentAssy>`

ICN-S3627-S1000D0650-001-01

Fig 12 Element `<componentAssy>`

**Attributes:**

- None

**Child elements:**

- `<name>`, the name of the item. Refer to [Chap 3.9.5.2.1.10](#).
- `<typeDesignation>`, the textual information for additional information about the item.

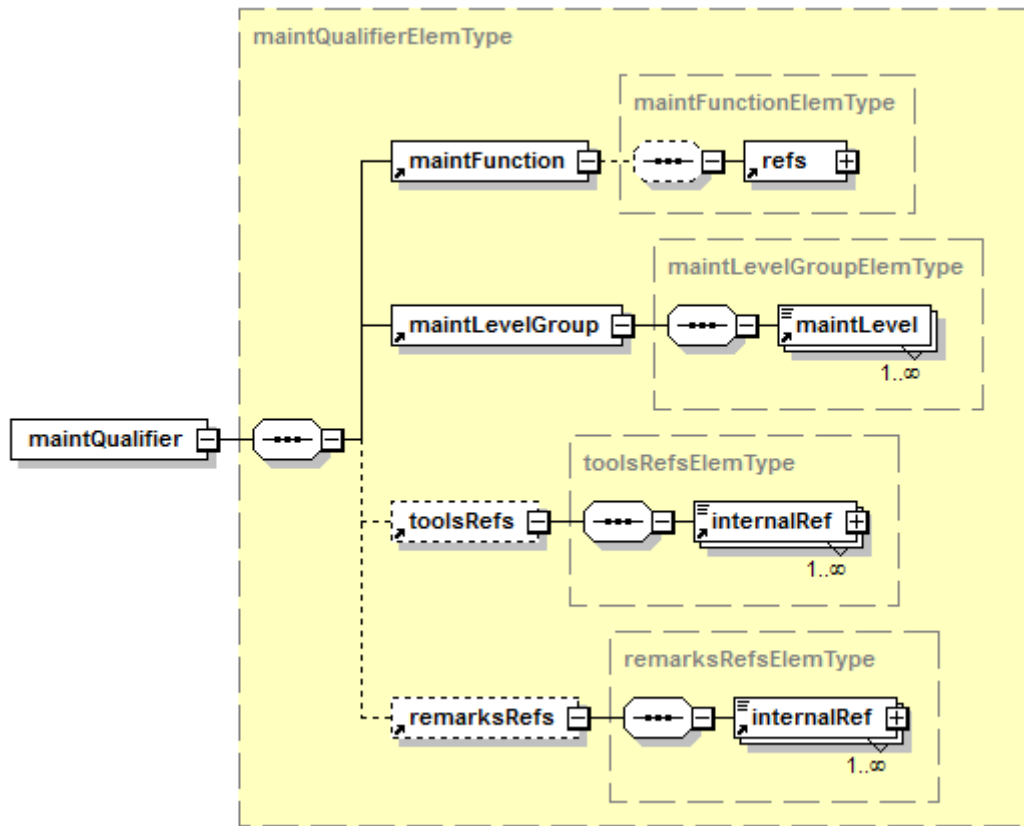

**Markup example:**

```
<componentAssy>
<name>Flight Data Recorder</name>
<typeDesignation>
Here is some text.
</typeDesignation>
</componentAssy>
```

### 2.9.1.3 Maintenance qualifier

**Description:** The element `<maintQualifier>` contains maintenance action qualification such as maintenance function, maintenance level, estimated work time, any support equipment and any remarks.

Markup element: `<maintQualifier>`

ICN-S3627-S1000D0651-001-01

Fig 13 Element `<maintQualifier>`

**Attributes:**

- None

**Child elements:**

- `<maintFunction>`. Refer to [Para 2.9.1.3.1](#).
- `<maintLevelGroup>`. Refer to [Para 2.9.1.3.2](#).
- `<toolsRefs>`. Refer to [Para 2.9.1.3.4](#).
- `<remarksRefs>`. Refer to [Para 2.9.1.3.5](#).

**Markup example:**

```
<maintQualifier>
<maintFunction function="ft00"/>
<maintLevelGroup>
...
</maintLevelGroup>
</maintQualifier>
```

**2.9.1.3.1 Maintenance function**

**Description:** The element `<maintFunction>` contains the maintenance function to be performed on the item listed.

**Markup element:** `<maintFunction>`

**Attributes:**

- `function` (M), the maintenance action (eg, Inspect, Test, Service). The attribute `function` can have one of the following values:
  - `"ft01"` thru `"ft99"`. Refer to [Chap 3.9.6.1](#).

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

2.9.1.3.2 *Maintenance level group*

**Description:** The element `<maintLevelGroup>` contains the information about the lowest authorized maintenance level and the associated estimated work time to perform the maintenance.

**Markup element:** `<maintLevelGroup>`

**Attributes:**

- None

**Child elements:**

- `<maintLevel>`. Refer to [Para 2.9.1.3.3](#).

2.9.1.3.3 *Maintenance level*

**Description:** The element `<maintLevel>` contains the maintenance level by selecting an enumerated value for the attribute `maintLevelCode`. The estimated work time can be entered as textual information within the element.

**Markup element:** `<maintLevel>`

**Attributes:**

- `maintLevelCode` (M), the values for the maintenance levels such as crew, operator, organization, direct, general support, or depot. The attribute `maintLevelCode` can have one of the following values:
  - `"ml01"` thru `"ml99"`. Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

2.9.1.3.4 *Tools references*

**Description:** The element `<toolsRefs>` contains references to required support equipment (standard tools, special tools and test equipment) that is contained in the tools list. Refer to [Para 2.10](#).

**Markup element:** `<toolsRefs>`

**Attributes:**

- None

**Child elements:**

- `<internalRef>`, the reference to a support equipment contained in the tools list (refer to [Para 2.10](#)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<toolsRefs>
<internalRef internalRefId="tool-001"
internalRefTargetType="irtt05">
...
</internalRef>
</toolsRefs>
```

2.9.1.3.5 *Remarks references*

**Description:** The element [<remarksRefs>](#) contains a reference to remarks contained in the remarks list. Refer to [Para 2.11](#).

**Markup element:** [<remarksRefs>](#)

**Attributes:**

- None

**Child elements:**

- [<internalRef>](#). Refer to [Chap 3.9.5.2.1.2](#).

2.9.1.4 *Component assembly group*

**Description:** The element [<componentAssyGroup>](#) contains a group of subassemblies when there is a need to divide the item (component assembly).

**Markup element:** [<componentAssyGroup>](#)

ICN-S3627-S1000D0652-001-01

Fig 14 Element [<componentAssyGroup>](#)

**Attributes:**

- None

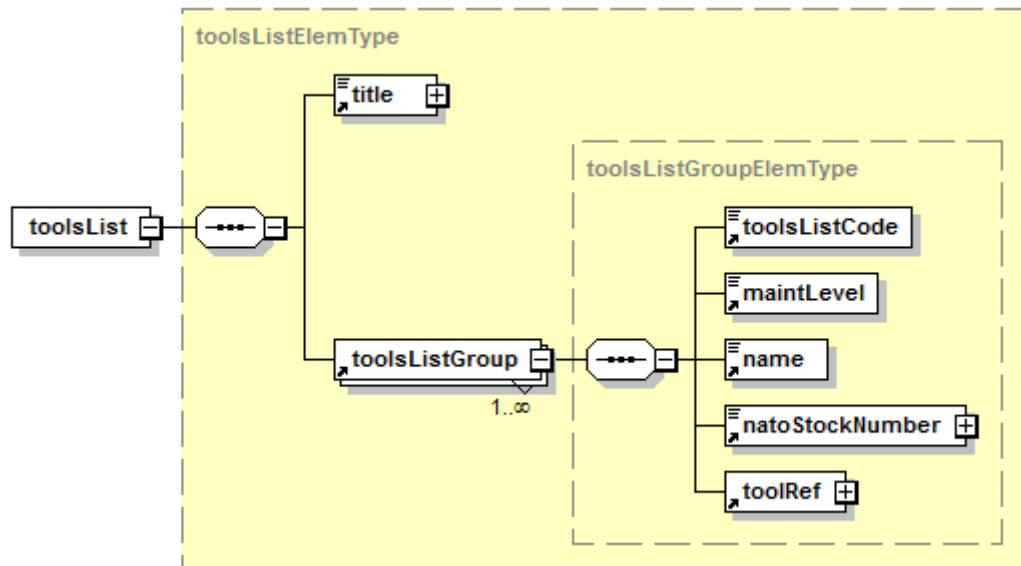

**Child elements:**

- [<componentAssy>](#). Refer to [Para 2.9.1.2](#).
- [<maintQualifier>](#). Refer to [Para 2.9.1.3](#).

## 2.10 Tools list

**Description:** The element [<toolsList>](#) contains a list of support equipment (special tools, standard tools and test equipment) required to maintain the equipment as indicated in the maintenance allocation. When support equipment is indicated in the maintenance allocation, the tools list must be included.

Markup element: `<toolsList>`

ICN-S3627-S1000D0653-001-01

Fig 15 Element `<toolsList>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `skillLevelCode` (O), the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`, the support equipment list title. Refer to [Chap 3.9.5.2.1.5](#).
- `<toolsListGroup>`. Refer to [Para 2.10.1](#).

### 2.10.1

#### Tools list group

**Description:** The element `<toolsListGroup>` contains the data about the support equipment. It includes the maintenance level, name of the support equipment, NATO stock number, and support equipment number.

Markup element: `<toolsListGroup>`

#### Attributes:

- None

#### Child elements:

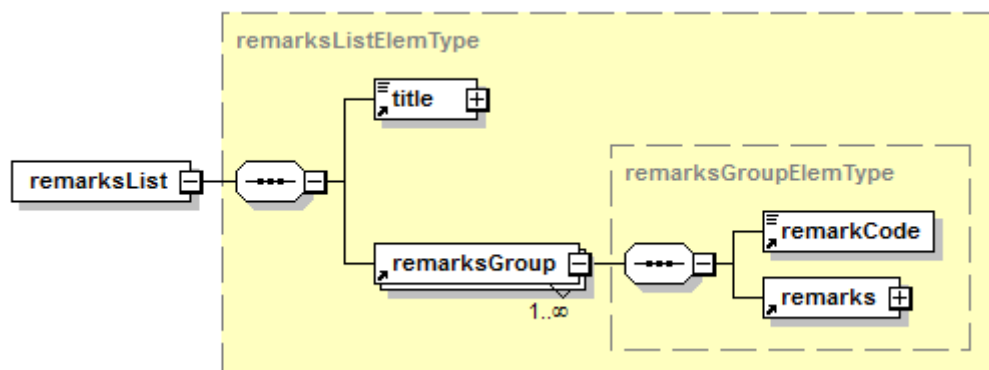

- `<toolsListCode>`, the identification for the purposes of cross-referencing. The element `<toolsListCode>` also allows textual data in the event that a particular code such as "A", "B", or "C" is used to identify the support equipment in the maintenance allocation data.

- `<maintLevel>`, the lowest authorized maintenance level. Refer to [Para 2.9.1.3.3](#).
- `<name>`, the name of the support equipment. A basic name or noun must be used. Refer to [Chap 3.9.5.2.1.10](#).
- `<natoStockNumber>`. Refer [Chap 3.9.5.2.7](#).
- `<toolRef>`. Refer to [Chap 3.9.5.2.1.9](#).

## 2.11 Remarks list

**Description:** The element `<remarksList>` contains a list of remarks pertinent to the maintenance functions listed in maintenance allocation data. The purpose is to provide a list for referencing from maintenance allocation. When a "remark" is indicated in the maintenance allocation, the remarks list must be included.

**Markup element:** `<remarksList>`

ICN-S3627-S1000D0654-001-01

Fig 16 Element `<remarksList>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `skillLevelCode` (O) the skill level required of the person who will perform the task. Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`, the remarks list title. Refer to [Chap 3.9.5.2.1.5](#).
- `<remarksGroup>`. Refer to [Para 2.11.1](#).

### 2.11.1 Remarks group

**Description:** The element `<remarksGroup>` contains the remark with an identifier.

**Markup element:** `<remarksGroup>`

### Attributes:

- None

#### Child elements:

- `<remarkCode>`, the identification for the purposes of cross referencing. The element also allows for textual content in the event that a particular code such as "A", "B", or "C" is used to identify the remark in the maintenance allocation data.
- `<remarks>`, the textual comment about the data. Refer to [Chap 3.9.5.1](#).

## 1 General

The crew Schema is provided for the production of Crew/Operator information such as description and operation of the Product and sequential information.

For aircrew information, refer to [Chap 5.2.2.7](#). For crew/operator information for land/sea products, refer to [Chap 5.2.3](#).

## 2 Crew Information

### 2.1 Schema basic rules

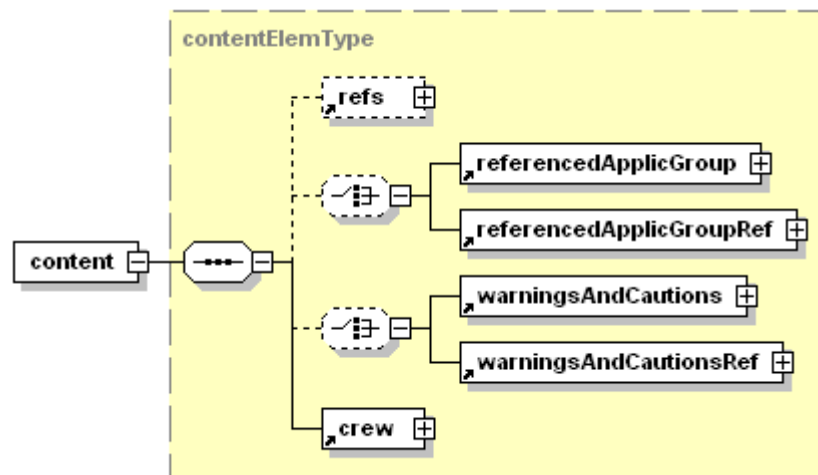

This Schema is used to capture and represent information to be used by crew/operators. The granularity of crew data modules follows the breakdown reflected by the SNS.

The use of the common entities, elements and attributes is as detailed in [Chap 3.9.5.2.1](#).

### 2.2 Content

**Description:** The element `<content>` is the top level element in the content section of this Schema.

**Markup element:** `<content>`

ICN-83007-0000000065-001-01

Fig 1 Major elements in crew content

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- <refs>. Refer to [Chap 3.9.5.2.1.2](#).
- <referencedApplicGroup>. Refer to [Chap 3.9.5.3](#).
- <referencedApplicGroupRef>. Refer to [Chap 3.9.5.3](#).
- <warningsAndCautions>. Refer to [Chap 3.9.3](#).
- <warningsAndCautionsRef>. Refer to [Chap 3.9.3](#).
- <crew>. Refer to [Para 2.3](#).

## 2.3

### Crew

**Description:** The element <crew> is the container for all crew/operator content (excluding references).

**Markup element:** <crew>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

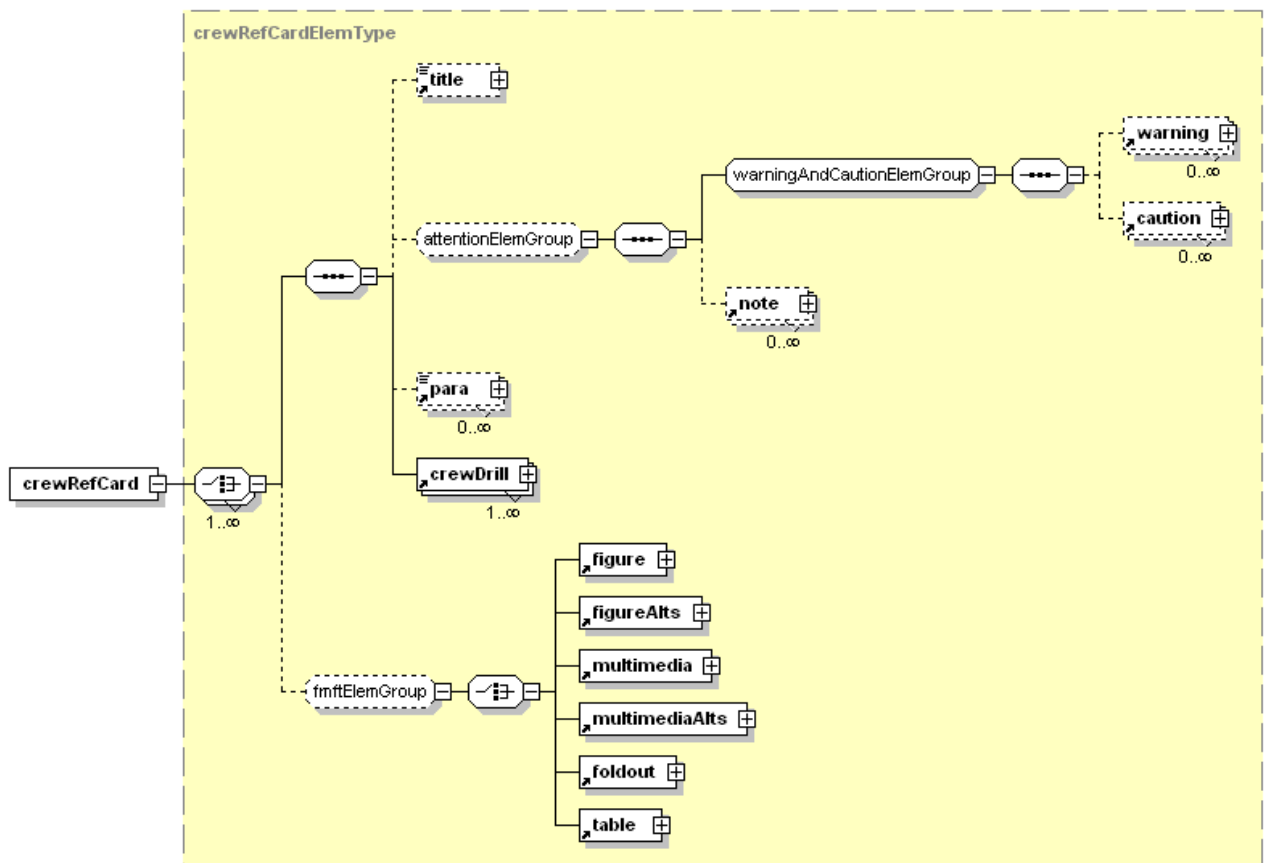

- <crewRefCard>. Refer to [Para 2.3.1](#).
- <descrCrew>. Refer to [Para 2.3.2](#).

### 2.3.1

#### Reference card

**Description:** The element <crewRefCard> contains a crew/operator reference card information for drills.

**Markup element:** <crewRefCard>

ICN-84007-0000000066-001-01

Fig 2 Element <crewRefCard>

#### Attributes:

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <crewDrill>. Refer to [Para 2.3.1.1](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).

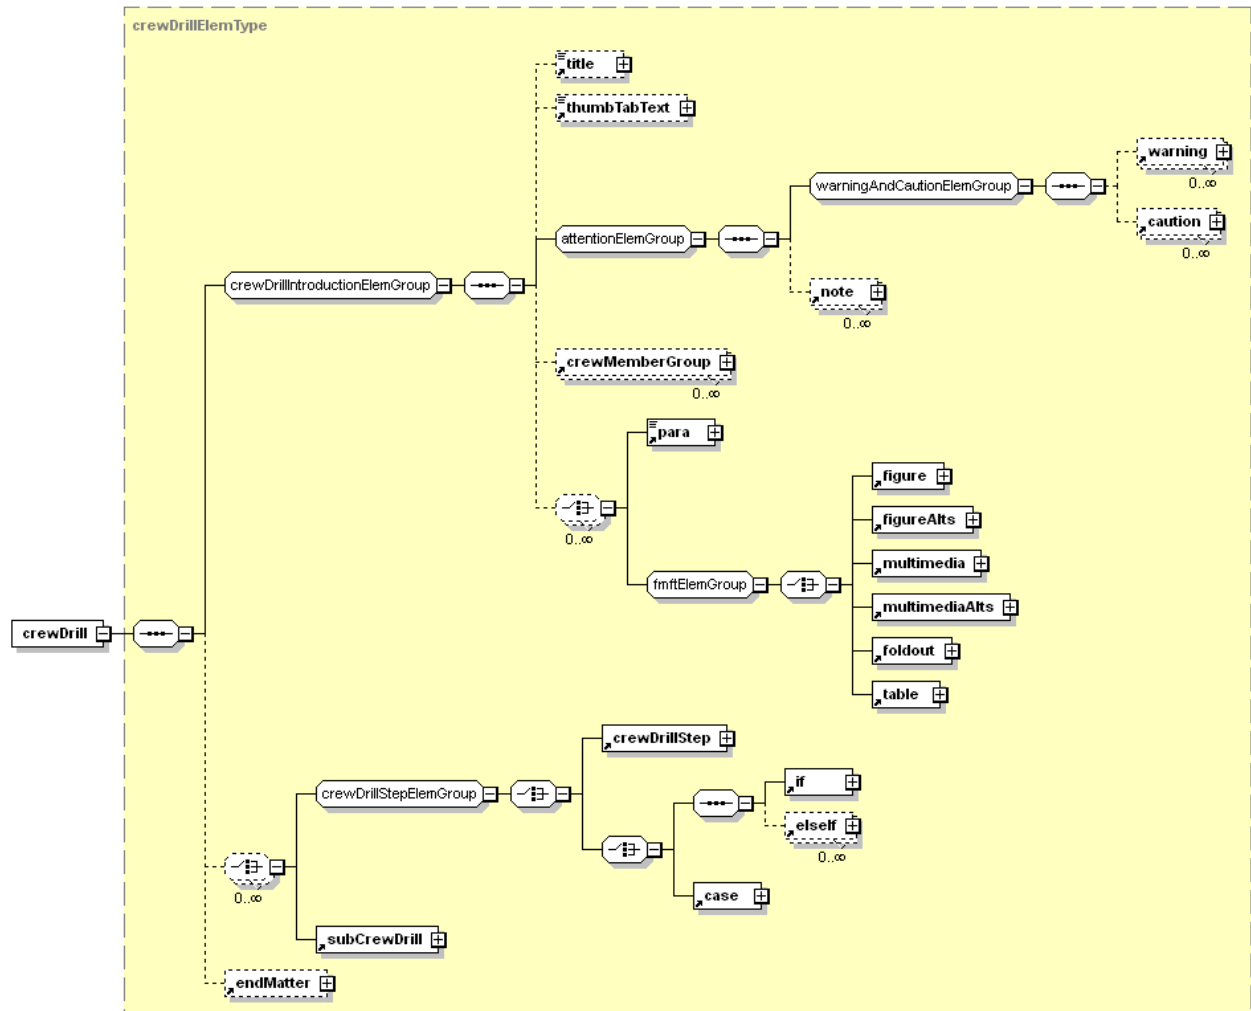

- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).

### 2.3.1.1 Drill

**Description:** The element `<crewDrill>` contains a crew/operator drill.

**Markup element:** `<crewDrill>`

ICN-83007-0000000089-001-01

Fig 3 Element `<crewDrill>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).

- drillType (O), the type of drill. The attribute drillType can have one of the following values:
  - "dt00" (D) thru "dt99". Refer to [Chap 3.9.6.1](#).
- orderedStepsFlag (O), indicates whether the drill steps are a chronologically ordered list. The attribute orderedStepsFlag can have one of the following values:
  - "1" (D) - Yes, the list is chronologically ordered
  - "0" - No, the list is not chronologically ordered
- crewStepCondition (O), the special conditions associated with a drill. The attribute crewStepCondition can have one or more of the following values:
  - "csc01" thru "csc99". Refer to [Chap 3.9.6.1](#).
- independentCheck (O), the drill must be checked by a supervisor with a given qualification
- skillLevelCode (O), the skill level required for the drill. The attribute skillLevelCode can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

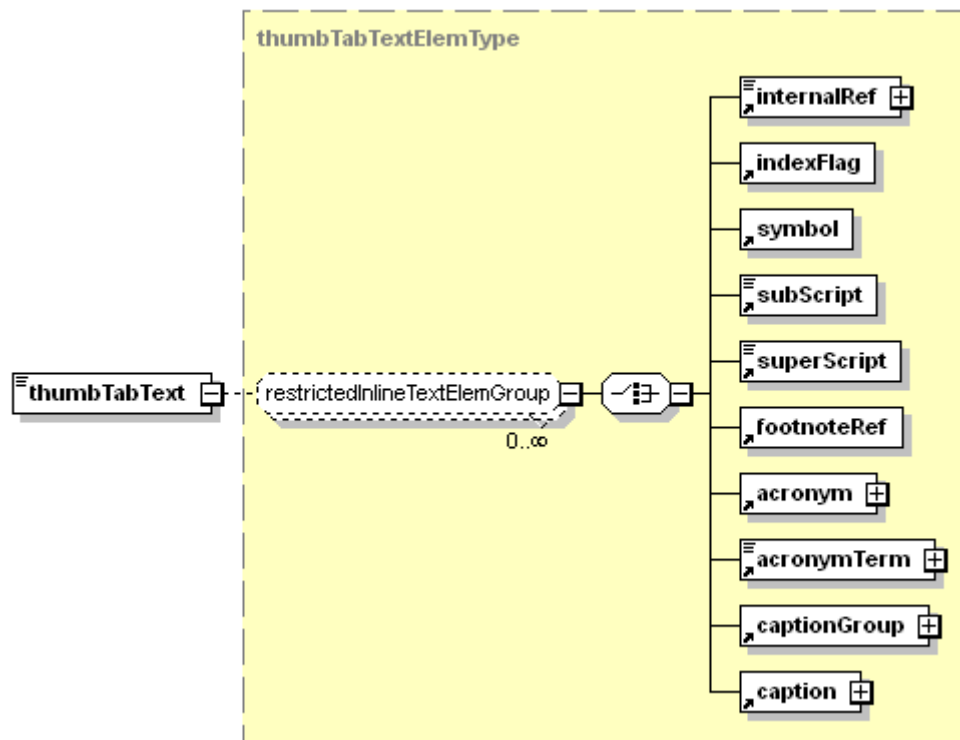

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <thumbTabText>. Refer to [Para 2.3.1.1.1](#).
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <crewMemberGroup>. Refer to [Para 2.3.1.1.2](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).
- <crewDrillStep>. Refer to [Para 2.3.1.1.4](#).
- <if>. Refer to [Para 2.3.1.1.9](#).
- <elseif>. Refer to [Para 2.3.1.1.11](#).
- <case>. Refer to [Para 2.3.1.1.12](#).
- <subCrewDrill>. Refer to [Para 2.3.1.1.13](#).
- <endMatter>. Refer to [Para 2.3.1.1.14](#).

#### 2.3.1.1.1 Tab text

**Description:** The element <thumbTabText> contains thumb tab text for the drill or subdrill.

Markup element: `<thumbTabText>`

ICN-83007-0000000090-001-01

Fig 4 Element `<thumbTabText>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<indexFlag>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<footnoteRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronym>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<acronymTerm>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<captionGroup>`. Refer to [Chap 3.9.5.2.1.4](#).
- `<caption>`. Refer to [Chap 3.9.5.2.1.4](#).

#### 2.3.1.1.2 Crew

**Description:** The element `<crewMemberGroup>` contains the identification of the crew/operator responsible for carrying out an action.

Markup element: `<crewMemberGroup>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `actionResponsibility` (O), the responsibility for performing the actions. The attribute `actionResponsibility` can have one of the following values:
  - `"all"` - all of the crew/operator listed are responsible
  - `"any"` - any of the crew/operator listed are responsible

**Child elements:**

- `<crewMember>`. Refer to [Para 2.3.1.1.3](#).

**2.3.1.1.3** *Crew member*

**Description:** The element `<crewMember>` contains the identification of a crew/operator member.

**Markup element:** `<crewMember>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `crewMemberType` (M), the type of crew member. The attribute `crewMemberType` can have one of the following values:
  - `"cm01"` thru `"cm99"`. Refer to [Chap 3.9.6.1](#).

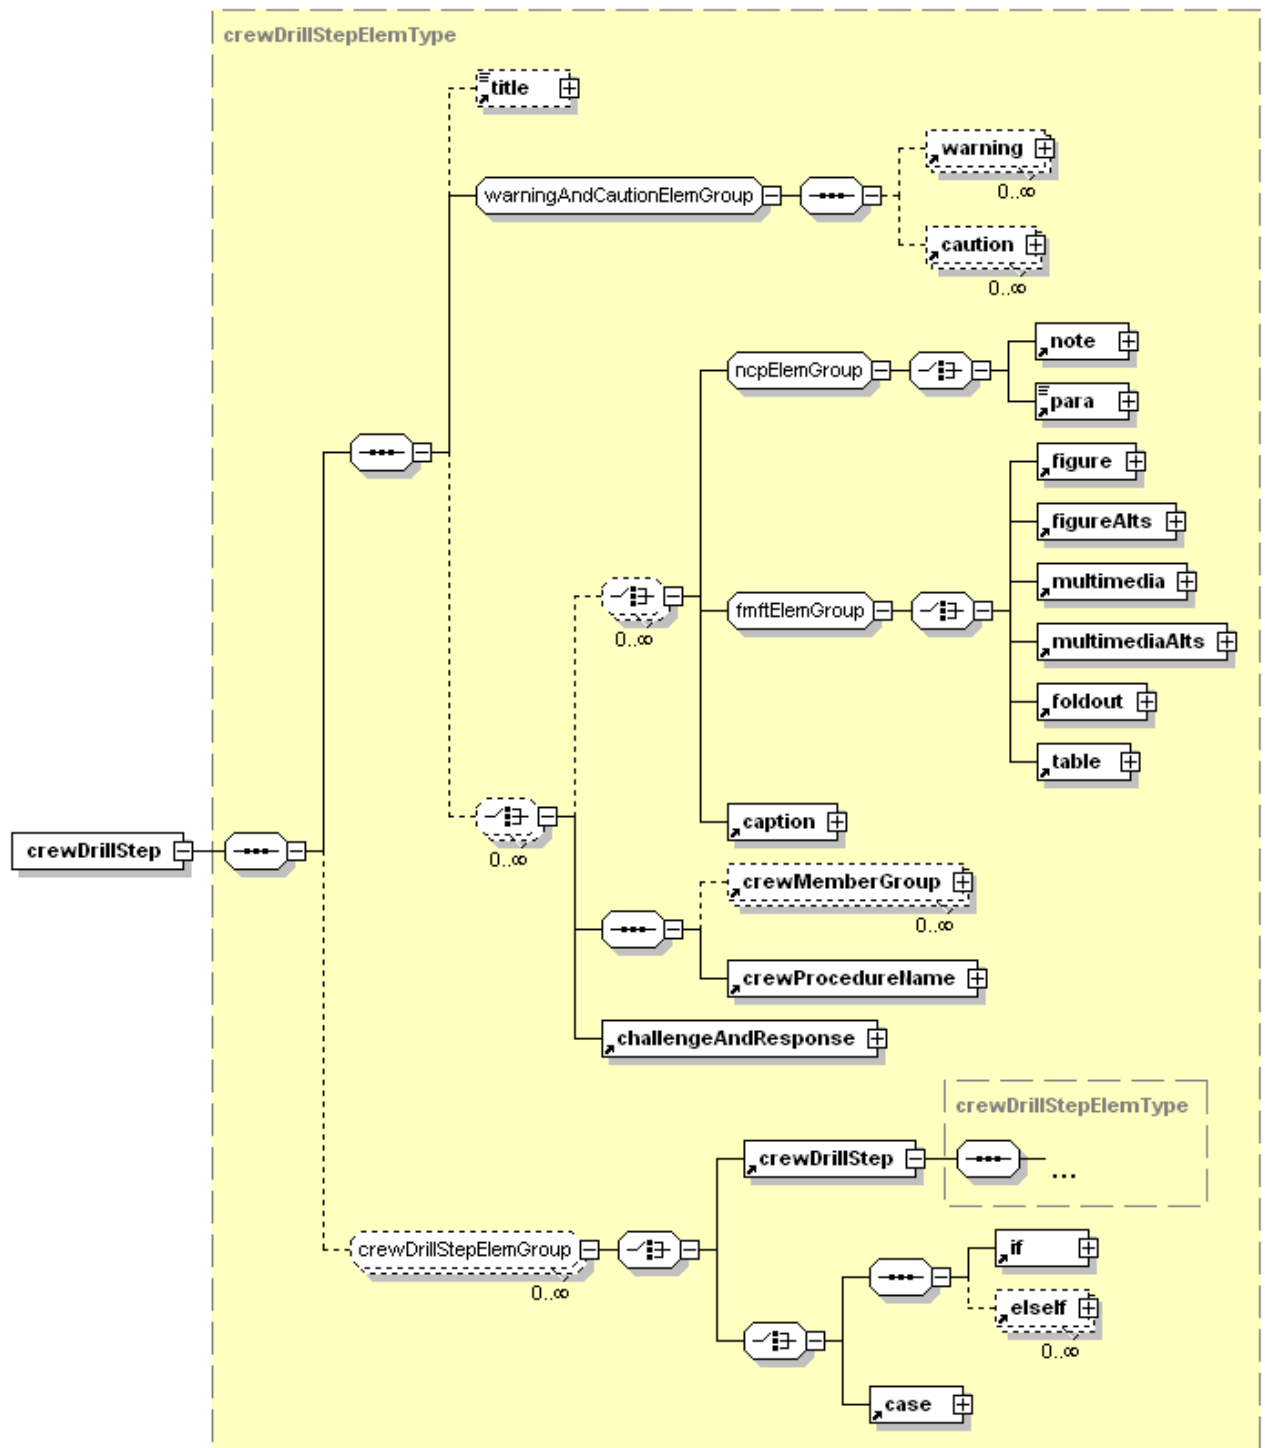

**Child elements:**

- None

**2.3.1.1.4** *Crew drill step*

**Description:** The element `<crewDrillStep>` contains a step in a crew/operator data module.

**Markup element:** `<crewDrillStep>`

ICN-83007-0000000067-001-01

Fig 5 Element `<crewDrillStep>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `stepLabel` (O), the label of the step
- `keepWithNext` (O), indicates whether a step is presented together with the next step. The attribute `keepWithNext` has no meaning when placed on a final step. It can have one of the following values:
  - "0" (D) - No, the step need not be kept with the next sibling step
  - "1" - Yes, the step must be kept with the next sibling step (if one exists) and therefore, all children of the step for which the attribute is set must be kept together as well (if possible)
- `memorizeStepsFlag` (O), indicates whether a step must be memorized by crew/operator. The attribute `memorizeStepsFlag` can have one of the following values:
  - "0" (D) - No, the step need not be memorized
  - "1" - Yes, the step must be memorized by the crew/operator
- `separatorStyle` (O), the separator characters between a challenge and a response. The attribute `separatorStyle` can have one of the following values:
  - "dot" (D) - a sequence of dots
  - "line" - a line
  - "none" - no separator
- `orderedStepsFlag` (O), indicates whether the drill steps are a chronologically ordered list. The attribute `orderedStepsFlag` can have one of the following values:
  - "1" (D) - Yes, the list is chronologically ordered
  - "0" - No, the list is not chronologically ordered
- `crewStepCondition` (O), the special conditions associated with a crew step. The attribute `crewStepCondition` can have one or more of the following values:
  - "csc01" thru "csc99". Refer to [Chap 3.9.6.1](#).
- `independentCheck` (O), the step must be checked by a supervisor with a given qualification
- `skillLevelCode` (O), the skill level required for the step. The attribute `skillLevelCode` can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

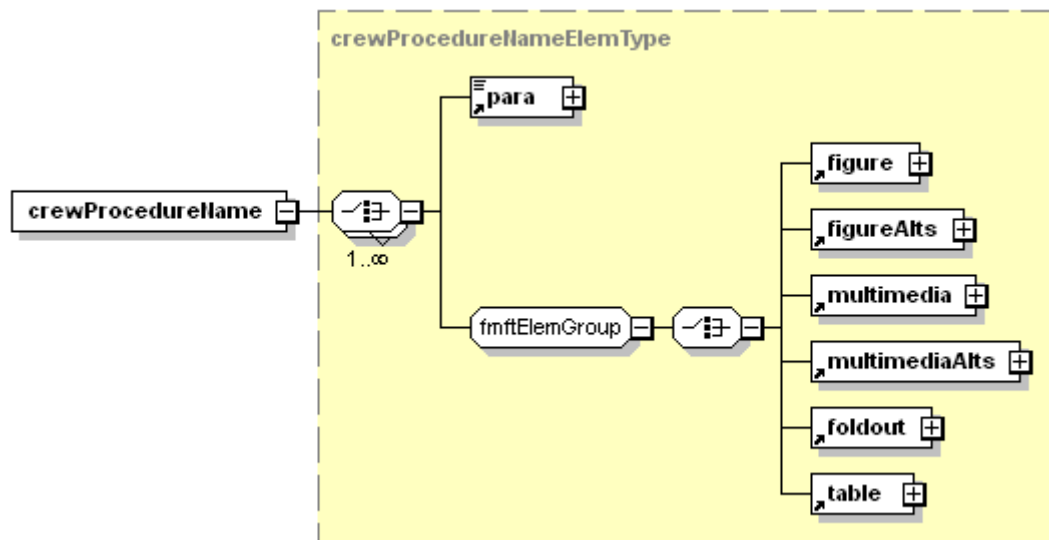

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).
- <caption>. Refer to [Chap 3.9.5.2.1.4](#).
- <crewMemberGroup>. Refer to [Para 2.3.1.1.2](#).
- <crewProcedureName>. Refer to [Para 2.3.1.1.5](#).
- <challengeAndResponse>. Refer to [Para 2.3.1.1.6](#).
- <crewDrillStep>. Refer to [Para 2.3.1.1.4](#).
- <if>. Refer to [Para 2.3.1.1.9](#).
- <elseif>. Refer to [Para 2.3.1.1.11](#).
- <case>. Refer to [Para 2.3.1.1.12](#).

#### 2.3.1.1.5 Crew/operator procedure

**Description:** The element <crewProcedureName> contains the crew/operator procedure.

**Markup element:** <crewProcedureName>

ICN-83007-0000000091-001-01

Fig 6 Element <crewProcedureName>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

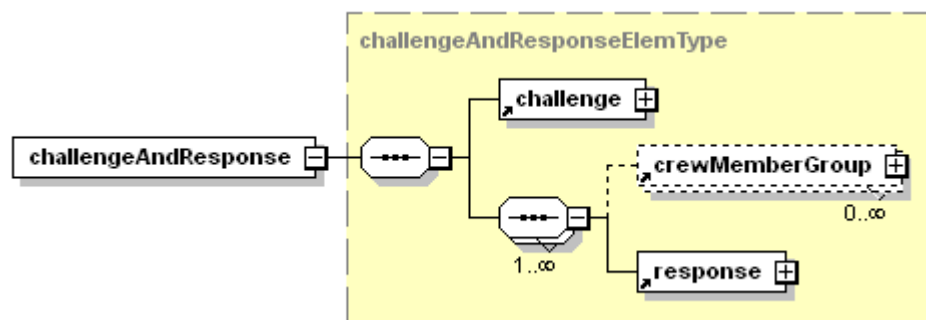

**Child elements:**

- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).

**2.3.1.1.6** *Crew/operator challenge and response*

**Description:** The element <challengeAndResponse> contains the crew/operator challenge and response.

**Markup element:** <challengeAndResponse>

ICN-83007-0000000092-001-01

Fig 7 Element <challengeAndResponse>

**Attributes:**

- None

**Child elements:**

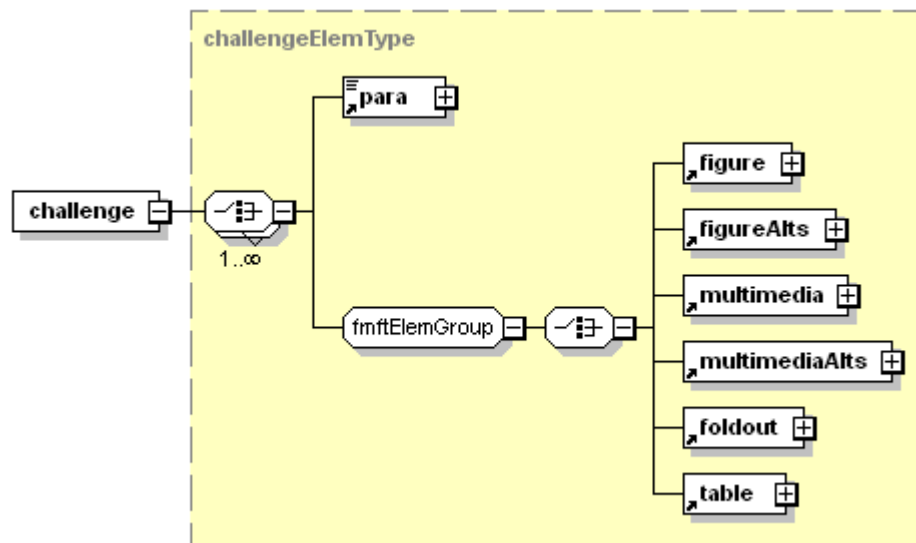

- <challenge>. Refer to [Para 2.3.1.1.7](#).
- <crewMemberGroup>. Refer to [Para 2.3.1.1.2](#).
- <response>. Refer to [Para 2.3.1.1.8](#).

**2.3.1.1.7** *Challenge*

**Description:** The element <challenge> contains the crew/operator challenge.

**Markup element:** <challenge>

ICN-83007-0000000093-001-01

Fig 8 Element &lt;challenge&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

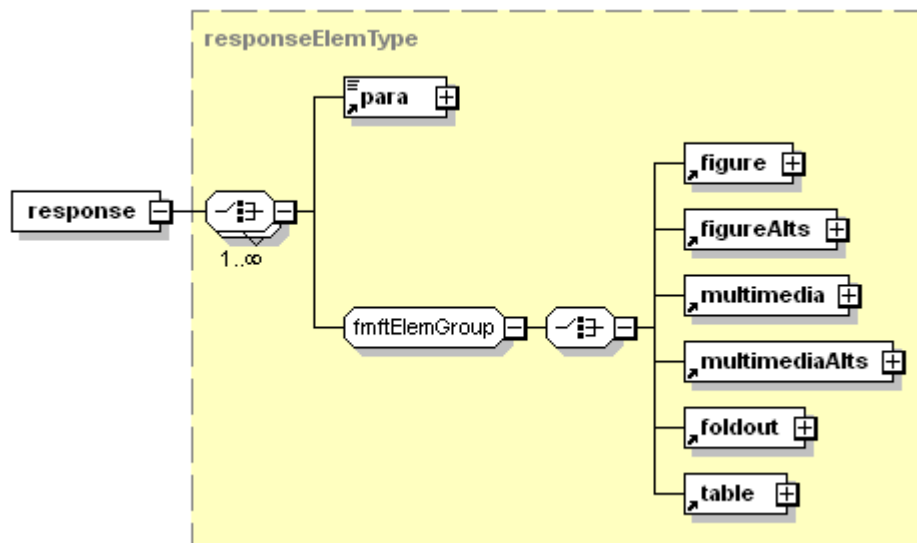

#### Child elements:

- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).

#### 2.3.1.1.8 Response

**Description:** The element <response> contains the expected response to the challenge.

**Markup element:** <response>

ICN-83007-0000000094-001-01

Fig 9 Element <response>

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).

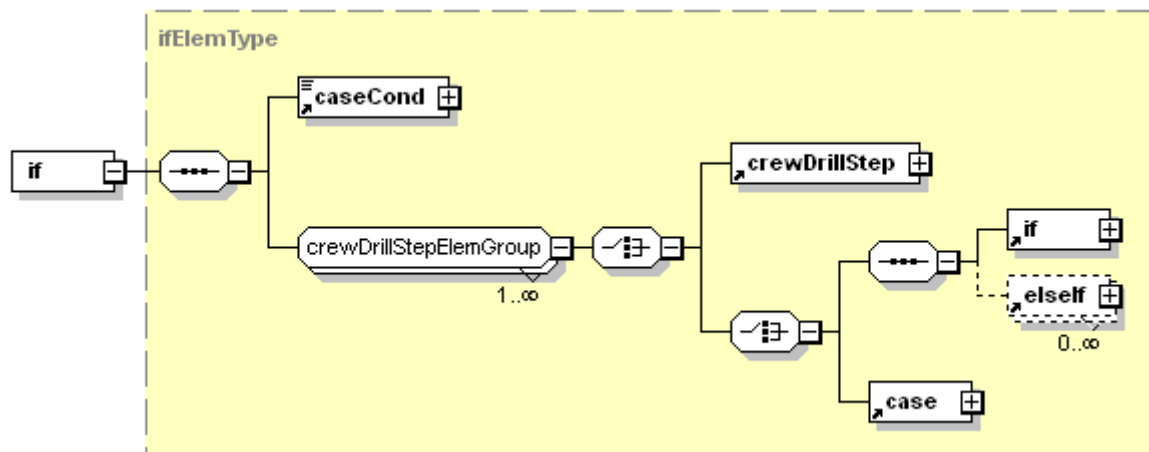

**Child elements:**

- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).

2.3.1.1.9 If statement

**Description:** The element <if> contains an "if" statement.

**Markup element:** <if>

ICN-83007-0000000095-001-01

Fig 10 Element &lt;if&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <caseCond>. Refer to [Para 2.3.1.1.10](#).
- <crewDrillStep>. Refer to [Para 2.3.1.1.4](#).
- <elseif>. Refer to [Para 2.3.1.1.11](#).
- <if>. Refer to [Para 2.3.1.1.9](#).
- <case>. Refer to [Para 2.3.1.1.12](#).

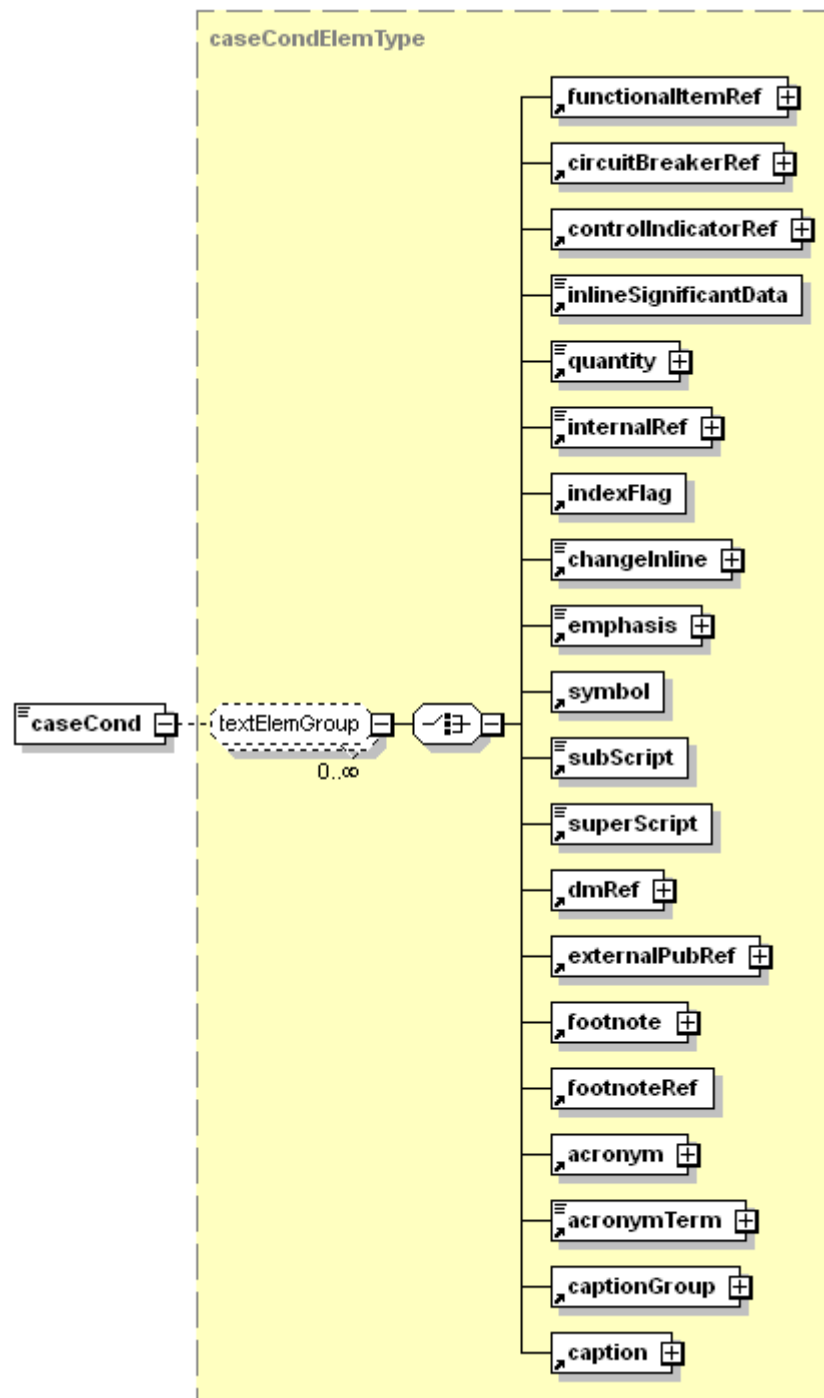

#### Markup example:

```
<if>
<caseCond>Handlebars twist in stem</caseCond>
<crewDrillStep>
<crewProcedureName><para>Tighten clamp bolt</para>
</crewProcedureName>
</crewDrillStep>
</if>
```

#### 2.3.1.1.10 Condition statement

**Description:** The element <caseCond> contains the condition as part of an "if" statement.

**Markup element:** <caseCond>

ICN-83007-0000000096-001-01

Fig 11 Element `<caseCond>`

**Attributes:**

- securityClassification (O), commercialClassification (O), caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

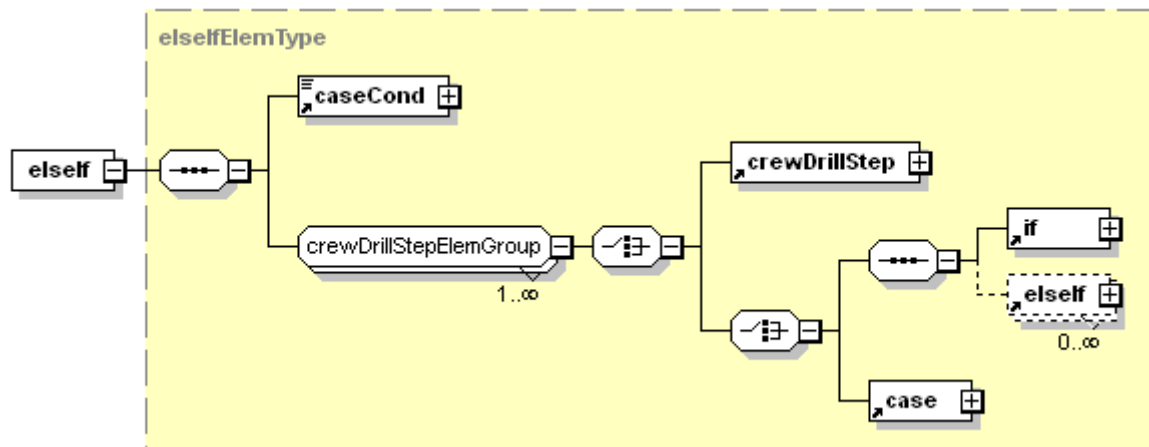

#### Child elements:

- <functionalItemRef>. Refer to [Chap 3.9.5.1](#).
- <circuitBreakerRef>. Refer to [Chap 3.9.5.2.1.10](#).
- <controlIndicatorRef>. Refer to [Chap 3.9.5.2.1.10](#).
- <inlineSignificantData>. Refer to [Chap 3.9.5.2.1.10](#).
- <quantity>. Refer to [Chap 3.9.5.2.1.10](#).
- <internalRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <indexFlag>. Refer to [Chap 3.9.5.2.1.10](#).
- <changeInline>. Refer to [Chap 3.9.5.2.1.1](#).
- <emphasis>. Refer to [Chap 3.9.5.2.1.10](#).
- <symbol>. Refer to [Chap 3.9.5.2.1.10](#).
- <subScript>. Refer to [Chap 3.9.5.2.1.10](#).
- <superScript>. Refer to [Chap 3.9.5.2.1.10](#).
- <dmRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <externalPubRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <footnote>. Refer to [Chap 3.9.5.2.1.10](#).
- <footnoteRef>. Refer to [Chap 3.9.5.2.1.10](#).
- <acronym>. Refer to [Chap 3.9.5.2.1.10](#).
- <acronymTerm>. Refer to [Chap 3.9.5.2.1.10](#).
- <captionGroup>. Refer to [Chap 3.9.5.2.1.4](#).
- <caption>. Refer to [Chap 3.9.5.2.1.4](#).

#### 2.3.1.1.11 Else-if statement

**Description:** The element <elseIf> contains an "if" statement to be used if another "if" condition is not met.

**Markup element:** <elseIf>

ICN-83007-0000000097-001-01

Fig 12 Element <elseIf>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <caseCond>. Refer to [Para 2.3.1.1.10](#).
- <crewDrillStep>. Refer to [Para 2.3.1.1.4](#).
- <case>. Refer to [Para 2.3.1.1.12](#).
- <if>. Refer to [Para 2.3.1.1.9](#).
- <elseif>. Refer to [Para 2.3.1.1.11](#).

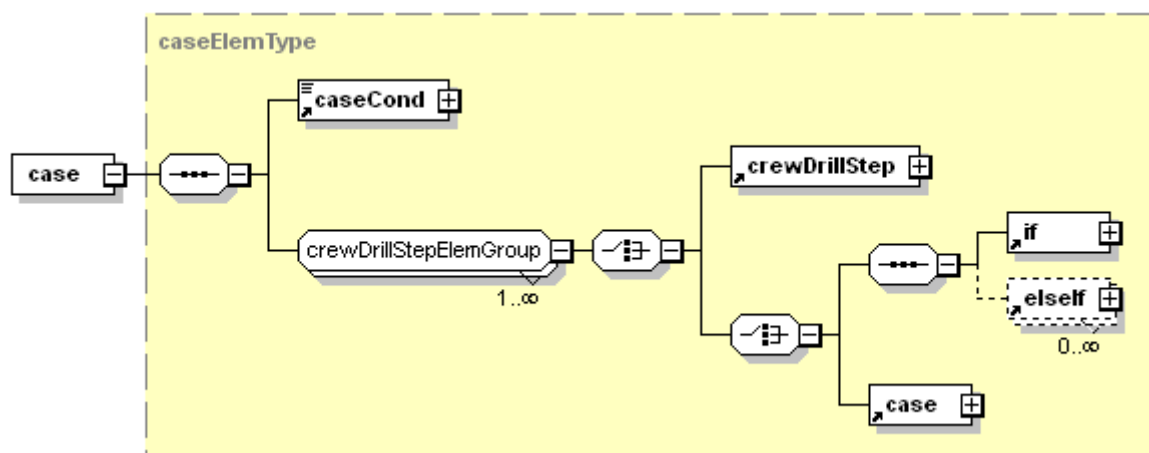

#### Markup example:

```
<elseif>
<caseCond>Clamp loose</caseCond>
<crewDrillStep>
<crewProcedureName>
<para>Tighten clamp</para>
</crewProcedureName>
</crewDrillStep>
</elseif>
```

#### 2.3.1.1.12 Case statement

**Description:** The element <case> contains a case as part of the list of possible cases.

**Markup element:** <case>

ICN-83007-0000000098-001-01

Fig 13 Element <case>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<caseCond>`. Refer to [Para 2.3.1.1.10](#).
- `<crewDrillStep>`. Refer to [Para 2.3.1.1.4](#).
- `<case>`. Refer to [Para 2.3.1.1.12](#).
- `<if>`. Refer to [Para 2.3.1.1.9](#).
- `<elseIf>`. Refer to [Para 2.3.1.1.11](#).

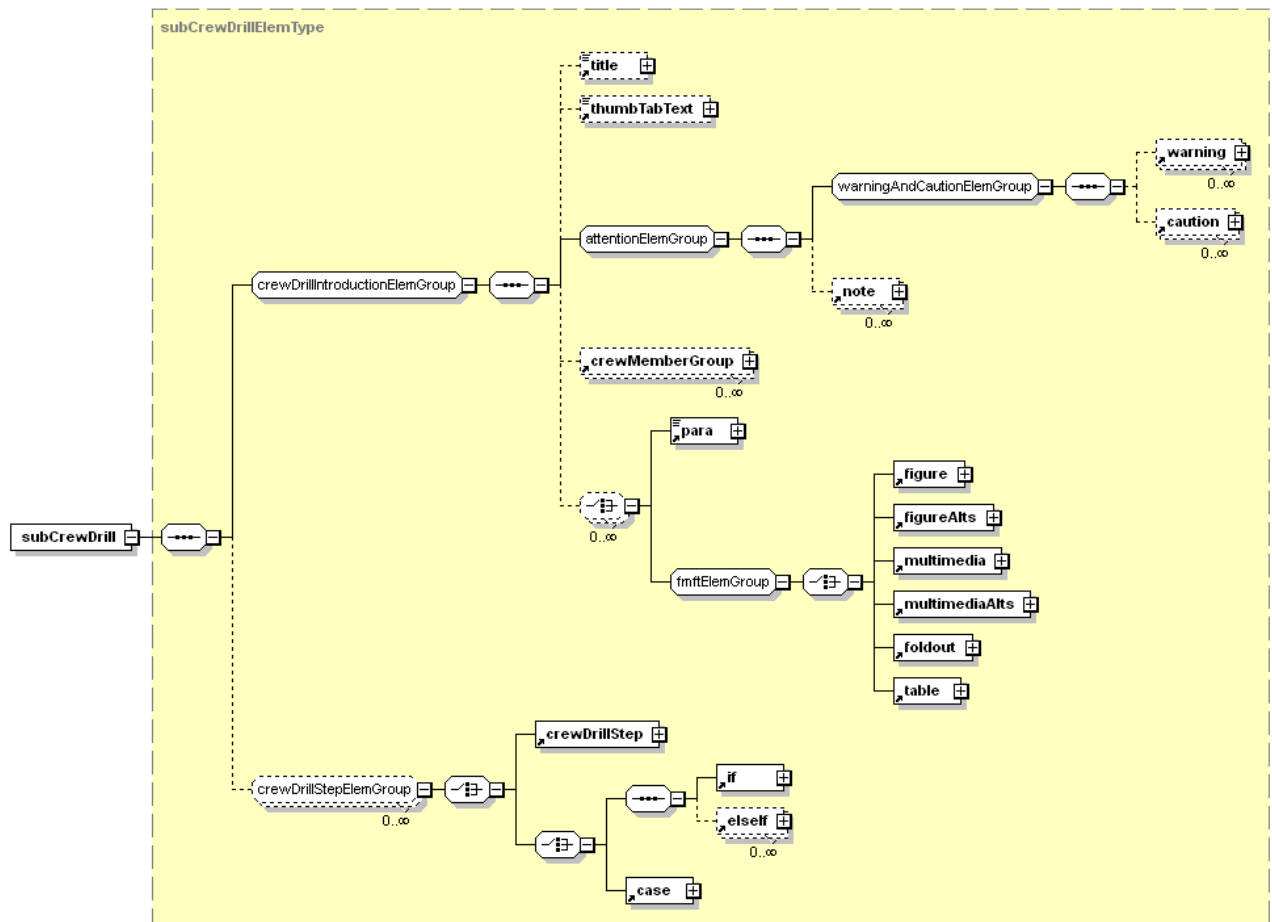

#### Markup example:

```
<case>
<caseCond>Dial set to A</caseCond>
<crewDrillStep>
<crewProcedureName>
<para>Set dial to B</para>
</crewProcedureName>
</crewDrillStep>
</case>
<case>
<caseCond>Dial set to B</caseCond>
<crewDrillStep>
<crewProcedureName>
<para>Do nothing</para>
</crewProcedureName>
</crewDrillStep>
</case>
```

#### 2.3.1.1.13 Subdrill statement

**Description:** The element `<subCrewDrill>` contains a subdrill, which is part of a crew/operator drill.

**Markup element:** `<subCrewDrill>`

ICN-83007-0000000099-001-01

Fig 14 Element `<subCrewDrill>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `orderedStepsFlag` (O), indicates whether the drill steps are a chronologically ordered list. The attribute `orderedStepsFlag` can have one of the following values:
  - "1" (D) - Yes, the list is chronologically ordered
  - "0" - No, the list is not chronologically ordered
- `independentCheck` (O), the subdrill must be checked by a supervisor with a given qualification
- `skillLevelCode` (O), the skill level required for the subdrill. The attribute `skillLevelCode` can have one of the following values:

- "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <thumbTabText>. Refer to [Para 2.3.1.1.1](#).
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <crewMemberGroup>. Refer to [Para 2.3.1.1.2](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).
- <crewDrillStep>. Refer to [Para 2.3.1.1.4](#).
- <if>. Refer to [Para 2.3.1.1.9](#).
- <elseif>. Refer to [Para 2.3.1.1.11](#).
- <case>. Refer to [Para 2.3.1.1.12](#).

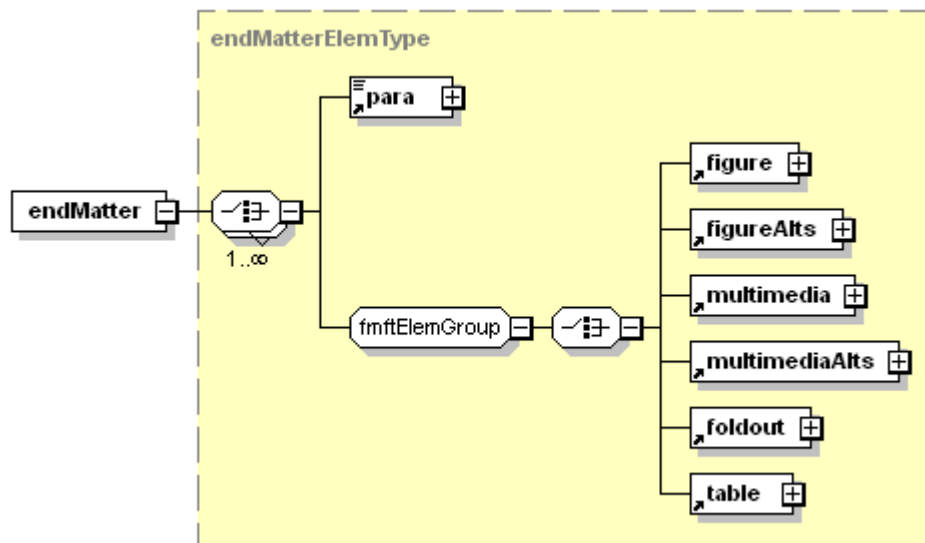

#### Markup example:

```
<subCrewDrill>

#### 2.3.1.1.14 End matter statement

**Description:** The element <endMatter> contains end matter using the element <para>.

**Markup element:** <endMatter>

ICN-83007-0000000100-001-01

Fig 15 Element <endMatter>

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).

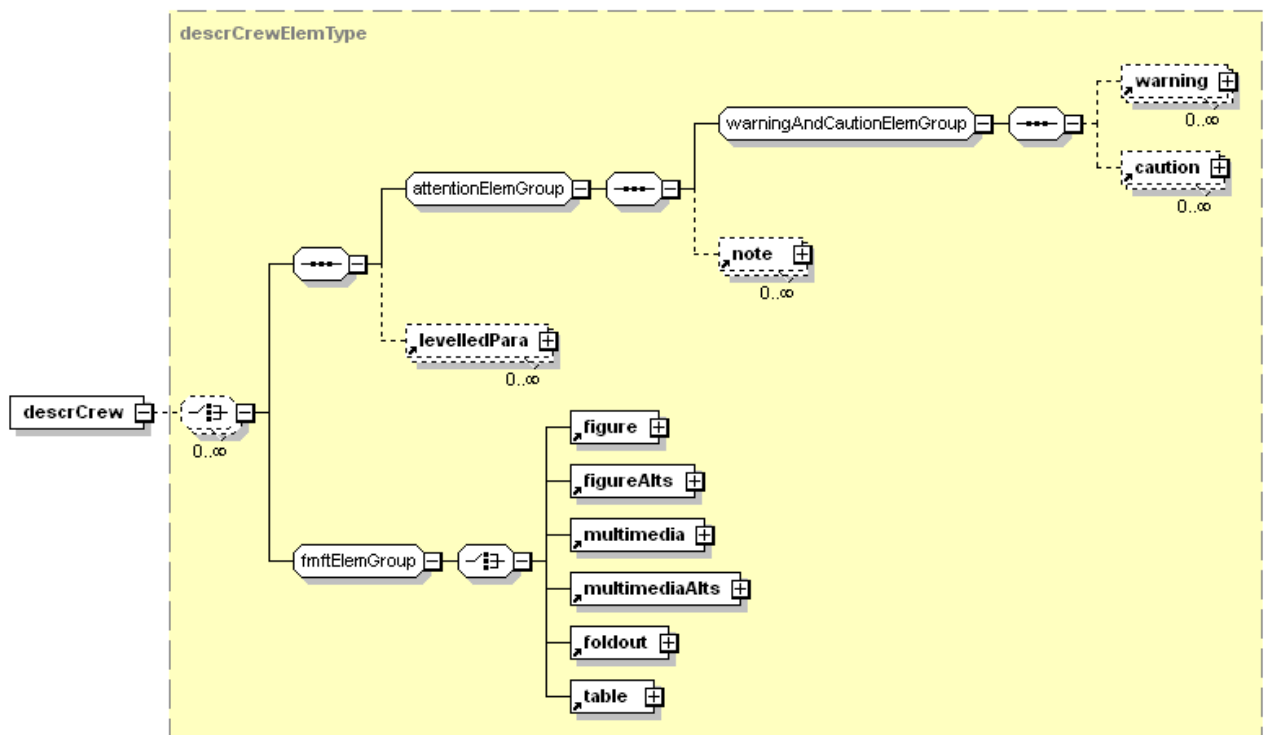

**Child elements:**

- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).

### 2.3.2 Descriptive information for crew/operators

**Description:** The element <descrCrew> contains descriptive information for use by crew/operators.

**Markup element:** <descrCrew>

ICN-83007-0000000101-001-01

Fig 16 Element &lt;descrCrew&gt;

#### Attributes:

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- securityClassification (O), commercialClassification (O), caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <levelledPara>. Refer to [Chap 3.9.5.2.2](#) with the inclusion of the element <crewDrill>. Refer to [Para 2.3.1.1](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).

#### Markup example:

## 1 General

The IPD Schema is used to capture and represent parts lists and IPD. This information can be drawn from an S2000M provisioning database or from engineering data for a non-S2000M project.

## 2 Parts information

**Description:** The element `<content>` contains the illustrated parts catalog information of a data module.

**Markup element:** `<content>`

ICN-S1000D-A-030905-D-F6117-00001-A-002-01

Fig 1 Element `<content>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

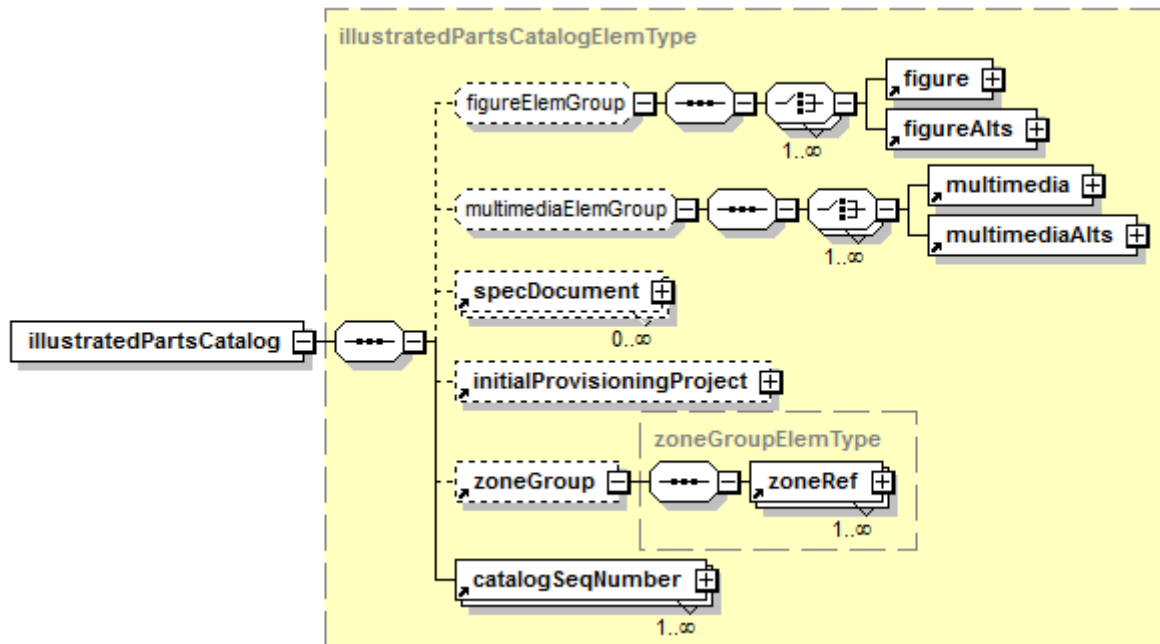

### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<illustratedPartsCatalog>`. Refer to [Para 2.1](#).

### 2.1 Illustrated parts catalog

**Description:** The element `<illustratedPartsCatalog>` contains the illustrated parts catalog information of a data module (excluding references).

Markup element: `<illustratedPartsCatalog>`

ICN-S1000D-A-030905-D-F6117-00002-A-003-01

Fig 2 Element `<illustratedPartsCatalog>`

#### Attributes:

- None

#### Child elements:

- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<figureAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.2.4](#).
- `<multimediaAlts>`. Refer to [Chap 3.9.2.4](#).
- `<specDocument>`, indicates the design office drawing from which the IPD figure is derived. Refer to [Chap 3.9.5.2.11.3](#).
- `<initialProvisioningProject>`. Refer to [Para 2.2](#).
- `<zoneGroup>`. Refer to [Para 2.3](#).
- `<catalogSeqNumber>`. Refer to [Para 2.4](#).

#### Markup example:

```
<illustratedPartsCatalog>
<figure>...</figure>
<initialProvisioningProject>...</initialProvisioningProject>
<catalogSeqNumber systemCode="72" subSystemCode="0"
subSubSystemCode="1" assyCode="67" figureNumber="10" item="001"
itemVariant="A" indenture="1">...</catalogSeqNumber>
</illustratedPartsCatalog>
```

## 2.2 Initial provisioning project number

**Description:** The element `<initialProvisioningProject>` contains the information regarding the initial provisioning project (IPP).

Markup element: `<initialProvisioningProject>`

ICN-S1000D-A-030905-D-F6117-00010-A-001-01

Fig 3 Element `<initialProvisioningProject>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- initialProvisioningProjectNumber (M), provides the means to break the complete IPP information into manageable sections. This allows for the identification of spares and the regulation of processes by section. The first five characters contain the CAGE code. The sixth to the ninth characters are a serial number allocated by the project or the organization. The initial provisioning project number (IPPN) must be unique.
- initialProvisioningProjectNumberSubject (M), the IPPN subject which contains the first 19 characters of the description for part (DFP) in accordance with S2000M.
- fileIdent (O), the file identifier (FID) which indicates whether the IPPN is for the complete Product or a component. The attribute can have one of the following values:
  - "s" - complete Product
  - "t" - component part of the Product
- languageCode (O), the language code (LGE) which contains the code for the language in which the data is transmitted. It must be populated with the user (nation) code.
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<subjectVariantSegment>`. Refer to [Para 2.2.1](#).

#### Markup example:

```
<initialProvisioningProject
initialProvisioningProjectNumber="F61172312"
initialProvisioningProjectNumberSubject="Servo actuator"
fileIdent="t">...</initialProvisioningProject>
```

### 2.2.1 Subject variant

**Description:** The element `<subjectVariantSegment>` identifies the S2000M subject variant segment (VAS). It is an extension of the IPPN to store information regarding the identification (part number, manufacturer (CAGE code) and NATO stock number) of the subject for which the IPP has been prepared. In cases where the IPP presents data against variants of the subject, the element `<subjectVariantSegment>` is repeated the appropriate number of times to hold all the variants' identifications.

If the element `<subjectVariantSegment>` is not used, then the corresponding information can be retrieved from the first data module (figure) of the IPP which means from all first CSN. In the formatted CSN, these are the digits 10 thru 13 for the six character SNS and 13

thru 16 for the nine character SNS. These four digits represent the item number (given by the attribute `item`) and the item number variant (given by the attribute `itemVariant`).

**Markup element:** `<subjectVariantSegment>`

**Attributes:**

- None

**Child elements:**

- `<subjectIdent>`. Refer to [Para 2.2.1.1](#).
- `<natoStockNumber>`. Refer to [Para 2.2.1.2](#).

#### 2.2.1.1 Subject identification

**Description:** The element `<subjectIdent>` contains the subject's identification (SID) and provides identification of the item, or items, which are the subjects of the IPPN.

**Markup element:** `<subjectIdent>`

**Attributes:**

- None

**Child elements:**

- `<manufacturerCode>`. Refer to [Para 2.2.1.1.1](#).
- `<partNumber>`. Refer to [Para 2.2.1.1.2](#).

##### 2.2.1.1.1 Manufacturer

**Description:** The element `<manufacturerCode>` contains an identifier for the manufacturer of the equipment. The textual content is the CAGE code for the manufacturer.

**Markup element:** `<manufacturerCode>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

##### 2.2.1.1.2 Part number

**Description:** The element `<partNumber>` contains the part number of an item. This part number is allocated by the design authority of the equipment.

**Markup element:** `<partNumber>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

#### 2.2.1.2 NATO stock number

**Description:** The element `<natoStockNumber>` contains the NATO stock number (NSN) of the equipment. The primary method to populate the element `<natoStockNumber>` is to populate its constituent parts by using the three attributes `natoSupplyClass`, `natoCodificationBureau` and `natoItemIdentNumberCore`.

**Note**

An alternative method is to populate its child element `<fullNatoStockNumber>` ready for presentation.

**Note**

It is recommended not to use the textual content of the element `<natoStockNumber>` itself.

The NSN is built up of 13 digits:

- NATO supply classification (NSC) - 4 digits
- National codification bureau (NCB) - 2 digits
- Non-significant number assigned by the NCB - 7 digits

**Note**

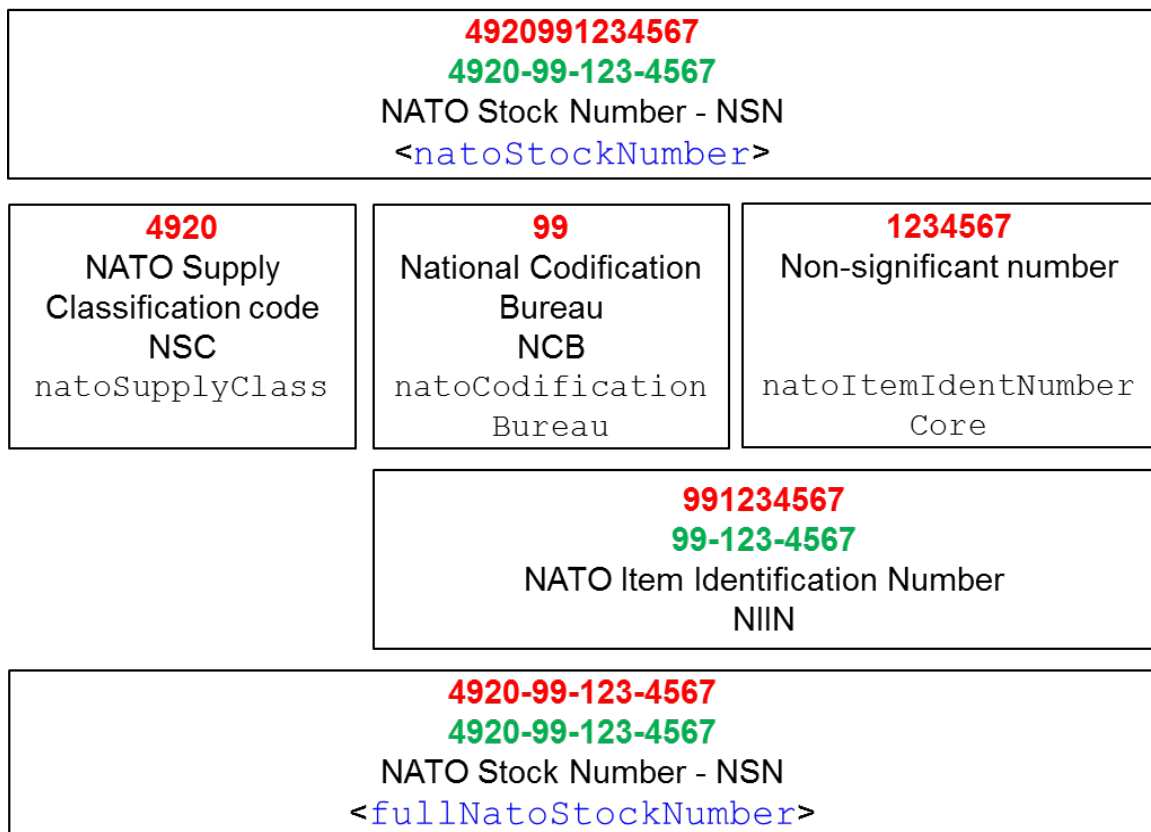

The non-significant number is split into three + four digits, separated by a hyphen, at presentation.

**Note**

The NSN can be incomplete in an IPD. For example, the NCB and/or the non-significant number not being set yet. When used in procedures, for example, in preliminary requirements, the complete NSN must be given.

**Example:**

Refer to [Fig 4](#).

Data format

Format at presentation

ICN-S1000D-A-030905-D-F6117-00011-A-001-01

*Fig 4 NSN data format and format for presentation*

**Markup element:** <natoStockNumber>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- natoSupplyClass (O), the NSC (first part of the NSN)
- natoCodificationBureau (O), the NCB (second part of the NSN)
- natoItemIdentNumberCore (O), the non-significant number (third part of the NSN)

**Note**

The content of the attribute natoItemIdentNumberCore must not include hyphens.

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <fullNatoStockNumber>, contains the NSN as a text string with its constituent parts separated by hyphens (eg, "4920-99-123-4567") ready for presentation. Refer to [Fig 4](#).

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<natoStockNumber natoSupplyClass="4920"
natoCodificationBureau="99" natoItemIdentNumberCore="1234567"/>
```

## 2.3 Zones

**Description:** The element `<zoneGroup>` contains the zoning information of a figure, in order to know where components, described in a figure, are installed on the Product. For instance, in case of damage, this enables that all figures impacted by the damage can easily be identified.

**Markup element:** `<zoneGroup>`

**Attributes:**

- None

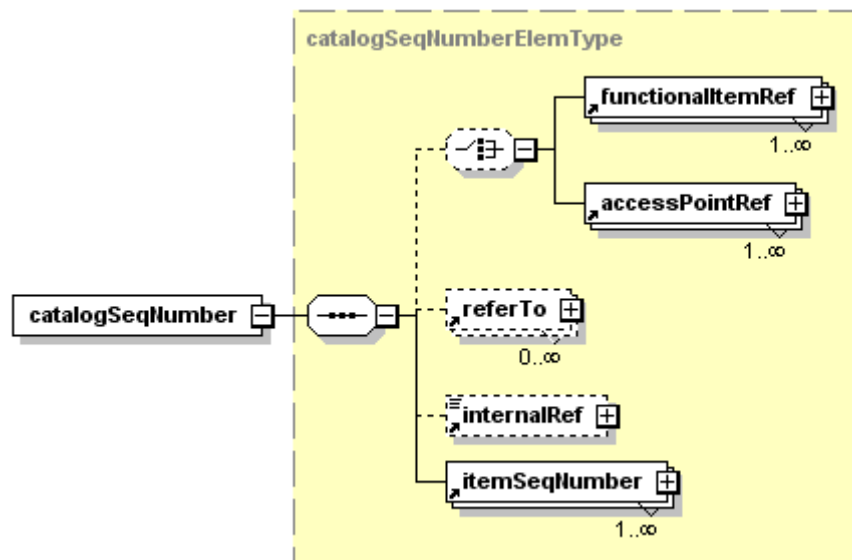

**Child elements:**

- `<zoneRef>`. Refer to [Chap 3.9.5.2.1.10](#).

## 2.4 Catalog sequence number

**Description:** The element `<catalogSeqNumber>` contains the catalog sequence number and all related parts information.

**Markup element:** `<catalogSeqNumber>`

ICN-S1000D-A-030905-D-F6117-00003-A-002-01

Fig 5 Element `<catalogSeqNumber>`

There are specific rules for IPD data modules as follows:

- Chapterized IPD data modules have a data module code with the SNS of the Product as given in [Chap 8](#).
- Non-chapterized IPD data modules, where S2000M is used, have a data module code with a specific SNS as given in [Chap 4.3.3](#).
- For a non-chapterized IPD, where S2000M is not used, the project defines values for the SNS attributes and follows the rules for a chapterized IPD. Refer to [Chap 4.3.3](#).

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `systemCode` (O), the system code of the data module code of the IPD data module that contains the CSN. For a non-chapterized IPD, the attribute `systemCode` must not be used. For a chapterized IPD, the attribute `systemCode` is mandatory. Refer to default BREX rules BREX-S1-00087 and BREX-S1-00088.
- `subSystemCode` (O), the subsystem code of the data module code of the IPD data module that contains the CSN. For a non-chapterized IPD, the attribute `subSystemCode` must not be used. For a chapterized IPD, the attribute `subSystemCode` is mandatory. Refer to default BREX rules BREX-S1-00087 and BREX-S1-00088.
- `subSubSystemCode` (O), the sub-subsystem code of the data module code of the IPD data module that contains the CSN. For a non-chapterized IPD, the attribute `subSubSystemCode` must not be used. For a chapterized IPD, the attribute `subSubSystemCode` is mandatory. Refer to default BREX rules BREX-S1-00087 and BREX-S1-00088.
- `assyCode` (O), the assembly code of the data module code of the IPD data module that contains the CSN. For a non-chapterized IPD, the attribute `assyCode` must not be used. For a chapterized IPD, the attribute `assyCode` is mandatory. Refer to default BREX rules BREX-S1-00087 and BREX-S1-00088.
- `figureNumber` (M), the figure number (as specified in the disassembly code) of the data module code of the IPD data module that contains the CSN.
- `figureNumberVariant` (O), the figure number variant (as specified in the disassembly code variant) of the data module code of the IPD data module that contains the CSN. If there is no figure number variant, then the disassembly code variant of the IPD data module code must be "0". Refer to default BREX rules BREX-S1-00081, BREX-S1-00083 and BREX-S1-00085.
- `item` (M), the item number of the CSN.
- `itemVariant` (O), the item number variant of the CSN. Refer to default BREX rules BREX-S1-00082, BREX-S1-00084 and BREX-S1-00086.
- `indenture` (M), the indenture level (IND) of an item. This single character numeric code indicates the hierarchical level of an item within the breakdown of a figure. The attribute can have one of the following values:
  - "1" thru "9" - the indenture level of an item
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<functionalItemRef>`. Refer to [Para 2.4.1](#).
- `<accessPointRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<referTo>`. Refer to [Para 2.4.2](#).
- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<itemSeqNumber>`. Refer to [Para 2.5](#).

The CSN attributes are used to build up a code for hyperlinking and for creating the data module code of the IPD data module that contains the CSN. The code is made up as shown in [Table 2](#) and [Table 3](#).

*Table 2 Catalog sequence number - When using a six character SNS*

Position	Content for chapterized IPD	Content for non-chapterized IPD	CSN attribute
1 and 2	System (from the SNS)	omit the attribute	systemCode
3	Subsystem (from the SNS)	omit the attribute	subSystemCode
4	Sub-subsystem (from the SNS)	omit the attribute	subSubSystemCode
5 and 6	Unit or assembly (from the SNS)	omit the attribute	assyCode
7 and 8	Figure number	Figure number	figureNumber
9	Figure number variant	Figure number variant	figureNumberVariant
10, 11 and 12	Item number	Item number	item
13	Item number variant	Item number variant	itemVariant

*Table 3 Catalog sequence number - When using a nine character SNS*

Position	Content for chapterized IPD	Content for non-chapterized IPD - S2000M only	CSN attribute
1, 2 and 3	System incl material item category code (from the SNS)	omit the attribute	systemCode
4	Subsystem (from the SNS)	omit the attribute	subSystemCode
5	Sub-subsystem (from the SNS)	omit the attribute	subSubSystemCode
6, 7, 8 and 9	Unit or assembly (from the SNS)	omit the attribute	assyCode
10 and 11	Figure number	Figure number	figureNumber
12	Figure number variant	Figure number variant	figureNumberVariant
13, 14 and 15	Item number	Item number	item
16	Item number variant	Item number variant	itemVariant

When a CSN is given for the Product (chapterized IPD), the complete content of the CSN must be provided. If the figure number variant (attribute `figureNumberVariant`) and the item number variant (attribute `itemVariant`) do not apply to this figure, then these attributes must not be used.

For example, the following markup:

```
<catalogSeqNumber systemCode="72" subSystemCode="0"
subSubSystemCode="1" assyCode="67" figureNumber="10"
item="000" indenture="1">...</catalogSeqNumber>
```

gives the CSN reference "72-01-67 Fig 10 Item 000".

When a CSN is contained in the separate IP presentation of equipment (non-chapterized IPD) then only the last seven characters are applicable and the first six characters are to be filled with spaces. This means that the CSN attributes `systemCode`, `subSystemCode`, `subSubSystemCode` and `assyCode` must not be used.

For example, the following markup:

```
<catalogSeqNumber figureNumber="01"
item="001">...</catalogSeqNumber>
```

gives the CSN reference "Fig 01 Item 001".

#### 2.4.1 Functional item

**Description:** The element `<functionalItemRef>` contains a functional item and also allows referring to its definition in the functional item common information repository (CIR) data module, for a project or an organization implementing the CIR.

This optional link is addressed through either the identification of the functional item or the identification of the access point. Refer to [Chap 3.9.5.2.1.10](#).

For IPD, the functional item can be populated at the CSN level or at the item sequence number (ISN) level.

A functional item is also known as a reference designator.

For more information on the element `<functionalItemRef>`, refer to [Chap 3.9.5.1](#).

#### 2.4.2 Refer to

**Description:** The element `<referTo>` contains a reference to multiple IPP or CSN.

##### Note

The next higher assembly and refer for detail values provides a two way link between the two locations that an item has when it appears in the breakdown of one figure and is 'referred out' to a separate figure which is created to present the breakdown of that item.

**Markup element:** `<referTo>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `refType` (O), the qualifier of the "refer to" link. The attribute can have one of the following values:
  - "rft01" thru "rft08". Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <[initialProvisioningProjectRef](#)>. Refer to [Para 2.4.2.1](#).
- <[catalogSeqNumberRef](#)>. Refer to [Para 2.4.2.2](#).
- <[functionalItemRef](#)>. Refer to [Chap 3.9.5.1](#).
- <[refs](#)>. Refer to [Chap 3.9.5.2.1.2](#).

## 2.4.2.1 Refer to IPP

**Description:** The element <[initialProvisioningProjectRef](#)> contains a reference to another IPP for non-chapterized IPD (in an electronic IPD publication it mainly addresses the first CSN of the referenced IPPN).

**Markup element:** <[initialProvisioningProjectRef](#)>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- initialProvisioningProjectNumber (M), the IPPN of the referenced IPP.
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

## 2.4.2.2 Refer to CSN

**Description:** The element <[catalogSeqNumberRef](#)> contains a reference to another CSN. For non-S2000M projects the attributes systemCode, subSystemCode, subsubSystemCode and assyCode are used to refer to the SNS of the reference target. For non-S2000M projects, the attributes initialProvisioningProjectNumber and responsiblePartnerCompanyCode must not be used.

**Markup element:** <[catalogSeqNumberRef](#)>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- modelIdentCode (O), the model identification code or project name. Refer to [Chap 4.3.1](#).
- systemDiffCode (O), the system difference code. Refer to [Chap 4.3.2](#).
- systemCode (O), the system code of the data module code of the IPD data module that contains the CSN. For non-chapterized IPD, S2000M only, the attribute systemCode must not be used. For chapterized IPD, the attribute systemCode is mandatory. Refer to default BREX rule BREX-S1-00089.
- subSystemCode (O), the subsystem code of the data module code of the IPD data module that contains the CSN. For non-chapterized IPD, S2000M only, the attribute subSystemCode must not be used. For chapterized IPD, the attribute subSystemCode is mandatory. Refer to default BREX rule BREX-S1-00089.

- subSubSystemCode (O), the sub-subsystem code of the data module code of the IPD data module that contains the CSN. For non-chapterized IPD, S2000M only, the attribute subSubSystemCode must not be used. For chapterized IPD, the attribute subSubSystemCode is mandatory. Refer to default BREX rule BREX-S1-00089.
- assyCode (O), the assembly code of the data module code of the IPD data module that contains the CSN. For non-chapterized IPD, S2000M only, the attribute assyCode must not be used. For a chapterized IPD, the attribute assyCode is mandatory. Refer to default BREX rule BREX-S1-00089.
- figureNumber (M), the figure number (as specified in the disassembly code) of the data module code of the IPD data module that contains the CSN.
- figureNumberVariant (O), the figure number variant (as specified in the disassembly code variant) of the data module code of the IPD data module that contains the CSN. If there is no figure number variant, then the disassembly code variant of the IPD data module code must be "0".
- item (M), the item of the CSN
- itemVariant (O), the item variant of the CSN
- itemLocationCode (O), the item location code. Refer to [Chap 4.3.8](#).
- itemSeqNumberValue (O), the referenced ISN
- initialProvisioningProjectNumber (O), the referenced IPPN. This is used for non-chapterized CSN references, in projects or organizations using S2000M, in accordance with [Para 2.2](#).
- responsiblePartnerCompanyCode (O), the responsible partner company expressed as a project specific, one character code when referencing a non-chapterized parts data module. Refer to [Chap 4.3.3](#).

#### Note

This code identifies an enterprise like a CAGE code. However, it must be a single character code, because it is used to generate the reference data module code. Refer to [Chap 5.3.1.3](#).

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Note

For chapterized IPD, to define the data module code that contains the given CSN, use the attributes modelIdentCode, systemDiffCode, systemCode, subsystemCode, subsubsystemCode, assyCode, figureNumber (which will be the disassembly code) and figureNumberVariant (which will be the disassembly code variant), value "941" (which is always the information code on an IPD data module), the value "A" (which is always the infoCodeVariant for IPD data modules) and the value "D" of the attribute itemLocationCode, as shown in the markup example.

For non-chapterized IPD, non-S2000M projects have defined values for the SNS attributes and follow the rules for a chapterized IPD.

For non-chapterized IPD, S2000M projects apply the same method, but substitute the absent values of the attributes systemCode, subsystemCode, subSubSystemCode, subSubSystemCode and assyCode with the values "Z" or "ZZ", followed by the value of the attribute

responsiblePartnerCompanyCode, followed by the last four characters of the value of attribute initialProvisioningProjectNumber, as defined in [Para 2.2](#).

#### Note

The element `<catalogSeqNumberRef>` also includes five attributes normally populated by applications to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup examples:

The following markup example will generate a link to the IPD data module DMC-E2-A-11-22-33-01A-941A-D and refers to the CSN "11-22-33 Fig 01A Item 001A".

```
<catalogSeqNumberRef modelIdentCode="E2" systemDiffCode="A"
systemCode="11" subSystemCode="2" subSubSystemCode="2"
assyCode="33" figureNumber="01" figureNumberVariant="A"
item="001" itemVariant="A" itemSeqNumberValue="00A"
itemLocationCode="D"/>
```

The following markup example will generate a link to the IPD data module DMC-E2-A-11-22-33-010-941A-D and refers to CSN "11-22-33-01 Fig 01 Item 001A".

```
<catalogSeqNumberRef modelIdentCode="E2" systemDiffCode="A"
systemCode="11" subSystemCode="2" subSubSystemCode="2"
assyCode="33" figureNumber="01" item="001" itemVariant="A"
itemSeqNumberValue="00A" itemLocationCode="D"/>
```

The following markup example will generate a link to the non-chapterized IPD data module DMC-E2-A-ZR-99-AA-010-941A-D and refers to CSN "Fig 01 Item 001A".

```
<catalogSeqNumberRef responsiblePartnerCompanyCode="R"
initialProvisioningProjectNumber="F611799AA" modelIdentCode="E2"
systemDiffCode="A" figureNumber="01" item="001" itemVariant="A"
itemSeqNumberValue="00A" itemLocationCode="D"/>
```

```

## 2.5 Item sequence number

**Description:** The element `<itemSeqNumber>` contains the item sequence number. It also contains elements which store metadata about the item.

**Markup element:** `<itemSeqNumber>`

ICN-S1000D-A-030905-D-F6117-00004-A-002-01

Fig 6 Element `<itemSeqNumber>`

#### Attributes:

- `applicRefIds` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `itemSeqNumberValue` (M), contains the ISN. Positions one and two of the ISN comprise a sequence number, the first number being "00". Position three contains an alphanumeric variant code.
- `partStatus` (O), the status of the part according to the product configuration (basic part, spare, etc). The attribute can have one of the following values:
  - "pst01" thru "pst99". Refer to [Chap 3.9.6.1](#).
- `partCharacteristic` (O), indicates special part characteristics. The attribute can have one or more of the following values:
  - "pc01" thru "pc99". Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<reasonForSelection>`. Refer to [Para 2.5.1](#).
- `<quantityPerNextHigherAssy>`. Refer to [Para 2.5.2](#).
- `<totalQuantity>`. Refer to [Para 2.5.3](#).
- `<removalOrInstallationQuantity>`, the quantity needed for one component. This quantity is provided for parts that need to be manipulated to remove or install a given component. Refer to [Para 2.5.4](#).
- `<partRef>`, the part reference. Refer to [Chap 3.9.5.2.1.10](#).
- `<partSegment>`, the part identity information. Refer to [Para 2.5.5](#).
- `<partLocationSegment>`, the part location information. Refer to [Para 2.5.6](#).
- `<applicabilitySegment>`, the applicability information. Refer to [Para 2.5.7](#).
- `<categoryOneContainerLocation>`, the container information. Refer to [Para 2.5.8](#).
- `<locationRcmdSegment>`, the location recommendation information. Refer to [Para 2.5.9](#).
- `<functionalItemRef>`, the functional item reference. Refer to [Chap 3.9.5.1](#).
- `<ilsNumber>`, the integrated logistics information. Refer to [Para 2.5.10](#).
- `<changeAuthorityData>`, the change authority information. Refer to [Para 2.5.11](#).
- `<genericPartDataGroup>`, the project specific information. Refer to [Para 2.5.12](#).

### 2.5.1

#### Reason for selection

**Description:** The element `<reasonForSelection>` contains the reason for selection (RFS) of an item.

**Markup element:** `<reasonForSelection>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- reasonForSelectionValue (M), the RFS value. The attribute can have one of the following values:
  - "0" thru "9". Refer to [Table 4](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

Table 4 Reason for selection

Value	Reason
"0"	Not a recommended spare
"1"	Wear
"2"	Maintenance damage
"3"	Loss
"4"	Vibration
"5"	Corrosion
"6"	Deterioration
"7"	Extreme temperature
"8"	Other
"9"	Accidental damage (Insurance)

**Child elements:**

- None

## 2.5.2 Quantity per next higher assembly

**Description:** The element [<quantityPerNextHigherAssy>](#) contains the quantity per next higher assembly (QNA) of an item. If the item is included for reference only the letters "REF" are entered. If the quantity cannot be established or it is otherwise not appropriate to include the data, the letters "AR" (as required) are entered.

**Markup element:** [<quantityPerNextHigherAssy>](#)

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

### 2.5.3 Total quantity

**Description:** The element `<totalQuantity>` contains the total number of units of the subject part used in the complete assembly of the Product. This information can be used to build the alphanumeric index.

**Markup element:** `<totalQuantity>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

### 2.5.4 Removal or installation quantity

**Description:** The element `<removalOrInstallationQuantity>` contains the number of units of the subject part required to remove or install one component. This information can be used to build the alphanumeric index.

**Markup element:** `<removalOrInstallationQuantity>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

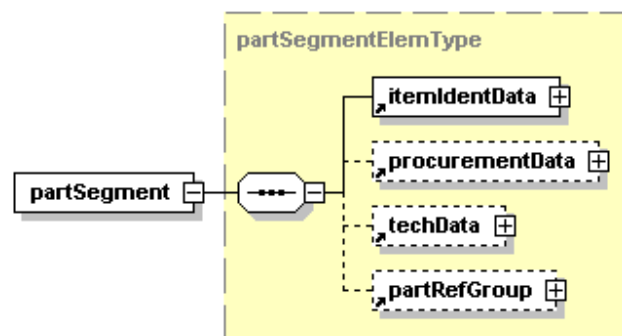

- None

### 2.5.5 Part data

**Description:** The element `<partSegment>` contains data pertaining to the part, independent of the location. The element `<partSegment>` is optional as part data can also be stored in the part CIR. Refer to [Chap 3.9.5.2.11.3](#).

For an S2000M project, the element `<partSegment>` partly corresponds to the S2000M part identity segment (PAS). It "partly" corresponds because it has additional information suitable for a non-S2000M project.

**Markup element:** `<partSegment>`

ICN-S1000D-A-030905-D-F6117-00005-A-001-01

Fig 7 Element `<partSegment>`

**Attributes:**

- None

**Child elements:**

- `<itemIdentData>`. Refer to [Para 2.5.5.1.](#)
- `<procurementData>`. Refer to [Para 2.5.5.2.](#)
- `<techData>`. Refer to [Para 2.5.5.3.](#)
- `<partRefGroup>`. Refer to [Para 2.5.5.4.](#)

**Business rule decision point BRDP-S1-00219 - Use of the element `<partSegment>` in the element `<itemSeqNumber>`:**

- Decide whether to use the element `<partSegment>` to store the part data in the IPD data module each time the part is listed, or store the part data once externally in the part CIR data module.

**Note**

The element `<partSegment>` must be used for S2000M IPD data modules.

## 2.5.5.1

Description data

**Description:** The element `<itemIdentData>` groups the properties that describe the part.

**Markup element:** `<itemIdentData>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2.](#)
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1.](#)
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6.](#)

**Child elements:**

- `<descrForPart>`. Refer to [Para 2.5.5.1.1.](#)
- `<partKeyword>`. Refer to [Para 2.5.5.1.2.](#)
- `<shortName>`. Refer to [Para 2.5.5.1.3.](#)
- `<overLengthPartNumber>`. Refer to [Para 2.5.5.1.4.](#)
- `<limitedPartNumber>`. Refer to [Para 2.5.5.1.5.](#)
- `<customerStockNumber>`. Refer to [Para 2.5.5.1.6.](#)
- `<natoStockNumber>`. Refer to [Para 2.2.1.2.](#)

## 2.5.5.1.1

Description for part

**Description:** The element `<descrForPart>` contains a detailed description for a part. It corresponds to the S2000M data element DFP and must be the identifying noun of the item, followed by appropriate adjective and further details, if necessary.

**Markup element:** `<descrForPart>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1.](#)

**Child elements:**

- None

2.5.5.1.2 *Part keyword*

**Description:** The element `<partKeyword>` contains the single word name of a part as defined by the project or the organization.

**Markup element:** `<partKeyword>`

**Note**

The element `<partKeyword>` must not be used for S2000M IPD projects.

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<partKeyword>PANEL</partKeyword>
```

2.5.5.1.3 *Part short name*

**Description:** The element `<shortName>` gives an abbreviated alternate name of the part corresponding to the element `<name>`. This short form for the name of the part is meant to be presented in the narrative of the data module to make reading easier.

**Markup element:** `<shortName>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<shortName>INSIDE CONTROL</shortName>
```

2.5.5.1.4 *Original part number*

**Description:** The element `<overLengthPartNumber>` contains the original part number of a part. It can be used when the attribute `partNumberValue` contains a re-identified part number.

**Markup element:** `<overLengthPartNumber>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<overLengthPartNumber>FDBA57-8-3ASNK090A499
</overLengthPartNumber>
```

#### 2.5.5.1.5 Limited part number

**Description:** The element [<limitedPartNumber>](#) contains the shortened part number when the over length part number is used throughout the documentation.

**Markup element:** [<limitedPartNumber>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<limitedPartNumber>1124587-69</limitedPartNumber>
```

#### 2.5.5.1.6 Customer stock number

**Description:** The element [<customerStockNumber>](#) contains the stock number assigned by the customer to identify and control the part in its inventory and control system. As this number depends on the customer, the attribute applicRefId and the referenced element [<applic>](#) must both be populated in accordance with [Chap 3.9.5.3](#).

**Markup element:** [<customerStockNumber>](#)

**Attributes:**

- applicRefId (O), the applicability information by referencing the element [<applic>](#). Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<customerStockNumber>AFR281324</customerStockNumber>
```

## 2.5.5.2 Procurement data

**Description:** The element `<procurementData>` groups the properties to procure a part.

**Markup element:** `<procurementData>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<enterpriseRef>`. Refer to [Para 2.5.5.2.1](#).
- `<buyerFurnishedEquipFlag>`. Refer to [Para 2.5.5.2.3](#).
- `<sourcingType>`. Refer to [Para 2.5.5.2.4](#).

2.5.5.2.1 *Reference to an enterprise*

**Description:** The element `<enterpriseRef>` contains data about an enterprise and also allows referring to its position in the enterprise CIR. In the context of the part data, the element `<enterpriseRef>` can be used to indicate the authorized prime source supplier for the part or to specify additional suppliers.

**Markup element:** `<enterpriseRef>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `enterpriseType` (O), the type of enterprise. Refer to [Chap 3.9.5.2.11.6](#).
- `enterpriseRefType` (O), indicates whether the specified enterprise is a manufacturer, a supplier, an optional supplier, etc
- `manufacturerCodeValue` (M), the CAGE code of the enterprise
- `qualifiedSiteFlag` (O), indicates whether the site must be qualified
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<name>`, the full name of the enterprise. Refer to [Para 2.5.5.2.2](#).
- `<shortName>`, the short name of the part. Refer to [Para 2.5.5.1.3](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).

2.5.5.2.2 *Name of an enterprise*

**Description:** The element `<name>` contains the full name of an enterprise.

**Markup element:** `<name>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

```
<name>ACME Widget Company</name>
```

### 2.5.5.2.3 *Buyer furnished equipment flag*

**Description:** The element `<buyerFurnishedEquipFlag>` indicates whether the customer furnishes the part or not, that is, it enables the data user to identify a buyer furnished equipment (BFE) part. As this value depends on the customer, the attribute `applicRefId` can be used to specify for which customer(s) the information is valid. Refer to [Chap 3.9.5.3](#).

**Note**

The use of the element `<buyerFurnishedEquipFlag>` is deprecated in S1000D Issue 4.2. It is kept in Issue 4.2 for upward compatibility reasons. Its use is restricted to legacy projects. For new projects in accordance with S1000D Issue 4.2, BFE parts must be identified using the element `<sourcingType>`. Refer to [Para 2.5.5.2.4](#).

**Markup element:** `<buyerFurnishedEquipFlag>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

### 2.5.5.2.4 *Sourcing type*

**Description:** The element `<sourcingType>` indicates how the part can be procured. It can be used, for example, to indicate whether the part is a BFE part or a seller furnished equipment (SFE) part. It can also be used to indicate if the part sourcing is supervised by a specific contract. This value can be customer-dependent so the attribute `applicRefId` can be used to specify the customer(s) for which the information is valid.

**Markup Element:** `<sourcingType>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `sourcingTypeValue` (M), the type of sourcing (BFE, SFE, contract-dependent, etc). The attribute can have one of the following values:
  - `"stv01"` thru `"stv99"`. Refer to [Chap 3.9.6.1](#).

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

### 2.5.5.3

#### Technical data

**Description:** The element <techData> contains the technical properties related to the part.

**Markup element:** <techData>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- etopsFlag (O), indicates whether the part is an extended twin operations part or not. The attribute can have one of the following values:
  - "1" - Yes, for ETOPS parts
  - "0" - No, for non-ETOPS parts

**Note**

Refer to [Chap 9.2.2](#) for the acronym ETOPS.

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <sparePartClass>. Refer to [Para 2.5.5.3.1](#).
- <partUsage>. Refer to [Para 2.5.5.3.2](#).
- <specDocument>. Refer to [Para 2.5.5.3.3](#).
- <quantity>. Refer to [Chap 3.9.5.2.1.10](#).
- <quantityGroup>. Refer to [Chap 3.9.5.2.1.10](#).
- <physicalSecurityPilferageCode>. Refer to [Para 2.5.5.3.4](#).
- <fitmentCode>. Refer to [Para 2.5.5.3.5](#).
- <unitOfIssue>. Refer to [Para 2.5.5.3.6](#).
- <unitOfIssueQualificationSegment>. Refer to [Para 2.5.5.3.7](#).
- <specialStorage>. Refer to [Para 2.5.5.3.8](#).
- <calibrationMarker>. Refer to [Para 2.5.5.3.9](#).
- <placardText>. Refer to [Para 2.5.5.3.10](#).
- <hazardousClass>. Refer to [Para 2.5.5.3.11](#).

### 2.5.5.3.1

#### Spare parts classification

**Description:** The element <sparePartClass> contains the spare parts classification (SPC).

**Markup element:** <sparePartClass>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sparePartClassCode (M), specifies the class of the spare part. The attribute can have one of the following values:
  - "0" - non-procurable parts
  - "1" - expendable parts
  - "2" - rotatable parts
  - "6" - repairable parts

Refer to default BREX rule BREX-S1-00090.

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

### 2.5.5.3.2 *Part usage*

**Description:** The element `<partUsage>` contains information about the usage of a part.

**Markup element:** `<partUsage>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- partUsageCode (M), the code classifying the use of the part. The attribute can have one of the following values:
  - "pu01" thru "pu99". Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

### 2.5.5.3.3 *Specification*

**Description:** The element `<specDocument>` contains identifications of the part specifications. This includes information such as drawing numbers for manufacturer parts and standard specification numbers for standard parts.

**Markup element:** `<specDocument>`. Refer to [Chap 3.9.5.2.11.3](#).

**Markup example:**

```
<specDocument manufacturerCodeValue="I9009"
specDocumentNumber="86-2-IEC" specDocumentType="specification"/>
```

#### 2.5.5.3.4 Physical security/pilferage code

**Description:** The element `<physicalSecurityPilferageCode>` indicates the degree of security risk or pilferage controls for storage and retrieval of physical assets.

**Markup element:** `<physicalSecurityPilferageCode>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00221 - Use of the element `<physicalSecurityPilferageCode>` in the element `<techData>` within the element `<itemSeqNumber>`:**

- Decide whether and how to use the element `<physicalSecurityPilferageCode>`. S2000M lists the possible codes in the data definition for physical security pilferage code (PSC).

#### 2.5.5.3.5 Fitment code

**Description:** The element `<fitmentCode>` indicates whether an item can be fitted as supplied.

**Markup element:** `<fitmentCode>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `fitmentCodeValue` (M), contains the fitment code and can have one of the following values:
  - "1" - the part needs drilling, reaming or trimming during fitting which usually is carried out at organizational or intermediate level
  - "m" - the part needs depot or industrial maintenance organization level facilities for fitting

**Child elements:**

- None

#### 2.5.5.3.6 Unit of issue

**Description:** The element `<unitOfIssue>` contains the unit of issue (UOI) information. The unit of issue indicates the physical measurement, count or container in which the item is issued.

**Markup element:** `<unitOfIssue>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

#### 2.5.5.3.7 PCS data

**Description:** The element `<unitOfIssueQualificationSegment>` identifies an S2000M unit of issue qualification segment (PCS).

**Note**

The element `<unitOfIssueQualificationSegment>` must not be used unless the element `<unitOfIssue>` is present. Refer to default BREX rule BREX-S1-00091.

**Markup element:** `<unitOfIssueQualificationSegment>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `unitOfMeasure` (M), the unit of measure for the item.

**Child elements:**

- `<quantityPerUnit>`, the quantity of items per unit of issue

**Business rule decision point BRDP-S1-00222 - Use of the attribute `unitOfMeasure` in the element `<unitOfIssueQualificationSegment>` within the element `<techData>`:**

- Decide on the range and definitions of the values for the attribute `unitOfMeasure`.

**Note**

When the IPD data modules are created from S2000M, the list of allowed unit of measure (UOM) values must contain those defined in the data definition in S2000M. When S2000M is used, it is strongly recommended to use the S2000M UOM values throughout the project.

#### 2.5.5.3.8 Special storage

**Description:** The element `<specialStorage>` indicates whether an item requires special storage. `<specialStorage>0</specialStorage>` indicates that the item does not require special storage. `<specialStorage>1</specialStorage>` indicates that the item has special storage requirements. If the content of `<specialStorage>` is set to "1" then the content of element `<reasonForSelection>` must not be "0".

**Markup element:** `<specialStorage>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

#### 2.5.5.3.9 Calibration marker

**Description:** The element `<calibrationMarker>` identifies items that require calibration. The content of element must be "1" if an item requires calibration.

**Markup element:** `<calibrationMarker>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

2.5.5.3.10 *Placard text*

**Description:** The element `<placardText>` is for placards only. The element `<placardText>` contains the text that shows on a placard.

**Markup element:** `<placardText>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<placardText>MAXIMUM LOAD WEIGHT 300 KG</placardText>
```

2.5.5.3.11 *Hazardous part*

**Description:** The element `<hazardousClass>` identifies hazardous parts. In addition, the class of hazard can be specified by the attribute `hazardousClassValue`.

**Markup element:** `<hazardousClass>`

**Attributes:**

- `hazardousClassValue` (O), indicates the class of hazard (eg, Class1: Explosive, Class 2: Compressed gasses, Class 3: Flammable liquids). The attribute can have one of the following values:
  - "hz01" thru "hz99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

2.5.5.4 *Relationships with other parts*

**Description:** The element `<partRefGroup>` contains the different types of relationships with other parts.

**Markup element:** `<partRefGroup>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<replacedBy>`. Refer to [Para 2.5.5.4.1](#).
- `<optionalPart>`. Refer to [Para 2.5.5.4.3](#).
- `<preferredSparePart>`. Refer to [Para 2.5.5.4.4](#).
- `<alteredFromPart>`. Refer to [Para 2.5.5.4.5](#).
- `<localFabricationMaterial>`. Refer to [Para 2.5.5.4.7](#).

#### 2.5.5.4.1 Replacement relationship

**Description:** The element `<replacedBy>` provides a part that can replace the defined part, ie, it indicates the interchangeable parts. A new part is defined as interchangeable to an old part following a design modification. The installation of an interchangeable part changes the product configuration. Several types of interchangeability are possible and the interchangeability relationship can depend on applicability statements, functional items and technical conditions.

The interchangeable part can be identified by:

- using the part number and manufacturer code (allowing then to refer to the part common information repository data module, if it is implemented) or
- using the reference to the catalog sequence number where the part is described

**Markup element:** `<replacedBy>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `replacementCode` (M), the type of replacement relationship (one or two ways, with condition or not). The definition of the codes is left to each project or organization.
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<partRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<catalogSeqNumberRef>`. Refer to [Para 2.4.2.2](#).
- `<functionalItemRef>`. Refer to [Chap 3.9.5.1](#).
- `<replacementCond>`. Refer to [Para 2.5.5.4.2](#).

#### 2.5.5.4.2 Replacement condition

**Description:** The element `<replacementCond>` specifies the condition that has to be fulfilled for the replacement, if any.

**Markup element:** `<replacementCond>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<replacementCond>EXCEPT IN THE HEATER ASSY</replacementCond>
```

2.5.5.4.3 *Optional part*

**Description:** The element [<optionalPart>](#) provides one or several optional parts that are equivalent alternatives to the defined part. It represents a choice between parts that are exactly the same (fit, form and function) but have different manufacturers (this often occurs for standard parts). The installation of an optional part does not change the product configuration.

The optional part can be identified by:

- using the part number and manufacturer code (allowing then to refer to the part common information repository data module, if it is implemented) or
- using the reference to the catalog sequence number where the part is described

**Markup element:** [<optionalPart>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<partRef>](#). Refer to [Chap 3.9.5.2.1.10](#).
- [<catalogSeqNumberRef>](#). Refer to [Para 2.4.2.2](#).

**Business rule decision point BRDP-S1-00223 - Use of the element [<optionalPart>](#) in the element [<partRefGroup>](#) within the element [<itemSeqNumber>](#):**

- Decide on the method of identification of the optional part.

**Markup example:**

Part number 2 is optional to part number 1

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<optionalPart>
<partRef partNumberValue="2".../>
</optionalPart>
</partRefGroup>
</partSpec>
```

2.5.5.4.4 *Preferred spare part*

**Description:** The element [<preferredSparePart>](#) provides one or several preferred spare parts, ie, alternative parts that are recommended by the data provider. The installation of a preferred spare part does not change the product configuration.

The preferred spare part can be identified by:

- using the part number and manufacturer code (allowing then to refer to the part common information repository data module, if it is implemented) or
- using the reference to the catalog sequence number where the part is described

**Markup element:** `<preferredSparePart>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<partRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<catalogSeqNumberRef>`. Refer to [Para 2.4.2.2](#).

**Business rule decision point BRDP-S1-00224 - Use of the element**

`<preferredSparePart>` in the element `<partRefGroup>` within the element `<itemSeqNumber>`:

- Decide on the method of identification of the preferred spare part.

**Markup example:**

Part number 3 is preferred to part number 1

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<preferredSparePart>
<partRef partNumberValue="3".../>
</preferredSparePart>
</partRefGroup>
</partSpec>
```

#### 2.5.5.4.5 *Altered from parts*

**Description:** The element `<alteredFromPart>` provides one or several parts from which the defined part has been modified. The altered from parts can be used on condition that a modification has been performed. The description of the modification can be provided.

The altered from part can be identified by:

- using the part number and manufacturer code (allowing then to refer to the part common information repository data module, if it is implemented) or
- using the reference to the catalog sequence number where the part is described

**Markup element:** `<alteredFromPart>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <partRef>. Refer to [Chap 3.9.5.2.1.10](#).
- <catalogSeqNumberRef>. Refer to [Para 2.4.2.2](#).
- <alteredFromPartDescr>. Refer to [Para 2.5.5.4.6](#).

**Business rule decision point BRDP-S1-00225 - Use of the element <alteredFromPart> in the element <partRefGroup> within the element <itemSeqNumber>:**

- Decide on the method of identification of the altered from part.

#### Markup example:

Part number 1 has been altered from part number 4

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<alteredFromPart>
<partRef partNumberValue="4".../>
</alteredFromPart>
</partRefGroup>
</partSpec>
```

#### 2.5.5.4.6 Altered from part modification

**Description:** The element <alteredFromPartDescr> contains the modification to be performed on one altered from part.

**Markup element:** <alteredFromPartDescr>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

Part number 1 has been altered from part number 4

```
<alteredFromPartDescr>Loose part included in the
assembly.</alteredFromPartDescr>
```

#### 2.5.5.4.7 *Manufactured from part*

**Description:** The element `<localFabricationMaterial>` specifies one or several raw parts from which the defined part can be manufactured and their dimensions or quantity. The altered from parts can be used on condition that a modification has been performed. The description of the modification can be provided.

The raw material part can be identified by:

- using the part number and manufacturer code (allowing then to refer to the part common information repository data module, if it is implemented) or
- using the reference to the catalog sequence number where the part is described

**Markup element:** `<localFabricationMaterial>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<partRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<catalogSeqNumberRef>`. Refer to [Para 2.4.2.2](#).
- `<quantity>`. Refer to [Chap 3.9.5.2.1.10](#).

**Business rule decision point BRDP-S1-00226 - Use of the element `<localFabricationMaterial>`:**

- Decide on the method of identification of the local fabrication material.

**Markup example:**

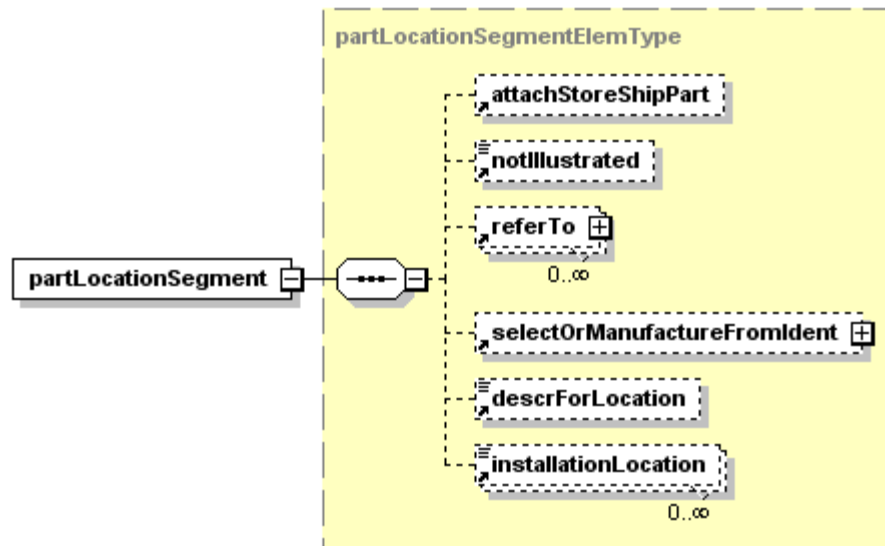

Part number 1 can be manufactured from part number 2 and part number 3.

```
<partSpec>
<partIdent partNumberValue="1".../>
...
<partRefGroup>
<localFabricationMaterial>
<partRef partNumberValue="2".../>
<partRef partNumberValue="3".../>
</localFabricationMaterial>
</partRefGroup>
</partSpec>
```

#### 2.5.6 **Part location data**

**Description:** The element `<partLocationSegment>` identifies an S2000M part location data segment (CBS).

Markup element: `<partLocationSegment>`

ICN-S1000D-A-030905-D-F6117-00006-A-002-01

Fig 8 Element `<partLocationSegment>`

#### Attributes:

- None

#### Child elements:

- `<attachStoreShipPart>`. Refer to [Para 2.5.6.1](#).
- `<notIllustrated>`. Refer to [Para 2.5.6.2](#).
- `<referTo>`. Refer to [Para 2.4.2](#).
- `<selectOrManufactureFromIdent>`. Refer to [Para 2.5.6.3](#).
- `<descrForLocation>`. Refer to [Para 2.5.6.5](#).
- `<installationLocation>`, the precise indication, where the part is located on the Product. X,Y,Z coordinates are used for this purpose. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.5.6.1 Attaching storage or shipping part

**Description:** The element `<attachStoreShipPart>` indicates if an item is an attaching, storage or shipping part.

Markup element: `<attachStoreShipPart>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `attachStoreShipPartCode` (M). The attribute can have one of the following values:
  - "1" - attaching part
  - "2" - storage part
  - "3" - shipping part

**Note**

Storage parts are used only when a unit is in storage and shipping parts are used only when a unit is being shipped.

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

## 2.5.6.2 Not illustrated

**Description:** The element `<notIllustrated>` indicates that an item has not been illustrated. If an item has not been illustrated the element `<notIllustrated>` is populated with a hyphen "-".

**Markup element:** `<notIllustrated>`

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

## 2.5.6.3 Select or manufacture from identifier

**Description:** The element `<selectOrManufactureFromIdent>` indicates that an item must be selected to suit specific operating conditions, or that the item can be locally manufactured.

**Markup element:** `<selectOrManufactureFromIdent>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- selectOrManufactureValue (M), the type of selection to make. Refer to [Table 5](#). The attribute can have one of the following values:
  - "f" - select on fit
  - "t" - select on test
  - "m" - manufacture from
  - "r" - reworked from
  - "p" - repaired from
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

Table 5 Values for the attribute *selectOrManufactureValue*

Value	Reason	Meaning
"f"	Select on fit	Applied against items which vary in physical dimension (eg, washers, shims, oversize/undersize parts)
"t"	Select on test	Applied against items which vary in electrical characteristics (eg, resistors, capacitors)
"m"	Manufacture from	Applied against items which can be locally manufactured or programmed
"r"	Reworked from	Applied against items which can be produced by the reworking of a pre-modified item. Reference to modification instructions is obligatory.
"p"	Repaired from	Applied against items which can be repaired from special repair parts, repair kits or part kits

#### Child elements:

- [<selectOrManufacture>](#). Refer to [Para 2.5.6.4](#).

#### 2.5.6.4

##### Select or manufacture

**Description:** The element [<selectOrManufacture>](#) identifies the range of items to be used for the selection, manufacture, rework or repair of an item. Items must be identified using the CSN, figure number and item number or just the item number as appropriate.

**Markup element:** [<selectOrManufacture>](#)

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- None

#### 2.5.6.5

##### Description for location

**Description:** The element [<descrForLocation>](#) contains a description for the location of the item which complements the description of the item stored in the element [<descrForPart>](#).

**Markup element:** [<descrForLocation>](#)

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

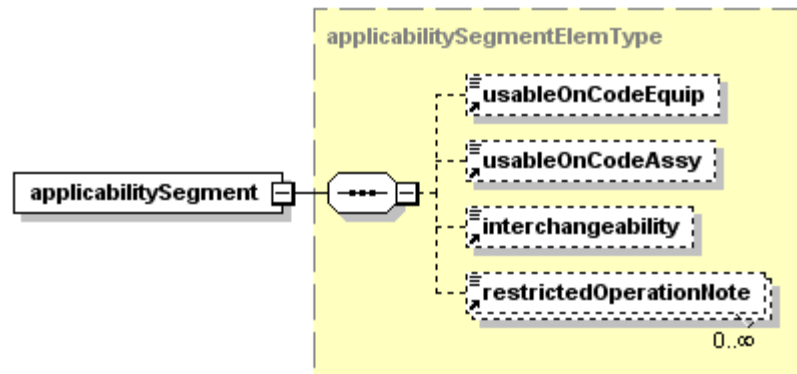

- None

#### 2.5.7

##### Applicability segment

**Description:** The element [<applicabilitySegment>](#) identifies an S2000M applicability segment.

Markup element: `<applicabilitySegment>`

ICN-S1000D-A-030905-D-F6117-00007-A-002-01

Fig 9 Element `<applicabilitySegment>`

**Attributes:**

- None

**Child elements:**

- `<usableOnCodeEquip>`. Refer to [Para 2.5.7.1](#).
- `<usableOnCodeAssy>`. Refer to [Para 2.5.7.2](#).
- `<interchangeability>`. Refer to [Para 2.5.7.3](#).
- `<restrictedOperationNote>`. Refer to [Para 2.5.7.4](#).

#### 2.5.7.1 Usable on code equipment

**Description:** The element `<usableOnCodeEquip>` contains the equipment variants and configurations to which the item is applied. The element `<usableOnCodeEquip>` is used for non-chapterized IPD.

**Markup element:** `<usableOnCodeEquip>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00229 - Use of the element**

`<usableOnCodeEquip>` in the element `<applicabilitySegment>` within the element `<itemSeqNumber>`:

- Decide whether and how to use the element `<usableOnCodeEquip>`. If used, decide on the values and their definitions. S2000M lists the possible codes and their usage in the data definition for usable on code equipment (UCE).

### 2.5.7.2 Usable on code assembly

**Description:** The element `<usableOnCodeAssy>` contains the assembly variants and configuration variants to which the item is applied. The element `<usableOnCodeAssy>` is used for chapterized IPD.

**Markup element:** `<usableOnCodeAssy>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00230 - Use of the element**

`<usableOnCodeAssy>` in the element `<applicabilitySegment>` within the element `<itemSeqNumber>`:

- Decide whether and how to use the element `<usableOnCodeAssy>`. If used, decide on the values and their definitions. S2000M lists the possible codes and their usage in the data definition for usable on code assembly (UCA).

### 2.5.7.3 Interchangeability

**Description:** The element `<interchangeability>` contains the interchangeability of two or more items at the same location. The element `<interchangeability>` will only be populated if the element `<reasonForSelection>` does not contain "0".

**Markup element:** `<interchangeability>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00231 - Use of the element**

`<interchangeability>` in the element `<applicabilitySegment>` within the element `<itemSeqNumber>`:

- Decide whether and how to use the element `<interchangeability>`. If used, decide on the values and their definitions. S2000M lists the possible codes and their usage in the definition for interchangeability (ICY).

#### 2.5.7.4 Restricted operation notes

**Description:** The element `<restrictedOperationNote>` contains messages related to specific operations, and more precisely when the installation of the parts limits the Product in its operations and/or systems.

Examples:

- ETOPS (Refer to [Chap 9.2.2](#)) restrictions (eg, "Not approved for ETOPS")
- Compliance with the RNP (Required Navigation Performance) system (eg, "Not RNP system compliant")
- Compliance with the OMTS (On-board Mobile Telephony System) system (eg, "Not OMTS system compliant")

#### Note

When using the element `<restrictedOperationNote>`, the relevant information must also be covered in the operational and maintenance publication.

**Markup element:** `<restrictedOperationNote>`

#### Attributes:

- `operationType` (O), the type of operation or system which is concerned by the restriction message. The attribute can have one or more of the following values:
  - "op01" thru "op99". Refer to [Chap 3.9.6.1](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- None

#### 2.5.8 Category 1 container location

**Description:** The element `<categoryOneContainerLocation>` contains the location at which the data record of an item's category 1 container is held.

**Markup element:** `<categoryOneContainerLocation>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `modelIdentCode` (O), the model identification code or project name. Refer to [Chap 4.3.1](#).
- `systemDiffCode` (O), the system difference code. Refer to [Chap 4.3.2](#).
- `systemCode` (O). Refer to [Para 2.4.2.2](#).
- `subSystemCode` (O). Refer to [Para 2.4.2.2](#).
- `subSubSystemCode` (O). Refer to [Para 2.4.2.2](#).
- `assyCode` (O). Refer to [Para 2.4.2.2](#).
- `figureNumber` (M). Refer to [Para 2.4.2.2](#).
- `figureNumberVariant` (O). Refer to [Para 2.4.2.2](#).
- `item` (M). Refer to [Para 2.4.2.2](#).
- `itemVariant` (O). Refer to [Para 2.4.2.2](#).
- `itemLocationCode` (O), the item location code. Refer to [Chap 4.3.8](#).
- `itemSeqNumberValue` (O), the ISN of the item's category 1 container

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Note

Refer to the attribute list in [Para 2.4](#) for details of how the CSN is used to create a hyperlink to the IPD data module.

#### Note

The attributes modelIdentCode, systemDiffCode and itemLocationCode are not needed for S2000M projects as the container location is normally within the same figure. When needed, non-S2000M projects can use these attributes.

#### Note

The element also includes five attributes normally populated by applications to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- None

### 2.5.9 CES data - Location recommendation segment

**Description:** The element `<locationRcmdSegment>` identifies an S2000M location recommendation segment (CES). The element `<locationRcmdSegment>` is only mandatory for S2000M programs.

**Markup element:** `<locationRcmdSegment>`

#### Attributes:

- None

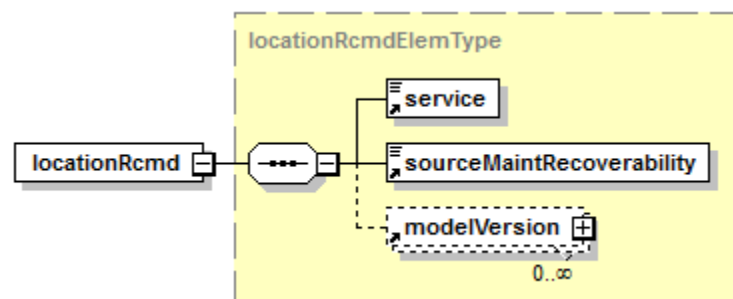

#### Child elements:

- `<locationRcmd>`, provides information for each location recommendation. Refer to [Para 2.5.9.1](#).

#### 2.5.9.1 Location recommendation

**Description:** The element `<locationRcmd>` provides information for each location recommendation.

**Markup element:** `<locationRcmd>`

ICN-S1000D-A-030905-D-F6117-00008-A-001-01

Fig 10 Element `<locationRcmd>`

**Attributes:**

- None

**Child elements:**

- [<service>](#). Refer to [Para 2.5.9.2](#).
- [<sourceMaintRecoverability>](#). Refer to [Para 2.5.9.3](#).
- [<modelVersion>](#). Refer to [Para 2.5.9.4](#).

## 2.5.9.2

## Service

**Description:** The element [<service>](#) identifies the user service to which specific data is applicable. The text content of the element has three characters. The first two characters must be populated with the user nation code. The third character is project or organization specific.

**Markup element:** [<service>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00232 - Use of the element [<service>](#) in the element [<locationRcmdSegment>](#) within the element [<itemSeqNumber>](#):**

- Decide on the values and definitions of the third character of the element [<service>](#).

## 2.5.9.3

## Source maintenance and recoverability

**Description:** The element [<sourceMaintRecoverability>](#) identifies maintenance activities which are performed on an item. The population of this element is in accordance with [Table 6](#).

*Table 6 Source maintenance and recoverability*

Position	Content
1 and 2	Source code indicating the means of acquiring the item
3	Maintenance code indicating the lowest maintenance level allowed to remove, replace or use the item
4	Maintenance code indicating the lowest maintenance level allowed to repair the item
5	Recoverability code indicating disposal action to be taken for unserviceable items
6	Defined by the project or the organization

**Markup element:** [<sourceMaintRecoverability>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00233 - Use of the element**

**<sourceMaintRecoverability> in the element <locationRcmdSegment> within the element <itemSeqNumber>:**

- Decide which values to use for the sixth character of the element <sourceMaintRecoverability> and allocate suitable definitions.

## 2.5.9.4

**Model version**

**Description:** The element <modelVersion> identifies the specific version of the product (described by the model identification code) on which an item is fitted in this location.

**Markup element:** <modelVersion>

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- modelVersionValue (M), the identification of the specific version of the equipment to which the item is fitted in this location

**Child elements:**

- <effectivity>. Refer to [Para 2.5.9.5](#).

**Business rule decision point BRDP-S1-00234 - Use of the element <modelVersion> in the element <locationRcmdSegment> within the element <itemSeqNumber>:**

- Decide whether and how to use the element <modelVersion>. If used, decide on the values and their definitions.

## 2.5.9.5

**Effectivity**

**Description:** The element <effectivity> identifies the range of products on which the item is fitted in this location.

**Note**

In general, S1000D does not use effectivity. However, it is included in the IPD Schema because that Schema reflects that part of the S2000M message.

**Markup element:** <effectivity>

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00235 - Use of the element [<effectivity>](#) in the element [<locationRcmdSegment>](#) within the element [<itemSeqNumber>](#):**

- Decide whether and how to use the element [<effectivity>](#). If used, decide on its range and the definition of the values to be used.

**2.5.10 Integrated logistic support number**

**Description:** The element [<ilsNumber>](#) contains an interdisciplinary cross reference to an integrated logistic support number.

**Markup element:** [<ilsNumber>](#)

**Attributes:**

- [id](#) (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [changeType](#) (O), [changeMark](#) (O) and [reasonForUpdateRefIds](#) (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- [securityClassification](#) (O), [commercialClassification](#) (O), [caveat](#) (O) and [derivativeClassificationRefId](#) (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**2.5.11 Change authority data**

**Description:** The element [<changeAuthorityData>](#) contains conditions impacting a part or a wire. These impacting conditions indicate why it is allowed to install this part or wire. Generally, this indication consists of a condition (eg, design office modification, Service bulletin, or customer originated change).

**Markup element:** [<changeAuthorityData>](#)

**Attributes:**

- [applicRefId](#) (O), the applicability information by referencing the element [<applic>](#). Refer to [Chap 3.9.5.3](#).
- [id](#) (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [changeType](#) (O), [changeMark](#) (O) and [reasonForUpdateRefIds](#) (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- [condValue](#) (O), the status for which the condition is listed, for example, "Pre" or "Post"

**Child elements:**

- [<changeAuthority>](#). Refer to [Para 2.5.11.1](#).
- [<refs>](#). Refer to [Chap 3.9.5.2.1.2](#).

**2.5.11.1 Change authority**

**Description:** The element [<changeAuthority>](#) represents one impacting condition. It corresponds to the S2000M definition of change authority number (CAN).

Either the content of element [<changeAuthority>](#) or its attributes can be used to store the CAN information.

**Markup element:** `<changeAuthority>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- condNumber (O), the identifier of the change authority document
- manufacturerCodeValue (O), the CAGE code of the manufacturer
- condTypeName (O), the name of the condition type
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

## 2.5.12 Non-S2000M data

**Description:** The element `<genericPartDataGroup>` contains any project or organization specific data.

The current IPD structure strongly relies on the S2000M data organization. For non-S2000M projects, some specific data cannot be covered by the existing S2000M data elements. For that purpose, the element `<genericPartDataGroup>` allows the definition and storage of any kind of non-S2000M data within the IPD content.

The IPD team must nevertheless first analyze the correspondence between the source data and the S2000M data elements which are already addressable by the current IPD Schema. If there is compliance, the existing S2000M data must be used. Otherwise the new data is populated in the element `<genericPartDataGroup>` with its name and value.

### Note

Non-S2000M illustrated parts data modules must follow the rules defined for chapterized parts data modules.

**Markup element:** `<genericPartDataGroup>`

ICN-S1000D-A-030905-D-F6117-00009-A-001-01

Fig 11 Element `<genericPartDataGroup>`

**Attributes:**

- None

**Child elements:**

- `<genericPartData>`. Refer to [Para 2.5.12.1](#).

**Business rule decision point BRDP-S1-00237 - Use of BREX to define the non-S2000M elements:**

- Decide whether to use BREX for the definition of the non-S2000M elements.

#### 2.5.12.1 Generic part data

**Description:** The element `<genericPartData>` contains one project or organization specific part data item not covered by any of the other data elements in the IPD Schema.

**Markup element:** `<genericPartData>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `genericPartDataName` (M), a suitable name to identify the data item

**Child elements:**

- `<genericPartDataValue>`. Refer to [Para 2.5.12.2](#).

#### 2.5.12.2 Generic part data value

**Description:** The element `<genericPartDataValue>` contains the non-S2000M data value.

**Markup element:** `<genericPartDataValue>`

**Attributes:**

- None

**Child elements:**

- None

## 2.6 Parts data element mapping

As the IPD Schema can be used to capture and represent parts lists and IPD initially drawn from an S2000M parts database, [Table 7](#) describes the mapping between the initial S2000M elements (defined through their S2000M text element identifier) and the IPD Schema elements and attributes.

*Table 7 Parts data element mapping*

Text element identifier	Data element name	M/O	Mapping to Schema elements/attributes
ASP	Attaching, storage or shipping part	O	<code>&lt;attachStoreShipPart attachStoreShipPartCode="..."&gt;</code>
CAN	Change authority number	O	<code>&lt;changeAuthorityData&gt; &lt;changeAuthority&gt;...&lt;/changeAuthority&gt; &lt;/changeAuthorityData&gt;</code>
CMK	Calibration marker	O	<code>&lt;calibrationMarker&gt;... &lt;/calibrationMarker&gt;</code>

Text element identifier	Data element name	M/O	Mapping to Schema elements/attributes

### 3 Examples

#### 3.1 Refer to

A reference from one item to two higher assemblies (item 040 part of project 23121101 and item 010 part of project 23121110) will be authored as follows:

```
<referTo refType="rft01">
<catalogSeqNumberRef responsiblePartnerCompanyCode="R"
initialProvisioningProjectNumber="K03781101"
modelIdentCode="..." systemDiffCode="..." figureNumber="..."
figureNumberVariant="..." itemLocationCode="D" item="040"
itemVariant="..." />
<catalogSeqNumberRef responsiblePartnerCompanyCode="F"
initialProvisioningProjectNumber="K03781110"
modelIdentCode="..." systemDiffCode="..." figureNumber="..."
figureNumberVariant="..." itemLocationCode="D" item="010"
itemVariant="..." />
</referTo>
```

A reference from one item to a sub-decomposition item (item 050 part of project K03781101) will be authored as follows:

```
<referTo refType="rft02">
<catalogSeqNumberRef responsiblePartnerCompanyCode="F"
```

```
initialProvisioningProjectNumber="23121101" modelIdentCode="..."
systemDiffCode="..." figureNumber="..."
figureNumberVariant="..." itemLocationCode="D" item="050"
itemVariant="..." />
</referTo>
```

If the sub-decomposition item referred is given in a non-chapterized IPD, then a direct reference to the IPPN only will be addressed:

```
<referTo refType="rft02">
<initialProvisioningProjectRef
initialProvisioningProjectNumber="KZ9990001" />
</referTo>
```

### 3.2 Generic parts data

Markup for the management of, ie, distributing level (nid), keywords (key) desiccating standard (dhy), storage container (emb) and nota (xnt) can be authored as follows:

```
<genericPartDataGroup>
<genericPartData genericPartDataName="nid">
<genericPartDataValue>2</genericPartDataValue></genericPartData>
<genericPartData genericPartDataName="key">
<genericPartDataValue>Bicycle</genericPartDataValue>
</genericPartData>
<genericPartData genericPartDataName="dhy">
<genericPartDataValue>F2408:1-4UD:02</genericPartDataValue>
</genericPartData>
<genericPartData genericPartDataName="emb">
<genericPartDataValue>KZ999:LNS10276051</genericPartDataValue>
</genericPartData>
<genericPartData genericPartDataName="xnt">
<genericPartDataValue>SP</genericPartDataValue>
</genericPartData>
</genericPartDataGroup>
```

### 3.3 Illustrated parts data content

## 1 General

Wiring data consists of two data module types, each with a dedicated Schema:

- Wiring data
- Wiring data description

The purpose of the wiring data description data modules is to define the occurrence, the names and the meanings of the elements and attributes that are used in the wiring data modules.

Applicable to: All

**S1000D-A-03-09-0502-09A-040A-A**

**Chap 3.9.5.2.9**

Although the use of the wiring data description data module type is a project or an organization decision, it is recommended that wiring data description data modules are created for the project.

## 2 Wiring data

The content section of wiring data data modules is described in the following chapters:

- Wiring data - Wiring data Schema basic rules. Refer to [Chap 3.9.5.2.9.1.](#)
- Wiring data - Wire. Refer to [Chap 3.9.5.2.9.2.](#)

Data modules - Applicability

[Chap 5.2.1.4](#)

Common information sets - Wiring data

## 1 General

The wiring data Schema is used to capture and represent the wiring data of the Product such as wire data, harness data, electrical equipment data and standard parts data. The use of the common elements and attributes is detailed in [Chap 3.9.5.2.1](#).

The granularity of wiring data data modules must follow the breakdown reflected by the SNS, providing wiring data at:

- system
- subsystem
- sub-subsystem levels

as required by the:

- maintenance philosophy
- scope and depth of information

For details on the scope and depth of information, refer to [Chap 5.2.1.4](#).

## 2 Wiring data

### 2.1 Schema basic rules

The wiring data Schema has structural elements that are used to provide information about wire data, harness data, electrical equipment data and electrical standard parts data as follows:

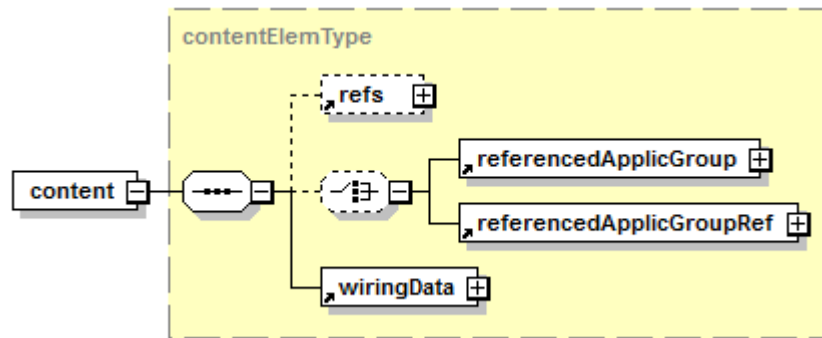

- List of wires. Refer to [Chap 3.9.5.2.9.2](#).
- List of harnesses. Refer to [Chap 3.9.5.2.9.3](#).
- List of electrical equipment. Refer to [Chap 3.9.5.2.9.4](#).
- List of electrical standard parts with the following subordinated lists:
  - List of connectors. Refer to [Chap 3.9.5.2.9.5](#).
  - List of distribution parts. Refer to [Chap 3.9.5.2.9.6](#).
  - List of accessories. Refer to [Chap 3.9.5.2.9.7](#).
  - List of solder sleeves. Refer to [Chap 3.9.5.2.9.8](#).
  - List of shrink sleeves. Refer to [Chap 3.9.5.2.9.9](#).
  - List of identification sleeves. Refer to [Chap 3.9.5.2.9.10](#).
  - List of conduits. Refer to [Chap 3.9.5.2.9.11](#).
  - List of wire materials. Refer to [Chap 3.9.5.2.9.12](#).

### 2.2 Content

**Description:** The element `<content>` of this Schema is used to capture and represent the wiring data of the Product.

**Markup element:** `<content>`

ICN-C0419-S1000D0208-002-01

Fig 1 Element &lt;content&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

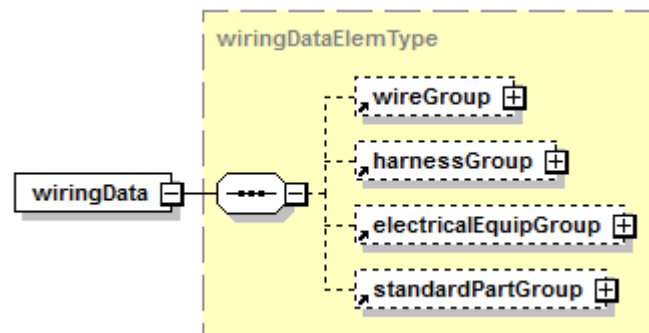

#### Child elements:

- <refs>. Refer to [Chap 3.9.5.2.1.2](#).
- <referencedApplicGroup>. Refer to [Chap 3.9.5.3](#).
- <referencedApplicGroupRef>. Refer to [Chap 3.9.5.3](#).
- <wiringData>. Refer to [Para 2.3](#).

## 2.3 Element <wiringData>

**Description:** The element <wiringData> is used as a container for the lists of wires, harnesses, electrical equipment and electrical standard parts.

**Markup element:** <wiringData>

ICN-C0419-S1000D0210-001-01

Fig 2 Element &lt;wiringData&gt;

#### Attributes:

- None

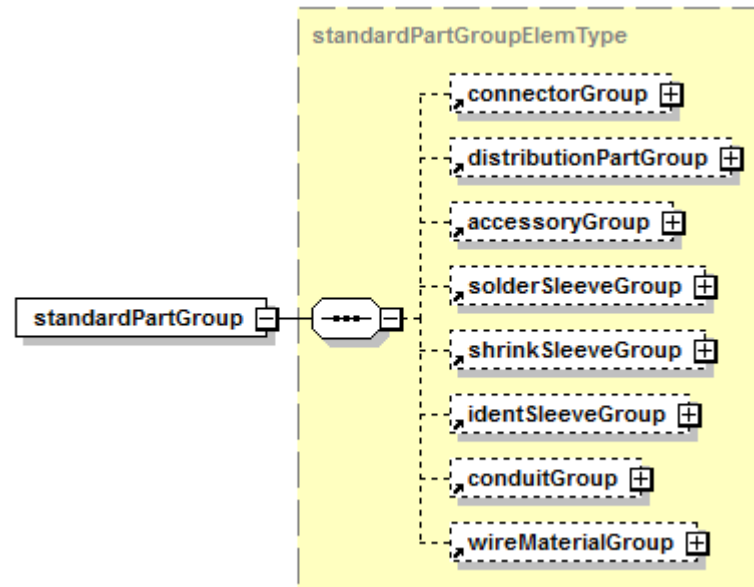

#### Child elements:

- <wireGroup>, the list of wires. Refer to [Chap 3.9.5.2.9.2](#).
- <harnessGroup>, the list of harnesses. Refer to [Chap 3.9.5.2.9.3](#).
- <electricalEquipGroup>, the list of electrical equipment. Refer to [Chap 3.9.5.2.9.4](#).
- <standardPartGroup>, the list of electrical standard parts. Refer to [Para 2.3.1](#).

### 2.3.1 Electrical standard parts

**Description:** The element `<standardPartGroup>` is used as a container for the different categories of electrical standard parts data.

**Markup element:** `<standardPartGroup>`

ICN-C0419-S1000D0211-001-01

Fig 3 Element `<standardPartGroup>`

**Attributes:**

- None

**Child elements:**

- `<connectorGroup>`, the list of connectors. Refer to [Chap 3.9.5.2.9.5](#).
- `<distributionPartGroup>`, the list of distribution parts. Refer to [Chap 3.9.5.2.9.6](#).
- `<accessoryGroup>`, the list of accessories. Refer to [Chap 3.9.5.2.9.7](#).
- `<solderSleeveGroup>`, the list of solder sleeves. Refer to [Chap 3.9.5.2.9.8](#).
- `<shrinkSleeveGroup>`, the list of shrink sleeves. Refer to [Chap 3.9.5.2.9.9](#).
- `<identSleeveGroup>`, the list of identification sleeves. Refer to [Chap 3.9.5.2.9.10](#).
- `<conduitGroup>`, the list of conduits. Refer to [Chap 3.9.5.2.9.11](#).
- `<wireMaterialGroup>`, the list of wire materials. Refer to [Chap 3.9.5.2.9.12](#).

## 1 General

The element <wire> and its child elements are used to capture and represent the wires, which are installed in the Product, and the related information.

## 2 Element <wire> and child elements

**Description:** The element <wire>, within the list of wires element <wireGroup>, contains wire information about the Product's wiring. The wires are the electrical connections between two equipment, different contacts of an equipment, etc. Electrical wires of a system are often bundled into harnesses.

ICN-C0419-S1000D0226-001-01

Fig 1 Element &lt;wireGroup&gt;

It is strongly recommended to define wire applicability precisely and populate the elements and attributes in accordance with the project or the organization specific rules. It is further recommended to use at least the version and version number information given in the Product's cross-reference table. Wires with modifications must in addition use the information given in the conditions cross-reference table.

Markup element: <wire>

ICN-C0419-S1000D0227-001-01

Fig 2 Element &lt;wire&gt;

#### Attributes:

- **wireState** (O), the electrical state of a wire. Normally, wires are divided into physical electrical wires and logical connections (eg, the connection of a circuit breaker to the bus bar by a screw). The attribute **wireState** can have one of the following values:
  - **"active"** - for wires which are active in one of the system circuits
  - **"stowed"** - for wires which are stowed (not connected) at least on one end
  - **"pigtail"** - for wires which are connected only at one end to an equipment of the system for measurement purposes
  - **"notactiv"** - for wires which are not active in one of the system circuits
  - **"logconn"** - for electrical connections in one of the system circuits which are not realized by a physical wire or do not have a wire identification (in some cases called flying leads)
- **changeInfo** (O), the change information of a wire in connection with the related modification. The attribute **changeInfo** can have one of the following values:
  - **"add"** - for wires which are added to the system circuits by a modification
  - **"delete"** - for wires which are removed from the system circuits by a modification
  - **"modify"** - for wires which are modified in the system circuits by a modification
- **applicRefId** (O), the applicability information of a wire by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <wireIdent>, the wire identification
- <wireConnection>, the wire connection
- <wireInfo>, the wire information

#### Markup example:

```
<wiringData>
<wireGroup>
<wire wireState="active" applicRefId="app-0001">
<wireIdent>
<wireNumber>BT2AA</wireNumber>
</wireIdent>
<wireConnection>
<fromEquip>
<functionalItemRef functionalItemNumber="3000VN"/>
</fromEquip>
</wireConnection>
</wire>
</wireGroup>
</wiringData>
```

## 2.1

### Wire identification

**Description:** The element <wireIdent> is the unique identifier of a wire in the system.

**Markup element:** <wireIdent>

ICN-C0419-S1000D0228-001-01

Fig 3 Element <wireIdent>

#### Attributes:

- contextIdent (O), the context identification which is used in combination with the attribute manufacturerCodeValue to ensure the uniqueness of manufacturer wire data. Context identification contains an identifier (eg, the part number of the next higher assembly that has been given to the assembly by the manufacturer).
- manufacturerCodeValue (O), the identification of the manufacturer (eg, the CAGE code), which is used in combination with the attribute contextIdent to ensure uniqueness of manufacturer wire data.
- itemOriginator (O), the origin of the wire (eg, whether a wire is an aircraft manufacturer wire or a supplier wire). Values and their meanings are defined by using the BREX mechanism. Refer to [Chap 3.9.6.1](#) and [Chap 4.10](#).

**Child elements:**

- <ircuitIdent>, the circuit code
- <wireNumber>, the wire identification number
- <sectionIdent>, the wire section identification

**Markup example:**

```
<wireIdent contextIdent="PN-AC-12561"
manufacturerCodeValue="F0001" itemOriginator="orig01">
<wireNumber>BT2AA</wireNumber>
</wireIdent>
```

**2.1.1**
**Circuit code**

**Description:** Projects with electrical wiring often consist of several systems or circuits. If the allocation of a wire to a system must be reflected in the wire identification, then the element <ircuitIdent> must be populated with the identifier for this system/circuit. [Table 2](#) gives examples of circuit codes.

*Table 2 Circuit codes*

Circuit code	System/Circuit
AG	Gun system
LD	Lighting control
YD	Armament control system

**Markup element:** <ircuitIdent>

**Attributes:**

- None

**Child elements:**

- None

**2.1.2**
**Wire identification number**

**Description:** All wires must have a wire identification number. If there is no further breakdown, by the use of the circuit code element <ircuitIdent> and the wire section identification element <sectionIdent>, then the element <wireNumber> must contain the complete wire identification.

If a conductor runs thru non-functional breaks (eg, a terminal junction module or a splice), the wire identification number must be the same for the two wires, but the section identifications are different.

**Markup element:** <wireNumber>

**Attributes:**

- None

**Child elements:**

- None

### 2.1.3 Wire section identification

**Description:** Wires which are connected by non-functional breaks such as connectors, terminal junction modules, splices, etc, often get the same wire identification number and different section identifications. In this case, the element `<sectionIdent>` must be populated with the identifiers for these different sections.

**Markup element:** `<sectionIdent>`

**Attributes:**

- None

**Child elements:**

- None

### 2.1.4 Markup examples

#### 2.1.4.1 Wire identification example using circuit code and section identification

The following markup example shows the wire identification for section AA of wire number 0486 within the armament control system (YD).

```
<wireIdent>
<circuitIdent>YD</circuitIdent>
<wireNumber>0486</wireNumber>
<sectionIdent>AA</sectionIdent>
</wireIdent>
```

#### 2.1.4.2 Wire identification example without using circuit code and section identification

The following example shows the markup of wire W5250-2023B-24 that is installed in the panel with the part number P1650-411, supplied by the manufacturer with the identification F2345:

```
<wireIdent contextIdent="P1650-411"
manufacturerCodeValue="F2345" itemOriginator="orig02">
<wireNumber>W5250-2023B-24</wireNumber>
</wireIdent>
```

## 2.2 Wire connection

**Description:** The element `<wireConnection>` contains connection information for the two ends of a wire. In special cases (eg, wires with `wireState = "pigtail"` or `"notactiv"`) only the connection of one wire end is used.

**Markup element:** `<wireConnection>`

ICN-C0419-S1000D0232-001-01

Fig 4 Element `<wireConnection>`

**Attributes:**

- None

#### Child elements:

- `<fromEquip>`, the from equipment information
- `<toEquip>`, the equipment information which must be populated for all wires with two relevant wire ends, otherwise not

#### Markup example:

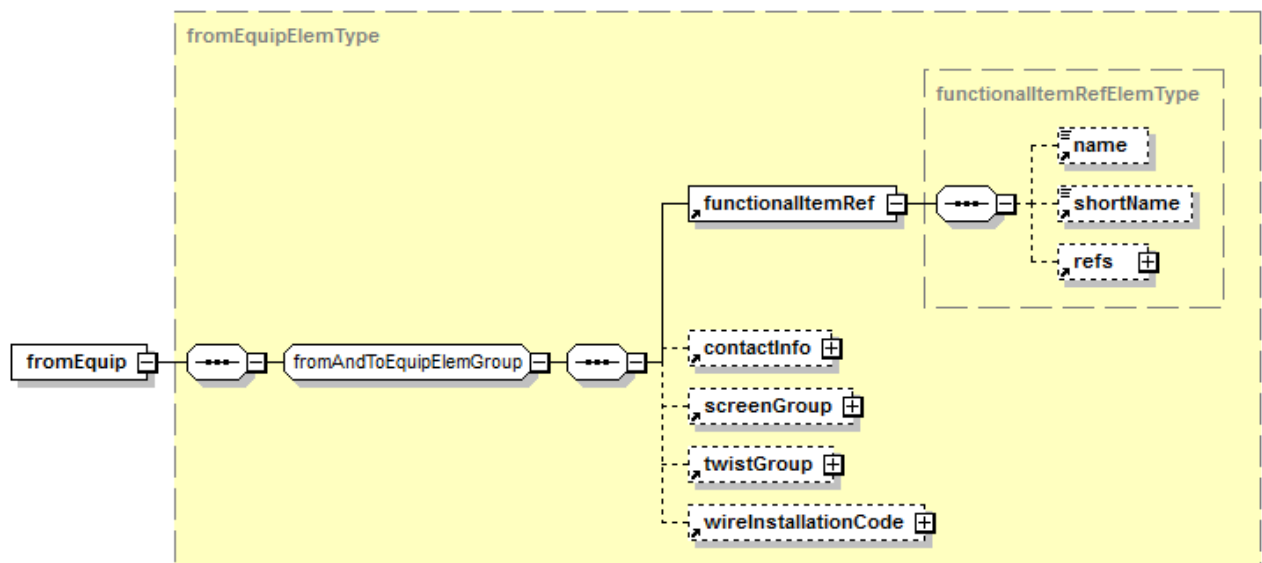

```
<wireConnection>
  <fromEquip>
    <functionalItemRef functionalItemNumber="6QXA"/>
  </fromEquip>
  <toEquip>
    <functionalItemRef functionalItemNumber="6712VR"/>
  </toEquip>
</wireConnection>
```

### 2.2.1

#### Content model electrical equipment

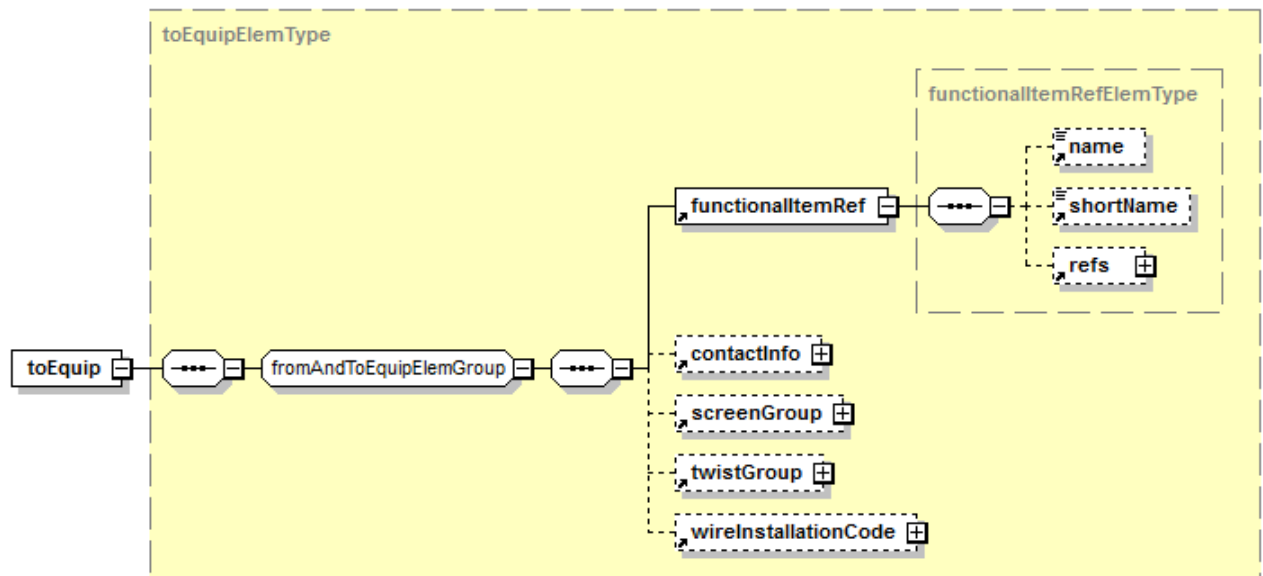

**Description:** The content model electrical equipment defines the child elements of the elements `<fromEquip>` and `<toEquip>`, which contain the wire connection information for the two wire ends.

**Markup elements:** `<fromEquip>` and `<toEquip>`

ICN-C0419-S1000D0233-001-01

Fig 5 Element `<fromEquip>`

ICN-C0419-S1000D0234-001-01

Fig 6 Element &lt;toEquip&gt;

#### Attributes:

- None

#### Child elements:

- <functionalItemRef>, the functional item reference. Functional items are also known as reference designators. Refer to [Chap 3.9.5.1](#).
- <contactInfo>, the contact information
- <screenGroup>, the list of screens
- <twistGroup>, the twist information group
- <wireInstallationCode>, the wire installation code

#### Markup example:

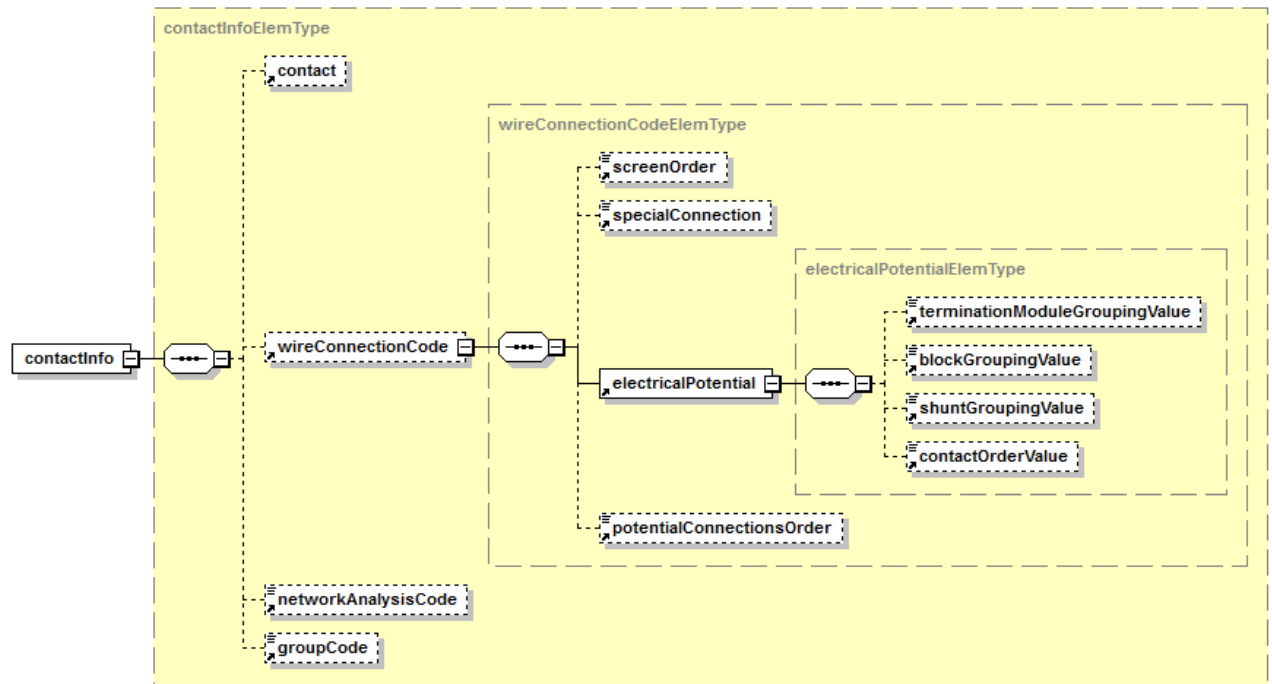

```

<fromEquip>
<functionalItemRef functionalItemNumber="Sensor"/>
<contactInfo>
<contact>
<contactInfo contactIdent="S"/>
</contact>
</contactInfo>
<screenGroup>
<screen>SCT1</screen>
</screenGroup>
</fromEquip>
  
```

#### 2.2.1.1 Contact information

**Description:** The element <contactInfo> contains child elements that identify the contact to which the wire end is connected.

Markup element: `<contactInfo>`

ICN-C0419-S1000D0235-001-01

Fig 7 Element `<contactInfo>`

#### Attributes:

- None

#### Child elements:

- `<contact>`, the contact identification
- `<wireConnectionCode>`, the wire connection code
- `<networkAnalysisCode>`, the network analysis code
- `<groupCode>`, the group code

#### Markup example:

```

<contactInfo>
  <contact contactIdent="GND"/>
  <wireConnectionCode>
    <electricalPotential>
      <contactOrderValue>1</contactOrderValue>
    </electricalPotential>
  </wireConnectionCode>
  <networkAnalysisCode>01</networkAnalysisCode>
  <groupCode>G1</groupCode>
</contactInfo>
  
```

#### 2.2.1.1.1 Contact identification

**Description:** The element `<contact>` describes the contact identification by its attributes. Normally, wires are connected to contacts with a given name. If not, the attribute `contactIdent` has no value for those contacts where at least one of the other attributes is used. If none of the attributes is used, the element `<contact>` must not be used at all.

**Markup element:** <contact>

**Attributes:**

- contactIdent (M), the identification of the contact (eg, "A", "1")
- contactFunction (O), the functional identification of the contact (eg, "ON", "OFF", "BRIGHT" or "DIM")
- contactType (O), the type of the contact (eg, "BASE", "PIN", "SOCKET", "COAX" or "BUS")
- connectedFlag (O), the information whether the wire is connected to the contact (stowed wires). The attribute connectedFlag can have one of the following values:
  - "0" - No, the wire is not connected to the contact
  - "1" - Yes, the wire is connected to the contact
- contactPartNumber (O), the part number of the contact to which the wire end is connected
- wireInstallationDirection (O), the direction information for non-symmetric wires

**Child elements:**

- None

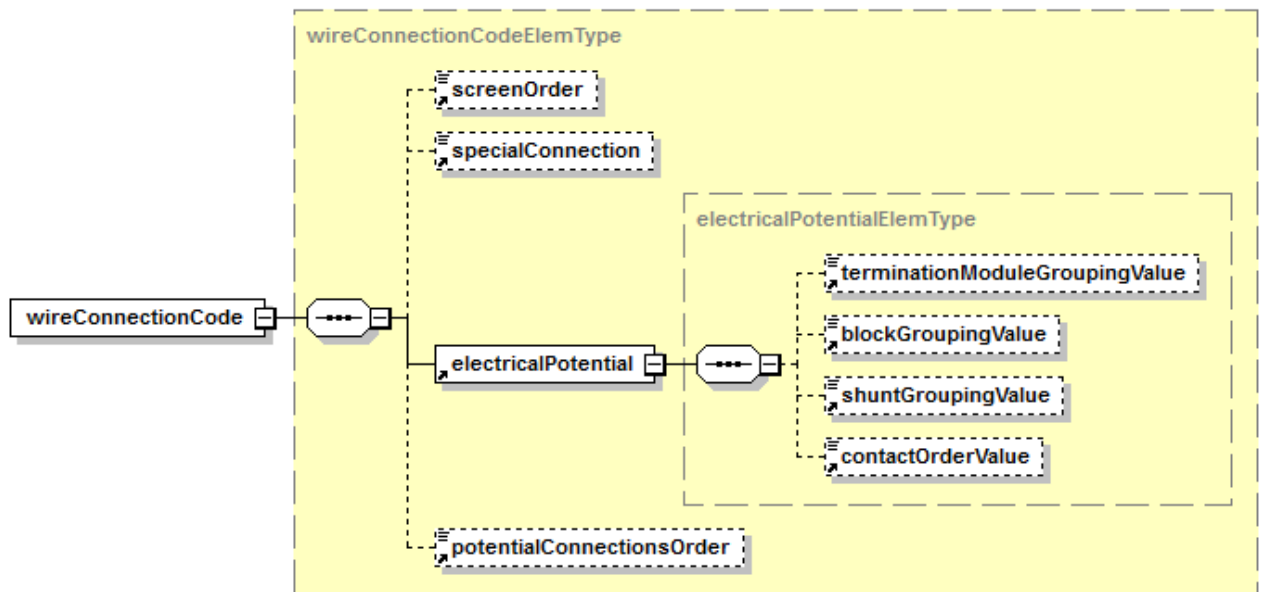

**Markup examples:**

```
<contact contactIdent="1" contactFunction="BRIGHT"/>
<contact contactIdent="A1" contactType="BASE"/>
<contact contactIdent="1" contactPartNumber="JN1003S-12"/>
<contact contactIdent="AA1" wireInstallationDirection="A"/>
```

**2.2.1.1.2 Wire connection code**

**Description:** The element <wireConnectionCode> is used for generic identification of the electrical potential to which a wire end is connected. This can be the basis to arrange the ends of the wires in a specific order for graphical display purposes and to generate a connection analysis.

Markup element: `<wireConnectionCode>`

ICN-C0419-S1000D0237-001-01

Fig 8 Element `<wireConnectionCode>`

#### Attributes:

- None

#### Child elements:

- `<screenOrder>`, the shielding order information
- `<specialConnection>`, the special connections information
- `<electricalPotential>`, the electrical potential information
- `<potentialConnectionsOrder>`, the potential connections information

#### Markup example:

```

<wireConnectionCode>
  <electricalPotential>
    <contactOrderValue>2</contactOrderValue>
  </electricalPotential>
</wireConnectionCode>
  
```

#### 2.2.1.1.3 Shielding order

**Description:** The element `<screenOrder>` contains an ascending numerical value, which represents the order of the wires connected to an equipment for graphical presentation of the shielding situation.

#### Note

Screen connections (eg, from a screen to the shell of an equipment) must always have a lower value than the wires which are shielded by this screen.

Markup element: `<screenOrder>`

#### Attributes:

- None

**Child elements:**

- None

**Markup example:**

```
<screenOrder>3</screenOrder>
```

2.2.1.1.4 *Special connections*

**Description:** The element [<specialConnection>](#) contains a numerical value and must be used for all wires, that are connected to "special contacts" of an equipment such as stowed wires and wires connected to the shell of this equipment.

In the graphical presentation, these wires are always, depending on the given value, shown after the wires, which are connected to real contacts of the equipment.

Wires with the wire state value ["logconn"](#), which are connected to special contacts (eg, when a shield is electrically connected to the shell of a connector by the cable clamp that is represented by the logical connection wire), must not get allocated data in element [<specialConnection>](#).

**Markup element:** [<specialConnection>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<specialConnection>100</specialConnection>
```

2.2.1.1.5 *Electrical potential*

**Description:** The element [<electricalPotential>](#) is used to order the wires based on project or organization specific rules, using the relation to termination module, block and shunt, or pole and position, and the contact identification.

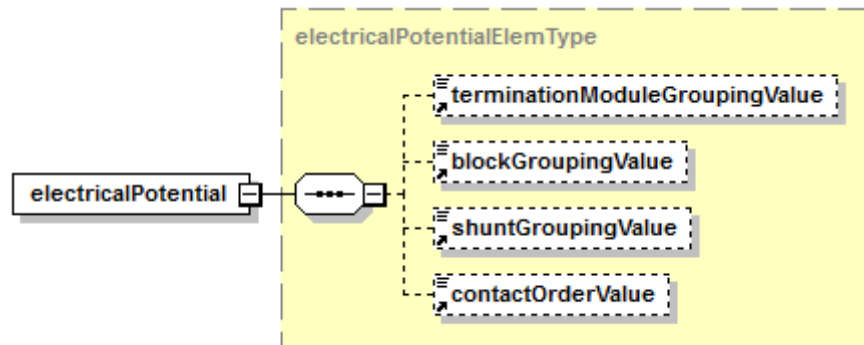

There are two different cases for coding of the electrical potential information:

- equipment without internal logic
- equipment with internal logic

**Equipment without internal logic.** Equipment, such as connectors, earth bolts, etc, do not have an internal logic. The ascending values in element [<contactOrderValue>](#) represent the order of the equipment contacts to facilitate graphical presentation and connection analysis. Contacts of the equipment to which no physical wire is connected are included by wires with the wire state value ["notactiv"](#). For equipment without internal logic, the elements [<terminationModuleGroupingValue>](#), [<blockGroupingValue>](#) and [<shuntGroupingValue>](#) must not be used.

**Equipment with internal logic.** Equipment, such as switches, relays and terminal junction modules have an internal logic. That means, the equipment has internal connections, which connect different contacts of the equipment electrically. For switches and relays, these electrical connections depend on the switch/relay position. The internal electrical connections are the basis for the coding of the elements [<terminationModuleGroupingValue>](#), [<blockGroupingValue>](#) and [<shuntGroupingValue>](#). Examples for the population of these elements are given in [Para 3.1](#).

Markup element: `<electricalPotential>`

ICN-C0419-S1000D0240-001-01

Fig 9 Element `<electricalPotential>`

#### Attributes:

- None

#### Child elements:

- `<terminationModuleGroupingValue>`, used for contacts that belong to the same module of a termination module assembly
- `<blockGroupingValue>`, used for contacts that belong to the same block of a termination module assembly or the same pole of a switch or a relay
- `<shuntGroupingValue>`, contains an identical alphanumeric value for all contacts that belong to the same shunt/bus of a termination module or the same position of a switch or a relay
- `<contactOrderValue>`, contains an alphanumeric value that represents the ascending order of the equipment contacts to facilitate graphical presentation and connection analysis. Contacts of the equipment to which no physical wire is connected are included by wires with the wire state value "notactiv".

#### Markup example:

```
<electricalPotential>
<terminationModuleGroupingValue>1
</terminationModuleGroupingValue>
<blockGroupingValue>1</blockGroupingValue>
<shuntGroupingValue>1</shuntGroupingValue>
<contactOrderValue>1</contactOrderValue>
</electricalPotential>
```

#### 2.2.1.1.6 Termination module grouping information

**Description:** The element `<terminationModuleGroupingValue>` is only used for equipment with internal logic. It provides grouping information for contacts that belong to the same module of a termination module assembly.

It must contain an identical alphanumeric value for all these contacts.

**Markup element:** `<terminationModuleGroupingValue>`

#### Attributes:

- None

**Child elements:**

- None

**Markup example:**

```
<terminationModuleGroupingValue>1  
</terminationModuleGroupingValue>
```

**2.2.1.1.7** *Block grouping information*

**Description:** The element `<blockGroupingValue>` is only used for equipment with internal logic. It provides grouping information for contacts that belong to the same block of a termination module assembly or the same pole of a switch or a relay.

It must contain an identical alphanumerical value for all these contacts.

**Markup element:** `<blockGroupingValue>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<blockGroupingValue>1</blockGroupingValue>
```

**2.2.1.1.8** *Shunt grouping information*

**Description:** The element `<shuntGroupingValue>` is only used for equipment with internal logic. It provides grouping information for contacts that belong to the same shunt/bus of a termination module or the same position of a switch or a relay.

It must contain an identical alphanumerical value for all these contacts.

**Markup element:** `<shuntGroupingValue>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<shuntGroupingValue>1</shuntGroupingValue>
```

**2.2.1.1.9** *Contact order information*

**Description:** The element `<contactOrderValue>` is used to order the wire ends, connected to equipment with internal logic, in addition to the termination module, block and shunt grouping information.

All wires, which are not connected to base contacts of switches and relays, must get values higher than the values of base contacts. In this case, the base contact (supply) will be shown before the different positions of the switch/relay in the graphical presentation of the wires connected to this equipment.

When more than one wire is connected to an electrical potential, all these wires must have the same content in the element `<contactOrderValue>`.

**Note**

More than one wire can be connected to earth bolts. But also modifications in the wiring and splits in the applicability of the system can cause that more than one wire is connected to the same contact of equipment, because for coding purposes the wires of all applicability ranges and modifications are taken into consideration.

**Note**

More than one wire can also be connected to data bus contacts. The contact is composed of physically different pins. Therefore, the wire ends that are connected to the physically different pins of the composed contact must get different values in the element `<contactOrderValue>`.

**Markup element:** `<contactOrderValue>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<contactOrderValue>3</contactOrderValue>
```

#### 2.2.1.1.10 Potential connections order

**Description:** The element `<potentialConnectionsOrder>` is used in the situation when more than one wire is connected to an electrical potential (eg, an earth bolt). All these wires must have the same value for the electrical potential block grouping information in the wire connection code. In this case, these wires must have ascending numerical values at the potential connections of the wire connection code, which orders the wire to facilitate graphical presentation.

**Markup element:** `<potentialConnectionsOrder>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<potentialConnectionsOrder>2</potentialConnectionsOrder>
```

#### 2.2.1.1.11 Network analysis code

**Description:** The element `<networkAnalysisCode>` describes the behavior of the wire end in the network connection analysis in relation to other wires via the equipment. It is based on the behavior of the equipment to which the wire end is connected. This information can be used as the basis for the analysis of electrical connections in a system.

The network analysis code must contain a two-digit numerical value and is used for the analysis of the electrical connections in a system. It defines for every wire end, whether it is a starting point, the end of a connection analysis or whether the analysis is continued via equipment connections (eg, connectors, switches).

The values given in [Table 3](#) are recommended.

*Table 3 Network analysis codes*

Value	Meaning for connection analysis
01	Starting point and end of connection analysis
02	Starting point, analysis continued via a plug/receptacle connection (transfer point)
03	Starting point, analysis continued via an equipment connection with internal logic (eg, terminal junction modules (transfer point))
04	Starting point, analysis continued via an equipment connection with internal logic and alternative switch positions (eg, switches and relays (transfer point))
05	No starting point and end of connection analysis
06	No starting point, analysis continued at the same equipment
07	Starting point with special usage (depth of iteration 1) and end of connection analysis
08	Starting point and end of connection analysis with special usage
11	Starting point and end of connection analysis for data bus systems (similar to value 01)
12	Starting point, analysis continued via a plug/receptacle connection (transfer point) for data bus systems (similar to value 02)
17	Starting point with special usage (depth of iteration 1) and end of connection analysis for data bus systems (similar to value 07)

**Markup element:** [<networkAnalysisCode>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<networkAnalysisCode>04</networkAnalysisCode>
```

#### 2.2.1.1.12 Group code

**Description:** The element [<groupCode>](#) indicates the physical grouping of wires connected to the same contact. For example, where multiple wires are connected to a terminal stud using multiple ring terminals, each wire connected to the same ring terminal must have the same group code (eg, A). Wires that are connected to the same terminal stud but to another ring terminal must have another group code (eg, B). This means that an identical group code indicates wires, which are physically connected to the same ring terminal.

**Markup element:** [<groupCode>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<groupCode>B</groupCode>
```

## 2.2.1.2 List of screens

**Description:** The element `<screenGroup>` is used as a container for the screen/shield information.

**Markup element:** `<screenGroup>`

ICN-C0419-S1000D0248-001-01

Fig 10 Element `<screenGroup>`

**Attributes:**

- None

**Child elements:**

- `<screen>`, the screen/shield information

## 2.2.1.2.1 Screen/shield information

**Description:** The element `<screen>` and its attributes contain information about the type of the wire in a shielding situation and the identification of the screen to which the wire end is connected.

**Note**

The term 'shielding situation' is used in this chapter when it is necessary to describe the terminations of screens that shield wires. This information is essential for maintenance personnel in order to enable them to make the correct terminations of screens.

**Note**

The screen/shield information provides a unique identifier to screens (eg, over all screens or screens of a cable), which shield a wire or a cable. When shielded wires are connected to the equipment, the ends of their screens are connected to a pin or a chassis of the equipment by using an active wire or by clamping or soldering the screen with the shell as for wiring data with a logical connection. It is also possible that the screen end is left open, which means that there is no connection to any equipment.

It is recommended to populate the element `<screen>` and the available attributes as follows:

In special cases an overall screen covers shielded wires. For graphical display purposes the attribute `screenLevel` defines the hierarchy of the screens with two-digit numeric data for screen connections. Inner screens must have lower values, starting with value "01". Shielded wires must have the screen level attribute `screenLevel` value set to "00".

The attribute `screenType` defines the type of a wire in a shielding situation by two-digit numeric data. The attribute `screenType` is used for graphical display purposes. The values given in [Table 4](#) are recommended.

*Table 4 Types of a wire in a shielding situation*

Value	Meaning (Type of wire)
01	Shielded wire
02	Virtual screen connection
03	Connection from a screen to a shell
04	Connection from a screen to a pin of the equipment (pin screen)
05	Connection of two screens (screen link)
06	Connection from a screen to another equipment (screen follower) and PIGTAIL wire to a screen
07	Connection from a screen to one of the shielded wires
90	Unshielded wire
99	Wire for which the shielding situation can not be shown

The attribute `screenStyle` defines the presentation format of a screen. It is only used for screen connections. Shielded wires must have the screen style attribute `screenStyle` value set to "00". If used, the values given in [Table 5](#) are recommended.

*Table 5 Types of a screen*

Value	Meaning (Type of screen)
01	Normal screen
02	Screen of a data bus cable
03	Screen of a coaxial cable
04	Outer screen of a tri-axial cable
05	Inner screen of a tri-axial cable

The element `<screen>` itself contains, if applicable, the identification of the screen to which the wire is connected

**Markup element:** `<screen>`

**Attributes:**

- `screenLevel` (O), the physical level of the screen in a shielding situation. Outer screens (over all screens) must have higher values than inner screens (screens of cables).
- `screenType` (O), the type of the wire in a shielding situation

**Note**

The attribute `screenType` describes the connection type of a wire (normally on both ends of the screen, a wire is connected to pin screens for example), connected to

this screen or the shielded wire itself. Screen information for the complete screen is provided in the element [<wireInfo>](#). Therefore it is recommended not to use the attribute `screenType` in this context.

- `screenStyle` (O), the style for the graphical presentation of the screen in a shielding situation

#### Child elements:

- None

#### Markup example:

```
<screen screenLevel="01" screenType="03"
screenStyle="01">SCT1</screen>
```

#### 2.2.1.3 Twisting of twisted wires

**Description:** The element [<twistGroup>](#) is used as a container for the twist information.

**Markup element:** [<twistGroup>](#)

ICN-C0419-S1000D0250-001-01

Fig 11 Element [<twistGroup>](#)

#### Attributes:

- None

#### Child elements:

- [<twist>](#), the twist information

#### 2.2.1.3.1 Twist information

**Description:** The element [<twist>](#) and its attribute `twistingType` contain information about the twisting of a wire. The element [<twist>](#) must contain all twist information of the wire. The attribute `twistingType` specifies the type of twisting in coded form. Twist information can be different on both sides of a wire. The element [<twist>](#) must contain the twist information on this side of the wire.

[Table 6](#) gives the recommended codes for twisting types.

Table 6 Twist type codes

Twisting type code	Twisting type
1	Twisting of multi-core cables
2	Manually twists
3	Manually twists of already twisted wires

**Markup element:** [<twist>](#)

**Attributes:**

- twistingType (O), the type of twisting

**Child elements:**

- None

**Markup example:**

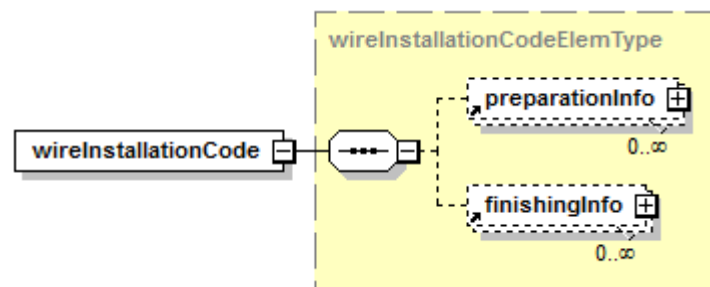

The following markup example shows the twisting of a wire that is manually twisted with one or more other wires. All wires that are twisted together have the same twist identifier T%CM0005AA.

```
<twist twistingType="2">T%CM0005AA</twist>
```

#### 2.2.1.4 Wire installation code

**Description:** The element `<wireInstallationCode>` contains the information for preparation and finishing of the wire for connection purposes.

**Markup element:** `<wireInstallationCode>`

ICN-C0419-S1000D0252-001-01

Fig 12 Element `<wireInstallationCode>`

**Attributes:**

- None

**Child elements:**

- `<preparationInfo>`, the wire preparation information
- `<finishingInfo>`, the wire finishing information

**Markup example:**

The following markup example shows the preparation information for a wire end. It shows the preparation instruction in coded form PRE609 and gives a reference to the instruction sheet.

```
<wireInstallationCode>
<preparationInfo>
<instructionIdent>PRE609</instructionIdent>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="20"
subSystemCode="9" subSubSystemCode="0" assyCode="16"
disassyCode="09" disassyCodeVariant="A" infoCode="010"
infoCodeVariant="A" itemLocationCode="D"/>
```

```

</dmRefIdent>
</dmRef>
</refs>
</preparationInfo>
</wireInstallationCode>

```

#### 2.2.1.4.1 Content model preparationInfo/finishingInfo

**Description:** For wires, the content model preparationInfo/finishingInfo defines the child elements `<preparationInfo>` and `<finishingInfo>`.

**Markup elements:** `<preparationInfo>` and `<finishingInfo>`

ICN-C0419-S1000D0253-001-01

Fig 13 Element `<preparationInfo>`

ICN-C0419-S1000D0254-001-01

Fig 14 Element `<finishingInfo>`

#### Attributes:

- None

#### Child elements:

- `<instructionIdent>`, the wire preparation or finishing information in coded form
- `<refs>`, the references to detailed instructions for preparation or finishing of a wire

#### 2.2.1.4.2 Preparation/finishing information identification

**Description:** The element `<instructionIdent>` gives wire preparation or finishing information in coded form.

**Markup element:** `<instructionIdent>`

#### Attributes:

- None

#### Child elements:

- None

#### Markup example:

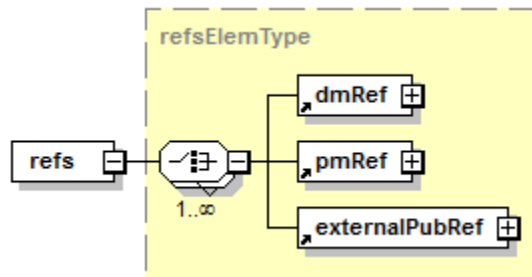

```
<instructionIdent>PRE609</instructionIdent>
```

#### 2.2.1.4.3 References

**Description:** The element `<refs>` contains links to other parts of the project's publications, which give detailed instructions for preparation or finishing of a wire. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

**Markup element:** `<refs>`

ICN-C0419-S1000D0256-001-01

Fig 15 Element `<refs>`

#### Attributes:

- None

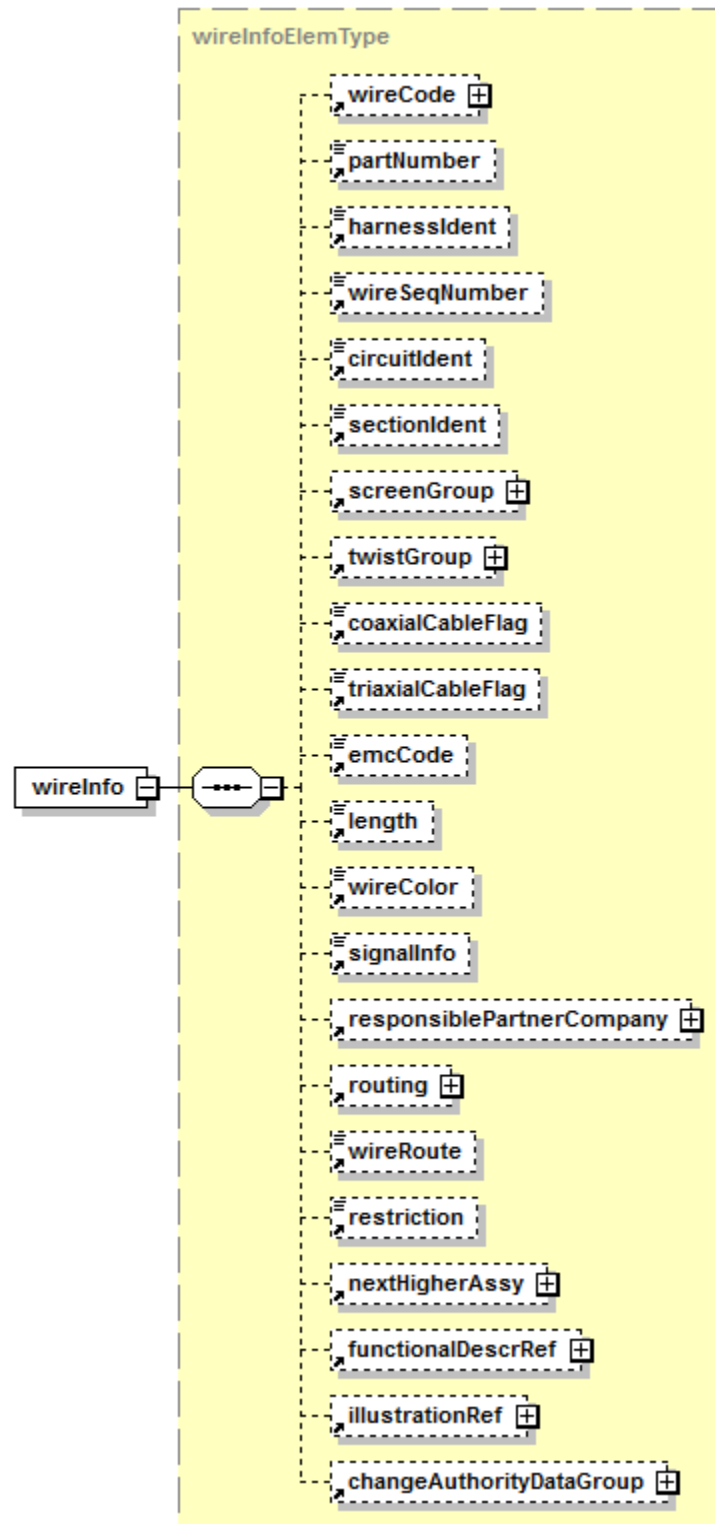

#### Child elements:

- Refer to [Chap 3.9.5.2.1.2](#).

## 2.3 Wire information

**Description:** The element `<wireInfo>` contains child elements, which describe properties of the wire and other information related to the complete wire.

Markup element: <wireInfo>

ICN-C0419-S1000D0257-001-01

Fig 16 Element <wireInfo>

#### Attributes:

- None

#### Child elements:

- `<wireCode>`, the wire code
- `<partNumber>`, the wire part number
- `<harnessIdent>`, the identification of the harness to which the wire belongs
- `<wireSeqNumber>`, the wire sequential number
- `<circuitIdent>`, the circuit code. Refer to [Para 2.1.1](#).
- `<sectionIdent>`, the wire section identification. Refer to [Para 2.1.3](#).
- `<screenGroup>`, the list of screens. Refer to [Para 2.2.1.2](#).
- `<twistGroup>`, the twisting information of twisted wires. Refer to [Para 2.2.1.3](#).
- `<coaxialCableFlag>`, the coaxial information
- `<triaxialCableFlag>`, the tri-axial information
- `<emcCode>`, the electromagnetic compatibility (EMC) code
- `<length>`, the wire length
- `<wireColor>`, the wire color
- `<signalInfo>`, the wire signal information
- `<responsiblePartnerCompany>`, the company or the organization, which is responsible for the wire data
- `<routing>`, the wire routing information
- `<wireRoute>`, the wire route lane code
- `<restriction>`, the wire restriction information
- `<nextHigherAssy>`, the identification of the next higher assembly
- `<functionalDescrRef>`, the functional description reference
- `<illustrationRef>`, the reference to circuit or wiring diagrams
- `<changeAuthorityDataGroup>`, the group of change authority information

#### Markup example:

```
<wireInfo>
<harnessIdent>2309VB</harnessIdent>
<wireColor>B</wireColor>
<signalInfo>115V AC, 400Hz</signalInfo>
</wireInfo>
```

### 2.3.1

#### Wire code

**Description:** The element `<wireCode>` gives information on the type of a wire and its gauge.

**Markup element:** `<wireCode>`

ICN-C0419-S1000D0258-001-01

Fig 17 Element `<wireCode>`

**Attributes:**

- None

**Child elements:**

- [<wireType>](#), the wire type
- [<wireGauge>](#), the wire gauge

**Markup example:**

```
<wireCode>
<wireType>CH</wireType>
</wireCode>
```

## 2.3.1.1

## Wire type

**Description:** The element [<wireType>](#) gives information on the type of a wire. Normally, the wire type is defined in coded form. [Table 7](#) shows examples for the coding of wire types.

*Table 7 Wire type codes*

Wire type code	Wire type
CH	600V, 150°C, Single, Nickel-Coated Copper
PC	600V, 150°C, Multi-Core, 2 cores, Overall Sheathed, Nickel-Coated Copper
QC	600V, 150°C, Multi-Core, 3 cores, Overall Sheathed, Nickel-Coated Copper

**Markup element:** [<wireType>](#)
**Attributes:**

- None

**Child elements:**

- None

**Business rule decision point BRDP-S1-00239 - Use of the element [<wireType>](#):**

- Decide on the definition of wire type content/codes.

**Markup example:**

```
<wireType>QC</wireType>
```

## 2.3.1.2

## Wire gauge

**Description:** The element [<wireGauge>](#) contains the gauge of a wire. The measure type is given in the attribute `wireGaugeType`.

**Markup element:** [<wireGauge>](#)
**Attributes:**

- `wireGaugeType` (M), the type of measure for the wire gauge. The attribute `wireGaugeType` can have one of the following values:

- "proj" - for wires which gauge type is measured in a project or an organization specific unit
- "awg" - for wires which gauge type is measured in accordance with the American Wire Gauge units
- "mt" - for wires which gauge type is measured in a metric unit

**Child elements:**

- None

**Markup example:**

```
<wireGauge wireGaugeType="awg">006</wireGauge>
```

### 2.3.2 Wire part number

**Description:** The element `<partNumber>` contains the project specific part number of a wire. If applicable, the properties of a wire with a specific part number are given in the element `<wireMaterial>` within the electrical standard parts branch of the wiring data Schema. Refer to [Chap 3.9.5.2.9.12](#). The part number is the unique identifier. Refer to [Chap 3.9.5.2.7](#).

**Markup element:** `<partNumber>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<partNumber>JN1018QC020</partNumber>
```

### 2.3.3 Harness identification

**Description:** The element `<harnessIdent>` contains the identification of the harness to which the wire belongs. For more detailed information about the population of this element. Refer to [Chap 3.9.5.2.9.3](#).

**Markup element:** `<harnessIdent>`

**Attributes:**

- contextIdent (O), manufacturerCodeValue (O) and itemOriginator (O), further qualifies the harness identification. Refer to [Chap 3.9.5.2.9.3](#).

**Child elements:**

- None

**Markup example:**

```
<harnessIdent>1109VB</harnessIdent>
```

#### 2.3.4 Wire sequential number

**Description:** The element `<wireSeqNumber>` contains the sequential number of a wire, which can be part of the entire wire identification.

The wire sequential number must be used if the entire wire identification including its sequential number is not given in the element `<wireNumber>`. Refer to [Para 2.1.2](#).

For projects or organizations that hold the sequential wire number in the element `<wireNumber>` of the wire identification, the population of the element `<wireSeqNumber>` is not necessary.

**Markup element:** `<wireSeqNumber>`

**Attributes:**

- None

**Child elements:**

- None

**Business rule decision point BRDP-S1-00240 - Use of the element `<wireSeqNumber>`:**

- Decide whether and how to use the wire sequential number.

**Note**

The element `<wireSeqNumber>` must be used if the wire sequential number is not given in the element `<wireNumber>`.

**Markup example:**

The following markup example shows a wire with the identification W0237-0161-24B. The sequential number of the wire (0161) (eg, in the harness), is given in element `<wireSeqNumber>`.

```
<wire wireState="active">
  <wireIdent>
    <wireNumber>W0237-0161-24B</wireNumber>
  </wireIdent>
  <wireInfo>
    <wireSeqNumber>0161</wireSeqNumber>
  </wireInfo>
</wire>
```

#### 2.3.5 Circuit code

**Description:** For projects that do not use the circuit code of a wire in the identification of the wire itself, the element `<circuitIdent>` is additionally available in the element `<wireInfo>`.

For projects or organizations that hold the circuit code in the element `<circuitIdent>` of the wire identification, the population of the element `<circuitIdent>` is not necessary here. Refer to [Para 2.1.1](#).

**Markup element:** `<circuitIdent>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<circuitIdent>234</circuitIdent>
```

**2.3.6 Wire section identification in the wire information branch**

**Description:** For projects that do not use the wire section identification in the identification of the wire itself, the element `<sectionIdent>` is additionally available in the wire information element `<wireInfo>`.

For projects or organizations that hold the wire section identification in the element `<sectionIdent>` of the wire identification, the population of the element `<sectionIdent>` is not necessary here. Refer to [Para 2.1.3](#).

**Markup element:** `<sectionIdent>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<sectionIdent>567</sectionIdent>
```

**2.3.7 List of screens**

**Description:** The element `<screenGroup>` contains the screen/shield information. Refer to [Para 2.2.1.2](#).

**2.3.8 Twisting of twisted wires**

**Description:** The element `<twistGroup>` contains the twist information. Refer to [Para 2.2.1.3](#).

**2.3.9 Coaxial information**

**Description:** The element `<coaxialCableFlag>` identifies coaxial cables. In many cases, a coaxial cable is indicated by the letter "Y" in the element content.

**Markup element:** `<coaxialCableFlag>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<coaxialCableFlag>Y</coaxialCableFlag>
```

**2.3.10 Tri-axial information**

**Description:** The element `<triaxialCableFlag>` identifies tri-axial cables. In many cases, a tri-axial cable is indicated by the letter "Y" in the element content.

**Markup element:** `<triaxialCableFlag>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<triaxialCableFlag>Y</triaxialCableFlag>
```

### 2.3.11

#### Electromagnetic compatibility code

**Description:** The element `<emcCode>` identifies the electromagnetic compatibility (EMC) classification of a wire.

Normally, the EMC classification is defined in coded form. [Table 8](#) gives examples for the coding of EMC classifications.

*Table 8 EMC codes*

EMC code	EMC classification
E	Emissive wire
S	Susceptible wire

**Markup element:** `<emcCode>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the EMC code of an emissive wire.

```
<emcCode>E</emcCode>
```

### 2.3.12

#### Length information

**Description:** The element `<length>` contains the length of a wire. It is recommended to specify in the attribute `wireLengthType`, whether the length information gives the design length, the real length, or a critical length.

**Markup element:** `<length>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the wire length
- `wireLengthType` (O), the type of wire length information. The attribute `wireLengthType` can have one of the following values:
  - `"critical"` - the new wire must have exactly this defined length when a wire change is performed. Otherwise, the data delivered thru the wire will not be accurate.

- "estimated"- the wire length corresponds with the cut length without any constraints to the final length (after installation of the wire)
- "final"- the wire length corresponds with the length after installation of the wire

#### Child elements:

- None

#### Markup example:

The following markup example shows the length information of a wire with an estimated length of 2150 millimeter.

```
<length unitOfMeasure="mm" wireLengthType="estimated">2150
</length>
```

### 2.3.13

#### Color information

**Description:** The element `<wireColor>` identifies the color of a wire. Normally, the color information is defined in coded form. [Table 9](#) gives examples for the coding of color information.

Table 9 Color codes

Color code	Color of the wire sheathing
W	White
Y	Yellow
R	Red
G	Green
B	Blue
BK	Black

**Markup element:** `<wireColor>`

#### Attributes:

- None

#### Child elements:

- None

#### Markup example:

The following markup example shows the color information of a red sheathed wire.

```
<wireColor>R</wireColor>
```

### 2.3.14

#### Signal information

**Description:** The element `<signalInfo>` contains information about the signals on a wire. This can be the signal name, the effective voltage, the effective current or the waveform of the signal.

**Markup element:** `<signalInfo>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the information for a signal on the wire, which is specified as a 115 volt alternating current with a frequency of 400 hertz.

```
<signalInfo>115V AC, 400Hz</signalInfo>
```

**2.3.15**
**Responsible partner company**

**Description:** The element `<responsiblePartnerCompany>` indicates the company or the organization, which is responsible for the wire data. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<responsiblePartnerCompany>`

ICN-C0419-S1000D0270-001-01

Fig 18 Element `<responsiblePartnerCompany>`

**Attributes:**

- `enterpriseCode` (O), the CAGE code of the enterprise (for clarification: "responsible company or organization")
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<enterpriseName>` (O), the name of the enterprise/manufacture/supplier

**Note**

The use of the child element `<enterpriseName>` can considerably increase the amount of data to be stored and exchanged. Therefore it is recommended to use only the attribute `enterpriseCode` in context with the element `<wire>` instead of, or in addition to the child element `<enterpriseName>`.

**Markup example:**

The following markup example shows the responsible partner company information of a wire. The responsible partner company is indicated by its CAGE code.

```
<responsiblePartnerCompany enterpriseCode="K0999" />
```

**2.3.15.1**
**Enterprise/manufacture/supplier name**

**Description:** The element `<enterpriseName>` contains the name of the enterprise/manufacture/supplier, which is responsible for the data. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<enterpriseName>`

**Attributes:**

- None

**Child elements:**

- None

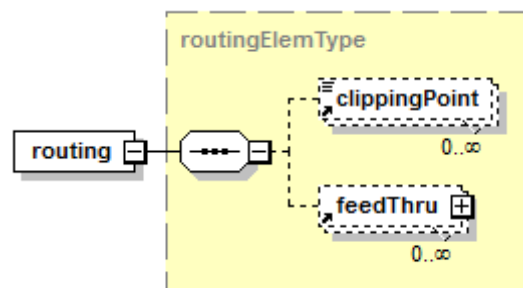

**Markup example:**

```
<enterpriseName>Amphenol Ltd</enterpriseName>
```

**2.3.16**
**Routing**

**Description:** The element `<routing>` contains routing information of a wire via clipping points and special components (eg, current transformers, panels or bungs), thru which wires pass.

**Markup element:** `<routing>`

ICN-C0419-S1000D0272-001-01

Fig 19 Element `<routing>`

**Attributes:**

- None

**Child elements:**

- `<clippingPoint>`, the clipping point information for a wire
- `<feedThru>`, the information about the equipment thru which a wire passes

**Markup example:**

```
<routing>
<clippingPoint>271-11</clippingPoint>
<clippingPoint>271-12</clippingPoint>
<feedThru>
<functionalItemRef functionalItemNumber="42XU4T"/>
</feedThru>
</routing>
```

**2.3.16.1**
**Clipping point information**

**Description:** The clipping points of a wire that fasten it to the structure of an aircraft, an equipment, etc, are listed in the `<clippingPoint>` elements. If used, every clipping point must be populated in exactly one of the `<clippingPoint>` elements (ie, the clipping point identification contains only one clipping point that fastens the wire to the structure).

**Markup element:** `<clippingPoint>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<clippingPoint>271-11</clippingPoint>
```

### 2.3.16.2 Feed-thru information

**Description:** If a wire passes thru equipment (eg, a current transformer), this is identified by using the feed-thru element [<feedThru>](#).

**Markup element:** [<feedThru>](#)

ICN-C0419-S1000D0274-001-01

Fig 20 Element [<feedThru>](#)

**Attributes:**

- holeIdent (O), the hole identifier

**Child elements:**

- [<functionalItemRef>](#), the identification of the equipment thru which a wire passes. Functional items are also known as reference designators. Refer to [Chap 3.9.5.1](#).

**Markup example:**

The following markup example shows a wire that passes thru the hole with the identification '3' of equipment '42XU4T'.

```
<feedThru holeIdent="3">
<functionalItemRef functionalItemNumber="42XU4T"/>
</feedThru>
```

### 2.3.17 Wire route lane code

**Description:** The element [<wireRoute>](#) contains lane codes for wires, which belong to a primary system, and must be given a routing apart from other wires of the system.

**Markup element:** [<wireRoute>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows a wire that belongs to lane 'L1'.

```
<wireRoute>L1</wireRoute>
```

### 2.3.18 Wire restriction

**Description:** The element `<restriction>` contains restrictions concerning a wire.

**Markup element:** `<restriction>`

**Attributes:**

- None

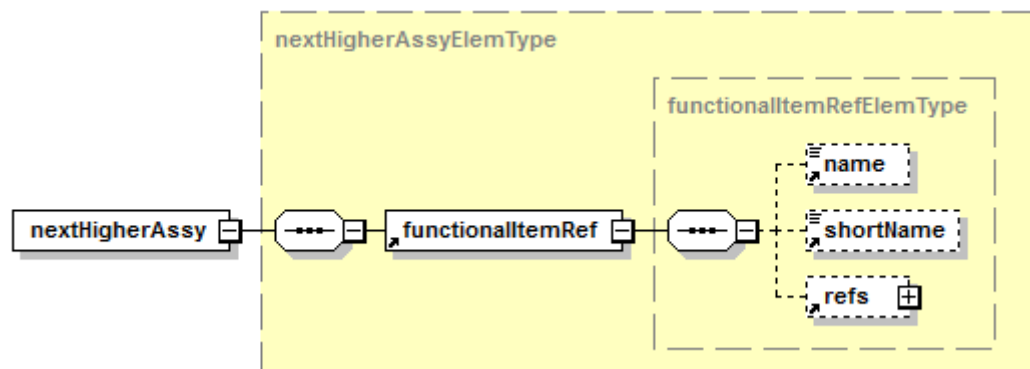

**Child elements:**

- None

### 2.3.19 Next higher assembly

**Description:** For wires that are part of a physical or logical assembly (eg, a box and/or a panel), the element `<nextHigherAssy>` can be used to identify this equipment.

**Markup element:** `<nextHigherAssy>`

ICN-C0419-S1000D0277-001-01

Fig 21 Element `<nextHigherAssy>`

**Attributes:**

- None

**Child elements:**

- `<functionalItemRef>`, the identification of the physical or logical assembly to which the wire belongs. Functional items are also known as reference designators. Refer to [Chap 3.9.5.1](#).

**Markup example:**

The following markup example shows a wire that is installed in the next higher assembly 231VU.

```
<nextHigherAssy>
<functionalItemRef functionalItemNumber="231VU"/>
</nextHigherAssy>
```

### 2.3.20 Functional description reference

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a wire (eg, a description of how it is made and its function). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0278-001-01

Fig 22 Element `<functionalDescrRef>`

**Attributes:**

- None

**Child elements:**

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

### 2.3.21 Illustration reference

**Description:** The element `<illustrationRef>` contains references to other parts of the electrical system publications that contain wiring illustrations. Such an illustration can show circuit or wiring diagrams. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0279-001-01

Fig 23 Element `<illustrationRef>`

**Attributes:**

- None

**Child elements:**

- `<refs>`, the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

### 2.3.22 Change authority data group

**Description:** The element `<changeAuthorityDataGroup>` contains a list of conditions impacting the wire.

Markup element: `<changeAuthorityDataGroup>`

ICN-C0419-S1000D0280-001-01

Fig 24 Element `<changeAuthorityDataGroup>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<changeAuthorityData>`, contains a single condition impacting the wire. Refer to [Chap 3.9.5.2.7](#).

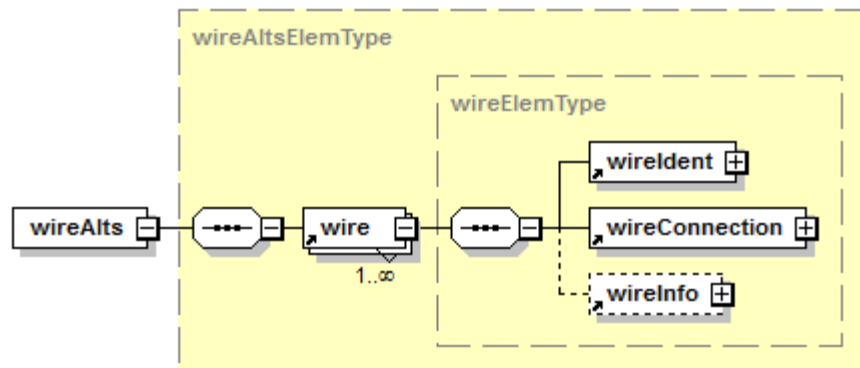

#### Markup example:

```
<changeAuthorityDataGroup>
  <changeAuthorityData>
    <changeAuthority condNumber="2012-26-51" condTypeName="AD" />
  </changeAuthorityData>
</changeAuthorityDataGroup>
```

## 2.4 Element `<wireAlts>`

**Description:** The element `<wireAlts>`, within the element `<wireGroup>`, provides the capability to group several alternate solutions of wire data for different applicability annotations. Refer to [Chap 4.13.3](#) for information related to the use of the alternates group mechanism in data module content.

Markup element: `<wireAlts>`

ICN-C0419-S1000D0281-001-01

Fig 25 Element `<wireAlts>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<wire>`, the wire data. Refer to [Para 2](#).

#### Markup example:

```
<wiringData>
<wireGroup>
<wireAlts>
<wire wireState="active" applicRefId="app-0001">
<wireIdent>
<wireNumber>QX24QA</wireNumber>
</wireIdent>
<wireConnection>
<fromEquip>
<functionalItemRef functionalItemNumber="6QXA"/>
</fromEquip>
</wireConnection>
<wireInfo>
<wireCode>
<wireType>AP</wireType>
</wireCode>
</wireInfo>
</wire>
<wire wireState="notactiv" applicRefId="app-0002">
<wireIdent>
```

```

<wireNumber>NC00001NA</wireNumber>
</wireIdent>
<wireConnection>
<fromEquip>
<functionalItemRef functionalItemNumber="61UR"/>
</fromEquip>
</wireConnection>
<wireInfo>
<wireCode>
<wireType>TB</wireType>
</wireCode>
</wireInfo>
</wire>
</wireAlts>
</wireGroup>
</wiringData>

```

### 3

## Examples

### 3.1

## Wire connection code examples

#### 3.1.1

### Connector with six contacts

The following [Fig 26](#) and [Table 10](#) show the content of the wire connection code and its child elements for a connector with six contacts.

ICN-C0419-S1000D0124-004-01

*Fig 26 Coding of wire connection code child elements - Connector*

Table 10 Coding of wire connection code child elements - Connector

Contact identification	Screen order	Special connection	Electrical potential				Potential connections order
			Termination module grouping value	Block grouping value	Shunt grouping value	Contact order value	
A						1	
B						2	
C						3	
D						4	
E						5	
F						6	

### 3.1.2 Connector with five contacts and shielded wires

The following [Fig 27](#) and [Table 11](#) show the content of the wire connection code and its child elements for a connector with five contacts when shielded wires are connected to.

ICN-C0419-S1000D0187-002-01

Fig 27 Coding of wire connection code child elements - Connector with shielded wires

Table 11 Coding of wire connection code child elements - Connector with shielded wires

Contact identification	Screen order	Special connection	Electrical potential				Potential connections order
			Termination module grouping value	Block grouping value	Shunt grouping value	Contact order value	
	1	1				0	
A	2					1	
B	3					2	
C	5					3	
D	6					4	
E	4					5	

### 3.1.3 Switch with two poles and two positions

In the following example a switch with two poles (1-2-3, 4-5-6) and two positions (OFF-ON) is shown. Refer to [Fig 28](#). In this example, all contacts, which are not base contacts, have allocated a higher value than the base contacts by adding an offset of 100 to order the base contacts before the non-base contacts. Refer to [Table 12](#).

ICN-C0419-S1000D0125-003-01

Fig 28 Coding of wire connection code child elements - Switch

Table 12 Coding of wire connection code child elements - Switch

Contact identification	Screen order	Special connection	Electrical potential				Potential connections order
			Termination module grouping value	Block grouping value	Shunt grouping value	Contact order value	
1				1	1	101	
2				1	1	2	
3				1	2	103	
4				2	1	104	
5				2	1	5	
6				2	2	106	

### 3.1.4 Relay with two poles

A relay with two poles (1-2-3, 4-5-6) is shown in the following example. Refer to [Fig 29](#). Here, again all contacts of a pole, which are not base contacts, have allocated a higher value than the base contacts by adding an offset of 100. The coil of the relay has the lowest block grouping value 1 and will be displayed in a graphical presentation before the poles of the relay. Refer to [Table 13](#).

ICN-C0419-S1000D0126-003-01

Fig 29 Coding of wire connection code child elements - Relay

Table 13 Coding of wire connection code child elements - Relay

Contact identification	Screen order	Special connection	Electrical potential				Potential connections order
			Termination module grouping value	Block grouping value	Shunt grouping value	Contact order value	
A				1	1	7	
B				1	1	8	
1				2	1	101	
2				2	1	2	
3				2	2	103	
4				3	1	104	
5				3	1	5	
6				3	2	106	

### 3.1.5 Block of a termination module assembly

The following example shows one block of a termination module assembly. The block contains three shunts/busses. Refer to [Fig 30](#). The contacts are ordered alphabetically by the contact order value. The different values for the shunt grouping information can be used to group and order the wires, connected to the same busses, for graphical presentation purposes. Refer to [Table 14](#).

ICN-C0419-S1000D0127-003-01

Fig 30 Coding of wire connection code child elements - Terminal junction module

Table 14 Coding of wire connection code child elements - Terminal junction module

Contact identification	Screen order	Special connection	Electrical potential				Potential connections order
			Termination module grouping value	Block grouping value	Shunt grouping value	Contact order value	
A			1	1	1	1	
B			1	1	1	2	
C			1	1	1	3	
D			1	1	1	4	
E			1	1	2	5	
F			1	1	2	6	
G			1	1	3	7	
H			1	1	3	8	
J			1	1	3	9	
K			1	1	3	10	

### 3.1.6 Earth bolt

Wires, connected to earth bolts, must have allocated the same value in the contact order element <contactOrderValue> and ascending values in the potential connections order element <potentialConnectionsOrder> as shown in [Fig 31](#) and [Table 15](#).

ICN-C0419-S1000D0188-002-01

Fig 31 Coding of wire connection code child elements - Earth bolt

Table 15 Coding of wire connection code child elements - Earth bolt

Contact identification	Screen order	Special connection	Electrical potential				Potential connections order
			Termination module grouping value	Block grouping value	Shunt grouping value	Contact order value	
						1	1
						1	2
						1	3

### 3.2 Wire end information of a screened and twisted wire

This example shows the wire end information of a screened and twisted wire that is connected to contact A of the connector 1071VP.

```
<fromEquip>
<functionalItemRef functionalItemNumber="1071VP"/>
<contactInfo>
<contact contactIdent="A"/>
<wireConnectionCode>

### 3.5 Wire end information of wires in a relay box

The following example shows the wire end information of some wires in a relay box, connecting relay 61UR, terminal junction module 3209VVB and receptacle on the relay box 3209VE as shown in [Fig 33](#).

### 3.6 Grouping of wires

The following example shows the grouping of four wires that are connected to the terminal stud with the contact identifier T5. The wires W-001 and W-002 are connected to one ring terminal, the wires W-003 and W-004 are connected to another ring terminal. Refer to [Fig 34](#). Group code "A" is assigned to W-001 and W-002 and group code "B" to W-003 and W-004.

ICN-C0419-S1000D0206-001-01

## 1 General

The element `<harness>` and its child elements are used to capture and represent the harnesses that are installed in the Product and their related information.

## 2 Element `<harness>` and child elements

**Description:** The element `<harness>` is contained within the element `<harnessGroup>` to provide a list of harnesses. It contains harness information of the Product's wiring. The electrical wires of a system are often divided into separate harnesses.

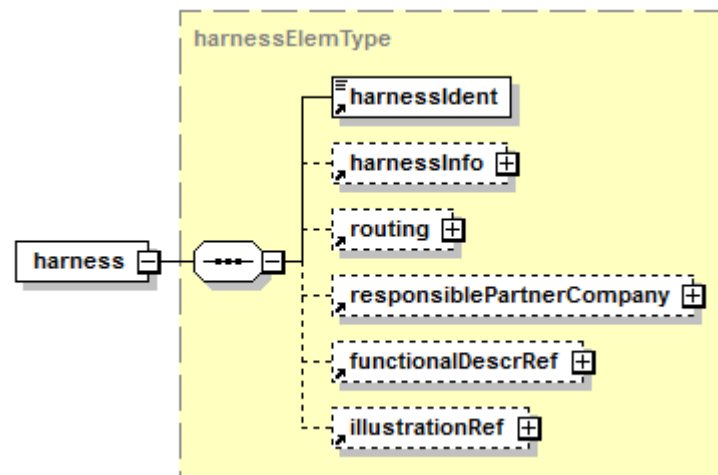

ICN-C0419-S1000D0294-001-01

Fig 1 Element `<harnessGroup>`

It is strongly recommended to define harness applicability precisely and populate the elements and attributes in accordance with the project or the organization specific rules. It is further recommended to use at least the version and version number information given in the products cross-reference table. In addition, harnesses with modifications must use the information given in the conditions cross-reference table.

**Markup element:** `<harness>`

ICN-C0419-S1000D0284-001-01

Fig 2 Element &lt;harness&gt;

#### Attributes:

- applicRefId (O), the applicability information of a harness by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeInfo (O), the change information of a harness in connection with the related modification. This attribute can have one of the following values:
  - "add" - for harnesses which are added to the systems circuits by a modification
  - "delete" - for harnesses which are removed from the systems circuits by a modification
  - "modify" - for harnesses which are modified in the systems circuits by a modification
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O) , the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <harnessIdent>, the harness identification. Refer to [Para 2.1](#).
- <harnessInfo>, the harness information. Refer to [Para 2.2](#).
- <routing>, the harness routing information. Refer to [Para 2.3](#).
- <responsiblePartnerCompany>, the company or the organization that is responsible for the harness data. Refer to [Para 2.4](#).
- <functionalDescrRef>, the functional description reference. Refer to [Para 2.5](#).
- <illustrationRef>, the reference to harness illustrations. Refer to [Para 2.6](#).

#### Markup example:

```
<wiringData>
<harnessGroup>
<harness applicRefId="app-0001">
<harnessIdent>W5250</harnessIdent>
<harnessInfo><harnessName>E ROUTE RH</harnessName></harnessInfo>
<routing>
<clippingPoint>271-11</clippingPoint>
<clippingPoint>273-2</clippingPoint>
</routing>
<responsiblePartnerCompany enterpriseCode="K0378" />
</harness>
</harnessGroup>
</wiringData>
```

```
</harness>  
</harnessGroup>  
</wiringData>
```

## 2.1 Harness identification

**Description:** The element [<harnessIdent>](#) contains the unique identifier of a harness in the system. It is the link between the harness and the included wires.

**Markup element:** [<harnessIdent>](#)

**Attributes:**

- `contextIdent` (O), the context identification which is used in combination with the attribute `manufacturerCodeValue` to ensure the uniqueness of manufacturer harness data. Context identification contains an identifier (eg, the part number of the next higher assembly that has been given to the assembly by the manufacturer).
- `manufacturerCodeValue` (O), the identification of the manufacturer (eg, the CAGE code), which is used in combination with the attribute `contextIdent` to ensure uniqueness of manufacturer harness data.
- `itemOriginator` (O), the origin of the harness (eg, whether a harness is an aircraft manufacturer harness or a supplier harness). Values and their meanings are defined by using the BREX mechanism. Refer to [Chap 3.9.6.1](#) and [Chap 4.10](#).

**Child elements:**

- None

**Markup examples:**

The first example shows a harness with the identification 1310VB.

```
<harnessIdent>1310VB</harnessIdent>
```

The second example shows the markup of harness W5250 that is installed in the panel with the part number P1650-411, supplied by the manufacturer with the identification 01234.

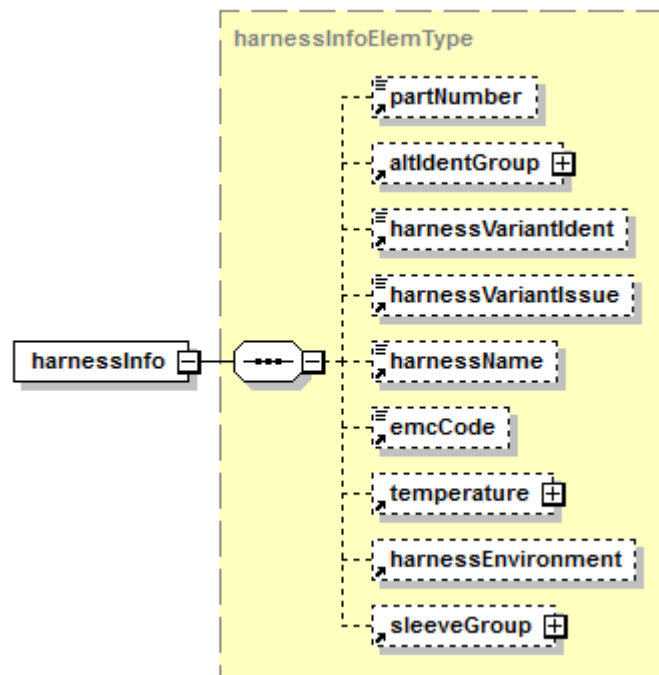

```
<harnessIdent contextIdent="P1650-411"  
manufacturerCodeValue="01234" itemOriginator="orig02">W5250  
</harnessIdent>
```

## 2.2 Harness information

**Description:** The element [<harnessInfo>](#) contains harness information for the detailed identification of a harness (eg, the part number and alternative identifications that can be used to identify this harness).

If the element [<harnessInfo>](#) is used, then it is recommended that at least the child element [<partNumber>](#) is populated for detailed identification of the harness.

**Markup element:** [<harnessInfo>](#)

ICN-C0419-S1000D0285-001-01

Fig 3 Element *<harnessInfo>*
**Attributes:**

- None

**Child elements:**

- *<partNumber>*, the harness part number. Refer to [Para 2.2.1](#).
- *<altIdentGroup>*, the list of alternative harness identifications. Refer to [Para 2.2.2](#).
- *<harnessVariantIdent>*, the harness variant identification. Refer to [Para 2.2.3](#).
- *<harnessVariantIssue>*, the harness variant issue. Refer to [Para 2.2.4](#).
- *<harnessName>*, the harness name. Refer to [Para 2.2.5](#).
- *<emcCode>*, the harness separation code. Refer to [Para 2.2.6](#).
- *<temperature>*, the harness temperature rating. Refer to [Para 2.2.7](#).
- *<harnessEnvironment>*, the harness environmental information. Refer to [Para 2.2.8](#).
- *<sleeveGroup>*, the list of harness sleeves. Refer to [Para 2.2.9](#).

**Markup example:**

```
<harnessInfo>
<partNumber>J92101310-407</partNumber>
<harnessVariantIdent>407</harnessVariantIdent>
<harnessVariantIssue>B</harnessVariantIssue>
<harnessName>E ROUTE RH</harnessName>
<emcCode>E</emcCode>
</harnessInfo>
```

**2.2.1 Part number**

**Description:** The element *<partNumber>* contains the project or the organization specific part number of the harness. Refer to [Chap 3.9.5.2.7](#).

**Markup element:** `<partNumber>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

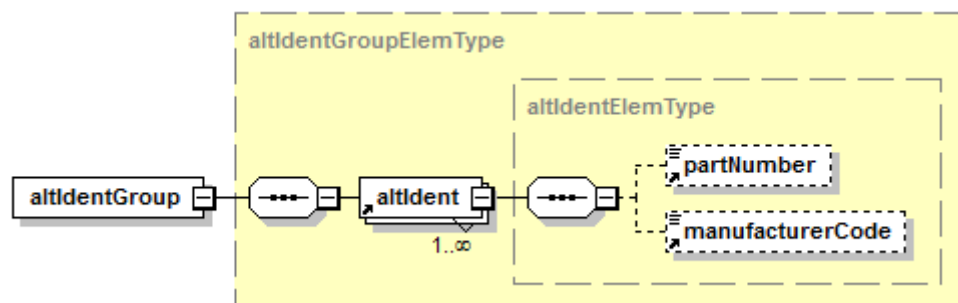

```
<partNumber>J92223100-410</partNumber>
```

## 2.2.2

### Alternative identifications

**Description:** The element `<altIdentGroup>` is used as a container for the subordinate alternative identification elements.

**Markup element:** `<altIdentGroup>`

ICN-C0419-S1000D0286-001-01

Fig 4 Element `<altIdentGroup>`

**Attributes:**

- None

**Child elements:**

- `<altIdent>`, the alternative identification. Refer to [Para 2.2.2.1](#).

### 2.2.2.1

#### Alternative identification

**Description:** The element `<altIdent>` is used for additional identification of a harness. An alternative identification can contain a manufacturer part number and the related manufacturer code.

**Markup element:** `<altIdent>`

**Attributes:**

- None

**Child elements:**

- [<partNumber>](#), the harness alternative part number. Refer to [Para 2.2.1](#).
- [<manufacturerCode>](#), the CAGE code of the harness manufacturer. Refer to [Para 2.2.2.1.1](#).

**Markup example:**

The following markup example shows alternative identification information of a harness.

```
<altIdentGroup>
<altIdent>
<partNumber>LO3100FEB</partNumber>
<manufacturerCode>12345</manufacturerCode>
</altIdent>
</altIdentGroup>
```

**2.2.2.1.1 Harness manufacturer code**

**Description:** The element [<manufacturerCode>](#) must be used in conjunction with the alternative harness part number. It contains the CAGE code of the harness manufacturer.

**Markup element:** [<manufacturerCode>](#)

**Attributes:**

- [id \(O\)](#), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [changeType \(O\)](#), [changeMark \(O\)](#) and [reasonForUpdateRefIds \(O\)](#), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- [securityClassification \(O\)](#), [commercialClassification \(O\)](#), [caveat \(O\)](#) and [derivativeClassificationRefId \(O\)](#), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<manufacturerCode>F0001</manufacturerCode>
```

**2.2.3 Harness variant**

**Description:** The element [<harnessVariantIdent>](#) contains the variant of a harness. Improvements during series production or engineering requirements are reasons why different harnesses are used in one type of system. This element identifies the different harnesses. A harness variant can be part of the project or the organization specific part number.

**Markup element:** [<harnessVariantIdent>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the variant 410 of harness J92223100-410.

```
<harnessVariantIdent>410</harnessVariantIdent>
```

**2.2.4 Harness variant issue**

**Description:** The element [<harnessVariantIssue>](#) contains the issue of a harness variant.

**Markup element:** [<harnessVariantIssue>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<harnessVariantIssue>A</harnessVariantIssue>
```

**2.2.5 Harness name**

**Description:** The element [<harnessName>](#) contains the name of a harness.

**Markup element:** [<harnessName>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<harnessName>FCS LANE 1 FORWARD EQUIPMENT BAY</harnessName>
```

**2.2.6 Harness separation code**

**Description:** The element [<emcCode>](#) contains the electromagnetic compatibility (EMC) classification of a harness.

**Markup element:** [<emcCode>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<emcCode>E</emcCode>
```

**2.2.7 Harness temperature rating**

**Description:** The element [<temperature>](#) describes the minimum and maximum temperature rating for which the harness is approved.

**Markup element:** [<temperature>](#)

ICN-C0419-S1000D0287-001-01

Fig 5 Element `<temperature>`

#### Attributes:

- None

#### Child elements:

- `<minTemperature>`, the minimum temperature rating. Refer to [Para 2.2.7.1](#).
- `<maxTemperature>`, the maximum temperature rating. Refer to [Para 2.2.7.1](#).

#### Markup example:

The following markup example shows the maximum temperature rating for a harness, in this case 500 degrees Fahrenheit.

```
<temperature>
<maxTemperature unitOfMeasure="degF">500</maxTemperature>
</temperature>
```

#### 2.2.7.1 Harness temperature rating child elements

**Description:** The elements `<minTemperature>` and `<maxTemperature>` give the lower and upper temperature rating boundaries for a harness.

**Markup element:** `<minTemperature>` and `<maxTemperature>`

#### Attributes:

- `unitOfMeasure` (O), the unit of measure for the temperature

#### Child elements:

- None

#### Markup example:

```
<temperature>
<minTemperature unitOfMeasure="degC">-10</minTemperature>
<maxTemperature unitOfMeasure="degC">60</maxTemperature>
</temperature>
```

#### 2.2.8 Harness environment

**Description:** The element `<harnessEnvironment>` contains information concerning the environment in which a harness is located.

**Markup element:** `<harnessEnvironment>`

#### Attributes:

- `highVibrationFlag` (O), indicates if a harness is located in a high vibration environment. The attribute can have one of the following values:

- "0" (D) - the harness is not located in a high vibration environment
- "1" - the harness is located in a high vibration environment
- hydraulicFlag (O), indicates if a harness is located in a hydraulic environment. The attribute can have one of the following values:
  - "0" (D) - the harness is not located in a hydraulic environment
  - "1" - the harness is located in a hydraulic environment

#### Child elements:

- None

#### Markup example:

```
<harnessEnvironment highVibrationFlag="1" hydraulicFlag="0"/>
```

### 2.2.9

#### List of harness sleeves

**Description:** The element `<sleeveGroup>` contains a list of sleeves that are used on the harness.

**Markup element:** `<sleeveGroup>`

ICN-C0419-S1000D0288-001-01

Fig 6 Element `<sleeveGroup>`

#### Attributes:

- None

#### Child elements:

- `<sleeve>`, the harness sleeve information. Refer to [Para 2.2.9.1](#).

#### Markup example:

```
<sleeveGroup>
<sleeve><partNumber>SPN1234</partNumber></sleeve>
<sleeve><partNumber>SPN4321</partNumber></sleeve>
</sleeveGroup>
```

### 2.2.9.1

#### Harness sleeve information

**Description:** The element `<sleeve>` contains information about a harness sleeve.

**Markup element:** `<sleeve>`

#### Attributes:

- sleeveMaterial (O), the material of which the sleeve is made

#### Child elements:

- `<partNumber>`, the part number of the harness sleeve. Refer to [Para 2.2.1](#).

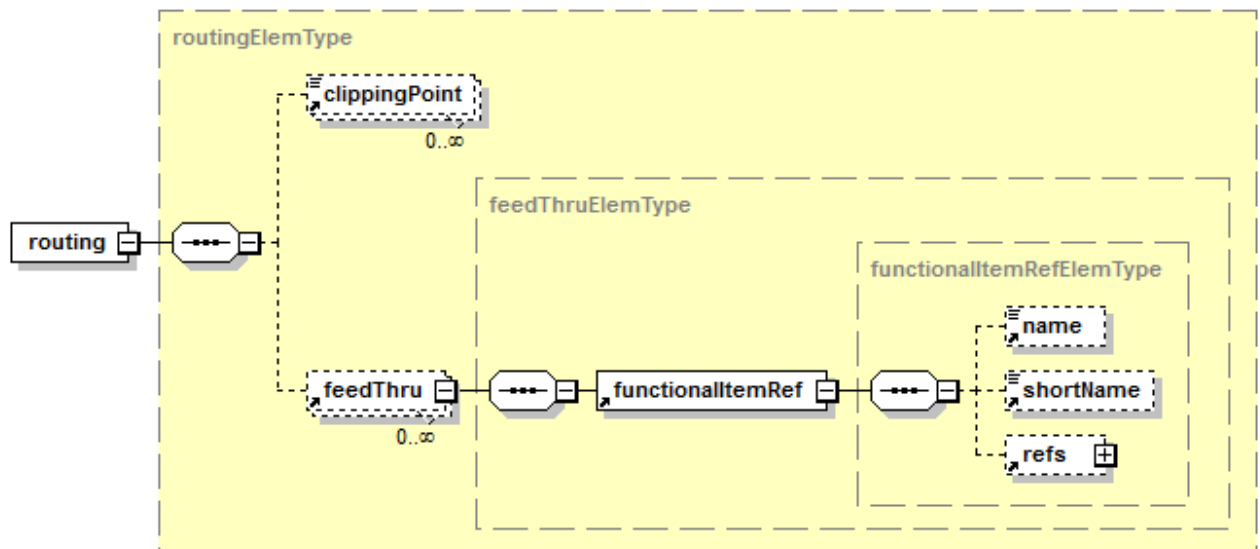

#### Markup example:

```
<sleeveGroup>
<sleeve sleeveMaterial="Teflon">
<partNumber>SLV-5678</partNumber>
</sleeve>
</sleeveGroup>
```

## 2.3 Routing

**Description:** The element `<routing>` contains routing information of a harness via clipping points. It can also contain routing information thru special components (eg, panels or bungs).

**Markup element:** `<routing>`

ICN-C0419-S1000D0289-001-01

Fig 7 Element `<routing>`

#### Attributes:

- None

#### Child elements:

- `<clippingPoint>`, the clipping point information for a harness. Refer to [Chap 3.9.5.2.9.2](#).
- `<feedThru>`, the information about the equipment thru which a harness passes. Refer to [Chap 3.9.5.2.9.2](#).

#### Markup example:

```
<routing>
<clippingPoint>271-11</clippingPoint>
<clippingPoint>273-2</clippingPoint>
</routing>
```

## 2.4 Responsible partner company

**Description:** The element `<responsiblePartnerCompany>` contains the company or the organization that is responsible for the harness data. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<responsiblePartnerCompany>`

ICN-C0419-S1000D0290-001-01

Fig 8 Element `<responsiblePartnerCompany>`

### Attributes:

- `enterpriseCode` (O), the CAGE code of the responsible company or organization
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Child elements:

- `<enterpriseName>`, the name of the responsible company or organization. Refer to [Para 2.4.1](#).

### Note

The use of the child element `<enterpriseName>` can considerably increase the amount of data to be stored and exchanged. Therefore it is recommended to use only the attribute `enterpriseCode` in context with the element `<harness>` to indicate the responsible partner company instead of or in addition using the child element `<enterpriseName>`.

### Markup example:

The following markup example shows the responsible partner company information of a harness. The responsible partner company is indicated by its CAGE code.

```
<responsiblePartnerCompany enterpriseCode="K0378" />
```

### 2.4.1 Responsible partner company name

**Description:** The element `<enterpriseName>` contains the name of the company or the organization that is responsible for the data. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<enterpriseName>`

### Attributes:

- None

### Child elements:

- None

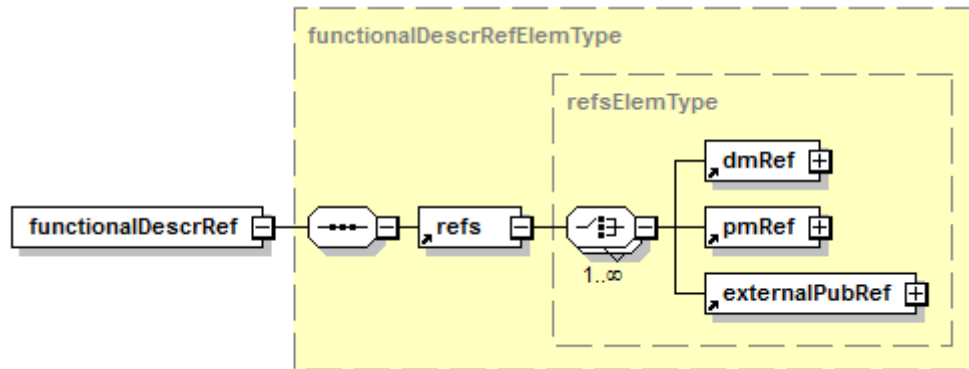

### Markup example:

```
<enterpriseName>Amphenol Ltd</enterpriseName>
```

## 2.5 Functional description reference

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a harness (eg, a description of how it is made and its function). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 9 Element `<functionalDescrRef>`

**Attributes:**

- None

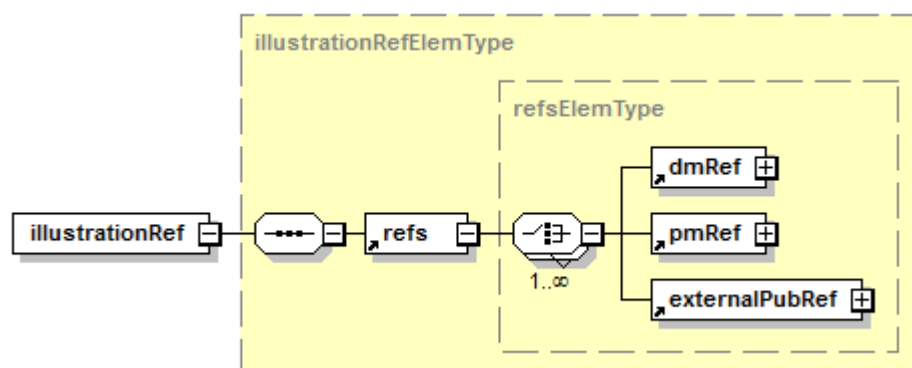

**Child elements:**

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.6 Illustration reference

**Description:** The element `<illustrationRef>` contains references to other parts of the electrical system publications that show harness illustrations. These illustrations can show the routing of the harness. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 10 Element `<illustrationRef>`

**Attributes:**

- None

#### Child elements:

- [<refs>](#), the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.7 Element [<harnessAlts>](#)

**Description:** The element [<harnessAlts>](#), within the list of harnesses element [<harnessGroup>](#), provides the capability to group several alternate solutions of harness data for different applicability annotations. Refer to [Chap 4.13.3](#) for information related to the use of the alternates group mechanism in data module content.

**Markup element:** [<harnessAlts>](#)

ICN-C0419-S1000D0293-001-01

Fig 11 Element [<harnessAlts>](#)

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<harness>](#), the harness data. Refer to [Para 2](#).

#### Markup example:

```
<wiringData>
<harnessGroup>
<harnessAlts>
<harness applicRefId="app-0001">
<harnessIdent>Lamp1</harnessIdent>
<harnessInfo>
<partNumber>Front light_501</partNumber>
<harnessVariantIdent>501</harnessVariantIdent>
<harnessVariantIssue>A</harnessVariantIssue>
<harnessName>Front light harness</harnessName>
<emcCode>LS3</emcCode>
<temperature>
<minTemperature unitOfMeasure="degC">-10</minTemperature>
</temperature>
<sleeveGroup>
<sleeve>
<partNumber>SPN1234</partNumber>
```

```
</sleeve>
<sleeve>
<partNumber>SPN4321</partNumber>
</sleeve>
</sleeveGroup>
</harnessInfo>
<routing>...</routing>
<responsiblePartnerCompany enterpriseCode="U8025"/>
</harness>
<harness applicRefId="app-0002">
<harnessIdent>Lamp2</harnessIdent>
<harnessInfo>
<partNumber>Rear light_503</partNumber>
<harnessVariantIdent>503</harnessVariantIdent>
<harnessVariantIssue>A</harnessVariantIssue>
<harnessName>Rear light harness</harnessName>
<emcCode>LS3</emcCode>
<harnessEnvironment hydraulicFlag="1"/>
</harnessInfo>
<responsiblePartnerCompany enterpriseCode="U8025"/>
</harness>
</harnessAlts>
</harnessGroup>
</wiringData>
```

## 1 General

The element <electricalEquip> and the child elements are used to capture and represent the electrical equipment that is installed in the Product, and related information.

## 2 Element <electricalEquip> and child elements

**Description:** The element <electricalEquip> is contained within the list of electrical equipment element <electricalEquipGroup>. It contains electrical equipment information of the Product's wiring.

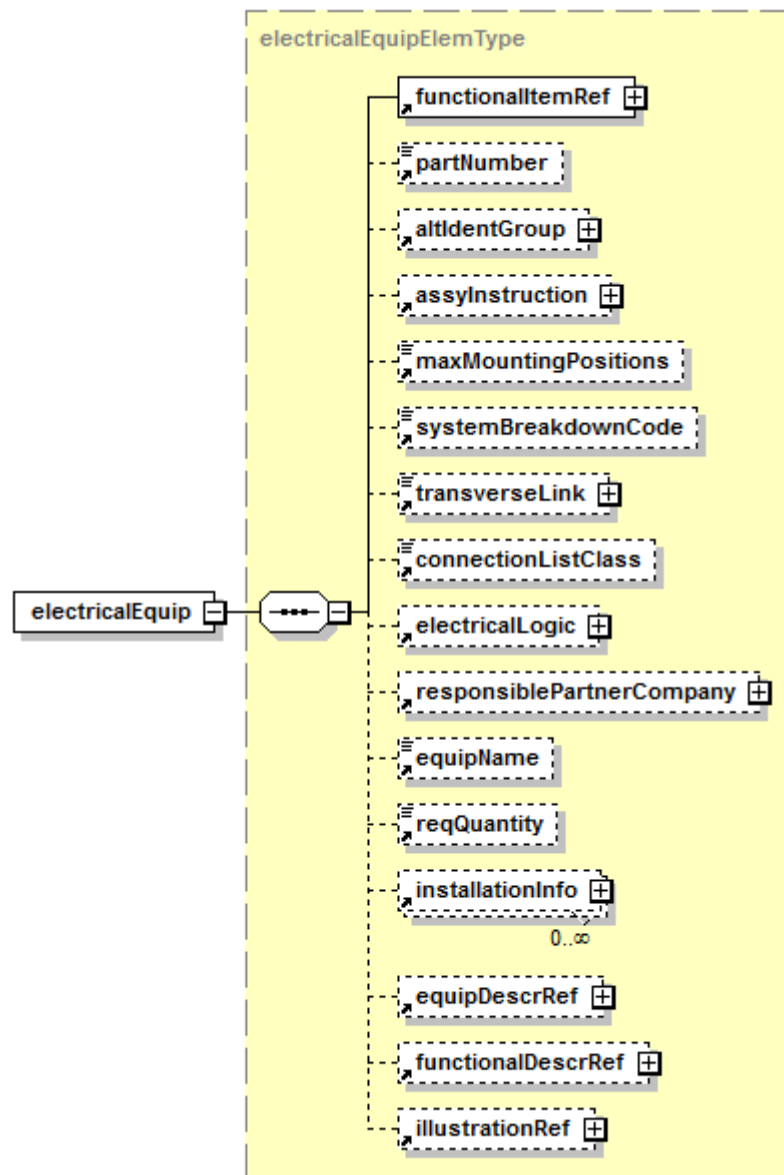

ICN-C0419-S1000D0295-001-01

Fig 1 Element <electricalEquipGroup>

It is strongly recommended to define the electrical equipment applicability precisely and populate it in accordance with the project or the organization specific rules. It is further recommended to use at least the version and version number information given in the products cross-reference table. Electrical equipment with modifications must in addition use the information given in the conditions cross-reference table.

**Markup element:** <electricalEquip>

ICN-C0419-S1000D0296-001-01

Fig 2 Element <electricalEquip>

**Attributes:**

- applicRefId (O), the applicability information of electrical equipment by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- changeInfo (O), the change information of electrical equipment in connection with the related modification. The attribute can have one of the following values:
  - "add" - for electrical equipment that is added to the systems circuits by a modification
  - "delete" - for electrical equipment that is removed from the systems circuits by a modification
  - "modify" - for electrical equipment that is modified in the systems circuits by a modification

- equipState (O), the electrical state of equipment. The different values of this attribute are used to distinguish electrical equipment with allocated functional item, electrical equipment that has no functional item allocated, and placeholders for empty positions on panels, etc. Functional items are also known as reference designators. The attribute equipState can have one of the following values:
  - "active" - for electrical equipment, which is installed in one of the systems circuits and has a functional item allocated
  - "notactiv" - for electrical equipment, which is not active in one of the systems circuits. A not active electrical equipment is used as a placeholder, where for example no component is installed in a position of a circuit breaker panel
  - "logequip" - for electrical equipment, which is installed in one of the systems circuits and has no functional item allocated

#### Child elements:

- <functionalItemRef>, the functional item reference. Functional items are also known as reference designators. Refer to [Chap 3.9.5.1](#).
- <partNumber>, the part number
- <altIdentGroup>, the list of alternative identifications
- <assyInstruction>, the assembly instruction information
- <maxMountingPositions>, the maximum number of mounting positions
- <systemBreakdownCode>, the system breakdown code
- <transverseLink>, the transverse link information
- <connectionListClass>, the connection list class
- <electricalLogic>, the electrical logic information
- <responsiblePartnerCompany>, the company or the organization which is responsible for the electrical equipment data
- <equipName>, the electrical equipment name
- <reqQuantity>, the required quantity information
- <installationInfo>, the installation information
- <equipDescrRef>, the electrical equipment description reference
- <functionalDescrRef>, the functional description reference
- <illustrationRef>, the reference to electrical equipment illustrations

#### Markup example:

```
<wiringData>
<electricalEquipGroup>
<electricalEquip equipState="active" applicRefId="app-0001">
<functionalItemRef functionalItemNumber="AC1650"/>
<partNumber>JN1022-GA45AX</partNumber>
<connectionListClass>15</connectionListClass>
<electricalLogic>
<electricalEquipState initialStateFlag="1">
<electricalEquipConnection>
<contact contactIdent="C"/>
<contact contactIdent="NC"/>
</electricalEquipConnection>
<electricalStateDescr>DEENERGIZED</electricalStateDescr>
</electricalEquipState>
<electricalEquipState>
<electricalEquipConnection>
```

```

<contact contactId="C"/>
<contact contactId="NO"/>
</electricalEquipConnection>
<electricalStateDescr>ENERGIZED</electricalStateDescr>
</electricalEquipState>
</electricalLogic>
<responsiblePartnerCompany enterpriseCode="K0378"/>
<equipName>BATTERY MASTER SWITCH</equipName>
<installationInfo>
<nextHigherAssy>
<functionalItemRef functionalItemNumber="AC1600"/>
</nextHigherAssy>
<positionOnNextHigherAssy mountPosition="5">
</positionOnNextHigherAssy>
</installationInfo>
</electricalEquip>
</electricalEquipGroup>
</wiringData>

```

## 2.1 Part number

**Description:** The element `<partNumber>` contains the project or the organization specific part number of the electrical equipment. Refer to [Chap 3.9.5.2.7](#).

**Markup element:** `<partNumber>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

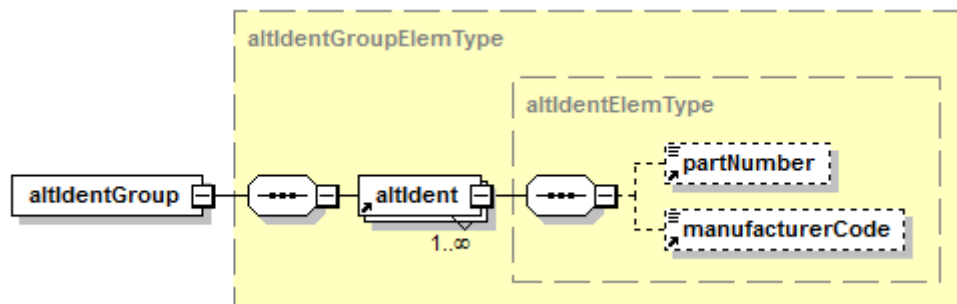

**Markup example:**

```
<partNumber>JN1022-GA45AX</partNumber>
```

## 2.2 Alternative identifications

**Description:** The list of alternative identifications element `<altIdentGroup>` is used as a container for the subordinate alternative identification elements.

**Markup element:** `<altIdentGroup>`

ICN-C0419-S1000D0286-001-01

Fig 3 Element `<altIdentGroup>`
**Attributes:**

- None

**Child elements:**

- `<altIdent>`, the alternative identification

**Markup example:**

```
<altIdentGroup>
<altIdent>
<partNumber>711-5016-3(462)</partNumber>
<manufacturerCode>K5678</manufacturerCode>
</altIdent>
<altIdent>
<partNumber>713-5018-2(469)</partNumber>
<manufacturerCode>K5678</manufacturerCode>
</altIdent>
</altIdentGroup>
```

## 2.2.1 Alternative identification

**Description:** The alternative identification element `<altIdent>` is used for additional identification of electrical equipment. An alternative identification can contain a manufacturer part number and the related manufacturer code.

**Markup element:** `<altIdent>`
**Attributes:**

- None

**Child elements:**

- `<partNumber>`, the electrical equipment alternative part number. Refer to [Para 2.1](#).
- `<manufacturerCode>`, the CAGE code of the electrical equipment manufacturer

**Markup example:**

The following markup example shows an alternative identification for part number JN1032A3:

```
<altIdentGroup>
<altIdent>
<partNumber>711-5016-3(462)</partNumber>
<manufacturerCode>K5678</manufacturerCode>
```

```
</altIdent>
</altIdentGroup>
```

#### 2.2.1.1 Electrical equipment manufacturer code

**Description:** The electrical equipment manufacturer code element `<manufacturerCode>` is used in conjunction with the alternative electrical equipment part number. It contains the CAGE code of the electrical equipment manufacturer.

**Markup element:** `<manufacturerCode>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

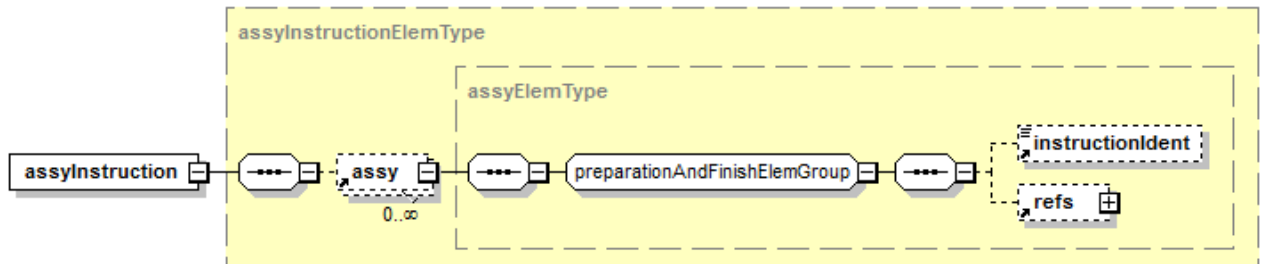

**Child elements:**

- None

## 2.3 Assembly instructions

**Description:** The element `<assyInstruction>` is used as a container for the subordinate electrical equipment assembly information.

**Markup element:** `<assyInstruction>`

ICN-C0419-S1000D0297-001-01

Fig 4 Element `<assyInstruction>`

**Attributes:**

- None

**Child elements:**

- `<assy>`, the assembly information for the electrical equipment

#### 2.3.1 Assembly information

**Description:** The electrical equipment assembly information element `<assy>` contains subordinate assembly information for the electrical equipment in coded form, and references detailed assembly instructions.

**Markup element:** `<assy>`

**Attributes:**

- None

**Child elements:**

- [<instructionIdent>](#), the electrical equipment assembly information in coded form
- [<refs>](#), the references to detailed instructions for assembling the electrical equipment

**Markup example:**

```
<assy>
<instructionIdent>ASSY806</instructionIdent>
</assy>
```

**2.3.1.1 Assembly information identification**

**Description:** The element [<instructionIdent>](#) gives electrical equipment assembly information in coded form.

**Markup element:** [<instructionIdent>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<instructionIdent>ASSY806</instructionIdent>
```

**2.3.1.2 References**

**Description:** The element [<refs>](#) contains links to other parts of the systems publication, which give the detailed instructions for assembling the electrical equipment. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** [<refs>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Chap 3.9.5.2.1.2](#)

**2.4 Maximum number of mounting positions**

**Description:** The element [<maxMountingPositions>](#) contains the number of mounting positions on a next higher assembly (eg, a circuit breaker panel). This element is only used for equipment that has mounting positions for other electrical equipment (eg, connectors or circuit breakers).

**Markup element:** [<maxMountingPositions>](#)

**Attributes:**

- None

#### Child elements:

- None

#### Markup example:

The following markup example shows the next higher assembly panel AC1650, which has six mounting positions.

```
<electricalEquip equipState="active">
<functionalItemRef functionalItemNumber="AC1650"/>
<maxMountingPositions>6</maxMountingPositions>
</electricalEquip>
```

## 2.5 System breakdown code

**Description:** Equipment of complex systems is divided into subsystems using the system breakdown code element `<systemBreakdownCode>`. This element can be used to provide the system breakdown code of such equipment.

**Markup element:** `<systemBreakdownCode>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- None

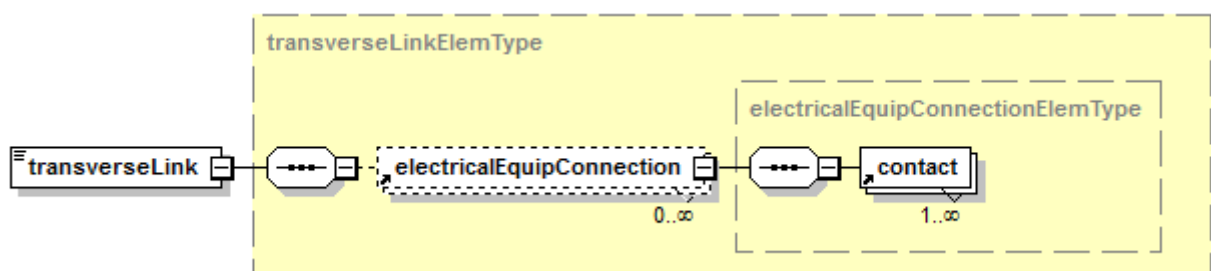

#### Markup example:

```
<systemBreakdownCode>24-31-02-00</systemBreakdownCode>
```

## 2.6 Transverse link

**Description:** The element `<transverseLink>` provides information about internally or externally realized electrical connections of different contacts/bolts of equipment (eg, terminal strips).

**Markup element:** `<transverseLink>`

ICN-C0419-S1000D0298-001-01

Fig 5 Element `<transverseLink>`

#### Attributes:

- None

#### Child elements:

- `<electricalEquipConnection>`, the electrical equipment connection information

**Markup example:**

```
<transverseLink>
<electricalEquipConnection>
<contact contactIdent="1"/>
<contact contactIdent="2"/>
</electricalEquipConnection>
<electricalEquipConnection>
<contact contactIdent="3"/>
</electricalEquipConnection>
</transverseLink>
```

**2.6.1 Electrical equipment connections**

**Description:** The element [<electricalEquipConnection>](#) gives information about the electrical connections that belong to a transverse link.

**Markup element:** [<electricalEquipConnection>](#)

**Attributes:**

- `connectionType` (O), the type of connection. As an example, consider a relay. The connections of the poles are direct, done by a piece of metal, but the contacts of the relay coil(s) must also be shown. In this case `connectionType="direct"` means it is a direct connection, `connectionType="coil"` means that a coil has to be shown between the contacts. Connection types can also be identified by using coded values like "1" - direct connection, "2" - coil, etc.

**Child elements:**

- [<contact>](#), the contact identification

**Business rule decision point BRDP-S1-00241 - Use of the element**

[<electricalEquipConnection>](#):

- Decide whether and how to use electrical equipment connection information, in particular define the values of attribute `connectionType` consistently.

**2.6.1.1 Contact identification**

**Description:** The element [<contact>](#) describes the contact identification by its attributes. Refer to [Chap 3.9.5.2.9.2](#).

**Markup element:** [<contact>](#)

**Attributes:**

- Refer to [Chap 3.9.5.2.9.2](#).

**Child elements:**

- None

**Markup example:**

The following example shows the markup for coding the transverse links of electrical equipment. The contacts/bolts 1, 2, 3 and 4 are electrically connected, and the contacts/bolts 5 and 6 are electrically connected.

```
<transverseLink>
<electricalEquipConnection>
```

```

<contact contactId="1"/>
<contact contactId="2"/>
<contact contactId="3"/>
<contact contactId="4"/>
</electricalEquipConnection>
<electricalEquipConnection>
<contact contactId="5"/>
<contact contactId="6"/>
</electricalEquipConnection>
</transverseLink>

```

## 2.7 Connection list class

**Description:** The element `<connectionListClass>` describes special groups of electrical equipment (eg, switches, connectors) in coded form.

It is recommended to use the connection list class element `<connectionListClass>` as given in [Table 2](#).

*Table 2 Connection list classes*

Connection list class	Electrical equipment group
1	Connectors, single
2	VR-/VP- Connectors, single
3	VR-/VP- Connectors
4	VE- Connectors, single
5	VE- Connectors
6	Earth bolts
7	Terminal junction modules
8	Terminal strips, single
9	Terminal strips, double
10	Relays, Contactors
11	Bungs
12	Splices
13	Electrical equipment whose connected wires are not part of the considered project wiring
14	Bus bars
15	Switches
16	Electrical equipment with no internal logic
17	Virtual connectors
18	Electrical equipment with internal logic
19	Terminals for bonding
20	Connectors, data bus, single

Connection list class	Electrical equipment group
21	Data bus couplers
23	Connectors, data bus
25	Circuit breakers, fuses

**Markup element:** `<connectionListClass>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the connection list class information of a switch.

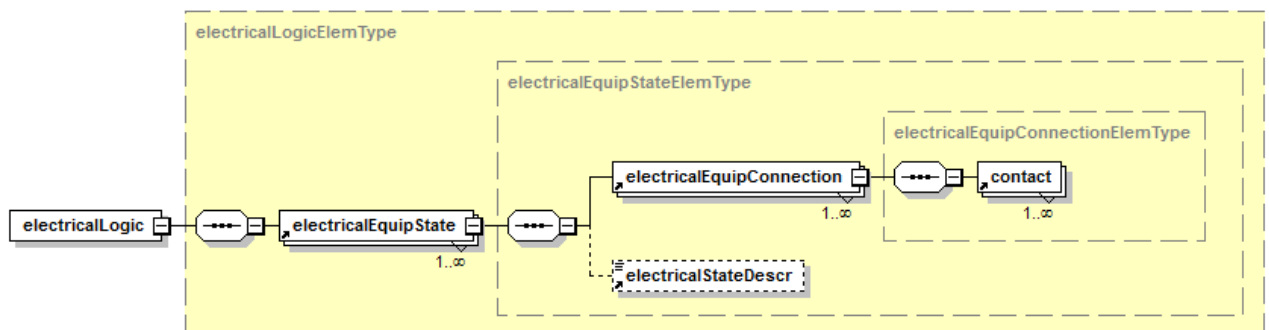

```
<connectionListClass>15</connectionListClass>
```

## 2.8

### Electrical logic

**Description:** The element `<electricalLogic>` provides an optional container for electrical states and internal connections between contacts for electrical or electronic equipment.

**Markup element:** `<electricalLogic>`

ICN-C0419-S1000D0299-001-01

Fig 6 Element `<electricalLogic>`

**Attributes:**

- None

**Child elements:**

- `<electricalEquipState>`, the electrical equipment state

#### 2.8.1

#### Electrical equipment state

**Description:** The electrical equipment state element `<electricalEquipState>` provides state information for each connection to some particular electrical equipment.

**Markup element:** `<electricalEquipState>`

**Attributes:**

- `initialStateFlag` (O), indicates whether the state information is the initial state of the electrical equipment or not. The attribute can have one of the following values:
  - "1" - for electrical states that are initial states
  - "0" - for electrical states that are not initial states. In this case, the attribute `initialStateFlag` can be dropped.

**Child elements:**

- `<electricalEquipConnection>`, the electrical equipment connection information
- `<electricalStateDescr>`, the description of an electrical state

## 2.8.1.1 Electrical equipment connections

**Description:** The electrical equipment connection element

`<electricalEquipConnection>` must be used and gives information about the connections that belong to the same electrical state. Refer to [Para 2.6.1](#).

## 2.8.1.2 Electrical state description

**Description:** The electrical state description element `<electricalStateDescr>` contains the narrative description of an electrical state, for example "ENERGIZED".

**Markup element:** `<electricalStateDescr>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example describes a switch, which has two states: DEENERGIZED and ENERGIZED. In the initial state or the default state (`initialStateFlag="1"`), the switch connects contacts C and NC. In the other state (`initialStateFlag="0"`) it connects contacts C and NO.

```
<electricalLogic>
<electricalEquipState initialStateFlag="1">
<electricalEquipConnection>
<contact contactIdent="C"/>
<contact contactIdent="NC"/>
</electricalEquipConnection>
<electricalStateDescr>DEENERGIZED</electricalStateDescr>
</electricalEquipState>
<electricalEquipState>
<electricalEquipConnection>
<contact contactIdent="C"/>
<contact contactIdent="NO"/>
</electricalEquipConnection>
<electricalStateDescr>ENERGIZED</electricalStateDescr>
</electricalEquipState>
</electricalLogic>
```

## 2.9 Responsible partner company

**Description:** The element `<responsiblePartnerCompany>` contains the company or the organization, which is responsible for the electrical equipment. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<responsiblePartnerCompany>`

ICN-C0419-S1000D0290-001-01

Fig 7 Element `<responsiblePartnerCompany>`

### Attributes:

- `enterpriseCode` (O), the CAGE code of the responsible company or organization
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Child elements:

- `<enterpriseName>`, the name of the responsible company or organization

### Note

The use of the child element `<enterpriseName>` can considerably increase the amount of data to be stored and exchanged. Therefore it is recommended to use only the attribute `enterpriseCode` in context with the element `<electricalEquip>` to indicate the responsible partner company instead of or in addition using the child element `<enterpriseName>`.

### Markup example:

```
<responsiblePartnerCompany enterpriseCode="K0378" />
```

## 2.9.1 Responsible partner company name

**Description:** The responsible partner company name element `<enterpriseName>` contains the name of the company or the organization, which is responsible for the data. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<enterpriseName>`

### Attributes:

- None

### Child elements:

- None

### Markup example:

```
<enterpriseName>Amphenol Ltd</enterpriseName>
```

## 2.10 Electrical equipment name

**Description:** The element `<equipName>` describes the electrical equipment. A standard name, like SWITCH, can be used or a name that defines the electrical equipment in conjunction with its use on the system, for example BATTERY MASTER SWITCH.

**Markup element:** `<equipName>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<equipName>BATTERY MASTER SWITCH</equipName>
```

## 2.11 Quantity

**Description:** The element `<reqQuantity>` contains the number of multiple occurrence electrical equipment installed in the Product, for example an aircraft.

It is recommended to use the quantity element `<reqQuantity>` only for multiple occurrence electrical equipment.

**Markup element:** `<reqQuantity>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the quantity
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

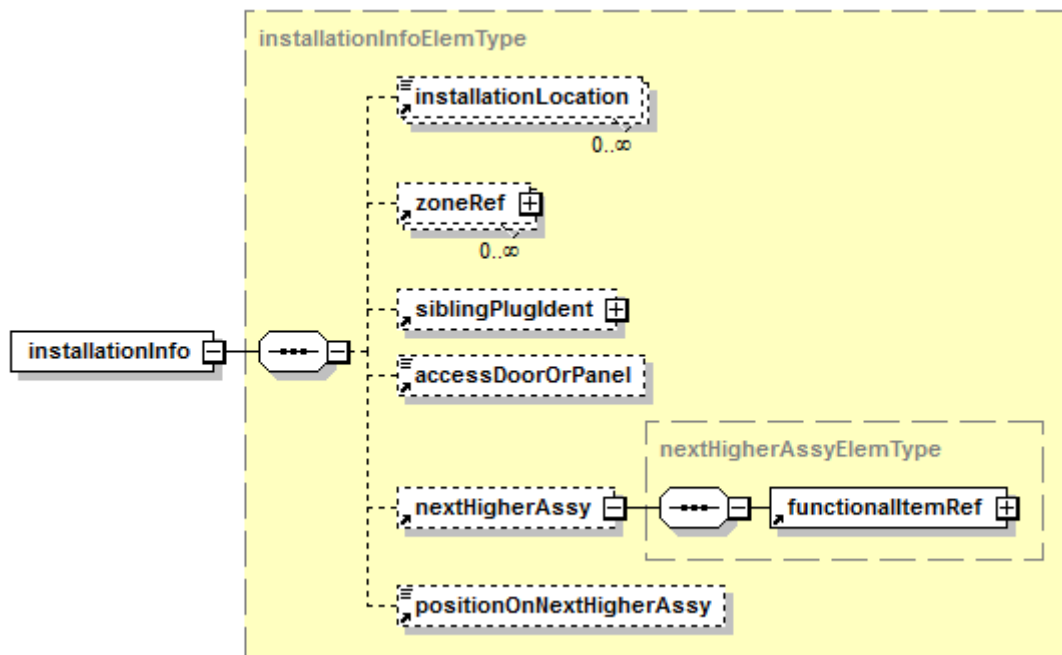

The following markup shows an example for using the element `<reqQuantity>` for multiple occurrence electrical equipment that is installed three times in the aircraft.

```
<reqQuantity>3</reqQuantity>
```

## 2.12 Installation information

**Description:** The element `<installationInfo>` contains electrical equipment installation information. The element is repeatable to cover multiple occurrence electrical equipment.

**Markup element:** `<installationInfo>`

ICN-C0419-S1000D0300-001-01

Fig 8 Element `<installationInfo>`

#### Attributes:

- `installationIdent` (O), contains a unique value for every instance of the functional item. Functional items are also known as reference designators. The instance identifier is necessary to achieve a 1:1 relationship between a plug and the mating connector.

#### Child elements:

- `<installationLocation>`, the installation location. Refer to [Chap 3.9.5.2.1.9](#).
- `<zoneRef>`, the zone reference. Refer to [Chap 3.9.5.2.1.10](#).
- `<siblingPlugIdent>`, the twin connector identification
- `<accessDoorOrPanel>`, the access door or panel
- `<nextHigherAssy>`, the next higher assembly
- `<positionOnNextHigherAssy>`, the position on the next higher assembly

#### Markup example:

Refer to [Para 3.1](#).

### 2.12.1 Twin connector identification

**Description:** The element `<siblingPlugIdent>` contains the functional item of the mate connector in the subordinate element `<functionalItemRef>`. That means, the plug gets as twin connector identification the functional item of the receptacle, and the receptacle gets as twin connector identification the functional item of the plug. Functional items are also known as reference designators.

**Markup element:** `<siblingPlugIdent>`

ICN-C0419-S1000D0301-001-01

Fig 9 Element `<siblingPlugIdent>`

#### Attributes:

- None

#### Child elements:

- `<functionalItemRef>`, the identification of the twin connector. Functional items are also known as reference designators. Refer to [Chap 3.9.5.1](#).

#### Markup example:

The following markup example shows the identification twin connector 1071VR (of the connector 1071VP).

```
<siblingPlugIdent>
<functionalItemRef functionalItemNumber="1071VR" />
</siblingPlugIdent>
```

### 2.12.2

#### Access door or panel

**Description:** The element `<accessDoorOrPanel>` contains information about doors or panels to be opened for getting access to the electrical equipment.

**Markup element:** `<accessDoorOrPanel>`

#### Attributes:

- None

#### Child elements:

- None

#### Markup example:

The following markup example shows that door L107 has to be opened for getting access to the electrical equipment.

```
<accessDoorOrPanel>L107</accessDoorOrPanel>
```

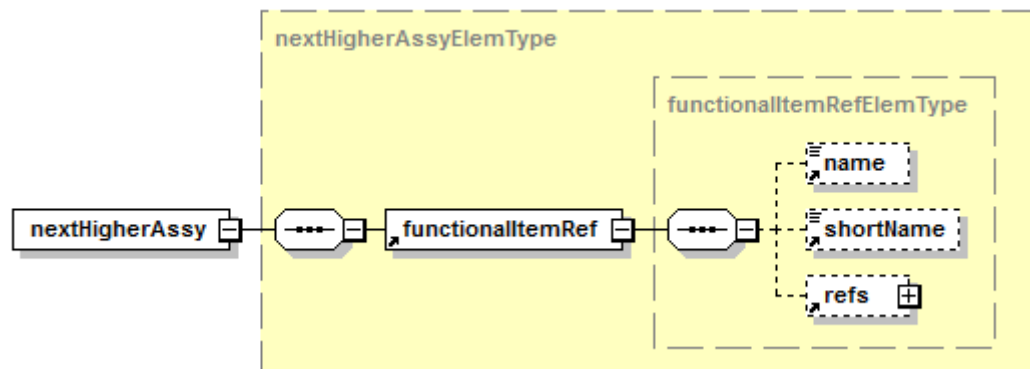

### 2.12.3

#### Next higher assembly

**Description:** Electrical equipment, which is part of a physical or logical assembly (eg, a box), the next higher assembly element `<nextHigherAssy>` can be used to identify this assembly.

**Markup element:** `<nextHigherAssy>`

ICN-C0419-S1000D0277-001-01

Fig 10 Element &lt;nextHigherAssy&gt;

#### Attributes:

- None

#### Child elements:

- <functionalItemRef>, the identification of the next higher assembly of the electrical equipment. Functional items are also known as reference designators. Refer to [Chap 3.9.5.1](#).

#### Markup example:

The following markup example shows electrical equipment, which is part of the box 1004VE.

```

<nextHigherAssy>
<functionalItemRef functionalItemNumber="1004VE" />
</nextHigherAssy>
  
```

### 2.12.4 Position on next higher assembly

**Description:** Electrical equipment, which is mounted on a physical assembly (eg, a box or a panel), has allocated the identification of the position on the next higher assembly element <positionOnNextHigherAssy>. The position is indicated either by a direct position or by grid coordinates.

**Markup element:** <positionOnNextHigherAssy>

#### Attributes:

- mountPosition (O), the direct position number on which the electrical equipment is mounted to the next higher assembly
- mountRow (O), the row information on which the electrical equipment is mounted to the next higher assembly. This attribute is normally used in combination with the attribute mountColumn
- mountColumn (O), the column information on which the electrical equipment is mounted to the next higher assembly. This attribute is normally used in combination with the attribute mountRow

#### Child elements:

- None

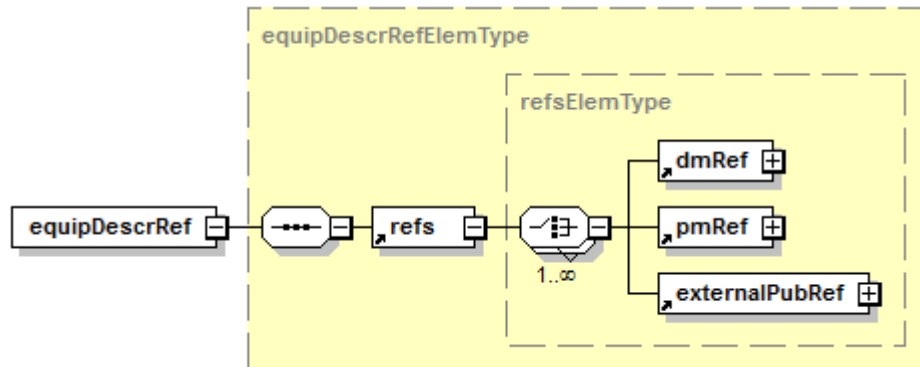

#### Markup example:

Refer to [Para 3.2](#).

## 2.13 Electrical equipment description reference

**Description:** The element `<equipDescrRef>` contains references to other parts of the electrical system publications, which give further information about this electrical equipment, such as the description of how it is made.

**Markup element:** `<equipDescrRef>`

ICN-C0419-S1000D0302-001-01

Fig 11 Element `<equipDescrRef>`

**Attributes:**

- None

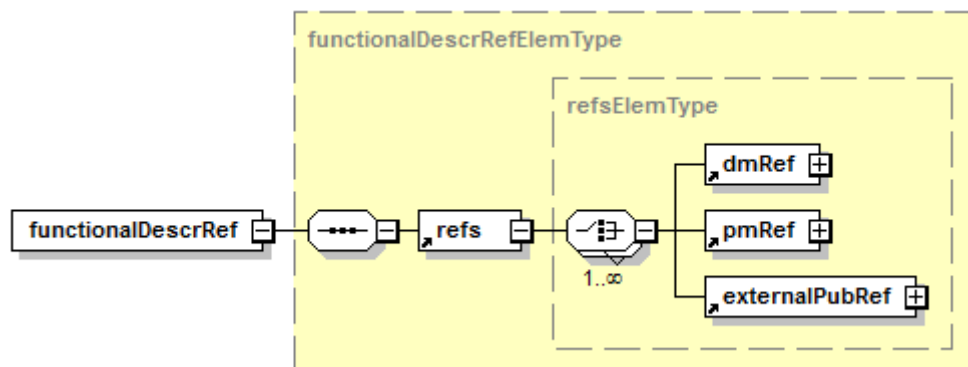

**Child elements:**

- `<refs>`, the electrical equipment description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.14 Functional description reference

**Description:** The functional description reference element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about the electrical equipment (eg, a description of its function). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 12 Element `<functionalDescrRef>`

**Attributes:**

- None

#### Child elements:

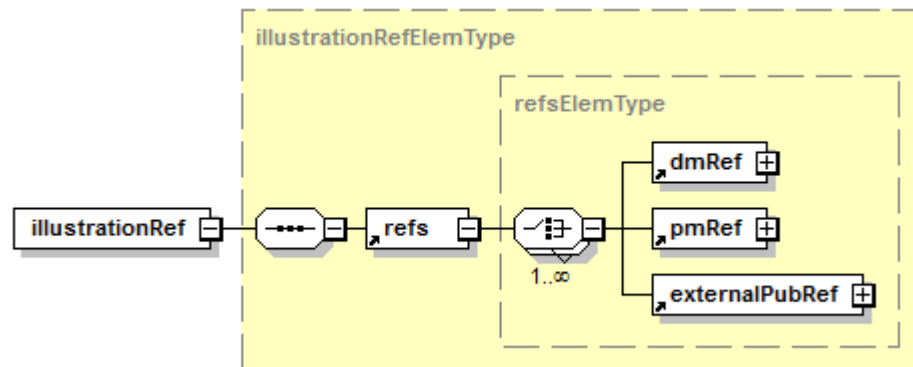

- [<refs>](#), the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.15

### Illustration reference

**Description:** The element [<illustrationRef>](#) contains references to other parts of the electrical system publications, which show illustrations of the electrical equipment. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** [<illustrationRef>](#)

ICN-C0419-S1000D0292-001-01

Fig 13 Element [<illustrationRef>](#)

#### Attributes:

- None

#### Child elements:

- [<refs>](#), the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.16

### Element [<electricalEquipAlts>](#)

**Description:** The element [<electricalEquipAlts>](#), within the list of electrical equipment element [<electricalEquipGroup>](#), provides the capability to group several alternate solutions of electrical equipment data for different applicability annotations. Refer to [Chap 4.13.3](#) for information related to the use of the alternates group mechanism in data module content.

ICN-C0419-S1000D0303-001-01

Fig 14 Element [<electricalEquipAlts>](#)

**Markup element:** [<electricalEquipAlts>](#)

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<electricalEquip>`, the harness data. Refer to [Para 2](#).

#### Markup example:

```
<wiringData>
<electricalEquipGroup>
<electricalEquipAlts>
<electricalEquip equipState="active" applicRefId="app-0001">
<functionalItemRef functionalItemNumber="AC1650"/>
</electricalEquip>
<electricalEquip equipState="notactiv" applicRefId="app-0002">
<functionalItemRef functionalItemNumber="AC1651"/>
</electricalEquip>
</electricalEquipAlts>
</electricalEquipGroup>
</wiringData>
```

## 3

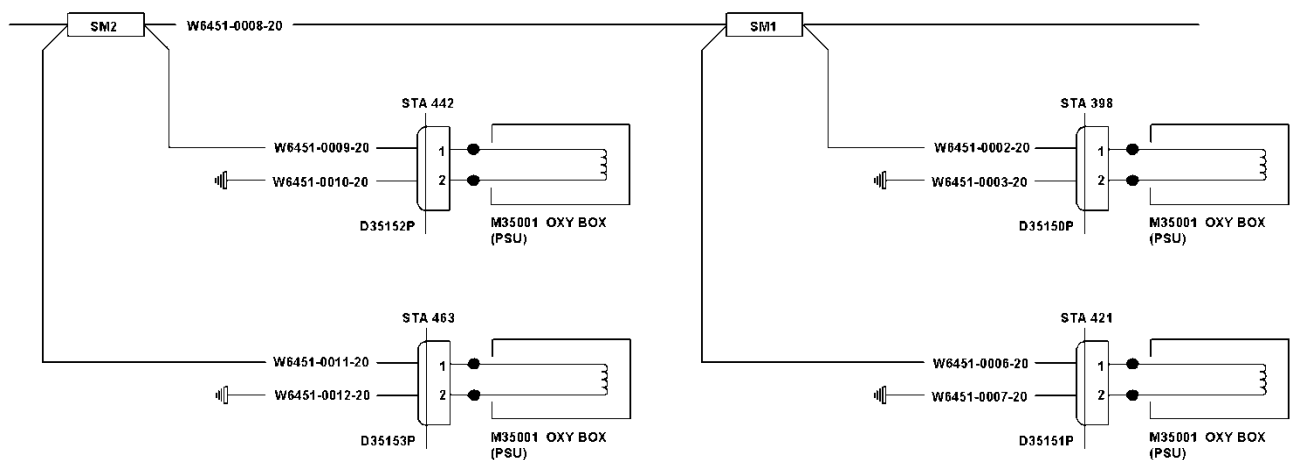

### 3.1

## Markup examples

### Multiple occurrence electrical equipment

The following markup example shows the use of attribute `installationIdent` for multiple occurrence electrical equipment. The equipment M35001 OXY BOX (PSU) with the functional item number M35001 is used four times in this example. A functional item is also known as a reference designator. The four electrical equipment instances are connected to D35150P thru D35153P. For details refer to [Fig 15](#).

The markup example also shows a reference to the fourth instance D35153P in the second occurrence of element `<electricalEquip>`.

ICN-C0419-S1000D0207-001-01

Fig 15 Multiple occurrence electrical equipment example

Applicable to: All

S1000D-A-03-09-0502-09E-040A-A

Chap 3.9.5.2.9.4

```

<electricalEquip>
<functionalItemRef functionalItemNumber="M35001"/>
<installationInfo installationIdent="1">
<installationLocation installationLocationType="instloctyp02">
398</installationLocation>
<siblingPlugIdent>
<functionalItemRef functionalItemNumber="D35150P"/>
</siblingPlugIdent>
</installationInfo>
<installationInfo installationIdent="2">
<installationLocation installationLocationType="instloctyp02">
421</installationLocation>
<siblingPlugIdent>
<functionalItemRef functionalItemNumber="D35151P"/>
</siblingPlugIdent>
</installationInfo>
<installationInfo installationIdent="3">
<installationLocation installationLocationType="instloctyp02">
442</installationLocation>
<siblingPlugIdent>
<functionalItemRef functionalItemNumber="D35152P"/>
</siblingPlugIdent>
</installationInfo>
<installationInfo installationIdent="4">
<installationLocation installationLocationType="instloctyp02">
463</installationLocation>
<siblingPlugIdent>
<functionalItemRef functionalItemNumber="D35153P"/>
</siblingPlugIdent>
</installationInfo>
</electricalEquip>
<electricalEquip>
<functionalItemRef functionalItemNumber="D35153P"/>
<installationInfo>
<installationLocation installationLocationType="instloctyp02">
463</installationLocation>
<siblingPlugIdent>
<functionalItemRef functionalItemNumber="M35001"/>
</siblingPlugIdent>
</installationInfo>
</electricalEquip>

```

## 3.2 Position on next higher assembly

### 3.2.1 Connector

The following markup example shows connector D4532J, which is mounted on position 5 of the next higher assembly AC1650.

```

<electricalEquip equipState="active">
<functionalItemRef functionalItemNumber="D4532J"/>
<installationInfo>
<nextHigherAssy>
<functionalItemRef functionalItemNumber="AC1650"/>
</nextHigherAssy>

```

```
<positionOnNextHigherAssy mountPosition="5">  
</positionOnNextHigherAssy>  
</installationInfo>  
</electricalEquip>
```

### 3.2.2 Circuit breaker

The following markup example shows circuit breaker CB0225, which is mounted in row C and column 7 of the next higher assembly P320.

```
<electricalEquip equipState="active">  
<functionalItemRef functionalItemNumber="CB0225"/>  
<installationInfo>  
<nextHigherAssy>  
<functionalItemRef functionalItemNumber="P320"/>  
</nextHigherAssy>  
<positionOnNextHigherAssy mountRow="C" mountColumn="7">  
</positionOnNextHigherAssy>  
</installationInfo>  
</electricalEquip>
```

## 1 General

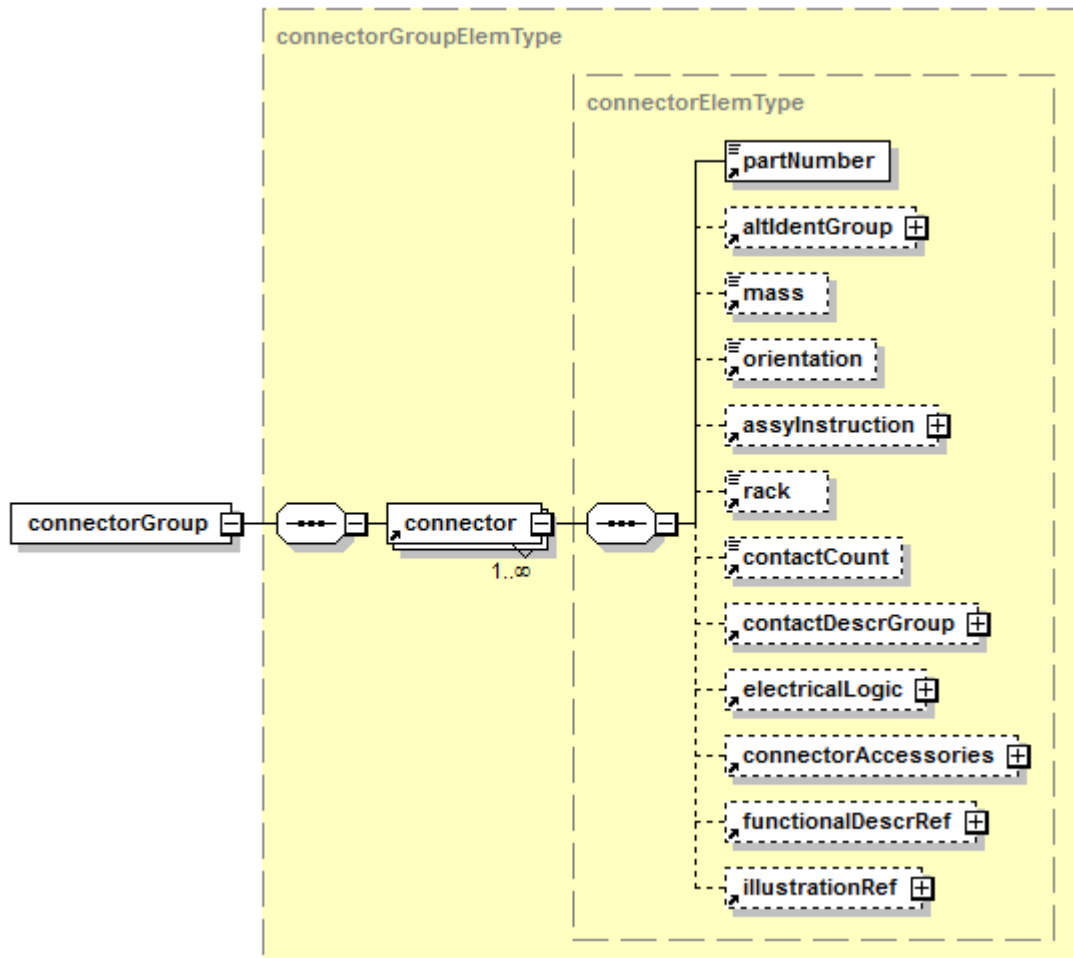

The element `<connector>` and its child elements are used to capture and represent connectors, which are used for the Product, and the related standard parts information.

## 2 Element `<connector>` and child elements

**Description:** The element `<connector>` is contained in the connector list element `<connectorGroup>`. The list of connectors is a child element of the list of standard parts element `<standardPartGroup>`.

The element `<connector>` contains information concerning the properties of connectors used in the Product's wiring. It is also used to describe terminal modules, switches and relays.

**Markup element:** `<connector>`

ICN-C0419-S1000D0304-001-01

Fig 1 Element `<connector>`

**Attributes:**

- `applicRefId` (O), the applicability of a connector by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<partNumber>`, the part number of the connector
- `<altIdentGroup>`, the list of alternative identifications
- `<mass>`, the mass information
- `<orientation>`, the orientation information
- `<assyInstruction>`, the assembly instruction information
- `<rack>`, the rack information
- `<contactCount>`, the contact count
- `<contactDescrGroup>`, the list of contact descriptions
- `<electricalLogic>`, the electrical logic information
- `<connectorAccessories>`, the list of accessories
- `<functionalDescrRef>`, the functional description reference
- `<illustrationRef>`, the reference to illustrations

**Markup example:**

```
<wiringData>
<standardPartGroup>
<connectorGroup>
<connector><partNumber>JN1003S-12</partNumber></connector>
<connector><partNumber>JN1018QC020</partNumber></connector>
</connectorGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element `<partNumber>` contains the project or the organization specific part number of a connector. This element must be populated in accordance with [Chap 3.9.5.2.7](#). The part number serves as a link to the equipment. Refer to [Chap 3.9.5.2.9.4](#).

## 2.2 Alternative identifications

**Description:** The element `<altIdentGroup>` contains a list of alternative identifications for connectors, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.4](#).

## 2.3 Mass

**Description:** The element `<mass>` contains the mass of a connector.

**Markup element:** `<mass>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the connector mass

**Child elements:**

- None

**Markup example:**

```
<mass unitOfMeasure="kg">0,0154</mass>
```

## 2.4 Orientation

**Description:** The element `<orientation>` contains orientation/polarization information about a connector. Polarization information is normally given as part of the connector's part number. The polarization code can represent the angle between the main keyway and the other keyways of the connector.

**Markup element:** `<orientation>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<orientation>` by inserting the polarization code of the connector (eg, JN1003A1335PA):

```
<orientation>A</orientation>
```

## 2.5 Assembly instructions

**Description:** The element `<assyInstruction>` is used as a container for the subordinate connector assembly information. Refer to [Chap 3.9.5.2.9.4](#).

## 2.6 Rack

**Description:** The element `<rack>` contains rack information about rack & panel connectors. If the part number of the complete rack & panel connector is used to describe the different inserts, then the element `<rack>` must be used to define which insert of the connector is described in this context. An element `<connector>` is required for all inserts of the rack & panel connector.

**Markup element:** `<rack>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of element `<rack>` for the insert A of the rack & panel connector (eg, JN1123FP1CGK11):

```
<rack>A</rack>
```

## 2.7 Contact count

**Description:** The element `<contactCount>` contains the number of contacts of the connector.

**Markup element:** `<contactCount>`

**Attributes:**

- None

**Child elements:**

- None

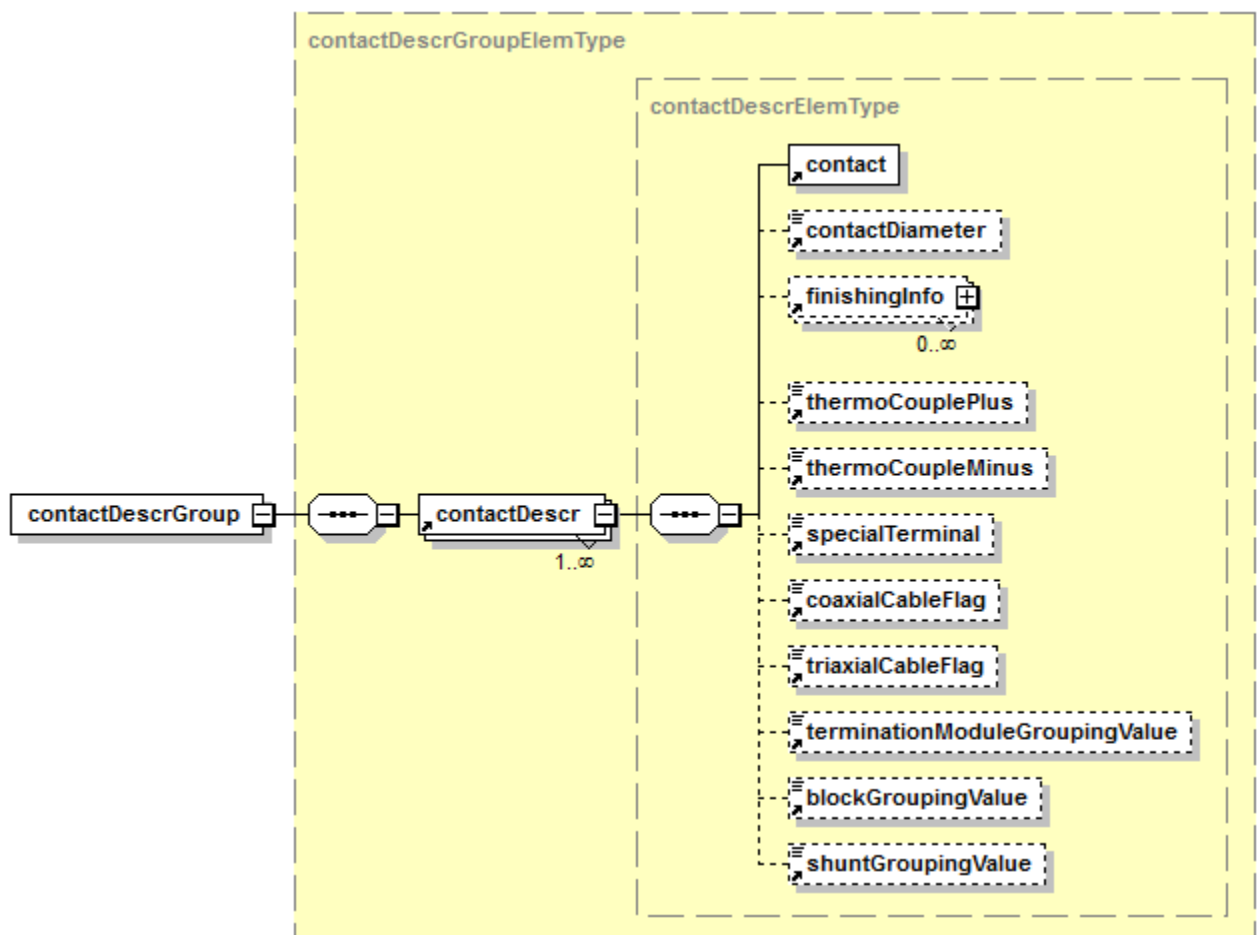

**Markup example:**

```
<contactCount>40</contactCount>
```

## 2.8 List of contact descriptions

**Description:** The element `<contactDescrGroup>` contains a list of contact descriptions.

**Markup element:** `<contactDescrGroup>`

ICN-C0419-S1000D0305-001-01

Fig 2 Element `<contactDescrGroup>`

**Attributes:**

- None

**Child elements:**

- `<contactDescr>`, the contact description

**Markup example:**

```
<contactDescrGroup>
<contactDescr><contact contactIdent="1" /></contactDescr>
<contactDescr><contact contactIdent="2" /></contactDescr>
</contactDescrGroup>
```

## 2.8.1 Contact description

**Description:** The element `<contactDescr>` contains a list of contact descriptions.

**Markup element:** `<contactDescr>`

**Attributes:**

- None

**Child elements:**

- `<contact>`, the contact identification
- `<contactDiameter>`, the contact diameter
- `<finishingInfo>`, the finishing information for the connection of wires
- `<thermoCouplePlus>`, identifies the positive contact of thermocouples
- `<thermoCoupleMinus>`, identifies the negative contact of thermocouples
- `<specialTerminal>`, the special terminal information
- `<coaxialCableFlag>`, the coaxial information
- `<triaxialCableFlag>`, the tri-axial information
- `<terminationModuleGroupingValue>`, used for contacts that belong to the same module of a termination module assembly
- `<blockGroupingValue>`, used for contacts that belong to the same block of a termination module assembly or the same pole of a switch or a relay
- `<shuntGroupingValue>`, used for contacts that belong to the same shunt/bus of a termination module or the same position of a switch or a relay

**Markup example:**

Refer to [Para 3](#).

### 2.8.1.1 Contact identification

**Description:** The element `<contact>` describes the contact identification thru its attributes.

Refer to [Chap 3.9.5.2.9.2](#).

Normally, the attribute `contactFunction` is not used in this context. The attributes `connectedFlag` and `wireInstallationDirection` must not be used in this context.

### 2.8.1.2 Contact diameter

**Description:** The element `<contactDiameter>` describes the diameter of a contact.

**Markup element:** `<contactDiameter>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the contact diameter

**Child elements:**

- None

**Markup example:**

The following example shows the markup of a 1,15 millimeter contact diameter.

```
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>
```

## 2.8.1.3 Finishing information

**Description:** The element [<finishingInfo>](#) contains the finishing information for the connection of wires to a contact. Refer to [Chap 3.9.5.2.9.2](#).

## 2.8.1.4 Thermocouple plus

**Description:** The element [<thermoCouplePlus>](#) identifies the positive contact of thermocouples. It is recommended to identify thermocouple contacts by populating this element with the value "Y". If the contact is not a thermocouple plus, this element can be populated with the value "N", or not used at all.

**Markup element:** [<thermoCouplePlus>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following example shows the markup of a contact, which is the positive contact of a thermocouple.

```
<thermoCouplePlus>Y</thermoCouplePlus>
```

## 2.8.1.5 Thermocouple minus

**Description:** The element [<thermoCoupleMinus>](#) identifies the negative contact of thermocouples. It is recommended to identify thermocouple contacts by populating this element with the value "Y". If the contact is not a thermocouple minus, this element can be populated with the value "N", or not used at all.

**Markup element:** [<thermoCoupleMinus>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following example shows the markup of a contact, which is the negative contact of a thermocouple.

```
<thermoCoupleMinus>Y</thermoCoupleMinus>
```

#### 2.8.1.6 Special terminal information

**Description:** The element `<specialTerminal>` identifies special terminals. It is recommended to define all special terminals and to identify them by populating this element with the value "Y". If the contact is not a special terminal, this element can be populated with the value "N", or not used at all.

**Markup element:** `<specialTerminal>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The example shows the markup of a contact, which is a special terminal.

```
<specialTerminal>Y</specialTerminal>
```

#### 2.8.1.7 Coaxial information

**Description:** The coax information element `<coaxialCableFlag>` identifies coaxial contacts. It is recommended to identify coaxial contacts by populating this element with the value "Y". If the contact is not a coaxial contact, this element can be populated with the value "N", or not used at all.

**Markup element:** `<coaxialCableFlag>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The example shows the markup of a coaxial contact.

```
<coaxialCableFlag>Y</coaxialCableFlag>
```

#### 2.8.1.8 Tri-axial information

**Description:** The tri-axial information element `<triaxialCableFlag>` identifies tri-axial contacts. It is recommended to identify tri-axial contacts by populating this element with the value "Y". If the contact is not a tri-axial contact, this element can be populated with the value "N", or not used at all.

**Markup element:** `<triaxialCableFlag>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The example shows the markup of a tri-axial contact.

```
<triaxialCableFlag>Y</triaxialCableFlag>
```

## 2.8.1.9 Termination module grouping information

**Description:** The element [<terminationModuleGroupingValue>](#) identifies the terminal modules on a mounting rail. If possible, this element gets allocated the same value that is used for the coding of the termination module grouping element [<terminationModuleGroupingValue>](#) as child element of the electrical potential element [<electricalPotential>](#) in the wire connection code. Refer to [Chap 3.9.5.2.9.2](#).

**Markup element:** [<terminationModuleGroupingValue>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

Refer to [Para 3](#).

## 2.8.1.10 Block grouping information

**Description:** The element [<blockGroupingValue>](#) contains the block information of terminal modules. If possible, this element gets allocated the same value that is used for the coding of the block grouping element [<blockGroupingValue>](#) as child element of the electrical potential element [<electricalPotential>](#) in the wire connection code. Refer to [Chap 3.9.5.2.9.2](#).

**Markup element:** [<blockGroupingValue>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

Refer to [Para 3](#).

## 2.8.1.11 Shunt grouping information

**Description:** The element [<shuntGroupingValue>](#) is used to divide contacts of terminal modules, which are electrically connected, into groups, the busses. If possible, this element gets allocated the same value that is used for the coding of the shunt element [<shuntGroupingValue>](#) as child element of the electrical potential element [<electricalPotential>](#) in the wire connection code. Refer to [Chap 3.9.5.2.9.2](#).

**Markup element:** [<shuntGroupingValue>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

Refer to [Para 3](#).

## 2.9 Electrical logic

**Description:** In this context, the electrical logic element `<electricalLogic>` provides an optional container for electrical states and internal connections between contacts for standard parts. Refer to [Chap 3.9.5.2.9.4](#).

## 2.10 List of accessories

**Description:** The element `<connectorAccessories>` contains the part numbers of accessories for the connector.

More than one accessory of the same kind can be available for a connector (eg, cable clamps with different angular positions). In this case, all possible accessories can be added to the connector, which results in more than one cable clamp appearing in the list of accessories. Another method in this case is to use different connector containers for the same connector, listing only one accessory of the same kind. This second method can generate a considerable amount of connector data. Therefore it is recommended to list all available accessories in one data set.

**Markup element:** `<connectorAccessories>`

ICN-C0419-S1000D0306-001-01

Fig 3 Element `<connectorAccessories>`

**Attributes:**

- None

**Child elements:**

- `<partNumber>`, the part number of an accessory. Refer to [Para 2.1](#).

**Markup example:**

The following markup example shows the use of the element `<connectorAccessories>` for the connector JN1003FG22-35PN1.

```
<connectorAccessories>
  <partNumber>JN1003P22</partNumber>
  <partNumber>JN1003C22</partNumber>
  <partNumber>JN1003D22</partNumber>
  <partNumber>JN1003K22</partNumber>
  <partNumber>JN1003L22</partNumber>
  <partNumber>JN1003MA22</partNumber>
  <partNumber>JN1003MB22</partNumber>
  <partNumber>JN1003MF22</partNumber>
</connectorAccessories>
```

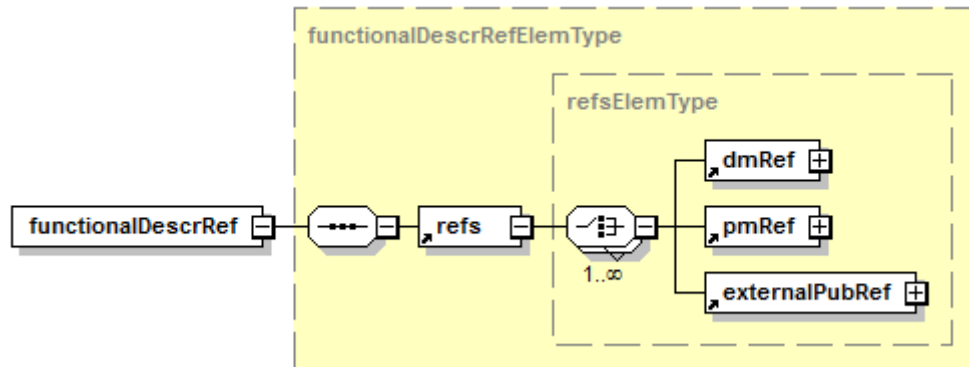

```
<partNumber>JN1003N22</partNumber>
</connectorAccessories>
```

## 2.11 Functional description reference

**Description:** The functional description reference element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a connector (eg, a description of how it is made (specification of the connector)). References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 4 Element `<functionalDescrRef>`

**Attributes:**

- None

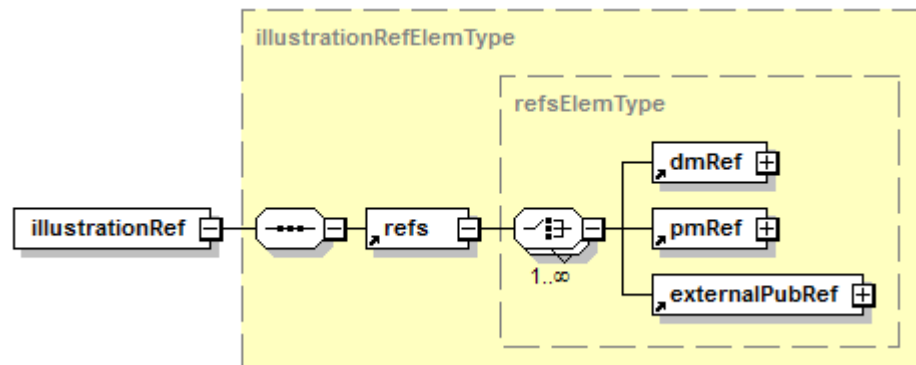

**Child elements:**

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.12 Illustration reference

**Description:** The illustration reference element `<illustrationRef>` contains references to other parts of the electrical system publications, which show illustrations of the connector (eg, the insert arrangement of the connector). References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 5 Element `<illustrationRef>`

**Attributes:**

- None

**Child elements:**

- [<refs>](#), the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

**3****Examples**

The following markup example shows the use of the element [<contactDescrGroup>](#) for a terminal junction module with two busses, 1-2 and 3-4, and four contacts of the diameter 1,15 mm.

```
<contactDescrGroup>
<contactDescr>
<contact contactIdent="1"/>
<contactDiameter unitOfMeasure="mm">1,15</contactDiameter>

## 1 General

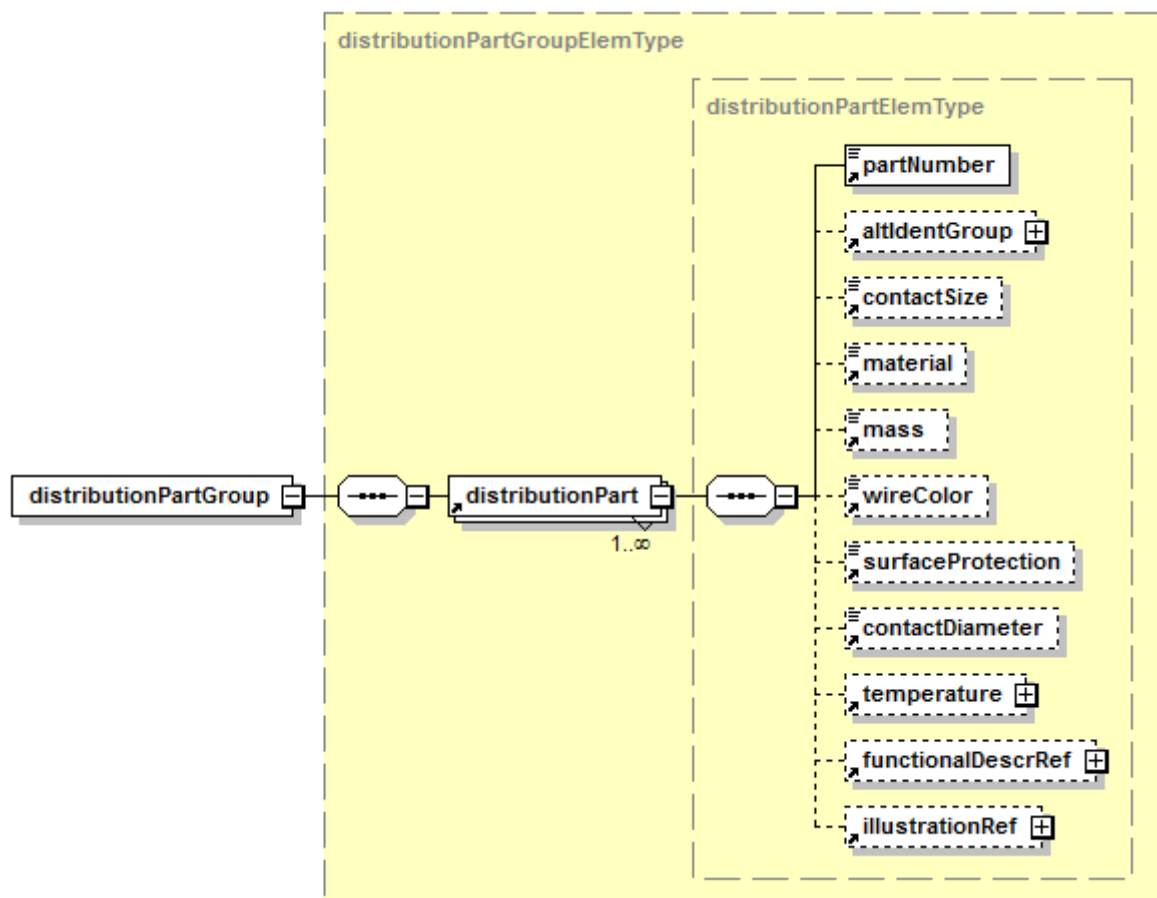

The element `<distributionPart>` and its child elements are used to capture and represent distribution parts, which are used for the Product, and the related standard parts information.

## 2 Element `<distributionPart>` and child elements

**Description:** The element `<distributionPart>` is contained in the list of distribution parts element `<distributionPartGroup>`. The list of distribution parts is a child element of the list of the standard parts element `<standardPartGroup>`.

It contains information concerning the properties of distribution parts, like contacts and splices, used in the Product's wiring.

**Markup element:** `<distributionPart>`

ICN-C0419-S1000D0307-001-01

Fig 1 Element `<distributionPart>`

### Attributes:

- `applicRefId` (O), the applicability information of a distribution part by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- [<partNumber>](#), the part number of the distribution part
- [<altIdentGroup>](#), the list of alternative identifications
- [<contactSize>](#), the contact size
- [<material>](#), the material information
- [<mass>](#), the mass of the distribution part
- [<wireColor>](#), the color information
- [<surfaceProtection>](#), the surface protection information
- [<contactDiameter>](#), the contact diameter
- [<temperature>](#), the temperature information
- [<functionalDescrRef>](#), the functional description reference
- [<illustrationRef>](#), the reference to illustrations

#### Markup example:

```
<wiringData>
<standardPartGroup>
<distributionPartGroup>
<distributionPart>
<partNumber>PAN6466A</partNumber>
</distributionPart>
<distributionPart>
<partNumber>PAN7568A</partNumber>
</distributionPart>
</distributionPartGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element [<partNumber>](#) contains the project or the organization specific part number of a distribution part. Refer to [Chap 3.9.5.2.7](#). The part number serves as a link to the electrical equipment. Refer to [Chap 3.9.5.2.9.4](#).

#### Markup example:

The following markup example shows the use of the element [<partNumber>](#) for a splice with part number PAN6466A.

```
<partNumber>PAN6466A</partNumber>
```

## 2.2 Alternative identifications

**Description:** The element [<altIdentGroup>](#) contains a list of alternative identifications for distribution parts, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.4](#).

## 2.3 Contact size

**Description:** The element [<contactSize>](#) contains size information about a distribution part, normally for a contact.

**Markup element:** [<contactSize>](#)

#### Attributes:

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<contactSize>` for the contact JN1003S12 of size 12.

```
<contactSize>12</contactSize>
```

## 2.4 Material

**Description:** The element `<material>` describes the material of which the distribution part is made.

**Markup element:** `<material>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<material>` for a distribution part made of copper alloy.

```
<material>Copper alloy</material>
```

## 2.5 Mass

**Description:** The element `<mass>` contains the mass information of a distribution part. If used, this element must be populated in accordance with [Chap 3.9.5.2.9.5](#).

## 2.6 Color

**Description:** The element `<wireColor>` contains the color information of a distribution part. This element can be used to indicate the color codes (color bands) of contacts or splices. Refer to [Chap 3.9.5.2.9.2](#).

**Markup example:**

The following markup example shows the use of the element `<wireColor>` for a contact with a three-color band of the colors orange, blue and green.

```
<wireColor>Orange/Blue/Green</wireColor>
```

## 2.7 Protection

**Description:** The element `<surfaceProtection>` contains the protection information applied to the surface of a distribution part.

**Markup element:** `<surfaceProtection>`

**Attributes:**

- None

#### Child elements:

- None

#### Markup example:

The following markup example shows the use of the element `<surfaceProtection>` for a gold plated contact.

```
<surfaceProtection>Gold plated</surfaceProtection>
```

## 2.8 Contact diameter

**Description:** The element `<contactDiameter>` describes the diameter of a distribution part, normally for contacts. Refer to [Chap 3.9.5.2.9.5](#).

#### Markup example:

The following markup example shows the use of the element `<contactDiameter>` for a contact of the size 12 (outer diameter = 2,41 millimeter).

```
<contactDiameter unitOfMeasure="mm">2,41</contactDiameter>
```

## 2.9 Temperature

**Description:** The element `<temperature>` describes the minimum and maximum temperature for which the distribution part is approved. Refer to [Chap 3.9.5.2.9.3](#).

#### Markup example:

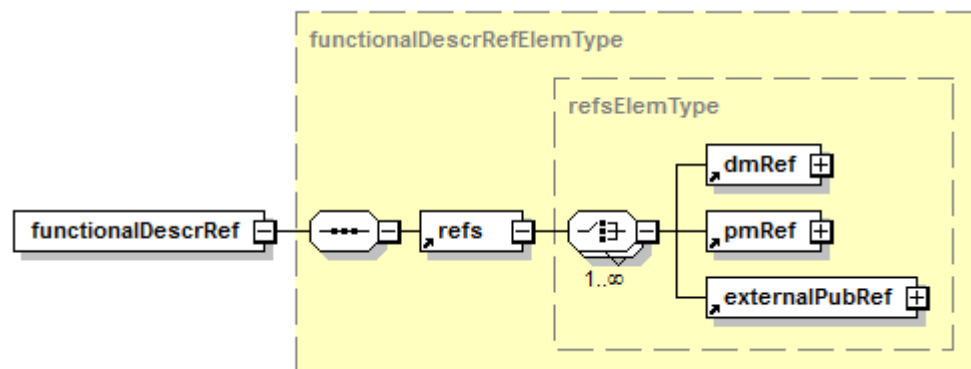

The following markup example shows the use of the element `<temperature>` for a distribution part, which is approved for temperatures from -55° C to 150° C.

```
<temperature>
<minTemperature unitOfMeasure="degC">-55</minTemperature>
<maxTemperature unitOfMeasure="degC">150</maxTemperature>
</temperature>
```

## 2.10 Functional description reference

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a distribution part (eg, a description of how it is made (specification of the distribution part)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 2 Element `<functionalDescrRef>`

**Attributes:**

- None

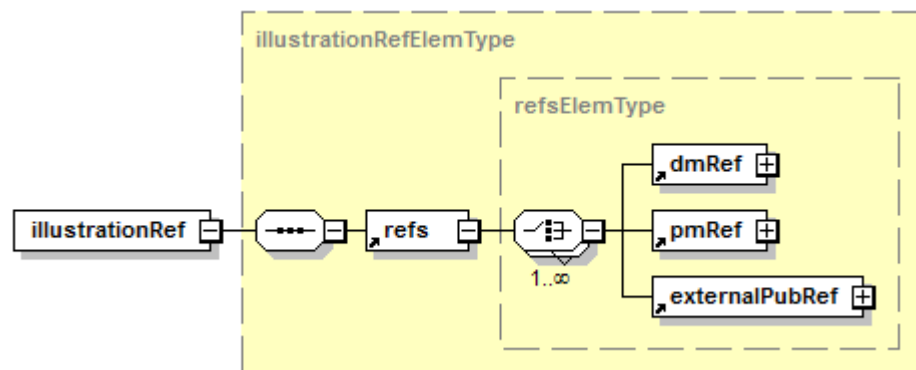

**Child elements:**

- [<refs>](#), the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.11 Illustration reference

**Description:** The element [<illustrationRef>](#) contains references to other parts of the electrical system publications, which show illustrations of the distribution part. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** [<illustrationRef>](#)

ICN-C0419-S1000D0292-001-01

Fig 3 Element [<illustrationRef>](#)

**Attributes:**

- None

**Child elements:**

- [<refs>](#), the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 1 General

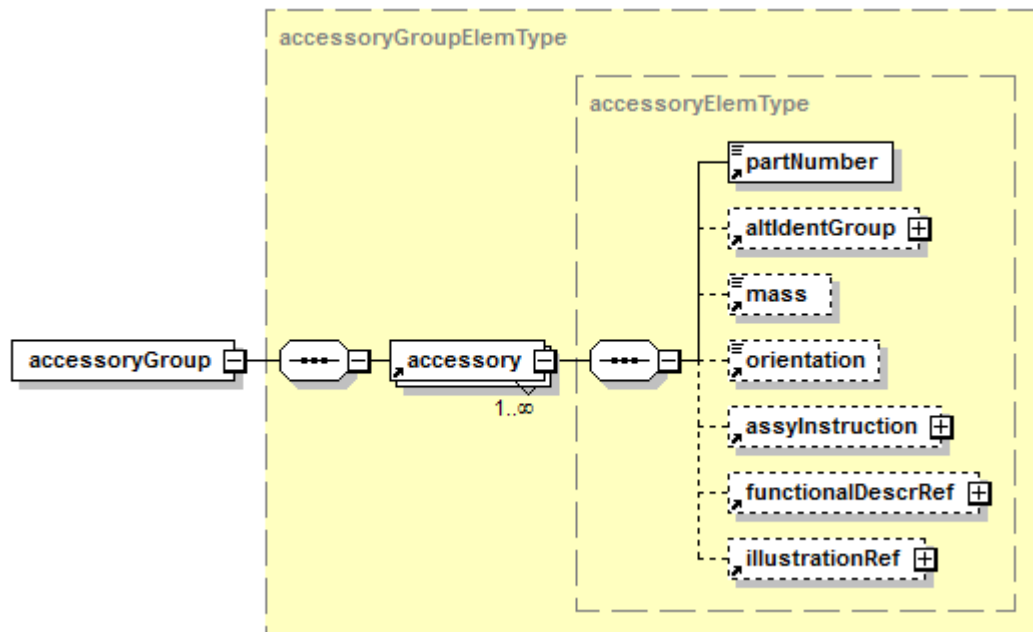

The element <accessory> and its child elements are used to capture and represent accessories, which are used for the Product, and the related standard parts information.

## 2 Element <accessory> and child elements

**Description:** The element <accessory> is contained in the list of accessories element <accessoryGroup>. The list of accessories is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of accessories used in the Product's wiring.

**Markup element:** <accessory>

ICN-C0419-S1000D0308-001-01

Fig 1 Element <accessory>

### Attributes:

- applicRefId (O), the applicability information of an accessory by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- <partNumber>, the part number of the accessory
- <altIdentGroup>, the list of alternative identifications
- <mass>, the mass of the accessory
- <orientation>, the orientation information
- <assyInstruction>, the assembly instruction information
- <functionalDescrRef>, the functional description reference
- <illustrationRef>, the reference to illustrations

### Markup example:

```
<wiringData>
<standardPartGroup>
<accessoryGroup>
<accessory><partNumber>accy_123</partNumber></accessory>
```

```
<accessory><partNumber>accy_456</partNumber></accessory>
</accessoryGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element `<partNumber>` contains the project or the organization specific part number of an accessory. Refer to [Chap 3.9.5.2.7](#). The part number is the link of the accessory with its properties to the list of accessories element `<connectorAccessories>`. Refer to [Chap 3.9.5.2.9.5](#).

## 2.2 Alternative identifications

**Description:** The element `<altIdentGroup>` contains alternative identifications of an accessory, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.5](#).

## 2.3 Mass

**Description:** The element `<mass>` contains the mass information of an accessory. Refer to [Chap 3.9.5.2.9.5](#).

## 2.4 Orientation

**Description:** The element `<orientation>` contains orientation information of an accessory. Orientation information of accessories is normally part of the accessory part number in coded form. The orientation can represent the angle of a cable clamp. Refer to [Chap 3.9.5.2.9.5](#).

### Markup example:

The following markup example shows the use of the element `<orientation>` to indicate the orientation of a 90° cable clamp.

```
<orientation>90</orientation>
```

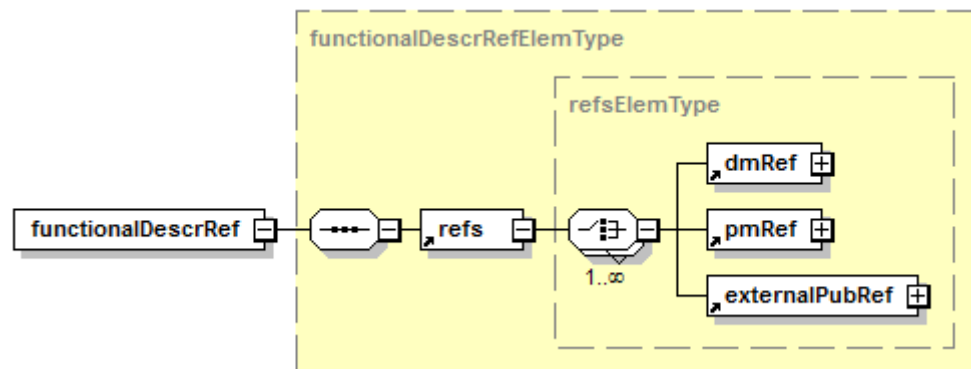

## 2.5 Assembly instructions

**Description:** The element `<assyInstruction>` is used as a container for the subordinate accessory assembly information. Refer to [Chap 3.9.5.2.9.5](#).

## 2.6 Functional description reference

**Description:** The functional description reference element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about an accessory (eg, a description of how it is made (specification of the accessory)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 2 Element `<functionalDescrRef>`

**Attributes:**

- None

**Child elements:**

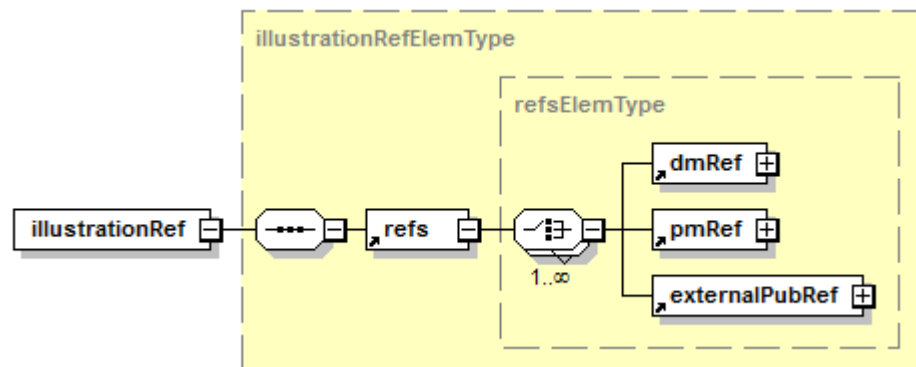

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.7

### Illustration reference

**Description:** The Illustration reference element `<illustrationRef>` contains references to other parts of the electrical system publications, which show illustrations of the accessory. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 3 Element `<illustrationRef>`

**Attributes:**

- None

**Child elements:**

- `<refs>`, the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 1 General

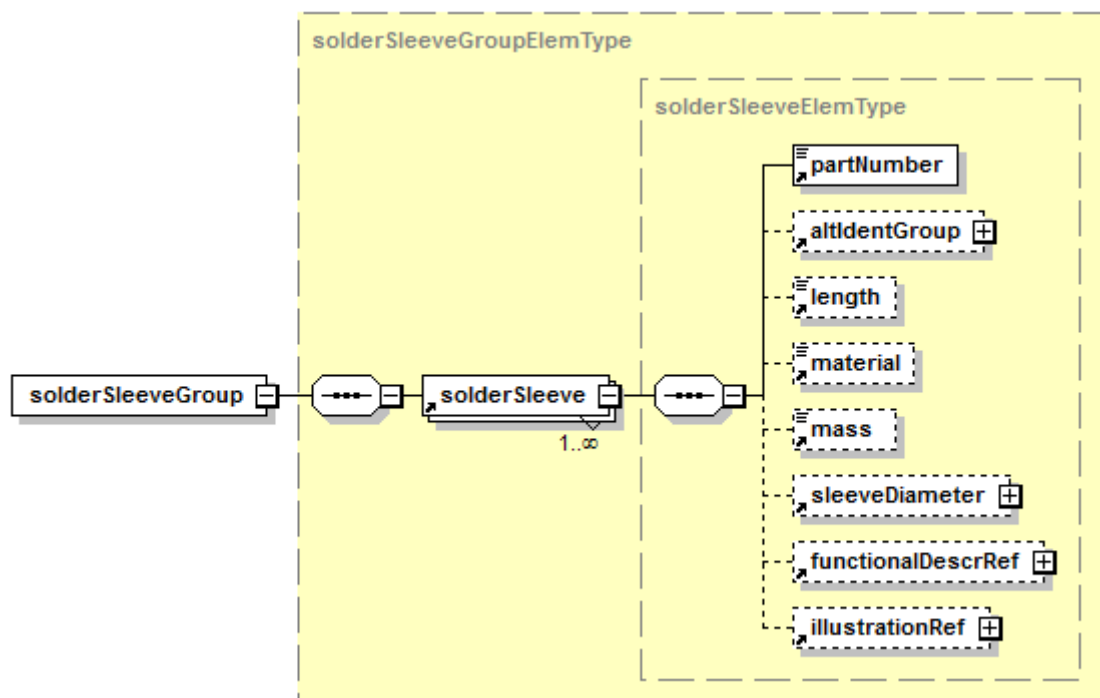

The element `<solderSleeve>` and its child elements are used to capture and represent solder sleeves that are used for the Product, and the related standard parts information.

## 2 Description of element `<solderSleeve>` and child elements

**Description:** The element `<solderSleeve>` is contained in the list of solder sleeves element `<solderSleeveGroup>`. The list of solder sleeves is a child element of the list of the standard parts element `<standardPartGroup>`.

It contains information concerning the properties of solder sleeves used in the Product's wiring.

**Markup element:** `<solderSleeve>`

ICN-C0419-S1000D0309-001-01

Fig 1 Element `<solderSleeve>`

### Attributes:

- `applicRefId` (O), the applicability information of a solder sleeve by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<partNumber>`, the part number of the solder sleeve
- `<altIdentGroup>`, the list of alternative identifications
- `<length>`, the length of the solder sleeve
- `<material>`, the material of the solder sleeve
- `<mass>`, the mass of the solder sleeve
- `<sleeveDiameter>`, the sleeve diameter

- [<functionalDescrRef>](#), the functional description reference
- [<illustrationRef>](#), the reference to illustrations

**Markup example:**

```
<wiringData>
<standardPartGroup>
<solderSleeveGroup>
<solderSleeve><partNumber>solder_987</partNumber></solderSleeve>
<solderSleeve><partNumber>solder_654</partNumber></solderSleeve>
</solderSleeveGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element [<partNumber>](#) contains the project or the organization specific part number of a solder sleeve. Refer to [Chap 3.9.5.2.7](#).

## 2.2 Alternative identifications

**Description:** The element [<altIdentGroup>](#) contains alternative identifications of a solder sleeve, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.5](#).

## 2.3 Length

**Description:** The element [<length>](#) contains the length information of a solder sleeve.

**Note**

The attribute `wireLengthType` provides additional length information for wires. It must not be used to describe the length of solder sleeves.

**Markup element:** [<length>](#)

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the solder sleeve length
- `wireLengthType` (O), the type of wire length, must not be used for solder sleeves

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element [<length>](#) to provide length information for a solder sleeve with part number PAN6468A.

```
<length unitOfMeasure="mm">14,23</length>
```

## 2.4 Material

**Description:** The element [<material>](#) describes the material of which a solder sleeve is made.

**Markup element:** [<material>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<material>Nickel</material>
```

## 2.5 Mass

**Description:** The element `<mass>` contains the mass information of a solder sleeve. Refer to [Chap 3.9.5.2.9.5](#).

**Markup example:**

```
<mass unitOfMeasure="g">0,226</mass>
```

## 2.6 Sleeve diameter

**Description:** The element `<sleeveDiameter>` contains the minimum and maximum diameter of a solder sleeve. Solder sleeves are normally defined by using several diameters (eg, diameters of the sleeve, or entry diameters). If this element is used, it must be defined which diameter is given.

**Markup element:** `<sleeveDiameter>`

ICN-C0419-S1000D0310-001-01

Fig 2 Element `<sleeveDiameter>`

**Attributes:**

- None

**Child elements:**

- `<minDiameter>`, the minimum diameter of a solder sleeve
- `<maxDiameter>`, the maximum diameter of a solder sleeve

**Markup example:**

The following markup example shows the use of the element `<sleeveDiameter>` and its child elements to provide entry diameter information for a solder sleeve.

```
<sleeveDiameter>
  <minDiameter unitOfMeasure="mm">2,04</minDiameter>
  <maxDiameter unitOfMeasure="mm">5,08</maxDiameter>
</sleeveDiameter>
```

### 2.6.1 Minimum sleeve diameter

**Description:** The element `<minDiameter>` contains the minimum diameter of a solder sleeve.

**Markup element:** `<minDiameter>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the solder sleeve diameter

**Child elements:**

- None

## 2.6.2 Maximum sleeve diameter

**Description:** The element `<maxDiameter>` contains the maximum diameter of a solder sleeve.

**Markup element:** `<maxDiameter>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the solder sleeve diameter

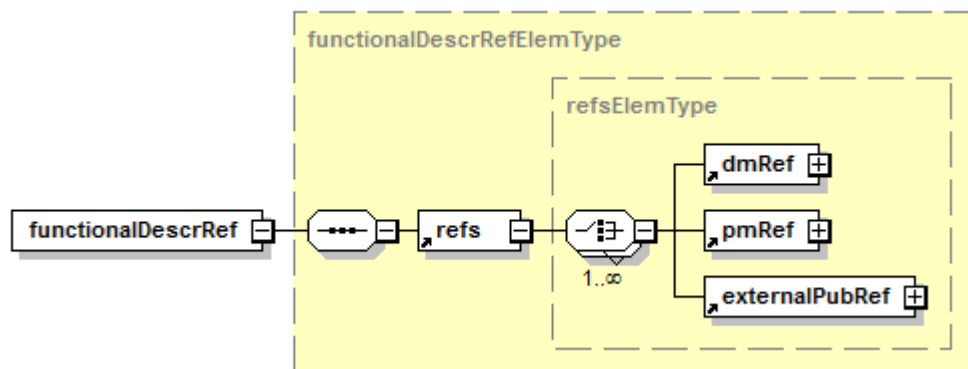

**Child elements:**

- None

## 2.7 Functional description reference

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a solder sleeve (eg, a description of how it is made (specification of the sleeve)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 3 Element `<functionalDescrRef>`

**Attributes:**

- None

**Child elements:**

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.8 Illustration reference

**Description:** The element `<illustrationRef>` contains references to other parts of the electrical system publications, which show illustrations of the solder sleeve. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 4 Element <illustrationRef>

**Attributes:**

- None

**Child elements:**

- <refs>, the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## Chapter 3.9.5.2.9.9

## 1 General

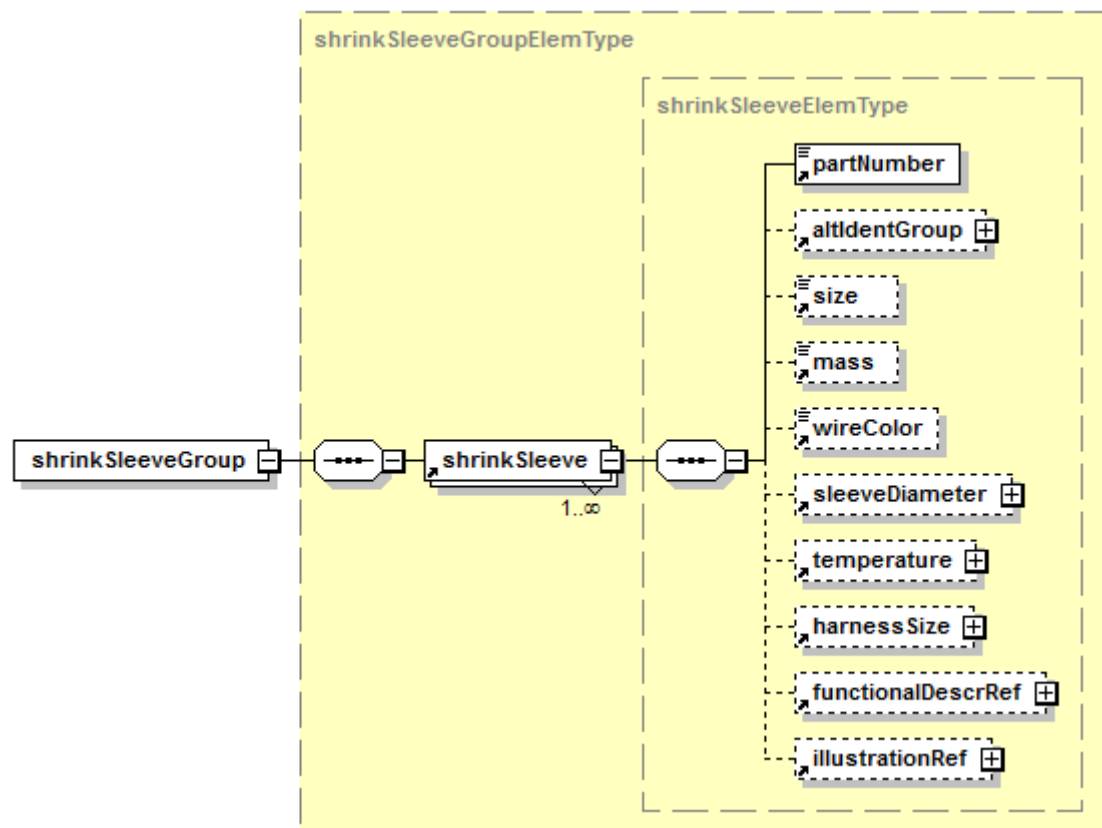

The element `<shrinkSleeve>` and its child elements are used to capture and represent shrink sleeves, which are used for the Product, and the related standard parts information.

## 2 Element `<shrinkSleeve>` and child elements

**Description:** The element `<shrinkSleeve>` is contained in the list of shrink sleeves element `<shrinkSleeveGroup>`. The list of shrink sleeves is a child element of the list of the standard parts element `<standardPartGroup>`.

It contains information concerning the properties of shrink sleeves used in the Product's wiring.

**Markup element:** `<shrinkSleeve>`

ICN-C0419-S1000D0311-001-01

Fig 1 Element `<shrinkSleeve>`

### Attributes:

- `applicRefId` (O), the applicability information of a shrink sleeve by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<partNumber>`, the part number of the shrink sleeve
- `<altIdentGroup>`, the list of alternative identifications
- `<size>`, the size information of the shrink sleeve
- `<mass>`, the mass of the shrink sleeve
- `<wireColor>`, the color information of the shrink sleeve
- `<sleeveDiameter>`, the sleeve diameter
- `<temperature>`, the temperature information
- `<harnessSize>`, the harness size
- `<functionalDescrRef>`, the functional description reference
- `<illustrationRef>`, the reference to illustrations

**Markup example:**

```
<wiringData>
<standardPartGroup>
<shrinkSleeveGroup>
<shrinkSleeve><partNumber>shrink_456</partNumber></shrinkSleeve>
<shrinkSleeve><partNumber>shrink_789</partNumber></shrinkSleeve>
</shrinkSleeveGroup>
</standardPartGroup>
</wiringData>
```

**2.1 Part number**

**Description:** The element `<partNumber>` contains the project or the organization specific part number of a shrink sleeve. Refer to [Chap 3.9.5.2.7](#).

**2.2 Alternative identifications**

**Description:** The element `<altIdentGroup>` contains alternative identifications of a shrink sleeve, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.5](#).

**2.3 Size**

**Description:** The element `<size>` contains the size information of a shrink sleeve.

**Markup element:** `<size>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the shrink sleeve size

**Child elements:**

- None

**Markup example:**

```
<size unitOfMeasure="in">3/16</size>
```

**2.4 Mass**

**Description:** The element `<mass>` contains the mass information of a shrink sleeve. Refer to [Chap 3.9.5.2.9.5](#).

**Markup example:**

```
<mass unitOfMeasure="kg/m">0,350</mass>
```

## 2.5 Color

**Description:** The element `<wireColor>` contains the color information of a shrink sleeve. Refer to [Chap 3.9.5.2.9.2](#).

**Markup example:**

```
<wireColor>Transparent</wireColor>
```

## 2.6 Sleeve diameter

**Description:** The element `<sleeveDiameter>` contains the minimum and maximum diameter of a shrink sleeve. Shrink sleeves are normally defined by using diameter information before and after shrinking. If this element is used, it must be defined which diameter is given.

**Markup element:** `<sleeveDiameter>`

**Attributes:**

- None

**Child elements:**

- `<minDiameter>`, the minimum diameter of a shrink sleeve. Refer to [Chap 3.9.5.2.9.8](#).
- `<maxDiameter>`, the maximum diameter of a shrink sleeve. Refer to [Chap 3.9.5.2.9.8](#).

**Markup example:**

The following markup example shows the use of the element `<sleeveDiameter>` for a shrink sleeve. The minimum diameter contains the minimum diameter before shrinking, the maximum diameter contains the maximum diameter after shrinking.

```
<sleeveDiameter>
<minDiameter unitOfMeasure="mm">1,6</minDiameter>
<maxDiameter unitOfMeasure="mm">0,8</maxDiameter>
</sleeveDiameter>
```

## 2.7 Temperature

**Description:** The element `<temperature>` describes the minimum and maximum temperature, for which the shrink sleeve is approved. Refer to [Chap 3.9.5.2.9.3](#).

**Markup example:**

The following markup example shows the use of the element `<temperature>` to provide the approved operating temperature range for a shrink sleeve.

```
<temperature>
<minTemperature unitOfMeasure="degC">-55</minTemperature>
<maxTemperature unitOfMeasure="degC">175</maxTemperature>
</temperature>
```

## 2.8 Harness size

**Description:** The element `<harnessSize>` describes the minimum and the maximum size of the harness, to which a shrink sleeve can be applied.

**Markup element:** `<harnessSize>`

ICN-C0419-S1000D0312-001-01

Fig 2 Element `<harnessSize>`
**Attributes:**

- None

**Child elements:**

- `<minHarnessSize>`, the minimum harness size
- `<maxHarnessSize>`, the maximum harness size

**Markup example:**

The following markup example shows the use of the element `<harnessSize>` and its child elements to provide harness size information for a shrink sleeve.

```
<harnessSize>
<minHarnessSize unitOfMeasure="mm">0,8</minHarnessSize>
<maxHarnessSize unitOfMeasure="mm">1,2</maxHarnessSize>
</harnessSize>
```

### 2.8.1 Minimum harness size

**Description:** The element `<minHarnessSize>` contains the minimum harness size.

**Markup element:** `<minHarnessSize>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the minimum harness size

**Child elements:**

- None

### 2.8.2 Maximum harness size

**Description:** The element `<maxHarnessSize>` contains the maximum harness size.

**Markup element:** `<maxHarnessSize>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the maximum harness size

**Child elements:**

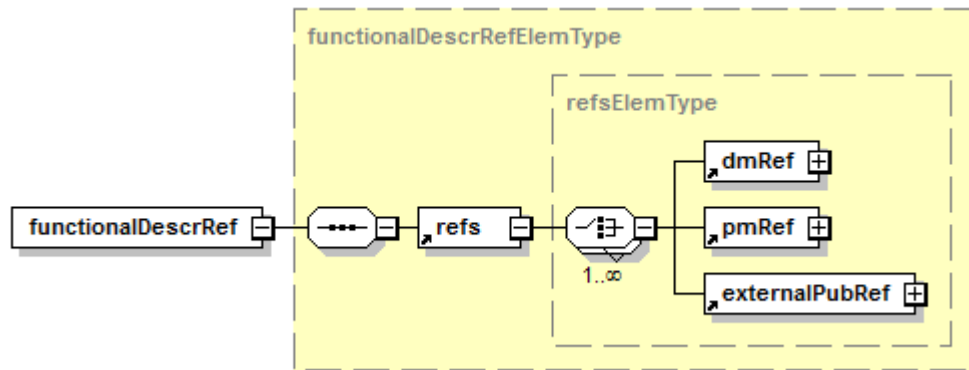

- None

## 2.9 Functional description reference

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a shrink sleeve (eg, a description of how it is made (specification of the sleeve)). Refer to [Chap 3.9.5.2.1.2](#).

Markup element: `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 3 Element `<functionalDescrRef>`

Attributes:

- None

Child elements:

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.10

### Illustration reference

**Description:** The element `<illustrationRef>` contains references to other parts of the electrical system publications, which show illustrations of the shrink sleeve. Refer to [Chap 3.9.5.2.1.2](#).

Markup element: `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 4 Element `<illustrationRef>`

Attributes:

- None

Child elements:

- `<refs>`, the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 1 General

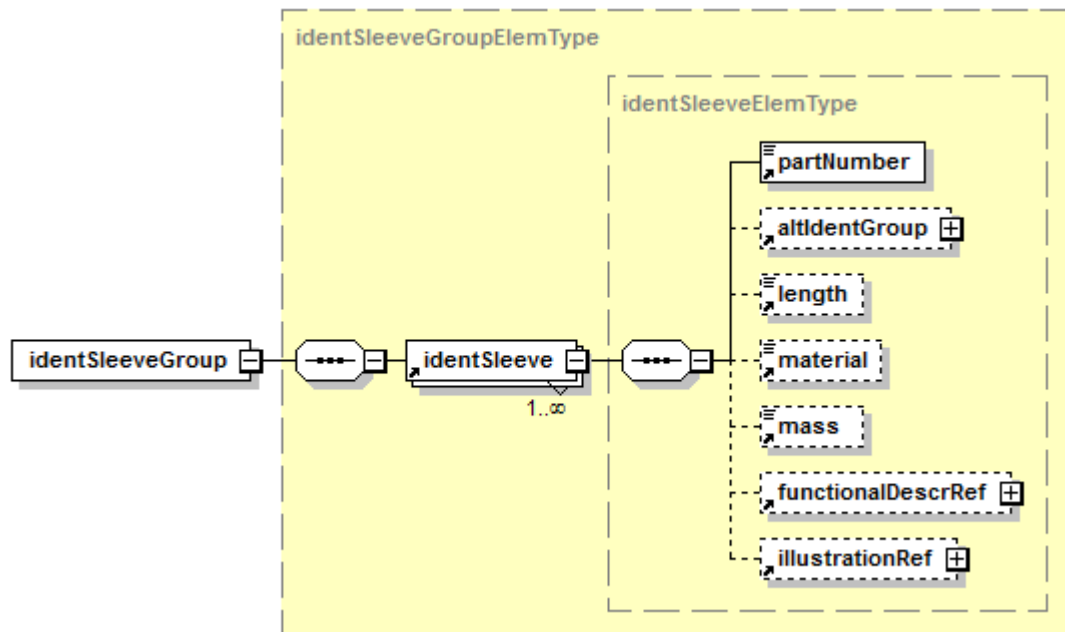

The element <identSleeve> and its child elements are used to capture and represent identification sleeves, which are used for the Product, and the related standard parts information.

## 2 Element <identSleeve> and child elements

**Description:** The element <identSleeve> is contained in the list of identification sleeves element <identSleeveGroup>. The list of identification sleeves is a child element of the list of the standard parts element <standardPartGroup>.

It contains information concerning the properties of identification sleeves used in the Product's wiring.

**Markup element:** <identSleeve>

ICN-C0419-S1000D0313-001-01

Fig 1 Element <identSleeve>

### Attributes:

- applicRefId (O), the applicability information of an identification sleeve by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- <partNumber>, the part number of the identification sleeve
- <altIdentGroup>, the list of alternative identifications
- <length>, the length of the identification sleeve
- <material>, the material of the identification sleeve
- <mass>, the mass of the identification sleeve
- <functionalDescrRef>, the functional description reference
- <illustrationRef>, the reference to illustrations

### Markup example:

```

<wiringData>
<standardPartGroup>
<identSleeveGroup>

```

```
<identSleeve><partNumber>ident_642</partNumber></identSleeve>
<identSleeve><partNumber>ident_531</partNumber></identSleeve>
</identSleeveGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The part number element `<partNumber>` contains the project or the organization specific part number of an identification sleeve. Refer to [Chap 3.9.5.2.7](#).

## 2.2 Alternative identifications

**Description:** The element `<altIdentGroup>` contains alternative identifications of an identification sleeve, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.5](#).

## 2.3 Length

**Description:** The element `<length>` contains the length information of an identification sleeve. Refer to [Chap 3.9.5.2.9.8](#).

### Note

The attribute `wireLengthType` provides additional length information for wires. It must not be used to describe the length of identification sleeves.

**Markup element:** `<length>`

## 2.4 Material

**Description:** The element `<material>` describes the material of which an identification sleeve is made. Refer to [Chap 3.9.5.2.9.8](#).

**Markup element:** `<material>`

### Markup example:

The following example shows the use of the element `<material>` for an identification sleeve.

```
<material>PVC-Nitrile</material>
```

## 2.5 Mass

**Description:** The element `<mass>` contains the mass information of an identification sleeve. Refer to [Chap 3.9.5.2.9.5](#).

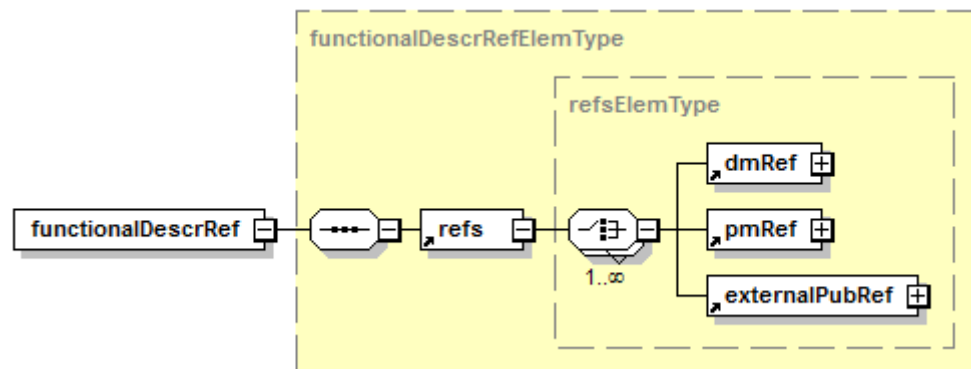

### Markup example:

```
<mass unitOfMeasure="kg">0,0001</mass>
```

## 2.6 Functional description reference

**Description:** The functional description reference element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about an identification sleeve (eg, a description of how it is made (specification of the sleeve)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 2 Element `<functionalDescrRef>`

**Attributes:**

- None

**Child elements:**

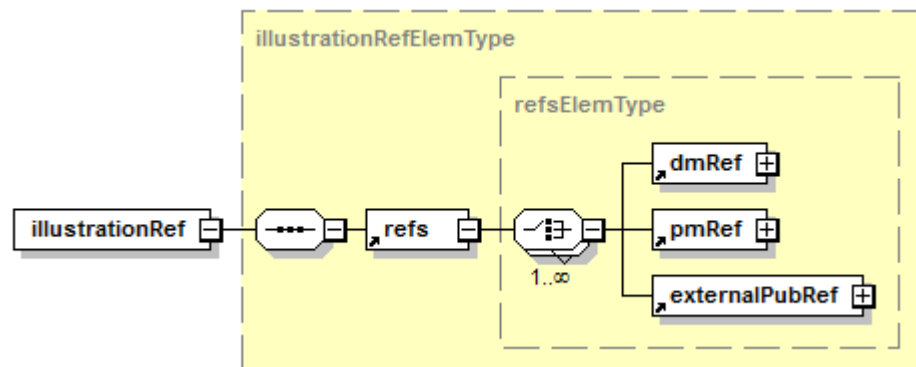

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.7

### Illustration reference

**Description:** The Illustration reference element `<illustrationRef>` contains references to other parts of the electrical system publications, which show illustrations of the identification sleeve. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 3 Element `<illustrationRef>`

**Attributes:**

- None

**Child elements:**

- `<refs>`, the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 1 General

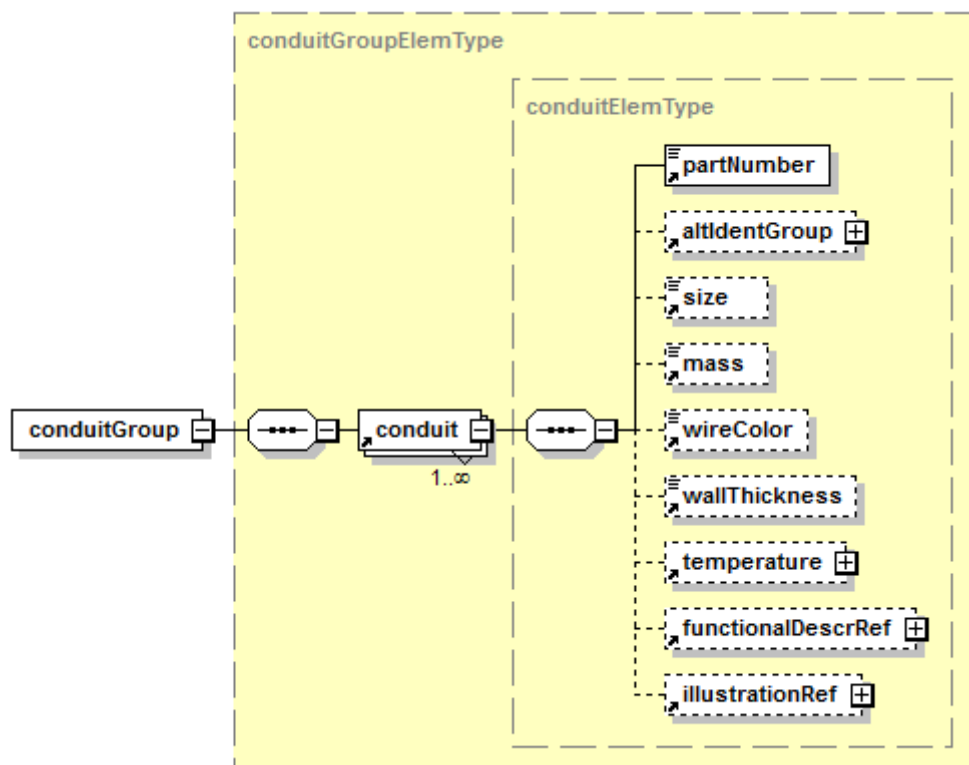

The element `<conduit>` and its child elements are used to capture and represent conduits, which are used for the Product, and the related standard parts information.

## 2 Element `<conduit>` and child elements

**Description:** The element `<conduit>` is contained in the list of conduits element `<conduitGroup>`. The list of conduits is a child element of the list of the standard parts element `<standardPartGroup>`.

It contains information concerning the properties of conduits used in the Product's wiring.

**Markup element:** `<conduit>`

ICN-C0419-S1000D0314-001-01

Fig 1 Element `<conduit>`

### Attributes:

- `applicRefId` (O), the applicability information of a conduit by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<partNumber>`, the part number of the conduit
- `<altIdentGroup>`, the list of alternative identifications
- `<size>`, the size of the conduit
- `<mass>`, the mass of the conduit

- `<wireColor>`, the color information
- `<wallThickness>`, the wall thickness of the conduit
- `<temperature>`, the temperature information
- `<functionalDescrRef>`, the functional description reference
- `<illustrationRef>`, the reference to illustrations

**Markup example:**

```
<wiringData>
<standardPartGroup>
<conduitGroup>
<conduit><partNumber>condt_468</partNumber></conduit>
<conduit><partNumber>condt_579</partNumber></conduit>
</conduitGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element `<partNumber>` contains the project or the organization specific part number of a conduit. Refer to [Chap 3.9.5.2.7](#).

## 2.2 Alternative identifications

**Description:** The element `<altIdentGroup>` contains alternative identifications of a conduit, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.5](#).

## 2.3 Size

**Description:** The element `<size>` contains the size information of a conduit. Refer to [Chap 3.9.5.2.9.9](#).

Normally, the inside diameter and the outer diameter are available for a conduit. It is also possible, that the size is identified by a size code. Then the attribute `unitOfMeasure` must not be used.

**Markup element:** `<size>`

**Markup example:**

The following markup example shows the use of the element `<size>` for a conduit, giving its outer diameter.

```
<size unitOfMeasure="mm">11,4</size>
```

## 2.4 Mass

**Description:** The element `<mass>` contains the mass information of a conduit. Refer to [Chap 3.9.5.2.9.5](#).

**Markup example:**

```
<mass unitOfMeasure="g/m">4,67</mass>
```

## 2.5 Color information

**Description:** The element `<wireColor>` contains the color information of a conduit. Refer to [Chap 3.9.5.2.9.2](#).

**Markup example:**

```
<wireColor>Black</wireColor>
```

## 2.6 Wall thickness

**Description:** The element `<wallThickness>` contains the information of the wall thickness of a conduit.

**Markup element:** `<wallThickness>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the wall thickness

**Child elements:**

- None

**Markup example:**

```
<wallThickness unitOfMeasure="mm">0,15</wallThickness>
```

## 2.7 Temperature

**Description:** The element `<temperature>` describes the minimum and maximum temperature, for which the conduit is approved. Refer to [Chap 3.9.5.2.9.3](#).

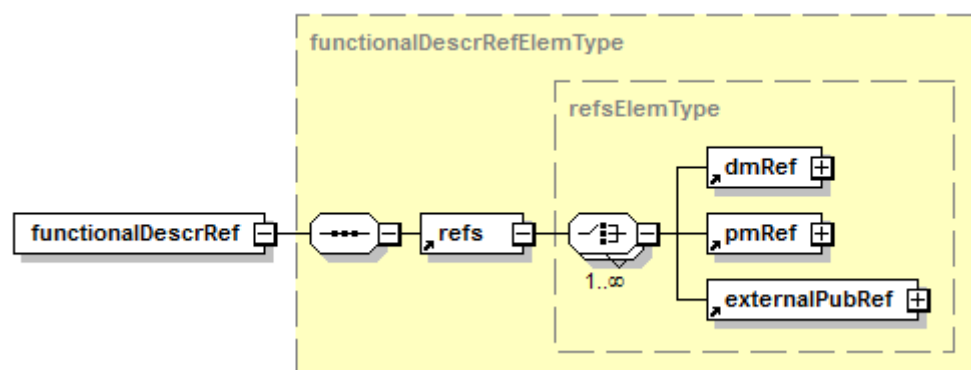

**Markup example:**

```
<temperature>
<minTemperature unitOfMeasure="degC">-55</minTemperature>
<maxTemperature unitOfMeasure="degC">200</maxTemperature>
</temperature>
```

## 2.8 Functional description reference

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about a conduit (eg, a description of how it is made (specification of the conduit)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 2 Element `<functionalDescrRef>`

**Attributes:**

- None

#### Child elements:

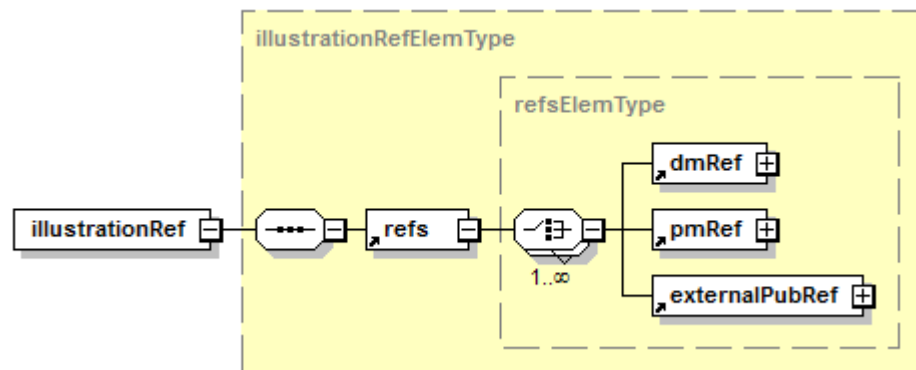

- [<refs>](#), the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.9

### Illustration reference

**Description:** The element [<illustrationRef>](#) contains references to other parts of the electrical system publications, which show illustrations of the conduit. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** [<illustrationRef>](#)

ICN-C0419-S1000D0292-001-01

Fig 3 Element [<illustrationRef>](#)

#### Attributes:

- None

#### Child elements:

- [<refs>](#), the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

### 1 General

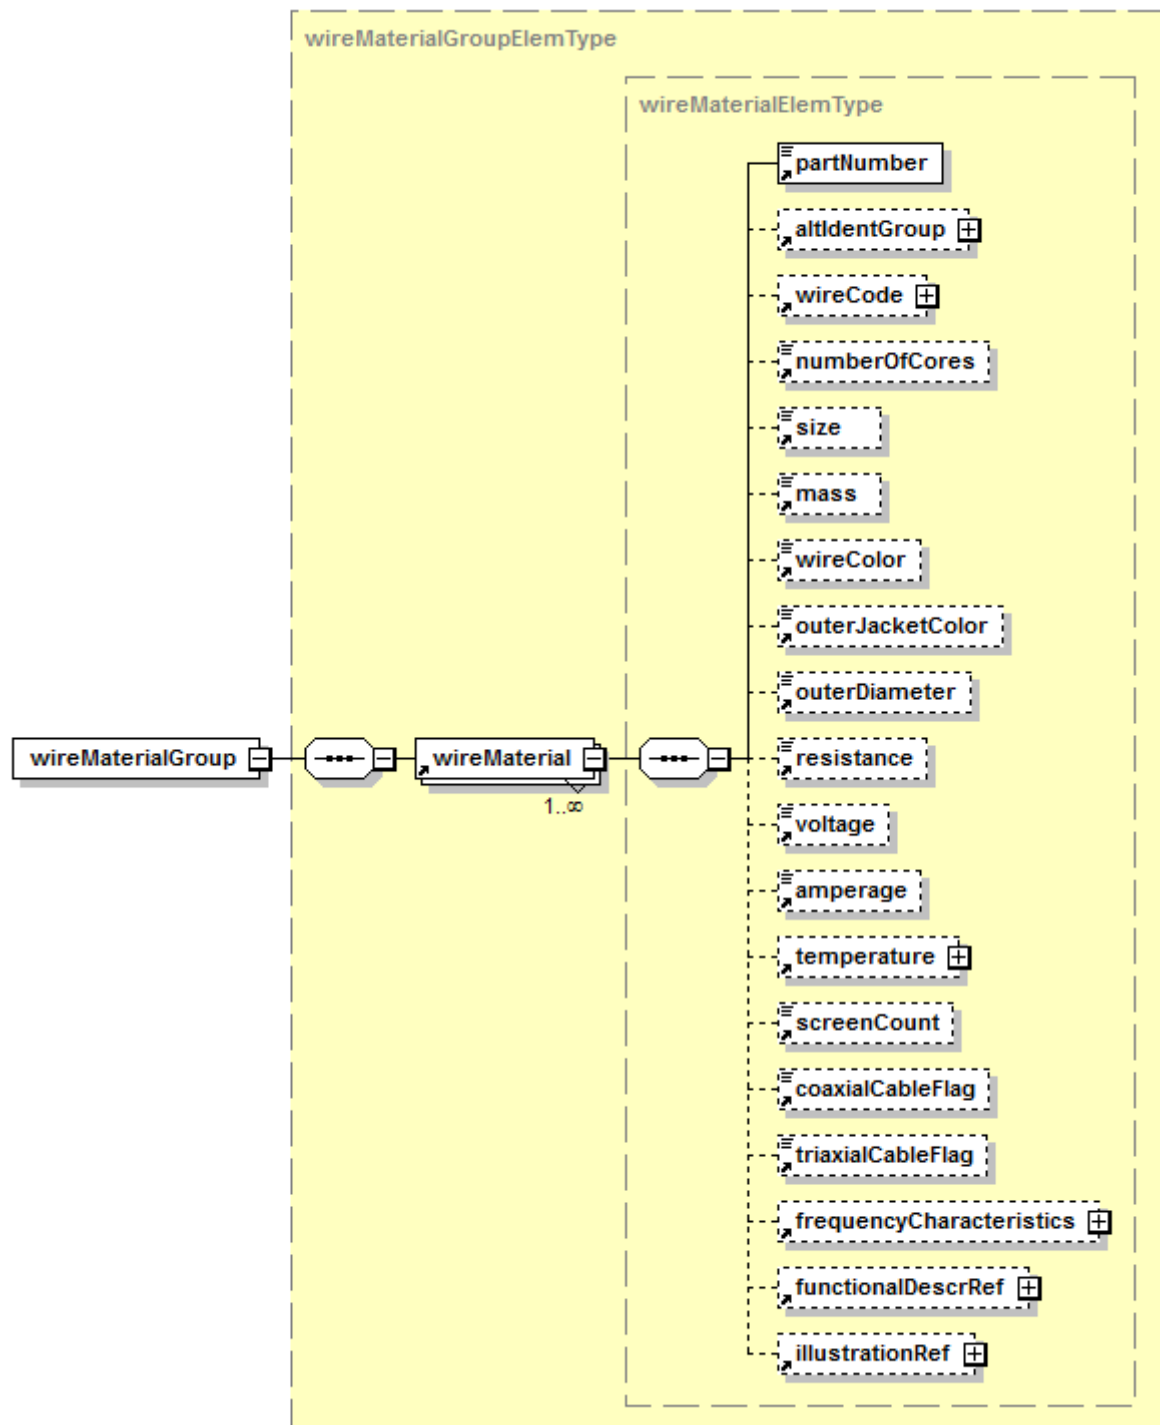

The element `<wireMaterial>` and its child elements are used to capture and represent wire material, which is used for the Product, and the related standard parts information.

### 2 Element `<wireMaterial>` and child elements

**Description:** The element `<wireMaterial>` is contained in the list of wire material element `<wireMaterialGroup>`. The list of wire material is a child element of the list of standard parts element `<standardPartGroup>`.

It contains information concerning the properties of wire material used in the Product's wiring.

**Markup element:** `<wireMaterial>`

ICN-C0419-S1000D0315-001-01

Fig 1 Element &lt;wireMaterial&gt;

#### Attributes:

- applicRefId (O), the applicability information of the wire material by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<partNumber>`, the part number of the wire material
- `<altIdentGroup>`, the list of alternative identifications
- `<wireCode>`, the wire code
- `<numberOfCores>`, the number of cores
- `<size>`, the size of the wire material
- `<mass>`, the mass of the wire material
- `<wireColor>`, the color information
- `<outerJacketColor>`, the outer jacket color
- `<outerDiameter>`, the outer diameter
- `<resistance>`, the resistance information
- `<voltage>`, the voltage information
- `<amperage>`, the amperage information
- `<temperature>`, the temperature information
- `<screenCount>`, the number of screens
- `<coaxialCableFlag>`, the coaxial information
- `<triaxialCableFlag>`, the tri-axial information
- `<frequencyCharacteristics>`, the frequency characteristics
- `<functionalDescrRef>`, the functional description reference
- `<illustrationRef>`, the reference to illustrations

#### Markup example:

```
<wiringData>
<standardPartGroup>
<wireMaterialGroup>
<wireMaterial><partNumber>Connector_C1</partNumber></wireMaterial>
<wireMaterial><partNumber>Diode_D2</partNumber></wireMaterial>
</wireMaterialGroup>
</standardPartGroup>
</wiringData>
```

## 2.1 Part number

**Description:** The element `<partNumber>` contains the project or the organization specific part number of the wire material. Refer to [Chap 3.9.5.2.7](#).

## 2.2 Alternative identifications

**Description:** The element `<altIdentGroup>` contains alternative identifications of the wire material, described by manufacturer part numbers and the related manufacturer. Refer to [Chap 3.9.5.2.9.5](#).

## 2.3 Wire code

**Description:** The element `<wireCode>` gives information about the type of a wire and its gauge thru its child elements. Refer to [Chap 3.9.5.2.9.2](#).

For one type of wire material more than one wire gauge can be available. In this case, the wires normally get different part numbers, so that for all wire sizes a different wire material element `<wireMaterial>` is used. It is also possible to use the wire gauge element `<wireGauge>` multiple times to show the gauge of a wire in different units of measure.

Markup element: `<wireCode>`

ICN-C0419-S1000D0258-001-01

Fig 2 Element `<wireCode>`

Attributes:

- None

Child elements:

- `<wireType>`, the wire type. Refer to [Chap 3.9.5.2.9.2](#).
- `<wireGauge>`, the wire gauge. Refer to [Chap 3.9.5.2.9.2](#).

Markup example:

The following markup example shows the use of the element `<wireCode>` for wire material, which contains the wire gauge in metric units.

```
<wireCode>
<wireType>QC</wireType>
<wireGauge wireGaugeType="mt">1,82</wireGauge>
</wireCode>
```

## 2.4 Core

**Description:** The element `<numberOfCores>` contains the number of cores of the wire material.

Markup element: `<numberOfCores>`

Attributes:

- None

Child elements:

- None

Markup example:

The following markup example shows the use of the element `<numberOfCores>` for wire material with three cores.

```
<numberOfCores>3</numberOfCores>
```

## 2.5 Size

**Description:** The element `<size>` contains the size information of wire material. Refer to [Chap 3.9.5.2.9.9](#).

The size of the wire material is often part of the part number of the wire material. It can also be given by the element `<wireGauge>`. In this case, the element `<size>` must not be used.

**Markup element:** `<size>`

**Markup example:**

The following markup example shows the use of the element `<size>` for wire material, providing size information in coded form (as it is part of the part number of the wire material, eg, JN1008QC030).

```
<size>030</size>
```

## 2.6 Mass

**Description:** The element `<mass>` contains the mass information of wire material. Refer to [Chap 3.9.5.2.9.5](#).

**Markup example:**

```
<mass unitOfMeasure="kg/km">58,7</mass>
```

## 2.7 Color information

**Description:** The element `<wireColor>` contains the color information of wire material. Refer to [Chap 3.9.5.2.9.2](#).

Due to the fact that it is only for single use, the color of the cores of multiple core cables must be given in a single element `<wireColor>`.

**Markup example:**

The following example shows the use of the element `<wireColor>` to provide color information (red, blue, yellow) of the cores of a three-core wire material.

```
<wireColor>R,B,Y</wireColor>
```

## 2.8 Outer jacket color

**Description:** The element `<outerJacketColor>` contains the color information of the outer jacket of wire material.

**Markup element:** `<outerJacketColor>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<outerJacketColor>` for wire material with a white outer jacket.

```
<outerJacketColor>W</outerJacketColor>
```

## 2.9 Outer diameter

**Description:** The element `<outerDiameter>` contains the outer diameter of wire material.

**Markup element:** `<outerDiameter>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the wire material outer diameter

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<outerDiameter>` to provide outer diameter information for wire material in mm.

```
<outerDiameter unitOfMeasure="mm">4,85</outerDiameter>
```

**2.10****Resistance**

**Description:** The element `<resistance>` contains the direct current resistance information of wire material.

**Markup element:** `<resistance>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the direct current resistance

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<resistance>` for wire material in mΩ per m.

```
<resistance unitOfMeasure="mohm/m">6,8</resistance>
```

**2.11****Voltage**

**Description:** The element `<voltage>` contains the voltage information of wire material.

**Markup element:** `<voltage>`

**Attributes:**

- `unitOfMeasure (O)`, the unit of measure for the voltage

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<voltage>` to provide voltage information for wire material in Volts.

```
<voltage unitOfMeasure="V">600</voltage>
```

**2.12****Amperage**

**Description:** The element `<amperage>` contains the amperage information of wire material.

**Markup element:** `<amperage>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the amperage

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<amperage>` for wire material in Ampere.

```
<amperage unitOfMeasure="A">10</amperage>
```

## 2.13 Temperature

**Description:** The element `<temperature>` describes the minimum and maximum temperature, for which the wire material is approved. In many cases, only the maximum working temperature of wire material is available. Refer to [Chap 3.9.5.2.9.3](#).

**Markup example:**

The following markup example shows the use of the element `<temperature>` by providing the maximum working temperature of the wire material.

```
<temperature>  
<maxTemperature unitOfMeasure="degC">260</maxTemperature>  
</temperature>
```

## 2.14 Screen count

**Description:** The element `<screenCount>` contains the number of screens of the wire material.

**Markup element:** `<screenCount>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<screenCount>` for wire material with one screen (eg, a coaxial cable).

```
<screenCount>1</screenCount>
```

## 2.15 Coaxial information

**Description:** The element `<coaxialCableFlag>` indicates coaxial wire material. Refer to [Chap 3.9.5.2.9.5](#).

**Markup element:** `<coaxialCableFlag>`

**Markup examples:**

The following markup example shows the use of the element `<coaxialCableFlag>` for coaxial wire material.

```
<coaxialCableFlag>Y</coaxialCableFlag>
```

The following markup example shows the use of the element `<coaxialCableFlag>` for non-coaxial wire material.

```
<coaxialCableFlag>N</coaxialCableFlag>
```

## 2.16 Tri-axial information

**Description:** The element `<triaxialCableFlag>` indicates tri-axial wire material. Refer to [Chap 3.9.5.2.9.5](#).

**Markup element:** `<triaxialCableFlag>`

**Markup example:**

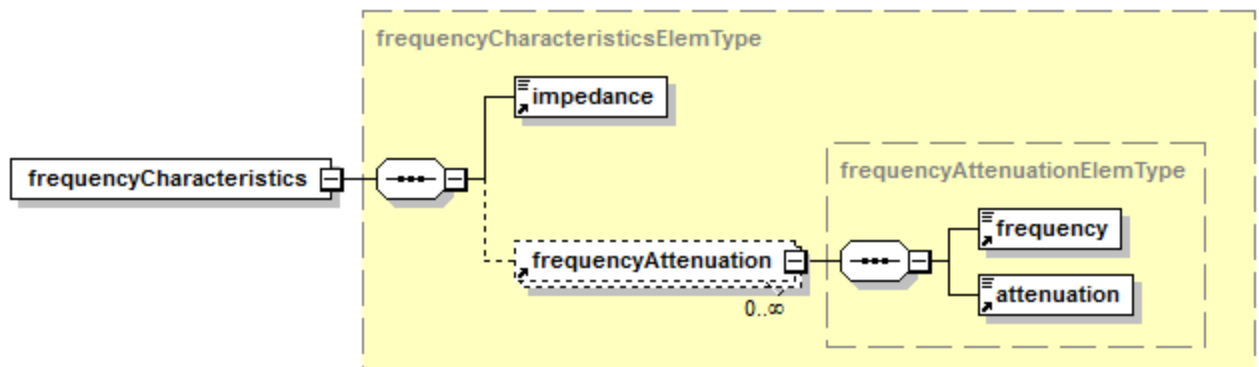

The following markup example shows the use of the element `<triaxialCableFlag>` for tri-axial wire material.

```
<triaxialCableFlag>Y</triaxialCableFlag>
```

## 2.17 Frequency characteristics

**Description:** The element `<frequencyCharacteristics>` contains alternating current frequency characteristics of wire material.

**Markup element:** `<frequencyCharacteristics>`

ICN-C0419-S1000D0316-001-01

Fig 3 Element `<frequencyCharacteristics>`

**Attributes:**

- None

**Child elements:**

- `<impedance>`, the impedance information
- `<frequencyAttenuation>`, the frequency and attenuation information

**Markup example:**

The following markup example shows the use of the element `<frequencyCharacteristics>` for wire material. The impedance of the wire material is 50  $\Omega$ , the frequency and the attenuation are provided as given in [Table 2](#).

Table 2 Frequency characteristics

Frequency	Attenuation
20 MHz	14 dB/100m
100 MHz	31 dB/100m

```

<frequencyCharacteristics>
<impedance unitOfMeasure="ohm">50</impedance>
<frequencyAttenuation>
<frequency unitOfMeasure="MHz">20</frequency>
<attenuation unitOfMeasure="dB/100m">14</attenuation>
</frequencyAttenuation>
<frequencyAttenuation>
<frequency unitOfMeasure="MHz">100</frequency>
<attenuation unitOfMeasure="dB/100m">31</attenuation>
</frequencyAttenuation>
</frequencyCharacteristics>

```

### 2.17.1

#### Impedance

**Description:** The element [<impedance>](#) contains the alternating current impedance of wire material, normally of a cable.

**Markup element:** [<impedance>](#)

**Attributes:**

- unitOfMeasure (O), the unit of measure for the impedance

**Child elements:**

- None

### 2.17.2

#### Frequency and attenuation

**Description:** The element [<frequencyAttenuation>](#) contains the frequency and attenuation information of wire material.

**Markup element:** [<frequencyAttenuation>](#)

**Attributes:**

- None

**Child elements:**

- [<frequency>](#), the frequency information
- [<attenuation>](#), the attenuation information

### 2.17.2.1

#### Frequency

**Description:** The element [<frequency>](#) contains the frequency of wire material in relation to the attenuation.

**Markup element:** [<frequency>](#)

**Attributes:**

- unitOfMeasure (O), the unit of measure for the frequency

**Child elements:**

- None

## 2.17.2.2

**Attenuation**

**Description:** The element `<attenuation>` contains the attenuation information of wire material.

**Markup element:** `<attenuation>`

**Attributes:**

- `unitOfMeasure` (O), the unit of measure for the attenuation

**Child elements:**

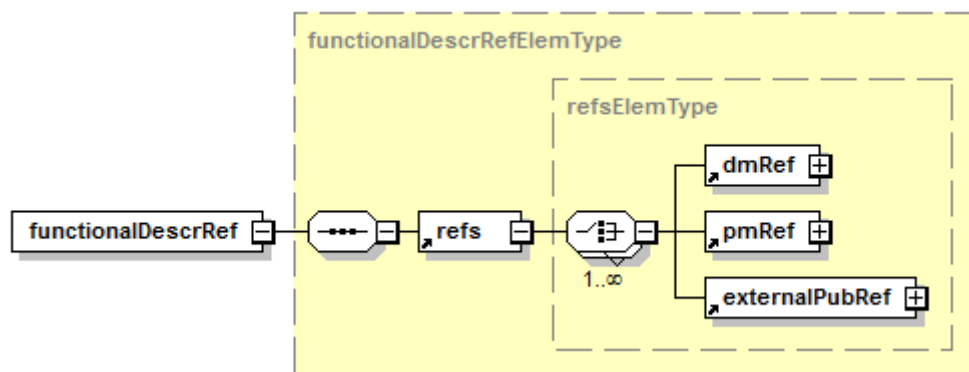

- None

## 2.18

**Functional description reference**

**Description:** The element `<functionalDescrRef>` contains references to other parts of the electrical system publications for further information about wire material (eg, a description of how it is made (specification of the wire material)). Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<functionalDescrRef>`

ICN-C0419-S1000D0291-001-01

Fig 4 Element `<functionalDescrRef>`

**Attributes:**

- None

**Child elements:**

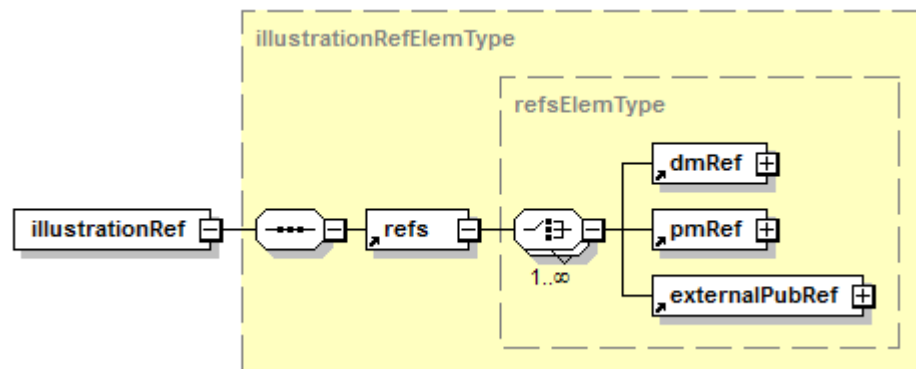

- `<refs>`, the functional description reference information. Refer to [Chap 3.9.5.2.1.2](#).

## 2.19

**Illustration reference**

**Description:** The element `<illustrationRef>` contains references to other parts of the electrical system publications, which show illustrations of the wire material. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<illustrationRef>`

ICN-C0419-S1000D0292-001-01

Fig 5 Element `<illustrationRef>`

**Attributes:**

- None

**Child elements:**

`<refs>`, the illustration reference information. Refer to [Chap 3.9.5.2.1.2](#).

<a href="#">Chap 3.9.5.3</a>	Data modules - Applicability

## 1 General

The wiring data description Schema is used for configuration and declaration of the elements of the wiring data Schema. It is recommended to declare elements of the wiring data Schema, which describe the components used in the Product's wiring, in the wiring data description data module(s) of the project. Elements of the wiring data Schema which are not used, must not be defined in the wiring data description data module(s) prepared for the project.

It is possible to prepare more than one wiring data description data module. The different data modules can then contain the definitions of the used elements in different languages. It is also possible to generate different wiring data description data modules for different presentation purposes, which means, the elements provided for maintenance personnel can differ from the elements for final assembly personnel. For data exchange purposes, the wiring data description data module(s) can be used to define the wiring data/elements that will be exchanged.

The wiring data description can be used in an interactive wiring publication for headlines, brief descriptions, or for configuration and control of the interactive wiring publication according to the specific naming conventions of a project or an organization.

Common elements and attributes must be populated in accordance with [Chap 3.9.5.2.1](#). Recommended wiring specific restrictions are detailed in this chapter.

## 2 Wiring data description

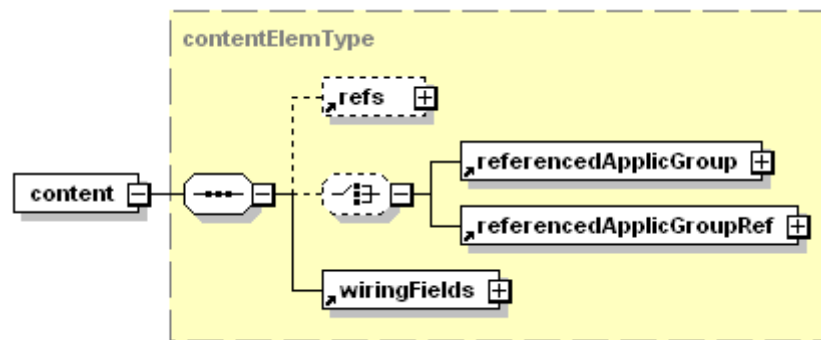

### 2.1 Schema basic rules

The wiring data description Schema is used to configure and declare the elements of the wiring data Schema. Refer to [Chap 3.9.5.2.9.1](#).

### 2.2 Content

**Description:** The element <[content](#)> of this Schema is used to capture and represent the wiring data/field descriptions of the Product.

**Markup element:** <[content](#)>

ICN-C0419-S1000D0209-002-01

Fig 1 Element &lt;content&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

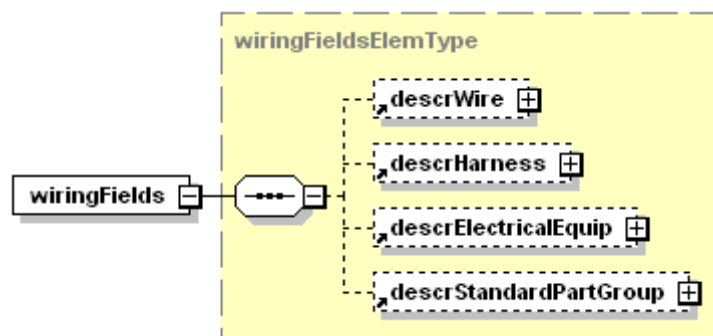

- <refs>. Refer to [Chap 3.9.5.2.1.2](#).
- <referencedApplicGroup>. Refer to [Chap 3.9.5.3](#).
- <referencedApplicGroupRef>. Refer to [Chap 3.9.5.3](#).
- <wiringFields>. Refer to [Para 2.3](#).

## 2.3

### Element <wiringFields>

**Description:** The wiring data description Schema defines the major element <wiringFields>, which contains the child elements for wire data/fields description, harness data/fields description, equipment data/fields description and standard parts data/fields description.

**Markup element:** <wiringFields>

ICN-C0419-S1000D0212-001-01

Fig 2 Element &lt;wiringFields&gt;

#### Attributes:

- None

#### Child elements:

- <descrWire>, the wire data/fields description
- <descrHarness>, the harness data/fields description
- <descrElectricalEquip>, the electrical equipment data/fields description

- `<descrStandardPartGroup>`, the standard parts data/fields description

#### Markup example:

```
<wiringFields>
<descrWire>
<descrWireNumber>
<fieldName>Wire Number</fieldName>
</descrWireNumber>
</descrWire>
<descrHarness>
<descrHarnessIdent>
<fieldName>Harness Identification</fieldName>
</descrHarnessIdent>
</descrHarness>
<descrElectricalEquip>
<descrFunctionalItemRef>
<fieldName>Functional Item</fieldName>
</descrFunctionalItemRef>
</descrElectricalEquip>
<descrStandardPartGroup>
<descrConnector>
<descrPartNumber>
<fieldName>Manufacturer Part Number</fieldName>
</descrPartNumber>
</descrConnector>
</descrStandardPartGroup>
</wiringFields>
```

## 2.4 Common constructs

**Description:** The description and declaration information for wiring data elements is given by a block of three elements. These are:

- the data/field name. Refer to [Para 2.4.1](#).
- the data/field description. Refer to [Para 2.4.2](#).
- the reference information. Refer to [Para 2.4.3](#).

ICN-C0419-S1000D0213-001-01

Fig 3 Common wiring data description constructs

### 2.4.1 Data/field name

**Description:** The element `<fieldName>` contains the name of the data field (ie, the project or the organization specific naming of electrical data).

**Markup element:** `<fieldName>`

#### Attributes:

- None

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<fieldName>` as a child element of `<descrPartNumber>`.

```
<fieldName>Part number</fieldName>
```

Further examples for the use of `<fieldName>` are given below in this chapter.

**2.4.2****Data/field description**

**Description:** The element `<descr>` contains the description of the data field (ie, the project or the organization specific description of electrical data). The element `<descr>` can in addition contain declarations of the described data.

**Markup element:** `<descr>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonforUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

The following markup example shows the use of the element `<descr>` as a child element of `<descrPartNumber>`. It is shown in the context of the list of solder sleeves element `<solderSleeveGroup>`.

```
<descr>Part number provides the project or the organization  
specific part number of the solder sleeve. Manufacturer part  
numbers are available in the section 'Alternative  
identifications'.</descr>
```

Further examples for the use of the element `<descr>` are given below.

**2.4.3****Data/field references**

**Description:** The data/field references element `<refs>` contains references to other parts of the electrical system publications, which give additional information. Refer to [Chap 3.9.5.2.1.2](#).

**Markup element:** `<refs>`

**Attributes:**

- None

**Child elements:**

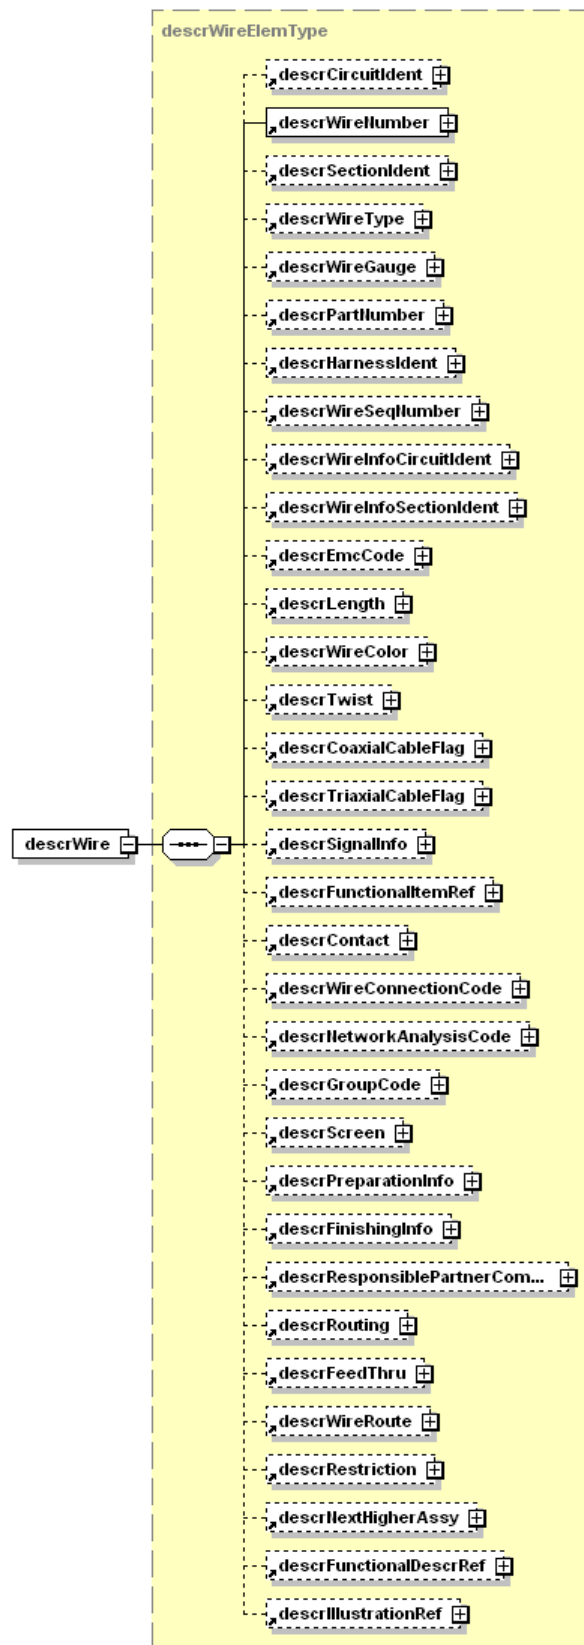

- `<dmRef>`, the reference to a data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<pmRef>`, the reference to a publication module. Refer to [Chap 3.9.5.2.1.2](#).
- `<externalPubRef>`, the reference to an external publication. Refer to [Chap 3.9.5.2.1.2](#).

---

## 2.5 Wire data/field descriptions

**Description:** The element <descrWire> contains all relevant elements to describe the wire data elements of the project.

**Markup element:** <descrWire>

ICN-C0419-S1000D0214-001-01

Fig 4 Element *<descrWire>*

**Attributes:**

- None

**Child elements:**

- <descrCircuitIdent>, the circuit code description. Refer to [Para 2.5.1](#).
- <descrWireNumber>, the wire number description. Refer to [Para 2.5.2](#).
- <descrSectionIdent>, the section identification description. Refer to [Para 2.5.3](#).
- <descrWireType>, the wire type description. Refer to [Para 2.5.4](#).
- <descrWireGauge>, the wire gauge description. Refer to [Para 2.5.5](#).
- <descrPartNumber>, the part number description. Refer to [Para 2.5.6](#).
- <descrHarnessIdent>, the harness identification description. Refer to [Para 2.5.7](#).
- <descrWireSeqNumber>, the wire sequential number description. Refer to [Para 2.5.8](#).
- <descrWireInfoCircuitIdent>, the wire information circuit code description. Refer to [Para 2.5.9](#).
- <descrWireInfoSectionIdent>, the description of the wire section identification for the wire information branch. Refer to [Para 2.5.10](#).
- <descrEmcCode>, the electromagnetic compatibility (EMC) code description. Refer to [Para 2.5.11](#).
- <descrLength>, the length description. Refer to [Para 2.5.12](#).
- <descrWireColor>, the color description. Refer to [Para 2.5.13](#).
- <descrTwist>, the twist description. Refer to [Para 2.5.14](#).
- <descrCoaxialCableFlag>, the coaxial information description. Refer to [Para 2.5.15](#).
- <descrTriaxialCableFlag>, the tri-axial information description. Refer to [Para 2.5.16](#).
- <descrSignalInfo>, the signal description. Refer to [Para 2.5.17](#).
- <descrFunctionalItemRef>, the functional item reference description. Functional items are also known as reference designators. Refer to [Para 2.5.18](#).
- <descrContact>, the contact description. Refer to [Para 2.5.19](#).
- <descrWireConnectionCode>, the wire connection code description. Refer to [Para 2.5.20](#).
- <descrNetworkAnalysisCode>, the network analysis code description. Refer to [Para 2.5.21](#).
- <descrGroupCode>, the group code description. Refer to [Para 2.5.22](#).
- <descrScreen>, the screen information description. Refer to [Para 2.5.23](#).
- <descrPreparationInfo>, the preparation information description. Refer to [Para 2.5.24](#).
- <descrFinishingInfo>, the finishing information description. Refer to [Para 2.5.25](#).
- <descrResponsiblePartnerCompany>, the responsible partner company information description. Refer to [Para 2.5.26](#).
- <descrRouting>, the routing description. Refer to [Para 2.5.27](#).
- <descrFeedThru>, the feed-thru information description. Refer to [Para 2.5.28](#).
- <descrWireRoute>, the wire route lane code description. Refer to [Para 2.5.29](#).
- <descrRestriction>, the wire restrictions description. Refer to [Para 2.5.30](#).
- <descrNextHigherAssy>, the next higher assembly information description. Refer to [Para 2.5.31](#).
- <descrFunctionalDescrRef>, the functional description reference description. Refer to [Para 2.5.32](#).

- [<descrIllustrationRef>](#), the illustration reference description. Refer to [Para 2.5.33](#).

**Markup example:**

```
<descrWire><descrWireNumber>
<fieldname>Wire Number</fieldname>
</descrWireNumber></descrWire>
```

## 2.5.1

### Circuit code description

**Description:** The element [<descrCircuitIdent>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the circuit code child element [<circuitIdent>](#) of the element [<wireIdent>](#).

**Markup element:** [<descrCircuitIdent>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**Markup example:**

```
<descrCircuitIdent>
<fieldName>Circuit Code</fieldName>
<descr>Aircraft electrical systems are identified by a primary
alphabetic letter (eg, A = Armament). A circuit within a system
is identified by the primary alphabetic letter (system
identification) and a secondary letter (subsystem
identification). Both letters together make the circuit code
(eg, AG = Gun System).</descr>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="91"
subSystemCode="0" subSubSystemCode="0" assyCode="12"
disassyCode="03" disassyCodeVariant="A" infoCode="018"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrCircuitIdent>
```

## 2.5.2

### Wire number description

**Description:** The element [<descrWireNumber>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire number element [<wireNumber>](#).

**Markup element:** [<descrWireNumber>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.3 Section identification description**

**Description:** The element `<descrSectionIdent>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the section identification child element `<sectionIdent>` of the element `<wireIdent>`.

**Markup element:** `<descrSectionIdent>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.4 Wire type description**

**Description:** The element `<descrWireType>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire type element `<wireType>`.

**Markup element:** `<descrWireType>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.5 Wire gauge description**

**Description:** The element `<descrWireGauge>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire gauge element `<wireGauge>`.

**Markup element:** `<descrWireGauge>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.6 Part number description**

**Description:** The element `<descrPartNumber>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the part number element `<partNumber>`.

**Markup element:** `<descrPartNumber>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.7 Harness identification description**

**Description:** The element <descrHarnessIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness identification element <harnessIdent>.

**Markup element:** <descrHarnessIdent>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.8 Wire sequential number description**

**Description:** The element <descrWireSeqNumber> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire sequential number element <wireSeqNumber>.

**Markup element:** <descrWireSeqNumber>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.9 Wire information circuit code description**

**Description:** The element <descrWireInfoCircuitIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the circuit code child element <circuitIdent> of the element <wireInfo>.

**Markup element:** <descrWireInfoCircuitIdent>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.10 Wire section identification description for the wire information branch**

**Description:** The element <descrWireInfoSectionIdent> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire section identification child element <sectionIdent> of the element <wireInfo>

**Markup element:** <descrWireInfoSectionIdent>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.11 EMC code description**

**Description:** The element <descrEmcCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the EMC code element <emcCode>.

**Markup element:** <descrEmcCode>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.12 Length description**

**Description:** The element <descrLength> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the length element <length>.

**Markup element:** <descrLength>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.13 Color information description**

**Description:** The element <descrWireColor> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire color element <wireColor>.

**Markup element:** <descrWireColor>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.14 Twist information description**

**Description:** The element <descrTwist> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the twist element <twist>.

**Markup element:** <descrTwist>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.15 Coaxial information description**

**Description:** The element <[descrCoaxialCableFlag](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the coaxial information element <[coaxialCableFlag](#)>.

**Markup element:** <[descrCoaxialCableFlag](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.16 Tri-axial information description**

**Description:** The element <[descrTriaxialCableFlag](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the tri-axial information element <[triaxialCableFlag](#)>.

**Markup element:** <[descrTriaxialCableFlag](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.17 Signal information description**

**Description:** The element <[descrSignalInfo](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the signal information element <[signalInfo](#)>.

**Markup element:** <[descrSignalInfo](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.18 Functional item reference description**

**Description:** The element <[descrFunctionalItemRef](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the functional item reference element <[functionalItemRef](#)>. Functional items are also known as reference designators.

**Markup element:** <[descrFunctionalItemRef](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.5.19 Contact information description

**Description:** The element <[descrContact](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact information element <[contact](#)>.

**Markup element:** <[descrContact](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.5.20 Wire connection code description

**Description:** The element <[descrWireConnectionCode](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire connection code element <[wireConnectionCode](#)>.

**Markup element:** <[descrWireConnectionCode](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.5.21 Network analysis code description

**Description:** The element <[descrNetworkAnalysisCode](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the network analysis code element <[networkAnalysisCode](#)>.

**Markup element:** <[descrNetworkAnalysisCode](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

---

**2.5.22 Group code description**

**Description:** The element <descrGroupCode> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the group code element <groupCode>.

**Markup element:** <descrGroupCode>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.23 Screen information description**

**Description:** The element <descrScreen> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the screen information element <screen>.

**Markup element:** <descrScreen>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.24 Preparation information description**

**Description:** The element <descrPreparationInfo> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the preparation information element <preparationInfo>.

**Markup element:** <descrPreparationInfo>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.25 Finishing information description**

**Description:** The element <descrFinishingInfo> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the finishing information element <finishingInfo>.

**Markup element:** <descrFinishingInfo>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.26 Responsible partner company information description**

**Description:** The element `<descrResponsiblePartnerCompany>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the responsible partner company information element `<responsiblePartnerCompany>`.

**Markup element:** `<descrResponsiblePartnerCompany>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.27 Routing description**

**Description:** The element `<descrRouting>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the clipping point identification child element `<clippingPoint>` of the routing information element `<routing>`.

**Markup element:** `<descrRouting>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.28 Feed-thru information description**

**Description:** The element `<descrFeedThru>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the functional item reference element `<functionalItemRef>` and the attribute `holeIdent` of the feed-thru information element `<feedThru>`.

**Markup element:** `<descrFeedThru>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.5.29 Wire route lane code description**

**Description:** The element `<descrWireRoute>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire route lane code element `<wireRoute>`.

**Markup element:** `<descrWireRoute>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.30 Wire restrictions information description**

**Description:** The element `<descrRestriction>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wire restrictions information element `<restriction>`.

**Markup element:** `<descrRestriction>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.31 Next higher assembly information description**

**Description:** The element `<descrNextHigherAssy>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the next higher assembly information element `<nextHigherAssy>`.

**Markup element:** `<descrNextHigherAssy>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.32 Functional description reference description**

**Description:** The element `<descrFunctionalDescrRef>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the functional description reference element `<functionalDescrRef>`.

**Markup element:** `<descrFunctionalDescrRef>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.5.33 Illustration reference description**

**Description:** The element `<descrIllustrationRef>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the illustration reference element `<illustrationRef>`.

**Markup element:** `<descrIllustrationRef>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.6 Harness data/field descriptions

**Description:** The element `<descrHarness>` contains all relevant elements to describe the harness data elements of the project.

**Markup element:** `<descrHarness>`

ICN-C0419-S1000D0215-001-01

Fig 5 Element `<descrHarness>`

**Attributes:**

- None

**Child elements:**

- <descrHarnessIdent>, the harness identification description. Refer to [Para 2.5.7.](#)
- <descrPartNumber>, the part number description. Refer to [Para 2.5.6.](#)
- <descrAltPartNumber>, the alternative part number description. Refer to [Para 2.6.1.](#)
- <descrManufacturerCode>, the manufacturer code description. Refer to [Para 2.6.2.](#)
- <descrHarnessVariantIdent>, the harness variant identification description. Refer to [Para 2.6.3.](#)
- <descrHarnessVariantIssue>, the harness variant description. Refer to [Para 2.6.4.](#)
- <descrHarnessName>, the harness name description. Refer to [Para 2.6.5.](#)
- <descrEmcCode>, the EMC code description. Refer to [Para 2.5.11.](#)
- <descrMinTemperature>, the minimum temperature description. Refer to [Para 2.6.6.](#)
- <descrMaxTemperature>, the maximum temperature description. Refer to [Para 2.6.7.](#)
- <descrHarnessEnvironment>, the harness environment description. Refer to [Para 2.6.8.](#)
- <descrSleeve>, the harness sleeve description. Refer to [Para 2.6.9.](#)
- <descrRouting>, the routing description. Refer to [Para 2.5.27.](#)
- <descrFeedThru>, the feed-thru information description. Refer to [Para 2.5.28.](#)
- <descrResponsiblePartnerCompany>, the responsible partner company information description. Refer to [Para 2.5.26.](#)
- <descrFunctionalDescrRef>, the functional description reference description. Refer to [Para 2.5.32.](#)
- <descrIllustrationRef>, the illustration reference description. Refer to [Para 2.5.33.](#)

**Markup example:**

```
<descrHarness>
<descrHarnessIdent>
<fieldName>Loom identification</fieldName>
<descr>All looms that are installed in the aircraft are
identified by a loom identification (eg, 3001VB).</descr>
<refs>
<dmRef>

disassyCode="00" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrHarnessIdent>
</descrHarness>
```

### 2.6.1 Alternative part number description

**Description:** The element `<descrAltPartNumber>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the part number child element `<partNumber>` of the element `<altIdent>` within the list of alternative identifications.

**Markup element:** `<descrAltPartNumber>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.6.2 Manufacturer code description

**Description:** The element `<descrManufacturerCode>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the manufacturer code child element `<manufacturerCode>` of the element `<altIdent>` within the list of alternative identifications.

**Markup element:** `<descrManufacturerCode>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.6.3 Harness variant identification description

**Description:** The element `<descrHarnessVariantIdent>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness variant identification element `<harnessVariantIdent>`.

**Markup element:** `<descrHarnessVariantIdent>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.6.4 Harness variant issue description

**Description:** The element `<descrHarnessVariantIssue>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness variant issue element `<harnessVariantIssue>`.

**Markup element:** `<descrHarnessVariantIssue>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.6.5 Harness name description**

**Description:** The element `<descrHarnessName>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness name element `<harnessName>`.

**Markup element:** `<descrHarnessName>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.6.6 Minimum temperature description**

**Description:** The element `<descrMinTemperature>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the minimum temperature element `<minTemperature>`.

**Markup element:** `<descrMinTemperature>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.6.7 Maximum temperature description**

**Description:** The element `<descrMaxTemperature>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum temperature element `<maxTemperature>`.

**Markup element:** `<descrMaxTemperature>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.6.8 Harness environment description**

**Description:** The element `<descrHarnessEnvironment>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the harness environment element `<harnessEnvironment>`.

**Markup element:** `<descrHarnessEnvironment>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.6.9****Harness sleeve description**

**Description:** The element <[descrSleeve](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the part number element <[partNumber](#)> and the attribute `sleeveMaterial` of the harness sleeve element <[sleeve](#)>.

**Markup element:** <[descrSleeve](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.7****Electrical equipment data/field descriptions**

**Description:** The element <[descrElectricalEquip](#)> contains all relevant elements to describe the electrical equipment data elements of the project.

**Markup element:** <[descrElectricalEquip](#)>

ICN-C0419-S1000D0216-001-01

Fig 6 Element <descrElectricalEquip>

**Attributes:**

- None

#### Child elements:

- <descrFuntionalItemRef>, the functional item reference description. Functional items are also known as reference designators. Refer to [Para 2.5.18.](#)
- <descrPartNumber>, the part number description. Refer to [Para 2.5.6.](#)
- <descrAltPartNumber>, the alternative part number description. Refer to [Para 2.6.1.](#)
- <descrManufacturerCode>, the manufacturer code description. Refer to [Para 2.6.2.](#)
- <descrInstallationLocation>, the installation location information description. Refer to [Para 2.7.1.](#)
- <descrAccessDoorOrPanel>, the access door or panel information description. Refer to [Para 2.7.2.](#)
- <descrAssy>, the assembly information description. Refer to [Para 2.7.3.](#)
- <descrNextHigherAssy>, the next higher assembly information description. Refer to [Para 2.5.31.](#)
- <descrPositionOnNextHigherAssy>, the position on next higher assembly description. Refer to [Para 2.7.4.](#)
- <descrMaxMountingPositions>, the maximum number of mounting positions description. Refer to [Para 2.7.5.](#)
- <descrSystemBreakdownCode>, the system breakdown code description. Refer to [Para 2.7.6.](#)
- <descrSiblingPlugIdent>, the sibling plug identification description. Refer to [Para 2.7.7.](#)
- <descrTransverseLink>, the transverse link information description. Refer to [Para 2.7.8.](#)
- <descrConnectionListClass>, the connection list class description. Refer to [Para 2.7.9.](#)
- <descrElectricalContact>, the electrical connection contact description. Refer to [Para 2.7.10.](#)
- <descrElectricalStateDescr>, the electrical state information description. Refer to [Para 2.7.11.](#)
- <descrResponsiblePartnerCompany>, the responsible partner company information description. Refer to [Para 2.5.26.](#)
- <descrEquipName>, the equipment name description. Refer to [Para 2.7.12.](#)
- <descrReqQuantity>, the quantity information description. Refer to [Para 2.7.13.](#)
- <descrEquipDescrRef>, the equipment description reference description. Refer to [Para 2.7.14.](#)
- <descrFunctionalDescrRef>, the functional description reference description. Refer to [Para 2.5.32.](#)
- <descrIllustrationRef>, the illustration reference description. Refer to [Para 2.5.33.](#)

#### Markup example:

```
<descrElectricalEquip>
<descrFunctionalItemRef>
<fieldName>Functional item</fieldName>
<descr>Each item of equipment within a system / circuit is
identified by its circuit code with a sequential number before
it (eg, 1AG). If items of equipment are used by more than one
system, they are identified by the use of a systems letter V.
The systems letter V will have an equipment sequential number
```

before it. The second letter after the V identifies the type of equipment used, and is identified within the system V. Connectors are identified by an additional letter. The letter will come after the equipment ident (eg, 1AGA).</descr>

```

### 2.7.1 Installation location information description

**Description:** The element <descrInstallationLocation> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the installation location information child element <installationLocation> of the element <installationInfo>.

**Markup element:** <descrInstallationLocation>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.7.2 Access door or panel information description

**Description:** The element <descrAccessDoorOrPanel> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the access door or panel child element <accessDoorOrPanel> of the element <installationInfo>.

**Markup element:** <descrAccessDoorOrPanel>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.7.3 Assembly information description

**Description:** The element <descrAssy> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the assembly information child element <assy> of the assembly instructions element <assyInstruction>.

**Markup element:** <descrAssy>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.7.4 Position on next higher assembly description**

**Description:** The element `<descrPositionOnNextHigherAssy>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the position on next higher assembly child element `<positionOnNextHigherAssy>` of the element `<installationInfo>`.

**Markup element:** `<descrPositionOnNextHigherAssy>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.7.5 Maximum number of mounting positions description**

**Description:** The element `<descrMaxMountingPositions>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum number of mounting positions element `<maxMountingPositions>`.

**Markup element:** `<descrMaxMountingPositions>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.7.6 System breakdown code description**

**Description:** The element `<descrSystemBreakdownCode>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the system breakdown code element `<systemBreakdownCode>`.

**Markup element:** `<descrSystemBreakdownCode>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

**2.7.7 Sibling plug identification description**

**Description:** The element `<descrSiblingPlugIdent>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the functional item reference child element

<[functionalItemRef](#)> of the sibling plug identification element  
<[siblingPlugIdent](#)>.

**Markup element:** <[descrSiblingPlugIdent](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.7.8 Transverse link information description

**Description:** The element <[descrTransverseLink](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact identification child element <[contact](#)> of the electrical equipment connection element <[electricalEquipConnection](#)> within the transverse link element <[transverseLink](#)>.

**Markup element:** <[descrTransverseLink](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.7.9 Connection list class description

**Description:** The element <[descrConnectionListClass](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the connection list class element <[connectionListClass](#)>.

**Markup element:** <[descrConnectionListClass](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.7.10 Electrical connection contact description

**Description:** The element <[descrElectricalContact](#)> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical connection contact child element <[contact](#)> of the electrical equipment connection element <[electricalEquipConnection](#)>.

**Markup element:** <[descrElectricalContact](#)>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.7.11 Electrical state information description**

**Description:** The element `<descrElectricalStateDescr>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical state description child element `<electricalStateDescr>` of the electrical equipment state information element `<electricalEquipState>`.

**Markup element:** `<descrElectricalStateDescr>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.7.12 Electrical equipment name description**

**Description:** The element `<descrEquipName>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical equipment name element `<equipName>`.

**Markup element:** `<descrEquipName>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.7.13 Quantity description**

**Description:** The element `<descrReqQuantity>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the required quantity information element `<reqQuantity>`.

**Markup element:** `<descrReqQuantity>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

**2.7.14 Electrical equipment description reference description**

**Description:** The element `<descrEquipDescrRef>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the electrical equipment description reference element `<equipDescrRef>`.

**Markup element:** `<descrEquipDescrRef>`

**Attributes:**

- None

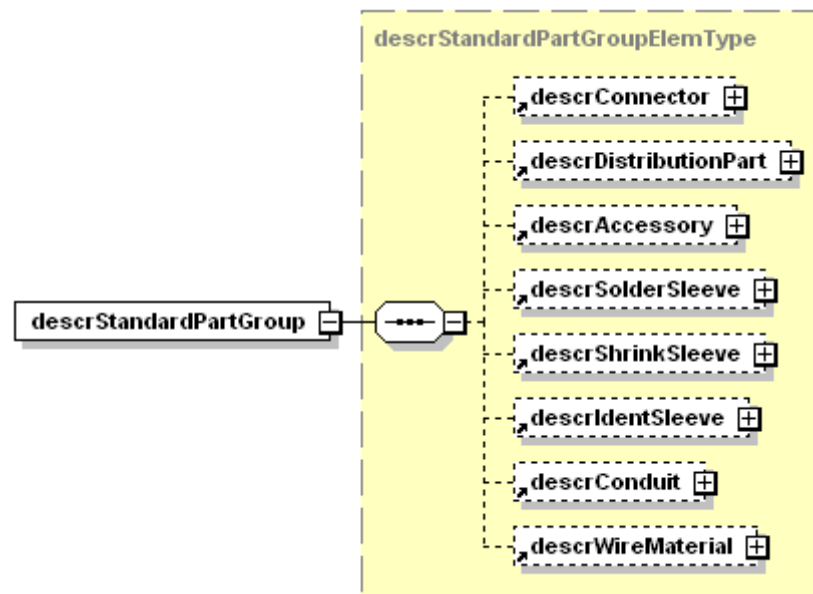

**Child elements:**

- Refer to [Para 2.4](#).

## 2.8 Standard parts data/field descriptions

**Description:** The element `<descrStandardPartGroup>` contains child elements, which describe the electrical standard parts data elements.

**Markup element:** `<descrStandardPartGroup>`

ICN-C0419-S1000D0217-001-01

Fig 7 Element `<descrStandardPartGroup>`

**Attributes:**

- None

**Child elements:**

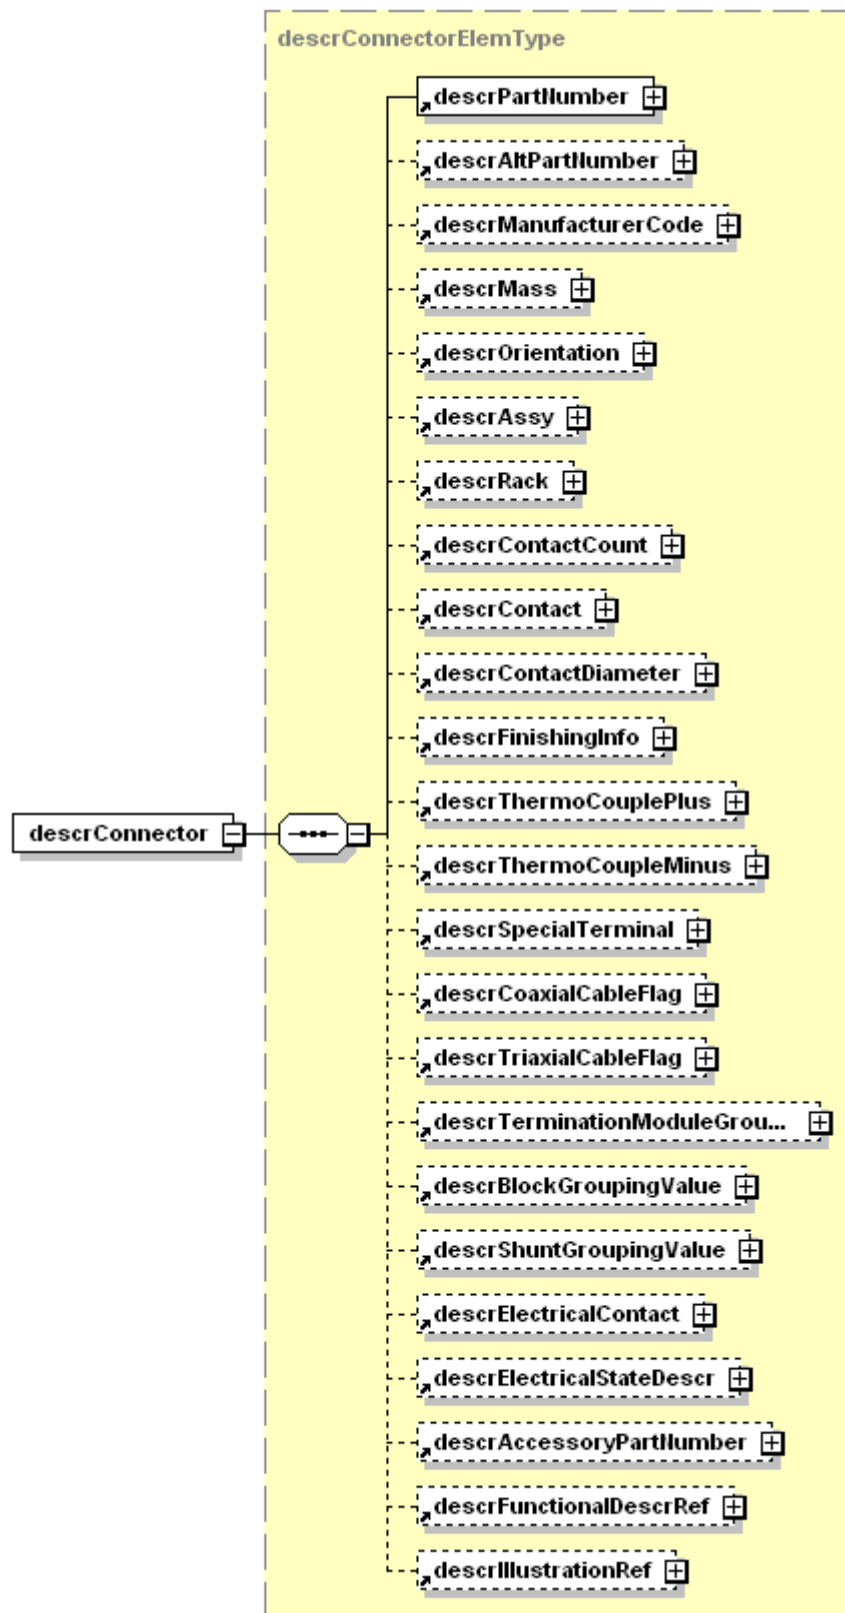

- `<descrConnector>`, the connector data/field descriptions. Refer to [Para 2.8.1](#).
- `<descrDistributionPart>`, the distribution part data/field descriptions. Refer to [Para 2.8.2](#).
- `<descrAccessory>`, the accessory data/field descriptions. Refer to [Para 2.8.3](#).
- `<descrSolderSleeve>`, the solder sleeve data/field descriptions. Refer to [Para 2.8.4](#).
- `<descrShrinkSleeve>`, the shrink sleeve data/field descriptions. Refer to [Para 2.8.5](#).
- `<descrIdentSleeve>`, the identification sleeve data/field descriptions. Refer to [Para 2.8.6](#).
- `<descrConduit>`, the conduit data/field descriptions. Refer to [Para 2.8.7](#).
- `<descrWireMaterial>`, the wire material data/field descriptions. Refer to [Para 2.8.8](#).

---

2.8.1 **Connector data/field descriptions**

**Description:** The element <descrConnector> contains all relevant elements to describe the connector data elements of the project.

**Markup element:** <descrConnector>

ICN-C0419-S1000D0218-001-01

Fig 8 Element `<descrConnector>`

**Attributes:**

- None

**Child elements:**

- <descrPartNumber>, the part number description. Refer to [Para 2.5.6.](#)
- <descrAltPartNumber>, the alternative part number description. Refer to [Para 2.6.1.](#)
- <descrManufacturerCode>, the manufacturer code description. Refer to [Para 2.6.2.](#)
- <descrMass>, the mass information description. Refer to [Para 2.8.1.1.](#)
- <descrOrientation>, the orientation information description. Refer to [Para 2.8.1.2.](#)
- <descrAssy>, the assembly information description. Refer to [Para 2.7.3.](#)
- <descrRack>, the rack information description. Refer to [Para 2.8.1.3.](#)
- <descrContactCount>, the contact count description. Refer to [Para 2.8.1.4.](#)
- <descrContact>, the contact information description. Refer to [Para 2.5.19.](#)
- <descrContactDiameter>, the contact diameter description. Refer to [Para 2.8.1.5.](#)
- <descrFinishingInfo>, the finishing information description. Refer to [Para 2.5.25.](#)
- <descrThermoCouplePlus>, the thermocouple plus information description. Refer to [Para 2.8.1.6.](#)
- <descrThermoCoupleMinus>, the thermocouple minus information description. Refer to [Para 2.8.1.7.](#)
- <descrSpecialTerminal>, the special terminal information description. Refer to [Para 2.8.1.8.](#)
- <descrCoaxialCableFlag>, the coaxial information description. Refer to [Para 2.5.15.](#)
- <descrTriaxialCableFlag>, tri-axial information description. Refer to [Para 2.5.16.](#)
- <descrTerminationModuleGroupingValue>, the termination module grouping information description. Refer to [Para 2.8.1.9.](#)
- <descrBlockGroupingValue>, the block grouping information description. Refer to [Para 2.8.1.10.](#)
- <descrShuntGroupingValue>, the shunt grouping information description. Refer to [Para 2.8.1.11.](#)
- <descrElectricalContact>, the electrical connections contact description. Refer to [Para 2.7.10.](#)
- <descrElectricalStateDescr>, the electrical state information description. Refer to [Para 2.7.11.](#)
- <descrAccessoryPartNumber>, the accessory information description. Refer to [Para 2.8.1.12.](#)
- <descrFunctionalDescrRef>, the functional description reference description. Refer to [Para 2.5.32.](#)
- <descrIllustrationRef>, the illustration reference description. Refer to [Para 2.5.33.](#)

**Markup example:**

The following markup example shows the definition of the elements <partNumber> and <manufacturerCode> of the alternate identification of connector data. No references are applicable.

```
<descrAltPartNumber>
<fieldName>Manufacturer part number</fieldName>
```

```
<descr>Manufacturer part number provides manufacturer part
numbers, which show cross reference part numbers to the standard
part number of the connector.</descr>
</descrAltPartNumber>
<descrManufacturerCode>
<fieldName>Manufacturer</fieldName>
<descr>Manufacturer shows the manufacturer of the connector,
described by manufacturer part number.</descr>
</descrManufacturerCode>
```

#### 2.8.1.1 Mass information description

**Description:** The element `<descrMass>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the mass information element `<mass>`.

**Markup element:** `<descrMass>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

#### 2.8.1.2 Orientation information description

**Description:** The element `<descrOrientation>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the orientation information element `<orientation>`.

**Markup element:** `<descrOrientation>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

#### 2.8.1.3 Rack information description

**Description:** The element `<descrRack>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the rack information element `<rack>`.

**Markup element:** `<descrRack>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4.](#)

#### 2.8.1.4 Contact count description

**Description:** The element `<descrContactCount>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact count element `<contactCount>`.

**Markup element:** <descrContactCount>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.5 Contact diameter description

**Description:** The element <descrContactDiameter> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact diameter element <contactDiameter>.

**Markup element:** <descrContactDiameter>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.6 Thermocouple plus information description

**Description:** The element <descrThermoCouplePlus> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the thermocouple plus information element <thermoCouplePlus>.

**Markup element:** <descrThermoCouplePlus>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.7 Thermocouple minus information description

**Description:** The element <descrThermoCoupleMinus> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the thermocouple minus information element <thermoCoupleMinus>.

**Markup element:** <descrThermoCoupleMinus>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.8 Special terminal information description

**Description:** The element <descrSpecialTerminal> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other

data modules or publications for the special terminal information element [<specialTerminal>](#).

**Markup element:** [<descrSpecialTerminal>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.9 Termination module grouping information description

**Description:** The element [<descrTerminationModuleGroupingValue>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the termination module grouping information child element [<terminationModuleGroupingValue>](#) of the contact description element [<contactDescr>](#).

**Markup element:** [<descrTerminationModuleGroupingValue>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.10 Block grouping information description

**Description:** The element [<descrBlockGroupingValue>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the block grouping information child element [<blockGroupingValue>](#) of the contact description element [<contactDescr>](#).

**Markup element:** [<descrBlockGroupingValue>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.1.11 Shunt grouping information description

**Description:** The element [<descrShuntGroupingValue>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the shunt grouping information child element [<shuntGroupingValue>](#) of the contact description element [<contactDescr>](#).

**Markup element:** [<descrShuntGroupingValue>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.8.1.12 Accessory part number description

**Description:** The element `<descrAccessoryPartNumber>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the accessory part number child element `<partNumber>` of the list of accessories element `<connectorAccessories>`.

**Markup element:** `<descrAccessoryPartNumber>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.8.2 Distribution part data/field descriptions

**Description:** The element `<descrDistributionPart>` contains all relevant elements to describe the distribution part data elements of the project.

**Markup element:** `<descrDistributionPart>`

ICN-C0419-S1000D0219-001-01

Fig 9 Element `<descrDistributionPart>`

**Attributes:**

- None

#### Child elements:

- `<descrPartNumber>`, the part number description. Refer to [Para 2.5.6.](#)
- `<descrAltPartNumber>`, the alternative part number description. Refer to [Para 2.6.1.](#)
- `<descrManufacturerCode>`, the manufacturer code description. Refer to [Para 2.6.2.](#)
- `<descrContactSize>`, the contact size description. Refer to [Para 2.8.2.1.](#)
- `<descrMaterial>`, the material information description. Refer to [Para 2.8.2.2.](#)
- `<descrMass>`, the mass information description. Refer to [Para 2.8.1.1.](#)
- `<descrWireColor>`, the color information description. Refer to [Para 2.5.13.](#)
- `<descrSurfaceProtection>`, the surface protection information description. Refer to [Para 2.8.2.3.](#)
- `<descrContactDiameter>`, the contact diameter description. Refer to [Para 2.8.1.5.](#)
- `<descrMinTemperature>`, the minimum temperature description. Refer to [Para 2.6.6.](#)
- `<descrMaxTemperature>`, the maximum temperature description. Refer to [Para 2.6.7.](#)
- `<descrFunctionalDescrRef>`, the functional description reference description. Refer to [Para 2.5.32.](#)
- `<descrIllustrationRef>`, the illustration reference description. Refer to [Para 2.5.33.](#)

#### Markup example:

The following markup example shows the definition of the element `<wireColor>` of distribution part data. No references are applicable.

```
<descrWireColor>
<fieldName>Color codes</fieldName>
<descr>Color codes provide, if applicable, the colors of the
color bands of contacts that identify the size of the
contact.</descr>
</descrWireColor>
```

#### 2.8.2.1 Contact size description

**Description:** The element `<descrContactSize>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the contact size element `<contactSize>`.

**Markup element:** `<descrContactSize>`

#### Attributes:

- None

#### Child elements:

- Refer to [Para 2.4.](#)

#### 2.8.2.2 Material information description

**Description:** The element `<descrMaterial>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the material information element `<material>`.

**Markup element:** `<descrMaterial>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.8.2.3 Surface protection information description

**Description:** The element `<descrSurfaceProtection>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the surface protection information element `<surfaceProtection>`.

**Markup element:** `<descrSurfaceProtection>`

**Attributes:**

- None

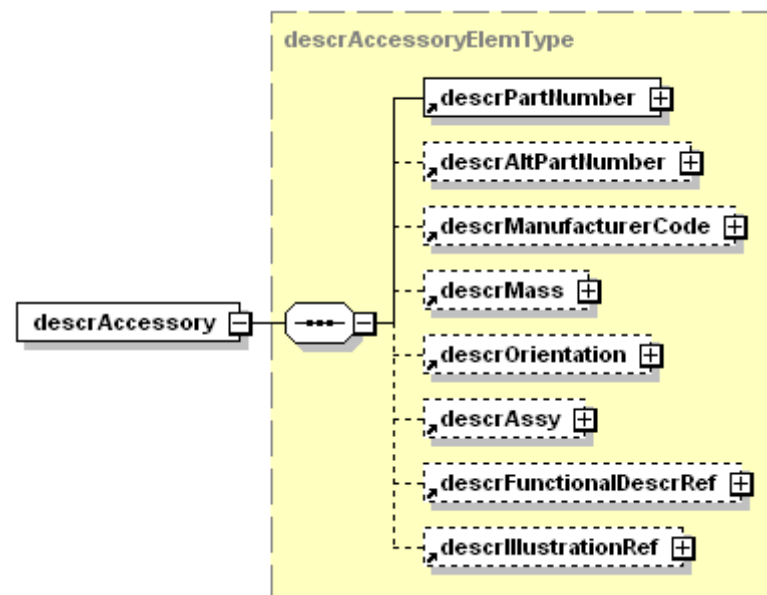

**Child elements:**

- Refer to [Para 2.4](#).

### 2.8.3 Accessory data/field descriptions

**Description:** The element `<descrAccessory>` contains all relevant elements to describe the accessory data elements of the project.

**Markup element:** `<descrAccessory>`

ICN-C0419-S1000D0220-001-01

Fig 10 Element `<descrAccessory>`

**Attributes:**

- None

**Child elements:**

- `<descrPartNumber>`, the part number description. Refer to [Para 2.5.6](#).

- `<descrAltPartNumber>`, the alternative part number description. Refer to [Para 2.6.1.](#)
- `<descrManufacturerCode>`, the manufacturer code description. Refer to [Para 2.6.2.](#)
- `descrMass`, the mass information description. Refer to [Para 2.8.1.1.](#)
- `<descrOrientation>`, the orientation information description. Refer to [Para 2.8.1.2.](#)
- `<descrAssy>`, the assembly information description. Refer to [Para 2.7.3.](#)
- `<descrFunctionalDescrRef>`, the functional description reference description. Refer to [Para 2.5.32.](#)
- `<descrIllustrationRef>`, the illustration reference description. Refer to [Para 2.5.33.](#)

#### Markup example:

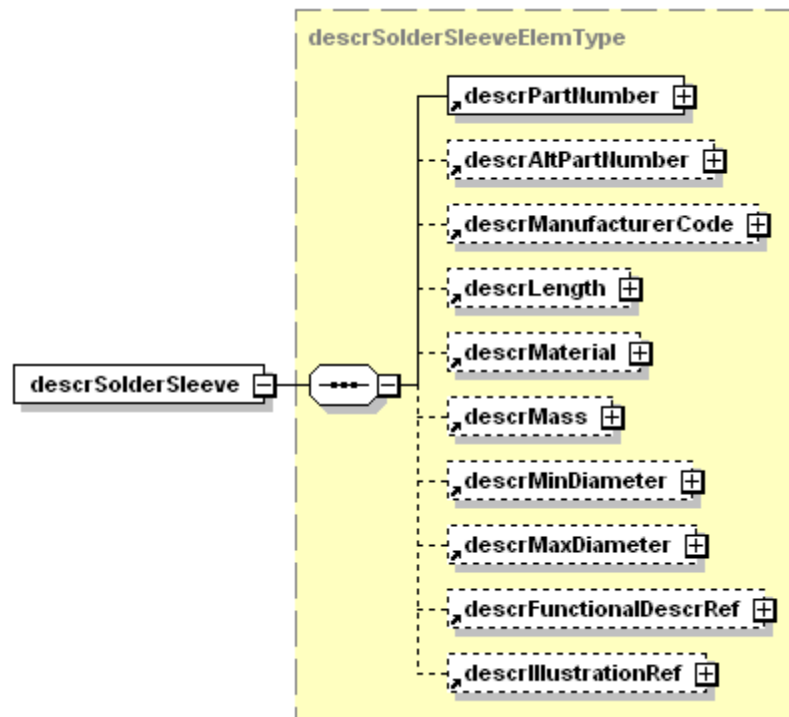

The following markup example shows the definition of the element `<orientation>` of accessory data. No references are applicable.

```
<descrOrientation>
<fieldName>Cable clamp orientation</fieldName>
<descr>Cable clamp orientation provides information of the
angular position of the cable clamp in degrees.</descr>
</descrOrientation>
```

#### 2.8.4 Solder sleeve data/field descriptions

**Description:** The element `<descrSolderSleeve>` contains all relevant elements to describe the solder sleeve data elements of the project.

**Markup element:** `<descrSolderSleeve>`

ICN-C0419-S1000D0221-001-01

Fig 11 Element `<descrSolderSleeve>`

**Attributes:**

- None

**Child elements:**

- `<descrPartNumber>`, the part number description. Refer to [Para 2.5.6](#).
- `<descrAltPartNumber>`, the alternative part number description. Refer to [Para 2.6.1](#).
- `<descrManufacturerCode>`, the manufacturer code description. Refer to [Para 2.6.2](#).
- `<descrLength>`, the length description. Refer to [Para 2.5.12](#).
- `<descrMaterial>`, the material information description. Refer to [Para 2.8.2.2](#).
- `<descrMass>`, the mass information description. Refer to [Para 2.8.1.1](#).
- `<descrMinDiameter>`, the minimum diameter description. Refer to [Para 2.8.4.1](#).
- `<descrMaxDiameter>`, the maximum diameter description. Refer to [Para 2.8.4.2](#).
- `<descrFunctionalDescrRef>`, the functional description reference description. Refer to [Para 2.5.32](#).
- `<descrIllustrationRef>`, the illustration reference description. Refer to [Para 2.5.33](#).

**Markup example:**

The following markup example shows the definition of the elements `<minDiameter>` and `<maxDiameter>` of solder sleeve data.

```
<descrMinDiameter>
<fieldName>Entry diameter 'd' min</fieldName>
<descr>The entry diameter 'd' min describes the minimum diameter
of the stripped wires in the center of the solder sleeve.
</descr>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="91"
subSystemCode="0" subSubSystemCode="0" assyCode="33"
disassyCode="08" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrMinDiameter>
<descrMaxDiameter>
<fieldName>Entry diameter 'D' max</fieldName>
<descr>The entry diameter 'D' max describes the maximum diameter
of the unstripped wires at the edge of the solder sleeve.
</descr>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="1B" systemDiffCode="B" systemCode="91"
subSystemCode="0" subSubSystemCode="0" assyCode="33"
disassyCode="08" disassyCodeVariant="A" infoCode="040"
infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</descrMaxDiameter>
```

```
</dmRefIdent>  
</dmRef>  
</refs>  
</descrMaxDiameter>
```

#### 2.8.4.1 Minimum diameter description

**Description:** The element `<descrMinDiameter>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the minimum diameter child element `<minDiameter>` of the sleeve diameter element `<sleeveDiameter>`.

**Markup element:** `<descrMinDiameter>`

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.4.2 Maximum diameter description

**Description:** The element `<descrMaxDiameter>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum diameter child element `<maxDiameter>` of the sleeve diameter element `<sleeveDiameter>`.

**Markup element:** `<descrMaxDiameter>`

**Attributes:**

- None

**Child elements:**

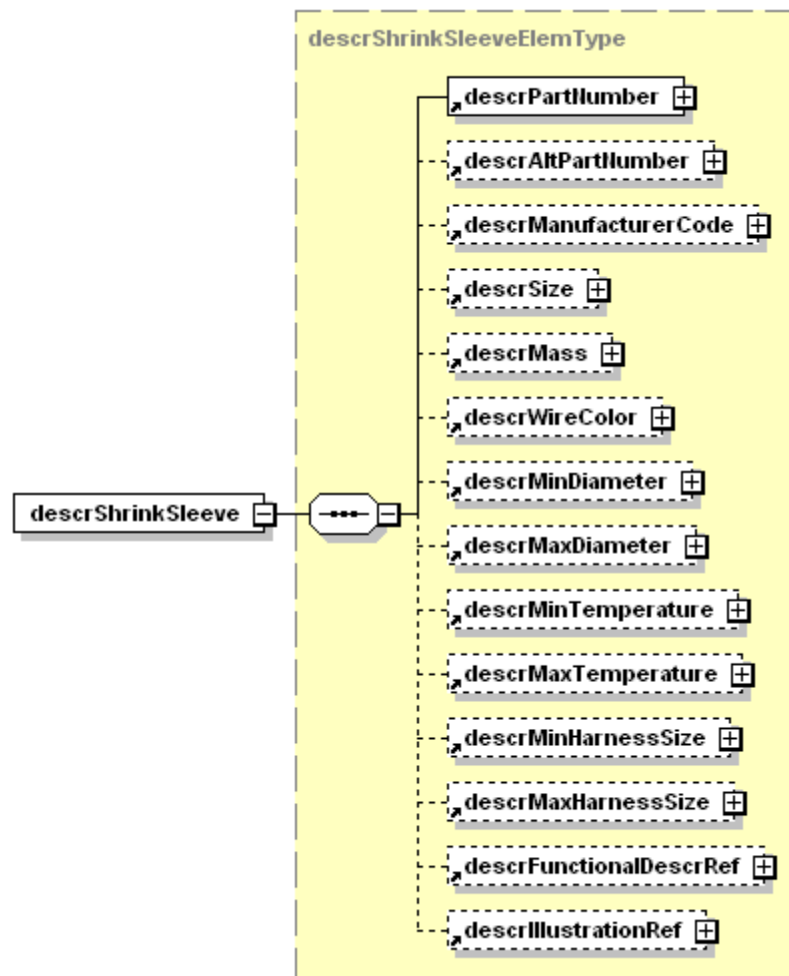

- Refer to [Para 2.4](#).

#### 2.8.5 Shrink sleeve data/field descriptions

**Description:** The element `<descrShrinkSleeve>` contains all relevant elements to describe the shrink sleeve data elements of the project.

**Markup element:** `<descrShrinkSleeve>`

ICN-C0419-S1000D0222-001-01

Fig 12 Element *<descrShrinkSleeve>*

#### Attributes:

- None

#### Child elements:

- *<descrPartNumber>*, the part number description. Refer to [Para 2.5.6](#).
- *<descrAltPartNumber>*, the alternative part number description. Refer to [Para 2.6.1](#).
- *<descrManufacturerCode>*, the manufacturer code description. Refer to [Para 2.6.2](#).
- *<descrSize>*, the size information description. Refer to [Para 2.8.5.1](#).
- *<descrMass>*, the mass information description. Refer to [Para 2.8.1.1](#).
- *<descrWireColor>*, the color information description. Refer to [Para 2.5.13](#).
- *<descrMinDiameter>*, the minimum diameter description. Refer to [Para 2.8.4.1](#).
- *<descrMaxDiameter>*, the minimum diameter description. Refer to [Para 2.8.4.2](#).
- *<descrMinTemperature>*, the minimum temperature description. Refer to [Para 2.6.6](#).
- *<descrMaxTemperature>*, the maximum temperature description. Refer to [Para 2.6.7](#).

- [<descrMinHarnessSize>](#), the minimum harness size description. Refer to [Para 2.8.5.2](#).
- [<descrMaxHarnessSize>](#), the maximum harness size description. Refer to [Para 2.8.5.3](#).
- [<descrFunctionalDescrRef>](#), the functional description reference description. Refer to [Para 2.5.32](#).
- [<descrIllustrationRef>](#), the illustration reference description. Refer to [Para 2.5.33](#).

**Markup example:**

The following example shows the definition of the elements [<minTemperature>](#) and [<maxTemperature>](#) of shrink sleeve data. No references are applicable.

```
<descrMinTemperature>
<fieldName>Minimum ambient temperature</fieldName>
<descr>The minimum ambient temperature indicates the minimum
temperature, where application of the shrink sleeve is
recommended.</descr>
</descrMinTemperature>
<descrMaxTemperature>
<fieldName>Maximum ambient temperature</fieldName>
<descr>The maximum ambient temperature indicates the maximum
temperature, where application of the shrink sleeve is
recommended.</descr>
</descrMaxTemperature>
```

#### 2.8.5.1 Size information description

**Description:** The element [<descrSize>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the size information element [<size>](#).

**Markup element:** [<descrSize>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

#### 2.8.5.2 Minimum harness size description

**Description:** The element [<descrMinHarnessSize>](#) contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the minimum harness size child element [<minHarnessSize>](#) of the harness size element [<harnessSize>](#).

**Markup element:** [<descrMinHarnessSize>](#)

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

### 2.8.5.3 Maximum harness size description

**Description:** The element `<descrMaxHarnessSize>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the maximum harness size child element `<maxHarnessSize>` of the harness size element `<harnessSize>`.

**Markup element:** `<descrMaxHarnessSize>`

**Attributes:**

- None

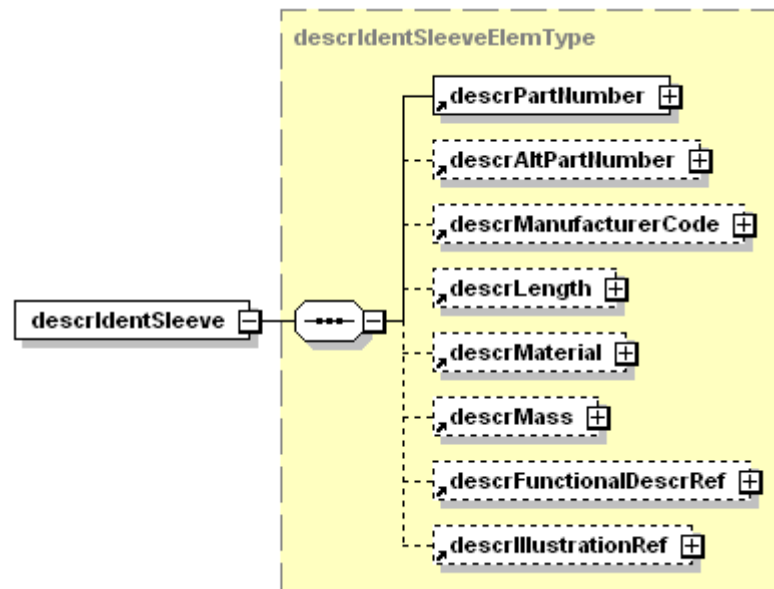

**Child elements:**

- Refer to [Para 2.4](#).

### 2.8.6 Identification sleeve data/field descriptions

**Description:** The element `<descrIdentSleeve>` contains all relevant elements to describe the identification sleeve data elements of the project.

**Markup element:** `<descrIdentSleeve>`

ICN-C0419-S1000D0223-001-01

Fig 13 Element `<descrIdentSleeve>`

**Attributes:**

- None

**Child elements:**

- `<descrPartNumber>`, the part number description. Refer to [Para 2.5.6](#).
- `<descrAltPartNumber>`, the alternative part number description. Refer to [Para 2.6.1](#).
- `<descrManufacturerCode>`, the manufacturer code description. Refer to [Para 2.6.2](#).
- `<descrLength>`, the length description. Refer to [Para 2.5.12](#).
- `<descrMaterial>`, the material information description. Refer to [Para 2.8.2.2](#).

- [<descrMass>](#), the mass information description. Refer to [Para 2.8.1.1](#).
- [<descrFunctionalDescrRef>](#), the functional description reference description. Refer to [Para 2.5.32](#).
- [<descrIllustrationRef>](#), the illustration reference description. Refer to [Para 2.5.33](#).

#### Markup example:

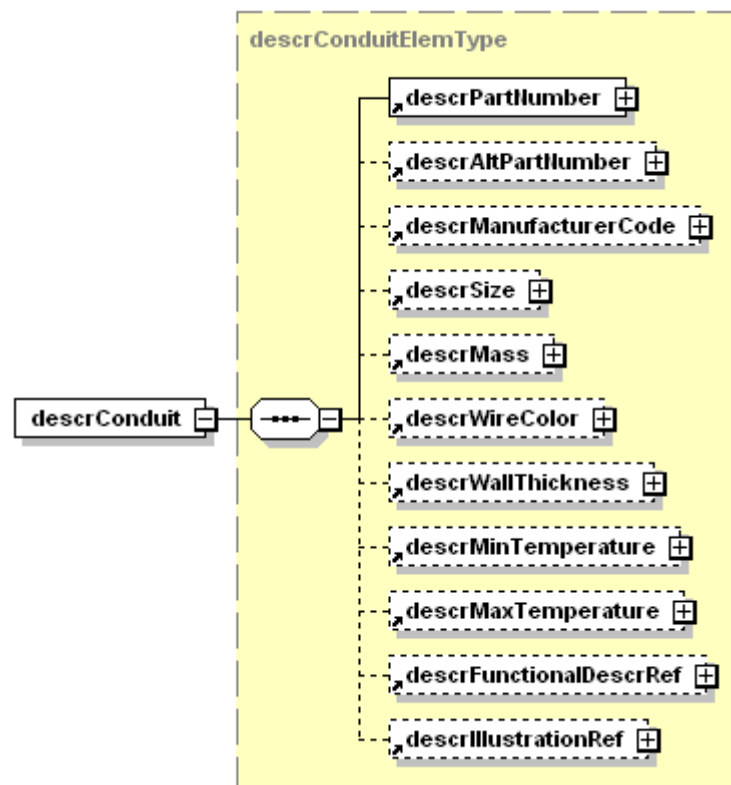

The following markup example shows the definition of the element [<length>](#) of identification sleeve data. No references are applicable.

```
<descrLength>
<fieldName>Sleeve length</fieldName>
<descr>Sleeve length provides information on the length of the
identification sleeve.</descr>
</descrLength>
```

### 2.8.7 Conduit data/field descriptions

**Description:** The element [<descrConduit>](#) contains all relevant elements to describe the conduit data elements of the project.

**Markup element:** [<descrConduit>](#)

ICN-C0419-S1000D0224-001-01

Fig 14 Element [<descrConduit>](#)

#### Attributes:

- None

#### Child elements:

- `<descrPartNumber>`, the part number description. Refer to [Para 2.5.6](#).
- `<descrAltPartNumber>`, the alternative part number description. Refer to [Para 2.6.1](#).
- `<descrManufacturerCode>`, the manufacturer code description. Refer to [Para 2.6.2](#).
- `<descrSize>`, the size information description. Refer to [Para 2.8.5.1](#).
- `<descrMass>`, the mass information description. Refer to [Para 2.8.1.1](#).
- `<descrWireColor>`, the color information description. Refer to [Para 2.5.13](#).
- `<descrWallThickness>`, the wall thickness description. Refer to [Para 2.8.7.1](#).
- `<descrMinTemperature>`, the minimum temperature description. Refer to [Para 2.6.6](#).
- `<descrMaxTemperature>`, the maximum temperature description. Refer to [Para 2.6.7](#).
- `<descrFunctionalDescrRef>`, the functional description reference description. Refer to [Para 2.5.32](#).
- `<descrIllustrationRef>`, the illustration reference description. Refer to [Para 2.5.33](#).

#### Markup example:

The following markup example shows the definition of the element `<wallThickness>` of conduit data. No references are applicable.

```
<descrWallThickness>
<fieldName>Wall thickness</fieldName>
<descr>Wall thickness provides the wall thickness information of
the conduit in millimeter.</descr>
</descrWallThickness>
```

#### 2.8.7.1 Wall thickness description

**Description:** The element `<descrWallThickness>` contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the wall thickness element `<wallThickness>`.

**Markup element:** `<descrWallThickness>`

#### Attributes:

- None

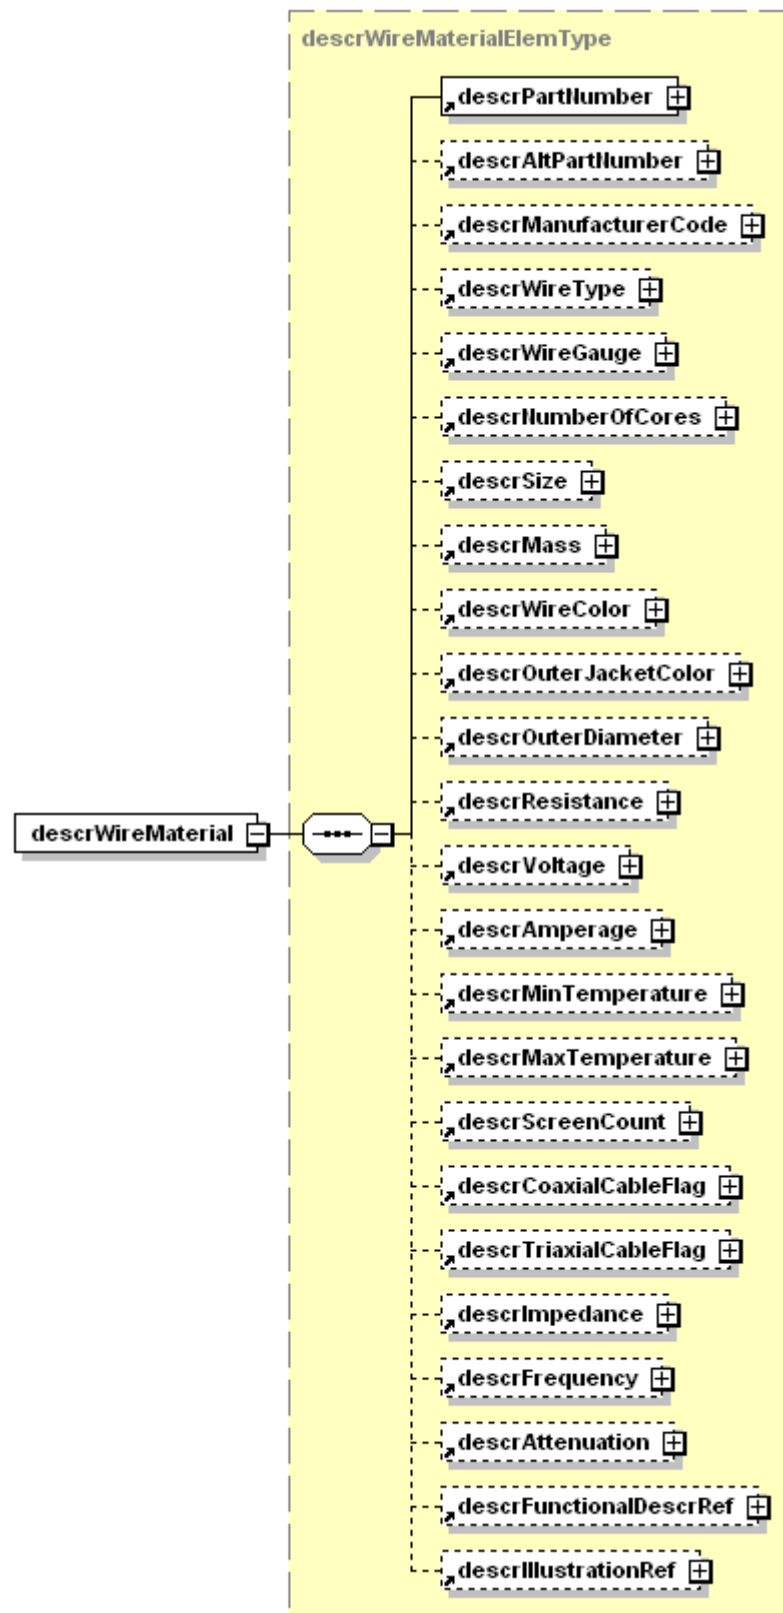

#### Child elements:

- Refer to [Para 2.4](#).

#### 2.8.8 Wire material data/field descriptions

**Description:** The element `<descrWireMaterial>` contains all relevant elements to describe the wire material data elements of the project.

**Markup element:** `<descrWireMaterial>`

ICN-C0419-S1000D0225-001-01

Fig 15 Element <descrWireMaterial>

**Attributes:**

- None

**Child elements:**

- <descrPartNumber>, the part number description. Refer to [Para 2.5.6](#).
- <descrAltPartNumber>, the alternative part number description. Refer to [Para 2.6.1](#).
- <descrManufacturerCode>, the manufacturer code description. Refer to [Para 2.6.2](#).
- <descrWireType>, the wire type description. Refer to [Para 2.5.4](#).
- <descrWireGauge>, the wire gauge description. Refer to [Para 2.5.5](#).
- <descrNumberOfCores>, the number of cores description. Refer to [Para 2.8.8.1](#).
- <descrSize>, the size information description. Refer to [Para 2.8.5.1](#).
- <descrMass>, the mass information description. Refer to [Para 2.8.1.1](#).
- <descrWireColor>, the color information description. Refer to [Para 2.5.13](#).
- <descrOuterJacketColor>, the outer jacket color description. Refer to [Para 2.8.8.2](#).
- <descrOuterDiameter>, the outer diameter description. Refer to [Para 2.8.8.3](#).
- <descrResistance>, the resistance information description. Refer to [Para 2.8.8.4](#).
- <descrVoltage>, the voltage information description. Refer to [Para 2.8.8.5](#).
- <descrAmperage>, the amperage information description. Refer to [Para 2.8.8.6](#).
- <descrMinTemperature>, the minimum temperature description. Refer to [Para 2.6.6](#).
- <descrMaxTemperature>, the maximum temperature description. Refer to [Para 2.6.7](#).
- <descrScreenCount>, the screen count description. Refer to [Para 2.8.8.7](#).
- <descrCoaxialCableFlag>, the coaxial information description. Refer to [Para 2.5.15](#).
- <descrTriaxialCableFlag>, tri-axial information description. Refer to [Para 2.5.16](#).
- <descrImpedance>, the impedance information description. Refer to [Para 2.8.8.8](#).
- <descrFrequency>, the frequency information description. Refer to [Para 2.8.8.9](#).
- <descrAttenuation>, the attenuation information description. Refer to [Para 2.8.8.10](#).
- <descrFunctionalDescrRef>, the functional description reference description. Refer to [Para 2.5.32](#).
- <descrIllustrationRef>, the illustration reference description. Refer to [Para 2.5.33](#).

**Markup example:**

The following markup example shows the definition of the element <wireColor> of wire material data. No references are applicable.

```
<descrWireColor>
<fieldName>Wire color</fieldName>
<descr>Wire color provides information on the color of the wire
sheathing. For multi-core cables, the colors of the single wire
sheathings are shown, separated by slashes (eg,
red/blue/yellow).</descr>
</descrWireColor>
```

- 2.8.8.1 Core description  
**Description:** The element <descrNumberOfCores> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the number of cores element <numberOfCores>.
- Markup element:** <descrNumberOfCores>
- Attributes:**
- None
- Child elements:**
- Refer to [Para 2.4.](#)
- 2.8.8.2 Outer jacket color description  
**Description:** The element <descrOuterJacketColor> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the outer jacket color element <outerJacketColor>.
- Markup element:** <descrOuterJacketColor>
- Attributes:**
- None
- Child elements:**
- Refer to [Para 2.4.](#)
- 2.8.8.3 Outer diameter description  
**Description:** The element <descrOuterDiameter> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the outer diameter element <outerDiameter>.
- Markup element:** <descrOuterDiameter>
- Attributes:**
- None
- Child elements:**
- Refer to [Para 2.4.](#)
- 2.8.8.4 Resistance information description  
**Description:** The element <descrResistance> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the resistance information element <resistance>.
- Markup element:** <descrResistance>
- Attributes:**
- None
- Child elements:**
- Refer to [Para 2.4.](#)

## 2.8.8.5 Voltage information description

**Description:** The element <descrVoltage> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the voltage information element <voltage>.

**Markup element:** <descrVoltage>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.8.8.6 Amperage information description

**Description:** The element <descrAmperage> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the amperage information element <amperage>.

**Markup element:** <descrAmperage>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.8.8.7 Screen count description

**Description:** The element <descrScreenCount> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the screen count element <screenCount>.

**Markup element:** <descrScreenCount>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.8.8.8 Impedance information description

**Description:** The element <descrImpedance> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the impedance information child element <impedance> of the frequency characteristics element <frequencyCharacteristics>.

**Markup element:** <descrImpedance>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

---

2.8.8.9 Frequency information description

**Description:** The element <descrFrequency> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the frequency information child element <frequency> of the frequency and attenuation element <frequencyAttenuation>.

**Markup element:** <descrFrequency>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

## 2.8.8.10 Attenuation information description

**Description:** The element <descrAttenuation> contains child elements, which provide a project or an organization specific name, a brief description and a reference to other data modules or publications for the attenuation information child element <attenuation> of the frequency and attenuation element <frequencyAttenuation>.

**Markup element:** <descrAttenuation>

**Attributes:**

- None

**Child elements:**

- Refer to [Para 2.4](#).

Chap No./Document No.	Title
<a href="#">Chap 7.6.1</a>	Software requirements - Process data module requirements

## 1 General

The process data module Schema is used to capture and represent process information. The process data module contains interactive processing structures to provide the capability to sequence other data modules or steps within it, based on static or dynamic state information.

The process data module can be of any type: procedural, fault, descriptive, etc. Its content can include preliminary requirements and requirements after job completion. The process data module is useful to achieve capabilities of the functionality matrix in categories of (refer to [Chap 6.4](#)):

- 1 diagnostics (particularly dynamic diagnostics, or system simulation)
- 2 external processes, where data is captured in the IETP and transmitted to the external process or vice versa
- 3 navigation and tracking in areas of filtering (only displaying data to the user that are applicable) and dialog-driven interaction

These concepts are explained in more detail in the following chapters:

- Process data module - Content. Refer to [Chap 3.9.5.2.10.1](#).
- Process data module - Dialogs. Refer to [Chap 3.9.5.2.10.2](#).
- Process data module - Expressions, variables and external applications. Refer to [Chap 3.9.5.2.10.3](#).
- Process data module - Logic engine. Refer to [Chap 3.9.5.2.10.4](#).
- Process data module - Example process data module. Refer to [Chap 3.9.5.2.10.5](#).

Sequencing, based on state information, together with management of dynamic and static state information are required capabilities to achieve intelligent, interactive data display. This functionality is fundamental to testing and troubleshooting sequences, where the next test is often based on the result of the current test (dynamic state information) or the input from the product interface (via the external application interface). The functionality also allows the presentation of information to the user to be customized to the product configuration or any system state.

Sequencing is accomplished by a software component called the logic engine. Refer to [Chap 3.9.5.2.10.4](#). This software component is only required for processing process data modules. Its function is basically to determine what to display next.

The process data module contains structures for traversing steps and data modules in a defined order and in if-then-else branches and loops. The process data module also filters steps and data modules based on the value of state variables as defined in [Chap 3.9.5.2.10.3](#) (eg, [*Model* equal "B" or *Test passed* equal TRUE]) which are stored in the state table.

### Note

In this chapter, variable names appear in *italics* and expressions in [brackets].

If the required variable values are not in the state table, the process data module gathers information from the user or other sources to populate the state table and then use that information to make branching and filtering decisions. When sequencing data modules, no change to the data module itself is required, and thus data modules can be reused in many sequences.

## 1.1 Interactive presentation functionality

The interactive presentation functionality is enabled thru structures provided in the process data module. The functionality is implemented in the logic engine, a software component that processes the interactive structures. Refer to [Chap 3.9.5.2.10.4](#). Detailed processing instructions are given in [Chap 7.6.1](#).

### 1.1.1 Screen-based information grouping

The process data module is designed for interactive electronic display. Information to be displayed simultaneously on the same screen is grouped on a node. Refer to [Chap 3.9.5.2.10.1](#). After viewing a screen of data, the user must provide an acknowledgement to move to the next node in the sequence.

### 1.1.2 State information

The power of the process data module is in its ability to capture, store, and act upon state information (the values of defined variables such as *Model*, *Serial Number*, *Power Source*, or *Continuity Exists*). State information is normally captured via user dialogs and stored in the state table. When the logic engine requires a variable value to determine what to display next, it searches the state table for this value.

### 1.1.3 Sequencing based on static/dynamic state information

The viewing system must support simple sequencing. This allows for the authoring of a maintenance stream such as:

- open door 1
- open circuit breaker B
- functional test B
- close circuit breaker B
- close door 1

where data items of the maintenance stream are data modules, steps, or a combination of both. The user will be automatically directed from one data item to another when the user acknowledges the completion of the instruction within the current data item.

There is also a need to sequence information in a non-linear stream based on system state. For instance, the user needs to see the information within data module A if continuity existed at a designated pin, but needs to see the information within data modules B and D if it did not. In another case, the user needs to loop thru a series of rigging steps until a certain gap is less than 1,5 cm.

### 1.1.4 Context filtering based on static/dynamic state information

Context filtering of data means that the user does not select information to view, but is only presented with information that applies to the current situation. This filtering is normally tied to the configuration or state of the product under maintenance.

There is also a need to handle cases where the filtering is not configuration related, for example:

- The data only applies when the unit is deployed in the field rather than being at a maintenance facility.
- The data only applies in a certain range of sensor reading values from the equipment.

Context filtering is achieved by attaching conditions to pieces of data that describe under what circumstances that data applies.

Hence, procedure A can have a condition attached to it making it applicable when the unit under maintenance is an "A" model with serial number greater than 155678. Procedure A will only be seen under those circumstances.

In the same manner, procedure B can be applicable when using battery power and procedure C can be applicable when using APU power. In this case, procedures B and C are authored as "alternatives" of one another. They can be grouped together and when accessed for maintenance, the appropriate one is used based on the type of power employed.

Most process data module elements have associated "Alts" elements allowing this grouping of data items that serve the same purpose but apply under different conditions. The "Alts" element is a powerful construct that, for example, allows an author to create one procedure that handles different configurations of the Product by employing alternative steps where the configuration differences drive unique data. This concept is discussed in [Chap 3.9.5.2.10.1](#) and [Chap 4.13.3](#).

### 1.1.5 State table management

In order to sequence and context filter data, the system must be capable of collecting and maintaining the system state. This is achieved thru the use of state variables and expressions that use these variables.

The system maintains a list of variables and their associated values. This list is called the state table. Any information that is required to make a filtering, branching, looping decision, or that is needed to pass to an external application must be defined as a variable and stored in the state table.

The system obtains values for variables thru user dialogs, external application interfaces, or authored variable assignments. The system uses these variable values to evaluate expressions. The result of an expression evaluation determines which data the user will see.

## 2 Process information

### 2.1 Schema basic rules

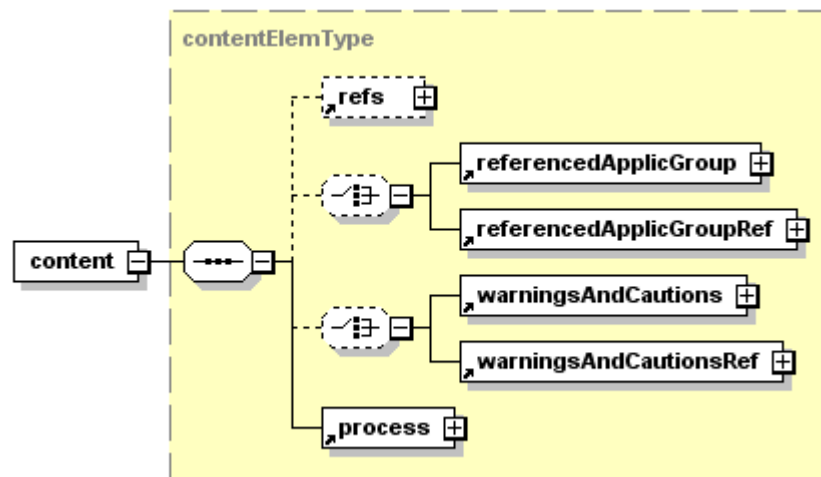

The process data module uses sequencing and filtering constructs to provide a seamless, logical flow of information to the user. This flow is implemented by the logic engine software component.

The user will move thru a sequence of data items based on how the process data module author intended. The user can be asked questions to facilitate if-then-else branching and applicability filtering. The author decides what the user sees, and what choices the user has. The user acknowledges the completion of the instruction within a data item, and the logic engine determines the next data item for viewing based on state information. Primary constructs of the process data module are described in the chapters referenced in [Para 1](#).

### 2.2 Content

**Description:** The element `<content>` contains the content section of the process data module.

**Markup element:** `<content>`

## 1 General

The process data module contains elements from the procedural data module such as warnings and cautions, procedural steps, preliminary requirements and requirements after job completion. Beyond that, the process data module contains interactive processing elements to provide the capability to sequence data modules or steps within it based on static or dynamic state information. The process data module can be of any type: procedural, fault, descriptive, etc. Its content can include preliminary requirements and requirements after job completion.

Sequencing, based on current state information, allows the process data module author to achieve intelligent, interactive data display. This functionality is fundamental to testing and troubleshooting sequences where the next test is often based on the result of the current test (dynamic state information) or input from the product interface (via the external application interface). It also allows the presentation of information to the user to be customized to the product configuration or any system state.

The process data module contains structures for traversing steps and data modules in a defined order and also in if-then-else branches and loops. The process data module also filters steps and data modules based on the value of state variables (eg, [*Model* equal "B" or *Test passed* equal TRUE]).

### Note

In this chapter, variable names appear in *italics* and expressions in [brackets].

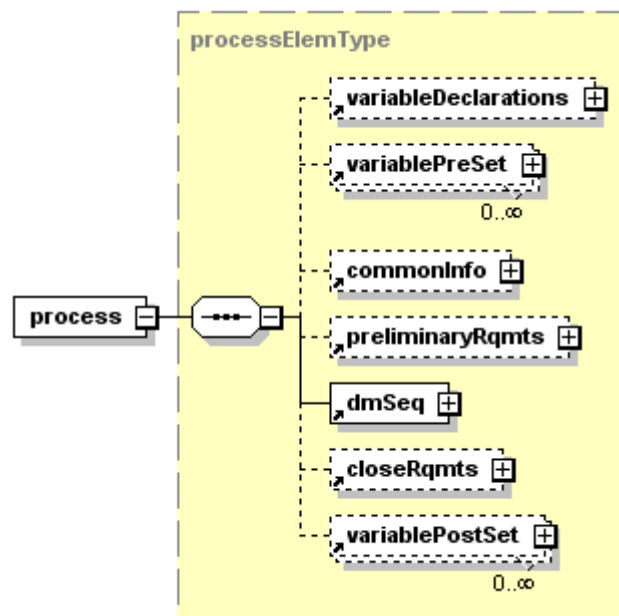

The process data module can gather information from the user or other sources to populate state information and then use that information to make branching and filtering decisions. When sequencing data modules, no change to the data module itself is required, and thus data modules can be reused in many sequences.

## 2

### Process

**Description:** The element `<process>` is the top level element which contains the process flow constructs.

**Markup element:** `<process>`

ICN-76301-S1000D0002-001-01

Fig 1 Element `<process>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<variableDeclarations>`. Refer to [Para 2.1](#).
- `<variablePreSet>`. Refer to [Para 2.3.1.10](#).
- `<commonInfo>`. Refer to [Chap 3.9.5.2.1.12](#).
- `<preliminaryRqmts>`. Refer to [Chap 3.9.5.2.1.9](#) and [Para 2.2](#).
- `<dmSeq>`. Refer to [Para 2.3](#).
- `<closeRqmts>`. Refer to [Chap 3.9.5.2.1.9](#) and [Para 2.2](#).
- `<variablePostSet>`. Refer to [Para 2.3.1.14](#).

## 2.1 Variable declarations (local)

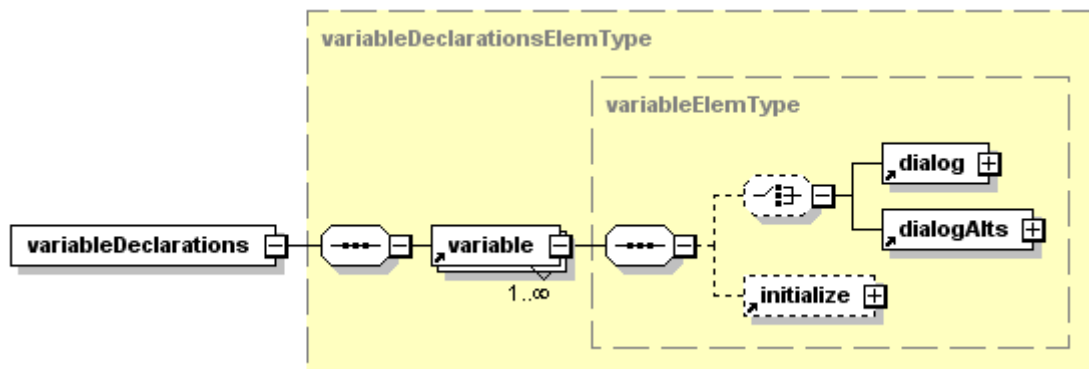

Local variables are declared in the process data module in which they are used by the element [<variableDeclarations>](#). These variables are available only in the data module in which they are declared.

### Note

Global variables, which are called global properties, are declared within the ACT and CCT data modules as product attributes and conditions. This enables the IETP software to use them both as global properties in the process data module and applicability properties IETP-wide. Once declared, these global properties are available for use in any process data module in the same way a local variable can be used. Refer to [Chap 3.9.5.2.10.3](#) for further discussion of local variables and global properties.

**Description:** Variable declarations define and can initialize one to many local variables that are used within the process data module.

**Markup element:** [<variableDeclarations>](#)

ICN-76301-S1000D0003-001-01

Fig 2 Element [<variableDeclarations>](#)

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Child elements:

- [<variable>](#). Refer to [Chap 3.9.5.2.10.3](#).

### Markup example:

```
<variableDeclarations>
<variable valueType="string" variableName="name"/>
<variable valueType="string" variableName="level">
<initialize>
<expression><stringValue>amateur</stringValue></expression>
</initialize>
</variable>
</variableDeclarations>
```

## 2.2 Preliminary requirements and requirements after job completion

**Description:** Preliminary requirements and requirements after job completion in the process data module are identical to those elements in a procedural data module with one difference. In the process data module, one to many optional elements [<variablePostSet>](#) (refer to [Para 2.3.1.14](#)) can be authored in conjunction with all child elements of element

<reqCondGroup> except element <noConds>. This feature allows the author to assert a variable value to the state table based on a required condition or requirement after job completion being satisfied. An example usage is to track doors opened or closed, power applied, etc. Refer to [Chap 3.9.5.2.1.9](#) for complete descriptions of elements <preliminaryRqmts> and <closeRqmts>. For viewer behavior, refer to [Chap 7.6.1.1](#).

**Markup element:** <reqCondNoRef>, like and similar to <reqCondDm>, <reqCondCircuitBreaker>, <reqCondPm> and <reqCondExternalPub>

ICN-76301-S1000D0004-001-01

Fig 3 Element <reqCondNoRef>

**Attributes:** Refer to [Chap 3.9.5.2.1.9](#).

**Child elements:**

- <reqCond>. Refer to [Chap 3.9.5.2.1.9](#).
- <variablePostSet>. Refer to [Para 2.3.1.14](#).

**Markup example:**

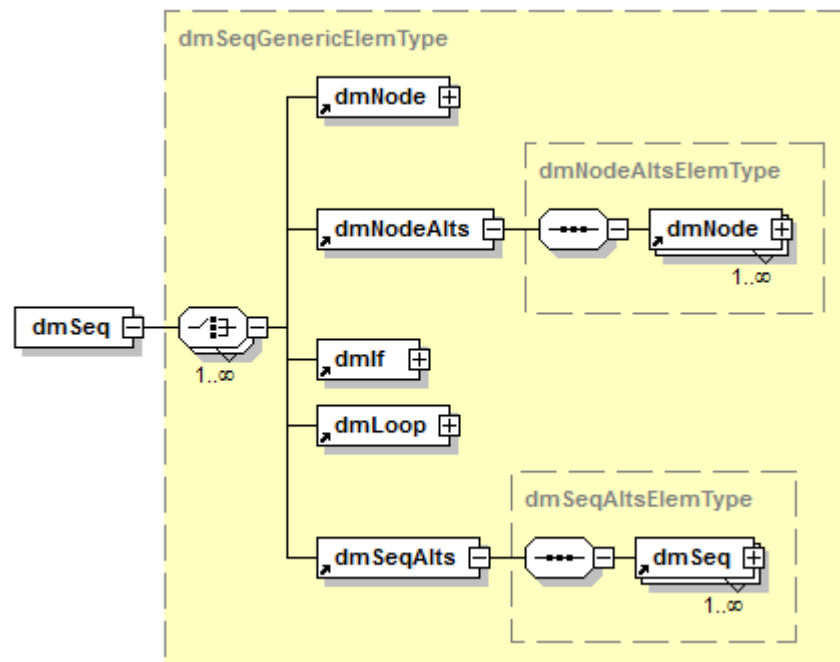

```
<reqCondNoRef>
<reqCond>Turn power off.</reqCond>
<variablePostSet>
<assertion>
<variableRef variableName="powerApplied"/>
<expression>
<booleanValue><falseValue/></booleanValue>
</expression>
</assertion>
</variablePostSet>
</reqCondNoRef>
```

## 2.3 Data module sequences

**Description:** A data module sequence determines the order of steps, dialogs, external application calls, data module references, and/or conditional actions within the data module.

**Markup element:** <dmSeq>

The element <dmSeq> contains a one to many choice sequence of elements defined below. The contents of the element <dmSeq> are processed in sequential order by the logic engine. The results of the processing determine whether or not the content of a particular element in the sequence is displayed or traversed. In the examples in [Chap 3.9.5.2.10.4](#) all occurrences of the element <dmNode> are subject to the process data module's expanded applicability processing (refer to [Para 2.3.1.9](#)) which can filter them out. In addition, the element <dmIf>, and/or the element <dmLoop> structures require processing to determine what is displayed.

ICN-SYU52-AASER00026-001-01

Fig 4 Element &lt;dmSeq&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- independentCheck (O). Refer to [Chap 3.9.5.1](#).
- skillLevelCode (O) Refer to [Chap 3.9.5.1](#).

#### Child elements:

- <dmNode>. Refer to [Para 2.3.1](#).
- <dmNodeAlts>. Refer to [Para 2.3.2](#).
- <dmIf>. Refer to [Para 2.3.3](#).
- <dmLoop>. Refer to [Para 2.3.4](#).
- <dmSeqAlts>. Refer to [Para 2.3.3.1.1](#).

#### Markup example:

```

<dmSeq>
<dmNode>
<proceduralStep>
<title>Introduction</title>
<para>Because you are an inexperienced user, you will be
presented a brief introduction on how to operate a
bicycle</para>
</proceduralStep>
</dmNode>
<dmNode>

```

```
<dmRef>
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="043" infoCodeVariant="A" itemLocationCode="A"
modelIdentCode="S1000DBIKE" subSubSystemCode="0"
subSystemCode="0" systemCode="D00" systemDiffCode="AAA"/>
</dmRefIdent>
</dmRef>
</dmNode>
</dmSeq>
```

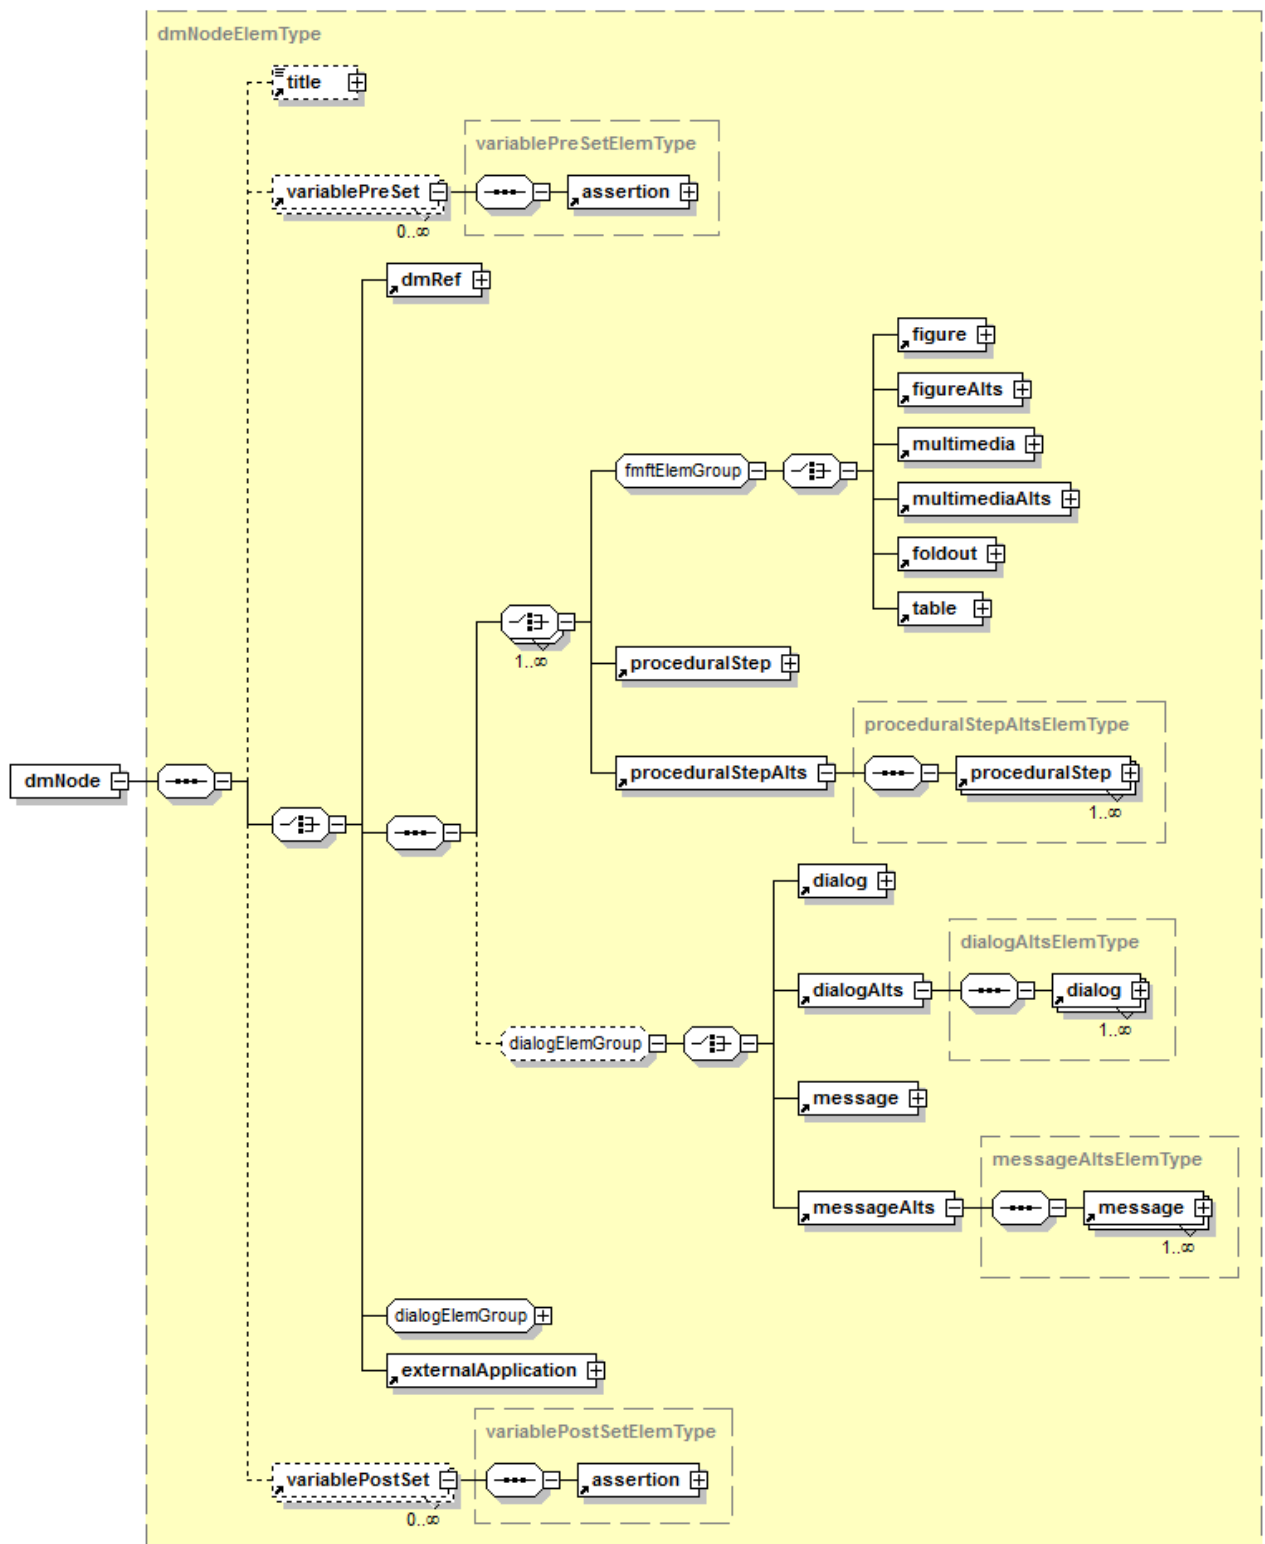

### 2.3.1 Data module node

**Description:** A data module node represents technical information that is to be displayed on one screen. This screen can be scrollable.

In a process data module, technical content is "wrapped" in the element `<dmNode>` structure allowing applicability (refer to [Para 2.3.1.9](#)) and variable settings, using element `<variablePreSet>` (refer to [Para 2.3.1.10](#)) and `<variablePostSet>` (refer to [Para 2.3.1.14](#)), to be applied to the content. The element `<title>` provides a descriptive heading, which applies to the whole node.

It is important to remember that the element `<dmNode>` represents one screen of data, and if a dialog or message appears on the screen, it must appear after a procedural step or by itself. Reasons for this are (1) dialogs can alter the state information possibly changing the applicability of something after the dialog on the screen, and (2) dialogs have navigation choices which would allow the user to exit the screen before reading everything on it.

**Markup element:** `<dmNode>`

ICN-SYU52-AASER00025-001-011

Fig 5 Element <dmNode>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <variablePreSet>. Refer to [Para 2.3.1.10](#).
- <dmRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <proceduralStep>. Refer to [Para 2.3.1.2](#).
- <proceduralStepAlts>. Refer to [Para 2.3.1.3](#).
- <dialog>. Refer to [Chap 3.9.5.2.10.2](#).
- <dialogAlts>. Refer to [Para 2.3.1.6](#).
- <message>. Refer to [Para 2.3.1.7](#).
- <messageAlts>. Refer to [Para 2.3.1.8](#).
- <externalApplication>. Refer to [Chap 3.9.5.2.10.3](#).
- <variablePostSet>. Refer to [Para 2.3.1.14](#).

#### Markup example:

A simple example showing the use of a title on the element <dmNode>:

```
<dmNode>
<title>Prerequisites</title>
<proceduralStep>
<para>Please make sure you are familiar with the functional
description of a bicycle.</para>
</proceduralStep>
</dmNode>
```

A more comprehensive example indicating the use of variable pre-settings within the element <dmNode> structure:

```
<dmNode>
<title>Specification Table from Technical data</title>
<variablePreSet id="A12345">
...</variablePreSet>
<dmRef referredFragment="tab-001">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
```

```

systemCode="DA2" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="030" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="002" inWork="00"/>
</dmRefIdent>
<dmRefAddressItems>
<dmTitle>
<techName>Handlebar</techName>
<infoName>Technical data</infoName>
</dmTitle>
</dmRefAddressItems>
</dmRef>
</dmNode>

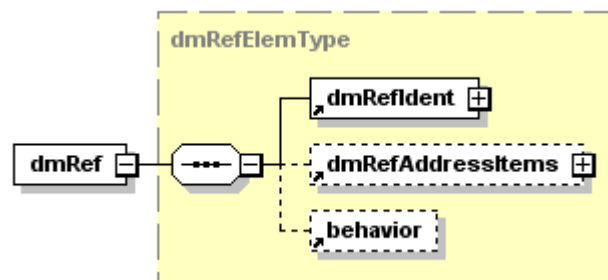

```

### 2.3.1.1

#### Data module reference behavior

**Description:** References are implemented in accordance with [Chap 3.9.5.2.1.2](#). When an element `<dmNode>` contains an element `<dmRef>`, the data module referenced is displayed depending on the values of the attributes `linkActuate` and `linkShow` of the child element `<behavior>` of element `<dmRef>`.

**Markup element:** `<behavior>`

ICN-76301-S1000D0007-001-01

Fig 6 Element `<behavior>`

#### Attributes:

- `linkShow` (O). The attribute `linkShow` can have one of the following values:
  - `"newPane"` - will open another window for the referenced data allowing the user to view the reference alongside the current data.
  - `"embedInContext"` - will display the linked data inline at the point where the data module reference occurred. This is useful when there are data that can be used verbatim in several data modules and maintained in a separate data module to itself.
  - `"replaceAndReturnToSource"` - will replace the current screen of data with the referenced data and then return the user to the origin of the data module reference when Next to continue is pressed. This is normal reference handling where the user views the reference and then returns to the original procedure.
  - `"replaceAndNoReturn"` - will replace the current screen of data with the referenced data and not provide a Next option. `"replaceAndNoReturn"` conceptually breaks the connection with the referencing data. It is useful in a troubleshooting situation when the fault has been isolated, the user is referenced to a remedy, and there is no reason for the user to return to the troubleshooting procedure.
- `linkActuate` (O). The attribute `linkActuate` can have one of the following values:

- "onLoad" - the referenced data to be automatically displayed with no action by the user
- "onRequest" - requires the user to click or otherwise indicate to view the referenced data at this time

#### Child elements:

- None

#### Markup example:

```
<dmRef>
<dmRefIdent>
<dmCode assyCode="0000" disassyCode="00"
disassyCodeVariant="000" infoCode="000" infoCodeVariant="0"
itemLocationCode="A" modelIdentCode="AA" subSubSystemCode="0"
subSystemCode="0" systemCode="01" systemDiffCode="AAA" />
</dmRefIdent>
<behavior linkShow="replaceAndReturnToSource"
linkActuate="onRequest" />
</dmRef>
```

#### 2.3.1.2 Procedural step

**Description:** The element [<proceduralStep>](#) is implemented as in the procedural data module in accordance with [Chap 3.9.5.2.3](#). An addition to the step model in the process data module is the ability to include the element [<variableRef>](#) or the element [<globalPropertyRef>](#) within the element [<para>](#). The use of these elements will include the local variable or global property value from the process data module state table in the paragraph text. Uses of this capability might be to display to the end user a test result received from an external application or the result of a calculation performed by the logic engine needed to perform a task.

The element [<proceduralStep>](#) also provides for subordinate steps, by nesting the element [<proceduralStep>](#), and the element [<proceduralStepAlts>](#) described in [Para 2.3.1.3](#). The step structure allows for substeps creating a hierarchical structure. This structure would be evident on the screen in an IETP. If more than one step of the same level occurs in the content, it will be evident on screen that the steps are at the same level of hierarchy. When the element [<proceduralStep>](#) is the content of an element [<dmNode>](#), all child elements [<proceduralStep>](#) and their content will be displayed as one screen of information.

Within an element [<dmNode>](#), after the element [<proceduralStep>](#) content, one of the following options can be inserted:

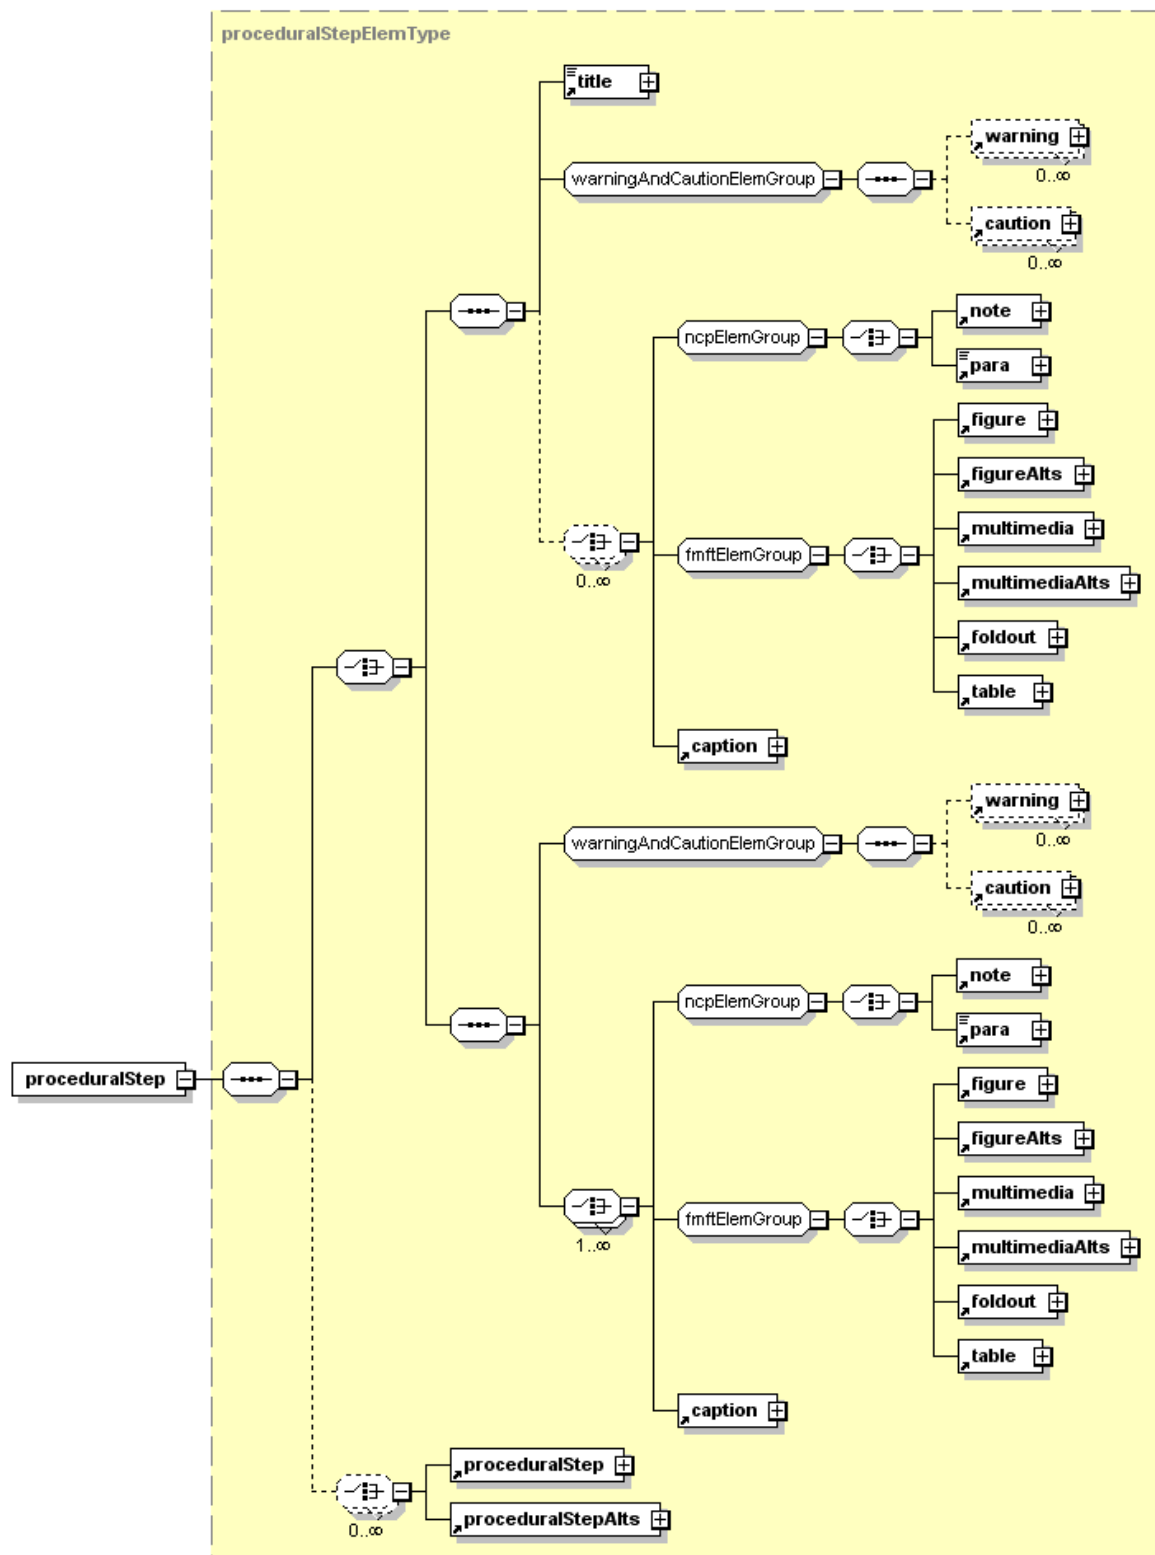

- the element [<dialog>](#)
- the element [<dialogAlts>](#)
- the element [<message>](#)
- element [<messageAlts>](#)

This allows an author to generate a screen of data with a user question or message at the end. It must be at the end of the screen content because the OK and Cancel buttons on a dialog are used for navigation to another screen. Expected viewer behavior is that Next and Previous functions on the screen will be disabled yielding to the OK and Cancel buttons on the dialog. OK will advance to the next screen. Cancel will move back to the previous screen. For dialog content, refer to [Chap 3.9.5.2.10.2](#). For viewer handling of a node with steps and a dialog, refer to [Chap 7.6.1.1](#).

**Note**

Authors must be careful using references with behavior "[replaceAndNoReturn](#)" on a node with step content and a dialog. Any user taking a "[replaceAndNoReturn](#)" link will never interact with the dialog following the step content.

**Markup element:** [<proceduralStep>](#)

ICN-76301-S1000D0008-001-01

Fig 7 Element `<proceduralStep>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `itemCharacteristic` (O), the characteristics of the item that is the subject of a given procedural step. The attribute `itemCharacteristic` can have one or more of the following values:
  - `"ic01"` thru `"ic99"`, refer to [Chap 3.9.6.1](#).
- `keepWithNext` (O), the step must be presented together with the next step, if possible. Refer to [Chap 3.9.5.2.3](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `independentCheck` (O). Refer to [Chap 3.9.5.2.3](#).
- `skillLevelCode` (O). Refer to [Chap 3.9.5.2.3](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<warning>`. Refer to [Chap 3.9.3](#).
- `<caution>`. Refer to [Chap 3.9.3](#).
- `<note>`. Refer to [Chap 3.9.3](#).

**Markup example:**

```
<dmNode>
<title>Practical part</title>
<proceduralStep>
<para>Take the bicycle from the garage.</para>
</proceduralStep>
<proceduralStep>
<para>Clean the dust from the bicycle.</para>
</proceduralStep>
<proceduralStep>
```

```
<para>Sit on the bike.</para>
</proceduralStep>
<proceduralStep>
<para>...and (RIDE)!</para>
</proceduralStep>
</dmNode>
```

### 2.3.1.3 Procedural step alternates group

**Description:** The element `<proceduralStepAlts>` provides the capability to group in one structure several potential steps of data for display. Only one or none will be displayed depending on the applicability assigned to the element `<proceduralStep>` within the element `<proceduralStepAlts>`. Refer to [Para 2.3.2](#) and [Chap 4.13.3](#) for more information about the alternates group concept.

**Markup element:** `<proceduralStepAlts>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altsName` (O), the name of the alternates group
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<proceduralStep>`. Refer to [Para 2.3.1.2](#).

#### Markup example:

```
<dmNode>
<proceduralStepAlts>
<proceduralStep applicRefId="applic1">
...
</proceduralStep>
<proceduralStep applicRefId="applic2">
...
</proceduralStep>
</proceduralStepAlts>
</dmNode>
```

### 2.3.1.4 External application

**Description:** The element `<externalApplication>` is a mechanism for launching an external application in the midst of a process data module. This application might be a wiring data viewer, a calculator, a diagnostic test, etc. Refer to [Chap 3.9.5.2.10.3](#) for expanded coverage of the element `<externalApplication>`.

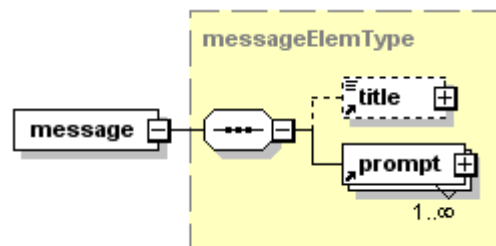

### 2.3.1.5 Dialog

**Description:** The element `<dialog>` allows the logic engine to interact with the user. It provides a means to obtain variable values from the user by asking a question. Refer to [Chap 3.9.5.2.10.2](#) for expanded coverage of the element `<dialog>`.

- 2.3.1.6 Dialog alternates group  
**Description:** The element `<dialogAlts>` groups configuration or situation unique dialogs for display to the user. Only one or none will be displayed depending on the applicability assigned to each element `<dialog>` within the element `<dialogAlts>`. Refer to [Chap 3.9.5.2.10.2](#) for expanded coverage of the element `<dialogAlts>`, and refer to [Chap 4.13.3](#) and [Para 2.3.2](#) for more information about the alternates group concept.

- 2.3.1.7 User message  
**Description:** The element `<message>` provides information from the IETP to the user or additional instructions or details about a dialog.

**Markup element:** `<message>`

ICN-76301-S1000D0028-001-01

Fig 8 Element `<message>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `submitCaption` (O), the caption used for the submit function push button. Refer to [Chap 3.9.6.1](#).
- `cancelCaption` (O), the caption used for the cancel function push button. Refer to [Chap 3.9.6.1](#).

**Child elements:**

- `<title>`, the dialog title bar text. Refer to [Chap 3.9.5.2.1.5](#).
- `<prompt>`. Refer to [Chap 3.9.5.2.10.2](#).

The element `<message>` can contain applicability, the element `<title>` and must contain one or more of the element `<prompt>` to be displayed to the user.

**Markup example:**

```
<message>
<prompt>
<paraBasic>Age must be within 4 to 100</paraBasic>
</prompt>
<prompt>
<paraBasic>All fields are mandatory</paraBasic>
</prompt>
</message>
```

## 2.3.1.8 Alternate message

**Description:** The element `<messageAlts>` contains alternative messages, one or none of which are applicable in a given situation and will be displayed to the user. Refer to [Chap 4.13.3](#) and [Para 2.3.2](#) for more information about the alternates group concept.

**Markup element:** `<messageAlts>`

ICN-76301-S1000D0029-001-01

Fig 9 Element `<messageAlts>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altName` (O), name for alt group.
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<message>`. Refer to [Para 2.3.1.7](#).

**Markup example:**

```
<messageAlts>
<message>
<prompt>
<paraBasic>Age out of range</paraBasic>
</prompt>
</message>
</messageAlts>
```

## 2.3.1.9 Applicability

The attribute `applicRefId` references an applicability structure which determines whether or not the element is displayed. Applicability is available on the child elements of the element `<dmNode>` such as the element `<dmRef>`, the element `<proceduralStep>`, the element `<dialog>`, the element `<menuChoice>` and others. The element `<applic>` and the attribute `applicRefId` are described in [Chap 3.9.5.3](#).

In the process data module, an expression can be authored as a part of the applicability structure. This is useful if filtering based on a variable that has not been declared as a global property, or if a more robust set of operators with which to filter (eg, mathematical operations) is needed.

How applicability is authored in a process data module largely depends on the logic engine employed in the viewer.

(1) If the goal is totally automated context filtering of the data, and the logic engine cannot automatically filter based on standard applicability, all of the filtering conditions, configuration ([*Model* equal "F4J"]) and other ([*Test Passed* equal TRUE]), must be authored in the element `<expression>`.

(2) If the goal is automated context filtering of the data, and the logic engine will do that using the standard S1000D applicability structure, the standard structure can be authored as in any other data module type. If an expression is authored also such as [*Test Passed* equal TRUE], it will be logically "anded" with the standard applicability structure.

**Business rule decision point BRDP-S1-00244 - Use of applicability for variables in process data modules:**

- Decide on the level of applicability filtering. This is established based on viewer capability and portability of the data.

#### 2.3.1.10 Variable preset

**Description:** A child of both the element `<process>` and the element `<dmNode>`, the element `<variablePreSet>` assigns a value to a local variable or global property before its parent element is traversed. The element `<variablePreSet>` contains the element `<assertion>`. An assertion contains the element `<variableRef>` or `<globalPropertyRef>` and the element `<expression>`. The element `<variableRef>` and the element `<globalPropertyRef>` have attributes which uniquely define a local variable or global property. The element `<variableRef>` has the attribute `variableName`. The element `<globalPropertyRef>` has attributes `applicPropertyIdent` and `applicPropertyType`. When an element `<variablePreSet>` is encountered in the data, the logic engine evaluates the expression and assigns the resulting value to the local variable or global property identified by the element `<variableRef>` or the element `<globalPropertyRef>`. One use case is that the element `<variablePreSet>` is used on an element `<dmNode>` with an external application call in order to assign values to one or more of the parameter variables to be passed to the application. On the element `<process>`, it can be necessary to preset to "noValue" the value of a global property representing wind speed prior to beginning a procedure because the wind speed can have changed since the value of that property was last accessed.

**Markup element:** `<variablePreSet>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<assertion>` assigns a value to a variable or global property. Refer to [Para 2.3.1.11](#).

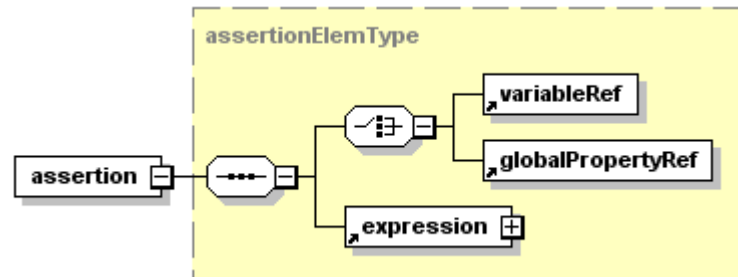

**Markup example:**

```
<variablePreSet>
<assertion>
<variableRef variableName="tourMistakes"/>
<expression>
<integerValue>0</integerValue>
</expression>
</assertion>
</variablePreSet>
```

### 2.3.1.11 Assertion

**Description:** The element `<assertion>` assigns a value to a local variable or global property.

**Markup element:** `<assertion>`

ICN-76301-S1000D0011-001-01

Fig 10 Element `<assertion>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- `<variableRef>`. Refer to [Para 2.3.1.12](#).
- `<globalPropertyRef>`. Refer to [Para 2.3.1.13](#).
- `<expression>`. Refer to [Chap 3.9.5.2.10.3](#).

When an assertion is evaluated, the resulting value of the expression is assigned to the local variable or global property referenced by the element `<variableRef>` or the element `<globalPropertyRef>`.

#### Markup example:

```
<assertion>
<variableRef variableName="level"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</assertion>
```

### 2.3.1.12 Variable reference

**Description:** The element `<variableRef>` points to a local variable.

**Markup element:** `<variableRef>`

#### Attributes:

- `variableName` (M), the name of the variable

#### Child elements:

- None

### 2.3.1.13 Global property reference

**Description:** The element `<globalPropertyRef>` points to a global property.

**Markup element:** `<globalPropertyRef>`

**Attributes:**

- `applicPropertyIdent` (M), the identifier of the global property
- `applicPropertyType` (M), the type (product attribute or condition) of the global property

**Child elements:**

- None

**Markup example:**

```
<globalPropertyRef applicPropertyIdent="I10"
applicPropertyType="condition"/>
```

#### 2.3.1.14 Variable postset

**Description:** The element `<variablePostSet>` mirrors the element `<variablePreSet>`. It contains an assertion and assigns a value to a variable after the element `<dmNode>` or the element `<process>` has been traversed. For example, a variable *postSet* could be used on a step to apply power to assert to the state table that power has been applied for future reference by the logic engine. Likewise, a variable *postSet* could be used on a process to record in the state table the fact that some component has been replaced which can be used downstream in the maintenance flow.

**Markup element:** `<variablePostSet>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<assertion>`. Refer to [Para 2.3.1.11](#).

**Markup example:**

```
<variablePostSet>
<assertion>
<variableRef variableName="powerApplied"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</variablePostSet>
```

#### 2.3.2 Data module node alternates group

**Description:** An alternative (or conditional) node is a group of objects, one or none of which will be applicable and thus displayed in a given situation.

The following discussion of the element `<dmNodeAlts>` applies to any other alternates group such as:

- the element `<dmSeqAlts>`
- the element `<proceduralStepAlts>`
- the element `<figureAlts>`
- the element `<multimediaAlts>`

- the element `<dialogAlts>`
- the element `<messageAlts>`

The alternates group concept is detailed in [Chap 4.13.3](#).

The element `<dmNodeAlts>` (a group of node alternatives) provides the ability to group occurrences of the element `<dmNode>` together which apply in different contextual situations. Only one node or none of the group will be displayed. For example, three versions of a "disconnect connector" step can exist in the element `<dmNodeAlts>` due to equipment configuration differences. For any configuration, only one version of the step applies. The logic engine will evaluate the applicability expression for all occurrences of the element `<dmNode>` within the element `<dmNodeAlts>`. Only the first node whose applicability expression evaluates to TRUE will be displayed. There need not be an occurrence of the element `<dmNode>` within the element `<dmNodeAlts>` that is applicable to every possible situation. In such cases, the logic engine simply moves on to the next element `<dmNode>`. Every node in an alternative node must have applicability. Applicability on the alternative elements is optional in the content section of the Schema with the exception of the element `<dmSeqAlts>` within the element `<dmIf>`. For alternative processing, however, applicability is required on the alternative elements.

Applicability on the nodes of an alternates group must be mutually exclusive. Although the Schema does not require the alternative element `<dmNode>` to have mutually exclusive applicability (or the attribute `applicRefId` at all), it is important to understand the danger of overlapping applicability on alternative nodes. At most one will pass thru the logic engine to be displayed to the user, and if more than one applies, the user will miss something. A node with no applicability always applies. There can be reasons to author overlapping applicability within an alternates group, but it is not recommended.

**Markup element:** `<dmNodeAlts>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altsName` (O), the name of alternates group
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<dmNode>`. Refer to [Para 2.3.1](#).

**Markup example:**

```
<dmNodeAlts>
<dmNode applicRefId="wrongAnswer">
<proceduralStep>
<title>Wrong answer!</title>
<para>You will be given the introduction once again.</para>
<para>Number of mistakes: <variableRef
variableName="tourMistakes"/></para>
</proceduralStep>
</dmNode>
```

```
<dmNode applicRefId="rightAnswer">
  <proceduralStep>
    <title>Correct!</title>
    <para>You can now continue with the practical part of this
    manual.</para>
  </proceduralStep>
</dmNode>
</dmNodeAlts>
```

### 2.3.3 Data module branch

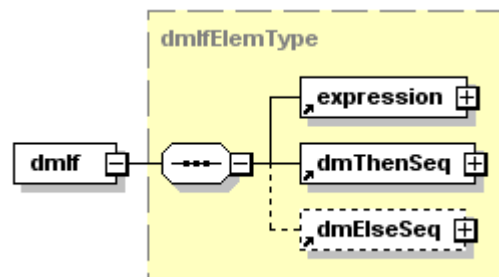

**Description:** A branch sends the user down separate data paths based on state information such as configuration information, or how the user has answered questions. Branches can be nested.

The element `<dmIf>` uses the same logic as the "if-then-else" statement in a programming language. An element `<dmIf>` contains an expression that the logic engine evaluates to determine whether the element `<dmThenSeq>` or the element `<dmElseSeq>` is to be traversed.

The element `<dmThenSeq>` defines the data module node, alternative sequence, branch, or loops to be traversed if the element `<dmIf>` expression evaluates to TRUE. Element `<dmThenSeq>` is required.

The element `<dmElseSeq>` defines a data module node, alternative sequence, branch, or loops to be traversed if the element `<dmIf>` expression evaluates to FALSE. The element `<dmElseSeq>` is optional.

**Markup element:** `<dmIf>`

ICN-76301-S1000D0014-001-01

Fig 11 Element `<dmIf>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<expression>`. Refer to [Chap 3.9.5.2.10.3](#).

- `<dmThenSeq>`. Refer to [Para 2.3.3.1](#).
- `<dmElseSeq>`. Refer to [Para 2.3.3.1](#).

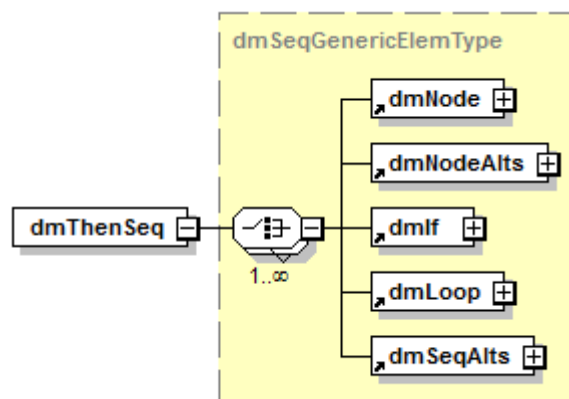

#### Markup example:

```
<dmIf>
<expression>
<expression>
<booleanFunction booleanAction="not"/>
<expression>
<variableRef variableName="level"/>
</expression>
</expression>
<booleanOperator booleanOperation="equal"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</expression>
<dmThenSeq>
<dmNode>
<dialog>
<message>
<prompt>
<paraBasic>Inexperienced users can not access this
data.</paraBasic>
</prompt>
</message>
</dialog>
</dmNode>
</dmThenSeq>
</dmIf>
```

#### 2.3.3.1 Data module branch result

**Description:** The element `<dmThenSeq>` and the element `<dmElseSeq>` are identical and contain data module nodes, alternative sequences, branches, or loops to be traversed depending on the evaluation of the element `<dmIf>` expression.

**Markup elements:** `<dmThenSeq>` and `<dmElseSeq>`

ICN-76301-S1000D0015-002-01

Fig 12 Element `<dmThenSeq>`

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- independentCheck (O). Refer to [Chap 3.9.5.1](#).
- skillLevelCode (O) Refer to [Chap 3.9.5.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <dmNode>. Refer to [Para 2.3.1](#).
- <dmNodeAlts>. Refer to [Para 2.3.2](#).
- <dmSeqAlts>. Refer to [Para 2.3.3.1.1](#).
- <dmIf>. Refer to [Para 2.3.3](#).
- <dmLoop>. Refer to [Para 2.3.4](#).

#### Markup example:

```

<dmThenSeq>
<dmNode>
<dialog>
<message>
<prompt>
<paraBasic>Inexperienced users can not access this
data.</paraBasic>
</prompt>
</message>
</dialog>
</dmNode>
</dmThenSeq>
<dmElseSeq>
<dmNode>
<dialog>
<message>
<prompt>
<paraBasic>Experienced users can access this data.</paraBasic>
</prompt>
</message>
</dialog>
</dmNode>
</dmElseSeq>

```

#### 2.3.3.1.1 Data module alternative sequence

**Description:** An alternative (or conditional) sequence is a group of sequence orders where one or none will be applicable and thus executed in a given situation. The element <dmSeqAlts> contains one or more order of data module sequences. Each child element <dmSeq> has an attribute applicRefId referring to a pre-defined element <applic>. Refer to [Para 2.3.2](#) and [Chap 4.13.3](#) for more information about the alternates group concept.

**Markup element:** `<dmSeqAlts>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altsName` (O), the name of the alternates group
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<dmSeq>`. Refer to [Para 2.3](#).

**Markup example:**

```
<dmSeqAlts>
<dmSeq applicRefId="applic001">
...
</dmSeq>
<dmSeq applicRefId="applic002">
...
</dmSeq>
</dmSeqAlts>
```

## 2.3.4

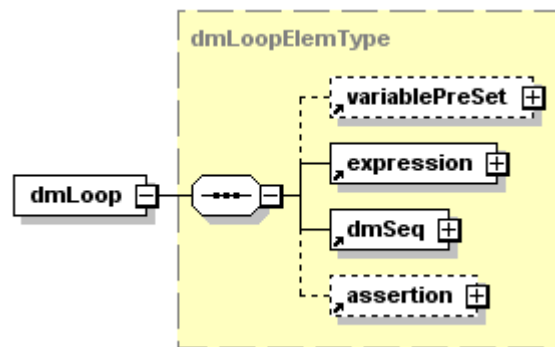

### Data module loops

**Description:** A loop repeats a sequence of information as long as the loop condition (based on the state information) is true.

The element `<dmLoop>` provides a capability similar to programming language loops. It provides the syntax for creating WHILE (eg, WHILE a gap measurement < 1,5) or FOR NEXT (eg, FOR NEXT 5 times) loops, whichever applies to the situation. The element `<dmLoop>` contains an expression that is the WHILE condition for the loop and the element `<dmSeq>` (the content of the loop). The user will traverse the data module sequence as long as the expression evaluates to TRUE. The author is responsible for providing a way to update the variable or global property used in the WHILE condition so that the “truth” of the condition can change and the user can exit the loop. Optionally a loop can contain a loop entrance assertion (described by the element `<variablePreSet>`) and a loop end assertion (described by the element `<assertion>`) enabling counters to be implemented. The loop entrance assertion is made when (and only when) the user first enters the loop (eg, [*Counter* = 0]). The loop end assertion (eg, [*Counter* = *Counter* + 1]) is made each time the user reaches the end of the loop sequence described by the element `<dmSeq>`. The loop condition might be [*Counter* <= 5].

**Markup element:** `<dmLoop>`

ICN-76301-S1000D0018-001-01

Fig 13 Element &lt;dmLoop&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <variablePreSet>. Refer to [Para 2.3.1.10](#).
- <expression>. Refer to [Chap 3.9.5.2.10.3](#).
- <dmSeq>. Refer to [Para 2.3](#).
- <assertion>. Refer to [Para 2.3.1.11](#).

#### Markup example:

```

<dmLoop>
<expression>
<expression>
<variableRef variableName="tourFinished"/>
</expression>
<numberOperator numberOperation="equal"/>
<expression>
<booleanValue><falseValue/></booleanValue>
</expression>
</expression>
<dmSeq>
<dmNode>
<proceduralStep>
<title>Introduction</title>

## 1 General

Dialogs in the process data module are discussed here. The process data module contains interactive processing structures to provide the capability to sequence other data modules or steps within it based on static or dynamic state information. State information can often be provided by the IETP user through use of a dialog. This is particularly true in the case of diagnostics and fault isolation where the user tests a function and then is able to report the results to the IETP by answering a dialog.

## 2 Collection of user information

The primary method of populating the state table for use in context filtering, branching, or looping is asking the user for information thru a dialog.

### 2.1 Definition

The element `<dialog>` enables the process data module to collect information from the user (eg, "Has component B been installed?", "Did continuity exist?") and assign values to global properties and local variables. Dialogs can be presented in four dialog types as a:

- menu, using the element `<menu>`
- "fill-in-the-blank", using the element `<userEntry>`
- push button, using the element `<pushButton>`
- message, using the element `<message>`

For examples of all four types, refer to [Para 2.4](#). The four dialog types can have multiple occurrences. Multiple dialog types can be grouped and arranged horizontally, using the element `<dialogGroup>`. When the user responds to a dialog and selects the navigation submit function, the logic engine updates the state table based on the response. Dialog elements can contain applicability and be contained in alternative elements to allow different dialogs to be displayed depending on the product configuration or other state variables. Dialog elements can contain enabling or disabling conditions for data entry fields dependent on the user input.

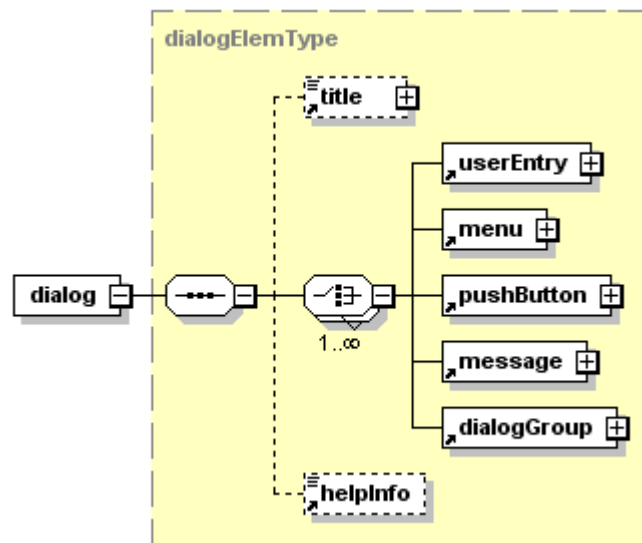

### 2.1.1 Dialog usage

A dialog is the method for a user to assign a value to a variable or global property. To facilitate this for local variables, a dialog can be associated with a variable in the markup. This association is not required, but it is recommended if a dialog is the primary source of the variable's value. Global properties (declared as product attributes or conditions) have the required elements for a viewer to construct a dialog if needed. Refer to [Chap 3.9.5.2.10.3](#). The logic engine will automatically construct a global property dialog or display a variable's associated dialog if it needs a value for expression evaluation and none exists in the state table. If there is no associated dialog and no value for a local variable in the state table, an error will be generated.

Authors must ensure that all variables and global properties have values (thru the element `<variablePreSet>` or the element `<variablePostSet>`) or means to obtain values (associated dialogs for local variables or required dialog elements for global properties) prior to their use in expressions. Dialogs can be explicitly authored in the element `<dmNode>`. This is useful if there is a variable/global property with no associated or constructable dialog and its value needs to be populated. Explicit dialogs can also be used to force a question to the user to update the value of a dynamic variable already in the state table. For example, if looping is based on a temperature that will change as the user progresses thru the loop sequence (loop WHILE condition: *Temperature* greaterThan 5000)), there is a need to query for the updated temperature at the end of the loop sequence with an explicit dialog and update the value so that the user can eventually exit the loop. The logic engine will not automatically display a dialog to obtain the value of a variable or global property when evaluating the loop WHILE condition if there is already a value in the state table.

## 2.2 Dialog

Markup element: `<dialog>`

ICN-76301-S1000D0019-001-01

Fig 1 Element &lt;dialog&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- submitCaption (O), the caption used for the submit function push button. Refer to [Chap 3.9.6.1](#).
- cancelCaption (O), the caption used for the cancel function push button. Refer to [Chap 3.9.6.1](#).
- resetCaption (O), the caption used for the optional reset function push button. Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>, the dialog title bar text. Refer to [Chap 3.9.5.2.1.5](#).
- Select at least one of the following:
  - <userEntry>. Refer to [Para 2.2.1.4](#).
  - <menu>. Refer to [Para 2.2.1](#).
  - <pushButton>. Refer to [Para 2.2.1.5](#).
  - <message>, provides information from the IETP to the user or additional instructions or details about a parent dialog. Refer to [Chap 3.9.5.2.10.1](#).
  - <dialogGroup>. Refer to [Para 2.2.1.6](#).
- <helpInfo>, provides additional textual information relative to the dialog

#### Business rule decision point BRDP-S1-00246 - Use of dialogs to declare unassigned variables in process data modules:

- Decide whether to use a dialog to assign values to an unassigned variable.

## Business rule decision point BRDP-S1-00247 - Use of default values in a dialog in process data modules:

- Decide whether a variable default value will be displayed in a dialog.

### Markup example:

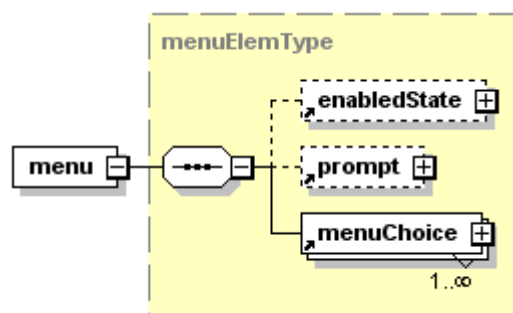

```
<dialog>
<userEntry>
<prompt>
<paraBasic>Enter your name</paraBasic>
</prompt>
<variableRef variableName="name" />
</userEntry>
</dialog>
```

## 2.2.1

### User menus

**Description:** Menus are the most popular way of getting information from a user. The process data module dialog menu has some powerful features.

**Markup element:** `<menu>`

ICN-76301-S1000D0020-001-01

Fig 2 Element `<menu>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `choiceSelection` (O), indicates whether single or multiple choices can be selected. The attribute `choiceSelection` can have one of the following values:
  - `"single"` (D) - only a single choice from the list must be selected, usually presented as a radio button
  - `"multiple"` - a single choice or several choices from the list can be selected, usually presented as a checkbox. At least one choice must be selected. All choices selected are processed.

If the multiple choices describe the same variable, the variable must have the attribute `valueType` `"set-string"`, `"set-real"` or `"set-integer"`. A set variable can be multi-valued where other types of variables can not. For example, an author can inquire of the end user "Which warning tones were heard?" and provide the choices: "Stall", "Engine fire", "APU Fire", "Unsafe landing". When the user selects one or more of these choices, the values would be added to the set-string variable *Warning tones*. Global

properties can not be set type variables. This is because product attributes and conditions can not be sets.

- choiceType (M), indicates how the menu choices are displayed. The attribute choiceType can have one of the following values:
  - "select" - the menu choices are displayed as selection (radio or checkbox)
  - "pulldown" - the menu choices are displayed as a scrollable list
- menuChoiceFlow (O), indicates the display direction of the menu choices. The attribute menuChoiceFlow can have one of the following values:
  - "list" (D) - the menu choices are listed vertically
  - "inline" - the menu choices are listed horizontally
- mandatory (O), indicates if a menu choice must be selected before dialog submittal. The attribute mandatory can have one of the following values:
  - "1" (D) - at least one menu choice must be selected
  - "0" - no menu choice must be selected

#### Child elements:

- <enabledState>, an expression which indicates if the menu is active or inactive. Refer to [Para 2.2.1.3](#).
- <prompt>, the question for the user. Refer to [Para 2.2.1.1](#).
- <menuChoice>. Refer to [Para 2.2.1.2](#).

#### Markup example:

```
<menu choiceSelection="single" choiceType="select">
<prompt>
<paraBasic>Did you ever ride a bicycle?</paraBasic>
</prompt>
<menuChoice>
<prompt>
<paraBasic>Yes</paraBasic>
</prompt>
<assertion>
<variableRef variableName="level"/>
<expression>
<stringValue>experienced</stringValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt>
<paraBasic>No</paraBasic>
</prompt>
<noAssertions/>
</menuChoice>
</menu>
```

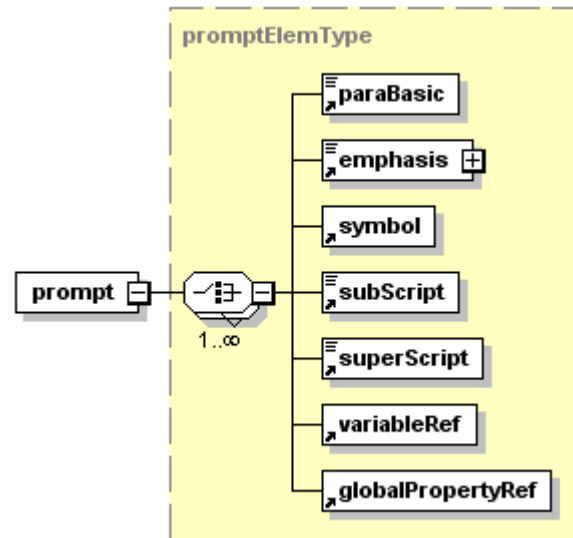

## 2.2.1.1

## User prompts

**Description:** The element `<prompt>` contains text that is the question or information for the user.

**Markup element:** `<prompt>`

ICN-76301-S1000D0021-001-01

Fig 3 Element `<prompt>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `textDisplayPosition` (O), the text display placement in relationship to the data entry or selection. If the attribute is not used, the IETP implies that the text is positioned above for a user menu question, left for a user entry question, and right for menu choice text. The attribute `textDisplayPosition` can have one of the following values:
  - `"top"` - the prompt is positioned above the data entry information
  - `"bottom"` - the prompt is positioned below the data entry information
  - `"right"` - the prompt is positioned right of the data entry information
  - `"left"` - the prompt is positioned left of the data entry information

**Child elements:**

- `<paraBasic>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<emphasis>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<variableRef>`, allows a variable value to be contained in the prompt text. Refer to the markup example in [Para 2.2](#).
- `<globalPropertyRef>`. Refer to [Chap 3.9.5.2.10.1](#).

**Markup example:**

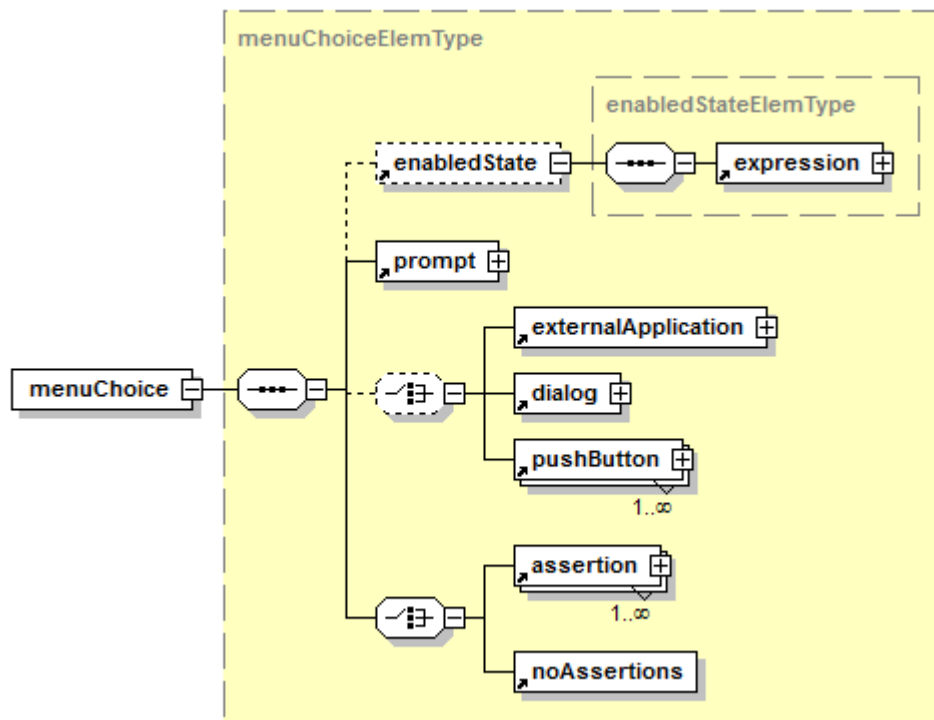

```
<prompt>
<paraBasic>Did you ever ride a bicycle?</paraBasic>
</prompt>
```

## 2.2.1.2

## User choices

**Description:** The element `<menuChoice>` represents one possible answer to the prompt question. The text of the answer is marked up by the element `<prompt>`.

**Markup element:** `<menuChoice>`

ICN-SYU52-AASER00028-001-01

Fig 4 Element `<menuChoice>`
**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `menuChoiceDefaultFlag` (O), indicates if this choice is to appear pre-selected in the dialog. The attribute `menuChoiceDefaultFlag` can have one of the following values:
  - "1" - the choice is pre-selected
  - "0" (D) - the choice is not pre-selected

**Child elements:**

- `<enabledState>`. Refer to [Para 2.2.1.3](#).
- `<prompt>`. Refer to [Para 2.2.1.1](#).
- `<externalApplication>`. Refer to [Chap 3.9.5.2.10.3](#).
- `<dialog>`. Refer to [Para 2.2](#).
- `<pushButton>`. Refer to [Para 2.2.1.5](#).
- `<assertion>`. Refer to [Chap 3.9.5.2.10.1](#).
- `<noAssertions>`, used when no state table variables are changed.

The element `<menuChoice>` must contain either one or more element `<assertion>` or an element `<noAssertions>`. If the user selects the choice and assertion(s) exist, the assertion(s) will be made to the state table after dialog submittal. If the element `<noAssertions>` exists, the state table is not updated. The purpose of a dialog is to assign the value of a state variable so that the logic engine can use that value in a later expression evaluation. Normally, the element `<menuChoice>` will have one assertion assigning a value to a state variable.

The element `<menuChoice>` can contain applicability to allow menu dialogs to be customized for different product configurations.

The element `<menuChoice>` can contain an enable/disable expression (element `<enabledState>`) indicating if the menu choice is active or inactive to allow menu dialogs to be customized.

The element `<menuChoice>` can contain an associated action as either an external application (element `<externalApplication>`) or a secondary dialog (element `<dialog>`). The associated action can be used to provide additional information (sound, image, execute diagnostic test, etc) to assist with the dialog selection. The action is executed by selecting the menu choice. The element `<menuChoice>` can contain a third choice - one to many push buttons (element `<pushButton>`). Push buttons can be used to execute dialogs and external applications as well. Regardless of how the action is executed, after the action is completed, control returns to the dialog.

The element `<menuChoice>` has the attribute `menuChoiceDefaultFlag`, which indicates if this choice is to appear pre-selected in the dialog.

#### Markup example:

```
<menu choiceSelection="multiple" choiceType="select">
  <menuChoice>
    <prompt>
      <paraBasic>Yes</paraBasic>
    </prompt>
    <assertion>
      <variableRef variableName="level"/>
      <expression>
        <stringValue>experienced</stringValue>
      </expression>
    </assertion>
  </menuChoice>
  <menuChoice>
    <prompt>
      <paraBasic>No</paraBasic>
    </prompt>
    <noAssertions/>
  </menuChoice>
</menu>
```

#### 2.2.1.3 User enabling/disabling entry

**Description:** The element `<enabledState>` contains an expression that evaluates state variables to determine if data entry field input is permitted or inhibited (usually the data entry is visible, but dimmed or grayed out).

The element `<enabledState>` is evaluated when data input is entered within the dialog and before the dialog is submitted. Typically, this is used when a user selects a menu choice that requires additional data entry information, while other menu choices do not require the additional data entry.

An example is a dialog containing both a menu and a user entry dialog. The menu has two choices: integer (assertion is `[datatype = "integer"]`) and real (assertion is `[datatype = "real"]`). The user entry dialog requests a real precision value (enable expression is `[datatype equal "real"]`). If the integer choice is selected from the menu, the user entry is disabled. If the real choice is selected, the user entry is enabled.

**Markup element:** `<enabledState>`

**Attributes:**

- None

**Child elements:**

- `<expression>`. Refer to [Chap 3.9.5.2.10.3](#).

**Markup example:**

```
<dialog submitCaption="ok01" cancelCaption="ca01">
  <dialogGroup>
    <title>Driving Condition</title>
    <menu choiceType="select" choiceSelection="single">
      <menuChoice>
        <prompt><paraBasic>Day</paraBasic></prompt>
        <assertion>
          <variableRef variableName="condition"/>
          <expression><stringValue>day</stringValue></expression>
        </assertion>
      </menuChoice>
      <menuChoice>
        <prompt><paraBasic>Night</paraBasic></prompt>
        <assertion>
          <variableRef variableName="condition"/>
          <expression><stringValue>night</stringValue></expression>
        </assertion>
      </menuChoice>
    </menu>
  </dialogGroup>
  <dialogGroup dialogSeparator="1">
    <title>Bike Checklist</title>
    <menu choiceType="select" choiceSelection="multiple">
      <menuChoice>
        <prompt><paraBasic>Wearing Helmet</paraBasic></prompt>
        <assertion>
          <variableRef variableName="helmet"/>
          <expression>
            <booleanValue><trueValue/></booleanValue>
          </expression>
        </assertion>
      </menuChoice>
      <menuChoice>
```

```

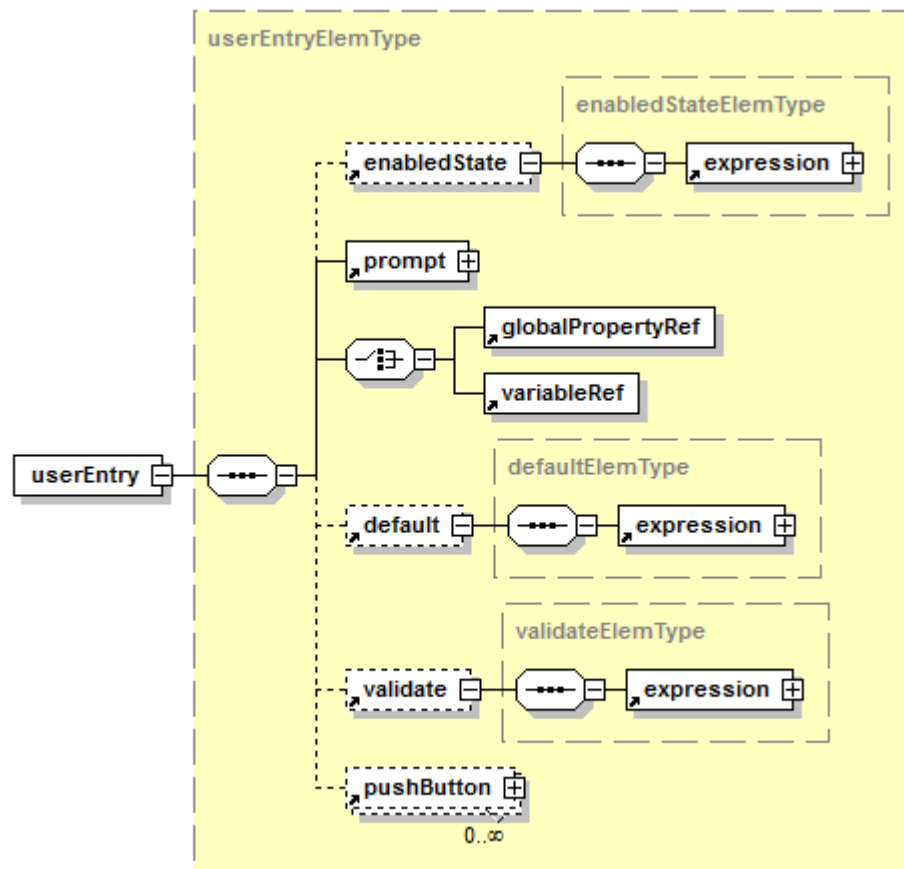

<enabledState>
<expression>
<expression><variableRef variableName="condition"/></expression>
<booleanOperator booleanOperation="equal"/>
<expression><stringValue>night</stringValue></expression>
</expression>
</enabledState>
<prompt><paraBasic>Headlight On</paraBasic></prompt>
<assertion>
<variableRef variableName="headlight"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt><paraBasic>Correct Air Pressure in
Tire</paraBasic></prompt>
<assertion>
<variableRef variableName="air pressure"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt><paraBasic>Mirror is Adjusted</paraBasic></prompt>
<assertion>
<variableRef variableName="mirror"/>
<expression>
<booleanValue><trueValue/></booleanValue>
</expression>
</assertion>
</menuChoice>
</menu>
</dialogGroup>
</dialog>

```

#### 2.2.1.4 User entry dialog

**Description:** A user entry dialog receives data input by the user.

Markup element: `<userEntry>`

ICN-SYU52-AASER00027-001-01

Fig 5 Element `<userEntry>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `mandatory` (O), indicates if an entry must be provided before dialog submittal. The attribute `mandatory` can have one of the following values:
  - "1" (D) - user must provide entry
  - "0" - no entry is required
- `dataEntryFieldLength` (O), the entry field length in number of characters

#### Child elements:

- `<enabledState>`. Refer to [Para 2.2.1.3](#).
- `<prompt>`. Refer to [Para 2.2.1.1](#).
- `<globalPropertyRef>`. Refer to [Chap 3.9.5.2.10.1](#).
- `<variableRef>`. Refer to [Chap 3.9.5.2.10.1](#).
- `<default>`. Refer to [Para 2.2.1.4.1](#).
- `<validate>`. Refer to [Para 2.2.1.4.2](#).
- `<pushButton>`. Refer to [Para 2.2.1.5](#).

The element `<userEntry>` contains the element `<prompt>` and the element `<variableRef>` to receive the value entered by the user.

The element `<userEntry>` can contain the element `<default>` containing a default value for the user entry.

The element `<userEntry>` can contain applicability to allow user entry dialogs to be customized for different product configurations.

The element `<userEntry>` can contain an enable/disable expression indicating if the user entry is active or inactive to allow the dialog to be customized.

The element `<userEntry>` can contain a data entry validation expression for both numerical and non-numerical data.

The attribute `dataEntryFieldLength` indicates the user entry field length in characters. When entered data is longer than the field, the data is scrolled to allow the additional information. The default length is 20.

#### Markup example:

```
<userEntry>
  <prompt>
    <paraBasic>Enter your name</paraBasic>
  </prompt>
  <variableRef variableName="name" />
</userEntry>
```

#### 2.2.1.4.1 Default user entry

**Description:** The user entry can have a default value that pre-populates the user entry field with the value.

**Markup element:** `<default>`

#### Attributes:

- None

#### Child elements:

- `<expression>`. Refer to [Chap 3.9.5.2.10.3](#).

The default value is assigned by using the optional element `<default>` that contains the element `<expression>`. The evaluated expression result is the default value used in the user entry field. The expression can contain:

- a fixed value (entered as a data type (integer, real, or string))
- a state variable reference (including the user entry state variable reference)
- an expression evaluated result from state variable references and/or fixed values (*Pressure + 20,0*).

#### Markup example:

```
<userEntry>
  <prompt>
    <paraBasic>Enter your name</paraBasic>
  </prompt>
  <variableRef variableName="name" />
  <default>
```

```
<expression><stringValue>Jane Doe</stringValue>
</expression>
</default>
</userEntry>
```

#### 2.2.1.4.2 Validate user entry

**Description:** The element `<validate>` is used for validating the user entry thru an expression evaluation (refer to [Chap 3.9.5.2.10.4](#)) of the input information.

The validation authenticates both numerical and non-numerical input.

- Validating numerical user entry inputs

The numerical validation expression determines if the input value is in a specified number range. The expression uses standard numerical comparison operators (ie, `equal`, `greaterThan`, `lessThanOrEqual`) and connects the numerical comparisons with a Boolean connector (ie, `or`, `and`, `exclusiveOr`).

An example is to validate that a pressure is entered in the range from 0 to 90 p.s.i. A state variable `Pressure` is used and the validation expression is given as `[[Pressure >= 0] and [Pressure <= 90]]`. A user entry that is `< 0` or `> 90` indicates an invalid value.

- Validating non-numerical (character string) user entry inputs

The non-numerical validation expression can use various expression operators to determine the user entry length, included or excluded within a `"set-string"`, or correct alpha or numerical text is entered in the correct sequence.

An example is to validate that five characters are entered for a CAGE code. A state variable `CAGEC` is used and the validation expression is given as `[sizeof (CAGEC) = 5]`. A user entry that is less or more than five characters indicates an invalid value.

#### Attributes:

- `errorMessage (O)`, the text displayed to the user if validation fails

#### Child elements:

- `<expression>`. Refer to [Chap 3.9.5.2.10.3](#).

#### Markup example:

```
<validate errorMessage="Age must be within 4 to 100">
  <expression>
    <expression>
      <expression>
        <variableRef variableName="age"/>
      </expression>
      <numberOperator numberOperation="greaterThanOrEqual"/>
      <expression>
        <integerValue>4</integerValue>
      </expression>
    </expression>
    <booleanOperator booleanOperation="and"/>
    <expression>
      <expression>
        <variableRef variableName="age"/>
      </expression>
    </expression>
  </expression>
</validate>
```

```

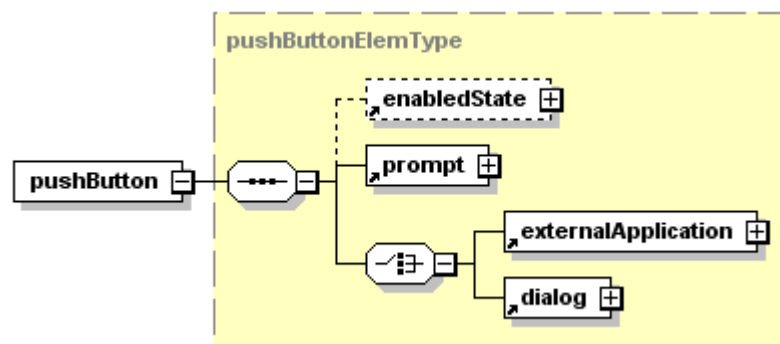

</expression>
<numberOperator numberOperation="lessThanOrEqual" />
<expression>
<integerValue>100</integerValue>
</expression>
</expression>
</expression>
</validate>

```

### 2.2.1.5 Push button

**Description:** The element [<pushButton>](#) provides a means to supply information for the data field entry(s) thru an external application (eg, diagnostic test, sound, and video) or a secondary dialog (eg, advanced features).

**Markup element:** [<pushButton>](#)

ICN-76301-S1000D0027-001-01

Fig 6 Element [<pushButton>](#)

#### Attributes:

- applicRefId (O), the applicability information by referencing the element [<applic>](#). Refer to [Chap 3.9.5.3](#).

#### Child elements:

- [<enabledState>](#). Refer to [Para 2.2.1.3](#).
- [<prompt>](#). Refer to [Para 2.2.1.1](#).
- [<externalApplication>](#). Refer to [Chap 3.9.5.2.10.3](#).
- [<dialog>](#). Refer to [Para 2.2](#).

The element [<pushButton>](#) must contain the element [<prompt>](#) and either the element [<externalApplication>](#) or the element [<dialog>](#). The element [<prompt>](#) provides the button caption.

The element [<pushButton>](#) can contain an enable/disable expression indicating whether the push button is active or inactive to allow the dialog to be customized.

#### Markup example:

```

<pushButton>
<prompt>
<paraBasic>View video</paraBasic>
</prompt>
<externalApplication application="videoApp">

```

```
<paraBasic>S1000D and Me</paraBasic>
</externalApplication>
</pushButton>
```

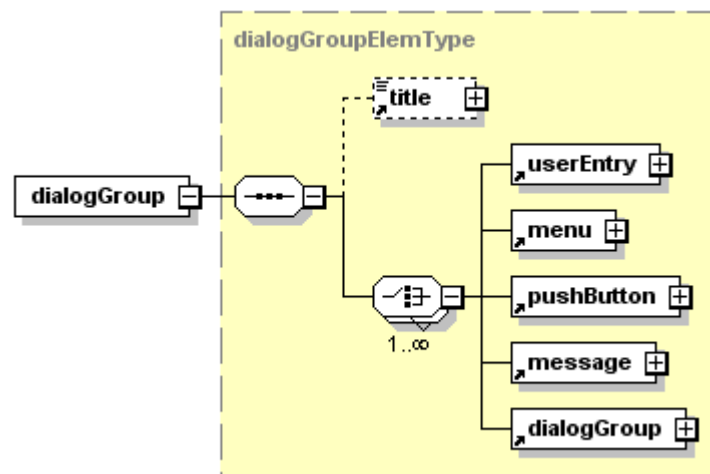

### 2.2.1.6 Dialog layout

**Description:** The element `<dialogGroup>` allows the positioning of multiple dialog elements within one dialog either vertically or horizontally.

When multiple dialog types (menu, user entry, push button, and message) are used in a single dialog, the author can describe simple formatting instructions to the IETP to provide a logical flow to the dialog. The following elements and attributes can affect dialog layout:

- The attribute `position` of element `<prompt>` specifies the prompt position as above, bottom, left or right of the dialog component.
- The attribute `menuChoiceFlow` of element `<menu>` describes the user menu choice direction as vertical or horizontal.
- The attribute `dataEntryFieldLength` of element `<userEntry>` describes the data entry field width in characters.
- When using multiple dialog types, the dialog types can be grouped to change the flow direction using the element `<dialogGroup>`. The element `<dialogGroup>` arranges the dialog types from vertical alignment to horizontal alignment. Nested dialog groups change the flow direction from either vertical alignment to horizontal alignment or horizontal alignment to vertical alignment. The elements within the element `<dialog>` normally have a vertical alignment (top to bottom), however, the dialog type elements within the element `<dialogGroup>` would change the alignment to horizontal (left to right) (refer to [Fig 8](#)). The element `<dialogGroup>` has the attribute `dialogSeparator` which indicates that the group dialog has a separator marking (ie, horizontal bar, boxed).

**Markup element:** `<dialogGroup>`

ICN-76301-S1000D0030-001-01

Fig 7 Element `<dialogGroup>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `dialogSeparator` (O), the dialog separator marking indication. The attribute `dialogSeparator` can have one of the following values:
  - "1" - separator marking

- "0" (D) - no separator marking

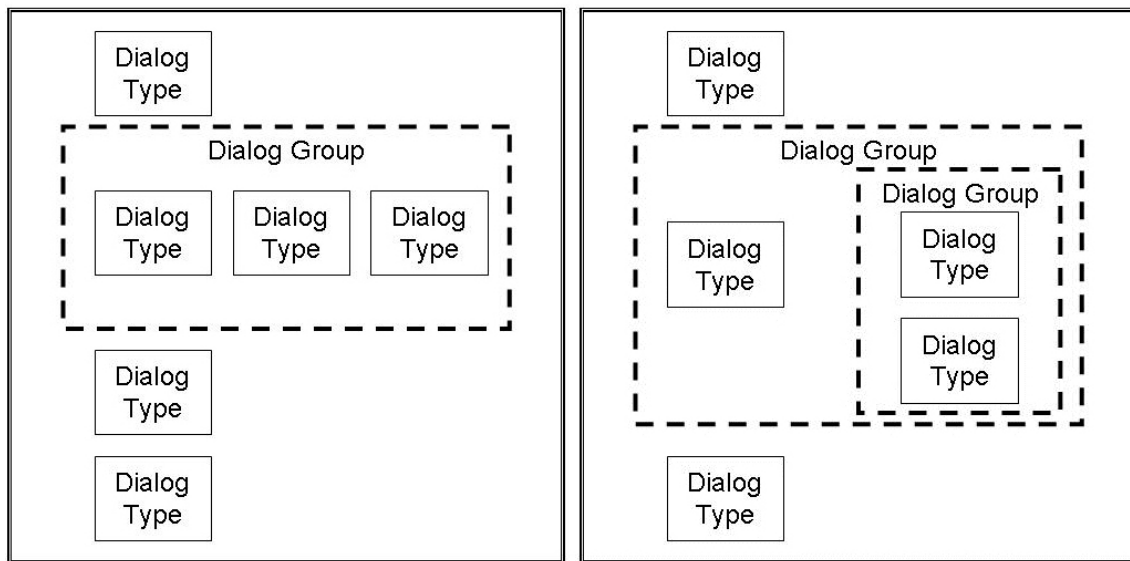

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- Same child elements as the element `<dialog>` without the element `<helpInfo>`. Refer to [Para 2.2](#).

#### Markup example:

```
<dialog>
<dialogGroup>
<userEntry>
<prompt><paraBasic>Enter your name</paraBasic></prompt>
<variableRef variableName="name"/>
</userEntry>
<menu choiceSelection="single" choiceType="select">
<prompt><paraBasic>Did you ever ride a
bicycle?</paraBasic></prompt>
<menuChoice>
<prompt><paraBasic>Yes</paraBasic></prompt>
<assertion>
<variableRef variableName="level"/>
<expression><stringValue>experienced</stringValue></expression>
</assertion>
</menuChoice>
<menuChoice>
<prompt><paraBasic>No</paraBasic></prompt>
<noAssertions/>
</menuChoice>
</menu>
</dialogGroup>
<dialogGroup dialogSeparator="1">
<message>
<prompt><paraBasic>You must be an experienced user to access
this data.</paraBasic></prompt>
</message>
</dialogGroup>
</dialog>
```

ICN-S1000D-A-030905-A-99994-00008-A-001-01

Fig 8 Single and nested dialog group alignment - Example

## 2.3 Dialog alternates

Markup element: `<dialogAlts>`

ICN-76301-S1000D0031-001-01

Fig 9 Element `<dialogAlts>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altName` (O), a name for the alternate group
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<dialog>`. Refer to [Para 2.2](#).

### Markup example:

Refer to the element `<proceduralStepAlts>` in [Chap 3.9.5.2.10.1](#) for like and similar markup.

```

<dialogAlts>
<dialog applicRefId="applic3">
<userEntry dataEntryFieldLength="3">
<prompt>
<paraBasic>Enter your age</paraBasic>
</prompt>
<variableRef variableName="age" /></userEntry>
</dialog>
<dialog applicRefId="applic4">
<userEntry dataEntryFieldLength="3">
<prompt>
<paraBasic>How old do you feel?</paraBasic>
</prompt>
<variableRef variableName="age" /></userEntry>
</dialog>
</dialogAlts>

```

## 2.4 Example dialogs

### 2.4.1 User menu with single selection markup

The example markup (refer to [Table 2](#)) and example IETP dialog (refer to [Fig 10](#)) is for a single selection menu dialog. In the example, the user is required to select one menu choice as determined by the value "single" of attribute choiceSelection and by the value "1" (true) of attribute mandatory on element <menu> (line 3 in the markup example below). The example menu has three menu choices. Each choice asserts the same state variable (*CheckCondition*), but assigns a different value (the first choice asserts "tire" (lines 7-12), the second choice asserts "brake" (lines 16-21), and the third choice asserts "light" (lines 36-41)).

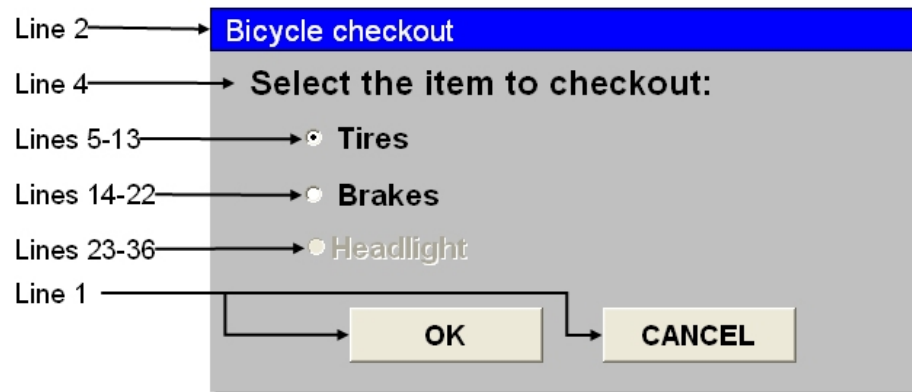

The first menu choice (lines 5-13) is pre-selected (defaulted) by the value "1" (true) of attribute menuChoiceDefaultFlag.

The third menu choice has the element <enabledState> (lines 24-34). The logic engine evaluates the expression and determines if the choice is active (evaluates to TRUE) or disabled (evaluates to FALSE) (the enable expression is [*Environment* equal "night"]). In this example the state variable *Environment* was previously asserted to "day". The third choice is disabled (grayed out) since the element <enabledState> for the menu choice evaluates to FALSE.

Table 2 User menu with single selection markup - Example

Line	Markup
1	<dialog submitCaption="ok01" cancelCaption="ca01">
2	<title>Bicycle checkout</title>
3	<menu choiceType="select" menuChoiceFlow="list" choiceSelection="single" mandatory="1">
4	<prompt><paraBasic>Select the item to checkout:</paraBasic></prompt>
5	<menuChoice menuChoiceDefaultFlag="1">
6	<prompt><paraBasic>Tires</paraBasic></prompt>
7	<assertion>
8	<variableRef variableName="CheckCondition" />

Line	Markup
9	<expression>
10	<stringValue>tire</stringValue>
11	</expression>
12	</assertion>
13	</menuChoice>
14	<menuChoice menuChoiceDefaultFlag="0">
15	<prompt><paraBasic>Brakes</paraBasic></prompt>
16	<assertion>
17	<variableRef variableName="CheckCondition"/>
18	<expression>
19	<stringValue>brake</stringValue>
20	</expression>
21	</assertion>
22	</menuChoice>
23	<menuChoice menuChoiceDefaultFlag="0">
24	<enabledState>
25	<expression>
26	<expression>
27	<variableRef variableName="Environment"/>
28	</expression>
29	<stringOperator stringOperation="equal"/>
30	<expression>
31	<stringValue>night</stringValue>
32	</expression>
33	</expression>
34	</enabledState>
35	<prompt><paraBasic>Headlight</paraBasic></prompt>
36	<assertion>
37	<variableRef variableName="CheckCondition"/>
38	<expression>
39	<stringValue>light</stringValue>
40	</expression>
41	</assertion>
42	</menuChoice>
43	</menu>
44	</dialog>
