The example markup (refer to [Table 3](#)) and example IETP dialog (refer to [Fig 11](#)) is for a menu dialog object using associated push buttons to launch an external application. In the example, each menu choice has prompted text (element `<prompt>`) (lines 6, 22 and 38 in the markup example below), a push button to launch an external application (element `<pushButton>`) (lines 7-13, 23-29, 39-45) and an assertion indicating the menu choice selected (element `<assertion>`) (lines 14-19, 30-35, 46-51). When a push button is selected, the external application is launched and executed. After the external application is completed and closed, control returns to the dialog.

Fig 11 Dialog user menu with push button session - Example

### 2.4.3 User menu with external application launched from menu choice

The example markup (refer to Table 4) and example IETP dialog (refer to Fig 12) is for a menu dialog object with associated external application that is launched when selected. In the example, each menu choice has prompted text (element `<prompt>`) (lines 6, 19, 33, in the markup example below), an external application (element `<externalApplication>`) (lines 7-10, 20-23, 34-37), and an assertion indicating the menu choice selected (element `<assertion>`) (lines 11-16, 24-29, 38-43). When a menu choice is selected, the external application is immediately launched and executed. After the external application is completed and closed, control returns to the dialog.

Table 4 User menu with external application markup - Example

Line	Markup
1	<code>&lt;dialog submitCaption="ok01" cancelCaption="ca01"&gt;</code>
2	<code>&lt;title&gt;Brake troubleshooting&lt;/title&gt;</code>

#### 2.4.4 User dialog entry example

The example markup (refer to [Table 5](#)) and example IETP dialog (refer to [Fig 13](#)) is for a user entry dialog object using an entry validation and an assigned default entry value. The example depicts a dialog with a prompt and user entry data field.

The element `<prompt>` appears left of the user entry (no attribute `textDisplayPosition` is defined, therefore the inferred user entry prompt position is "left") (line 4, in the markup example below).

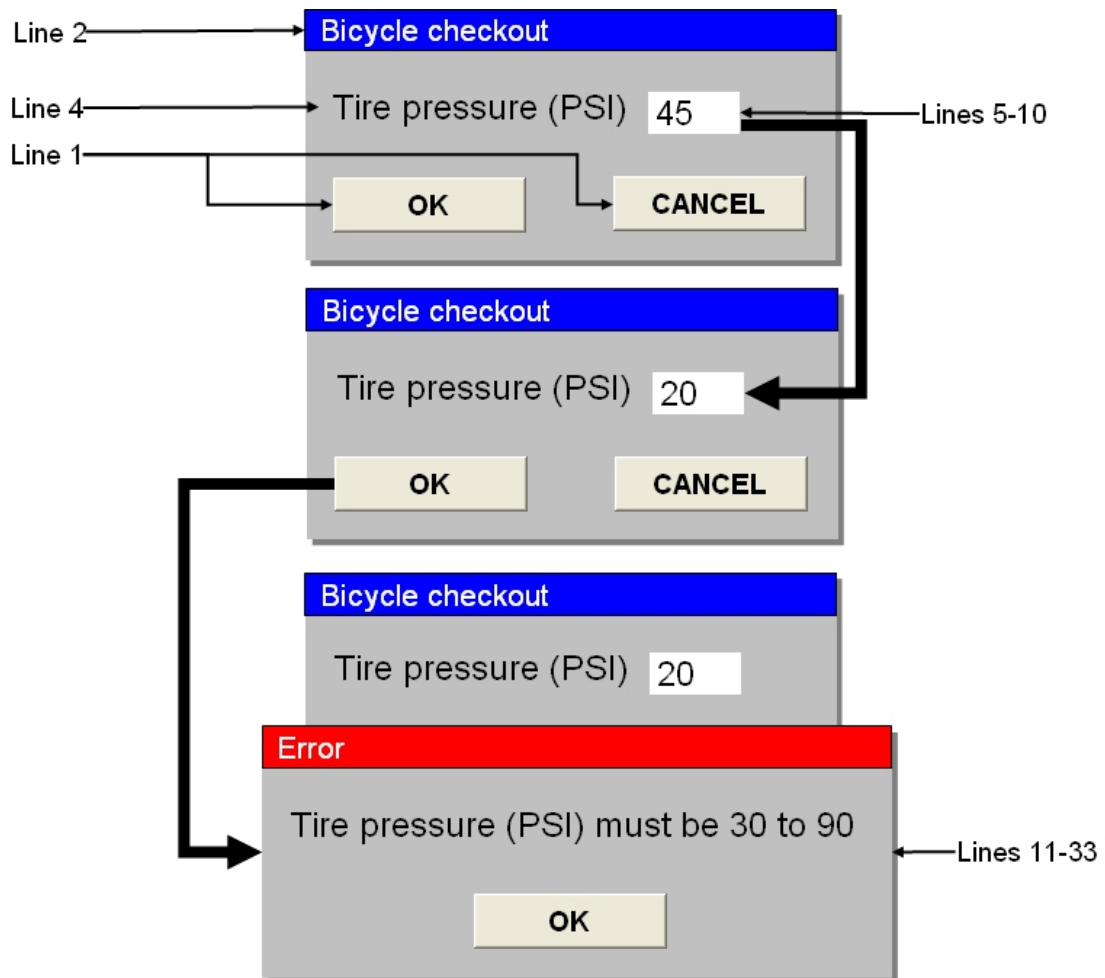

The user entry data will be asserted to the state variable named *Pressure* as defined by the attribute `variableName` (line 5) on element `<variableRef>`.

The default value is derived from the state variable *Pressure* (asserted prior to the integer value "45") and is assigned using the element `<default>` (lines 6-10) that evaluates the associated expression (the logic engine returns the stored value, "45", from the state table variable *Pressure*). The element `<validate>` defines that the allowable integer range is 30 thru 90 (lines 11-33). The attribute `errorMessage` on element `<validate>` contains an error message to be shown when the evaluated expression ( $30 \leq Pressure \leq 90$ ) is false.

Table 5 Push button markup - Example

Line	Markup
1	<code>&lt;dialog submitCaption="ok01" cancelCaption="ca01"&gt;</code>
2	<code>&lt;title&gt;Bicycle checkout&lt;/title&gt;</code>
3	<code>&lt;userEntry mandatory="1" dataEntryFieldLength="1"&gt;</code>
4	<code>&lt;prompt&gt;&lt;paraBasic&gt;Tire pressure (PSI)&lt;/paraBasic&gt;&lt;/prompt&gt;</code>

Line	Markup
5	<variableRef variableName="Pressure"/>
6	<default>
7	<expression>
8	<variableRef variableName="Pressure"/>
9	</expression>
10	</default>
11	<validate errorMessage="Tire pressure (PSI) must be 30 to 90">
12	<expression>
13	<expression>
14	<expression>
15	<integerValue>30</integerValue>
16	</expression>
17	<numberOperator numberOperation="lessThanOrEqual"/>

19	<variableRef variableName="Pressure"/>
20	</expression>
21	</expression>
22	<booleanOperator booleanOperation="and"/>
23	<expression>
24	<expression>
25	<variableRef variableName="Pressure"/>
26	</expression>
27	<numberOperator numberOperation="lessThanOrEqual"/>
28	<expression>
29	<integerValue>90</integerValue>
30	</expression>
31	</expression>
32	</expression>
33	</validate>
34	</userEntry>
35	</dialog>

ICN-S1000D-A-030905-A-99994-00005-A-001-01

Fig 13 Validate dialog entry session - Example

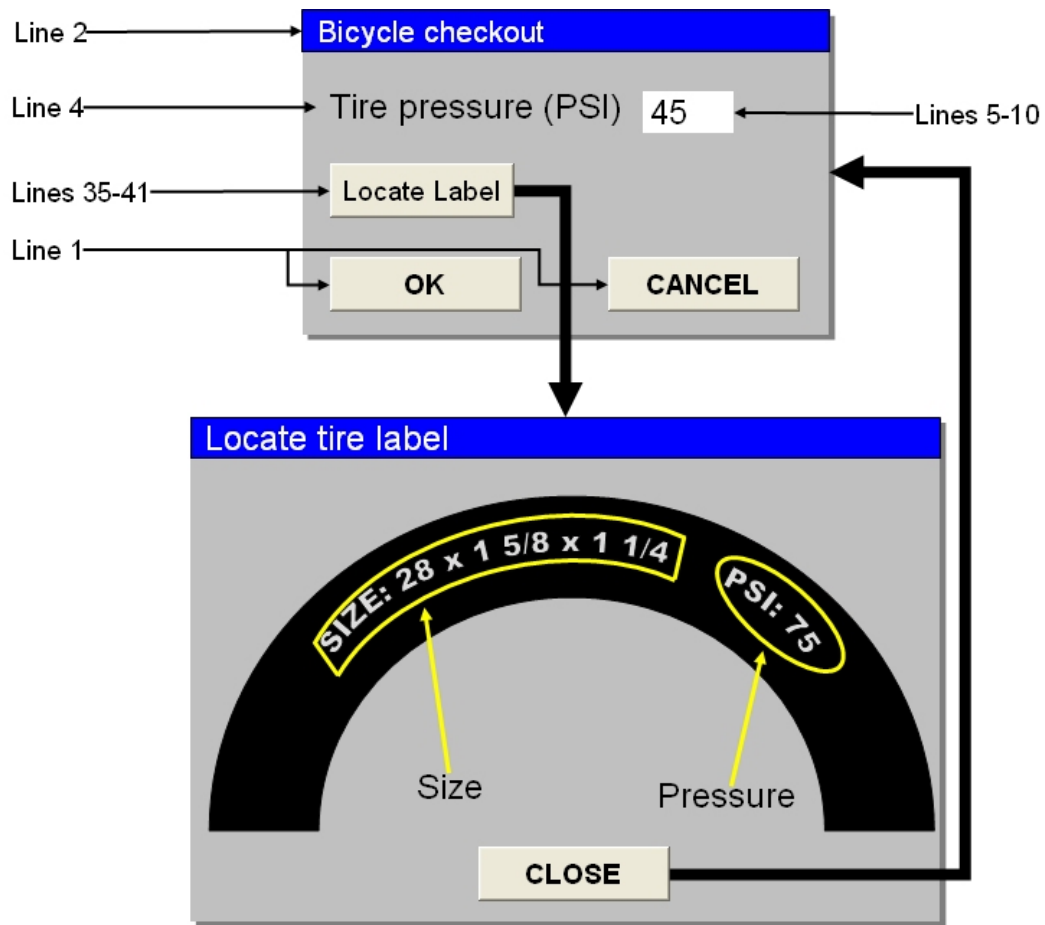

#### 2.4.5 Push button example

The example markup (refer to [Table 6](#)) and example IETP dialog (refer to [Fig 14](#)) is for a push button dialog object. In the example, the user needs to locate where to find the tire label information. When selected, the push button "Locate Tire Label" (lines 35-41, in the markup example below) launches an external application that displays an illustration about the tire label components. After closing the illustration, control returns to the dialog.

Table 6 Push button markup - Example:

Line	Markup
1	<dialog submitCaption="ok01" cancelCaption="ca01">
2	<title>Bicycle checkout</title>
3	<userEntry mandatory="1" dataEntryFieldLength="1">
4	<prompt><paraBasic>Tire pressure (PSI)</paraBasic></prompt>
5	<variableRef variableName="Pressure"/>
6	<default>
7	<expression>
8	<variableRef variableName="Pressure"/>

Line	Markup
9	</expression>
10	</default>
11	<validate errorMessage="Tire pressure (PSI) must be 30 to 90">
12	<expression>
13	<expression>
14	<expression>
15	<integerValue>30</integerValue>
16	</expression>
17	<numberOperator numberOperation="lessThanOrEqual"/>
18	<expression>
19	<variableRef variableName="Pressure"/>
20	</expression>
21	</expression>
22	<booleanOperator booleanOperation="and"/>
23	<expression>
24	<expression>
25	<variableRef variableName="Pressure"/>
26	</expression>
27	<numberOperator numberOperation="lessThanOrEqual"/>
28	<expression>
29	<integerValue>90</integerValue>
30	</expression>
31	</expression>
32	</expression>
33	</validate>
34	</userEntry>
35	<pushButton>
36	<prompt><paraBasic>Locate Tire Label</paraBasic></prompt>
37	<externalApplication application="illustrate">
38	<paraBasic>Display CGM graphic</paraBasic>
39	<send><stringValue>tirelocate.cgm</stringValue></send>
40	</externalApplication>
41	</pushButton>
42	</dialog>

ICN-S1000D-A-030905-A-99994-00006-A-001-01

Fig 14 Dialog push button session - Example

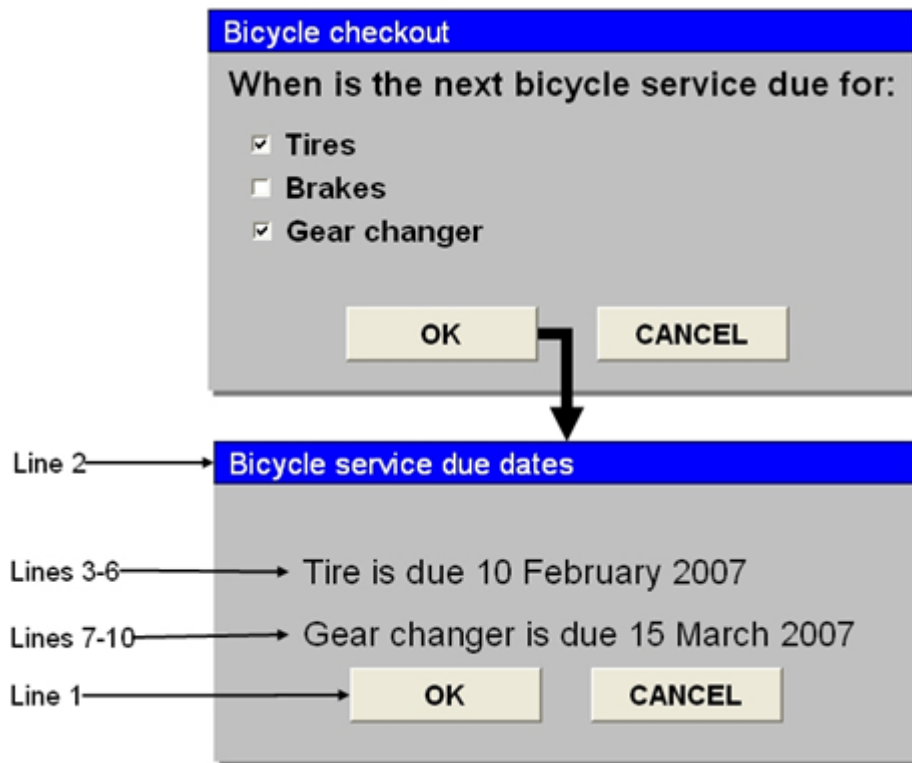

#### 2.4.6 User message example

The example markup (refer to [Table 7](#)) and example IETP dialog (refer to [Fig 15](#)) is for a message dialog object as a response from the IETP. In the example, the user selects the bicycle component(s) for service information and submits the information to the IETP. The IETP processes service dates requests, stores the information in the state variables *TireDue* and *GearDue*. Results are displayed in a dialog message (obtaining the information from state variables *TireDue* and *GearDue*).

Table 7 User message markup - Example

Line	Markup
1	<code>&lt;message submitCaption="ok01" cancelCaption="ca01"&gt;</code>
2	<code>&lt;title&gt;Bicycle service due dates&lt;/title&gt;</code>
3	<code>&lt;prompt&gt;</code>
4	<code>&lt;paraBasic&gt;Tire is due &lt;/paraBasic&gt;</code>
5	<code>&lt;variableRef variableName="TireDue" /&gt;</code>
6	<code>&lt;/prompt&gt;</code>
7	<code>&lt;prompt&gt;</code>
8	<code>&lt;paraBasic&gt;Gear changer is due &lt;/paraBasic&gt;</code>

Line	Markup
9	<variableRef variableName="GearDue" />
10	</prompt>
11	</message>

Fig 15 Dialog user message session - Example

#### 2.4.7 Complex dialog layout example

The example markup (refer to [Table 8](#)) and example IETP dialog (refer to [Fig 16](#)) is a combination of the three dialog types (menu, user entry, and message) using dialog grouping to display the information in a more logical layout.

The first dialog group (element <dialogGroup>, lines 3-89 in the markup example below) contains information on the bicycle tire size. The dialog group has the common title "Tire size" (line 4). The dialog types (element <menu> (lines 5-42) and element <userEntry> (lines 43-88)) are aligned horizontally (side-by-side). The group determines the tire size by:

- Measurement methods, of which the tire has four: ISO (ETRTO) (metric) (element <menuChoice>, lines 6-14), Fractional (U.S.) (element <menuChoice>, lines 15-23), Decimal (U.S.) (element <menuChoice>, lines 24-32), and French (metric) (element <menuChoice>, lines 33-41) that are displayed in a dialog pull down menu (value of attribute choiceType is "pull down" on element <menu>, line 5).
- Tire size, of which there are three:
  - **ISO (ETRTO)** requires one user entry (value of attribute mandatory on element <userEntry> is "1" (lines 43-46)) and disables the remaining two user entries

(element `<enable>` expression `[TireSizeMethod notEqual "iso"]` (lines 47-61) and second element `<enable>` expression `[[TireSizeMethod equal "fractional"] OR [TireSizeMethod equal "decimal"]]` (lines 62-88))

- **French** requires two user entries (value of attribute mandatory on element `<userEntry>` is "1" (lines 43-46 and 47-61)) and disables the remaining one user entry (element `<enable>` expression `[[TireSizeMethod equal "fractional"] OR [TireSizeMethod equal "decimal"]]` (lines 62-88))
- **Fractional** and **Decimal** require two user entries (value of attribute mandatory on element `<userEntry>` is "1" (lines 43-46 and 47-61)) and the third user entry is optional (value of attribute mandatory on element `<userEntry>` is "0" (lines 62-88)).

The second dialog group (element `<dialogGroup>` (lines 90-126)) contains information on the bicycle tire style. A separator divides the two groups by setting the attribute `dialogSeparator` to "1" (line 90). The dialog group has a common title "Tire style" (line 91). The dialog types (element `<menu>` (lines 92-120) and element `<message>` (lines 121-125)) are aligned horizontally (side-by-side) and the group determines the tire style by:

- Tire style, of which there are three: Touring (lines 93-101), Racing (lines 102-110), and/or All Terrain (lines 111-119). Some tires are designed for one, two or all tire styles requiring a dialog multiple selection menu.
- a message (element `<message>` (lines 121-125)) to the user indicating that some bicycle tire style combinations can not be possible

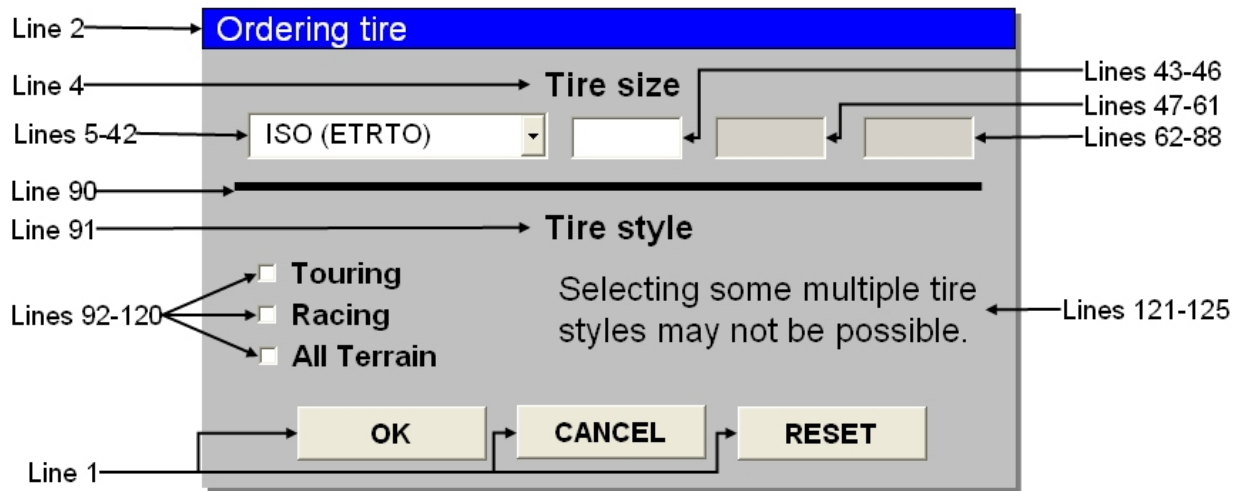

Table 8 Complex dialog markup - Example

Line	Markup
1	<code>&lt;dialog submitCaption="ok01" cancelCaption="ca01"&gt;</code>
2	<code>&lt;title&gt;Ordering tire&lt;/title&gt;</code>

## 1 General

The content of expressions, variables, and external applications is described here. Variables and expressions are cornerstones of the process data module as they enable the logic engine to perform automated data filtering and navigation through the data module.

Sequencing, based on state information, together with management of dynamic and static state information are required capabilities to achieve intelligent, interactive data display. This functionality is fundamental to testing and troubleshooting sequences where the next test is often based on the result of the current test (dynamic state information) or input from the product interface (via the external application interface). It also allows the presentation of information to the user to be customized to the product configuration or any system state.

The process data module contains structures for traversing steps and data modules in a defined order and in if-then-else branches and loops driven by the valuation of expressions. The process data module also filters steps and data modules based on the value of state variables, eg, [*Model* equal "B" or *Test passed* equal TRUE] which are stored in the state table. (In this chapter, variable names appear in *italics*, expressions are given in [brackets])

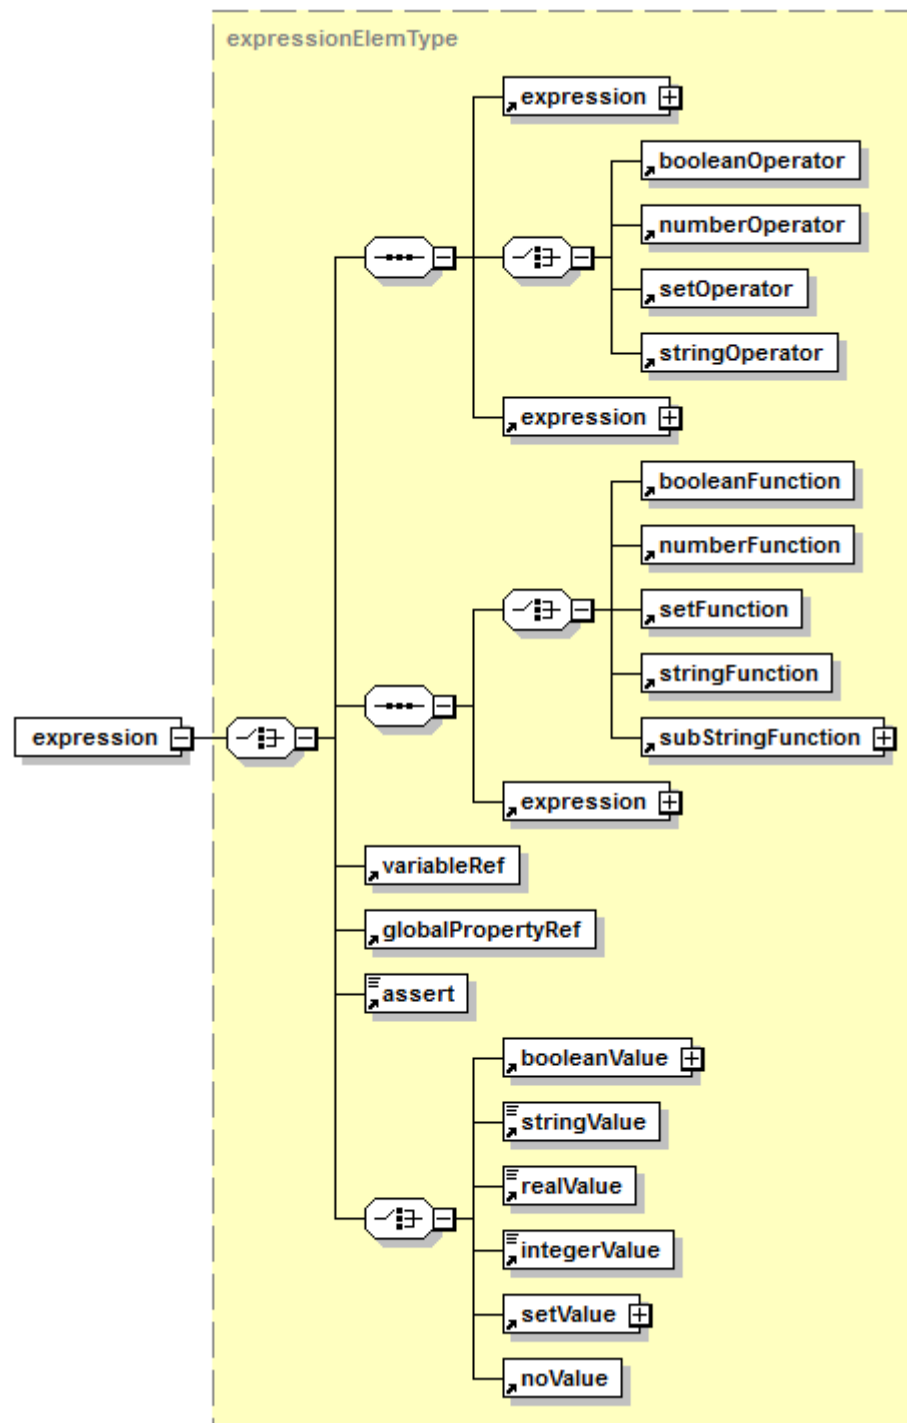

## 2 Expression, variable, external application content

### 2.1 Expressions

**Description:** Expressions are combinations of variables or global properties and operators. The logic engine evaluates expressions primarily in order to determine what is displayed to the user as in applicability ([*Model* = "T"]) and branching ([If *Error Condition* = "4"]) and loop (WHILE [*Counter* < "5"]) conditions. Expressions are also used to assign a value to a variable or global property ([*Ave* = Sum / 3]). Refer to [Chap 7.6.1.4](#) for detailed information.

The element <expression> defines something to be evaluated by the logic engine. Expressions are used to assign values to variables in assertions, eg, the value of the expression [*Counter* plus 1] might be assigned to the variable *Counter*. They are also used in applicability, branches, and other constructs to determine what is displayed to the user. In element <applic>, for example, if the expression [*Item deployed* equal TRUE] evaluates to TRUE, the data item containing the applicability is displayed and vice versa. Expressions are authored by combining variables (or other expressions) and values with binary or unary operators. In their simplest form, an expression can be just a variable/global property or a value. The element <assert> can also be used to simplify the authoring of complicated expressions.

**Markup element:** <expression>

ICN-76301-S1000D0032-001-01

Fig 1 Element `<expression>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `humanReadableForm` (O), the textual form of the expression to be used in printing

#### Child elements:

- `<booleanOperator>`. Refer to [Chap 7.6.1.4](#).
- `<numberOperator>`. Refer to [Chap 7.6.1.4](#).
- `<setOperator>`. Refer to [Chap 7.6.1.4](#).
- `<stringOperator>`. Refer to [Chap 7.6.1.4](#).
- `<booleanFunction>`. Refer to [Chap 7.6.1.4](#).
- `<numberFunction>`. Refer to [Chap 7.6.1.4](#).
- `<setFunction>`. Refer to [Chap 7.6.1.4](#).
- `<stringFunction>`. Refer to [Chap 7.6.1.4](#).
- `<substringFunction>`. Refer to [Chap 7.6.1.4](#).
- `<booleanValue>`. Refer to [Chap 7.6.1.4](#).

- `<integerValue>`. Refer to [Chap 7.6.1.4](#).
- `<setValue>`. Refer to [Chap 7.6.1.4](#).
- `<noValue>`. Refer to [Chap 7.6.1.4](#).
- `<variableRef>`. Refer to [Chap 3.9.5.2.10.1](#).
- `<globalPropertyRef>`. Refer to [Chap 3.9.5.2.10.1](#).
- `<assert>`. Refer to [Chap 3.9.5.3](#).
- `<expression>`. Refer to [Para 2.1](#).

#### Markup example:

```
<expression>
<stringValue>experienced</stringValue>
</expression>
<expression>
<integerValue>0</integerValue>
</expression>
<expression>
<expression>
<variableRef variableName="tourFinished"/>
</expression>
<numberOperator numberOperation="equal"/>
<expression>
<booleanValue><falseValue/></booleanValue>
</expression>
</expression>
```

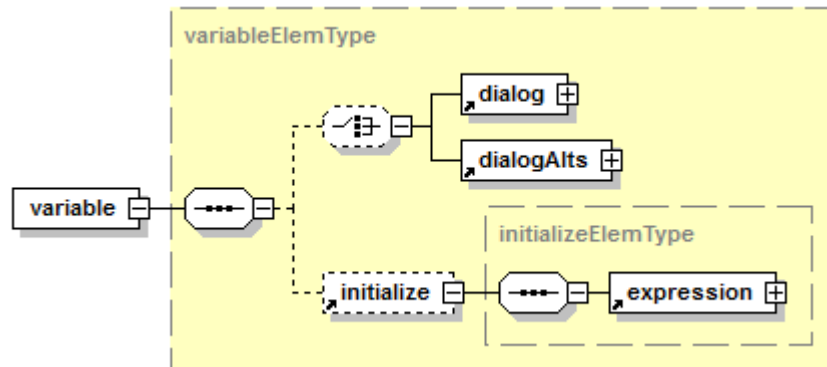

## 2.2 Variables (local)

**Description:** Variables define pieces of information required by the logic engine to context filter, branch, etc, within a process data module. Variables can be global or local in scope. Local variables are defined in the element `<variable>` described below. Local variables are only available to the process data module in which they are declared.

If a variable must be available to several process data modules, it must be declared in the ACT or CCT as a product attribute or condition. It will then be recognized by the logic engine as a global property and made available to all process data modules. Refer to [Chap 3.9.5.3.1](#) and [Chap 3.9.5.3.2](#) for descriptions of the element `<productAttribute>` and the element `<condition>`. More information is provided in [Chap 4.14.1](#) and [Chap 4.14.2](#) on these concepts.

In the process data module, the element `<productAttribute>` and the element `<condition>` can be used in the applicability structure as well as in expressions, assertions, etc. These elements are initialized in the PCT. They will not have a dialog as part of their content compared to local variables. However, they have a prompt available in their definitions which can be used to query the user for the value of the product attribute or condition as well as enumeration label attributes which can be used as menu choices in an IETP software constructed dialog. Dialogs, such as are defined for local variables, can also be authored for global properties on the element `<dmNode>` or the element `<proceduralStep>`.

Markup element: `<variable>`

ICN-SYU52-AASER00029-001-01

Fig 2 Element `<variable>`

#### Attributes:

- `variableName` (M), a short name for the variable. The attribute `variableName` is not normally seen by the end user.
- `variableDescr` (O), a human-readable description of the variable. Often the variable name is not descriptive enough. The description is not normally seen by the end user.
- `productConfigurationFlag` (O), a flag indicating if this variable describes the configuration of the Product. For example, *Model* and *Serial number* are configuration variables. In an implementation where the IETP can extract configuration information from a configuration management system, the attribute `productConfigurationFlag` identifies which variable values the IETP might query for.
- `valueType` (O), the type of the variable value. The attribute `valueType` can have one of the following values:
  - `"boolean"` - boolean type values are TRUE or FALSE
  - `"string"` - string type values are alphanumeric
  - `"integer"` (D) - integer type values are numeric and contain no decimal point
  - `"real"` - real type values are numeric and contain a decimal point
  - `"set-string"`, `"set-real"`, or `"set-integer"` - set type values represent an unordered list of like value types: string, real, or integer
- `valuePrecision` (O), the precision of real type data
- `variableScope` (O), the scope of the variable. The attribute `variableScope` can have only one value:
  - `"local"` (D) - the scope is for the entire user session. `"local"` is the only scope supported for variables declared within the process data module.

#### Child elements:

- `<dialog>`. Refer to [Chap 3.9.5.2.10.2](#).
- `<dialogAlts>`. Refer to [Chap 3.9.5.2.10.2](#).
- `<initialize>`. Refer to [Para 2.2.1](#).

The element `<variable>` can have different values at different times in the same way as a programming variable. Variables and their values are stored in the state table and the values are used when evaluating expressions. In [Para 2.1](#), *Counter* and *Item deployed* are variables. The element `<variable>` contains an optional dialog that can be used by the logic engine to obtain the value for the variable if no value has been asserted. It also contains an optional element `<initialize>` that is used to set an initial value for the variable using the element `<expression>`.

#### Business rule decision point BRDP-S1-00248 - Use of the attribute `variableName` in the element `<variable>` in process data modules:

- Decide on naming conventions to be used in setting variable names.

#### Business rule decision point BRDP-S1-00249 - Use of the attribute `variableType` in the element `<variable>` in process data modules:

- Decide whether to use the attribute `variableType` and decide on the rules for selection of the defined values.

#### Markup example:

```
<variableDeclarations>
<variable valueType="string" variableName="name"></variable>
<variable valueType="string" variableName="level">
<initialize>
<expression><stringValue>amateur</stringValue></expression>
</initialize>
</variable>
</variableDeclarations>
```

### 2.2.1 Initialize

**Description:** The element `<initialize>` is used to set an initial value for the variable using the element `<expression>`.

**Markup element:** `<initialize>`

#### Attributes:

- None

#### Child elements:

- `<expression>`. Refer to [Para 2.1](#).

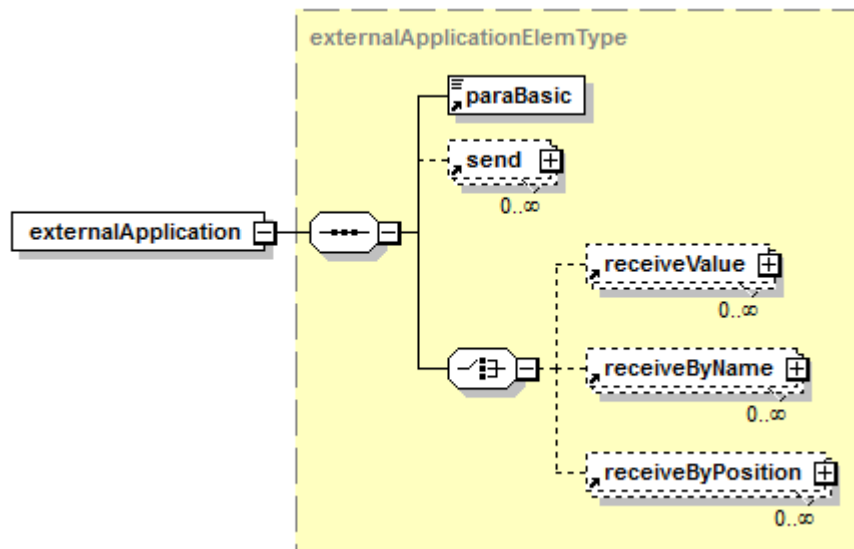

#### Markup example:

```
<initialize>
<expression>
<stringValue>amateur</stringValue>
</expression>
</initialize>
```

## 2.3 External application interface

**Description:** The element `<externalApplication>` provides the capability to launch an external program from the IETP. Parameter data can be passed to the program and values can be received back from the program. Parameter data can be passed to the application in the form of variable values or strings. Data received from an external application must be assigned to a previously defined variable of the appropriate type. External application calls can only appear in the element `<dmNode>`.

**Markup element:** `<externalApplication>`

ICN-76301-S1000D0035-001-01

Fig 3 Element `<externalApplication>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `application` (M), the entity reference to the external application.
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<paraBasic>`. Refer to [Para 2.3.1](#).
- `<send>`. Refer to [Para 2.3.2](#).
- `<receiveValue>`. Refer to [Para 2.3.3](#).
- `<receiveByName>`. Refer to [Para 2.3.4](#).
- `<receiveByPosition>`. Refer to [Para 2.3.5](#).

### Markup example:

```
<dmNode>
<externalApplication application="MMS">
```

```
<paraBasic>Update the Maintenance Management System
(MMS)</paraBasic>
<send>
<sendName>code</sendName>
<variableRef variableName="ECU.fault-code"/>
</send>
</externalApplication>
</dmNode>
```

### 2.3.1

#### Para basic

**Description:** The element [<paraBasic>](#) contains a description of the external application or other information that will be displayed to the user.

**Markup element:** [<paraBasic>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

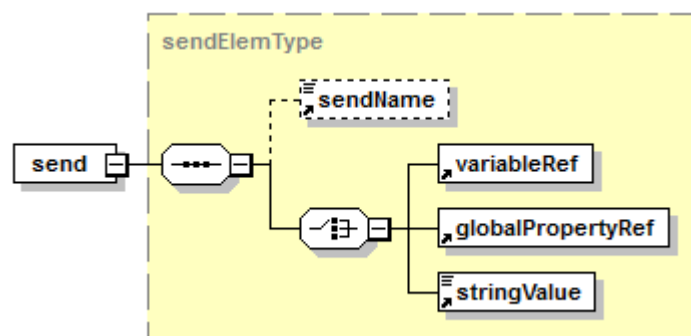

```
<paraBasic>Update the Maintenance Management System
(MMS)</paraBasic>
```

### 2.3.2

#### Send

**Description:** The element [<send>](#) defines parameters to send to the called application. The element [<send>](#) contains an optional element [<sendName>](#) and the element [<variableRef>](#), the element [<globalPropertyRef>](#) or the element [<stringValue>](#). Send parameters can be either local variable or global property values or strings. The element [<sendName>](#) defines the parameter name used by the external application. When used in conjunction with the element [<variableRef>](#), the element [<globalPropertyRef>](#) or the element [<stringValue>](#), it clearly defines each sending parameter.

**Markup element:** [<send>](#)

ICN-76301-S1000D0037-001-01

Fig 4 Element [<send>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <sendName>, the parameter name used by the external application. Refer to [Para 2.3.2.1](#).
- Choice of either:
  - <variableRef>. Refer to [Chap 3.9.5.2.10.1](#).
  - <globalPropertyRef>. Refer to [Chap 3.9.5.2.10.1](#).
  - <stringValue>, the send value is a fixed value. Refer to [Chap 7.6.1.4](#).

**Markup example:**

```
<externalApplication application="MMS">
<paraBasic>Update the Maintenance Management System
(MMS)</paraBasic>
<send>
<sendName>code</sendName>
<variableRef variableName="ECU.fault-code"/>
</send>
</externalApplication>
```

## 2.3.2.1

**Send name**

**Description:** The element <sendName> contains a character string giving the name of a parameter sent to and used by a called external application.

**Markup element:** <sendName>

**Attributes:**

- None

**Child elements:**

- None

## 2.3.3

**Receive value**

**Description:** The element <receiveValue> contains the element <variableRef> or the element <globalPropertyRef> which is the local variable or global property to be assigned the value received from the external application. When the returned values exceed the number of receive value definitions, the remaining receive value information is discarded.

**Markup element:** <receiveValue>

ICN-76301-S1000D0038-001-01

Fig 5 Element `<receiveValue>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<variableRef>`, the state table variable to receive the returned value. Refer to [Chap 3.9.5.2.10.1](#).
- `<globalPropertyRef>`, the state table global property to receive the returned value. Refer to [Chap 3.9.5.2.10.1](#).

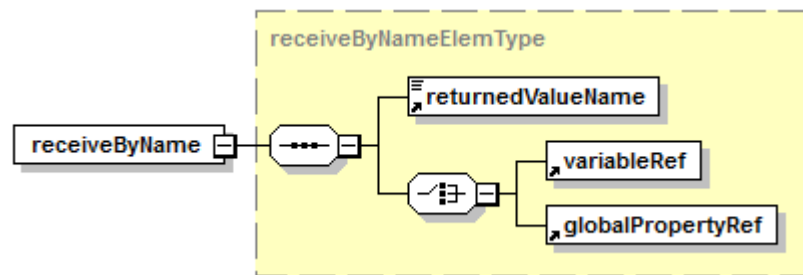

#### Markup example:

```
<externalApplication application="MMS">
  <paraBasic>Receive Maintainer Name</paraBasic>
  <receiveValue>
    <variableRef variableName="Maintainer"/>
  </receiveValue>
</externalApplication>
```

### 2.3.4 Receive by name

**Description:** The element `<receiveByName>` is used when the external application returns data in name/value pairs. The element `<receiveByName>` contains the element `<returnedValueName>` that is the name of the returned value, and the element `<variableRef>` or the element `<globalPropertyRef>` defining the local variable or global property to be updated with the returned value. When the external application returns a returned value name not defined by the element `<returnedValueName>`, that name/value pair is discarded.

**Markup element:** `<receiveByName>`

ICN-76301-S1000D0039-001-01

Fig 6 Element &lt;receiveByName&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <returnedValueName>, a parameter name returned from the external application. Refer to [Para 2.3.4.1](#).
- <variableRef>, the state table variable to receive the returned value. Refer to [Chap 3.9.5.2.10.1](#).
- <globalPropertyRef>, the state table global property to receive the returned value. Refer to [Chap 3.9.5.2.10.1](#).

#### Markup example:

```
<externalApplication application="MMS">
  <paraBasic>Receive test results</paraBasic>
  <receiveByName>
    <returnedValueName>testresult</returnedValueName>
    <variableRef variableName="Result Test 5"/>
  </receiveByName>
</externalApplication>
```

#### 2.3.4.1 Returned value name

**Description:** The element <returnedValueName> contains a character string giving then name of a parameter returned from a called external application.

**Markup element:** <returnedValueName>

#### Attributes:

- None

#### Child elements:

- None

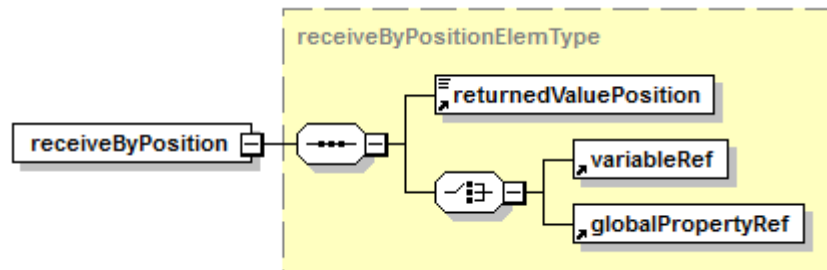

#### 2.3.5 Receive by position

**Description:** The element <receiveByPosition> is used when the external application returns data in a stream of delimited values by position. The element

<receiveByPosition> contains the element <returnedValuePosition>, the position of a returned value starting with 1, and the element <variableRef> or the element <globalPropertyRef> defining the variable to be updated with the returned value. When a returned value position is not defined, the information in that position is discarded.

**Markup element:** <receiveByPosition>

ICN-76301-S1000D0040-001-01

Fig 7 Element <receiveByPosition>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <returnedValuePosition>, the parameter position in the returned external application list. Refer to [Para 2.3.5.1](#).
- <variableRef>, the state table variable to receive the returned value. Refer to [Chap 3.9.5.2.10.1](#).
- <globalPropertyRef>, the state table global property to receive the returned value. Refer to [Chap 3.9.5.2.10.1](#).

#### Markup example:

```
<externalApplication application="MMS">
  <paraBasic>Receive test scores</paraBasic>
  <receiveByPosition>
    <returnedValuePosition>1</returnedValuePosition>
    <variableRef variableName="Score Test 1"/>
  </receiveByPosition>
  <receiveByPosition>
    <returnedValuePosition>5</returnedValuePosition>
    <variableRef variableName="Score Test 2"/>
  </receiveByPosition>
</externalApplication>
```

#### 2.3.5.1 Returned value position

**Description:** The element <returnedValuePosition> contains a character string giving the parameter position in the list returned from an external application.

---

**Markup element:** <returnedValuePosition>

**Attributes:**

- None

**Child elements:**

- None

## 1 General

This chapter introduces the logic engine. The logic engine is a software component that executes the process data module (Refer to [Chap 4.11](#) for the specification and [Chap 7.6.1](#) for the requirements). It implements the behavior associated with process data module Schema elements. The primary job of the logic engine is to determine what to display next. In order to do that, it must traverse process data module elements, maintain a state table, display dialogs and evaluate expressions.

The process data module contains interactive processing structures to provide the capability to sequence other data modules or steps within it based on static or dynamic state information. The process data module is useful to achieve capabilities of the Functionality Matrix in categories of (1) diagnostics (particularly dynamic diagnostics, or system simulation), (2) external processes where data is captured in the IETP and transmitted to the external process or vice versa, and (3) navigation and tracking in areas of filtering (only displaying to the user data that applies to him) and dialog-driven interaction. Refer to [Chap 6.4](#).

Sequencing, based on state information, together with management of dynamic and static state information are required capabilities to achieve intelligent, interactive data display. This functionality is fundamental to testing and troubleshooting sequences where the next test is often based on the result of the current test (dynamic state information) or input from the Product interface (via the external application interface). It also allows the presentation of information to the user to be customized to the Product configuration or any system state.

The process data module contains structures for traversing steps and data modules in a defined order and in if-then-else branches and loops. The process data module will also filter steps and data modules based on the value of state variables, eg [*Model* equal "B" or *Test passed* equal TRUE] which are stored in the state table. (In this chapter, variable names will appear in *italics*, expressions will be in [brackets]) If the required variable values are not in the State table, it will gather information from the user or other sources to populate the state table and then use that information to make branching and filtering decisions. When sequencing data modules, no change to the data module itself is required, and thus data modules can be reused in many sequences.

## 2 Logic engine tasks

### 2.1 Traverse process data module elements

The logic engine works through occurrences of the element `<dmSeq>` that are defined in a process data module. It processes each of element `<dmNode>`, element `<dmIf>`, and element `<dmLoop>` in order until there are none left to process. Refer to [Chap 7.6.1.1](#) for detail on this processing.

For the element `<dmNode>`, the logic engine must evaluate applicability expressions for filtering, update the state table with `variablePreSet` assertions, provide content to be displayed to the user and again update the state table with `variablePostSet` assertions.

For the element `<dmIf>`, the logic engine must evaluate the condition and based on the result of the evaluation, process the element `<dmThenSeq>` or the element `<dmElseSeq>`.

For the element `<dmLoop>`, the logic engine must update the state table with the loop entrance assertion, evaluate the WHILE condition and, based on the result, process the element `<dmSeq>` contained in the element `<dmLoop>` or bypass it. At the end of the data module sequence, the logic engine updates the state table with the loop end assertion, re-evaluates the WHILE condition and either processes the data module sequence again or exits the loop.

## 2.2 Maintain state variables

In order to perform context filtering and sequencing, the logic engine must populate, store, retrieve, update, and delete state information in the state table. Refer to [Chap 7.6.1.3](#) for details on these operations.

The logic engine populates the state table by accepting assertions from elements of the process data module (`<variablePreSets>`, `<variablePostSets>`, `<dialogs>`, `<externalApplications>`, `<assertions>`). The state table is simply a collection of variables and their values.

The logic engine utilizes the state information from the state table to evaluate expressions used in applicability, data module branches, and data module loops. In order to perform expression evaluations the logic engine must retrieve the required data from the state table. If the required data is not present there, the logic engine must acquire the data using dialogs which can be associated to the variable during the variable declaration. In the case that a variable is used in an expression and has no value in the state table and no associated dialog, ie there is no way to obtain a value, the logic engine will throw an error condition and stop processing. This is considered a fatal error (refer to [Chap 7.6.1.7](#)).

## 2.3 Present dialogs

A dialog is an authored construct presented to the end user, using the element `<dialog>`, to find the value of a variable. Dialogs can be menu type, using the element `<menu>` or "fill-in-the-blank" type, using the element `<userEntry>`. The logic engine must display dialogs when:

- dialogs are explicitly authored in the element `<dmNode>`
- the logic engine requires a value for a local variable to evaluate an expression and the state table holds no value for it. In this case, the logic engine displays the dialog associated with the variable in question.
- the logic engine requires a value for a global property to evaluate an expression and the state table holds no value for it. In this case, the logic engine generates for display a dialog from data in the ACT or CCT in order to obtain a value for the property in question.

Refer to [Chap 7.6.1.5](#) for details on the generation and display of dialogs.

## 2.4 Evaluate expressions

In order to sequence elements of a process data module, it is necessary to evaluate expressions found in If and Loop statements. It is also possible to encounter an expression within the applicability structure in a process data module. Using data from the state table, the logic engine must be able to determine the truth of expressions such as `[Fault message equal "Restart"]`, `[Continuity exists = TRUE]`, and `[Gap < 1,5]`. In certain circumstances, the logic engine will populate the state table with values from evaluating expressions. For example, in FOR loops the logic engine can evaluate expressions such as `[Counter = Counter + 1]` and update variable `Counter` accordingly.

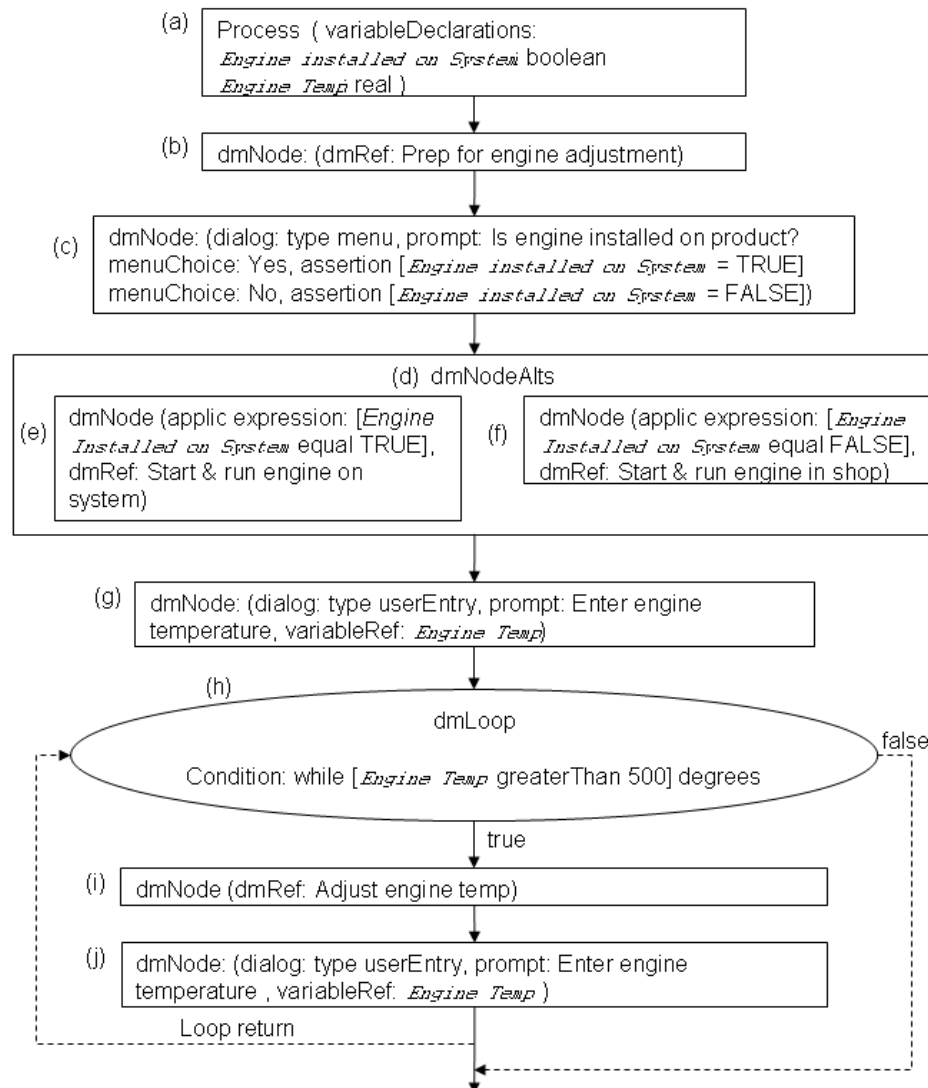

Expressions can be complex, such as: `[[Model = "A"] and [[Block = "3"] or [Block = "4"]]]` or `[Change_2 installed = TRUE]`.

## 3 Example process diagrams

The following illustrate sample process data modules as executed by a logic engine. A step by step description of processing follows each diagram.

[Fig 1](#) and [Fig 2](#) are authoring views of a process data module. The step by step description that follows each figure explains how the logic engine processes the authored data. [Fig 3](#) is the end user view of [Fig 2](#) - the result of logic engine processing. It shows the screens the user will see and the contents of the state table that determine what the user sees.

## Begin Process

## End Process

ICN-S1000D-A-030905-A-U8025-00070-A-03-3

Fig 1 Process diagram - Example sequencing data modules

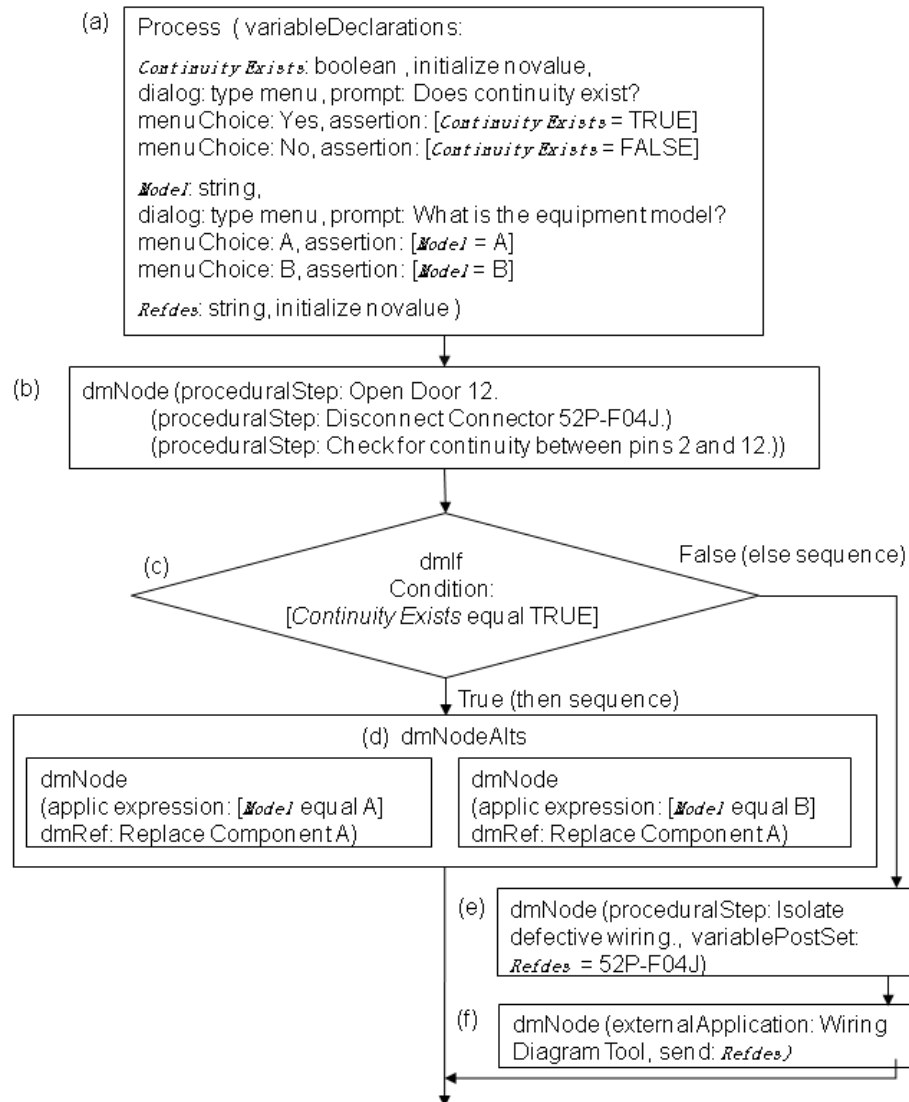

In [Fig 1](#) above, the logic engine would:

- Step a (refer to (a) on diagram):  
Set up the state table for variables declared in the process element. Declare variable *Engine installed on system* to be type Boolean and variable *Engine temp* to be type real. With no initialize attribute, both variables will have value "noValue". This example illustrates variables without associated dialogs.
- Step b:  
The first element in the process data module sequence is the element `<dmNode>` containing a reference to the data module entitled "Prep for engine adjustment". Before displaying this data module, its applicability must be processed. If indeed the data module is to be displayed, the logic engine will provide it for display and stop. The user will press "Next" to proceed.

- Step c:  
The next element <dmNode> contains an element <dialog>. This dialog was explicitly authored in this location to obtain a value for variable *Engine Installed on System* in order for the logic engine to process the following element <dmNodeAlts>. The user will select a menu choice. When the user hits OK on the dialog, the assertions associated with the element <menuChoice> selected will be made to the state table and the logic engine will move to the next element in the process.
- Step d:  
The next element is a <dmNodeAlts>. The element <dmNodeAlts> contains two elements <dmNode> containing element <dmRef>. Each element <dmNode> also contains an element <expression> to be evaluated about variable *Engine installed on system*. The logic engine will examine its state table to find a value for the variable and evaluate the first element <dmNode> (e) element <expression>.
- Step e:  
If this element <expression> evaluates to TRUE, the data module entitled "Start and run engine on system" will be displayed. Processing will stop until the user presses "Next". At that point, the logic engine will move past the element <dmNodeAlts> to the next element in the process. If the element <expression> does not evaluate to TRUE, the logic engine will evaluate the element <expression> on the next element <dmNode> in the element <dmNodeAlts> (f).
- Step f:  
If this element <expression> evaluates to TRUE, the data module entitled "Start and run engine in shop" will be seen. Processing will stop until the user presses "Next". If the element <expression> evaluates to FALSE, the logic engine will display nothing and move to the next element in the process.
- Step g:  
This element <dmNode> contains an element <dialog> explicitly authored at this place in order to populate the state table with a value for variable *Engine Temp*, which the logic engine will need to process the following loop. The user will provide a value for the variable which will be asserted to the state table.
- Step h:  
When "OK" is pressed, the logic engine will move to the element <dmLoop>. The loop condition [*Engine temp greaterThan 500 degrees*] will be evaluated using the *Engine temp* value just obtained from the preceding dialog.
- Step i:  
If the condition element <expression> evaluates to TRUE, the adjustment data module will be displayed. Processing will then stop until the user presses "Next". If the condition element <expression> evaluates to FALSE, the loop will not be traversed and the user will exit the process.
- Step j:  
When the user presses "Next", another *Engine temp* dialog will be displayed. The user's input will be recorded in the state table. At this point, the logic engine returns to step h and once again evaluates the loop condition. When the loop condition fails to be TRUE, the user will exit the element <dmLoop> and the process data module ends. The user will be informed that he has reached the end of task.

## Begin Process

## End Process

ICN-S1000D-A-030905-A-U8025-00071-A-03-3

Fig 2 Process diagram - Example dmNodeAlts, external application

The procedure in [Fig 2](#) would be processed as follows:

- Step a:  
Set up the variables to be used in the process. Three variables are defined. The variable *Continuity Exists* is defined as Boolean and initialized to "noValue". A dialog is provided for this variable. The variable *Model* is defined as a string variable. It is not initialized which allows it to maintain the value currently in the state table. If there is none, it will be initialized to "noValue". A dialog is provided for variable *Model*. The variable *Refdes* is defined as a string variable. It is initialized to "noValue" to discard the current value if one exists. The value of *Refdes* is always provided by the author. No dialog is required.
- Step b:  
This is a Step hierarchy on the first element <dmNode>. The logic engine would resolve

applicability on the element `<dmNode>` and the step content. Then the step content would be displayed on one screen such that the step hierarchy is clear to the viewer. After viewing, the user will press "Next" to proceed.

- Step c:  
The logic engine will attempt to evaluate the element `<expression>` [Continuity Exists equal `TRUE`]. There is no value for variable Continuity Exists in the state table, so the logic engine will display its associated dialog in order to obtain a value from the user. If the element `<expression>` evaluates to `TRUE`, the logic engine will begin processing (d), the element `<dmNodeAlts>`. If the element `<expression>` evaluates to `FALSE`, the logic engine will process element `<dmNode>` (e).
- Step d:  
The two elements `<dmNode>` in the alternative group have mutually exclusive applicability. The logic engine will evaluate the applicability expression on the element `<dmNodeAlts>` members until one is found with a `TRUE` expression. If and when this occurs, the logic engine will provide the element `<dmRef>` from the element `<dmNode>` for display. After viewing, the user will press "Next" to continue. If no element `<dmNode>` in the element `<dmNodeAlts>` passes applicability processing, the logic engine will process the next element in the sequence, or, if there is none, end the Process.
- Step e:  
The element `<proceduralStep>` content will be displayed on the screen. The user will press "Next" to continue and the element `<assertion>` in the element `<variablePostSet>` will assign a value of "52P-J024" to variable *RefDes* in the state table.
- Step f:  
This element `<externalApplication>` calls a wiring diagram tool. The author passes the reference designator (*RefDes*) of the connector under consideration to the wiring tool. The wiring tool takes control at this point and does whatever it is designed to do. Meanwhile, the logic engine processes the next element in the sequence. The user can close the external application whenever he/she wishes and continue in the IETP.

## End User View & State Table

### State Table after variable declarations:

Model = B  
 Continuity Exists = novalue  
 Refdes = novalue

### Screen 1 – Step content

Open door 12  
 Disconnect connector 52P-F04J.  
 Check for continuity between pins 2 and 12.

*User presses Next*

### Screen 2 - Dialog

Does Continuity Exist?

☐ Yes

☐ No

OK

Cancel

*User answers Yes and presses OK*

### State Table after Dialog:

Model = B  
 Continuity Exists = TRUE  
 Refdes = novalue

### Screen 3 – Referenced data scrolls as required in original window

#### 1 General

The markup for a complete process data module plus screens depicting what the end user would see when progressing thru the process is shown.

#### 2 Example process data module

The example markup below (refer to [Table 2](#)) and the example IETP dialog (refer to [Fig 1](#) thru [Fig 9](#)) represent an entire process data module, which includes external application, dialog box, procedural steps, and alternative choice.

The first part is the data module identification and status section (element [<identAndStatusSection>](#), lines 2-13 in the markup example below) containing the

data module code and various status type information. Most information is left out except for the applicability conditions within the data module (element `<referencedApplicGroup>`, lines 15-32). The information contained in the element `<referencedApplicGroup>` defines the applicability conditions used throughout the data module. The first applicability (lines 16-23) is when the user selects a correct answer, and the second applicability (lines 24-31) is when the user selects a wrong answer. The system filters the information when a reference from the alternative choice is requested.

The data module variables are declared in lines 33-40 and initialized to a value, as applicable.

The first node (screen of information) is in lines 42-49 and shown in [Fig 1](#). The node begins a procedure to familiarize the user with the bike and provide a data module reference to the introduction.

The second node is in lines 50-83 and shown in [Fig 2](#). The node is a dialog asking for information about the user. The dialog will verify (lines 60-62) the user's age is between 4 and 100. [Fig 3](#) shows that when an invalid age is entered the error message (attribute `errorMessage`) is displayed. Additionally, the dialog determines if the user has ridden a bike previously (lines 64-74) thru a menu selection. The information entered determines the nodes shown to the user (refer to [Fig 4](#)). Lines 76-81 contain a reminder to the user about the dialog requirements.

Lines 84-161 evaluate John Smith's bike riding experience with the element `<dmIf>`. If John has not ridden a bike before, he will need some training before operating the bike. Otherwise, he will proceed directly to operating procedures (lines 162-176 and shown in [Fig 9](#)).

Unfortunately, John is inexperienced and requires additional information and training about the bike. John is required to pass a test before he can continue to operate the bike. John will repeat (lines 87-159) the loop nodes until he passes the test (line 94). The system keeps track of the number of attempts John takes to pass the test. In the variable declarations, the counting variable `tourMistakes` is initialized to "0" (lines 88-93).

The next node (lines 96-104 and [Fig 5](#)) informs John that additional training is needed, since he is inexperienced. The following node (lines 105-107) is linked to a description data module to familiarize John with the bike. The node was personalized by using the variable name in the procedural step (line 99).

After completing the description data module, John is shown the next node (lines 108-113 and [Fig 6](#)) informing him that he will be tested on knowledge obtained. John can re-read the description data module by clicking the **BACK** button or clicking the **NEXT** button to take the test.

The test node (lines 114-142) is a menu dialog asking John which lever is the rear brake. If John selects the left brake lever (which is incorrect) the variable `tourCorrectAnswer` is asserted to FALSE and the variable `tourMistakes` is incremented (lines 120-127). If John selects the right brake lever (which is correct) the variable `tourCorrectAnswer` is asserted to TRUE and variable `tourFinished` is asserted to TRUE (lines 131-138).

After the test questions have been answered, the next node is determined by applicability of the test answer (lines 143-157). The first alternative node (lines 144-150) references the applicability "wrongAnswer" (located at lines 24-31) that evaluates the variable `tourCorrectAnswer = FALSE`. The second alternative node (lines 151-156) references the applicability "rightAnswer" (located at lines 16-23) that evaluates the variable `tourCorrectAnswer = TRUE`.

Since John selected the left brake lever (he did not read carefully) the first alternative node is shown (refer to [Fig 7](#)) and displays the number of mistakes made by John by using the element `<variableRef>` and the variable `tourMistakes` (line 148). Too bad for John, he now

must repeat the previous nodes to continue, since the criteria to remain in the loop is the variable `tourFinished = FALSE` (line 94). John will repeat the nodes in [Fig 5](#) and [Fig 6](#). This time John read carefully and passed the test (refer to [Fig 8](#)), and the asserted variable `tourFinished` is set to TRUE allowing him to exit the loop.

John has passed the test and is shown the last node (lines 162-176 and [Fig 9](#)), the procedure showing how to operate the bike.

## 1 General

The content section of a Common Information Repository (CIR) data module must be structured in accordance with one of the following information types:

- Functional items. Refer to [Chap 3.9.5.2.11.1](#).
- Circuit breakers. Refer to [Chap 3.9.5.2.11.2](#).
- Parts. Refer to [Chap 3.9.5.2.11.3](#).
- Zones. Refer to [Chap 3.9.5.2.11.4](#).
- Access points. Refer to [Chap 3.9.5.2.11.5](#).
- Enterprise information. Refer to [Chap 3.9.5.2.11.6](#).
- Supplies. Refer to [Chap 3.9.5.2.11.7](#).
- Supplies, requirements. Refer to [Chap 3.9.5.2.11.8](#).
- Support equipment. Refer to [Chap 3.9.5.2.11.9](#).
- Functional and/or physical areas. Refer to [Chap 3.9.5.2.11.10](#).
- Controls and indicators. Refer to [Chap 3.9.5.2.11.11](#).
- Applicability annotations. Refer to [Chap 3.9.5.2.11.12](#).
- Warnings. Refer to [Chap 3.9.5.2.11.13](#).
- Cautions. Refer to [Chap 3.9.5.2.11.14](#).

The general mechanism of CIR data modules is described in [Chap 4.13.1](#).

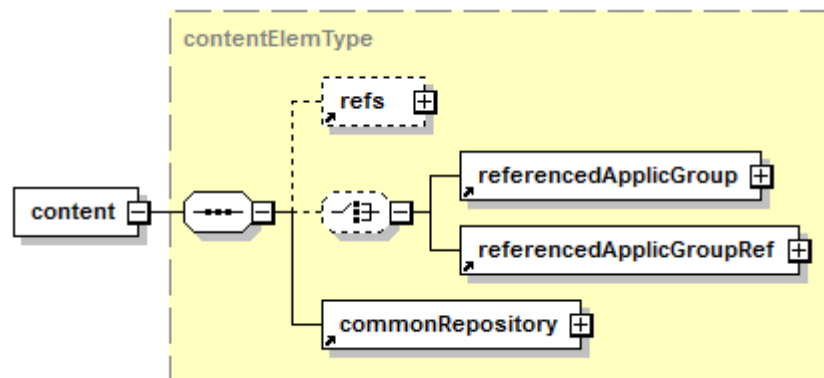

## 2 CIR data module content

### 2.1 Content

**Description:** The element `<content>` contains the content section of the CIR data module.

**Markup element:** `<content>`

ICN-S1000D-A-03090502-A-FAPE3-00004-A-001-01

Fig 1 Element `<content>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

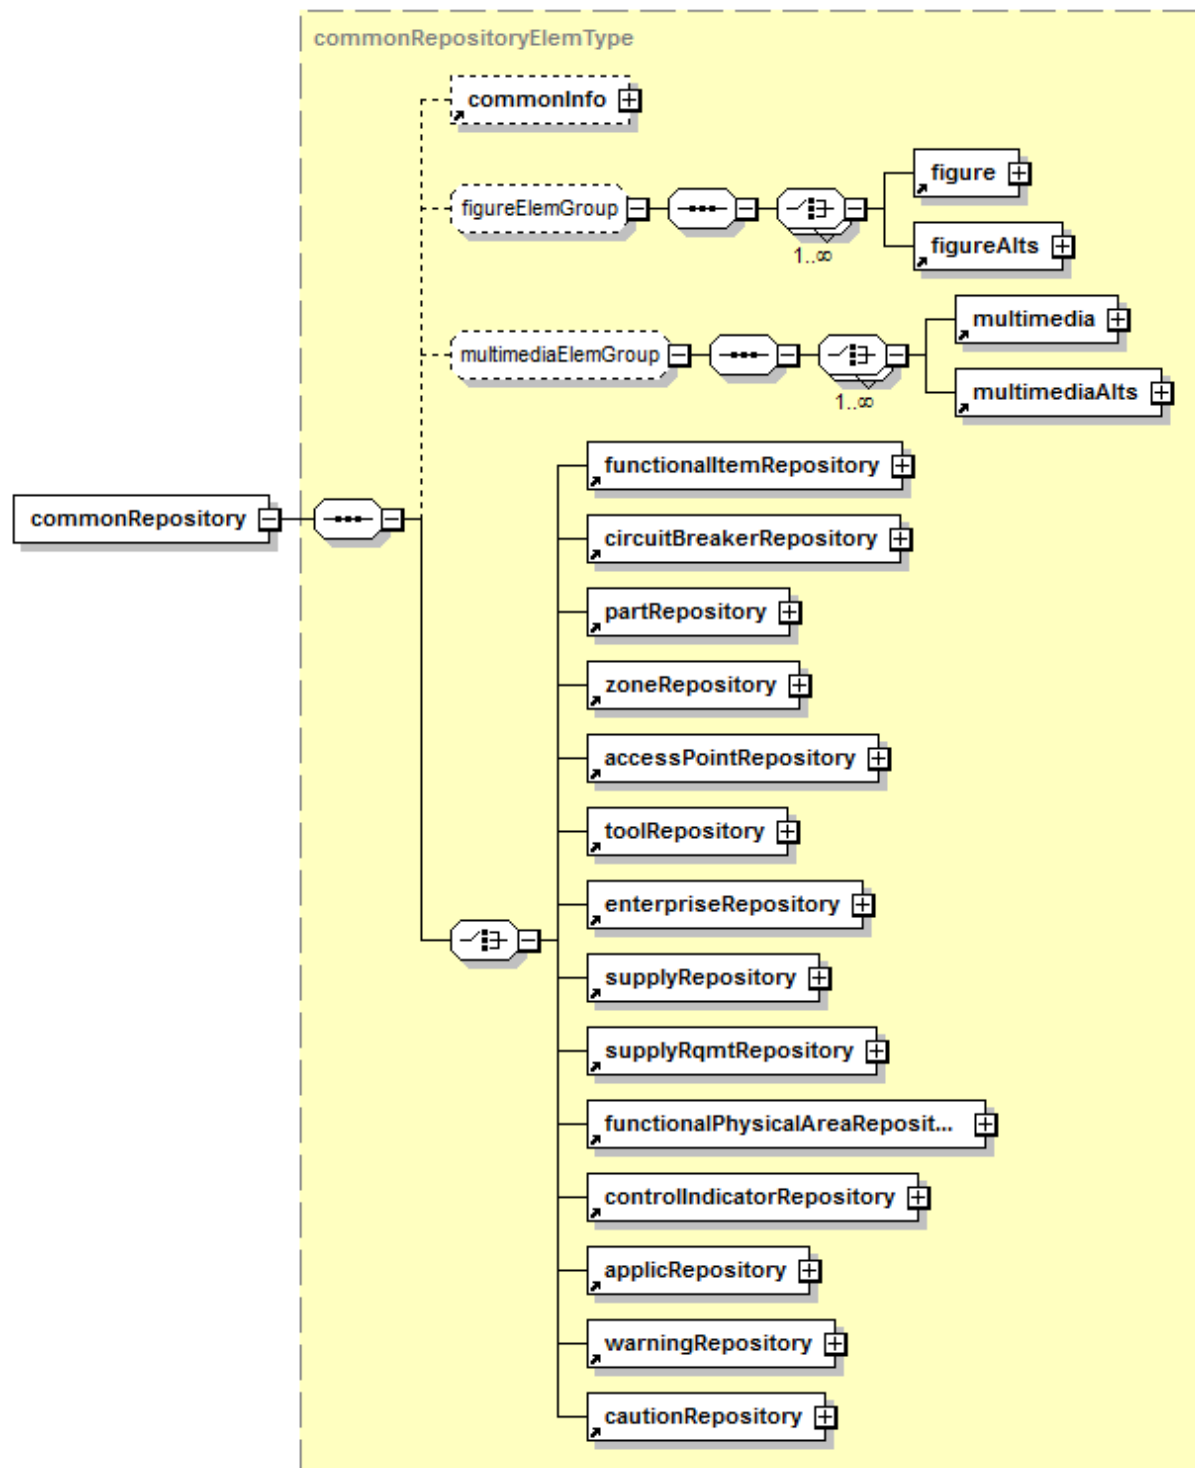

- `<refs>`, the references to data modules, publication modules and non-S1000D publications or documents given in the data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`, the applicability annotations directly collected in the data module. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`, the applicability annotations collected in the data module using the applicability annotations CIR. Refer to [Chap 3.9.5.3](#).
- `<commonRepository>`. Refer to [Para 2.1.1](#).

### 2.1.1

#### Common information repository

**Description:** The element `<commonRepository>` contains one type of CIR data module from the list of CIR data module types. For each CIR type, it is possible to add an introductory text (element `<commonInfo>`) and to store illustrations (element `<figure>` and/or `<figureAlts>`) or multimedia objects (elements `<multimedia>` and/or `<multimediaAlts>`) associated to the CIR entries.

**Markup element:** `<commonRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00005-A-001-01

Fig 2 Element *<commonRepository>*

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <commonInfo>, introductory information. Refer to [Chap 3.9.5.2.1.12](#).
- <figure>, illustrations associated to common information. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>, groups of alternate illustrations associated to common information. Refer to [Chap 4.13.3](#) for details on the alternates concept.
- <multimedia>, multimedia objects associated to common information. Refer to [Chap 7.3.3](#).
- <multimediaAlts>, groups of alternate multimedia objects associated to common information. Refer to [Chap 4.13.3](#) for details on the alternates concept.

One and only one of the following elements has to be used, depending on the information type:

- <functionalItemRepository>, for functional items. Refer to [Chap 3.9.5.2.11.1](#).
- <circuitBreakerRepository>, for circuit breakers. Refer to [Chap 3.9.5.2.11.2](#).
- <partRepository>, for parts. Refer to [Chap 3.9.5.2.11.3](#).
- <zoneRepository>, for zones. Refer to [Chap 3.9.5.2.11.4](#).
- <accessPointRepository>, for access points. Refer to [Chap 3.9.5.2.11.5](#).
- <toolRepository>, for support equipment. Refer to [Chap 3.9.5.2.11.9](#).
- <enterpriseRepository>, for enterprise information. Refer to [Chap 3.9.5.2.11.6](#).
- <supplyRepository>, for supplies (intrinsic properties). Refer to [Chap 3.9.5.2.11.7](#).
- <supplyRqmtRepository>, for supplies (requirements). Refer to [Chap 3.9.5.2.11.8](#).
- <functionalPhysicalAreaRepository>, for functional and/or physical areas. Refer to [Chap 3.9.5.2.11.10](#).
- <controlIndicatorRepository>, for control and indicators. Refer to [Chap 3.9.5.2.11.11](#).
- <applicRepository>, for applicability annotations. Refer to [Chap 3.9.5.2.11.12](#).
- <warningRepository>, for warnings. Refer to [Chap 3.9.5.2.11.13](#).
- <cautionRepository>, for cautions. Refer to [Chap 3.9.5.2.11.14](#).

## 1 General

The functional items Common Information Repository (CIR) data module is used to store information about functional items within the Product. Refer to [Chap 3.9.5.1](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Functional items CIR data module content

### 2.1 Functional item repository

**Description:** The element `<functionalItemRepository>` provides a list of functional items and their associated properties.

**Markup element:** `<functionalItemRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00006-A-001-01

Fig 1 Element `<functionalItemRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<functionalItemSpec>`. Refer to [Para 2.1.1](#).

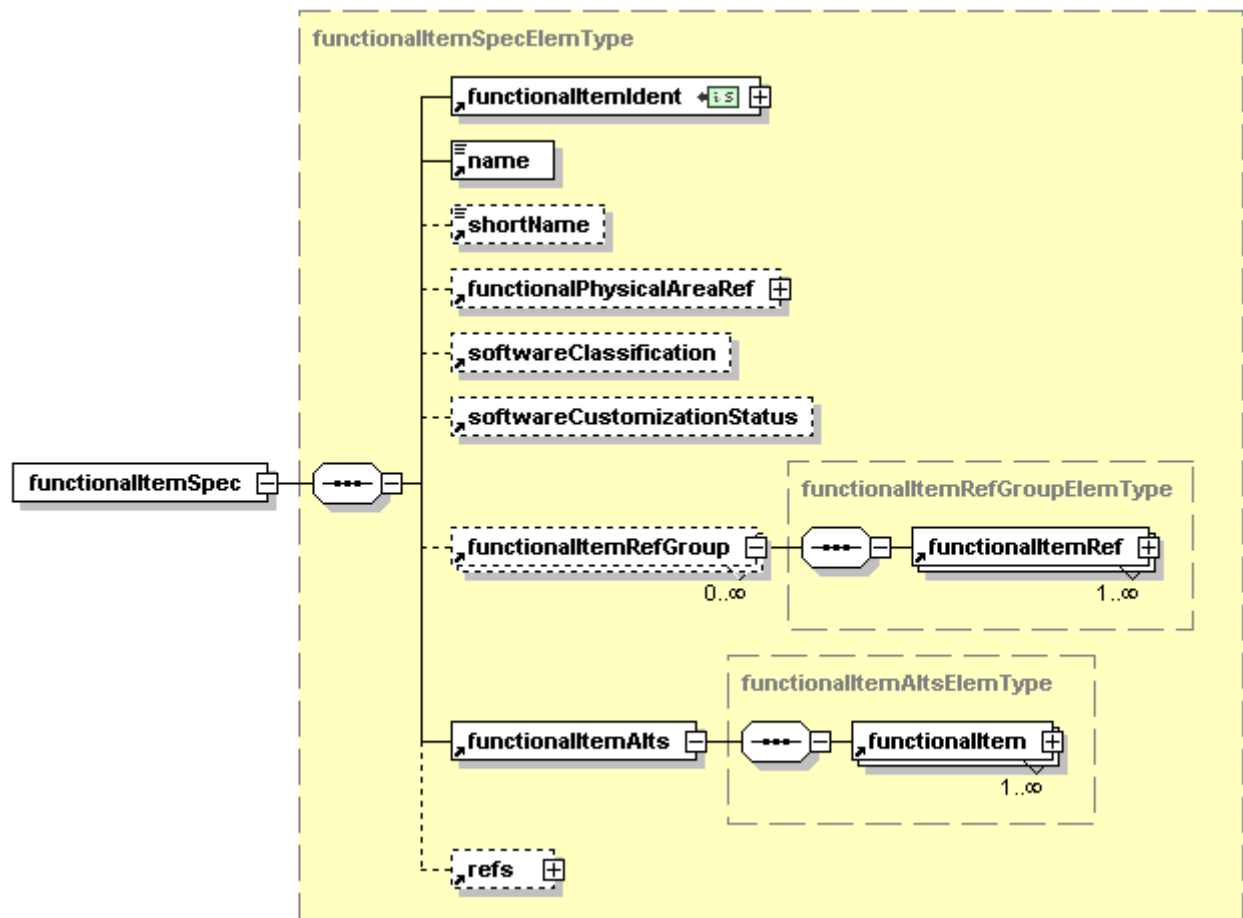

#### 2.1.1 Functional item specification

**Description:** The element `<functionalItemSpec>` contains the associated properties of one functional item.

Some properties of the functional item can vary from one product instance to another. Such properties are managed under the functional item alternates (element `<functionalItemAlts>`), which can contain a reference to an applicability annotation. Refer to [Chap 4.13.3](#) for details on the alternates concept.

For some properties appearing at both levels (eg, `<name>` or `<shortName>`), the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the parent element.

**Markup element:** `<functionalItemSpec>`

ICN-B6865-S1000D0002-001-01

Fig 2 Element `<functionalItemSpec>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<functionalItemIdent>`. Refer to [Para 2.1.1.1](#).
- `<name>`, the name of the functional item. Refer to [Chap 3.9.5.2.1.10](#).
- `<shortName>`, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- `<functionalPhysicalAreaRef>`, a reference to a functional and/or physical area of the Product. Refer to [Chap 3.9.5.2.11.10](#).
- `<softwareClassification>`. Refer to [Para 2.1.1.2](#).
- `<softwareCustomizationStatus>`. Refer to [Para 2.1.1.3](#).
- `<functionalItemRefGroup>`. Refer to [Para 2.1.1.4](#).
- `<functionalItemAlts>`. Refer to [Para 2.1.1.5](#).

- `<refs>`. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### 2.1.1.1 Functional item identifier

**Description:** The element `<functionalItemIdent>`, contrary to the attribute `id`, semantically identifies the functional item as a result of its attributes.

A functional item can be used to uniquely identify an item performing a function in a given system at a given position for a given Product.

For example a functional item can be the third pump in a hydraulic system for a given Product. Depending on the Product instance, this functional item can be mechanical or electrical and, so, can perform the function of a hydraulic pump.

The functional item is also known as the reference designator.

The codification of functional item identifier is up to the project or the organization.

**Markup element:** `<functionalItemIdent>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `functionalItemNumber` (M), the functional item number as assigned by the functional item designer. Refer to [Chap 3.9.5.1](#).
- `functionalItemType` (M), the functional item type. Projects or organizations are allowed to define their own functional item types. The attribute can have one of the following values:
  - `"fit01"` thru `"fit99"`. Refer to [Chap 3.9.6.1](#).
- `installationIdent` (O), the installation identifier
- `contextIdent` (O), the context identification which is used in combination with the attribute `manufacturerCodeValue` to ensure the uniqueness of supplier equipment data. The context identification contains an identifier, for example the part number of the next higher assembly that has been given to the assembly by the supplier.
- `manufacturerCodeValue` (O), the CAGE code of the functional item designer. As there is no standardized rule to assign a part number, the CAGE code of the functional item designer ensures the uniqueness of the functional item number.
- `itemOriginator` (O), used to indicate the origin of the equipment, for example if it is an aircraft manufacturer equipment or a supplier equipment. The attribute can have one of the following values:
  - `"orig01"` thru `"orig99"`. Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- None

##### Markup example:

```
<functionalItemIdent functionalItemNumber="8-DG-1"
functionalItemType="fit01" manufacturerCodeValue="FAPE3" />
```

### 2.1.1.2 Software classification

**Description:** The element `<softwareClassification>` is used for software classification as defined by the regulation authorities.

**Markup element:** `<softwareClassification>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `softwareClassificationValue` (M), the classification of the software. Projects or organizations are allowed to define their own software classifications. The attribute can have one of the following values:
  - "scv01" thru "scv99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Markup example:**

```
<softwareClassification softwareClassificationValue="scv05"/>
```

### 2.1.1.3 Software customization status

**Description:** The element `<softwareCustomizationStatus>` indicates if the software can be updated or customized by the operator.

**Markup element:** `<softwareCustomizationStatus>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `softwareCustomizationStatusValue` (M), the software customization status (eg, customization not allowed, customization allowed, customization mandatory). Projects or organizations are allowed to define their own software customization statuses. The attribute can have one of the following values:
  - "scs01" thru "scs99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Markup example:**

```
<softwareCustomizationStatus
softwareCustomizationStatusValue="scs01"/>
```

### 2.1.1.4 References to other functional items

**Description:** The element `<functionalItemRefGroup>` provides relationships and the types of relationships with other functional items (eg, sub-functional items or software functional items related to a hardware functional item).

Depending on the relationships, it can depend on the product instances or not. As a result, this element can be found at both container and alternate levels.

**Markup element:** `<functionalItemRefGroup>`. Refer to [Fig 2](#).

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- functionalItemRefType (M), the type of the relationship between the two functional items. Projects or organizations are allowed to define their own functional item reference types. The attribute can have one of the following values:
  - "fir01" thru "fir99". Refer to [Chap 3.9.6.1](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <functionalItemRef>, the references to the functional items. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<functionalItemRefGroup functionalItemRefType="fir03">
<functionalItemRef functionalItemNumber="1"/>
</functionalItemRefGroup>
```

#### 2.1.1.5 Functional item alternate group

**Description:** The element <functionalItemAlts> is a group of functional item alternates.

**Markup element:** <functionalItemAlts>. Refer to [Fig 2](#).

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

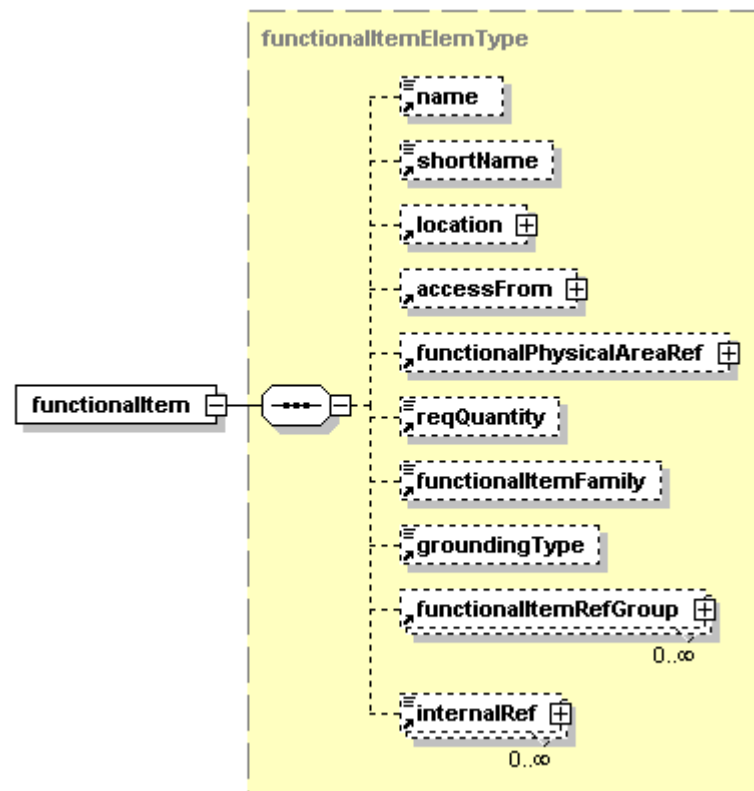

- <functionalItem>. Refer to [Para 2.1.1.6](#).

#### 2.1.1.6 Alternate functional item

**Description:** The element <functionalItem> contains information that describes the functional item and provides further information related to the functional item based on the Product configuration.

Configuration consistency between the various alternate functional items must be ensured. This means that, for a given Product configuration and under given operational conditions, only one alternate functional item is applicable at one time for a given functional item.

**Markup element:** <functionalItem>

ICN-B6865-S1000D0003-001-01

Fig 3 Element *<functionalItem>*

#### Attributes:

- applicRefId (O), the applicability information by referencing the element *<applic>*. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- altNumber (O), the alternate number to identify the alternate
- normativeComponentFlag (O), a flag to specify whether the functional item is a normative component or not. The attribute can have one of the following values:
  - "0" (D) - No, for non-normative component
  - "1" - Yes, for normative component
- sealedFlag (O), a flag to specify whether the functional item is protected with sealing material or not. The attribute can have one of the following values:
  - "0" (D) - No, for non-sealing protected functional item
  - "1" - Yes, for sealing protected functional item
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the alternate functional item. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <location>. Refer to [Para 2.1.1.6.1](#).
- <accessFrom>. Refer to [Para 2.1.1.6.2](#).
- <functionalPhysicalAreaRef>, a reference to a functional and/or physical area of the Product. Refer to [Chap 3.9.5.2.11.10](#).
- <reqQuantity>, the required quantity. Refer to [Chap 3.9.5.2.1.10](#).
- <functionalItemFamily>, the functional item family. Refer to [Para 2.1.1.6.3](#).
- <groundingType>, the grounding type or bonding segregation. Refer to [Para 2.1.1.6.4](#).
- <functionalItemRefGroup>. Refer to [Para 2.1.1.4](#).
- <internalRef>, reference to the illustration and/or multimedia file where the functional item is illustrated. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00251 - Use of the attribute altNumber in the functional items CIR:

- Decide whether to use the attribute altNumber, which values to use and allocate suitable definitions to the values.

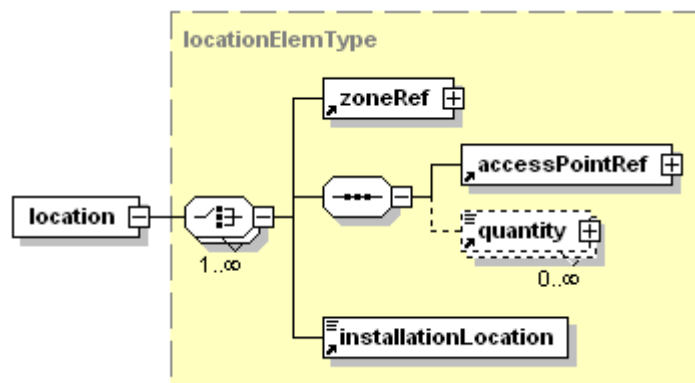

#### Markup example:

```
<functionalItem altNumber="00001" applicRefId="applic-001"
normativeComponentFlag="1">
<location><zoneRef zoneNumber="292"/></location>
</functionalItem>
```

#### 2.1.1.6.1 Functional item location

**Description:** The element <location> specifies in which zone and/or on which electric panel, with coordinates if necessary, the functional item is located.

**Markup element:** <location>

ICN-S1000D-A-03090502-A-FAPE3-00012-A-001-01

Fig 4 Element <location>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <zoneRef>, the references to the zones. Refer to [Chap 3.9.5.2.1.10](#).
- <accessPointRef>, the references to the access points. Refer to [Chap 3.9.5.2.1.10](#).
- <quantity>, the coordinates on the access panel. Refer to [Chap 3.9.5.2.1.10](#).
- <installationLocation>, the associated installation location information. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.1.1.6.2 Accesses to the functional item

**Description:** The element <accessFrom> enables specifying the zone(s) and/or access point(s) from which the functional item can be reached.

**Markup element:** <accessFrom>

ICN-S1000D-A-03090502-A-FAPE3-00013-A-001-01

Fig 5 Element <accessFrom>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <zoneRef>, the references to the zones. Refer to [Chap 3.9.5.2.1.10](#).
- <accessPointRef>, the references to the access points. Refer to [Chap 3.9.5.2.1.10](#).

#### 2.1.1.6.3 Functional item family

**Description:** The element <functionalItemFamily> contains the family equipment the functional item belongs to, for example a technological category that characterizes it.

**Markup element:** <functionalItemFamily>

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- None

**Markup example:**

```
<functionalItemFamily>Connector</functionalItemFamily>
```

**2.1.1.6.4 Grounding type**

**Description:** The element [<groundingType>](#) is used for electrical functional items (grounding points). It indicates the grounding type or bonding segregation, which is necessary to perform the appropriate ground tests after installation. The grounding type is specified according to the current type, the voltage and the system essentiality (eg, current return for 230V DC power supply in non-essential system 2). The bonding segregation is specified according to signal type and system essentiality (eg, bonding point for wire linked to essential system 1).

**Markup element:** [<groundingType>](#)

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

```
<groundingType>DC1</groundingType>
```

### 3 Example

The following example illustrates a functional item which is configuration dependent. As the zone can differ from one Product range to another, two alternate functional items have been defined.

```
<commonRepository>
<functionalItemRepository>
<functionalItemSpec>
<functionalItemIdent functionalItemNumber="40-MJ-49"
functionalItemType="fit01"/>
<name>P/BSW-MANUA) INFLATION,(DOOR U3R</name>
<functionalPhysicalAreaRef systemCode="52" subSystemCode="7"
subSubSystemCode="1" assyCode="28"/>
<functionalItemAlts>
<functionalItem altNumber="00001" applicRefId="appl-001"
normativeComponentFlag="1">
<location><zoneRef zoneNumber="292"/></location>
</functionalItem>
<functionalItem altNumber="00002" applicRefId="appl-002">
<location><zoneRef zoneNumber="293"/></location>
</functionalItem>
</functionalItemAlts>
</functionalItemSpec>
</functionalItemRepository>
</commonRepository>
```

## 1 General

The circuit breakers Common Information Repository (CIR) data module is used to store unique identification information about the circuit breakers and their electrical functions within the Product. Refer to [Chap 3.9.5.2.1.10](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Circuit breakers CIR data module content

### 2.1 Circuit breaker repository

**Description:** The element `<circuitBreakerRepository>` provides a list of circuit breakers and their associated properties.

**Markup element:** `<circuitBreakerRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00015-A-001-01

Fig 1 Element `<circuitBreakerRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<circuitBreakerSpec>`. Refer to [Para 2.1.1](#).

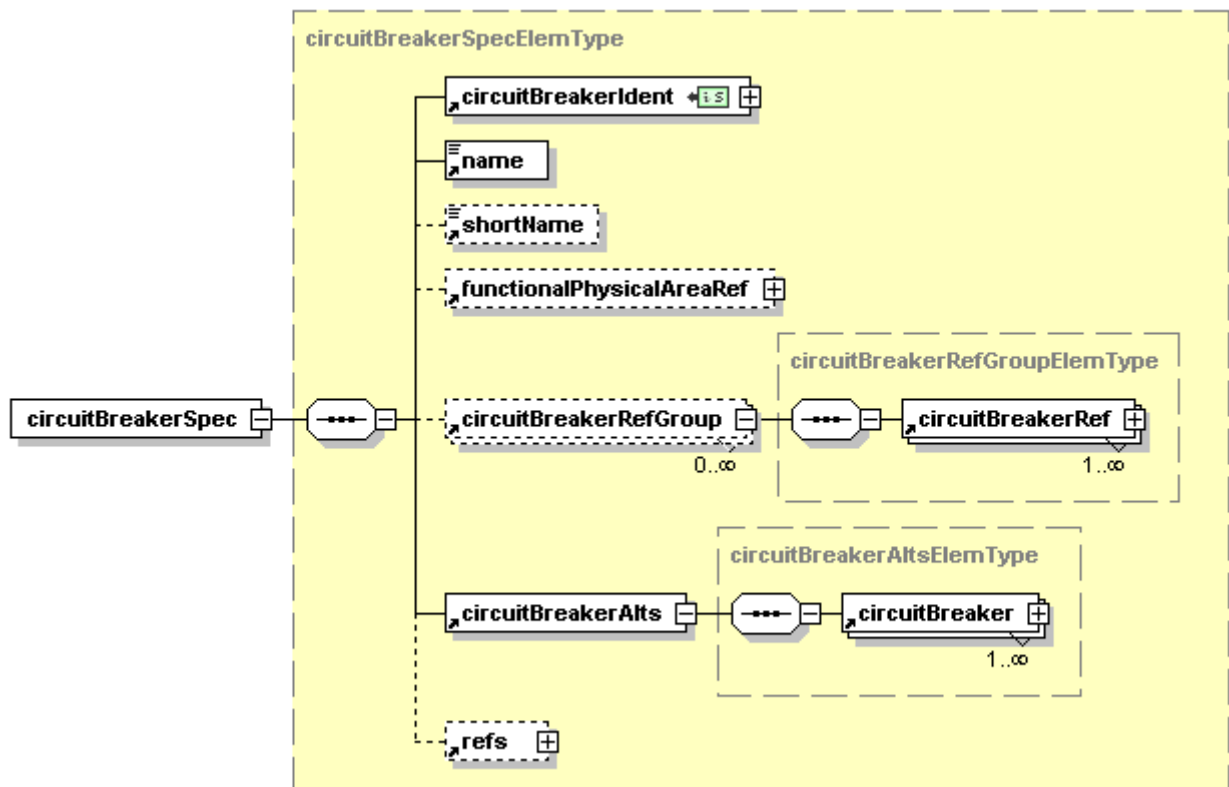

### 2.1.1 Circuit breaker specification

**Description:** The element `<circuitBreakerSpec>` contains the associated properties of one circuit breaker.

Some properties of the circuit breaker can vary from one product instance to another. Such properties are managed under the circuit breaker alternates (element `<circuitBreakerAlts>`), which can contain a reference to an applicability annotation. Refer to [Chap 4.13.3](#) for details on the alternates concept.

For some properties appearing at both levels (eg, `<name>` or `<shortName>`), the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the parent element.

Markup element: `<circuitBreakerSpec>`

ICN-B6865-S1000D0006-001-01

Fig 2 Element `<circuitBreakerSpec>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<circuitBreakerIdent>`. Refer to [Para 2.1.1.1](#).
- `<name>`, the name of the circuit breaker. Refer to [Chap 3.9.5.2.1.10](#).
- `<shortName>`, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- `<functionalPhysicalAreaRef>`, a reference to a functional and/or physical area of the Product. Refer to [Chap 3.9.5.2.11.10](#).
- `<circuitBreakerRefGroup>`. Refer to [Para 2.1.1.2](#).
- `<circuitBreakerAlts>`. Refer to [Para 2.1.1.3](#).
- `<refs>`. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<circuitBreakerSpec>
<circuitBreakerIdent circuitBreakerNumber="..." />
<name>...</name>
<circuitBreakerAlts>...</circuitBreakerAlts>
</circuitBreakerSpec>
```

## 2.1.1.1 Circuit breaker identifier

**Description:** The element `<circuitBreakerIdent>` semantically identifies the circuit breaker as a result of the constraints on its attributes. Refer to [Chap 3.9.5](#).

The circuit breaker can be used to uniquely identify a device that is used to break an electrical circuit or to render an electrical function inactive.

**Markup element:** `<circuitBreakerIdent>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `circuitBreakerNumber` (M), the circuit breaker number as assigned by the circuit breaker designer. Refer to [Chap 3.9.5.2.1.10](#).
- `installationIdent` (O), the installation identifier
- `contextIdent` (O), the context identification which is used in combination with the attribute `manufacturerCodeValue` to ensure the uniqueness of supplier circuit breaker data. The context identification contains an identifier, for example the part number of the next higher assembly that has been given to the assembly by the supplier.
- `manufacturerCodeValue` (O), the CAGE code of the circuit breaker designer. As there is no standardized rule to assign a part number, the CAGE code of the circuit breaker designer ensures the uniqueness of the circuit breaker number.
- `itemOriginator` (O), used to indicate the origin of the circuit breaker, for example if it is an aircraft manufacturer circuit breaker or a supplier circuit breaker. The attribute can have one of the following values:
  - "orig01" thru "orig99". Refer to [Chap 3.9.6.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<circuitBreakerIdent circuitBreakerNumber="9LW" />
```

## 2.1.1.2 References to other circuit breakers

**Description:** The element `<circuitBreakerRefGroup>` provides relationships and the types of relationships with other circuit breakers. Refer to [Fig 2](#).

**Markup element:** `<circuitBreakerRefGroup>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- circuitBreakerRefType (M), the type of the relationship with the circuit breaker. Projects or organizations are allowed to define their own circuit breaker reference types. The attribute can have one of the following values:
  - "cbr01" thru "cbr99". Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<circuitBreakerRef>](#), the references to the circuit breakers. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<circuitBreakerRefGroup circuitBreakerRefType="cbr01">
<circuitBreakerRef .../>
</circuitBreakerRefGroup>
```

#### 2.1.1.3 Circuit breaker alternate group

**Description:** The element [<circuitBreakerAlts>](#) is a group of circuit breaker alternates. Refer to [Fig 2](#).

**Markup element:** [<circuitBreakerAlts>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

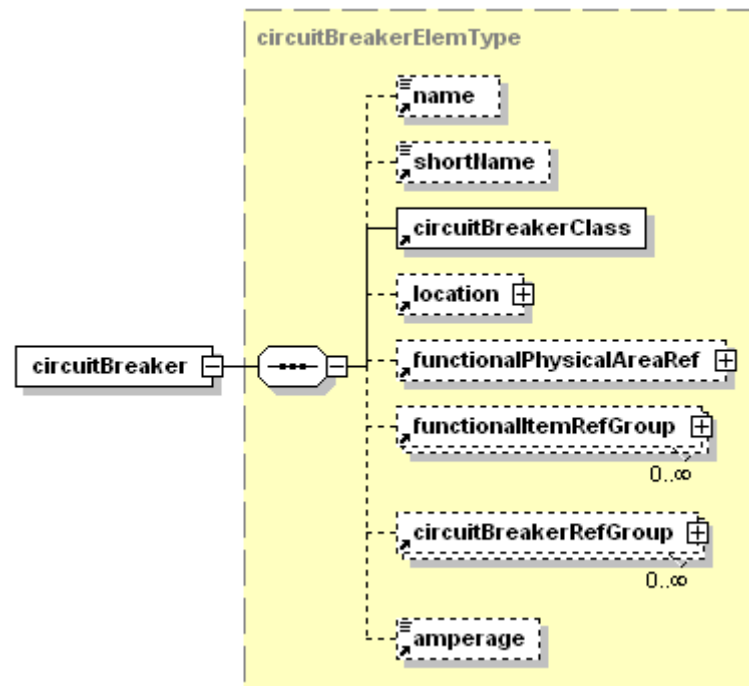

- [<circuitBreaker>](#). Refer to [Para 2.1.1.4](#).

#### 2.1.1.4 Alternate circuit breaker

**Description:** The element [<circuitBreaker>](#) contains information that describes the circuit breaker and provides further information related to the circuit breaker based on the Product configuration.

Configuration consistency between the various alternate circuit breakers must be ensured. This means that for a given Product configuration and under given operational conditions, only one alternate circuit breaker is applicable at one time for a given circuit breaker.

**Markup element:** [<circuitBreaker>](#)

ICN-S1000D-A-03090502-A-FAPE3-00020-A-001-01

Fig 3 Element `<circuitBreaker>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altNumber` (O), the alternate number to identify the alternate
- `monitoredFlag` (O), a flag to specify whether the circuit breaker is monitored or not. The attribute can have one of the following values:
  - "1" - Yes, for monitored circuit breakers
  - "0" - No, for non-monitored circuit breakers
- `collaredCircuitBreakerFlag` (O), a flag to specify whether the circuit breaker is fixed with a collar. The attribute can have one of the following values:
  - "1" - Yes, for collared circuit breakers
  - "0" - No, for non-collared circuit breakers
- `provisionedFlag` (O), a flag to specify whether the circuit breaker is a provisioned one. The attribute can have one of the following values:
  - "1" - Yes, for provisioned circuit breakers
  - "0" - No, for non-provisioned circuit breakers
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the alternate circuit breaker. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <circuitBreakerClass>. Refer to [Para 2.1.1.4.1](#).
- <location>. Refer to [Para 2.1.1.4.2](#).
- <functionalPhysicalAreaRef>, a reference to a functional and/or physical area of the Product. Refer to [Chap 3.9.5.2.11.10](#).
- <functionalItemRefGroup>, references to associated functional items. Refer to [Chap 3.9.5.2.11.1](#).
- <circuitBreakerRefGroup>. Refer to [Para 2.1.1.2](#).
- <amperage>. Refer to [Para 2.1.1.4.3](#).

#### Business rule decision point BRDP-S1-00252 - Use of the attribute altNumber in the circuit breakers CIR:

- Decide whether to use the attribute altNumber, which values to use and allocate suitable definitions to the values.

#### Markup example:

```
<circuitBreaker applicRefId="appl-001">
...
</circuitBreaker>
```

#### 2.1.1.4.1 Circuit breaker class

**Description:** The element <circuitBreakerClass> indicates whether the circuit breaker is electronic or electro-mechanic.

#### Markup element: <circuitBreakerClass>

##### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- circuitBreakerType (M), the circuit breaker type (eg, electronic, electro-mechanic). Projects or organizations are allowed to define their own circuit breaker types. The attribute can have one of the following values:
  - "cbt01" thru "cbt99". Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

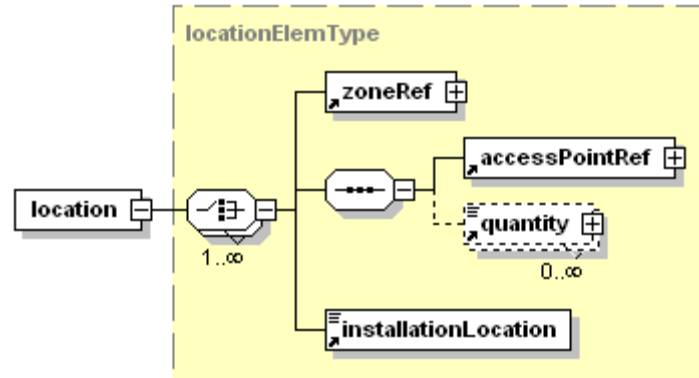

#### Markup example:

```
<circuitBreakerClass circuitBreakerType="cbt01"/>
```

#### 2.1.1.4.2 Circuit breaker location

**Description:** The element `<location>` specifies in which zone and/or on which electric panel, with coordinates if necessary, the circuit breaker is located.

**Markup element:** `<location>`

ICN-S1000D-A-03090502-A-FAPE3-00022-A-001-01

Fig 4 Element `<location>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<zoneRef>`, the references to the zones. Refer to [Chap 3.9.5.2.1.10](#).
- `<accessPointRef>`, the references to the access points. Refer to [Chap 3.9.5.2.1.10](#).
- `<quantity>`, the coordinates on the access panel. Refer to [Chap 3.9.5.2.1.10](#).
- `<installationLocation>`, the associated installation location information. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.1.1.4.3 Circuit breaker amperage

**Description:** The element `<amperage>` contains the amperage information of the circuit breaker.

**Markup element:** `<amperage>`

#### Attributes:

- `unitOfMeasure` (O), the unit of measure for the amperage

#### Child elements:

- None

#### Markup example:

```
<amperage unitOfMeasure="A">10</amperage>
```

### 3 Example

## 1 General

The parts Common Information Repository (CIR) data module is used to capture and represent parts and their associated properties.

The part identification can be used to uniquely identify an item of the Product, forming part of an assembly or subassembly which is not normally broken down further.

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Parts CIR data module content

### 2.1 Part repository

**Description:** The element `<partRepository>` provides a list of parts and their associated properties.

**Markup element:** `<partRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00024-A-001-01

Fig 1 Element `<partRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

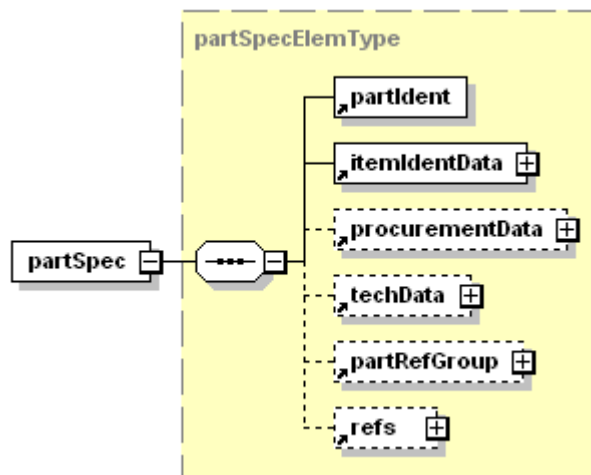

#### Child elements:

- `<partSpec>`. Refer to [Para 2.1.1](#).

### 2.1.1 Part specification

**Description:** The element `<partSpec>` contains the associated properties of one part.

**Markup element:** `<partSpec>`

ICN-S1000D-A-03090502-A-FAPE3-00025-A-001-01

Fig 2 Element `<partSpec>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<partIdent>`. Refer to [Para 2.1.1.1](#).
- `<itemIdentData>`. Refer to [Chap 3.9.5.2.7](#).
- `<procurementData>`. Refer to [Chap 3.9.5.2.7](#).
- `<techData>`. Refer to [Chap 3.9.5.2.7](#).
- `<partRefGroup>`. Refer to [Chap 3.9.5.2.7](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

#### 2.1.1.1 Part identifier

**Description:** The element `<partIdent>`, contrary to the attribute `id`, semantically identifies the part as a result of its attributes.

**Markup element:** `<partIdent>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- partNumberValue (M), the part number together with the attribute `manufacturerCodeValue`, as the identifier of the part, in the part repository (implicit reference method). Refer to [Chap 3.9.5.2.7](#).
- manufacturerCodeValue (M), the CAGE code of the part manufacturer. As there is no standardized rule to assign a part number, the CAGE code of the part manufacturer ensures the uniqueness of a part number. Refer to [Chap 3.9.5.2.7](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

## 1 General

The zones Common Information Repository (CIR) data module is used to store information about zones within the Product. Refer to [Chap 3.4](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Zones CIR data module content

### 2.1 Zone repository

**Description:** The element `<zoneRepository>` provides a list of zones and their associated properties.

**Markup element:** `<zoneRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00027-A-001-01

Fig 1 Element `<zoneRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<zoneSpec>`. Refer to [Para 2.1.1](#).

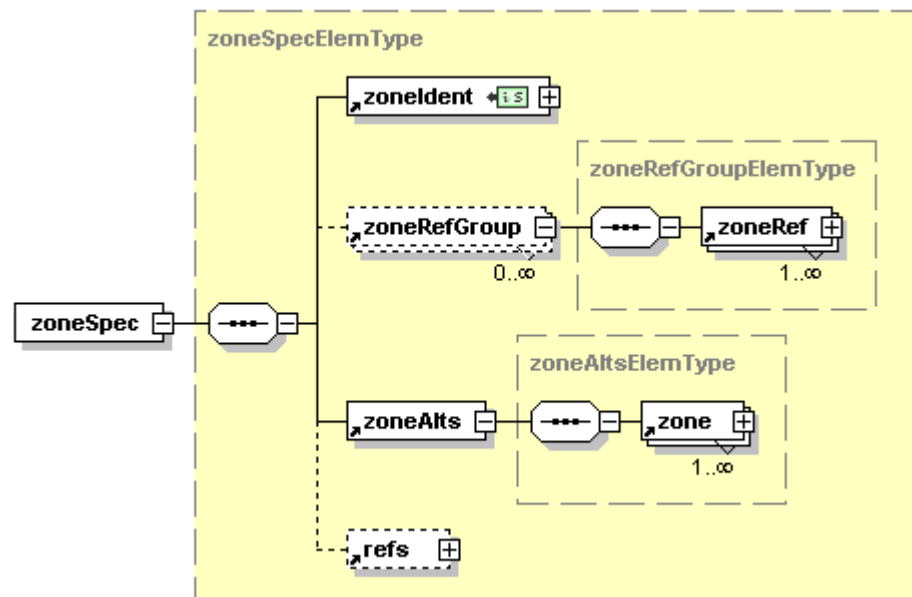

### 2.1.1 Zone specification

**Description:** The element `<zoneSpec>` contains the associated properties of one zone.

Some properties of the zone can vary from one product instance to another. Such properties are managed under the zone alternates (element `<zoneAlts>`), which can contain a reference to an applicability annotation. Refer to [Chap 4.13.3](#) for details on the alternates concept.

For some properties appearing at both levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the parent element.

**Markup element:** `<zoneSpec>`

ICN-B6865-S1000D0007-001-01

Fig 2 Element &lt;zoneSpec&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- zoneType (O), the type of the zone. The attribute can have one of the following values:
  - "majorzone" - for a major structural area of the Product
  - "subzone" - for a subdivision of a major structural area of the Product
  - "specifzone" - for a specific zone of the Product
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <zoneIdent>. Refer to [Para 2.1.1.1](#).
- <zoneRefGroup>. Refer to [Para 2.1.1.2](#).
- <zoneAlts>. Refer to [Para 2.1.1.3](#).
- <refs>. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<zoneSpec>
  <zoneIdent zoneNumber="..." />
  <zoneAlts>...</zoneAlts>
</zoneSpec>
```

## 2.1.1.1 Zone identifier

**Description:** The element `<zoneIdent>`, contrary to the attribute `id`, semantically identifies the zone as a result of its attributes.

**Markup element:** `<zoneIdent>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `zoneNumber` (M), the zone number. Refer to [Chap 3.4](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<zoneIdent zoneNumber="121"/>
```

## 2.1.1.2 References to other zones

**Description:** The element `<zoneRefGroup>` provides relationships and the types of relationships with other zones (eg, subzones). A proper use of this element enables the retrieval the zone breakdown (major zones that contain subzones that contain specific zones).

The types of relationships depend on the configuration of the Product. As a result, this element can be found at both the container and the alternate levels.

**Markup element:** `<zoneRefGroup>`. Refer to [Fig 2](#).

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `zoneRefType` (M), the type of the relationship between the two child zones
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<zoneRef>`, the references to the zones. The targets must be zone containers. Refer to [Chap 3.9.5.2.1.10](#).

**Business rule decision point BRDP-S1-00253 - Use of the attribute `zoneRefType`:**

- Decide which values (eg, subzones) to use for the attribute `zoneRefType` and allocate suitable definitions to the values.

**Markup example:**

```
<zoneRefGroup zoneRefType="breakdown">
  <zoneRef .../>
</zoneRefGroup>
```

## 2.1.1.3 Zone alternate group

**Description:** The element `<zoneAlts>` is a group of zone alternates.

**Markup element:** `<zoneAlts>`. Refer to [Fig 2](#).

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

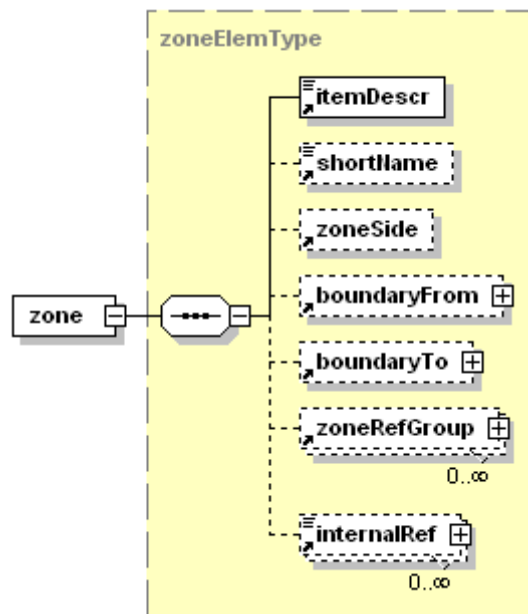

**Child elements:**

- `<zone>`. Refer to [Para 2.1.1.4](#).

## 2.1.1.4 Alternate zone

**Description:** The element `<zone>` contains information that describes the zone and provides further information related to the zone based on the Product configuration.

**Markup element:** `<zone>`

ICN-S1000D-A-03090502-A-FAPE3-00032-A-001-01

Fig 3 Element `<zone>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `altNumber` (O), the alternate number to identify the alternate
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<itemDescr>`. Refer to [Para 2.1.1.4.1](#).
- `<shortName>`, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- `<zoneSide>`. Refer to [Para 2.1.1.4.2](#).
- `<boundaryFrom>`. Refer to [Para 2.1.1.4.3](#).
- `<boundaryTo>`. Refer to [Para 2.1.1.4.3](#).
- `<zoneRefGroup>`. Refer to [Para 2.1.1.2](#).
- `<internalRef>`, reference to the illustration and/or multimedia file where the zone is illustrated. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00254 - Use of the attribute `altNumber` in the zones CIR:

- Decide whether to use the attribute `altNumber`, which values to use and allocate suitable definitions to the values.

#### Markup example:

```
<zone applicRefId="applic-001">
...
</zone>
```

#### 2.1.1.4.1 Description

**Description:** The element `<itemDescr>` is used to contain the textual description of the parent element.

#### Markup element: `<itemDescr>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

### Markup example:

```
<zone>
<itemDescr>LOWER THIRD OF FUSELAGE (BELOW CABIN FLOOR) INCLUDING
RADOME TO FORWARD FACE OF REAR PRESSURE BULKHEAD NOSE CONE
STA650 TO FR95</itemDescr>
...
</zone>
```

#### 2.1.1.4.2 Zone side

**Description:** The element `<zoneSide>` indicates on which side of the Product the zone is located.

**Markup element:** `<zoneSide>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `zoneSideValue` (M), the side of the Product where the zone is located. The attribute can have one of the following values:
  - `"lh"` - for a zone located on the left side of the Product
  - `"lr"` - when the zone is not located on any side of the Product
  - `"rh"` - for a zone located on the right side of the Product
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

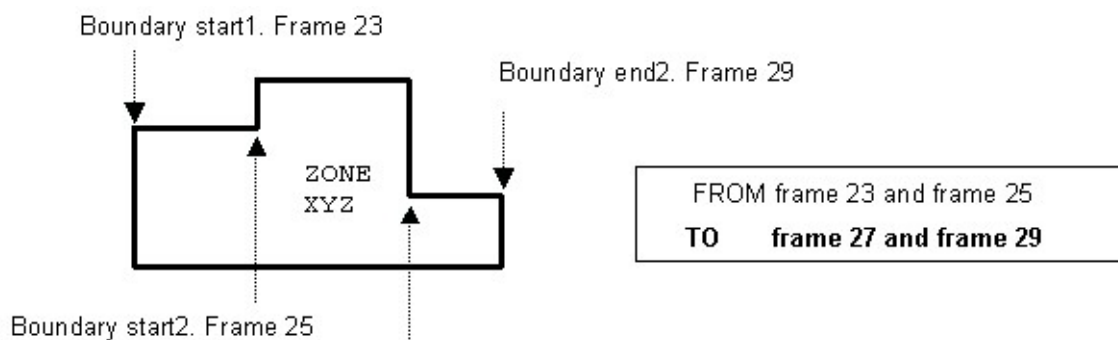

### Markup example:

```
<zoneSide zoneSideValue="lh"/>
```

#### 2.1.1.4.3 Zone boundaries

**Description:** The elements `<boundaryFrom>` and `<boundaryTo>` are used to define the boundaries of a zone, respectively the start and the end boundaries.

A zone can have several "from" boundaries and several "to" boundaries.

ICN-S1000D-A-030905-A-FAPE3-00007-A-001-01

Fig 4 Zone boundaries

Markup elements: `<boundaryFrom>` and `<boundaryTo>`

ICN-S1000D-A-03090502-A-FAPE3-00035-A-001-01

Fig 5 Element `<boundaryFrom>`

ICN-S1000D-A-03090502-A-FAPE3-00036-A-001-01

Fig 6 Element `<boundaryTo>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<boundary>`. Refer to [Para 2.1.1.4.4](#).

#### 2.1.1.4.4 Boundary

**Description:** The element `<boundary>` describes a boundary, which can be expressed textually or with specific measures (eg, rib or frame).

Markup element: `<boundary>`

ICN-S1000D-A-03090502-A-FAPE3-00037-A-001-01

Fig 7 Element `<boundary>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- textual characters. Refer to [Chap 3.9.5](#).
- **<quantity>**, expression of the boundary in terms of stringers, ribs, frames or stations. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<boundary>Boundary start1. Frame 23</boundary>
```

## 1 General

The access points Common Information Repository (CIR) data module is used to store information about access points and their functions. Refer to [Chap 3.4](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Access points CIR data module content

### 2.1 Access point repository

**Description:** The element `<accessPointRepository>` provides a list of access points and their associated properties.

**Markup element:** `<accessPointRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00038-A-001-01

Fig 1 Element `<accessPointRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<accessPointSpec>`. Refer to [Para 2.1.1](#).

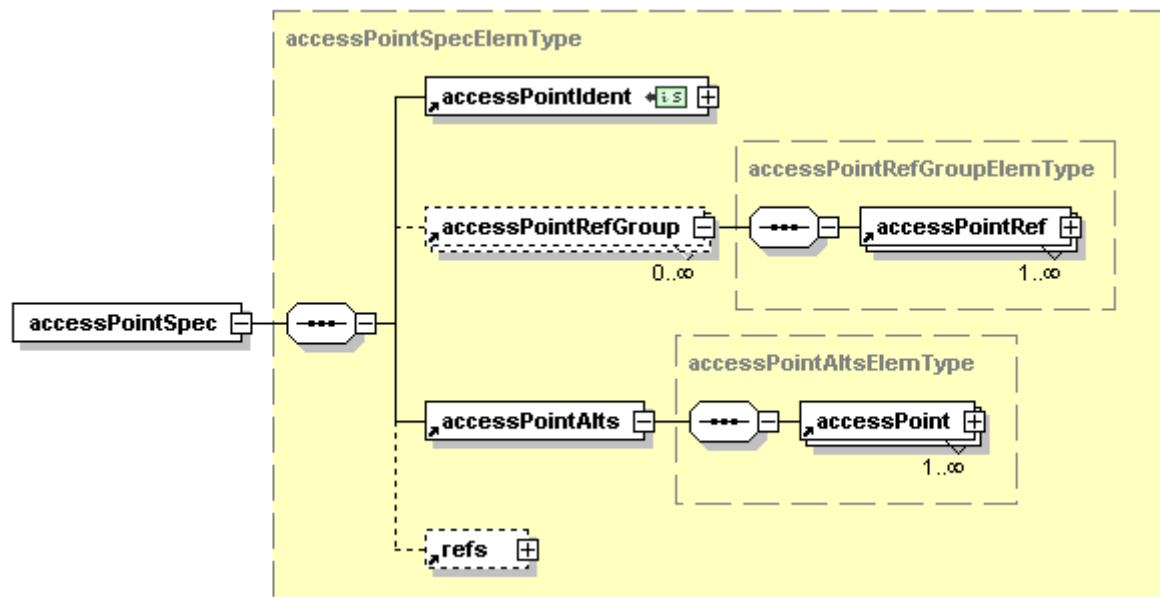

### 2.1.1 Access point specification

**Description:** The element `<accessPointSpec>` contains the associated properties for one access point.

Some properties of the access point can vary from one product instance to another. Such properties are managed under the access point alternates (element `<accessPointAlts>`), which can contain a reference to an applicability annotation. Refer to [Chap 4.13.3](#) for details on the alternates concept.

For some properties appearing at both levels, the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the parent element.

**Markup element:** `<accessPointSpec>`

ICN-B6865-S1000D0008-001-01

Fig 2 Element &lt;accessPointSpec&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <accessPointIdent>. Refer to [Para 2.1.1.1](#).
- <accessPointRefGroup>. Refer to [Para 2.1.1.2](#).
- <accessPointAlts>. Refer to [Para 2.1.1.3](#).
- <refs>. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### Markup example:

```

<accessPointSpec>
<accessPointIdent accessPointNumber="..." />
<accessPointAlts>...</accessPointAlts>
</accessPointSpec>

```

#### 2.1.1.1 Access point identifier

**Description:** The element <accessPointIdent>, contrary to the attribute id, semantically identifies the access point as a result of its attributes.

**Markup element:** <accessPointIdent>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- accessPointNumber (M). Refer to [Chap 3.9.5.2.1.10](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<accessPointIdent accessPointNumber="121"/>
```

## 2.1.1.2 References to other access points

**Description:** The element [<accessPointRefGroup>](#) provides relationships and the types of relationships with other access points (eg, subaccess points).

The types of relationships depend on the configuration of the Product. As a result, this element can be found at both container and alternate levels.

**Markup element:** [<accessPointRefGroup>](#). Refer to [Fig 2](#).

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- accessPointRefType (M), the type of the relationship between the two access points
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<accessPointRef>](#), the references to the access points. Refer to [Chap 3.9.5.2.1.10](#).

**Business rule decision point BRDP-S1-00255 - Use of the attribute [accessPointRefType](#):**

- Decide which values (eg, subaccess points) to use for the attribute [accessPointRefType](#) and allocate suitable definitions to the values.

**Markup example:**

```
<accessPointRefGroup accessPointRefType="contains">
<accessPointRef .../>
</accessPointRefGroup>
```

## 2.1.1.3 Access point alternate group

**Description:** The element [<accessPointAlts>](#) is a group of access point alternates.

**Markup element:** [<accessPointAlts>](#). Refer to [Fig 2](#).

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

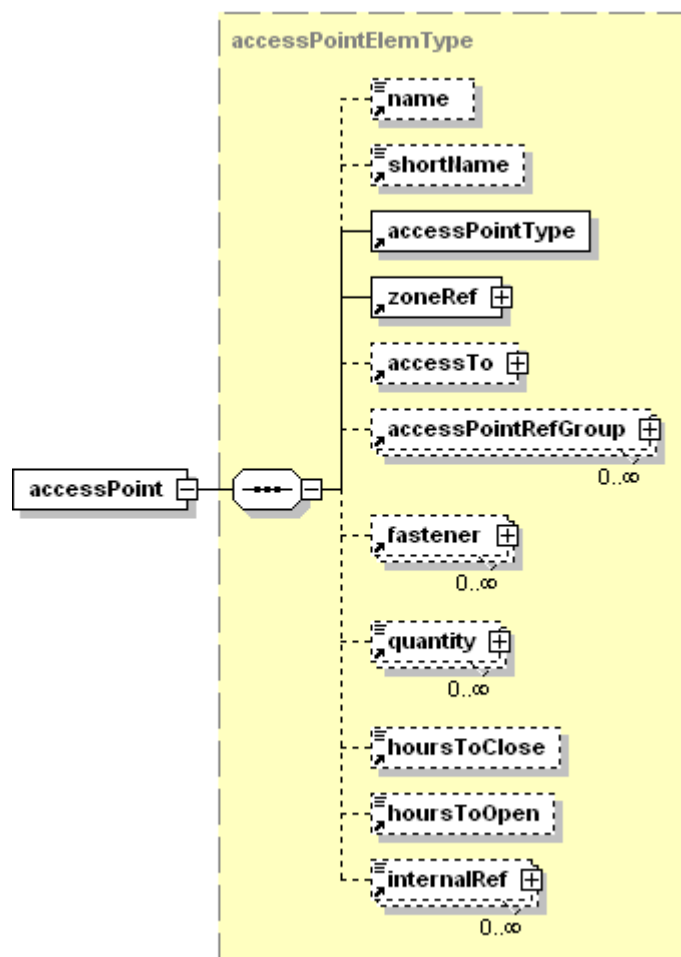

#### Child elements:

- [<accessPoint>](#). Refer to [Para 2.1.1.4](#).

#### 2.1.1.4 Alternate access point

**Description:** The element [<accessPoint>](#) contains information that describes the access point and provides further information related to the access point based on the Product configuration.

**Markup element:** [<accessPoint>](#)

ICN-S1000D-A-03090502-A-FAPE3-00043-A-001-01

Fig 3 Element [<accessPoint>](#)

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- altNumber (O), the alternate number to identify the alternate
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the access point. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, the abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <accessPointType>. Refer to [Para 2.1.1.4.1](#).
- <zoneRef>. The zone where the access point is located. The target must be a zone container. Refer to [Chap 3.9.5.2.1.10](#).
- <accessTo>. Refer to [Para 2.1.1.4.2](#).
- <accessPointRefGroup>. Refer to [Para 2.1.1.2](#).
- <fastener>. Refer to [Para 2.1.1.4.4](#).
- <quantity>, the access point dimensions. Refer to [Chap 3.9.5.2.1.10](#).
- <hoursToClose>. Refer to [Para 2.1.1.4.7](#).
- <hoursToOpen>. Refer to [Para 2.1.1.4.8](#).
- <internalRef>, reference to the illustration and/or multimedia file where the access point is illustrated. Refer to [Chap 3.9.5.2.1.2](#).

#### Business rule decision point BRDP-S1-00256 - Use of the attribute altNumber in the access points CIR:

- Decide whether to use the attribute altNumber, which values to use and allocate suitable definitions to the values.

#### Markup example:

```
<accessPoint applicRefId="appl-001">
<accessPointType .../>
<zoneRef .../>
</accessPoint>
```

#### 2.1.1.4.1 Access point type

**Description:** The element <accessPointType> is used to specify, thru its attribute, whether the access point is a panel, a door, an electrical panel or any other type of access point.

#### Markup element: <accessPointType>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- accessPointTypeValue (M), the access point type value. Projects or organizations are allowed to define their own access point types. The attribute can have one of the following values:
  - "accpn101" thru "accpn199". Refer to [Chap 3.9.6.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<accessPointType accessPointTypeValue="accpn101"/>
```

#### 2.1.1.4.2 Items reachable from the access point

**Description:** The element [<accessTo>](#) allows listing items that can be reached from the access point. Those items can be functional items or other items.

**Markup element:** [<accessTo>](#)

ICN-S1000D-A-03090502-A-FAPE3-00045-A-001-01

Fig 4 Element [<accessTo>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<functionalItemRef>](#), the references to the functional items. Refer to [Chap 3.9.5.1](#).
- [<otherItems>](#). Refer to [Para 2.1.1.4.3](#).

#### 2.1.1.4.3 Other items

**Description:** The element [<otherItems>](#) textually describes which items can be reached from the access point.

**Markup element:** [<otherItems>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<otherItems>INTERNAL STRUCTURE, ELECTRICAL WIRING, CONNECTORS
PLATE</otherItems>
```

#### 2.1.1.4.4 Fastener

**Description:** The element `<fastener>` is used to store access point fastener information.

**Markup element:** `<fastener>`

ICN-S1000D-A-03090502-A-FAPE3-00047-A-001-01

Fig 5 Element `<fastener>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- hingedFastenerFlag (O), a flag to indicate if the access point is hinged or not. The attribute can have one of the following values:
  - "1" - Yes, for hinged access points
  - "0" - No, for non-hinged access points
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<fastenerType>`. Refer to [Para 2.1.1.4.5](#).
- `<fastenerQuantity>`. Refer to [Para 2.1.1.4.6](#).

**Markup example:**

```
<fastener hingedFastenerFlag="0">
<fastenerType>...</fastenerType>
```

```
<fastenerQuantity>...</fastenerQuantity>  
</fastener>
```

#### 2.1.1.4.5 *Fastener type*

**Description:** The element `<fastenerType>` contains the type of the fastener.

**Markup element:** `<fastenerType>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<fastenerType>SF</fastenerType>
```

#### 2.1.1.4.6 *Fastener quantity*

**Description:** The element `<fastenerQuantity>` contains the quantity of fasteners.

**Markup element:** `<fastenerQuantity>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<fastenerQuantity>8</fastenerQuantity>
```

#### 2.1.1.4.7 *Elapsed time to close the access point*

**Description:** The element `<hoursToClose>` contains the elapsed time necessary to close the access point, in hours.

**Markup element:** `<hoursToClose>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<hoursToClose>0,2</hoursToClose>
```

#### 2.1.1.4.8 *Elapsed time to open the access point*

**Description:** The element `<hoursToOpen>` contains the elapsed time necessary to open the access point, in hours.

**Markup element:** `<hoursToOpen>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<hoursToOpen>0,2</hoursToOpen>
```

## 1 General

The enterprise information Common Information Repository (CIR) data module is used store information about an enterprise within the project. Refer to [Chap 3.9.5.2.7](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Enterprise information CIR data module content

### 2.1 Enterprise list repository

**Description:** The element `<enterpriseRepository>` contains a list of enterprise descriptions.

**Markup element:** `<enterpriseRepository>`

ICN-1654N-S1000D0002-001-01

Fig 1 Element `<enterpriseRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<enterpriseSpec>`. Refer to [Para 2.2](#).

#### Markup example:

```

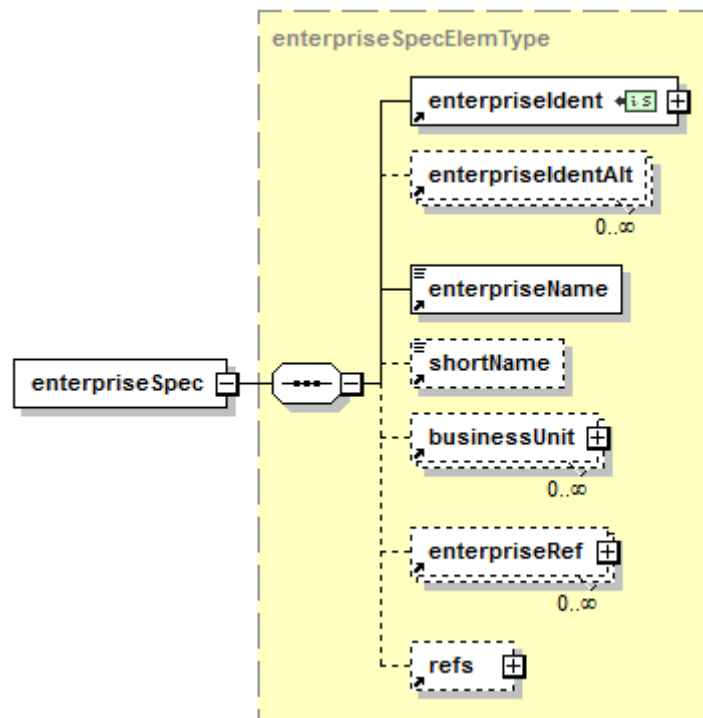

<enterpriseRepository>
<enterpriseSpec id="C001">
...
</enterpriseSpec>
</enterpriseRepository>

```

## 2.2 Enterprise specification

**Description:** The element `<enterpriseSpec>` contains the unique enterprise information for any enterprise that is involved in the development or supply of the Product. It contains information about the enterprise such as manufacturer code, enterprise name and business unit.

Markup element: `<enterpriseSpec>`

ICN-1654N-S1000D0003-001-01

Fig 2 Element `<enterpriseSpec>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<enterpriseIdent>`. Refer to [Para 2.3](#).
- `<enterpriseIdentAlt>`. Refer to [Para 2.4](#).
- `<enterpriseName>`. Refer to [Para 2.5](#).
- `<shortName>`, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- `<businessUnit>`. Refer to [Para 2.6](#).
- `<enterpriseRef>`. Refer to [Para 2.7](#).
- `<refs>`. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<enterpriseSpec id="C001">
...
</enterpriseSpec>
```

## 2.3 Enterprise identification

**Description:** The element `<enterpriseIdent>` identifies an enterprise, thru its CAGE code.

**Markup element:** `<enterpriseIdent>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `manufacturerCodeValue` (M), the CAGE code of the enterprise
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<enterpriseIdent manufacturerCodeValue="KZ444" />
```

## 2.4 Alternate enterprise identification

**Description:** The element `<enterpriseIdentAlt>` provides an alternate method of identifying an enterprise where the enterprise does not have a CAGE code.

**Markup element:** `<enterpriseIdentAlt>`

**Attributes:**

- `altCode` (M), the enterprise identification code when no CAGE code is available
- `altCodeType` (M), the type of code being used

**Child elements:**

- None

**Markup example:**

```
<enterpriseIdentAlt altCode="1235" altCodeType="DUNS" />
```

## 2.5 Enterprise name

**Description:** The element `<enterpriseName>` contains a text string identifying the name of the enterprise.

**Markup element:** `<enterpriseName>`

**Attributes:**

- None

**Child elements:**

- None

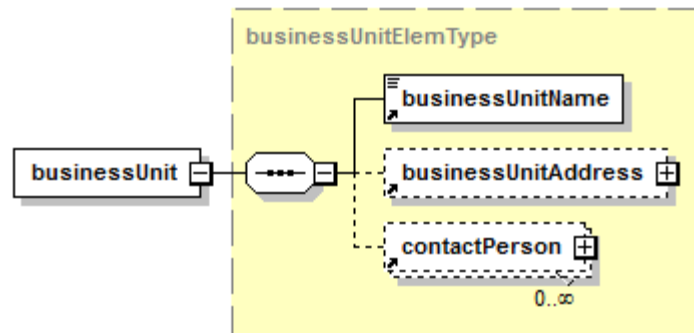

**Markup example:**

```
<enterpriseName>UTOPIA plc</enterpriseName>
```

## 2.6 Business unit

**Description:** The element `<businessUnit>` contains information about the business unit, including name, address and contacts.

**Markup element:** `<businessUnit>`

ICN-1654N-S1000D0004-001-01

Fig 3 Element `<businessUnit>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<businessUnitName>`. Refer to [Para 2.6.1](#).
- `<businessUnitAddress>`. Refer to [Para 2.6.2](#).
- `<contactPerson>`. Refer to [Para 2.6.3](#).

### Markup example:

```
<businessUnit>
<businessUnitName>Customers Services Business
Line</businessUnitName>
<businessUnitAddress>
...
</businessUnitAddress>
</businessUnit>
```

### 2.6.1 Business unit name

**Description:** The element `<businessUnitName>` contains a string identifying the name of the business unit.

**Markup element:** `<businessUnitName>`

### Attributes:

- None

---

**Child elements:**

- None

**Markup example:**

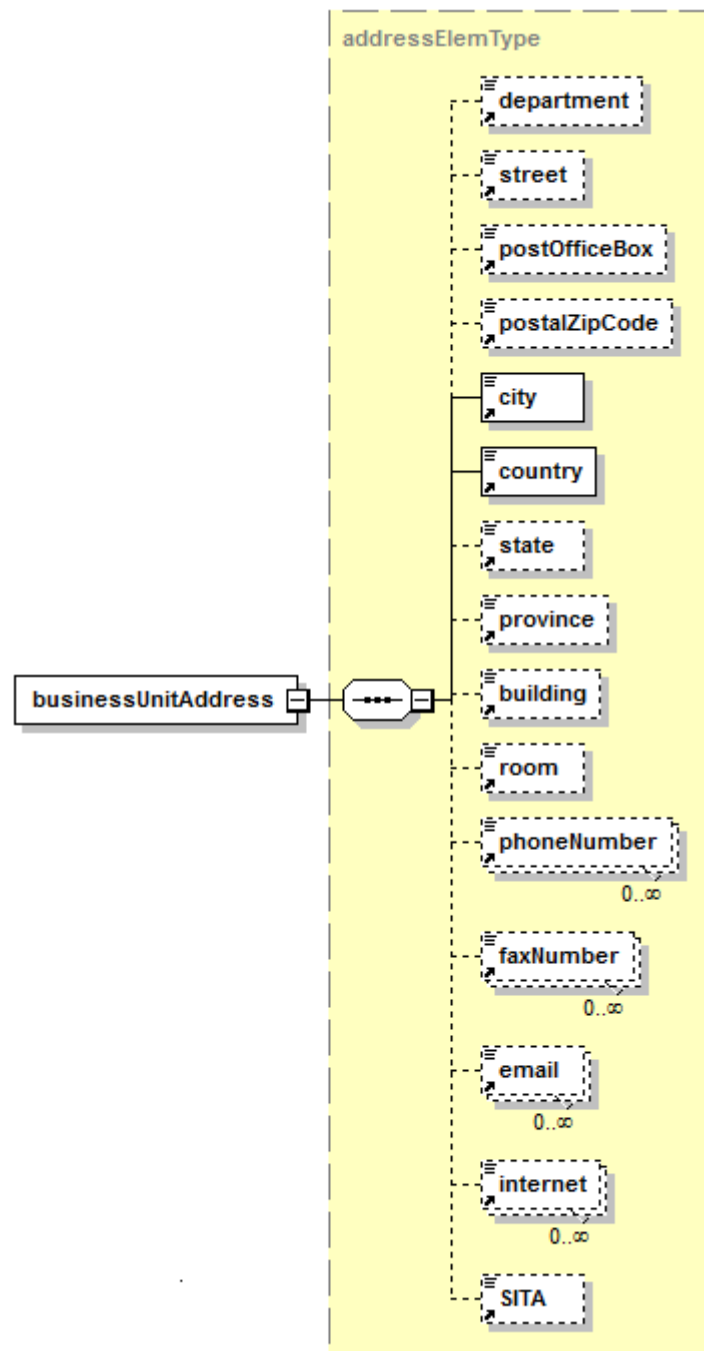

```
<businessUnitName>Customers Services Business  
Line</businessUnitName>
```

**2.6.2**

**Business unit address**

**Description:** The element [<businessUnitAddress>](#) contains the information required to contact the business unit.

**Markup element:** [<businessUnitAddress>](#)

ICN-1654N-S1000D0005-001-01

Fig 4 Element `<businessUnitAddress>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <department>. Refer to [Para 2.6.2.1](#).
- <street>. Refer to [Para 2.6.2.2](#).
- <postOfficeBox>. Refer to [Para 2.6.2.3](#).
- <postalZipCode>. Refer to [Para 2.6.2.4](#).
- <city>. Refer to [Para 2.6.2.5](#).
- <country>. Refer to [Para 2.6.2.6](#).
- <state>. Refer to [Para 2.6.2.7](#).
- <province>. Refer to [Para 2.6.2.8](#).
- <building>. Refer to [Para 2.6.2.9](#).
- <room>. Refer to [Para 2.6.2.10](#).
- <phoneNumber>. Refer to [Para 2.6.2.11](#).
- <faxNumber>. Refer to [Para 2.6.2.12](#).
- <email>. Refer to [Para 2.6.2.13](#).
- <internet>. Refer to [Para 2.6.2.14](#).
- <SITA>. Refer to [Para 2.6.2.15](#).

#### Markup example:

```
<businessUnitAddress>
<street>Heaven street</street>
<postalZipCode>99999</postalZipCode><city>Saint Vitus</city>
<country>UTOPIA</country>
<phoneNumber>111 222 333 444</phoneNumber>
<faxNumber>111 222 333 445</faxNumber>
<email>customers_services@utopia.com</email>
<email>info@utopia.com</email>
<internet>www.utopia.customers.services.online.com</internet>
<internet>www.utopia.online.com</internet>
</businessUnitAddress>
```

#### 2.6.2.1

##### Department

**Description:** The element <department> contains the identification of the business department.

**Markup element:** <department>

#### Attributes:

- None

#### Child elements:

- None

#### Markup example:

```
<department>Happy support group</department>
```

#### 2.6.2.2

##### Street

**Description:** The element <street> contains the street address of the business.

**Markup element:** <street>

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<street>123 Happy Lane</street>
```

## 2.6.2.3 Post office box

**Description:** The element `<postOfficeBox>` contains the post office box of the business defined.

**Markup element:** `<postOfficeBox>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<postOfficeBox>12345</postOfficeBox>
```

## 2.6.2.4 Postal zip code

**Description:** The element `<postalZipCode>` contains the zip code where the business is located.

**Markup element:** `<postalZipCode>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<postalZipCode>99999</postalZipCode>
```

## 2.6.2.5 City

**Description:** The element `<city>` contains the name of the city where the business is located.

**Markup element:** `<city>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<city>Happy Valley</city>
```

## 2.6.2.6

## Country Code

**Description:** The element `<country>` contains the International Standards Organization (ISO) country code where the business is located.

**Markup element:** `<country>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<country>UTOPIA</country>
```

## 2.6.2.7

## State

**Description:** The element `<state>` contains the state where the business is located.

**Markup element:** `<state>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<state>Euphoria</state>
```

## 2.6.2.8

## Province

**Description:** The element `<province>` contains the province where the business is located.

**Markup element:** `<province>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<province>Provincial</province>
```

## 2.6.2.9

## Building identifier

**Description:** The element `<building>` contains the building number where the business is located.

**Markup element:** `<building>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<building>11-22</building>
```

## 2.6.2.10 Room number

**Description:** The element `<room>` contains the room number in the building where the business is located.

**Markup element:** `<room>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<room>99</room>
```

## 2.6.2.11 Phone numbers

**Description:** The element `<phoneNumber>` contains contact phone numbers for the business.

**Markup element:** `<phoneNumber>`

**Attributes:**

- `contactRole` (O), whether this is the phone number for a primary, secondary or alternate contact

**Child elements:**

- None

**Markup example:**

```
<phoneNumber contactRole="primary">111 222 333 444</phoneNumber>
```

## 2.6.2.12 Fax numbers

**Description:** The element `<faxNumber>` contains contact fax numbers for the business.

**Markup element:** `<faxNumber>`

**Attributes:**

- `contactRole` (O), whether this is the fax number for a primary, secondary or alternate contact

**Child elements:**

- None

**Markup example:**

```
<faxNumber>111 222 333 444</faxNumber>
```

## 2.6.2.13

**Email addresses**

**Description:** The element [<email>](#) contains contact email addresses for the business.

**Markup element:** [<email>](#)

**Attributes:**

- `contactRole` (O), whether this is the email address for a primary, secondary or alternate contact

**Child elements:**

- None

**Markup example:**

```
<email>customers_services@utopia.com</email>
```

## 2.6.2.14

**Internet addresses**

**Description:** The element [<internet>](#) contains internet addresses for the business.

**Markup element:** [<internet>](#)

**Attributes:**

- `contactRole` (O), whether this is the internet address for a primary, secondary or alternate contact

**Child elements:**

- None

**Markup example:**

```
<internet>www.utopia.customers.services.online.com</internet>
```

## 2.6.2.15

**SITA address**

**Description:** The element [<SITA>](#) contains the address supplied in the aviation industry by the Société Internationale de Télécommunications Aéronautiques (SITA).

**Markup element:** [<SITA>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

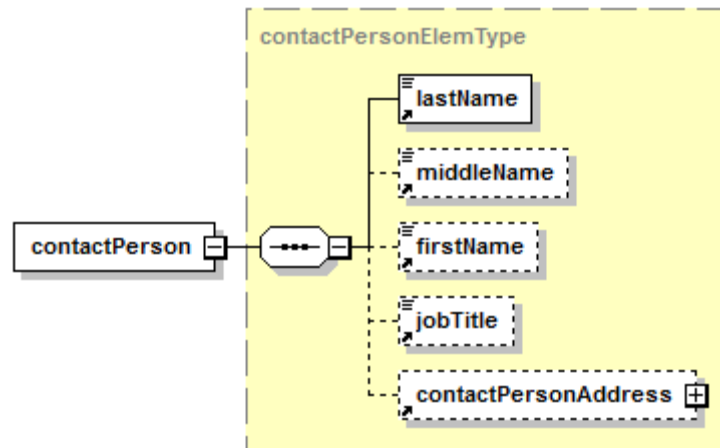

```
<SITA>111.222.333.444</SITA>
```

## 2.6.3

**Contact persons**

**Description:** The element [<contactPerson>](#) contains information related to individual contacts of a business unit.

Markup element: `<contactPerson>`

ICN-1654N-S1000D0006-001-01

Fig 5 Element `<contactPerson>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `personPrefix` (O), the title or prefix added to a person's name to signify veneration, an official position or a professional or academic qualification (eg, colonel, officer, lady, Mr., Mrs., Dr.)
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<lastName>`. Refer to [Para 2.6.3.1](#).
- `<middleName>`. Refer to [Para 2.6.3.2](#).
- `<firstName>`. Refer to [Para 2.6.3.3](#).
- `<jobTitle>`. Refer to [Para 2.6.3.4](#).
- `<contactPersonAddress>`. Refer to [Para 2.6.3.5](#).

#### Markup example:

```
<contactPerson>
<lastName>Smiley</lastName>
</contactPerson>
```

#### 2.6.3.1

##### Last name

**Description:** The element `<lastName>` contains the surname of the individual contact.

**Markup element:** `<lastName>`

#### Attributes:

- None

**Child elements:**

- None

**Markup example:**

```
<lastName>Smiley</lastName>
```

## 2.6.3.2 Middle name

**Description:** The element `<middleName>` contains the middle name of the individual contact.

**Markup element:** `<middleName>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<middleName>Quincy</middleName>
```

## 2.6.3.3 First name

**Description:** The element `<firstName>` contains the first or given name of the individual contact.

**Markup element:** `<firstName>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<firstName>Jonathon</firstName>
```

## 2.6.3.4 Job title

**Description:** The element `<jobTitle>` contains the job title of the individual contact.

**Markup element:** `<jobTitle>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

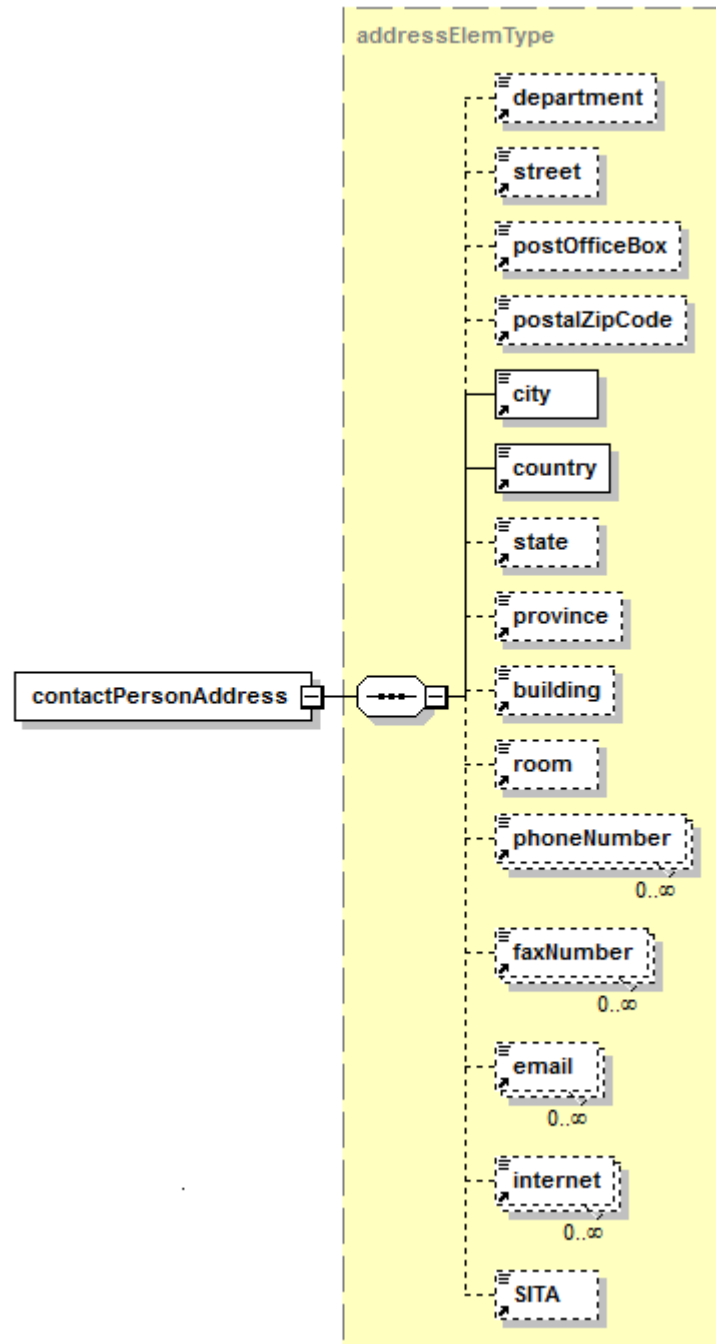

```
<jobTitle>Morale Booster</jobTitle>
```

## 2.6.3.5

## Contact person address

**Description:** The element `<contactPersonAddress>` contains the information required to contact the contact person.

**Markup element:** `<contactPersonAddress>`

ICN-1654N-S1000D0007-001-01

Fig 6 Element `<contactPersonAddress>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <department>. Refer to [Para 2.6.2.1](#).
- <street>. Refer to [Para 2.6.2.2](#).
- <postOfficeBox>. Refer to [Para 2.6.2.3](#).
- <postalZipCode>. Refer to [Para 2.6.2.4](#).
- <city>. Refer to [Para 2.6.2.5](#).
- <country>. Refer to [Para 2.6.2.6](#).
- <state>. Refer to [Para 2.6.2.7](#).
- <province>. Refer to [Para 2.6.2.8](#).
- <building>. Refer to [Para 2.6.2.9](#).
- <room>. Refer to [Para 2.6.2.10](#).
- <phoneNumber>. Refer to [Para 2.6.2.11](#).
- <faxNumber>. Refer to [Para 2.6.2.12](#).
- <email>. Refer to [Para 2.6.2.13](#).
- <internet>. Refer to [Para 2.6.2.14](#).
- <SITA>. Refer to [Para 2.6.2.15](#).

#### Markup example:

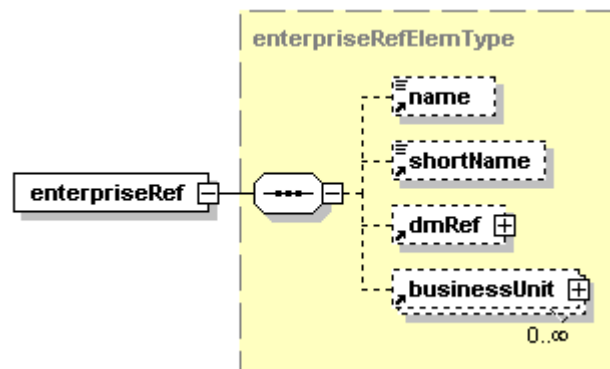

```
<contactPersonAddress>
<street>Heaven street</street>
<postalZipCode>99999</postalZipCode><city>Saint Vitus</city>
<country>UTOPIA</country>
<phoneNumber>111 222 333 444</phoneNumber>
<faxNumber>111 222 333 445</faxNumber>
<email>customers_services@utopia.com</email>
<email>info@utopia.com</email>
<internet>www.utopia.customers.services.online.com
</internet>
<internet>www.utopia.online.com</internet>
</contactPersonAddress>
```

## 2.7 Enterprise references

**Description:** The element <enterpriseRef> provides a method to reference other enterprises.

**Markup element:** <enterpriseRef>

ICN-B6865-S1000D0001-001-01

Fig 7 Element &lt;enterpriseRef&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- enterpriseType (O), the type of enterprise (production site, distributor or manufacturer enterprise)
- enterpriseRefType (O), the type of enterprise reference
- manufacturerCodeValue (M), the CAGE code of the enterprise being referenced
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>, the name of the enterprise. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <dmRef>. Data module references must be populated in accordance with [Chap 3.9.5.2.1.2](#).
- <businessUnit>. Refer to [Para 2.6](#).

#### Markup example:

```
<enterpriseRef enterpriseType="productSite"
manufacturerCodeValue="FAPE3" qualifiedSiteFlag="1"/>
```

### 3 Example

```
<commonRepository>
<enterpriseRepository>
<enterpriseSpec id="C001">
<enterpriseIdent manufacturerCodeValue="KZ444"/>
<enterpriseName>UTOPIA plc</enterpriseName>
<businessUnit>
<businessUnitName>Customers Services Business
Line</businessUnitName>
<businessUnitAddress>
<street>Heaven street</street>
<postalZipCode>99999</postalZipCode>
<city>Saint Vitus</city>
```

---

```
<country>UTOPIA</country>
<phoneNumber>111 222 333 444</phoneNumber>
<faxNumber>111 222 333 445</faxNumber>
<email>customers_services@utopia.com</email>
<email>info@utopia.com</email>
<internet>www.utopia.customers.services.online.com
</internet>
<internet>www.utopia.online.com</internet>
</businessUnitAddress>
</businessUnit>
</enterpriseSpec>
</enterpriseRepository>
</commonRepository>
```

## 1 General

The supplies Common Information Repository (CIR) data module is used to capture and represent supply intrinsic properties and related information.

A supply has intrinsic properties which are always valid (eg, the specification of the supply, its manufacturer, a flash point). The supply identification can be used to uniquely identify the supply products (such as oils, greases, paints) by using the element [<supplyRef>](#). Refer to [Chap 3.9.5.2.1.9](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Supplies CIR data module content

### 2.1 Supplies repository

**Description:** The element [<supplyRepository>](#) provides a list of supplies and their associated properties.

**Markup element:** [<supplyRepository>](#)

ICN-S1000D-A-03090502-A-FAPE3-00052-A-001-01

Fig 1 Element [<supplyRepository>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

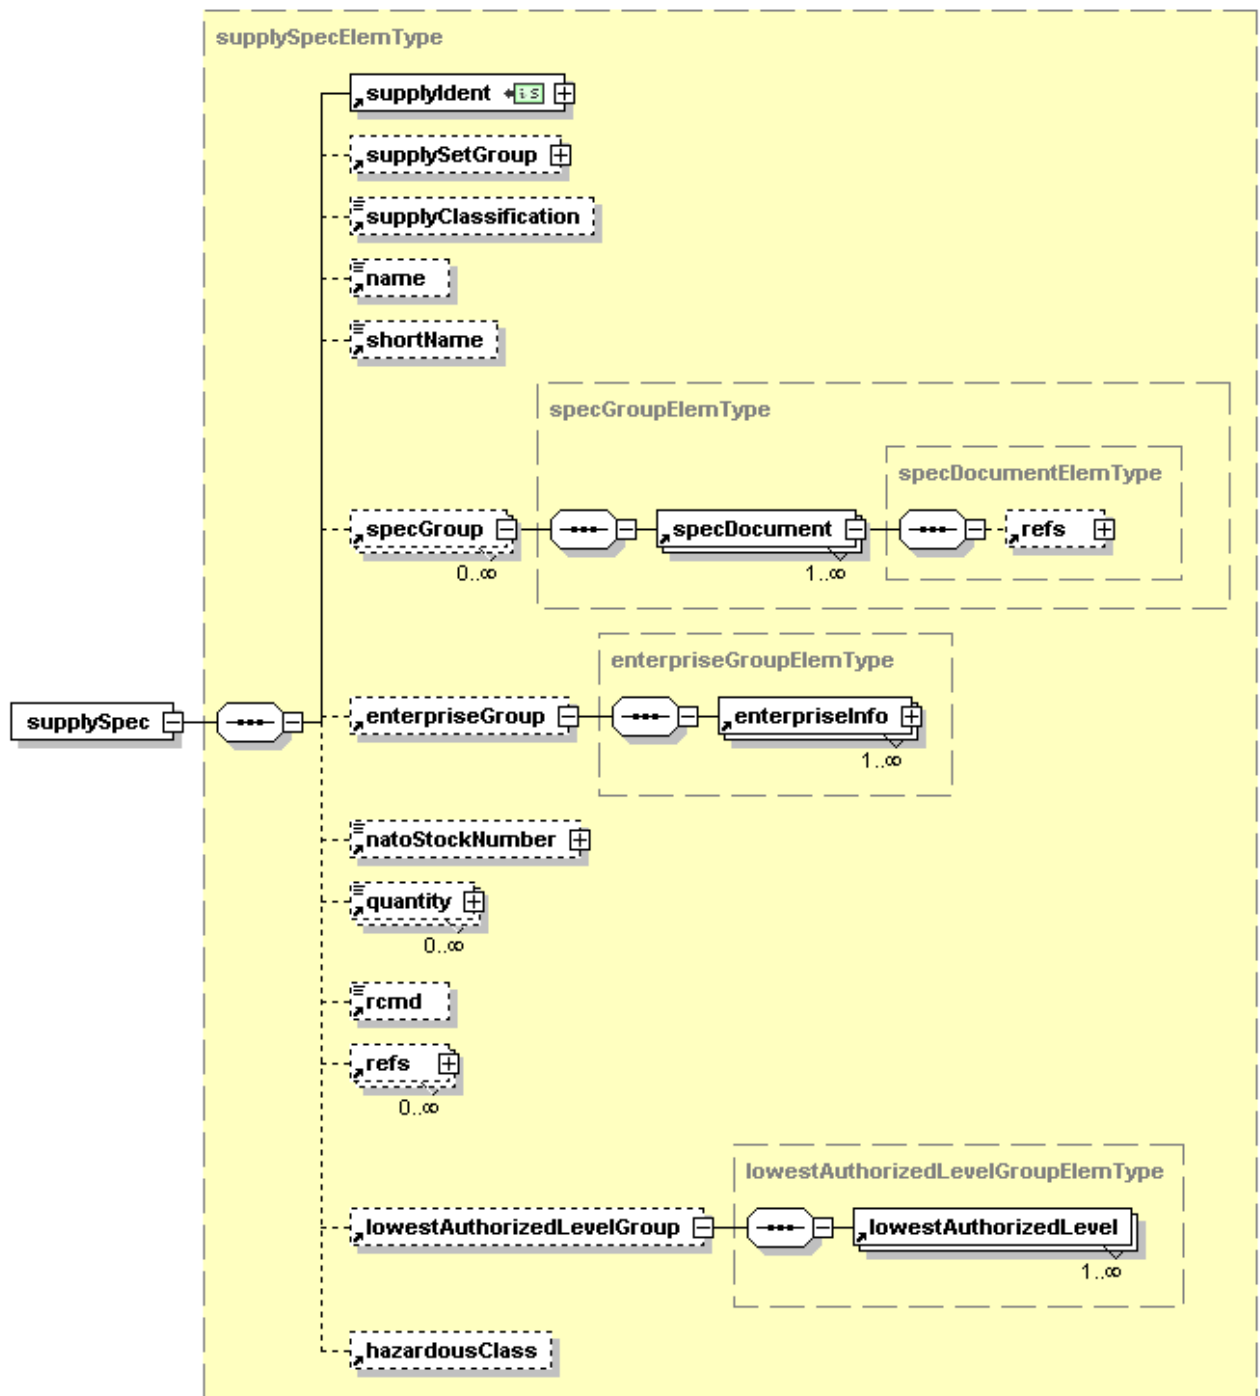

#### Child elements:

- [<supplySpec>](#). Refer to [Para 2.1.1](#).

### 2.1.1 Supply specification

**Description:** The element [<supplySpec>](#) contains the associated properties for one supply.

**Markup element:** [<supplySpec>](#)

ICN-B6865-S1000D0009-001-01

Fig 2 Element `<supplySpec>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- manufacturedFlag (O), a flag to indicate if the product is manufactured or no longer manufactured. The attribute can have one of the following values:

- "1" (D) - Yes, when the product is manufactured
- "0" - No, when the product is no longer manufactured
- obsoleteFlag (O), a flag to indicate that the supply is obsolete or not. The attribute can have one of the following values:
  - "1" - Yes, for obsolete supplies
  - "0" - No, for non-obsolete supplies
- specialLabelFlag (O), a flag to indicate that the supply product has a special labeling or not. The attribute can have one of the following values:
  - "1" - Yes, for supplies with special labeling
  - "0" - No, for supplies without special labeling
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <supplyIdent>. Refer to [Para 2.1.1.1](#).
- <supplySetGroup>. Refer to [Para 2.1.1.2](#).
- <supplyClassification>. Refer to [Para 2.1.1.4](#).
- <name>, the name of the supply. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <specGroup>. Refer to [Para 2.1.1.5](#).
- <enterpriseGroup>. Refer to [Para 2.1.1.6](#).
- <natoStockNumber>, the associated NATO Stock Number. Refer to [Chap 3.9.5.2.7](#).
- <quantity>, the supply flash point(s). Refer to [Chap 3.9.5.2.1.10](#).
- <rcmd>. Refer to [Para 2.1.1.7](#).
- <refs>. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).
- <lowestAuthorizedLevelGroup>. Refer to [Para 2.1.1.8](#).
- <hazardousClass>, identifies hazardous supplies. Refer to [Chap 3.9.5.2.7](#).

#### 2.1.1.1 Supply identifier

**Description:** The element <supplyIdent>, contrary to the attribute id, semantically identifies the supply as a result of its attributes.

**Markup element:** <supplyIdent>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- supplyNumber (M), the supply number. A unique label set by the project (eg, the supply trade name, a specification number).
- supplyNumberType (M), the type of supply identification. Projects or organizations are allowed to define their own supply number types. The attribute can have one of the following values:

- "sp01" thru "sp99". Refer to [Chap 3.9.6.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

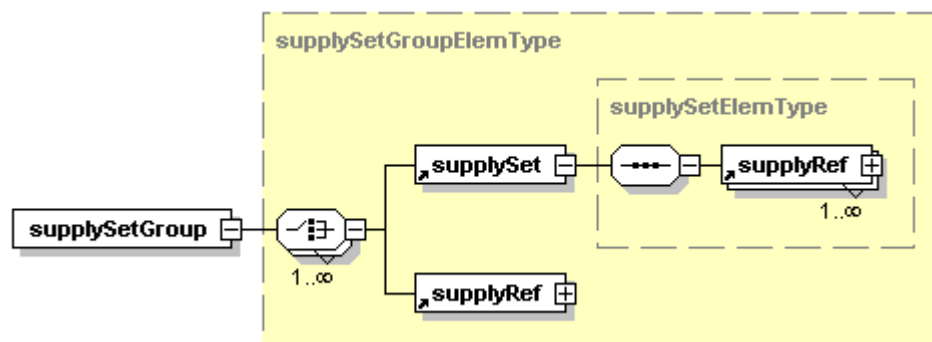

#### Markup example:

```
<supplyIdent supplyNumber="JET A1" supplyNumberType="sp01"/>
```

#### 2.1.1.2 Supply set group

**Description:** The element [<supplySetGroup>](#) is constituted of supplies and/or sets of supplies. Each supply or set of supplies can be used equally.

**Markup element:** [<supplySetGroup>](#)

ICN-B6865-S1000D0010-001-01

Fig 3 Element [<supplySetGroup>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<supplySet>](#), a set of supplies that have to be used together. Refer to [Para 2.1.1.3](#).
- [<supplyRef>](#), a supply. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.1.1.3 Supply set

**Description:** The element [<supplySet>](#) identifies supplies that must be used together (eg, base and primer supply).

**Markup element:** [<supplySet>](#). Refer to [Fig 3](#).

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <supplyRef>, the supplies in the set. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<supplySet>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="sp01" />
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="sp01" />
</supplySet>
```

#### 2.1.1.4 Supply classification

**Description:** The element <supplyClassification> contains a classification related to the supply. For example, it can be used to provide a rating of the supply eco-efficiency.

**Markup element:** <supplyClassification>

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<supplyClassification>eco-efficiency level
3</supplyClassification>
```

#### 2.1.1.5 Specification list

**Description:** The element <specGroup> contains the specification that the supply meets.

**Markup element:** <specGroup>. Refer to [Fig 2](#).

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- vendorFlag (O), whether the list is defined by a supplier or by the manufacturer of the Product. The attribute can have one of the following values:
  - "1" - Yes, the list is defined by a supplier
  - "0" - No, the list is defined by the manufacturer of the Product
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<specDocument>](#). Refer to [Para 2.1.1.5.1](#).

2.1.1.5.1 *Specification document*

**Description:** The element [<specDocument>](#) contains the identification information of a specification document with which the supply complies.

**Markup element:** [<specDocument>](#). Refer to [Fig 2](#).

**Attributes:**

- [applicRefId](#) (O), the applicability information by referencing the element [<applic>](#). Refer to [Chap 3.9.5.3](#).
- [id](#) (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [manufacturerCodeValue](#), not used in the context of supplies
- [countryIsoCode](#) (O), the country of the specification owner
- [specDocumentNumber](#) (O), the identifier number of the specification
- [specDocumentType](#) (O), the type of the document, always a specification for supplies
- [changeType](#) (O), [changeMark](#) (O) and [reasonForUpdateRefIds](#) (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- [securityClassification](#) (O), [commercialClassification](#) (O), [caveat](#) (O) and [derivativeClassificationRefId](#) (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<refs>](#). References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<specDocument countryIsoCode="FR" specDocumentNumber="ASNA3572"
specDocumentType="specification"/>
```

2.1.1.6 *Enterprise list*

**Description:** The element [<enterpriseGroup>](#) contains the supply product list of manufacturers, suppliers, etc.

**Markup element:** [<enterpriseGroup>](#). Refer to [Fig 2](#).

**Attributes:**

- [id](#) (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- [changeType](#) (O), [changeMark](#) (O) and [reasonForUpdateRefIds](#) (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- [securityClassification](#) (O), [commercialClassification](#) (O), [caveat](#) (O) and [derivativeClassificationRefId](#) (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<enterpriseInfo>](#). Refer to [Para 2.1.1.6.1](#).

2.1.1.6.1 *Enterprise information*

**Description:** The element [<enterpriseInfo>](#) contains information about a supplier of the supply.

Markup element: `<enterpriseInfo>`

ICN-S1000D-A-03090502-A-FAPE3-00061-A-001-01

Fig 4 Element `<enterpriseInfo>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `locallySuppliedFlag` (M), a flag to indicate if the supply can be locally purchased or not. The attribute can have one of the following values:
  - "1" - Yes, for locally purchased parts
  - "0" - No, for non-locally purchased parts
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<enterpriseRef>`, the reference to an enterprise. Refer to [Chap 3.9.5.2.11.6](#).
- `<shippingInfo>`. Refer to [Para 2.1.1.6.2](#).

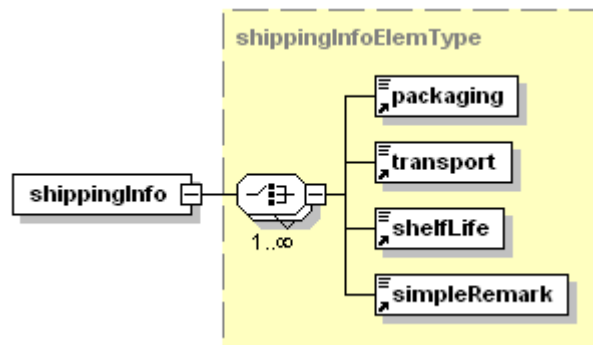

#### Markup example:

```
<enterpriseInfo locallySuppliedFlag="0">
  <enterpriseRef manufacturerCodeValue="F8808"/>
</enterpriseInfo>
```

#### 2.1.1.6.2 Shipping information

**Description:** The element `<shippingInfo>` contains the shipping information for the supply, if any. They are divided into four types of information.

Markup element: `<shippingInfo>`

ICN-S1000D-A-03090502-A-FAPE3-00062-A-001-01

Fig 5 Element &lt;shippingInfo&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

At least one of the child elements must be populated:

- <packaging>. Refer to [Para 2.1.1.6.3](#).
- <transport>. Refer to [Para 2.1.1.6.4](#).
- <shelfLife>. Refer to [Para 2.1.1.6.5](#).
- <simpleRemark>. Refer to [Para 2.1.1.6.6](#).

#### 2.1.1.6.3 Packaging

**Description:** The element <packaging> contains information about the packaging of the supply.

**Markup element:** <packaging>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
```

#### 2.1.1.6.4 Transport

**Description:** The element `<transport>` contains information about the transport of the supply.

**Markup element:** `<transport>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<transport>FLAMMABLE LIQUID</transport>
```

#### 2.1.1.6.5 Shelf life

**Description:** The element `<shelfLife>` contains information about the shelf life of the supply.

**Markup element:** `<shelfLife>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
```

#### 2.1.1.6.6 General remark

**Description:** The element `<simpleRemark>` contains general remarks about the shipping information related to the supply.

**Markup element:** `<simpleRemark>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<simpleRemark>FLAMMABLE,BUT DOES NOT REQUIRE A HAZARD
SYMBOL</simpleRemark>
```

#### 2.1.1.7

##### Recommendation

**Description:** The element `<rcmd>` contains recommendations related to the supply.

**Markup element:** `<rcmd>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<rcmd>Polysulfide sealant with Asbestos</rcmd>
```

#### 2.1.1.8

##### Lowest authorized maintenance level group

**Description:** The element `<lowestAuthorizedLevelGroup>` groups the different lowest authorized maintenance levels related to the supply.

**Markup element:** `<lowestAuthorizedLevelGroup>`. Refer to [Fig 2](#).

**Attributes:**

- None

**Child elements:**

- `<lowestAuthorizedLevel>`. Refer to [Para 2.1.1.9](#).

#### 2.1.1.9

##### Lowest authorized maintenance level

**Description:** The element `<lowestAuthorizedLevel>` contains the minimum skill authorized to remove, replace, or use an item. The use of this element will facilitate supplying the bench stock applicable to the maintainer's skill level without having to go thru an entire manual to determine what consumable supplies might be needed. It also alerts the clerk in the supply room of which supplies the maintainer is allowed to acquire for bench stock.

**Markup element:** `<lowestAuthorizedLevel>`

**Attributes:**

- lowestLevel (M), the lowest authorized level value. Projects or organizations are allowed to define their own lowest authorized levels. The attribute can have one of the following values:
  - "1a01" thru "1a99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

### 3 Examples

These examples show the combined use of the supplies CIR and the supply requirements CIR.

The following example illustrates the supplies CIR, for intrinsic properties. It defines two supplies and related properties.

```
<commonRepository>
<supplyRepository>
<supplySpec>
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="sp01"/>
<specGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="IPDA 28-05"/>
</specGroup>
<enterpriseGroup>
<enterpriseInfo locallySuppliedFlag="0">
<enterpriseRef manufacturerCodeValue="F8808"/>
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</enterpriseInfo>
</enterpriseGroup>
</supplySpec>
<supplySpec>
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="sp01"/>
<specGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="ASNA3572"/>
</specGroup>
<enterpriseGroup>
<enterpriseInfo locallySuppliedFlag="0">
<enterpriseRef manufacturerCodeValue="F8808"/>
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</enterpriseInfo>
```

```

</enterpriseGroup>
</supplySpec>
</supplyRepository>
</commonRepository>

```

The following example illustrates the supply requirements CIR. Defined supplies (see above) are targeted thru the use of the element `<supplyRef>` with attribute `supplyNumber` properly filled.

```

<commonRepository>
<supplyRqmtRepository>
<supplyRqmtSpec id="inv0105029-">
<supplyRqmtIdent materialCategory="05" supplyRqmtNumber="029"/>
<supplyRqmtAlts><supplyRqmt>
<supplyRqmtAltIdent materialCategory="05" supplyRqmtNumber="029"
vendorFlag="0"/>
<supplySetGroup>
<supplySet>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="sp01"/>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="sp01"/>
</supplySet>
</supplySetGroup>
<name>FIXATIVE FOR PLACARD INSTALLATION</name>
<safetyCategory safetyCategoryValue="C"/>
<usage>IMMERSION OF BSB LABEL</usage>
</supplyRqmt></supplyRqmtAlts>
</supplyRqmtSpec>
</supplyRqmtRepository>
</commonRepository>

```

## 1 General

The supply requirements Common Information Repository (CIR) data module is used to capture and represent supply requirements and use conditions.

A supply requirement gives a definition of the requirement and includes, amongst other things, references to the supplies which fulfill the requirement. The supply requirements identification can be used to uniquely identify the supply requirements, for example in which case a supply or a group of supplies can be used, by using the element [<supplyRqmtRef>](#). Refer to [Chap 3.9.5.2.1.9](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Supply requirements CIR data module content

### 2.1 Supply requirement repository

**Description:** The element [<supplyRqmtRepository>](#) contains a list of supply requirements and their associated properties.

**Markup element:** [<supplyRqmtRepository>](#)

ICN-S1000D-A-03090502-A-FAPE3-00070-A-001-01

Fig 1 Element [<supplyRqmtRepository>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

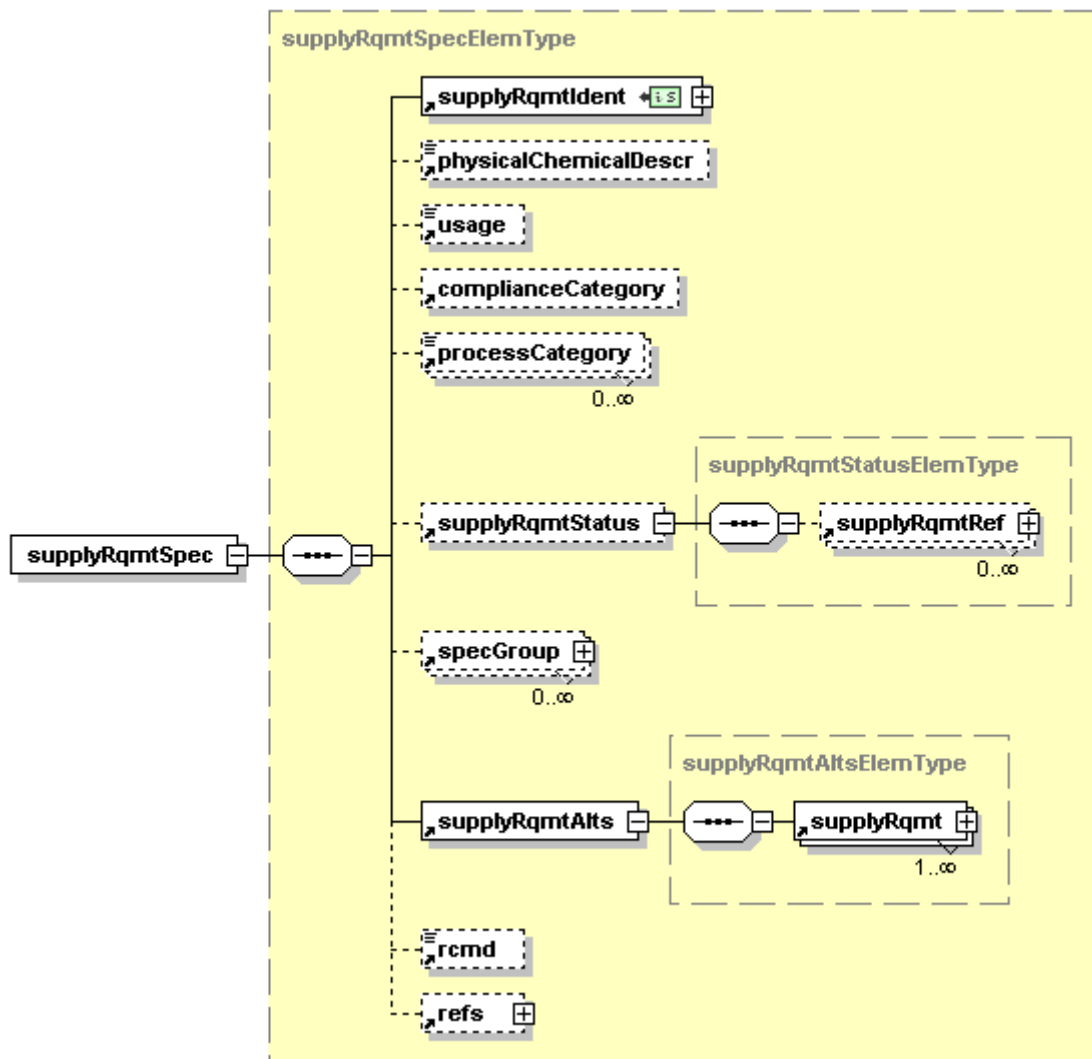

#### Child elements:

- [<supplyRqmtSpec>](#). Refer to [Para 2.1.1](#).

### 2.1.1 Supply requirement specification

**Description:** The element [<supplyRqmtSpec>](#) contains the associated properties of one supply requirement.

**Markup element:** [<supplyRqmtSpec>](#)

ICN-B6865-S1000D0011-001-01

Fig 2 Element `<supplyRqmtSpec>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<supplyRqmtIdent>`. Refer to [Para 2.1.1.1](#).
- `<physicalChemicalDescr>`. Refer to [Para 2.1.1.2](#).
- `<usage>`. Refer to [Para 2.1.1.3](#).
- `<complianceCategory>`. Refer to [Para 2.1.1.4](#).
- `<processCategory>`. Refer to [Para 2.1.1.5](#).

- <supplyRqmtStatus>. Refer to [Para 2.1.1.6](#).
- <specGroup>, references to the applicable specifications. Refer to [Chap 3.9.5.2.11.7](#).
- <supplyRqmtAlts>. Refer to [Para 2.1.1.7](#).
- <rcmd>. Refer to [Para 2.1.1.8.6](#).
- <refs>. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### 2.1.1.1 Supply requirement identifier

**Description:** The element <supplyRqmtIdent>, contrary to the attribute id, semantically identifies the supply requirement as a result of its attributes.

**Markup element:** <supplyRqmtIdent>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- materialCategory (O), the nature of use of the supply requirement (eg, fuel, cleaning agent, lubricant)
- supplyRqmtNumber (M), the supply requirement number
- vendorFlag (O), whether the supply requirement is defined by a supplier or by the Product manufacturer. The attribute can have one of the following values:
  - "1" - Yes, the supply requirement is defined by a supplier
  - "0" - No, the supply requirement is defined by the Product manufacturer
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<supplyRqmtIdent materialCategory="09"
supplyRqmtNumber="09-001" />
```

#### 2.1.1.2 Physical and/or chemical description

**Description:** The element <physicalChemicalDescr> contains the physical and/or chemical product properties describing the supply requirement.

**Markup element:** <physicalChemicalDescr>

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<physicalChemicalDescr>Manganese polysulphide sealant
overcoat</physicalChemicalDescr>
```

2.1.1.3 Usage  
**Description:** The element <usage> contains the textual description of the supply requirement usage.

**Markup element:** <usage>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<usage>For fuel tank</usage>
```

2.1.1.4 Compliance category  
**Description:** The element <complianceCategory> indicates whether the alternatives listed within the supply requirement are strictly limited to the ones listed or not, and to what extent the list of alternatives can be extended.

**Markup element:** <complianceCategory>

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- complianceCategoryValue (O), represents the value of the compliance category. The attribute can have one of the following values:
  - "A" - The supply requirements do not allow selection of other products than the one listed below it. They are not open to external market.
  - "B" - The supply requirements allow selection of additional products thru a proposed specification (eg, MIL, SAE). They are open to external market with a specification.
  - "C" - The supply requirements cover commonly available products that can be locally purchased. They are open to the external market without a specification.

**Child elements:**

- None

**Markup example:**

```
<complianceCategory complianceCategoryValue="A"/>
```

2.1.1.5 Process category  
**Description:** The element <processCategory> identifies the process category of the supply requirement. The process category is the technical or operational description of the processes of use (eg, roller application, brushing, spraying). For projects or organizations complying with REACH regulation, this element can contain the REACH process category value.

**Markup element:** `<processCategory>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<processCategory>Roller application</processCategory>
```

#### 2.1.1.6 Supply requirement status

**Description:** The element `<supplyRqmtStatus>` contains the supply requirement history. For instance, it indicates the supply requirement authorization status, if it has been superseded by another one, or split into two other supply requirements.

**Markup element:** `<supplyRqmtStatus>`. Refer to [Fig 2](#).

**Attributes:**

- `supplyRqmtStatusValue` (O), the status of the supply requirement (eg, not authorized, superseded, split)

**Child elements:**

- `<supplyRqmtRef>`, enables referring to another supply requirement if the supply requirement has been superseded or split by another one. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<supplyRqmtStatus supplyRqmtStatusValue="split">
<supplyRqmtRef .../>
<supplyRqmtRef .../>
</supplyRqmtStatus>
```

#### 2.1.1.7 Supply requirement alternative group

**Description:** The element `<supplyRqmtAlts>` contains a group of supply requirement alternatives.

**Markup element:** `<supplyRqmtAlts>`. Refer to [Fig 2](#).

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

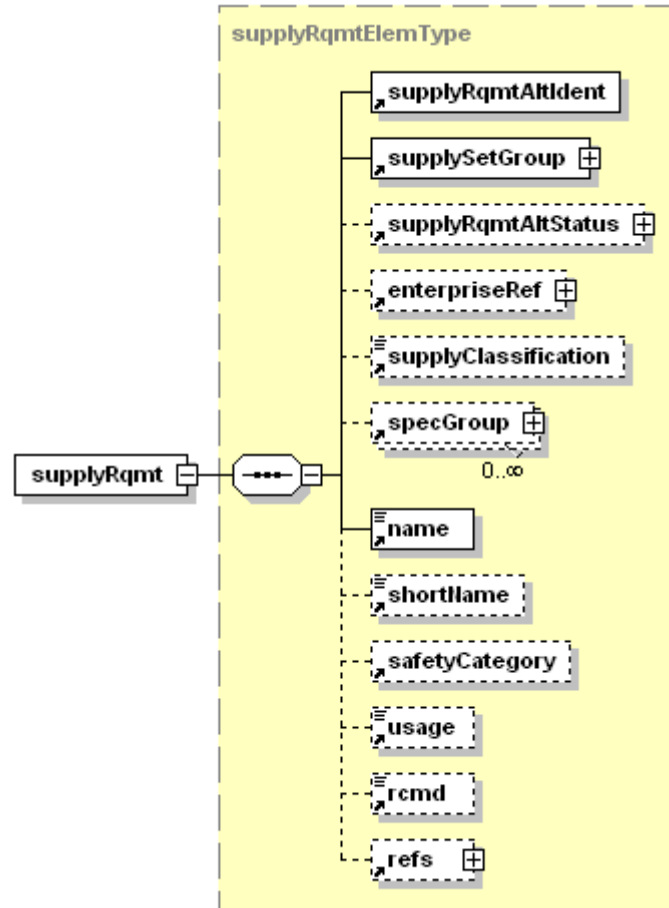

**Child elements:**

- `<supplyRqmt>`. Refer to [Para 2.1.1.8](#).

## 2.1.1.8 Alternative of the supply requirement

**Description:** The element <supplyRqmt> represents one alternative of the supply requirement. Each alternative lists one or several supplies that fulfill the supply requirement.

**Markup element:** <supplyRqmt>

ICN-S1000D-A-03090502-A-FAPE3-00079-A-001-01

Fig 3 Element <supplyRqmt>

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- productCategory (O), the product category of the supply requirement alternative. Projects or organizations are allowed to define their own product categories. The attribute can have one of the following values:
  - "pcg01" thru "pcg99". Refer to [Chap 3.9.6.1](#).
- supplyRqmtType (O), the type of the supply requirement alternative
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <supplyRqmtAltIdent>. Refer to [Para 2.1.1.8.1](#).
- <supplySetGroup>, the references to the sets of supplies. Refer to [Chap 3.9.5.2.11.7](#).
- <supplyRqmtAltStatus>. Refer to [Para 2.1.1.8.2](#).
- <enterpriseRef>, the reference to an enterprise. Refer to [Chap 3.9.5.2.11.6](#).
- <supplyClassification>, the classification related to the supply. Refer to [Chap 3.9.5.2.11.7](#).
- <specGroup>, references to the applicable specifications. Refer to [Chap 3.9.5.2.11.7](#).
- <name>, the name of the requirement. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <safetyCategory>. Refer to [Para 2.1.1.8.4](#).
- <usage>. Refer to [Para 2.1.1.8.5](#).
- <rcmd>. Refer to [Para 2.1.1.8.6](#).
- <refs>. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### 2.1.1.8.1 Supply requirement alternative identifier

**Description:** The element <supplyRqmtAltIdent>, contrary to the attribute id, semantically identifies the supply requirement as a result of its attributes.

**Markup element:** <supplyRqmtAltIdent>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- materialCategory (O), the nature of use of the supply requirement alternative (eg, fuel, cleaning agent, lubricant)
- supplyRqmtNumber (M), the supply requirement alternative number
- vendorFlag (O), whether the supply requirement alternative is defined by a supplier. The attribute can have one of the following values:
  - "1" - Yes, for a supply requirement alternative defined by a supplier
  - "0" - No, for a supply requirement alternative defined by the Product manufacturer
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<supplyRqmtAltIdent materialCategory="09"
supplyRqmtNumber="09-001A"/>
```

#### 2.1.1.8.2 Supply requirement alternative status

**Description:** The element `<supplyRqmtAltStatus>` tracks the supply requirement alternative history. For example, it indicates the supply requirement alternative authorization status and indicates if it has been superseded by another supply requirement or split into two other supply requirements.

**Markup element:** `<supplyRqmtAltStatus>`

ICN-S1000D-A-03090502-A-FAPE3-00081-A-001-01

Fig 4 Element `<supplyRqmtAltStatus>`

**Attributes:**

- None

**Child elements:**

- `<authorizationStatus>`. Refer to [Para 2.1.1.8.3](#).
- `<supplyRqmtRef>`, enables referring to another supply requirement if the supply requirement has been superseded or split by another one. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.1.1.8.3 Authorization status

**Description:** The element `<authorizationStatus>` contains the authorization status of the supply requirement alternative.

**Markup element:** `<authorizationStatus>`

**Attributes:**

- `authorizationStatusDate` (O), the date from which the authorization status is valid

**Child elements:**

- None

**Markup example:**

```
<authorizationStatus authorizationStatusDate="20100801">REACH
banned</authorizationStatus>
```

#### 2.1.1.8.4 Safety category

**Description:** The element `<safetyCategory>` contains the safety category of the supply listed in the supply requirement alternative.

**Markup element:** `<safetyCategory>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `safetyCategoryValue` (M), specifies the supply requirement safety category. The attribute can have one of the following values:
  - "A" - for supply requirement alternatives mandatory for safety reasons
  - "B" - for recommended supply requirement alternatives
  - "C" - for common supply requirement alternatives
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<safetyCategory safetyCategoryValue="A" />
```

#### 2.1.1.8.5 Usage

**Description:** The element `<usage>` contains the alternative textual description of the supply requirement usage.

**Markup element:** `<usage>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<usage>IMMERSION OF BSB LABEL</usage>
```

#### 2.1.1.8.6 Recommendation

**Description:** The element `<rcmd>` contains the recommendations linked to the supply requirement or the supply requirement alternative.

**Markup element:** `<rcmd>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<rcmd>REFER TO THE ENGINE MANUFACTURERS DATA FOR APPROVED FUEL
ADDITIVES</rcmd>
```

### 3

## Examples

These examples show the combined use of the supplies CIR and the supply requirements CIR.

The following example illustrates the supplies CIR, for intrinsic properties. It defines two supplies and related properties.

```
<commonRepository>
<supplyRepository>
<supplySpec>
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="sp01"/>
<specGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="IPDA 28-05"/>
</specGroup>
<enterpriseGroup>
<enterpriseInfo locallySuppliedFlag="0">
<enterpriseRef manufacturerCodeValue="F8808"/>
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</enterpriseInfo>
</enterpriseGroup>
</supplySpec>
<supplySpec>
<supplyIdent supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="sp01"/>
<specGroup vendorFlag="0">
<specDocument countryIsoCode="FR"
specDocumentNumber="ASNA3572"/>
</specGroup>
<enterpriseGroup>
<enterpriseInfo locallySuppliedFlag="0">
<enterpriseRef manufacturerCodeValue="F8808"/>
<shippingInfo>
<packaging>1 AND 20 LITER (0.265 AND 5.3 GAL) CAN</packaging>
<shelfLife>APPROX 4 YEARS AT 20 DEG C (68 DEG F)</shelfLife>
<transport>FLAMMABLE LIQUID</transport>
</shippingInfo>
</enterpriseInfo>
</enterpriseGroup>
</supplySpec>
```

```
</supplyRepository>
</commonRepository>
```

The following example illustrates the supply requirements CIR. Defined supplies (see above) are targeted thru the use of the element `<supplyRef>` with attribute `supplyNumber` properly filled.

```
<commonRepository>
<supplyRqmtRepository>
<supplyRqmtSpec id="inv0105029-">
<supplyRqmtIdent materialCategory="05" supplyRqmtNumber="029"/>
<supplyRqmtAlts><supplyRqmt>
<supplyRqmtAltIdent materialCategory="05" supplyRqmtNumber="029"
vendorFlag="0"/>
<supplySetGroup>
<supplySet>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW_SPECIAL"
supplyNumberType="sp01"/>
<supplyRef supplyNumber="BSB-DUROFIX_FIXATIF_UW"
supplyNumberType="sp01"/>
</supplySet>
</supplySetGroup>
<name>FIXATIVE FOR PLACARD INSTALLATION</name>
<safetyCategory safetyCategoryValue="C"/>
<usage>IMMERSION OF BSB LABEL</usage>
</supplyRqmt></supplyRqmtAlts>
</supplyRqmtSpec>
</supplyRqmtRepository>
</commonRepository>
```

## 1 General

The tools Common Information Repository (CIR) data module is used to capture and represent support equipment and their associated properties.

The support equipment identification can be used to uniquely identify any support equipment, including standard and special tools required to correctly accomplish a given action, task or procedure, using the element `<toolRef>`. Refer to [Chap 3.9.5.2.1.9](#).

### Note

Throughout this chapter, element and attribute names use the term “tool”, which in this chapter includes support equipment, which is defined in [Chap 9.2.1](#).

### Note

Refer to [Para 3](#) for markup examples for the individual elements.

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Tools CIR data module content

### 2.1 Support equipment repository

**Description:** The element `<toolRepository>` contains a list of support equipment and their associated properties.

**Markup element:** `<toolRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00086-A-001-01

Fig 1 Element `<toolRepository>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<toolSpec>`. Refer to [Para 2.1.1](#).

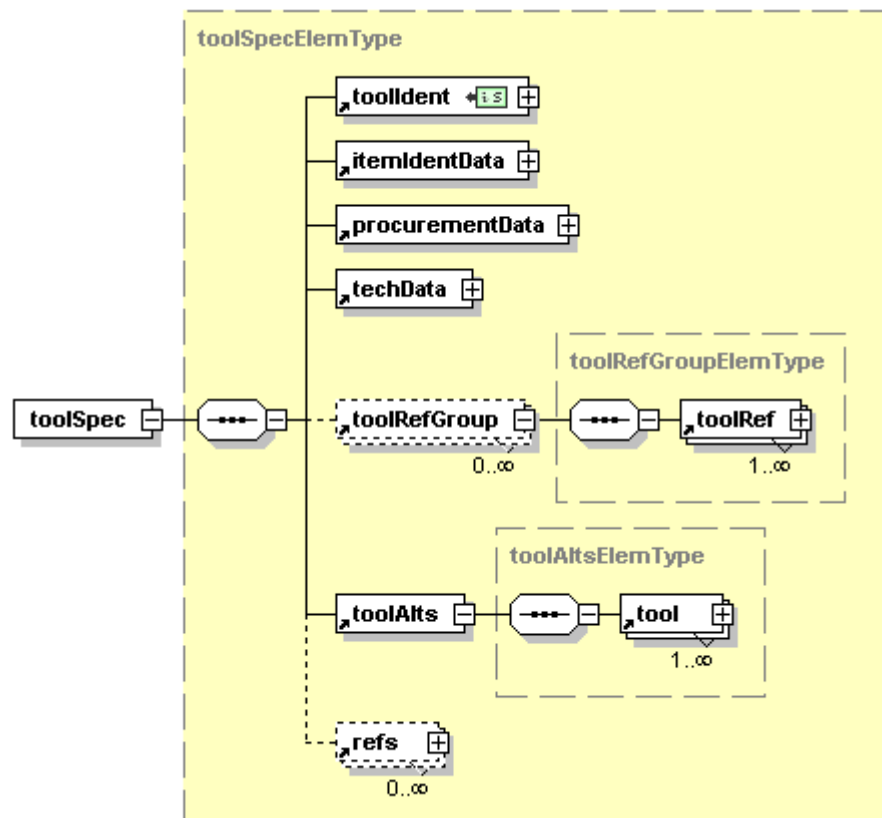

#### 2.1.1 Support equipment specification

**Description:** The element `<toolSpec>` contains the associated properties for one piece of support equipment.

Some properties of the support equipment can vary from one product instance to another. Such properties are managed under the support equipment alternates (element `<toolAlts>`), which can contain a reference to an applicability annotation. Refer to [Chap 4.13.3](#) for details on the alternates concept.

For some properties appearing at both levels (`<toolSpec>` and `<tool>`), the following rule must be applied: if the property is fulfilled in the alternate element, it supersedes the generic value stored in the parent element.

**Markup element:** `<toolSpec>`

ICN-B6865-S1000D0012-001-01

Fig 2 Element `<toolSpec>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<toolIdent>`. Refer to [Para 2.1.1.1](#).

- `<itemIdentData>`, the full description of the support equipment. Refer to [Chap 3.9.5.2.7](#).
- `<procurementData>`, how to procure the support equipment. Refer to [Chap 3.9.5.2.7](#).
- `<techData>`, the technical properties of the support equipment. Refer to [Chap 3.9.5.2.7](#).
- `<toolRefGroup>`. Refer to [Para 2.1.1.2](#).
- `<toolAlts>`. Refer to [Para 2.1.1.3](#).
- `<refs>`. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### 2.1.1.1 Support equipment identifier

**Description:** The element `<toolIdent>`, contrary to the attribute `id`, semantically identifies the support equipment as a result of its attributes.

**Markup element:** `<toolIdent>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `toolNumber` (M), the support equipment part number used, together with the attribute `manufacturerCodeValue`, as the identifier of the support equipment, in the support equipment repository (implicit reference method).
- `manufacturerCodeValue` (M), the CAGE code of the support equipment manufacturer. As there is no standardized rule to assign a part number, the CAGE code of the support equipment manufacturer ensures the uniqueness of the support equipment identifier. Refer to [Chap 3.9.5.2.7](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- None

#### 2.1.1.2 References to other support equipment

**Description:** The element `<toolRefGroup>` provides relationships and the types of relationships with other support equipment.

**Markup element:** `<toolRefGroup>`. Refer to [Fig 2](#).

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `toolRefType` (M), the type of the relationship with the child support equipment and tools (eg, symmetry, replacement relationship)
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<toolRef>`, the references to the support equipment and tools. Refer to [Chap 3.9.5.2.1.9](#).

**Business rule decision point BRDP-S1-00260 - Use of the attribute toolRefType in the tools CIR:**

- Decide which values to use for the attribute `toolRefType` and allocate suitable definitions to the values.

## 2.1.1.3 Support equipment alternate group

**Description:** The element `<toolAlts>` is a group of support equipment alternates.

**Markup element:** `<toolAlts>`. Refer to [Fig 2](#).

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

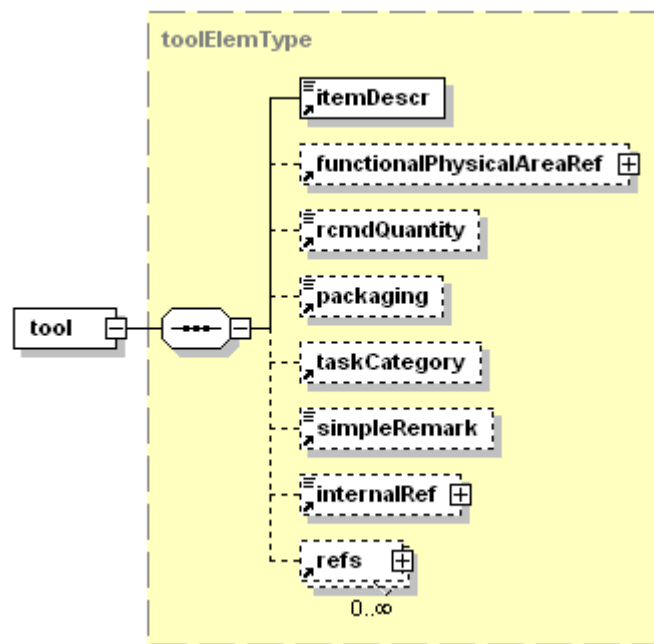

- `<tool>`. Refer to [Para 2.1.1.4](#).

## 2.1.1.4 Alternate support equipment

**Description:** The element `<tool>` contains information that describes the support equipment and provides further information related to the support equipment based on the Product configuration.

**Markup element:** `<tool>`

ICN-S1000D-A-03090502-A-FAPE3-00091-A-001-01

Fig 3 Element `<tool>`

#### Attributes:

- applicRefId (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- altNumber (O), the alternate number to identify the alternate
- deliveredSpecificationFlag (O), whether a specification sheet is delivered with the support equipment. The attribute can have one of the following values:
  - "1" - Yes, a specification sheet is delivered
  - "0" - No, a specification sheet is not delivered
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<itemDescr>`, the description of the support equipment. Refer to [Chap 3.9.5.2.11.4](#).
- `<functionalPhysicalAreaRef>`, a reference to a functional and/or physical area of the Product. Refer to [Chap 3.9.5.2.11.10](#).
- `<rcmdQuantity>`. Refer to [Para 2.1.1.4.1](#).
- `<packaging>`, information about the packaging of the support equipment. Refer to [Chap 3.9.5.2.11.7](#).
- `<taskCategory>`. Refer to [Para 2.1.1.4.2](#).
- `<simpleRemark>`, general remark (eg, about shipping the support equipment). Refer to [Chap 3.9.5.2.11.7](#).

- `<internalRef>`, reference to the illustration or multimedia file where the support equipment is illustrated. Refer to [Chap 3.9.5.2.1.2](#).
- `<refs>`. References must be populated in accordance with [Chap 3.9.5.2.1.2](#).

**Business rule decision point BRDP-S1-00261 - Use of the attribute `altNumber` in the tools CIR:**

- Decide whether to use the attribute `altNumber`, which values to use and allocate suitable definitions to the values.

**2.1.1.4.1 Recommended quantity**

**Description:** The element `<rcmdQuantity>` contains the support equipment recommended quantity.

**Markup element:** `<rcmdQuantity>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**2.1.1.4.2 Task code**

**Description:** The element `<taskCategory>` specifies the usage of the support equipment (eg, servicing, maintenance, overhaul, repair).

**Markup element:** `<taskCategory>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `taskCategoryCode` (M), the support equipment task category value
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00262 - Use of the attribute `taskCategoryCode` in the tools CIR:**

- Decide which values (eg, servicing, maintenance, overhaul, repair) to use for the attribute `taskCategoryCode` and allocate suitable definitions to the values.

## 1 General

The functional and/or physical areas Common Information Repository (CIR) data module is used to store information about the functional and/or physical breakdown of the Product. Refer to [Chap 4.3](#) and [Chap 8.2](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Functional and/or physical areas CIR data module content

### 2.1 Functional and/or physical area repository

**Description:** The element `<functionalPhysicalAreaRepository>` contains a list of functional and/or physical areas and their associated properties.

**Markup element:** `<functionalPhysicalAreaRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00094-A-001-01

Fig 1 Element `<functionalPhysicalAreaRepository>`

**Attributes:**

- None

**Child elements:**

- `<functionalPhysicalAreaSpec>`. Refer to [Para 2.1.1](#).

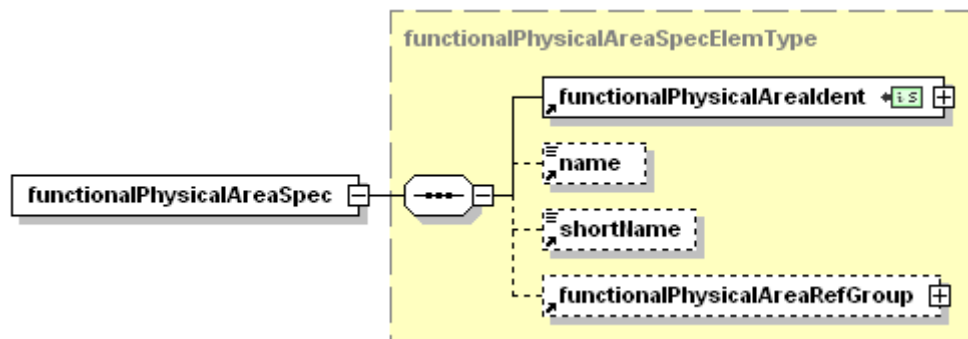

#### 2.1.1 Functional and/or physical area specification

**Description:** The element `<functionalPhysicalAreaSpec>` contains the associated properties of one functional and/or physical area.

There are six types of functional and/or physical areas: the systems, the subsystems, the sub-subsystems, the assemblies, the disassemblies and the disassembly variants.

A given functional and/or physical area can have applicability and may not be valid for all instances of a Product.

**Markup element:** `<functionalPhysicalAreaSpec>`

ICN-S1000D-A-03090502-A-FAPE3-00095-A-001-01

Fig 2 Element `<functionalPhysicalAreaSpec>`

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <functionalPhysicalAreaIdent>. Refer to [Para 2.1.1.1](#).
- <name>, the name of the functional and/or physical area. Refer to [Chap 3.9.5.2.1.10](#).
- <shortName>, the abbreviated alternate name. Refer to [Chap 3.9.5.2.1.10](#).
- <functionalPhysicalAreaRefGroup>. Refer to [Para 2.1.1.2](#).

### 2.1.1.1 Functional and/or physical area identifier

**Description:** The element <functionalPhysicalAreaIdent> semantically identifies the functional and/or physical area as a result of its attributes.

If values "0", "00" or "0000" are filled in the optional attributes subSystemCode, subSubSystemCode and assyCode, they are considered as significant values. In addition to the functional and/or physical area identifier, the system difference code can be specified for each functional and/or physical area.

**Markup element:** <functionalPhysicalAreaIdent>

**Attributes:**

- systemDiffCode (O), to indicate to which system difference code the functional and/or physical area pertains to. Refer to [Chap 3.9.5.1](#).
- systemCode (M), the functional and/or physical area system code. Refer to [Chap 3.9.5.1](#).
- subSystemCode (O), the functional and/or physical area subsystem code. Refer to [Chap 3.9.5.1](#).
- subSubSystemCode (O), the functional and/or physical area sub-subsystem code. Refer to [Chap 3.9.5.1](#).
- assyCode (O), the functional and/or physical area assembly code. Refer to [Chap 3.9.5.1](#).
- disassyCode (O), the functional and/or physical area disassembly code. Refer to [Chap 3.9.5.1](#).
- disassyCodeVariant (O), the functional and/or physical area disassembly code variant. Refer to [Chap 3.9.5.1](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00263 - Use of the attribute systemDiffCode in the element <functionalPhysicalAreaIdent>:**

- Decide whether to apply the system difference code in the functional and/or physical areas CIR data module.

**Business rule decision point BRDP-S1-00264 - Use of the attributes `disassyCode` and `disassyCodeVariant` in the element `<functionalPhysicalAreaIdent>`:**

- Decide whether to apply the disassembly code and disassembly variant code in the functional and/or physical areas CIR data module.

**Markup examples:**

The subsystem 21-1 must be populated:

```
<functionalPhysicalAreaIdent systemCode="21" subSystemCode="1"/>
```

The sub-subsystem 42-20 must be populated:

```
<functionalPhysicalAreaIdent systemCode="42" subSystemCode="2"
subSubSystemCode="0"/>
```

In case of project managing the disassembly in the functional and/or physical area repository, the disassembly 21-11-32-02 must be populated:

```
<functionalPhysicalAreaIdent systemCode="21" subSystemCode="1"
subSubSystemCode="1" assyCode="32" disassyCode="02"/>
```

In case of project managing several system difference codes, the system difference code value to which the functional area pertains to must to be indicated. The subsystem 21-1 in system difference code A must be populated:

```
<functionalPhysicalAreaIdent systemDiffCode="A" systemCode="21"
subSystemCode="1"/>
```

#### 2.1.1.2 References to other functional and/or physical areas

**Description:** The element `<functionalPhysicalAreaRefGroup>` reflects the functional and/or physical breakdown. If used, it must only contain the links from a functional and/or physical area to its direct child elements.

This means that a system can only refer to subsystems with the same system code values, a subsystem can only refer to sub-subsystems with the same system and subsystem code values, etc.

**Markup element:** `<functionalPhysicalAreaRefGroup>`

ICN-B6865-S1000D0013-001-01

Fig 3 Element `<functionalPhysicalAreaRefGroup>`

**Attributes:**

- None

**Child elements:**

- `<functionalPhysicalAreaRef>`. Refer to [Para 2.1.1.3](#).

### 2.1.1.3 Functional and/or physical area

**Description:** The element `<functionalPhysicalAreaRef>` is used to mark up a functional and/or physical area (outside of its specification in the functional and/or physical areas CIR) and also allows referring to its specification in the functional and/or physical areas CIR.

**Markup element:** `<functionalPhysicalAreaRef>`. Refer to [Fig 3](#).

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `systemDiffCode` (O), the system difference code to which the functional and/or physical area pertains. Refer to [Chap 3.9.5.1](#).
- `systemCode` (M), the functional and/or physical area system code. Refer to [Chap 3.9.5.1](#).
- `subSystemCode` (O), the functional and/or physical area subsystem code. Refer to [Chap 3.9.5.1](#).
- `subSubSystemCode` (O), the functional and/or physical area sub-subsystem code. Refer to [Chap 3.9.5.1](#).
- `assyCode` (O), the functional and/or physical area assembly code. Refer to [Chap 3.9.5.1](#).
- `disassyCode` (O), the functional and/or physical area disassembly code. Refer to [Chap 3.9.5.1](#).
- `disassyCodeVariant` (O), the functional and/or physical area disassembly code variant. Refer to [Chap 3.9.5.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<dmRef>`. Data module references must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<functionalPhysicalAreaRef systemCode="21" subSystemCode="1"/>
```

## 1 General

The controls and indicators Common Information Repository (CIR) data module is used to capture and represent control and indicator information.

This information assists personnel in determining the location and function of the controls and indicators.

For more information on the CIR data module principles. Refer to [Chap 4.13.1](#).

## 2 Controls and indicators CIR data module content

### 2.1 Controls and indicators repository

**Description:** The element `<controlIndicatorRepository>` contains control and indicator information.

**Markup element:** `<controlIndicatorRepository>`

ICN-S3627-S1000D0675-001-01

Fig 1 Element `<controlIndicatorRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

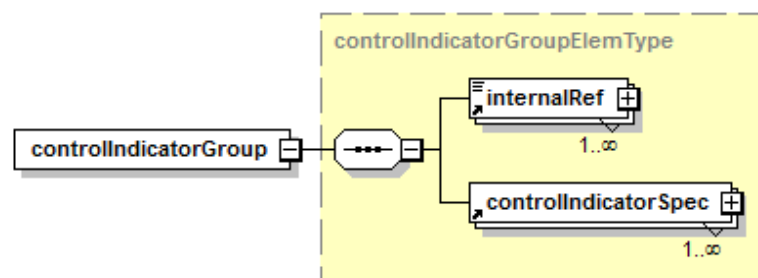

#### Child elements:

- `<controlIndicatorGroup>`. Refer to [Para 2.1.1](#).

### 2.1.1 Control or indicator group

**Description:** The element `<controlIndicatorGroup>` contains a unique identification of controls and indicators, each grouped by equipment, assembly, or control panel.

**Markup element:** `<controlIndicatorGroup>`

ICN-S3627-S1000D0676-001-01

Fig 2 Element `<controlIndicatorGroup>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<controlIndicatorSpec>`. Refer to [Para 2.1.1.1](#).

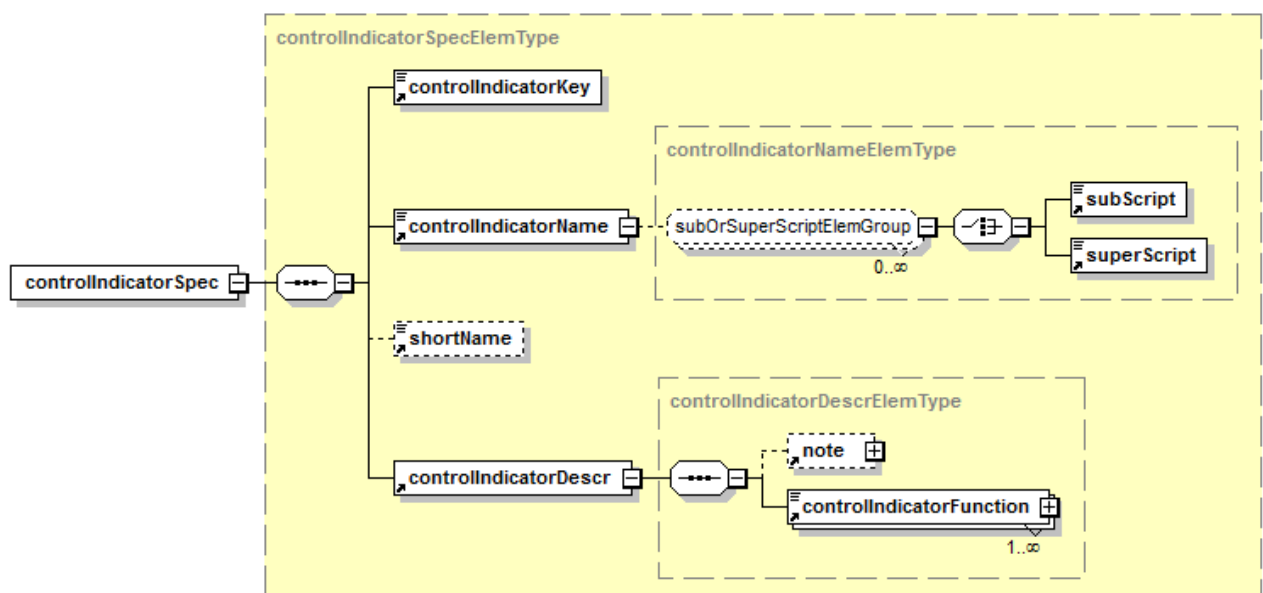

#### Markup example:

```
<controlIndicatorGroup>
<internalRef internalRefId="fig-0001"
internalRefTargetType="irtt01"/>
<controlIndicatorSpec>...</controlIndicatorSpec>
</controlIndicatorGroup>
```

#### 2.1.1.1 Control and indicator information

**Description:** The element `<controlIndicatorSpec>` contains control and indicator information including illustration or index key, name, and description. This element is the target when a control or indicator is referenced from another data module, for example from a procedural data module, using the element `<controlIndicatorRef>`. Refer to [Chap 3.9.5.2.1.10](#).

**Markup element:** `<controlIndicatorSpec>`

ICN-1G6E8-S1000D0001-002-01

Fig 3 Element `<controlIndicatorSpec>`

#### Attributes:

- applicRefId (O), the applicability information. Refer to [Chap 3.9.5.3](#).

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- controlIndicatorNumber (M), the identifier which can be used for implicit referencing within other data modules. Refer to [Chap 4.13.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <controlIndicatorKey>. Refer to [Para 2.1.1.1.1](#).
- <controlIndicatorName>. Refer to [Para 2.1.1.1.2](#).
- <shortName>. Refer to [Chap 3.9.5.2.1.10](#).
- <controlIndicatorDescr>. Refer to [Para 2.1.1.1.3](#).

#### 2.1.1.1.1 Control or indicator key

**Description:** The element <controlIndicatorKey> contains the illustration or index key of the control or indicator.

**Markup element:** <controlIndicatorKey>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<controlIndicatorKey>5</controlIndicatorKey>
```

#### 2.1.1.1.2 Control or indicator name

**Description:** The element <controlIndicatorName> contains the name of the control or indicator.

**Markup element:** <controlIndicatorName>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <subScript>. Refer to [Chap 3.9.5.2.1.10](#).

- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<controlIndicatorName>Chrome Bell</controlIndicatorName>
```

#### 2.1.1.1.3 Control or indicator description

**Description:** The element `<controlIndicatorDescr>` contains the information specific to a control or indicator.

**Markup element:** `<controlIndicatorDescr>`

#### Attributes:

- `applicRefId` (O), the applicability information. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

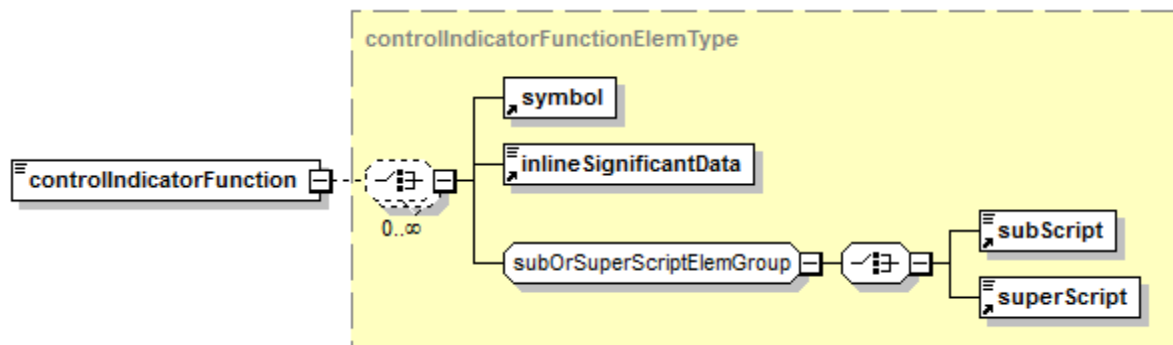

#### Child elements:

- `<note>`. Refer to [Chap 3.9.3](#).
- `<controlIndicatorFunction>`. Refer to [Para 2.1.1.1.4](#).

#### 2.1.1.1.4 Control or indicator function

**Description:** The element `<controlIndicatorFunction>` contains one or more brief descriptions of the control or indicator function.

**Markup element:** `<controlIndicatorFunction>`

ICN-S3627-S1000D0678-001-01

Fig 4 Element `<controlIndicatorFunction>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <symbol>. Refer to [Chap 3.9.5.2.1.10](#).
- <inlineSignificantData>. Refer to [Chap 3.9.5.2.1.10](#).
- <subScript>. Refer to [Chap 3.9.5.2.1.10](#).
- <superScript>. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<controlIndicatorFunction>Push button to turn light
<inlineSignificantData
significantParaDataType="psd10">ON</inlineSignificantData> or
<inlineSignificantData
significantParaDataType="psd10">OFF</inlineSignificantData>.</co
ntrolIndicatorFunction>
```

## **1 General**

The applicability annotations Common Information Repository (CIR) data module is used to store externalized applicability annotations for projects and organizations which need to externalize the applicability annotations from other data modules. The advantage of externalizing the applicability from other data modules is to simplify data module revisions.

The element `<applicRef>` is used in other data modules to refer to an applicability annotation stored in the applicability annotations CIR data module. Refer to [Chap 3.9.5.2.1.13](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Applicability annotations CIR data module content

### 2.1 Applicability annotations repository

**Description:** The element `<applicRepository>` contains a list of externalized applicability annotations used in the data modules.

**Markup element:** `<applicRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00099-A-001-01

Fig 1 Element `<applicRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<applicSpec>`. Refer to [Para 2.1.1](#).

### 2.1.1 Applicability annotation specification

**Description:** The element `<applicSpec>` represents one applicability annotation.

**Markup element:** `<applicSpec>`

ICN-S1000D-A-03090502-A-FAPE3-00100-A-001-01

Fig 2 Element `<applicSpec>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `applicMapRefId` (M), which refer to the referenced applicability annotation. Refer to [Chap 3.9.5.3](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <applicSpecIdent>. Refer to [Para 2.1.1.1](#).
- <refs>. Refer to [Chap 3.9.5.2.1.2](#).

#### 2.1.1.1 Applicability annotation identifier

**Description:** The element <applicSpecIdent> uniquely identifies the applicability annotation thru its attribute applicIdentValue. This identifier must be used to refer from the data modules where the applicability annotation is externalized (element <applicRef>) to the externalized applicability annotation in the applicability annotations CIR data module.

**Markup element:** <applicSpecIdent>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- applicIdentValue (M), the applicability annotation identifier
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<applicSpecIdent applicIdentValue="app-
S1000DLIGHTINGAAAD00000000AA056AA-0000" />
```

## 3 Examples

The following examples illustrate two externalized applicability annotations stored in the applicability annotations CIR data module.

The first one is coming from DMC-S1000DLIGHTING-AAA-D00-00-00-00AA-056A-A and the second one from DMC-S1000DLIGHTING-AAA-D00-00-00-00AA-057A-A.

## 1 General

The warnings Common Information Repository (CIR) data module is used to collect and centralize in one place warnings used in several data modules. It is an alternative to the warning collection at data module level. Refer to [Chap 3.9.3](#).

The element `<warningRef>`, child of the element `<warningsAndCautionsRef>`, is used in the other data modules to refer to a warning stored in the warnings CIR data module. Refer to [Chap 3.9.5.2.1.13](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Warnings CIR data module content

### 2.1 Warnings repository

**Description:** The element `<warningRepository>` contains a collection of warnings used in the data modules.

**Markup element:** `<warningRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00102-A-001-01

Fig 1 Element `<warningRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

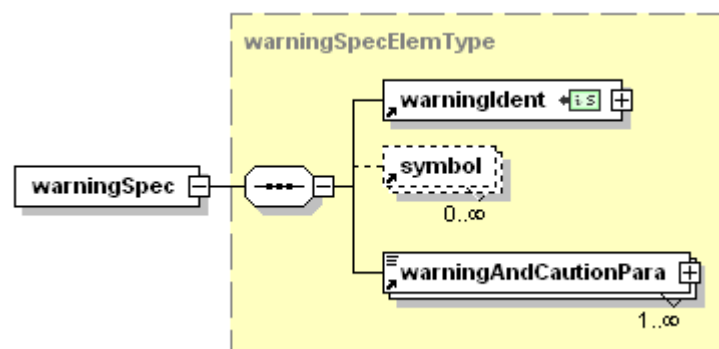

#### Child elements:

- `<warningSpec>`. Refer to [Para 2.1.1](#).

### 2.1.1 Warning specification

**Description:** The element `<warningSpec>` represents one warning.

**Markup element:** `<warningSpec>`

ICN-S1000D-A-03090502-A-FAPE3-00103-A-001-01

Fig 2 Element `<warningSpec>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <warningIdent>. Refer to [Para 2.1.1.1](#).
- <symbol>. Refer to [Chap 3.9.5.2.1.10](#).
- <warningAndCautionPara>. Refer to [Chap 3.9.3](#).

## 2.1.1.1 Warning identifier

**Description:** The element <warningIdent> uniquely identifies the warning thru its attribute warningIdentNumber. This identifier must be used to refer from the data modules where the warning is externalized (element <warningRef>) to the externalized warning in the warnings CIR data module.

**Markup element:** <warningIdent>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- warningIdentNumber (M), the warning identifier
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

**Markup example:**

```
<warningIdent warningIdentNumber="0-0204504-1"/>
```

### 3 Example

The following example illustrates two warnings stored in the warnings CIR data module.

```
<content>
<commonRepository>
<warningRepository>
<warningSpec id="warn-00001">
<warningIdent warningIdentNumber="0-0204504-1"/>
<warningAndCautionPara>Make sure that the bulb is cool before
you replace it.</warningAndCautionPara>
</warningSpec>
<warningSpec id="warn-00002">
```

---

```
<warningIdent warningIdentNumber="0008037-802"/>
<warningAndCautionPara>Make sure the light glass is not broken
before handling it</warningAndCautionPara>
</warningSpec>
...
</warningRepository>
</commonRepository>
</content>
```

## 1 General

The cautions Common Information Repository (CIR) data module is used to collect and centralize in one place cautions used in several data modules. It is an alternative to the caution collection at data module level. Refer to [Chap 3.9.3](#).

The element `<cautionRef>`, child of the element `<warningsAndCautionsRef>`, is used in the other data modules to refer to a caution stored in the cautions CIR data module. Refer to [Chap 3.9.5.2.1.13](#).

For more information on the CIR data module principles, refer to [Chap 4.13.1](#).

## 2 Cautions CIR data module content

### 2.1 Cautions repository

**Description:** The element `<cautionRepository>` contains a collection of cautions used in the data modules.

**Markup element:** `<cautionRepository>`

ICN-S1000D-A-03090502-A-FAPE3-00105-A-001-01

Fig 1 Element `<cautionRepository>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

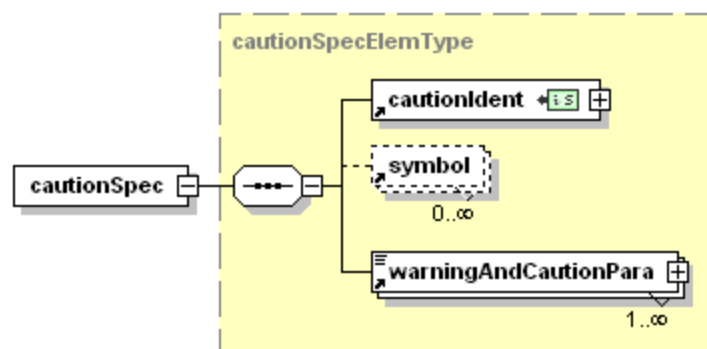

#### Child elements:

- `<cautionSpec>`. Refer to [Para 2.1.1](#).

### 2.1.1 Caution specification

**Description:** The element `<cautionSpec>` represents one caution.

**Markup element:** `<cautionSpec>`

ICN-S1000D-A-03090502-A-FAPE3-00106-A-001-01

Fig 2 Element `<cautionSpec>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <cautionIdent>. Refer to [Para 2.1.1.1](#).
- <symbol>. Refer to [Chap 3.9.5.2.1.10](#).
- <warningAndCautionPara>. Refer to [Chap 3.9.3](#).

#### 2.1.1.1

##### Caution identifier

**Description:** The element <cautionIdent> uniquely identifies the caution thru its attribute cautionIdentNumber. This identifier must be used to refer from the data modules where the caution is externalized (element <cautionRef>) to the externalized caution in the cautions CIR data module.

**Markup element:** <cautionIdent>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- cautionIdentNumber (M), the caution identifier
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<cautionIdent cautionIdentNumber="0-0204504-1"/>
```

## 3

### Example

The following example illustrates two cautions stored in the cautions CIR data module.

```
<content>
<commonRepository>
<cautionRepository>
<cautionSpec id="caut-00001">
<cautionIdent cautionIdentNumber="0-0204504-1"/>
<warningAndCautionPara>Do not touch the glass of the
bulb.</warningAndCautionPara>
</cautionSpec>
<cautionSpec id="caut-00002">
```

```
<cautionIdent cautionIdentNumber="0008037-802"/>
<warningAndCautionPara>Make sure that the glass is clean before
installing it on the light.</warningAndCautionPara>
</cautionSpec>
...
</cautionRepository>
</commonRepository>
</content>
```

<a href="#">Chap 4.13.4</a>	Optimizing and reuse - Container data module

#### 1 General

This chapter details the use of the container data module. The container data module provides a mechanism to associate several alternate data modules representing the same data. The general mechanism of the container data module is described in [Chap 4.13.4](#).

#### 2 Container data module content

##### 2.1 Container

**Description:** The element <container> contains the list of alternate data modules, which are in the container.

**Markup element:** <container>

ICN-S1000D-A-03090502-A-FAPE3-00109-A-001-01

Fig 1 Element &lt;container&gt;

#### Attributes:

## 1 General

S1000D supports technical training information development through the use of the learning data module. The Schema for this data module structures technical learning content and configures it to the system being instructed in the lessons. It also maintains the use of standard S1000D XML structures. By maintaining the common S1000D structures, reuse between technical data and its supporting learning content is possible without the need for conversion from other formats.

### 1.1 Why use S1000D for technical training data?

The primary reason for using S1000D for technical training content is to ensure that the training content is current with other system documentation throughout the life cycle. S1000D improves life cycle configuration management. It is crucial for a data manager to know how a system design change effects supporting documentation, including training. There must be a common thread linked throughout the life cycle support data. That thread is supported by S1000D metadata. The use of S1000D provides a common set of metadata for all life cycle supportability content, thereby enabling queries and tools to help manage the content en masse. S1000D serves as a common digital data format for technical data and technical training content.

### 1.2 How S1000D supports training content structures and file naming

Five data structures have been designed to support the instructional design process. These structures have been modeled with course development, course content and course assessment in mind. The target instructional development audiences are the operational and technical training communities. Learning content designed to teach operational and maintenance procedures, system breakdown and repair can be supported with file names configured according to a meaningful data module code.

To support the various types of information concerned, the structures offered provide a wide variety of possibilities. Generally, projects must ensure that these possibilities are used in a sensible way to avoid creating unnecessary complex content structures.

The Sharable Content Object Reference Model (SCORM) primarily addresses how a learning content package module is constructed so that it operates in any SCORM-conformant Learning Management System (LMS). Naming conventions are left to individual learning development teams. S1000D standardize the naming conventions by providing data module coding structures that configures the learning content to the supported systems and assemblies.

### 1.3 How S1000D works with SCORM

SCORM is a United States Department of Defense specification developed by Advanced Distributed Learning (ADL). It has been adopted around the world. Its function is to ensure that an electronic learning content package module is interoperable with any SCORM-conformant LMS. An LMS tracks the learner's progress through a course.

SCORM is a model that references a collection of learning-oriented specifications that work to collect, describe, enable and distribute learning. SCORM does not specify course content or data formats. The technology is applicable to any learning subject matter and any data format. S1000D is a markup specification and fills SCORM data specification gap for technical learning content. S1000D can name, identify and structure technical learning content and offer configuration management support.

## 2 Learning information

### 2.1 Description

The learning Schema supports the development of technical learning objects. Object structures include support for needs analysis, learning objectives and interactive assessment. The intention is to support technical learning content in the life cycle logistics process.

### Note

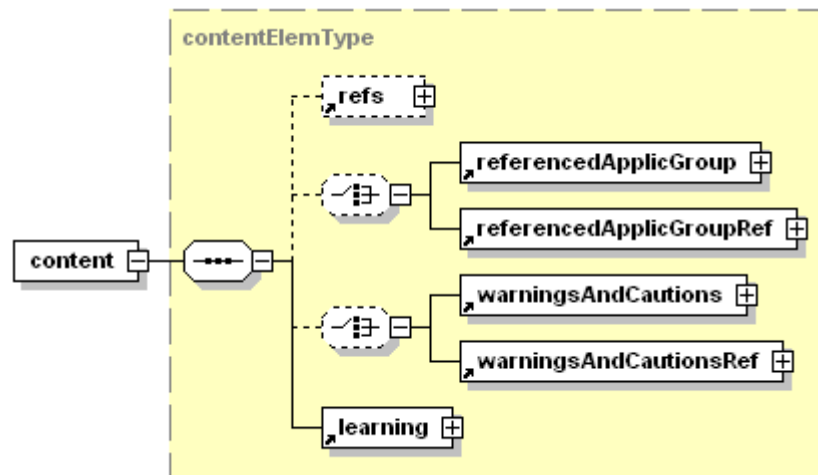

The learning data module uses common constructs in addition to the markup unique to the learning schema. Refer to [Chap 3.9.5.2.1](#).

## 2.2

### Content

**Description:** The element `<content>` contains the content section of the learning data module.

**Markup element:** `<content>`

ICN-06RT9-000001-001-01

Fig 1 Element `<content>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<warningsAndCautions>`. Refer to [Chap 3.9.3](#).
- `<warningsAndCautionsRef>`. Refer to [Chap 3.9.3](#).
- `<learning>`. Refer to [Para 2.3](#).

## 2.3

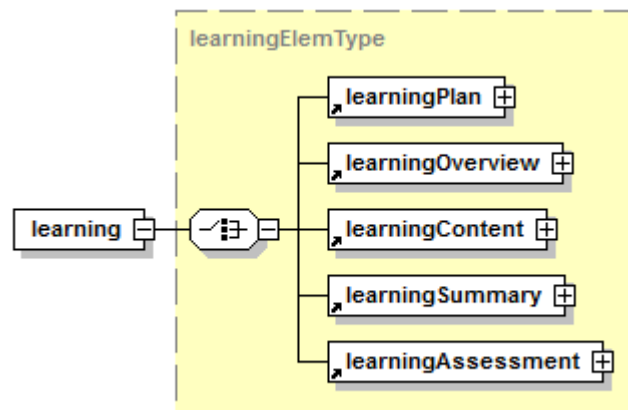

### Learning content

**Description:** The element `<learning>` contains one of the five learning information types:

- learning plan
- learning overview
- learning content
- learning summary
- learning assessment

Separate data modules are needed for each learning information type.

**Markup element:** `<learning>`

ICN-06RT9-000016-001-01

Fig 2 Element [<learning>](#)

#### Attributes:

- None

#### Child elements:

- [<learningPlan>](#), the learning planning information. Refer to [Chap 3.9.5.2.13.1](#).
- [<learningOverview>](#), the learning overview. Refer to [Chap 3.9.5.2.13.2](#).
- [<learningContent>](#), the learning content. Refer to [Chap 3.9.5.2.13.3](#).
- [<learningSummary>](#), the learning summary. Refer to [Chap 3.9.5.2.13.4](#).
- [<learningAssessment>](#), the learning assessment. Refer to [Chap 3.9.5.2.13.5](#).

The substructures of the element [<learning>](#) include in several locations optional occurrences of element [<title>](#) in several locations. In order to achieve a readable and unambiguous presentation, given titles and generated titles must be provided in the output a sensible way.

#### Business rule decision point BRDP-S1-00561 - Use of titles in the Learning data module:

- In the substructures of the Learning data module, decide to what extent optional occurrences of the element [<title>](#) can be used and how given titles and generated titles must be presented to achieve a readable presentation of the information.

### 3

## Example

Refer to [Chap 3.9.5.2.13.1](#) thru [Chap 3.9.5.2.13.5](#) for examples of markup of the child elements.

## Chapter 3.9.5.2.13.1

## 1 General

The learning plan information model is the first branch in the learning schema. It contains content structures to support the capture and management of human performance system analysis data and requirements. For example, worker attributes, resources available, capacity to perform required maintenance tasks. It also contains content structures to capture training needs analysis data, such as learning objectives, trainee characteristics, assessment criteria, etc.

The learning plan branch supports the processes and requirements of Performance Analysis (PA) for Human Performance Technology (HPT) and Training Needs Analysis (TNA) for Instructional Systems Design (ISD). Structures included within the learning plan schema to support HPT PA include the following: Organizational analysis, gap analysis, organizational

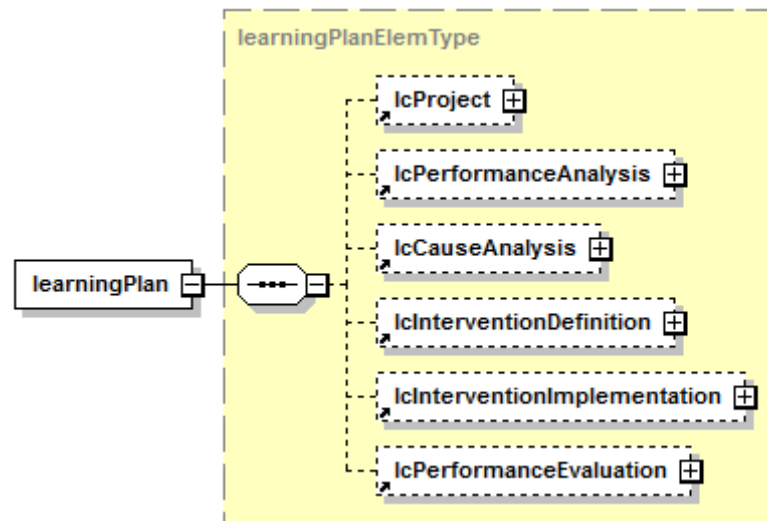

environment analysis, work environment analysis, performer analysis, cause analysis, and performance evaluation. Structures included to support ISD TNA include the following: Target audience, prerequisites, required entry behaviors, training component (learning strategy, duration, required personnel, etc), assessment strategy, learning objective.

## 2 Learning plan content

**Description:** The element `<learningPlan>` captures the human performance system characteristics and requirements with a learning data module. It is also used to describe the requirements of interventions, including training interventions, intended to support the end user in performing tasks related to the maintenance or operation of the product. For example, a learning plan topic can describe the learning objectives of a technician training lesson about the proper disassembly of product. The learning plan structure is contained within the element `<learning>`.

Lesson plans are not traditionally viewed or utilized by learners. However, a lesson plan is the precursor and the foundation to instructional material. Kept together, lesson plans and the learning content developed from the plans form a complete instructional unit.

**Markup element:** `<learningPlan>`

ICN-1654N-S1000D0018-001-01

Fig 1 Element `<learningPlan>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<lcProject>`. Refer to [Para 2.1](#).
- `<lcPerformanceAnalysis>`. Refer to [Para 2.2](#).

- `<lcCauseAnalysis>`. Refer to [Para 2.3](#).
- `<lcInterventionDefinition>`. Refer to [Para 2.4](#).
- `<lcInterventionImplementation>`. Refer to [Para 2.5](#).
- `<lcPerformanceEvaluation>`. Refer to [Para 2.6](#).

**Business rule decision point BRDP-S1-00267 - Conducting a performance analysis:**

- Decide whether to conduct a performance analysis to determine factors that can affect performance and gaps in job performance or a training needs analysis to determine training requirements.

**Business rule decision point BRDP-S1-00268 - Developing learning objectives:**

- Decide whether to develop learning objectives in accordance with task analysis items. Learning objectives ought to be developed in accordance with task analysis items that support system maintenance and operational procedures. Aligning learning objectives with task analysis items in the early content preplanning stages will foster reusable data and content alignment. Refer to [Chap 3.9.7](#) for content preplanning discussions.

**Business rule decision point BRDP-S1-00269 - Packaging lesson plans in SCORM content package modules:**

- Decide whether to package lesson plans in SCORM content package modules.

**Markup example:**

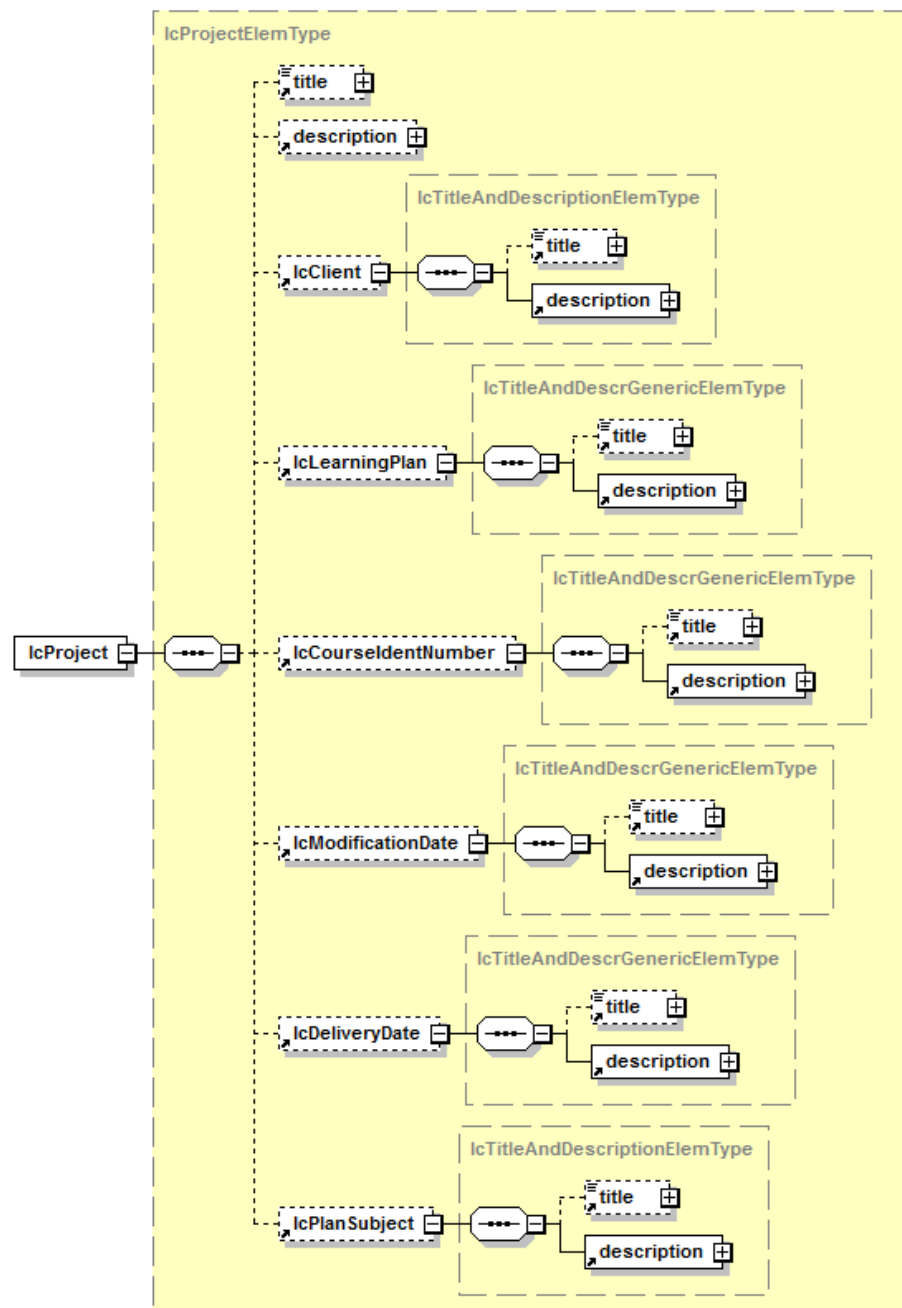

Refer to [Para 3](#).

## 2.1

### Project

**Description:** The element `<lcProject>` contains the administrative information about the learning plan structure being developed from a performance analysis or training needs analysis.

**Markup element:** `<lcProject>`

### 2.1.1

#### Client

**Description:** The element `<lcClient>` contains the name of the organization sponsoring or requesting the development of the learning plan. It can also include a short description of the organization.

**Markup element:** `<lcClient>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```

<lcClient>
<title>National Bike Courier Association</title>
<description>
<para>The NBCA is a national professional society for bike
couriers. The director of the NBCA has funded the development of
this learning plan.</para>
</description>
</lcClient>

```

### 2.1.2

#### Learning plan

**Description:** The element `<lcLearningPlan>` contains the title of the learning plan and a brief summary of its purpose or content.

**Markup element:** `<lcLearningPlan>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcLearningPlan>
<title>Bike maintenance for couriers</title>
<description>
<para>This lesson plan describes the learning needs and
instructional requirements for teaching the parts of a bike and
bike maintenance procedures.</para>
</description>
</lcLearningPlan>
```

### 2.1.3 Course identification number

**Description:** The element `<lcCourseIdentNumber>` contains an alphanumeric alternate identifier to the project title.

**Markup element:** `<lcCourseIdentNumber>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcCourseIdentNumber>
<title>Course identification number</title>
<description>
<para>N00174-05-D-0003</para>
</description>
</lcCourseIdentNumber>
```

### 2.1.4 Modification date

**Description:** The element `<lcModificationDate>` contains the date when the project modification is intended to be implemented.

**Markup element:** `<lcModificationDate>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcModificationDate>
<title>Modification date</title>
<description>
<para>2010-06-22</para>
</description>
</lcModificationDate>
```

## 2.1.5

### **Delivery date**

**Description:** The element `<lcDeliveryDate>` contains the date when the project delivery is intended to take place.

**Markup element:** `<lcDeliveryDate>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcDeliveryDate>
<title>Delivery date</title>
<description>
<para>20091228</para>
</description>
</lcDeliveryDate>
```

### 2.1.6 Plan subject

**Description:** The element `<lcPlanSubject>` contains a description of the scope of requirements or topics covered within the learning plan.

**Markup element:** `<lcPlanSubject>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

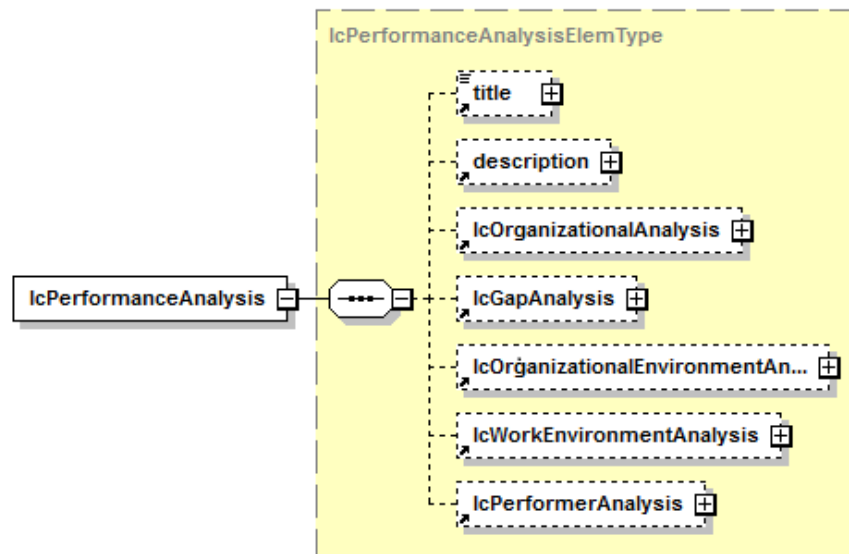

**Markup example:**

```
<lcPlanSubject>
<title>Periodic bike maintenance</title>
<description>
<para>The requirements documented in this learning plan are
intended for bike couriers who must perform regular maintenance
on their bikes.</para>
</description>
</lcPlanSubject>
```

## 2.2 Performance analysis

**Description:** The element `<lcPerformanceAnalysis>` contains the information and requirements resulting from an analysis of the affected human performance system or training needs of the product users. This is the second high-level container element in the element `<learningPlan>`.

**Markup element:** `<lcPerformanceAnalysis>`

ICN-1654N-S1000D0020-001-01

Fig 3 Element *<lcPerformanceAnalysis>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*. Refer to [Chap 3.9.5.2.1.5](#).
- *<description>*. Refer to [Chap 3.9.5.2.2](#).
- *<lcOrganizationalAnalysis>*. Refer to [Para 2.2.1](#).
- *<lcGapAnalysis>*. Refer to [Para 2.2.2](#).
- *<lcOrganizationalEnvironmentAnalysis>*. Refer to [Para 2.2.3](#).
- *<lcWorkEnvironmentAnalysis>*. Refer to [Para 2.2.4](#).
- *<lcPerformerAnalysis>*. Refer to [Para 2.2.5](#).

#### Business rule decision point BRDP-S1-00270 - Define life cycle need for performance analysis data:

- Define the life cycle need for analysis information and requirements resulting from a performance analysis for the client organization and human performance system affected by the product.

#### Business rule decision point BRDP-S1-00271 - Define life cycle need for training needs analysis data:

- Define the life cycle need for analysis information and requirements resulting from a training needs analysis for a training intervention.

**Markup example:**

```
<lcPerformanceAnalysis>
<title>Performance analysis</title>

</lcGapStatement>
</lcGapItem>
</lcGapAnalysis>
<lcOrganizationalEnvironmentAnalysis>
<title>Analysis of Speedy Couriers' business environment</title>
<description>
<para>An organizational environment analysis was conducted to
capture information about factors that may inhibit Speedy
Couriers corporation in its ability to use the S1000D Bike to
meet its objectives within the business community. During the
```

analysis, it was learned that the corporation's couriers are union workers. Union policy states that all general maintenance and minor repairs shall be performed by couriers and that they shall be compensated at a technician rate for such maintenance. Therefore, it is desired by Speedy Courier corporation that all procedures that fall within this part of the union policy be written for couriers versus normal bike technicians.</para>

</description>

</lcOrganizationalEnvironmentAnalysis>

<lcWorkEnvironmentAnalysis>

<title>Analysis of courier's work environment at Speedy Courier, Inc.</title>

<description>

<para>The work environment of Speedy Courier bike couriers is in urban locations. The streets are paved, but due to its northern locale, the streets are often damaged from ice and snow during the winter months. Winter temperature range is -9 to 2 degrees Celsius, spring is 4 to 20, summer is 22 to 27, and fall is 6 to 20. The couriers' bikes are subject to atmospheric conditions such as sun, rain, sleet, snow, etc. For maintenance procedures the couriers complete themselves, or that are performed by a non-union technician, they will be performed at the garage area provided by the corporation. In some cases, however, road hazard maintenance will have to be performed in the field. Specifically, this refers to tire tube replacements and chain replacement.</para>

</description>

<lcManagerialSupport>

<description>

<para>Speedy Couriers has one general manager and four shift managers with administrative duties related to dispatching couriers. No managers have any advanced bike repair skills beyond what the couriers possess. The shift managers are responsible for ensuring couriers perform all required preventive maintenance at the scheduled periodicity.</para>

</description>

</lcManagerialSupport>

<lcPhysicalAspectsOfSite>

<description>

<para>The maintenance location provided for couriers by the corporation is a single garage bay measuring 20-feet deep by 16-feet wide. Basic wrenches, pliers, screwdrivers, etc, are within the work area. Lighting is in full working order. Various moveable stools and benches are scattered throughout. No other items are in the maintenance location.</para>

</description>

</lcPhysicalAspectsOfSite>

<lcSocialAspectsOfSite>

<description>

<para>Due to the need to keep couriers constantly dispatched, there is often only one courier performing the required maintenance at a given time. Couriers generally do not have time

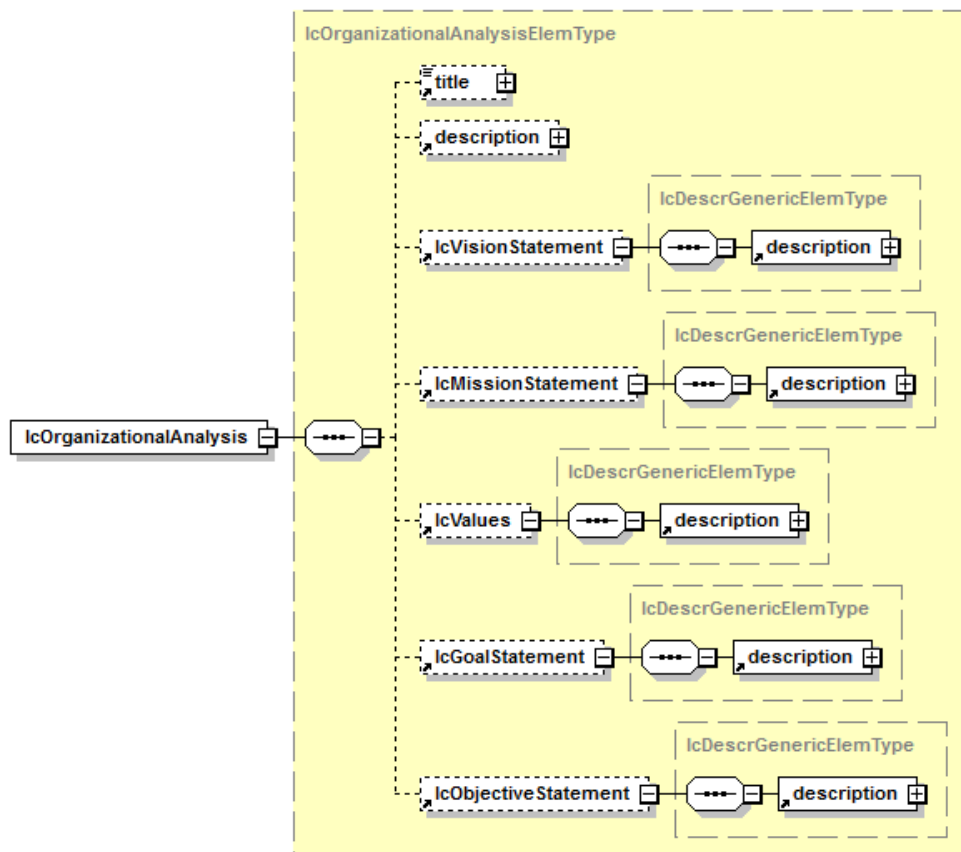

or opportunity to interact or assist one another in the maintenance location. Maintenance tasks are learned by the couriers while on the job, often without assistance.</para>

**Markup example:**

```
<lcVisionStatement>
<description>
<para>We grow the local business economy by helping businesses
of the city be more productive and successful.</para>
</description>
</lcVisionStatement>
```

### 2.2.1.2 Mission statement

**Description:** The element [<lcMissionStatement>](#) contains the high-level mission statement describing the mid-term end-state of an organization.

**Markup element:** [<lcMissionStatment>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcMissionStatement>
<description>
<para>Provide the city's businesses with the fastest, most
convenient and reliable courier services possible.</para>
</description>
</lcMissionStatement>
```

### 2.2.1.3 Values

**Description:** The element [<lcValues>](#) contains a description of the client organization's ethical boundaries in achieving its vision and mission.

**Markup element:** [<lcValues>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcValues>
<description>
<para>Promote the use of ecologically-friendly means of
transportation and respect the existence of wildlife, animals,
and humans when conducting business services.</para>
</description>
</lcValues>
```

#### 2.2.1.4 Goal statement

**Description:** The element [<lcGoalStatement>](#) contains a description of what the client organization must ultimately achieve as the result of some initiative or acquisition.

**Markup element:** [<lcGoalStatment>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcGoalStatement>
<description>
<para>To become the number-one, lowest-cost messenger service in
the city</para>
</description>
</lcGoalStatement>
```

#### 2.2.1.5 Objective statement

**Description:** The element [<lcObjectiveStatement>](#) contains a specific, measurable statement that describes what an organization must do to achieve its goal.

**Markup element:** [<lcObjectiveStatment>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <description>. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

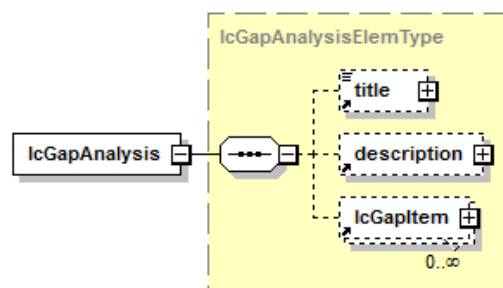

```
<lcObjectiveStatement>
<description>
<para>Achieve 98% customer satisfaction rating on all bike
courier services.</para>
</description>
</lcObjectiveStatement>
```

## 2.2.2

**Gap analysis**

**Description:** The element <lcGapAnalysis> contains the gap analysis information, which defines the delta between an organization's desired end state, as stated in its goal and objectives, and its current state.

**Markup element:** <lcGapAnalysis>

ICN-1654N-S1000D0042-001-01

Fig 5 Element <lcGapAnalysis>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcGapItem>`. Refer to [Para 2.2.2.1](#).

### 2.2.2.1 Gap item

**Description:** The element `<lcGapItem>` contains the structure required to define the current versus actual performance metric and the delta between those points.

**Markup element:** `<lcGapItem>`

ICN-1654N-S1000D0022-002-01

Fig 6 Element `<lcGapItem>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcDesiredPerformanceStatement>`. Refer to [Para 2.2.2.1.1](#).

- `<lcActualPerformanceStatement>`. Refer to [Para 2.2.2.1.2.](#)
- `<lcPlanObjective>`. Refer to [Para 2.2.2.1.3.](#)
- `<lcJtaItem>`. Refer to [Para 2.2.2.1.4.](#)
- `<lcGapStatement>`. Refer to [Para 2.2.2.1.5.](#)

**Markup example:**

```
<lcGapItem>
<title>Bike steering maintenance</title>
<description>
<para>Many couriers cannot correct mechanical problems with the
bike steering system within defined time parameters.</para>
</description>
</lcGapItem>
```

#### 2.2.2.1.1 *Desired performance statement*

**Description:** The element `<lcDesiredPerformanceStatement>` contains a measurable statement of the desired performance outcome.

**Markup element:** `<lcDesiredPerformanceStatement>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2.](#)
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1.](#)
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11.](#)
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6.](#)

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2.](#)

**Markup example:**

```
<lcDesiredPerformanceStatement>
<description>
<para>Ability to maintain bike in full working order by having
the ability to troubleshoot breakdowns and perform repairs
within an average of 30 minutes from the time of
breakdown</para>
</description>
</lcDesiredPerformanceStatement>
```

#### 2.2.2.1.2 *Actual performance statement*

**Description:** The element `<lcActualPerformanceStatement>` contains a measurable statement of the actual or current performance outcome.

**Markup element:** `<lcActualPerformanceStatement>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2.](#)

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcActualPerformanceStatement>
<description>
<para>Ability to maintain bike in full working order is observed
with the existing abilities to troubleshoot breakdowns and
perform repairs. However, the average time to repair is 75
minutes from the time of breakdown.</para>
</description>
</lcActualPerformanceStatement>
```

#### 2.2.2.1.3 Plan objective

**Description:** The element [<lcPlanObjective>](#) contains descriptions of actions, behaviors, conditions and standards required of the learner in order to complete a course.

**Markup element:** [<lcPlanObjective>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcPlanObjective>
<description>
<para>The student must earn a passing score on all assessments
in order to complete the course.</para>
</description>
</lcPlanObjective>
```

#### 2.2.2.1.4 Job task analysis item

**Description:** The element [<lcJtaItem>](#) contains the description of job task analysis as related to a particular learning objective.

**Markup element:** `<lcJtaItem>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcJtaItem>
<description>
<para>Disassemble bike steering system.</para>
</description>
</lcJtaItem>
```

#### 2.2.2.1.5 Gap statement

**Description:** The element `<lcGapStatement>` contains a statement of the gap observed between the actual and desired states of performance.

**Markup element:** `<lcGapStatement>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcGapStatement>
<description>
<para>Bike couriers, on average, are taking 45 minutes longer to
repair their bikes than required to ensure timely service to
customers.</para>
</description>
</lcGapStatement>
```

### 2.2.3 Organizational environment analysis

**Description:** The element `<lcOrganizationalEnvironmentAnalysis>` contains the information regarding internal and external factors that can influence an organization's ability to meet its vision, mission, goals, and objectives.

**Markup element:** `<lcOrganizationalEnvironmentAnalysis>`

ICN-1654N-S1000D0060-001-01

Fig 7 Element `<lcOrganizationalEnvironmentAnalysis>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

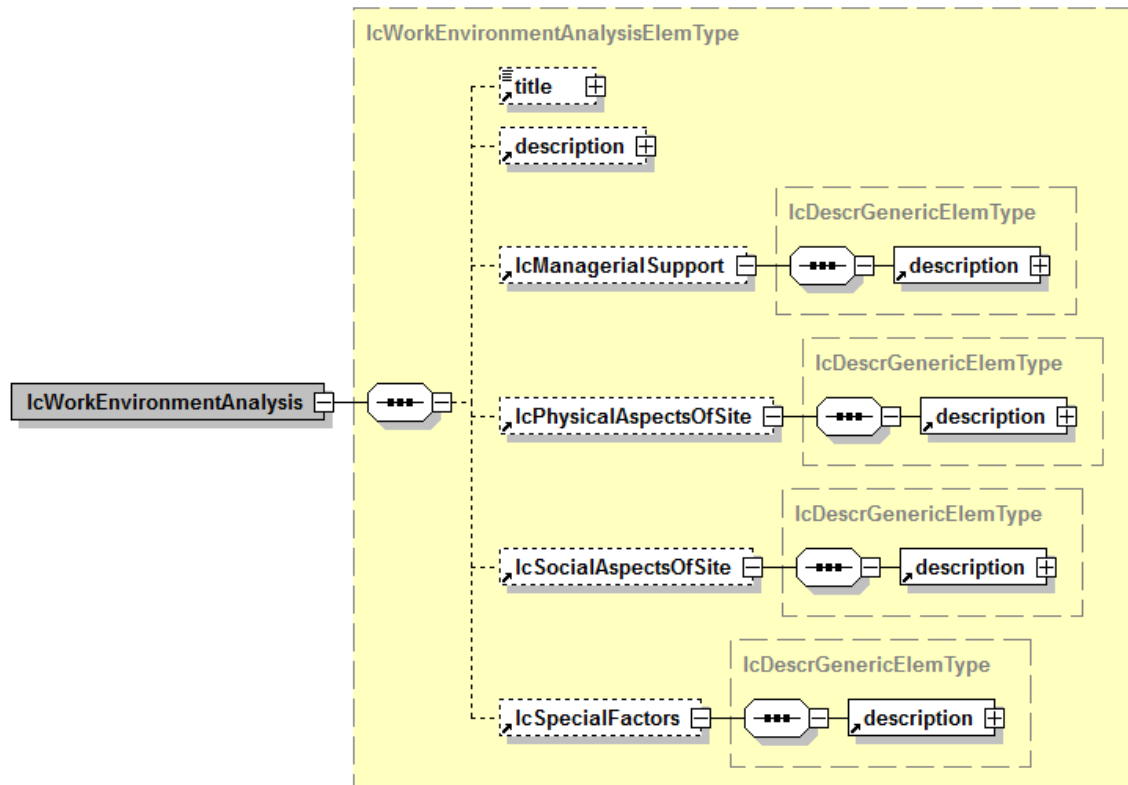

#### Markup example:

```
<lcOrganizationalEnvironmentAnalysis>
<title>Analysis of Speedy Couriers' business environment</title>
<description>
<para>An organizational environment analysis was conducted to
capture information about factors that may inhibit Speedy
Couriers corporation in its ability to use the S1000D Bike to
meet its objectives within the business community. During the
analysis, it was learned that the corporation's couriers are
union workers. Union policy states that all general maintenance
and minor repairs shall be performed by couriers and that they
shall be compensated at a technician rate for such maintenance.
Therefore, it is desired by Speedy Courier corporation that all
procedures that fall within this part of the union policy be
written for couriers versus normal bike technicians.</para>
</description>
</lcOrganizationalEnvironmentAnalysis>
```

## 2.2.4 Work environment analysis

**Description:** The element `<lcWorkEnvironmentAnalysis>` contains the information regarding factors in the workers' immediate environment that can influence the organization's ability to meet its vision, mission, goals, and objectives.

**Markup element:** `<lcWorkEnvironmentAnalysis>`

ICN-1654N-S1000D0023-002-01

Fig 8 Element `<lcWorkEnvironmentAnalysis>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcManagerialSupport>`. Refer to [Para 2.2.4.1](#).
- `<lcPhysicalAspectsOfSite>`. Refer to [Para 2.2.4.2](#).

- <lcSocialAspectsOfSite>. Refer to [Para 2.2.4.3.](#)
- <lcSpecialFactors>. Refer to [Para 2.2.4.4.](#)

**Markup example:**

```
<lcWorkEnvironmentAnalysis>
<title>Analysis of courier's work environment at Speedy Courier,
Inc.</title>
<description>
<para>The work environment of Speedy Courier bike couriers is in
urban locations. The streets are paved, but due to its northern
locale, the streets are often damaged from ice and snow during
the winter months. Winter temperature range is -9 to 2 degrees
Celsius, spring is 4 to 20, summer is 22 to 27, and fall is 6 to
20. The couriers' bikes are subject to atmospheric conditions
such as sun, rain, sleet, snow, etc. For maintenance procedures
the couriers complete themselves, or that are performed by a
non-union technician, they will be performed at the garage area
provided by the corporation. In some cases, however, road hazard
maintenance will have to be performed in the field.
Specifically, this refers to tire tube replacements and chain
replacement.</para>
</description>
<lcManagerialSupport>
<description>
<para>Speedy Couriers has one general manager and four shift
managers with administrative duties related to dispatching
couriers. No managers have any advanced bike repair skills
beyond what the couriers possess. The shift managers are
responsible for ensuring couriers perform all required
preventive maintenance at the scheduled periodicity.</para>
</description>
</lcManagerialSupport>
<lcPhysicalAspectsOfSite>
<description>
<para>The maintenance location provided for couriers by the
corporation is a single garage bay measuring 20-feet deep by 16-
feet wide. Basic wrenches, pliers, screwdrivers, etc, are within
the work area. Lighting is in full working order. Various
moveable stools and benches are scattered throughout. No other
items are in the maintenance location.</para>
</description>
</lcPhysicalAspectsOfSite>
<lcSocialAspectsOfSite>
<description>
<para>Due to the need to keep couriers constantly dispatched,
there is often only one courier performing the required
maintenance at a given time. Couriers generally do not have time
or opportunity to interact or assist one another in the
maintenance location. Maintenance tasks are learned by the
couriers while on the job, often without assistance.</para>

beyond what the couriers possess. The shift managers are
responsible for ensuring couriers perform all required
preventive maintenance at the scheduled periodicity.</para>
</description>
</lcManagerialSupport>
```

#### 2.2.4.2 Physical aspects of site

**Description:** The element `<lcPhysicalAspectsOfSite>` contains the description of tangible, overt characteristics or attributes of the workers' work locations that can influence an organization's ability to meet its vision, mission, goals, and objectives.

**Markup element:** `<lcPhysicalAspectsOfSite>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```

```

## 2.2.4.4

## Special factors

**Description:** The element `<lcSpecialFactors>` contains the description of any special factors observed at a work site that can affect the workers' performance and the organization's abilities to meet its vision, mission, goals, and objectives.

**Markup element:** `<lcSpecialFactors>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

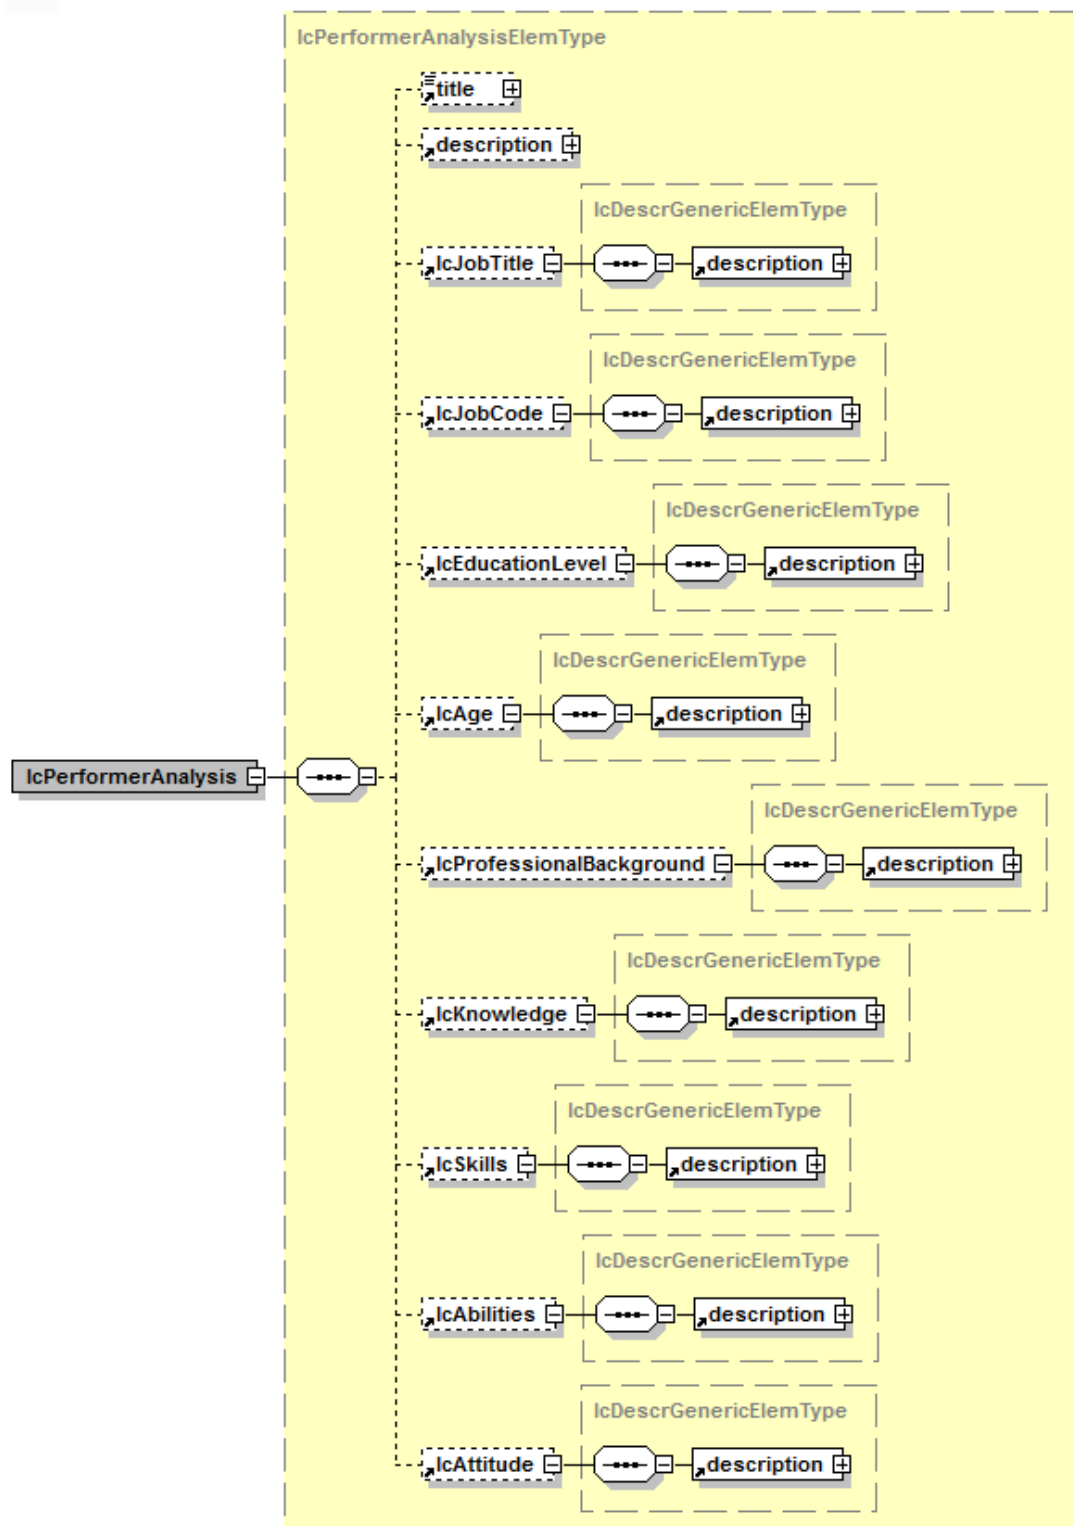

```
<lcSpecialFactors>
<description>
<para>None identified.</para>
</description>
</lcSpecialFactors>
```

## 2.2.5

## Performer analysis

**Description:** The element `<lcPerformerAnalysis>` contains information regarding factors within an organization's workforce that can influence its abilities to meet its vision, mission, goals, and objectives.

**Markup element:** `<lcPerformerAnalysis>`

ICN-1654N-S1000D0024-002-01

Fig 9 Element `<lcPerformerAnalysis>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

```

#### 2.2.5.5 Professional background

**Description:** The element <lcProfessionalBackground> contains the information about the professional work experience of the analyzed performers.

**Markup element:** <lcProfessionalBackground>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcProfessionalBackground>
<description>
<para>The typical bike courier at Speedy Bike has limited or no
professional experience in any career field. The majority are
college students employed part-time by the bike courier
company.</para>
</description>
</lcProfessionalBackground>
```

## 2.2.5.6

**Knowledge**

**Description:** The element [<lcKnowledge>](#) contains a description of the learners' current knowledge related to tasks required of their job tasks.

**Markup element:** [<lcKnowledge>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcKnowledge>
<description>
<para>Based on a survey of Speedy Bike couriers, it was
concluded that the majority (90%) know the major common
components and assemblies of a bike. This includes being able to
describe the basic mechanical functions and relationships
between those components and assemblies.</para>
```

```
</description>
</lcKnowledge>
```

#### 2.2.5.7

##### Skills

**Description:** The element `<lcSkills>` contains a description of the learners' current skills related to tasks required of their job tasks.

**Markup element:** `<lcSkills>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

##### Markup example:

```
<lcSkills>
<description>
<para>Prior to on-the-job experience, Speedy Bike couriers enter
the job with little to no experience with bike maintenance.
Chain tightening and wheel-tube replacement skills are possessed
by approximately 40% of the couriers. For the majority, skills
are mainly in bike operation.</para>
</description>
</lcSkills>
```

#### 2.2.5.8

##### Abilities

**Description:** The element `<lcAbilities>` contains a description of the learners' current abilities related to tasks required of their job tasks.

**Markup element:** `<lcAbilities>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcAbilities>
<description>
<para>The bike couriers have the ability to use basic hand
tools required to perform routine bike maintenance tasks.</para>
</description>
</lcAbilities>
```

## 2.2.5.9

**Attitude**

**Description:** The element `<lcAttitude>` contains a description of the learners' current attitudes related to tasks required of their job tasks or their organizations desired performance outcomes.

**Markup element:** `<lcAttitude>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

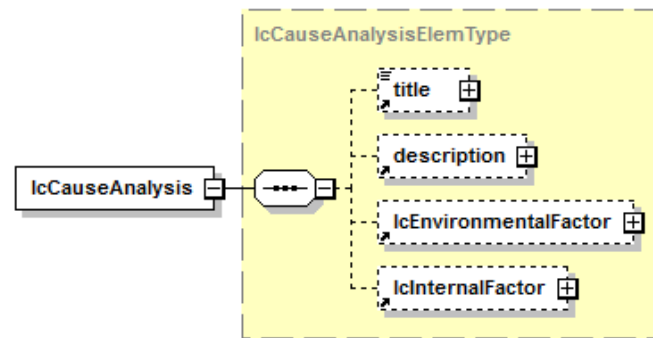

```
<lcAttitude>
<description>
<para>The majority of the bike couriers are motivated by the pay
and tips received as part of the courier job. They are not
concerned with or aware of how they impact the success of the
business and local economy.</para>
</description>
</lcAttitude>
```

## 2.3

**Cause analysis**

**Description:** The element `<lcCauseAnalysis>` contains the cause analysis information. This is the third high-level container element in the element `<learningPlan>`. It describes technical data regarding the root causes of a potential or observed human performance gap.

**Markup element:** `<lcCauseAnalysis>`

ICN-1654N-S1000D0025-001-01

Fig 10 Element `<lcCauseAnalysis>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcEnvironmentalFactor>`. Refer to [Para 2.3.1](#).
- `<lcInternalFactor>`. Refer to [Para 2.3.20](#).

#### Markup example:

```
<lcCauseAnalysis>
<title>Speedy Courier cause analysis</title>
<description>
<para>A causal factor tree analysis was conducted at Speedy
Couriers, Inc. to determine root causes of the couriers'
collective inability to make deliveries in accordance with the
company's defined requirement. This cause analysis was also used
to identify potential factors introduced by engineering changes
to the XYZ Bike used by Speedy Couriers, Inc., which may affect
(positively or negatively) the couriers' ability to meet the
requirement.</para>
</description>
<lcEnvironmentalFactor>
<title>Environmental factor</title>
<description>
<para>Causal factors external to the couriers were derived from
observations of the workplace, interviews with couriers,
supervisors, and the company's human resources director, and a
review of relevant company policies.</para>
</description>
```

```
<lcData>
<description>
<para>Job sheets with basic, step-by-step procedures for routine
maintenance tasks are provided to all couriers with their
company-issued handbook. The maintenance procedures are not
illustrated and do not reference tools that should be used in
any given step.</para>
</description>
</lcData>
<lcResources>
<description>
<para>Couriers are provided the tools and parts required to
maintain and repair their bikes. However, those tools are only
available in the workshop location. There are no onboard tool
packs or emergency repair kits that couriers may carry in
transit.</para>
</description>
</lcResources>
<lcIncentives>
<description>
<para>The study revealed that there is currently a negative
incentive to troubleshoot and repair bike problems while on
courier duties. Since the company provides unlimited breakdown
service at no cost to the courier, there is no reason for
couriers to repair their own bikes.</para>
</description>
</lcIncentives>
</lcEnvironmentalFactor>
<lcInternalFactor>
<title>Internal factor</title>
<description>
<para>Causal factors internal to the couriers were derived from
interviews with the couriers.</para>
</description>
<lcKnowledge>
<description>
<para>While basic knowledge of concepts (eg, parts, components,
operation) related to most bikes was demonstrated by couriers,
only 15% had the procedural knowledge necessary to maintain and
repair bicycles.</para>
</description>
</lcKnowledge>
<lcCapacity>
<description>
<para>No significant causal factors were observed or uncovered
during this analysis.</para>
</description>
</lcCapacity>

<para>No significant causal factors were observed or uncovered
during this analysis.</para>
```

```

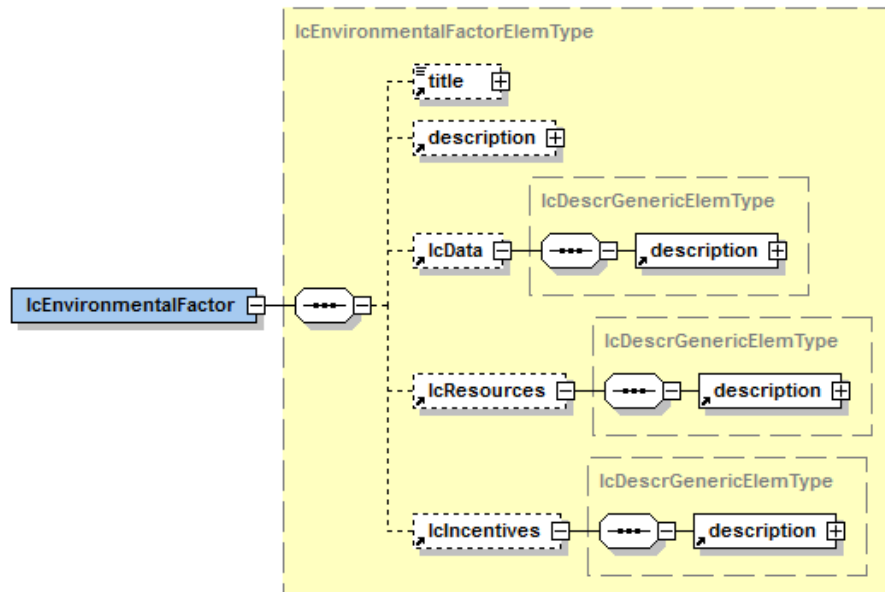

</description>
</lcMotives>
</lcInternalFactor>
</lcCauseAnalysis>

```

### 2.3.1 Environmental factor

**Description:** The element `<lcEnvironmentalFactor>` contains the information about causes of a potential or observed performance gap that is external to the human performer.

**Markup element:** `<lcEnvironmentalFactor>`

ICN-1654N-S1000D0026-002-01

Fig 11 Element `<lcEnvironmentalFactor>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcData>`. Refer to [Para 2.3.1.1](#).
- `<lcResources>`. Refer to [Para 2.3.1.2](#).
- `<lcIncentives>`. Refer to [Para 2.3.1.3](#).

**Markup example:**

```

<lcEnvironmentalFactor>
<title>Environmental factor</title>
<description>
<para>Causal factors external to the couriers were derived from
observations of the workplace, interviews with couriers,
supervisors, and the company's human resources director, and a
review of relevant company policies.</para>
</description>
<lcData>
<description>
<para>Job sheets with basic, step-by-step procedures for routine
maintenance tasks are provided to all couriers with their
company-issued handbook. The maintenance procedures are not

</lcResources>
<lcIncentives>
<description>
<para>The study revealed that there is currently a negative
incentive to troubleshoot and repair bike problems while on
courier duties. Since the company provides unlimited breakdown
service at no cost to the courier, there is no reason for
couriers to repair their own bikes.</para>
</description>
</lcIncentives>
</lcEnvironmentalFactor>

```

## 2.3.1.1 Data

**Description:** The element [<lcData>](#) contains the information about deficiencies in data that negatively impact the ability to perform a job, thus causing a potential or observed performance gap.

**Markup element:** [<lcData>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcData>
<description>
<para>Job sheets with basic, step-by-step procedures for routine
maintenance tasks are provided to all couriers with their
company-issued handbook. The maintenance procedures are not
illustrated and do not reference tools that should be used in
any given step.</para>
</description>
</lcData>
```

### 2.3.1.2 Resources

**Description:** The element [<lcResources>](#) contains the information about deficiencies in resources that negatively impact the ability to perform a job, thus causing a potential or observed performance gap.

**Markup element:** [<lcResources>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcResources>
<description>
<para>Couriers are provided the tools and parts required to
maintain and repair their bikes. However, those tools are only
available in the workshop location. There are no onboard tool
packs or emergency repair kits that couriers may carry in
transit.</para>
</description>
</lcResources>
```

### 2.3.1.3 Incentives

**Description:** The element [<lcIncentives>](#) contains the information about the policies, programs, or culture of an organization or work group that influences worker motivation and

prioritization of work tasks, which can positively or negatively impact the ability to perform a job or can be the cause of a potential or observed performance gap.

**Markup element:** `<lcIncentives>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

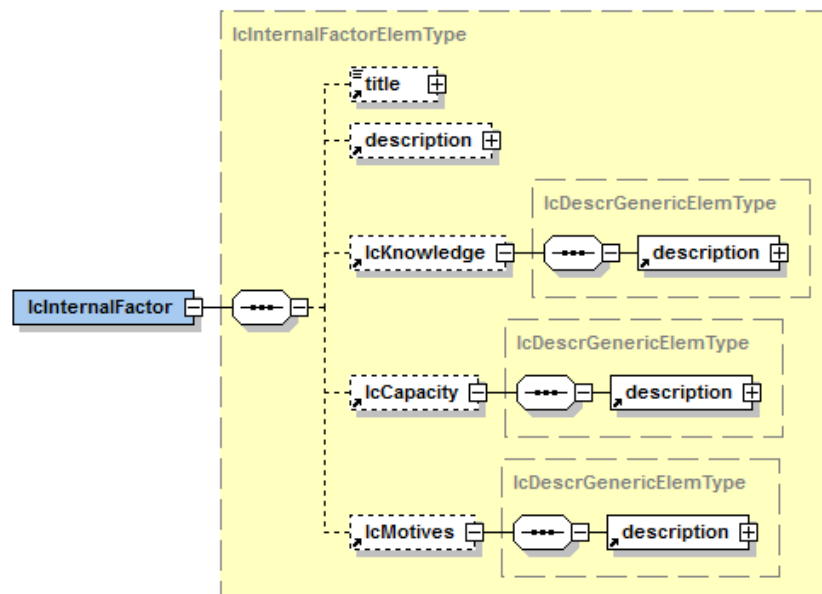

```
<lcIncentives>
<description>
<para>The study revealed that there is currently a negative
incentive to troubleshoot and repair bike problems while on
courier duties. Since the company provides unlimited breakdown
service at no cost to the courier, there is no reason for
couriers to repair their own bikes.</para>
</description>
</lcIncentives>
```

## 2.3.2

### Internal factor

**Description:** The element `<lcInternalFactor>` contains the information about causes of a potential or observed performance gap that is directly attributable to the human performer.

**Markup element:** `<lcInternalFactor>`

ICN-1654N-S1000D0027-002-01

Fig 12 Element *<lcInternalFactor>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*. Refer to [Chap 3.9.5.2.1.5](#).
- *<description>*. Refer to [Chap 3.9.5.2.2](#).
- *<lcKnowledge>*. Refer to [Para 2.3.2.1](#).
- *<lcCapacity>*. Refer to [Para 2.3.2.2](#).
- *<lcMotives>*. Refer to [Para 2.3.2.3](#).

#### Markup example:

```
<lcInternalFactor>
<title>Internal factor</title>
<description>
<para>Causal factors internal to the couriers were derived from
interviews with the couriers.</para>
</description>
<lcKnowledge>
<description>
<para>While basic knowledge of concepts (eg, parts, components,
operation) related to most bikes was demonstrated by couriers,
only 15% the had the procedural knowledge necessary to maintain
```

```

and repair bicycles.</para>
</description>
</lcKnowledge>
<lcCapacity>
<description>
<para>No significant causal factors were observed or uncovered
during this analysis.</para>
</description>
</lcCapacity>
<lcMotives>
<description>
<para>No significant causal factors were observed or uncovered
during this analysis.</para>
</description>
</lcMotives>
</lcInternalFactor>

```

#### 2.3.2.1 Knowledge

**Description:** The element `<lcKnowledge>` contains the information about deficiencies in the performers' knowledge that negatively impacts the ability to perform a job, thus causing a potential or observed performance gap.

**Markup element:** `<lcKnowledge>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```

<lcKnowledge>
<description>
<para>Only a small percentage of the couriers had the necessary
knowledge needed to maintain and repair bicycles because for
many of the employees this is the first time using a bike for a
job.</para>
</description>
</lcKnowledge>

```

#### 2.3.2.2 Capacity

**Description:** The element `<lcCapacity>` contains the information about deficiencies in the performers' capacity to perform a job that negatively impact the ability to be successful in completing the job, thus causing a potential or observed performance gap.

**Markup element:** `<lcCapacity>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcCapacity>
<description>
<para>Bike couriers are not physically capable of carrying a
portable jack stand needed to perform steering alignment
repairs.</para>
</description>
</lcCapacity>
```

### 2.3.2.3 Motives

**Description:** The element `<lcMotives>` contains the information about the internal motivations of the workers, which can positively or negatively impact the ability to perform a job or can be the cause of a potential or observed performance gap.

**Markup element:** `<lcMotives>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

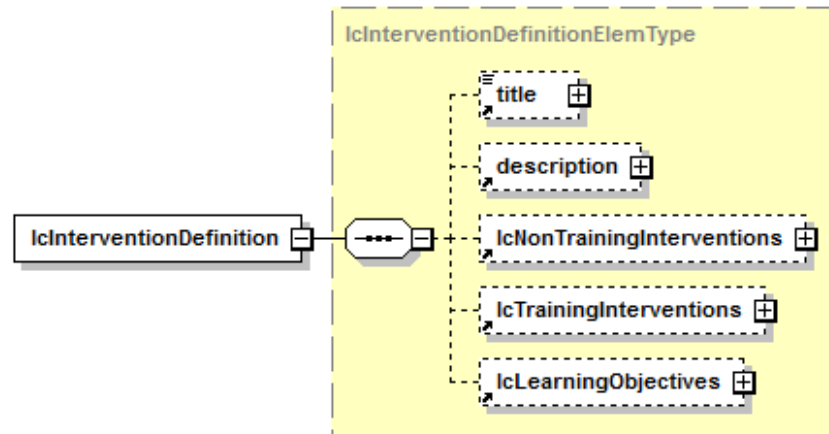

**Markup example:**

```
<lcMotives>
<description>
<para>The majority of bike couriers are performing the job for
pay to support their college tuition and living expenses.</para>
</description>
</lcMotives>
```

## 2.4 Intervention definition

**Description:** The element `<lcInterventionDefinition>` contains the data that defines the requirements or specifications for performance improvement types of intervention or for a training intervention to be designed and developed.

**Markup element:** `<lcInterventionDefinition>`

ICN-1654N-S1000D0028-001-01

Fig 13 Element `<lcInterventionDefinition>`

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcNonTrainingInterventions>`. Refer to [Para 2.4.1.1](#).
- `<lcTrainingInterventions>`. Refer to [Para 2.4.2](#).
- `<lcLearningObjectives>`. Refer to [Para 2.4.3](#).

#### 2.4.1 Non-training interventions

**Description:** The element `<lcNonTrainingInterventions>` contains the data that defines the requirements or specifications for performance improvement types of intervention.

**Markup element:** `<lcNonTrainingInterventions>`

ICN-1654N-S1000D0029-002-01

Fig 14 Element *<lcNonTrainingInterventions>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*. Refer to [Chap 3.9.5.2.1.5](#).
- *<description>*. Refer to [Chap 3.9.5.2.2](#).
- *<lcPerformanceSupport>*. Refer to [Para 2.4.1.1](#).
- *<lcJobDesign>*. Refer to [Para 2.4.1.2](#).
- *<lcPersonalDevelopment>*. Refer to [Para 2.4.1.3](#).
- *<lcHumanResourceDevelopment>*. Refer to [Para 2.4.1.4](#).

- <lcOrganizationalCommunication>. Refer to [Para 2.4.1.5](#).
- <lcOrganizationalDesign>. Refer to [Para 2.4.1.6](#).

</lcOrganizationalDesign>
</lcNonTrainingInterventions>
```

#### 2.4.1.1 Performance support

**Description:** The element `<lcPerformanceSupport>` contains the technical data that describes the purpose, requirements, or specifications of an intervention to be used on the job that will improve worker performance.

**Markup element:** `<lcPerformanceSupport>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcPerformanceSupport>
<description>
<para>Bike couriers shall be provided a Quick fix guide that
outlines the five most common bike breakdowns. This guide
contains the processes to address each of the five breakdown
types.</para>
</description>
</lcPerformanceSupport>
```

#### 2.4.1.2 Job design

**Description:** The element `<lcJobDesign>` contains the technical data that describes new or altered job requirements, specifications, responsibilities, processes, etc, that will improve performance of the job by the responsible workers.

**Markup element:** `<lcJobDesign>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcJobDesign>
<description>
<para>Two changes will be made to the courier job to better
align incentives with the company's goals. First, couriers will
not receive the commission for a delivery if the breakdown
service is used for a repair that could have been made "in the
field." Second, couriers will be placed under a tiered bonus
program that rewards calling in the breakdown service for
repairs listed in their Quick fix guide.</para>
</description>
</lcJobDesign>
```

#### 2.4.1.3 Personal development

**Description:** The element `<lcPersonalDevelopment>` contains the technical data that describes activities, actions, etc, to be taken by individuals to improve performance of job tasks.

**Markup element:** `<lcPersonalDevelopment>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcPersonalDevelopment>
<description>
<para>Bike couriers that are failing to meet the defined time
```

limit for any repair task listed in their manual will be required to practice those tasks twice per week. They will be assigned a mentor while performing the tasks. When they demonstrate that they can perform the repairs within the time limit, they will no longer be required to perform these task rehearsals.

</description>

</lcPersonalDevelopment>

#### 2.4.1.4 Human resource development

**Description:** The element <lcHumanResourceDevelopment> contains the technical data that describes a human resource type of intervention that will target the creation or modification of personnel selection processes.

**Markup element:** <lcHumanResourceDevelopment>

##### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- <description>. Refer to [Chap 3.9.5.2.2](#).

##### Markup example:

```
<lcHumanResourceDevelopment>
<description>
<para>New hiring criteria and assessments shall be instituted to
evaluate courier applicants' existing skills in basic bike
repair and maintenance.</para>
</description>
</lcHumanResourceDevelopment>
```

#### 2.4.1.5 Organizational communication

**Description:** The element <lcOrganizationalCommunication> contains the technical data that describes an intervention that alters the pattern, means of, and protocol for communicating within and across an organization's levels and departments.

**Markup element:** <lcOrganizationalCommunication>

##### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcOrganizationalCommunication>
<description>
<para>A designated delegate in the third tier of bike couriers
will report courier maintenance statistics directly to the
Courier Manager on the last Friday of each month. The statistics
will be entered directly into the Courier Manager's Maintenance
Awareness (CMMMA) tool.</para>
</description>
</lcOrganizationalCommunication>
```

#### 2.4.1.6

##### Organizational design

**Description:** The element [<lcOrganizationalDesign>](#) contains the technical data that describes a performance intervention designed to improve or align an organization's structure so that business objectives can be successfully met by its workers.

**Markup element:** [<lcOrganizationalDesign>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

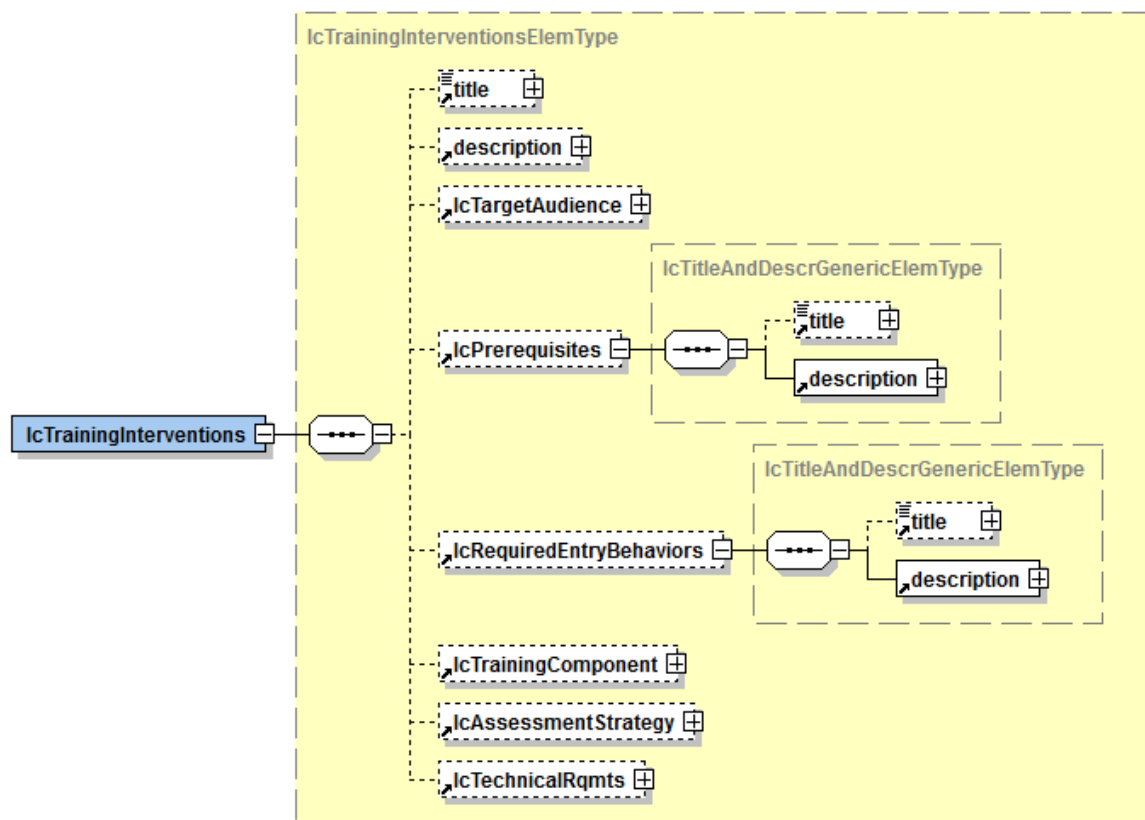

```
<lcOrganizationalDesign>
<description>
<para>Couriers will be structured into three tiers. The base
tier will be new hires with no experience. The second tier will
be couriers with 1-3 years of experience. The third tier will be
couriers with 4+ years of experience, and will include
supervisory-level couriers.</para>
</description>
</lcOrganizationalDesign>
```

#### 2.4.2

##### Training intervention

**Description:** The element [<lcTrainingInterventions>](#) contains the data that defines the specifications and requirements for the design and development of the courseware.

Markup element: `<lcTrainingInterventions>`

ICN-1654N-S1000D0030-002-01

Fig 15 Element `<lcTrainingInterventions>`

#### Attributes:

#### 2.4.2.1 Target audience

**Description:** The element [<lcTargetAudience>](#) contains the data that defines the student characteristics for a training intervention.

**Markup element:** [<lcTargetAudience>](#)

ICN-1654N-S1000D0031-002-01

Fig 16 Element *<lcTargetAudience>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*. Refer to [Chap 3.9.5.2.1.5](#).
- *<description>*. Refer to [Chap 3.9.5.2.2](#).
- *<lcCurrentEntryBehaviors>*. Refer to [Para 2.4.2.1.1](#).
- *<lcAttitudeTowardContent>*. Refer to [Para 2.4.2.1.2](#).
- *<lcLearningPreferences>*. Refer to [Para 2.4.2.1.3](#).

#### Markup example:

```
<lcTargetAudience>
<title>Target audience</title>
<description>
<para>Skill levels for entry-level bike couriers can vary from
none to novice experience levels, which range from 0 to 1 year
in service. Couriers have typically learned the skills needed
through trial and error.</para>
</description>
<lcCurrentEntryBehaviors>
<description>
<para>The majority of couriers have high school educations and
have basic knowledge of tool use.</para>
</description>
</lcCurrentEntryBehaviors>
</lcTargetAudience>
```

```

</description>
</lcCurrentEntryBehaviors>
<lcAttitudeTowardContent>
<description>
<para>A survey revealed that 95% of the couriers are willing to
complete training as long as the stated incentives are
employed.</para>
</description>
</lcAttitudeTowardContent>
<lcLearningPreferences>
<description>
<para>Given the physical and customer-oriented nature of courier
work, the type of person attracted for such positions tends to
be of the more assertive type and more emotionally responsive.
This type tends to prefer less-structured activities, anecdotes
and stories, interaction with others, taking action, and moving
as fast as possible (borderline impatient).</para>
</description>
</lcLearningPreferences>
</lcTargetAudience>

```

#### 2.4.2.1.1 *Current entry behaviors*

**Description:** The element `<lcCurrentEntryBehaviors>` contains the known existing knowledge, skills, or abilities of the target audience in relation to the required training.

**Markup element:** `<lcCurrentEntryBehaviors>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```

<lcCurrentEntryBehaviors>
<description>
<para>The majority of couriers have high school educations and
have basic knowledge of tool use.</para>
</description>
</lcCurrentEntryBehaviors>

```

#### 2.4.2.1.2 *Attitude toward content*

**Description:** The element `<lcAttitudeTowardContent>` contains the known attitudes of the target audience in relation to the required training.

**Markup element:** `<lcAttitudeTowardContent>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcAttitudeTowardContent>
<description>
<para>A survey revealed that 95% of the couriers are willing to
complete training as long as the stated incentives are
employed.</para>
</description>
</lcAttitudeTowardContent>
```

2.4.2.1.3 *Learning preferences*

**Description:** The element [<lcLearningPreferences>](#) contains the information about the target audience's methods or modes of learning for the training topic in question.

**Markup element:** [<lcLearningPreferences>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcLearningPreferences>
<description>
<para>Given the physical and customer-oriented nature of courier
work, the type of person attracted for such positions tends to
be of the more assertive type and more emotionally responsive.
This type tends to prefer less-structured activities, anecdotes
and stories, interaction with others, taking action, and moving
as fast as possible (borderline impatient).</para>
```

```
</description>
</lcLearningPreferences>
```

#### 2.4.2.2 Prerequisites

**Description:** The element `<lcPrerequisites>` contains a requirement that must be completed prior to the target training.

**Markup element:** `<lcPrerequisites>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcPrerequisites>
<title>Bike courier maintenance Prerequisites</title>
<description>
<para>Basic bike repair hand tools: Purpose and use.</para>
</description>
</lcPrerequisites>
```

#### 2.4.2.3 Required entry behaviors

**Description:** The element `<lcRequiredEntryBehaviors>` contains a task that must be demonstrated by the target audience in order to take the training.

**Markup element:** `<lcRequiredEntryBehaviors>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

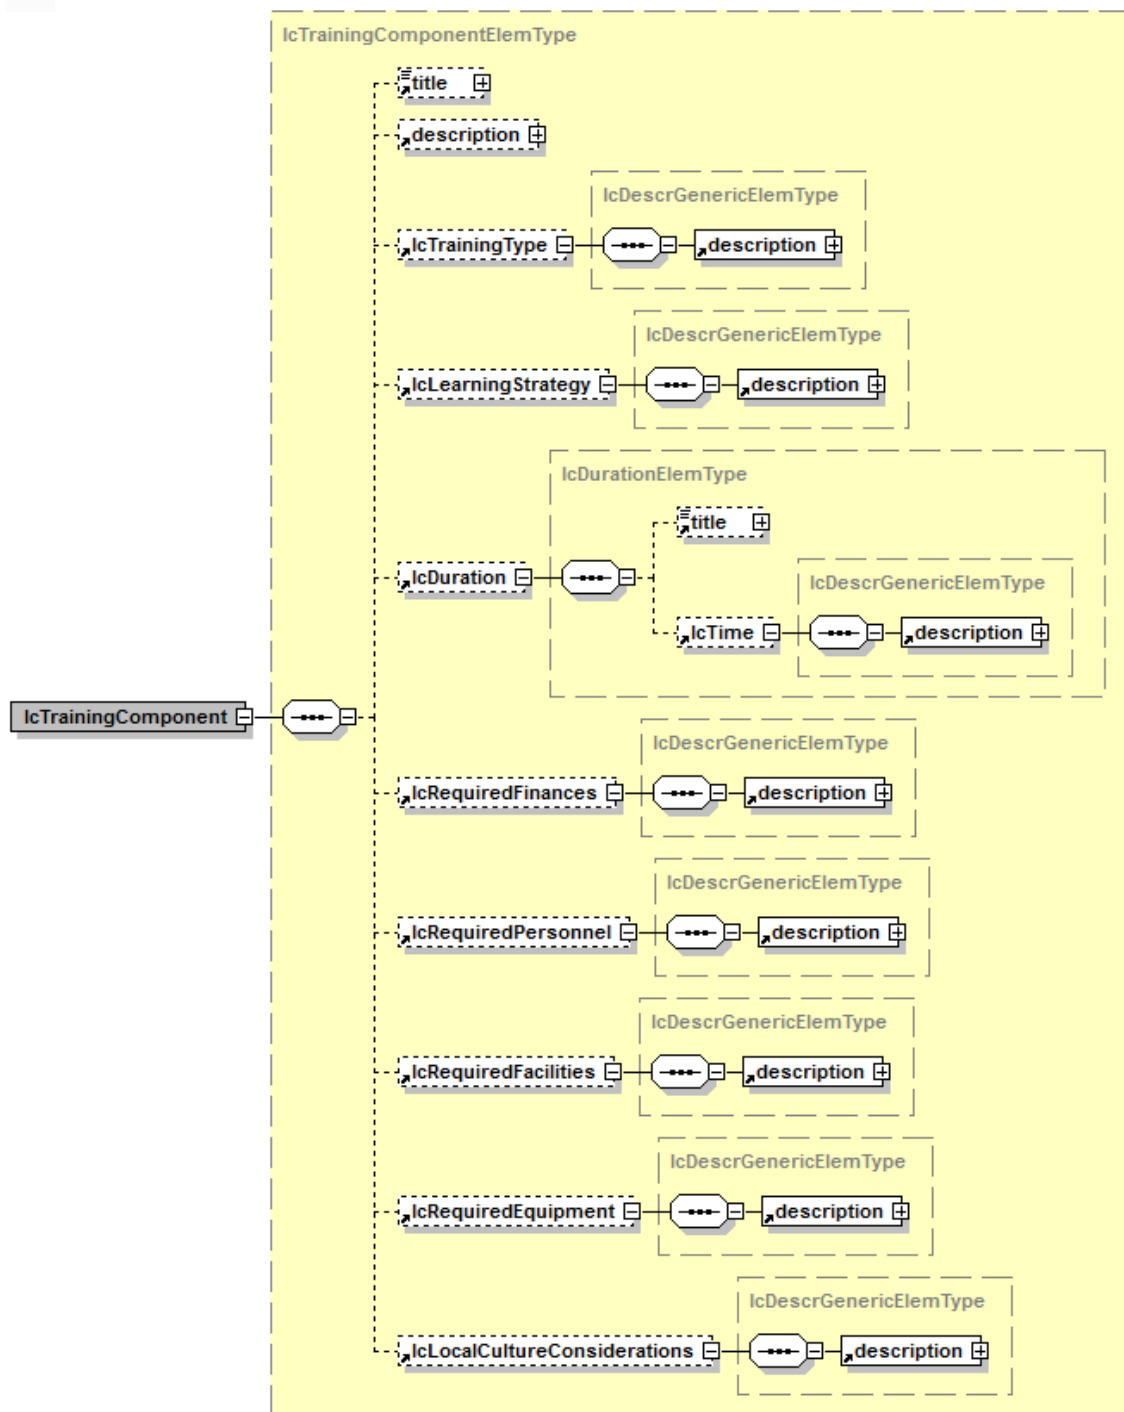

**Markup example:**

```
<lcRequiredEntryBehaviors>
<title>Required entry behaviors</title>
<description>
<para>Demonstrate proper use of basic hand tools and bike
jacks.</para>
</description>
</lcRequiredEntryBehaviors>
```

## 2.4.2.4 Training component

**Description:** The element [<lcTrainingComponent>](#) contains the data that describes the requirements for the support and logistics of the training intervention.

**Markup element:** [<lcTrainingComponent>](#)

ICN-1654N-S1000D0032-003-01

Fig 17 Element *<lcTrainingComponent>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <description>. Refer to [Chap 3.9.5.2.2](#).
- <lcTrainingType>. Refer to [Para 2.4.2.4.1](#).
- <lcLearningStrategy>. Refer to [Para 2.4.2.4.2](#).
- <lcDuration>. Refer to [Para 2.4.2.4.3](#).
- <lcRequiredFinances>. Refer to [Para 2.4.2.4.5](#).
- <lcRequiredPersonnel>. Refer to [Para 2.4.2.4.6](#).
- <lcRequiredFacilities>. Refer to [Para 2.4.2.4.7](#).
- <lcRequiredEquipment>. Refer to [Para 2.4.2.4.8](#).
- <lcLocalCultureConsiderations>. Refer to [Para 2.4.2.4.9](#).

#### Markup example:

```
<lcTrainingComponent>
<title>Training component</title>
<description>

exercises and end of training hands-on test.</para>
</description>
</lcRequiredEquipment>
<lcLocalCultureConsiderations>
<description>
<para>Most of the couriers take classes at the local community
college. Many view their jobs as a necessity and have poor
attitudes toward improving their performance.</para>
</description>
</lcLocalCultureConsiderations>
</lcTrainingComponent>

```

#### 2.4.2.4.1 Training type

**Description:** The element `<lcTrainingType>` contains the category of instruction that will occur.

**Markup element:** `<lcTrainingType>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcTrainingType>
<description>
<para>An online computer-based course will be used in
conjunction with hands-on practices.</para>
</description>
</lcTrainingType>
```

2.4.2.4.2 *Learning strategy*

**Description:** The element `<lcLearningStrategy>` contains the selected learning strategy for a training component.

**Markup element:** `<lcLearningStrategy>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcLearningStrategy>
<description>
<para>This training uses a blended approach to teaching bicycle
maintenance and repair.</para>
</description>
</lcLearningStrategy>
```

2.4.2.4.3 *Duration*

**Description:** The element `<lcDuration>` contains the expected amount of time required for the learner to complete the training component.

**Markup element:** `<lcDuration>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<lcTime>`. Refer to [Para 2.4.2.4.4](#).

**Markup example:**

```
<lcDuration>
<lcTime>
<description>
<para>The computer-based courseware will take approximately 1,5
hours to complete. The practical exercises will take
approximately 2 hours to complete.</para>
</description>
</lcTime>
</lcDuration>
```

2.4.2.4.4 *Time*

**Description:** The element `<lcTime>` contains the time expected to complete an activity.

**Markup element:** `<lcTime>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcTime>
<description>
<para>It should take no more than 1 hour and 30 minutes to
complete this course.</para>
</description>
</lcTime>
```

2.4.2.4.5 *Required finances*

**Description:** The element `<lcRequiredFinances>` contains the funding or cost requirements for a training component.

**Markup element:** `<lcRequiredFinances>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcRequiredFinances>
<description>
<para>All financial requirements will be covered by Speedy
Couriers, Inc.</para>
</description>
</lcRequiredFinances>
```

#### 2.4.2.4.6 *Required personnel*

**Description:** The element [<lcRequiredPersonnel>](#) contains the personnel required to support or implement a training component.

**Markup element:** [<lcRequiredPersonnel>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcRequiredPersonnel>
<description>
<para>The current bicycle repair technician will serve as a
facilitator during the practical exercise portion of the
training as well as the grader for the hands-on test at the end
of the training.</para>
</description>
</lcRequiredPersonnel>
```

#### 2.4.2.4.7 *Required facilities*

**Description:** The element [<lcRequiredFacilities>](#) contains the facilities required to support or implement a training component.

**Markup element:** [<lcRequiredFacilities>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcRequiredFacilities>
<description>
<para>The current bicycle repair area will be used for the
practical exercises and end of training hands-on test.</para>
</description>
</lcRequiredFacilities>
```

2.4.2.4.8 *Required equipment*

**Description:** The element [<lcRequiredEquipment>](#) contains the supplies and tools required to support or implement a training component.

**Markup element:** [<lcRequiredEquipment>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcRequiredEquipment>
<description>
<para>Couriers may take the computer portion of the training
using one of Speedy Courier's office computer workstations or
they may take a CD of the training to be completed at home. The
current bicycle repair equipment will be used for the practical
exercises and end of training hands-on test.</para>
</description>
</lcRequiredEquipment>
```

#### 2.4.2.4.9 Local culture considerations

**Description:** The element `<lcLocalCultureConsiderations>` contains any special local customs or cultural nuances to be considered in the implementation or delivery of a training component.

**Markup element:** `<lcLocalCultureConsiderations>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

##### Markup example:

```
<lcLocalCultureConsiderations>
<description>
<para>Most of the couriers take classes at the local community
college. Many view their jobs as a necessity and have poor
attitudes toward improving their performance.</para>
</description>
</lcLocalCultureConsiderations>
```

#### 2.4.2.5 Assessment strategy

**Description:** The element `<lcAssessmentStrategy>` contains the requirements of the plan for assessing learners' achievements in relation to the objective.

**Markup element:** `<lcAssessmentStrategy>`

ICN-1654N-S1000D0033-001-01

Fig 18 Element `<lcAssessmentStrategy>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcAssessmentComponent>`. Refer to [Para 2.4.2.5.2](#).

#### Markup example:

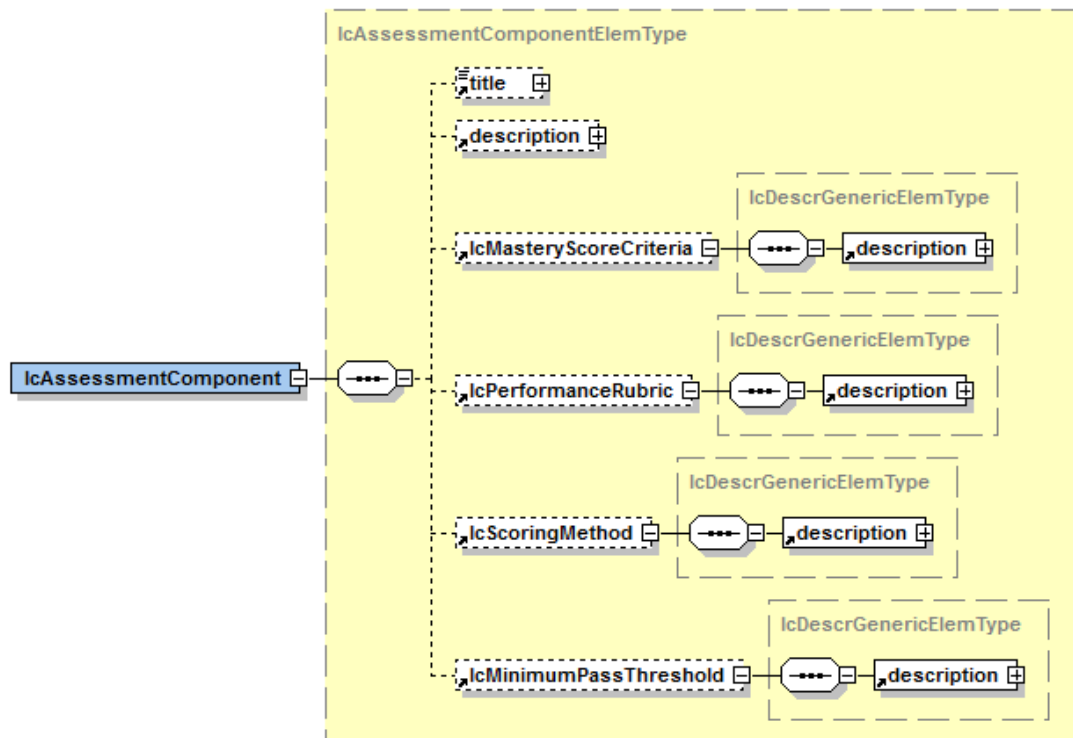

```
<lcAssessmentStrategy>
<title>Assessment strategy</title>
<description>
<para>The following information outlines the assessment
strategies for the Basic bike awareness course.</para>
</description>
<lcAssessmentComponent>
<title>Computer-based assessment component</title>
<description>
<para>The following information outlines the assessment strategy
for the computer-based portion of the training.</para>
</description>
<lcMasteryScoreCriteria>
<description>
<para>80% mastery of all lesson tests</para>
</description>
</lcMasteryScoreCriteria>
<lcPerformanceRubric>
<description>
<para>QUESTION: Which part of the steering system supplies the
sideways swiveling action that allows the rider to steer the
bike?</para>
<para>ANSWER: Headset</para>
</description>
</lcPerformanceRubric>
<lcScoringMethod>
<description>
<para>The lesson tests are scored using computer programming
built into the training.</para>
</description>
</lcScoringMethod>
<lcMinimumPassThreshold>
<description>
<para>The minimum passing score for the assessment is
80%.</para>
</description>
</lcMinimumPassThreshold>
</lcAssessmentComponent>
</lcAssessmentStrategy>
```

#### 2.4.2.5.1 Assessment component

**Description:** The element `<lcAssessmentComponent>` contains the specifications of the learner evaluation requirement for a training component.

**Markup element:** `<lcAssessmentComponent>`

ICN-1654N-S1000D0034-002-01

Fig 19 Element `<lcAssessmentComponent>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcMasteryScoreCriteria>`. Refer to [Para 2.4.2.5.2](#).
- `<lcPerformanceRubric>`. Refer to [Para 2.4.2.5.3](#).
- `<lcScoringMethod>`. Refer to [Para 2.4.2.5.4](#).
- `<lcMinimumPassThreshold>`. Refer to [Para 2.4.2.5.5](#).

**Markup example:**

```
<lcAssessmentComponent>
<title>Computer-based assessment component</title>
<description>
<para>The following information outlines the assessment strategy
for the computer-based portion of the training.</para>
</description>
<lcMasteryScoreCriteria>
<description>
<para>80% mastery of all lesson tests</para>
</description>
</lcMasteryScoreCriteria>
<lcPerformanceRubric>
<description>
<para>QUESTION: Which part of the steering system supplies the
sideways swiveling action that allows the rider to steer the
bike?</para>
<para>ANSWER: Headset</para>
</description>

</description>
</lcScoringMethod>
<lcMinimumPassThreshold>
<description>
<para>The minimum passing score for the assessment is
80%.</para>
</description>
</lcMinimumPassThreshold>
</lcAssessmentComponent>
```

#### 2.4.2.5.2 Mastery score criteria

**Description:** The element `<lcMasteryScoreCriteria>` contains the score or grade that is the minimum expected in order for the assessment to be considered successfully completed.

**Markup element:** `<lcMasteryScoreCriteria>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcMasteryScoreCriteria>
<description>
<para>80% mastery of all lesson tests</para>
</description>
</lcMasteryScoreCriteria>
```

2.4.2.5.3 *Performance rubric*

**Description:** The element `<lcPerformanceRubric>` contains information for the answer key used to evaluate the assessment.

**Markup element:** `<lcPerformanceRubric>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcPerformanceRubric>
<description>
<para>QUESTION: Which part of the steering system supplies the
sideways swiveling action that allows the rider to steer the
bike?</para>
<para>ANSWER: Headset</para>
</description>
</lcPerformanceRubric>
```

2.4.2.5.4 *Scoring method*

**Description:** The element `<lcScoringMethod>` gives a description of how the assessment is graded.

**Markup element:** `<lcScoringMethod>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcScoringMethod>
<description>
<para>The lesson tests are scored using computer programming
built into the training.</para>
</description>
</lcScoringMethod>
```

#### 2.4.2.5.5 *Minimum pass threshold*

**Description:** The element [<lcMinimumPassThreshold>](#) gives the minimum score required of the learner to successfully complete the assessment component.

**Markup element:** [<lcMinimumPassThreshold>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

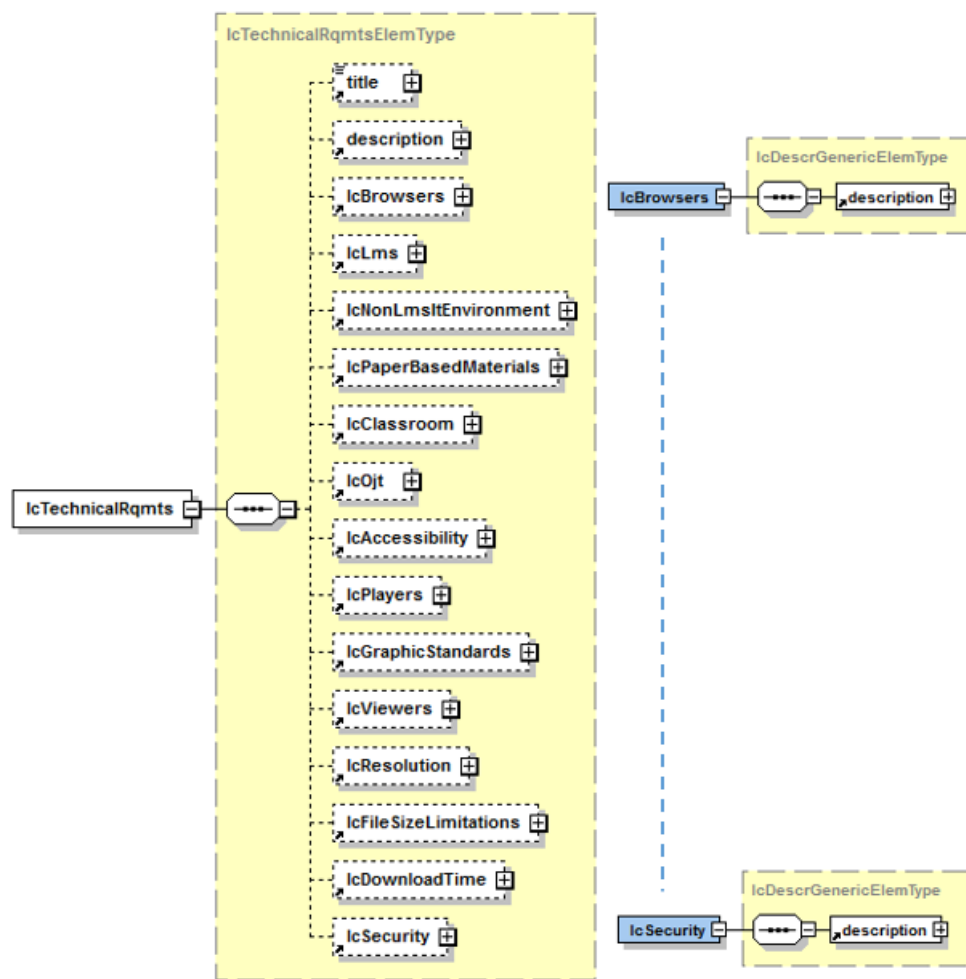

**Markup example:**

```
<lcMinimumPassThreshold>
<description>
<para>The minimum passing score for the assessment is
80%.</para>
</description>
</lcMinimumPassThreshold>
```

#### 2.4.2.6 *Technical requirements*

**Description:** The element [<lcTechnicalRqmts>](#) contains the technical requirements for how the learning content is delivered and how those requirements are supported by the instructional design.

**Markup element:** [<lcTechnicalRqmts>](#)

ICN-1654N-S1000D0035-002-01

Fig 20 Element `<lcTechnicalRqmts>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

#### 2.4.2.6.1 Browsers

**Description:** The element `<lcBrowsers>` gives the Internet browsers suitable for viewing the training material.

**Markup element:** `<lcBrowsers>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```

<lcBrowsers>
<description>
<para>This courseware is created to run in the Internet Explorer
6.x web browser.</para>
</description>
</lcBrowsers>

```

#### 2.4.2.6.2 LMS

**Description:** The element `<lcLms>` contains the Learning Management System (LMS) name and version number.

**Markup element:** `<lcLms>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcLms>
<description>
<para>Lesson content packages will be tracked in the Sum Total
LMS.</para>
</description>
</lcLms>
```

2.4.2.6.3 *Non-LMS environment*

**Description:** The element [<lcNonLmsEnvironment>](#) contains any technical requirements when SCORM and an LMS are not required.

**Markup element:** [<lcNonLmsEnvironment>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcNonLmsItEnvironment>
<description>
<para>The courseware does not require any special considerations
when it is running outside of an LMS.</para>
</description>
</lcNonLmsItEnvironment>
```

2.4.2.6.4 *Paper-based materials*

**Description:** The element [<lcPaperBasedMaterials>](#) contains the requirements for the training components delivered via paper-based formats.

**Markup element:** [<lcPaperBasedMaterials>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcPaperBasedMaterials>
<description>
<para>This courseware will use the Basic bike repair manual,
document number X45R56.</para>
</description>
</lcPaperBasedMaterials>
```

#### 2.4.2.6.5 Classroom

**Description:** The element [<lcClassroom>](#) contains the technical aspects of the course to take place in a classroom.

**Markup element:** [<lcClassroom>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcClassroom>
<description>
<para>Instruction will be taken in the Learning Lab at Speedy
Courier's main office. The training is part of the employee's
first-day orientation and is required. No courier assignments
will be given until the employee completes the orientation and
the training.</para>
</description>
</lcClassroom>
```

#### 2.4.2.6.6 On-the-job training

**Description:** The element [<lcOjt>](#) contains a description of the technical aspects of the course taking place in the work environment.

**Markup element:** [<lcOjt>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <description>. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcOjt>
<description>
<para>In addition to the performance practices and test that are
used in the curriculum, couriers will have access to the repair
facilitiy in order to hone their skills and abilities in
repairing the bike.</para>
</description>
</lcOjt>
```

2.4.2.6.7 *Accessibility*

**Description:** The element <lcAccessibility> contains the accessibility level for persons with disabilities.

**Markup element:** <lcAccessibility>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <description>. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcAccessibility>
<description>
<para>This courseware meets W3C Web Accessibility Initiative
Guidelines Priority 1 checkpoints.</para>
</description>
</lcAccessibility>
```

#### 2.4.2.6.8 *Players*

**Description:** The element `<lcPlayers>` contains a description of the tools used for time-sequenced display at runtime.

**Markup element:** `<lcPlayers>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcPlayers>
<description>
<para>The courseware will make use of the following players and
plug-ins: Adobe Flash player and Adobe Acrobat reader.</para>
</description>
</lcPlayers>
```

#### 2.4.2.6.9 *Graphic standards*

**Description:** The element `<lcGraphicStandards>` contains a description of the standards and system requirements for displaying graphics, 3D animations from Computer Aided Drawing (CAD), navigation thru virtual spaces, etc.

**Markup element:** `<lcGraphicStandards>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcGraphicStandards>
<description>
<para>Graphics utilized are JPEG and SWF files. SWF files may
contain 3D animation or interactivity. SWF files are being
```

utilized in lieu of CGM files to reach a broader audience because they can be viewed utilizing the Adobe Flash player.</para>  
</description>  
</lcGraphicStandards>

#### 2.4.2.6.10 Viewers

**Description:** The element <lcViewers> contains a description of the viewers used for time-sequenced display at runtime.

**Markup element:** <lcViewers>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <description>. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcViewers>
<description>
<para>This course will use RealPlayer and Windows Media
player.</para>
</description>
</lcViewers>
```

#### 2.4.2.6.11 Resolution

**Description:** The element <lcResolution> contains a description of the required computer screen resolution for delivered instruction.

**Markup element:** <lcResolution>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <description>. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcResolution>
<description>
<para>Although the courseware can be viewed using different
resolutions, it is best viewed in 1024x768 resolution.</para>
</description>
</lcResolution>
```

2.4.2.6.12 *File size limitations*

**Description:** The element `<lcFileSizeLimitations>` contains a description of the file size limitations in the client's delivery environment.

**Markup element:** `<lcFileSizeLimitations>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcFileSizeLimitations>
<description>
<para>This courseware keeps it file size to the bare minimum. It
tries to keep all files below 100k. If some files are larger
than the 100k, a pre-loader is attached.</para>
</description>
</lcFileSizeLimitations>
```

2.4.2.6.13 *Download time*

**Description:** The element `<lcDownloadTime>` contains a description of the maximum time allowed for download time in the client's delivery environment.

**Markup element:** `<lcDownloadTime>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcDownloadTime>
<description>
<para>Download time will vary due to the users' computer
specifications.</para>
</description>
</lcDownloadTime>
```

2.4.2.6.14 *Security*

**Description:** The element [<lcSecurity>](#) contains a description of the security requirements in the delivered instruction.

**Markup element:** [<lcSecurity>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcSecurity>
<description>
<para>Security level is unclassified.</para>
</description>
</lcSecurity>
```

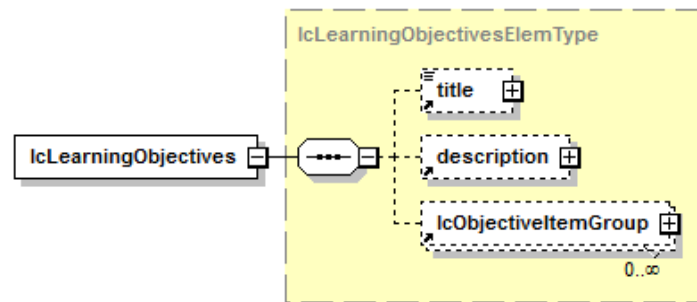

2.4.3 **Learning objectives**

**Description:** The element [<lcLearningObjectives>](#) contains the learning objectives data. Learning objectives state the actions, conditions, behaviors, and standards expected of the learner by the end of a training event.

**Referencing content data from learning objectives:** Learning objectives can be linked to the content items supporting them. Referencing is achieved thru the use of the element [<dmRef>](#) within an element [<lcObjectiveItem>](#). Refer to [Para 2.4.3.1.1](#).

References can be made for entire content data modules, or identifiable portions of content data modules, according to the rules of use of the element [<dmRef>](#) found in [Chap 3.9.5.2.1.2](#).

**Markup element:** [<lcLearningObjectives>](#)

ICN-1654N-S1000D0043-001-01

Fig 21 Element `<lcLearningObjectives>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcObjectiveItemGroup>`. Refer to [Para 2.4.3.1](#).

#### Markup example:

```

#### 2.4.3.1.1 Objective item

**Description:** The element `<lcObjectiveItem>` contains the objective item content. The element `<lcObjectiveItemGroup>` can be nested within the element `<lcObjectiveItem>` to allow for capture of objectives according to a particular course structure.

### Note

The child element [<dmRef>](#) can be used to establish references between learning objectives, assessments, technical data, and the learning content supporting them. Associating learning objectives and content allows courseware designers and evaluators opportunities to ensure that the learning materials meet explicit goals and expectations. Referencing allows more direct evaluation of the effectiveness of the design and presentation of learning materials according to their stated purposes. Maintenance of the learning content is made more efficient by the ability to directly locate the content items supporting objectives within the course structure. In addition, content referencing allows developers the opportunity to build navigational systems designed around the clear statement of learning objectives with hyperlinks to the content items they represent.

Markup element: [<lcObjectiveItem>](#)

ICN-1654N-S1000D0045-002-01

Fig 23 Element [<lcObjectiveItem>](#)

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- [<title>](#). Refer to [Chap 3.9.5.2.1.5](#).
- [<description>](#). Refer to [Chap 3.9.5.2.2](#).
- [<lcContentIdentifierName>](#). Refer to [Para 2.4.3.1.2](#).
- [<dmRef>](#), the reference to content supported by an objective item is identified by the element [<dmRef>](#). Use of the element [<dmRef>](#) will support XML data linking among learning objectives and their related content within learning materials. The element [<dmRef>](#) is used in accordance with the rules in [Chap 3.9.5.2.1.2](#).
- [<lcObjectiveItemGroup>](#). Refer to [Para 2.4.3.1](#).

**Markup example:**

```
<lcObjectiveItem>
<title>Enabling objective for SCO 2</title>
<description>
<para>Describe the steps for installing and removing a bike's
steering system.</para>
</description>
<lcContentIdentifierName>
<description>
<para>SCO 2 - Steering system installation and removal</para>
</description>
</lcContentIdentifierName>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="100" infoCodeVariant="A" itemLocationCode="T"
learnCode="T2G" learnEventCode="C"/>
<issueInfo issueNumber="001" inWork="01"/>
<language countryIsoCode="US" languageIsoCode="en"/>
</dmRefIdent>
</dmRef>
</lcObjectiveItem>
```

2.4.3.1.2 *Content identifier name*

**Description:** The element `<lcContentIdentifierName>` contains the common name of the objective item. The content identifier can be any name an organization chooses to assign to a learning objective. Examples include "enabling objective" and "terminal objective".

**Markup element:** `<lcContentIdentifierName>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcContentIdentifierName>
<description>
<para>SCO 2 - Steering system installation and removal</para>
</description>
</lcContentIdentifierName>
```

## 2.5 Intervention implementation

**Description:** The element `<lcInterventionImplementation>` contains the technical data regarding requirements for successful release and use of an intervention among the target population.

**Markup element:** `<lcInterventionImplementation>`

ICN-1654N-S1000D0060-001-01

Fig 24 Element `<lcInterventionImplementation>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

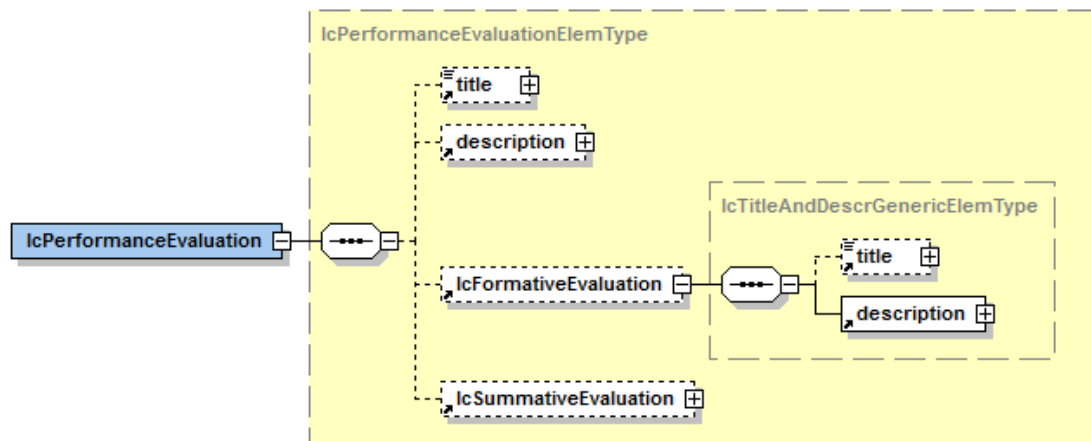

### Markup example:

```
<lcInterventionImplementation>
<title>Intervention implementation</title>
<description>
<para>The implementation of this intervention will be composed
of the creation and institution of a computer-based training
program that works in conjunction with hands-on practical
exercises.</para>
</description>
</lcInterventionImplementation>
```

## 2.6 Performance evaluation

**Description:** The element `<lcPerformanceEvaluation>` contains the technical data regarding the requirements for an evaluation instrument or plan that will determine the success of an intervention.

**Markup element:** `<lcPerformanceEvaluation>`

ICN-1654N-S1000D0036-002-01

Fig 25 Element `<lcPerformanceEvaluation>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcFormativeEvaluation>`. Refer to [Para 2.6.1](#).
- `<lcSummativeEvaluation>`. Refer to [Para 2.6.2](#).

#### Markup example:

```

<lcPerformanceEvaluation>
<title>Performance evaluation</title>
<description>
<para>The following information outlines the Performance
evaluation.</para>
</description>
<lcFormativeEvaluation>
<title>Formative evaluation</title>

<description>
<para>The immediate performance change will be evaluated during
the hands-on assessment conducted at the end of the training.
This assessment will determine if the training had the desired
immediate effect.</para>
</description>
</lcImmediatePerformanceCompetence>
<lcJobTransfer>
<description>
<para>At a time of 6 months after the course is provided to the
couriers, a survey will be taken to determine if the training
allowed the couriers to conduct their own repairs and reduce the
number of breakdown pickups by the company.</para>
</description>
</lcJobTransfer>
<lcOrganizationalImpact>
<description>
<para>At a time of 6 months after the start of the training
program, Speedy Couriers will evaluate the data in order to
determine if breakdown service has decreased and on-time
delivery has increased.</para>
</description>
</lcOrganizationalImpact>
</lcSummativeEvaluation>
</lcPerformanceEvaluation>

```

### 2.6.1 Formative evaluation

**Description:** The element `<lcFormativeEvaluation>` contains the requirements of ongoing feedback on performance in order to provide evaluative information useful in improving the training.

**Markup element:** `<lcFormativeEvaluation>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).

### Markup example:

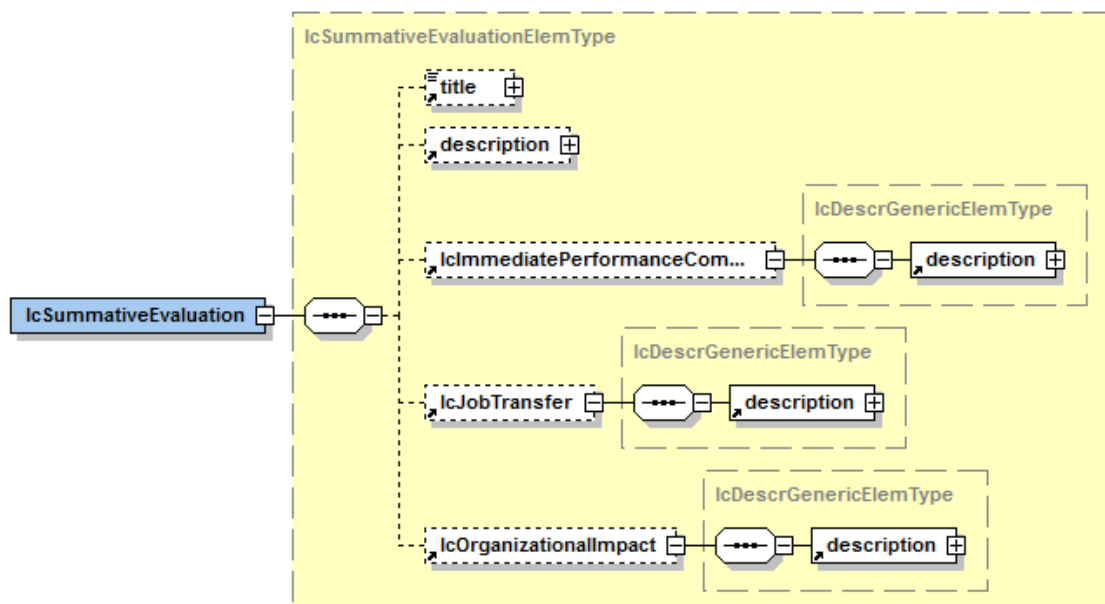

```
<lcFormativeEvaluation>
<title>Formative evaluation</title>
<description>
<para>Formative evaluation for this course is provided in the
form of checks on learning that are spread out throughout the
lessons. In addition, the core lessons have quizzes that assess
the content.</para>
</description>
</lcFormativeEvaluation>
```

## 2.6.2

### Summative evaluation

**Description:** The element `<lcSummativeEvaluation>` defines the criteria for identifying larger patterns and trends in performance and judging these findings against the objectives for the training.

**Markup element:** `<lcSummativeEvaluation>`

ICN-1654N-S1000D0037-002-01

Fig 26 Element `<lcSummativeEvaluation>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).

- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcImmediatePerformanceCompetence>`. Refer to [Para 2.6.2.1](#).
- `<lcJobTransfer>`. Refer to [Para 2.6.2.2](#).
- `<lcOrganizationalImpact>`. Refer to [Para 2.6.2.3](#).

#### Markup example:

```
<lcSummativeEvaluation>
<title>Summative evaluation</title>
<description>
<para>The summative evaluation will be conducted at two time
frames: first, immediately after the training takes place, and
second, 6 months after the training was conducted.</para>
</description>
<lcImmediatePerformanceCompetence>
<description>
<para>The immediate performance change will be evaluated during
the hands-on assessment conducted at the end of the training.
This assessment will determine if the training had the desired
immediate effect.</para>
</description>
</lcImmediatePerformanceCompetence>
<lcJobTransfer>
<description>
<para>At a time of 6 months after the course is provided to the
couriers, a survey will be taken to determine if the training
allowed the couriers to conduct their own repairs and reduce the
number of breakdown pickups by the company.</para>
</description>
</lcJobTransfer>
<lcOrganizationalImpact>
<description>
<para>At a time of 6 months after the start of the training
program, Speedy Couriers will evaluate the data in order to
determine if breakdown service has decreased and on-time
delivery has increased.</para>
</description>
</lcOrganizationalImpact>
</lcSummativeEvaluation>
```

#### 2.6.2.1 Immediate performance competence

**Description:** The element `<lcImmediatePerformanceCompetence>` contains the requirements for an evaluation instrument or plan that determines whether an intervention resulted in the desired immediate effect on human performance.

**Markup element:** `<lcImmediatePerformanceCompetence>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcImmediatePerformanceCompetence>
<description>
<para>The immediate performance change will be evaluated during
the hands-on assessment conducted at the end of the training.
This assessment will determine if the training had the desired
immediate effect.</para>
</description>
</lcImmediatePerformanceCompetence>
```

### 2.6.2.2 Job transfer

**Description:** The element [<lcJobTransfer>](#) contains the requirements for an evaluation instrument or plan that determines whether an intervention resulted in the desired effect on performance in the work environment.

**Markup element:** [<lcJobTransfer>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcJobTransfer>
<description>
<para>At a time of 6 months after the course is provided to the
couriers, a survey will be taken to determine if the training
allowed the couriers to conduct their own repairs and reduce the
number of breakdown pickups by the company.</para>
</description>
</lcJobTransfer>
```

### 2.6.2.3 Organizational impact

**Description:** The element [<lcOrganizationalImpact>](#) contains the requirements for an evaluation instrument or plan that determines whether an intervention resulted in the desired effect on overall performance of the organization.

**Markup element:** `<lcOrganizationalImpact>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcOrganizationalImpact>
<description>
<para>At a time of 6 months after the start of the training
program, Speedy Couriers will evaluate the data in order to
determine if breakdown service has decreased and on-time
delivery has increased.</para>
</description>
</lcOrganizationalImpact>
```

### 3

## Markup example

Below is a complete markup example for the element `<lcLearningPlan>`. It describes the learning data modules that were created for the Bike sample.

```

<lcCauseAnalysis>
<title>Cause analysis</title>
<description>
<para>A causal factor tree analysis was conducted on Speedy
Couriers, Inc.</para>
</description>
<lcEnvironmentalFactor>
<title>Environmental factor</title>
<description>
<para>The environmental factors were derived from examining the
workplace, resources, and any company incentives that may have
an impact on the gap.</para>
</description>
<lcData>
<description>
<para>Job sheets with basic step-by-step procedures for routine
maintenance tasks are provided to all couriers with their
company-issued handbook. The maintenance procedures are not

```

illustrated and do not reference tools that should be used in any given step.

Couriers are provided all of the resources needed to maintain and repair their bikes.

The study revealed that there is currently a negative incentive to troubleshoot and repair bike problems while on courier duties. Since the company provides unlimited breakdown service, there is no reason for couriers to repair their own bikes.

The internal factors were derived from interviews with the couriers.

Only a small percentage of the couriers had the necessary knowledge needed to maintain and repair bicycles.

All of the couriers possessed the capacity to learn the skills needed to maintain and repair bicycles.

No significant causal factors were observed or uncovered during this analysis.

The following information outlines the recommendations for addressing the identified gap.

```

## 1 General

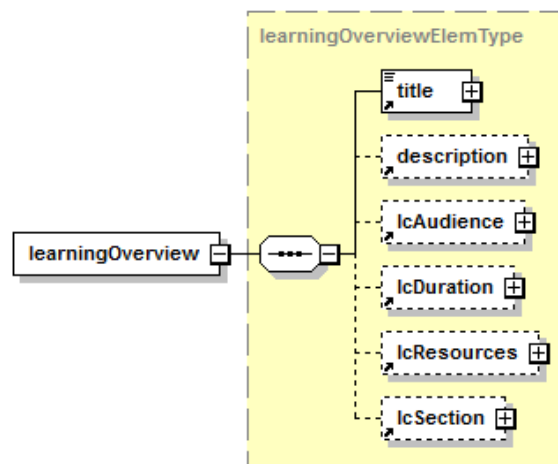

The learning overview information model is the second branch in the learning schema. It contains an overview of the learning content.

## 2 Learning overview content

### 2.1 Learning overview

**Description:** The element `<learningOverview>` contains the introductory learning content information. It includes information helpful to the learner, such as prerequisites, duration, intended audience, and can include information and strategies that seek to gain attention and stimulate recall of prior learning.

**Markup element:** `<learningOverview>`

ICN-1654N-S1000D0038-001-01

Fig 1 Element `<learningOverview>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `derivativeClassificationRefId` (O) and `caveat` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcAudience>`. Refer to [Para 2.2](#).
- `<lcDuration>`. Refer to [Para 2.3](#).
- `<lcResources>`. Refer to [Para 2.4](#).
- `<lcSection>`. Refer to [Para 2.5](#).

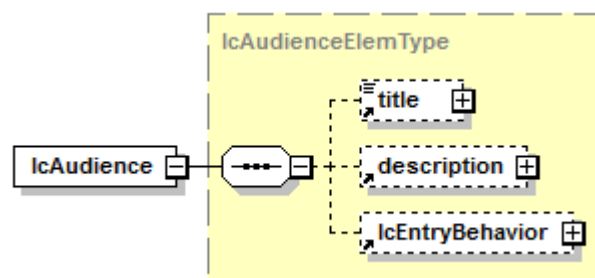

### Markup example:

```
<learningOverview>
<title>Steering system sverview</title>
<description>
<!-- the following dmRef points to an objective item found in
the learn plan for this lesson. -->
<para>
In order for a rider to keep his or her bike moving in a given
direction, he or she must steer the bike. A bike's steering
system offers input, which helps the bike and rider to remain
upright. Additionally, the rider's balance affects the bike's
steering. If the rider's center of gravity sways more to the
left or right of the wheels, the bike will lean. This lean
causes the handlebar to turn in the direction of the lean,
pulling the bike in that direction. In order to rebalance, the
rider uses inertia and the steering system.
</para>
<para>
Objective: Given a photograph of a bike's steering system, you
will be able to identify each part with 80 percent accuracy.
<dmRef referredFragment="lo-001">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"

<issueInfo issueNumber="001" inWork="01"/>
<language countryIsoCode="US" languageIsoCode="en"/>
</dmRefIdent>
</dmRef>
</para>
</description>
</learningOverview>
```

## 2.2 Audience

**Description:** The element `<lcAudience>` contains the intended learner's profile taking the instruction.

**Markup element:** `<lcAudience>`

ICN-1654N-S1000D0039-002-01

Fig 2 Element `<lcAudience>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), derivativeClassificationRefId (O) and caveat (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <description>. Refer to [Chap 3.9.5.2.2](#).
- <lcEntryBehavior>. Refer to [Para 2.2.1](#).

### 2.2.1

#### Entry behavior

**Description:** The element <lcEntryBehavior> contains the current skill level or activities of the learners in relation to the training purpose.

**Markup element:** <lcEntryBehavior>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), derivativeClassificationRefId (O) and caveat (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <description>. Refer to [Chap 3.9.5.2.2](#).

### 2.3

#### Duration

**Description:** The element <lcDuration> contains the estimated duration of the learning activity.

**Markup element:** <lcDuration>

ICN-1654N-S1000D0046-001-01

Fig 3 Element <lcDuration>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), derivativeClassificationRefId (O) and caveat (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <lcTime>. Refer to [Para 2.3.1](#).

**Markup example:**

```
<lcDuration>
<title>Duration</title>
<lcTime>
<description>
<para>It should take no more than 1 hour and 30 minutes to
complete this course.</para>
</description>
</lcTime>
</lcDuration>
```

**2.3.1****Time**

**Description:** The element <lcTime> contains the time expected to complete an activity.

**Markup element:** <lcTime>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), derivativeClassificationRefId (O) and caveat (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <description>. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcTime>
<description>
<para>It should take no more than 1 hour and 30 minutes to
complete this course.</para>
</description>
</lcTime>
```

## 2.4 Resources

**Description:** The element `<lcResources>` contains a list of related resources and information about them, such as related articles or samples on the Web.

**Markup element:** `<lcResources>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `derivativeClassificationRefId` (O) and `caveat` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcResources>
<description>
<para>Bike technical data </para>
</description>
</lcResources>
```

## 2.5 Section

**Description:** The element `<lcSection>` contains a generic element to contain optional learning overview content.

**Markup element:** `<lcSection>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `derivativeClassificationRefId` (O) and `caveat` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcSection>
<description>
<figure>
<title/>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-D000000-A-06RT9-
```

```
00149-A-001-01"/>
</figure>
</description>
</lcSection>
```

### 3 Examples

Below is a markup example for `<learningOverview>`. It describes a short lesson that is a part of the bike learning example.

```
<learning>
<learningOverview>
<title>Overview: Getting to know your bike</title>
<lcAudience>
<description>
<para>The intended audience are bike couriers.</para>
</description>
<lcEntryBehavior>
<description>
<para>Newly hired bike couriers do not necessarily have the
skills required to maintain their bikes. Currently employed
couriers may require refresher training on bike
maintenance.</para>
</description>
</lcEntryBehavior>
</lcAudience>
<lcDuration>
<title>Duration</title>

#### 1 General

The learning content information model contains the bulk of the learning materials. The learning content structure includes learning activities and language that form the learning materials. It holds the most potential for the appropriate reuse of technical data where content supplements are useful.

#### 2 Learning content

**Description:** A learning content data module comprises a set of data about a single terminal learning objective supported by zero or more enabling learning objectives. It contains the learning content itself, and enables direct use of content. It supports specific objectives declared in the learning plan topic type.

Markup element: `<learningContent>`

ICN-1654N-S1000D0040-001-01

Fig 1 Element `<learningContent>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### **1 General**

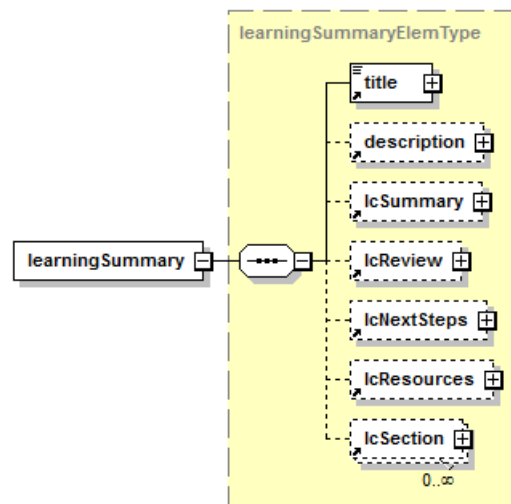

The learning summary information model summarizes the learning content. The learning summary structure reviews learning objectives, learning activities, and language that form the learning materials. It can also discuss lesson assessments and future learning requirements. The learning summary data module can be used any time a summation is required.

## 2 Learning summary content

### 2.1 Learning summary

**Description:** The element `<learningSummary>` recaps and provides context for the achievement or accomplishment of learning objectives, provides guidance to reinforce learning and long-term memory, and can pose questions to enhance encoding and verification of the learning content.

**Markup element:** `<learningSummary>`

ICN-1654N-S1000D0041-001-01

Fig 1 Element `<learningSummary>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<description>`. Refer to [Chap 3.9.5.2.2](#).
- `<lcSummary>`. Refer to [Para 2.2](#).
- `<lcReview>`. Refer to [Para 2.3](#).
- `<lcNextSteps>`. Refer to [Para 2.4](#).
- `<lcResources>`. Refer to [Chap 3.9.5.2.13.2](#).
- `<lcSection>`. Refer to [Chap 3.9.5.2.13.2](#).

### 2.2 Summary

**Description:** The element `<lcSummary>` provides a textual summary that describes the main learning goals and lessons learned.

**Markup element:** `<lcSummary>`)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

#### Markup example:

```
<lcSummary>
<description>
<para>
Damage to any of a bike's steering system components could
render the system inoperable. Therefore, you should know how to
remove and install each piece. The handlebar, stem, and headset
all play a vital role in steering. This topic provided the
information you will need to remove and install the components
of a bike's steering system.
</para>
<!-- the following dmRef points to an objective item listed
lcObjectives section of the learn plan for this lesson. -->
<para>
Now that you have completed this topic, you should be able to
describe the procedures for installing and removing a bike's
steering system.
</para>
<para>
<dmRef referredFragment="lo-002">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"

</dmRefIdent>
</dmRef>
</para>
</description>
</lcSummary>
```

## 2.3 Review

**Description:** The element [<lcReview>](#) provides a review of the main points.

**Markup element:** [<lcReview>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcReview>
<description>
<para>This lesson provided general bicycle care and maintenance
information. </para>
</description>
</lcReview>
```

## 2.4

**Next steps**

**Description:** The element [<lcNextSteps>](#) describes the next steps to reinforce the knowledge learned.

**Markup element:** [<lcNextSteps>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#). Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcNextSteps>
<description>
<para>Now that you have completed this topic, you can take the
related assessment.</para>
</description>
</lcNextSteps>
```

### 3 Example

Below is a complete markup example for `<learningSummary>`. It describes a short lesson summary on performing regular cleaning of the bike.

```
<learning>
<learningSummary>
<title>Summary</title>
<lcSummary>
<description>
<figure>
<title/>
<graphic infoEntityIdent="ICN-S1000DBIKE-AAA-D000000-A-06RT9-
00150-A-001-01"/>
</figure>
<para>Regular cleaning and testing of your bike's systems are
part of keeping your bike maintained. Over time, your bike's
moving parts become susceptible to dirt and grime and will
eventually fail to operate correctly if they are not maintained.
Because the bike has so many moving parts, it is important that
you know how to keep the bike clean and lubricated.</para>
<para>It is also important to know how to patch an inner tube
puncture. As you are riding, you never know what you might run
over. A nail or a tack can cause quite a bit of
aggravation.</para>
</description>
</lcSummary>
<lcReview>
<description>
<para>This lesson provided general bicycle care and maintenance
information. </para>
</description>
</lcReview>
<lcNextSteps>
<description>
<para>Now that you have completed this topic, you can take the
related assessment.</para>

	Instructional management system Question- test interoperability

## 1 General

The learning assessment information model allows for one or more questions to be presented to the user. These questions are meant to test the student's learning. Each assessment question is regarded as an independent interaction.

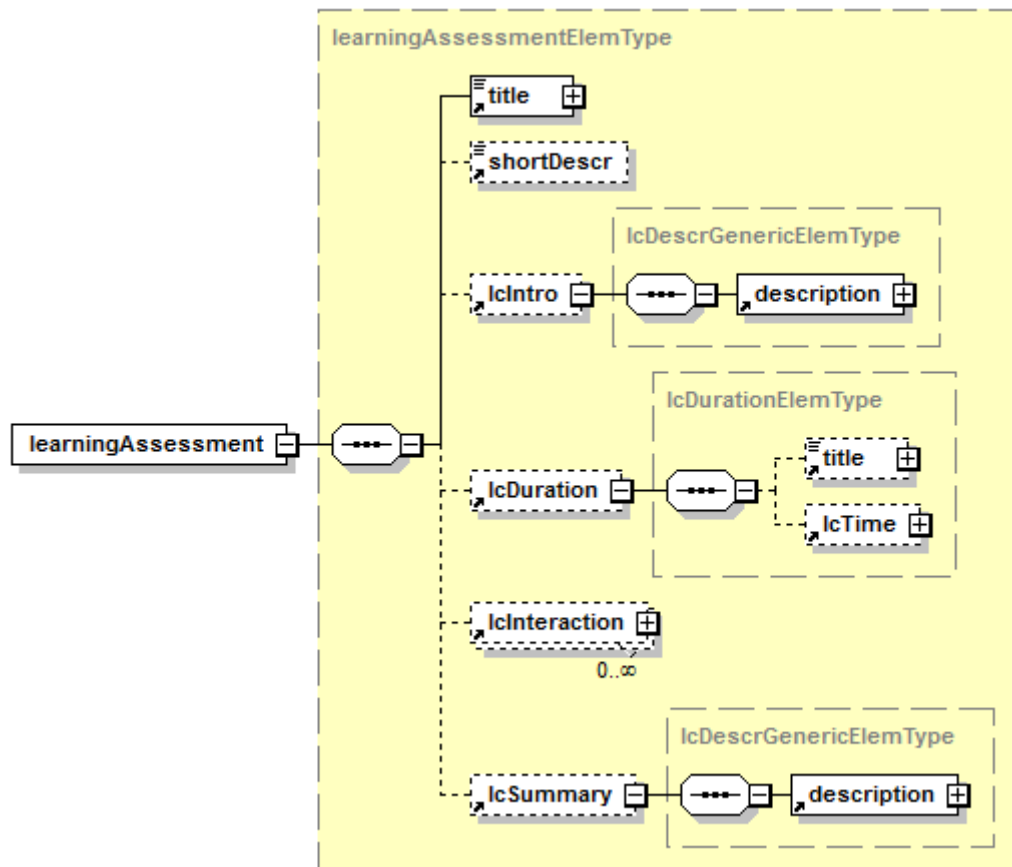

## 2 Learning assessment

**Description:** The element `<learningAssessment>` contains the learning assessment. It presents interactions that measure a learner's progress, encourage recollection, and stimulate reinforcement of the learning content. It can be presented before the content as a pre-assessment or at the end of the content as a post-assessment. The format of each interactive assessment question can be structured as one of the following question types: true/false, single select, multiple select, completion, sequencing, matching, drag-and-drop, or hotspot. A single learning assessment can contain one or more individual "interactions", each of which contains a "question type". The interactions use a subset of the Instructional management system question-test interoperability specification.

### Note

The true/false, single-select, and multiple-select structures use the same content model, `<lcQuestionOptionGroup>`. There is one `<lcQuestionOptionGroup>` for each assessment question.

**Markup element:** `<learningAssessment>`

ICN-S3627-S1000D0642-002-01

Fig 1 Element `<learningAssessment>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`, the title of the learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- `<shortDescr>`. Refer to [Para 2.1](#).
- `<lcIntro>`. Refer to [Para 2.2](#).
- `<lcDuration>`. Refer to [Para 2.3](#).
- `<lcInteraction>`. Refer to [Para 2.4](#).
- `<lcSummary>`. Refer to [Para 2.5](#).

## 2.1 Short description

**Description:** The element `<shortDescr>` contains a short description of the learning assessment portion of the course or lesson.

**Markup element:** `<shortDescr>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

## 2.2 Introduction

**Description:** The element `<lcIntro>` contains a detailed introduction and description of the assessment by use of the element `<description>`. It is used when the element `<shortDescr>` is not adequate to fully describe the content.

**Markup element:** `<lcIntro>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`. Refer to [Chap 3.9.5.2.2](#).

## 2.3 Duration

**Description:** The element `<lcDuration>` contains an estimated duration of the assessment by use of the element `<description>`.

**Markup element:** `<lcDuration>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

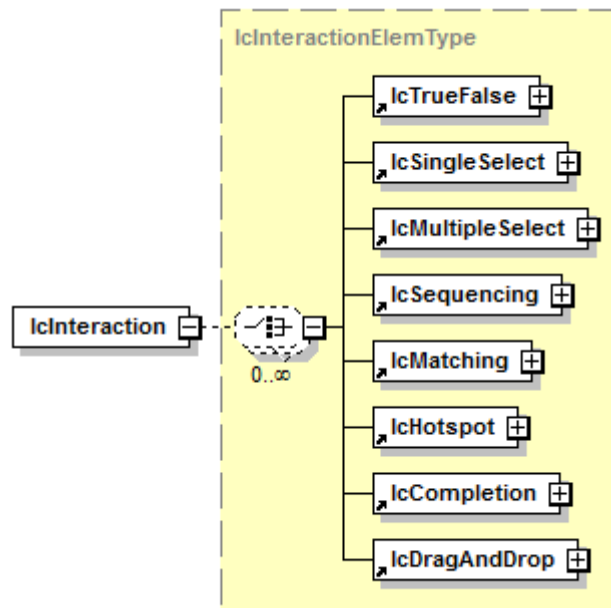

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <lcTime>. Refer to [Chap 3.9.5.2.13.1](#).

## 2.4 Interaction

**Description:** The element <lcInteraction> contains the assessment questions and a selection of possible answers.

**Markup element:** <lcInteraction>

ICN-S3627-S1000D0643-001-01

Fig 2 Element <lcInteraction>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- shuffle (O,) used to reorder the sequence of interactions within the assessment. The attribute can have one of the following values:

- "0" - No shuffle
- "1" - Shuffle

The attribute `shuffle` can be used to randomly redistribute the order of entire groups of assessment interactions or answer options as well individual assessment items within a group.

- weightingFactor (O), the factor customizing the score value of an interaction item. The attribute `weightingFactor` accepts numeric values to indicate the relative importance of an interaction item within an assessment scheme.

For example, when the importance of an assessment question is critical to the subject matter (such as a question concerning safety procedures), an interaction attribute `weightingFactor` can be assigned a numeric value calculated to trigger a fail threshold for a single incorrect response.

- attempts (O), the number of allowed attempts on an assessment. This attribute accepts numeric values.

The attribute attempts provides assessment designers the flexibility to develop assessments that allow assessment takers multiple attempts at individual assessment interactions. This technique is often used by designers when assessments are intended to reinforce acquired knowledge rather than test and score mastery of the subject matter.

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Note

The attributes shuffle, weightingFactor and attempts are used to customize interactions according to the learning goals of the assessment. Assessment designers can decide to use these attributes to customize individual assessment items within a sequence of assessment questions, or they can be used to customize any individual assessment question.

#### Child elements:

- <lcTrueFalse>, the true/false assessment interaction items. Refer to [Para 2.4.1](#).
- <lcSingleSelect>, the single-select assessment interaction items. Refer to [Para 2.4.2](#).
- <lcMultipleSelect>, the multiple-select assessment interaction items. Refer to [Para 2.4.3](#).
- <lcSequencing>, the sequencing assessment interaction items. Refer to [Para 2.4.4](#).
- <lcMatching>, the matching assessment interaction type. Refer to [Para 2.4.5](#).
- <lcHotspot>, the assessment items using embedded interactive hotspots. Refer to [Para 2.4.6](#).
- <lcCompletion>, the fill-in-the-blank type interaction items. Refer to [Para 2.4.7](#).
- <lcDragAndDrop>, the assessment items relying on user drag-and-drop interactivity. Refer to [Para 2.4.8](#).

#### Business rule decision point BRDP-S1-00273 - Use of the attribute weightingFactor:

- Decide whether to assign weighted values to individual interactions.

#### Business rule decision point BRDP-S1-00274 - Use of the attribute attempts:

- Decide whether to allow multiple response attempts for interaction items.

#### Markup example:

```
<lcInteraction shuffle="1" weightingFactor="25" attempts="2">
  <lcTrueFalse>
    <title />
    <lcQuestion>
      <description>
        <para>Select your answer, and then click NEXT.</para>
        <para>All bike tires require an inner tube?</para>
      </description>
    </lcQuestion>
    <lcAnswerOptionGroup>
```

```

<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>True</para>
</description>
</lcAnswerOptionContent>
</lcAnswerOption>
<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>False</para>
</description>
</lcAnswerOptionContent>
<lcCorrectResponse lcName="lcCorrectResponse"/>
</lcAnswerOption>
</lcAnswerOptionGroup>
<lcFeedbackItemGroup>...</lcFeedbackItemGroup>
</lcTrueFalse>
</lcInteraction>

```

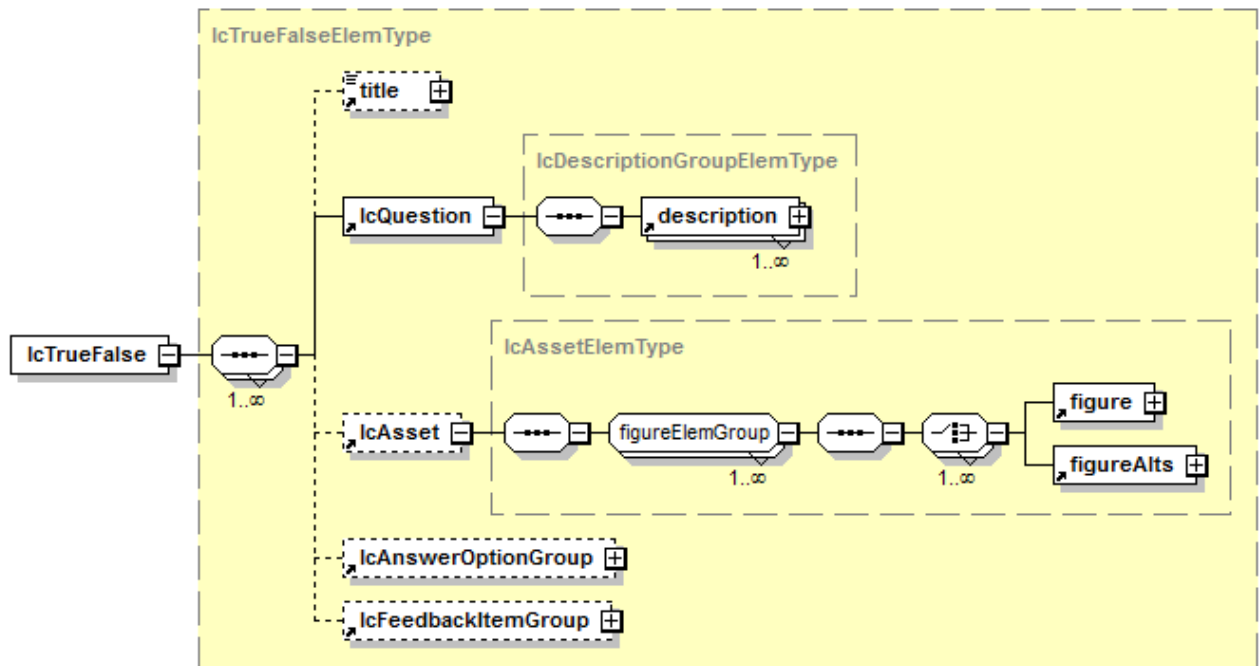

#### 2.4.1 True/false

**Description:** The element `<lcTrueFalse>` contains the markup for true/false assessment interaction items. The true/false interaction presents the learner with two choices, one correct, the other incorrect, and is often presented as true/false or yes/no responses.

##### Note

The element `<lcTrueFalse>` contains the same content model as the element `<lcSingleSelect>` and the element `<lcMultipleSelect>`. However, the true/false interaction contains only two `<answerOption>` elements within the child `<answerOptionGroup>` element: one answer option for the "true" answer option and one for the "false" answer option.

**Markup element:** `<lcTrueFalse>`

ICN-S3627-S1000D0644-001-01

Fig 3 Element *<lcTrueFalse>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*, the title of learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- *<lcQuestion>*. Refer to [Para 2.4.1.1](#).
- *<lcAsset>*. Refer to [Para 2.4.1.2](#).
- *<lcAnswerOptionGroup>*. Refer to [Para 2.4.1.3](#).
- *<lcFeedbackItemGroup>*. Refer to [Para 2.4.1.4](#).

#### Markup example:

```
<lcTrueFalse>
<title />
<lcQuestion>
<description>
<para>Select your answer, and then click NEXT.</para>
<para>All bike tires require an inner tube?</para>
</description>
</lcQuestion>
<lcAnswerOptionGroup>
<lcAnswerOption>
```

```

<lcAnswerOptionContent>
  <description>
    <para>True</para>
  </description>
</lcAnswerOptionContent>
</lcAnswerOption>
<lcAnswerOption>
  <lcAnswerOptionContent>
    <description>
      <para>False</para>
    </description>
  </lcAnswerOptionContent>
  <lcCorrectResponse lcName="lcCorrectResponse" />
</lcAnswerOption>
</lcAnswerOptionGroup>
<lcFeedbackItemGroup>...</lcFeedbackItemGroup>
</lcTrueFalse>

```

#### 2.4.1.1

##### Question

**Description:** The element `<lcQuestion>` contains the stem for an assessment interaction.

**Markup element:** `<lcQuestion>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<description>`, the description of the element in which it is contained. Refer to [Chap 3.9.5.2.2](#).

##### Markup example:

```

<lcQuestion>
  <description>
    <para>Select your answer, and then click CHECK.</para>
    <para>The stem attaches the _____ to the _____.</para>
  </description>
</lcQuestion>

```

#### 2.4.1.2

##### Asset

**Description:** The element `<lcAsset>` contains images and other graphic assets to support an assessment interaction.

**Markup element:** `<lcAsset>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).

#### 2.4.1.3

##### Answer option group

**Description:** The element <lcAnswerOptionGroup> contains answer options for true/false, single-select, completion, or multiple-select assessment interactions.

**Markup element:** <lcAnswerOptionGroup>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <lcAnswerOption>. Refer to [Para 2.4.1.3.1](#).

**Markup example:**

```
<lcAnswerOptionGroup>
<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>Spokes</para>
</description>
</lcAnswerOptionContent>
</lcAnswerOption>
<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>Control cables</para>
</description>
</lcAnswerOptionContent>
<lcCorrectResponse lcName="lcCorrectResponse"/>
</lcAnswerOption>
<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>Chain</para>
</lcAnswerOptionContent>
</lcAnswerOption>
```

```

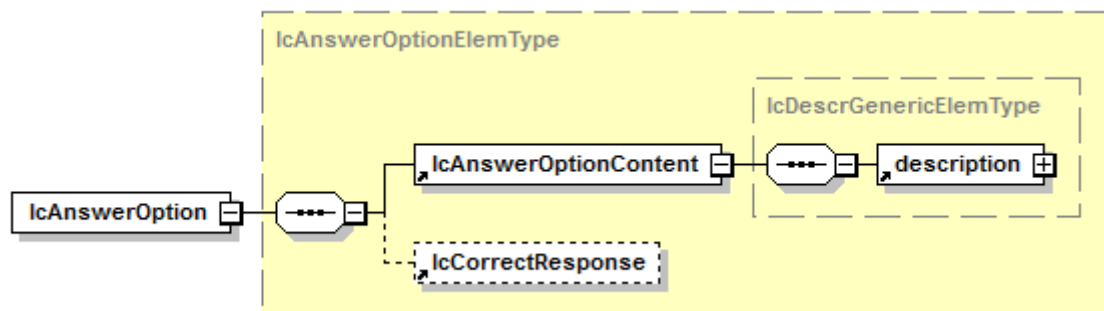

</description>
</lcAnswerOptionContent>
<lcCorrectResponse lcName="lcCorrectResponse"/>
</lcAnswerOption>
<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>Wheel rims</para>
</description>
</lcAnswerOptionContent>
</lcAnswerOption>
</lcAnswerOptionGroup>

```

#### 2.4.1.3.1 Answer option

**Description:** The element [<lcAnswerOption>](#) contains a single answer option for true/false, single-select, completion, or multiple-select assessment interactions.

**Markup element:** [<lcAnswerOption>](#)

ICN-S3627-S1000D0645-001-01

Fig 4 Element [<lcAnswerOption>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<lcAnswerOptionContent>](#). Refer to [Para 2.4.1.3.2](#).
- [<lcCorrectResponse>](#). Refer to [Para 2.4.1.3.3](#).

#### Markup example:

```

<lcAnswerOption id="ao_001" shuffle="1">
<lcAnswerOptionContent>
<description>
<para>headset/fork</para>
</description>

```

```
</lcAnswerOptionContent>
</lcAnswerOption>
```

#### 2.4.1.3.2 Answer option content

**Description:** The element `<lcAnswerOptionContent>` contains the content for an answer option to a question and can indicate that the answer option is correct or incorrect.

**Markup element:** `<lcAnswerOptionContent>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`, the description of the element in which it is contained. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcAnswerOptionContent>
<description>
<para>frame/handlebar</para>
</description>
</lcAnswerOptionContent>
```

#### 2.4.1.3.3 Correct response

**Description:** The (empty) element `<lcCorrectResponse>` contains a correct `<lcOptionContent>` response in a `<lcAnswerOption>`.

**Markup element:** `<lcCorrectResponse>`

**Attributes:**

- `lcName` (O), the indication of the assessment type. The default value is `"lcCorrectResponse"` in the context of use of the element `<lcCorrectResponse>`.
- `lcValue` (O), the value of the correct response

**Child elements:**

- None

**Markup example:**

```
<lcAnswerOption id="ao_003" shuffle="1">
<lcAnswerOptionContent>
<description>
<para>handlebar/headset</para>
</description>
</lcAnswerOptionContent>
```

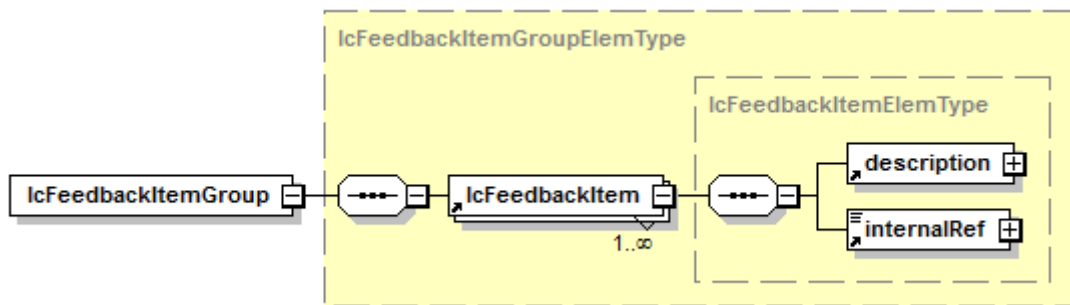

```
<lcCorrectResponse lcName="lcCorrectResponse" />
</lcAnswerOption>
```

#### 2.4.1.4 Feedback item group

**Description:** The element `<lcFeedbackItemGroup>` contains the content for supplying dynamic feedback to user assessment item responses.

The element `<lcFeedbackItemGroup>` supports linking of performance-based feedback thru the use of internal referencing. Assessment designers can use the element `<internalRef>` as a child of the element `<lcFeedbackItem>` to establish relationships among answer options and associated feedback content. This allows for the development of robust and flexible assessment interactions capable of providing feedback to users in response to multiple interaction performance results. As the markup example demonstrates, feedback can be developed to support the answer status as it applies to individual question responses. Feedback content can be logically associated with the current number of allowable user response attempts as well as the correct or incorrect status of the response.

**Markup element:** `<lcFeedbackItemGroup>`

ICN-S3627-S1000D0646-001-01

Fig 5 Element `<lcFeedbackItemGroup>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<lcFeedbackItem>`. Refer to [Para 2.4.1.4.1](#).

#### Markup example:

```
<lcFeedbackItemGroup>
<lcFeedbackItem attemptMatch="1"
feedbackStatus="fbCorrect"><description>
<para>Correct!</para>
</description>
<internalRef internalRefId="ao_003">
</internalRef>
```

```

</lcFeedbackItem>
<lcFeedbackItem attemptMatch="2"
feedbackStatus="fbCorrect"><description>
<para>You got it right this time. Good work!</para>
</description>
<internalRef internalRefId="ao_003">
</internalRef>
</lcFeedbackItem>
<lcFeedbackItem attemptMatch="1" feedbackStatus="fbIncorrect">
<description>
<para>The answer <emphasis>"headset/fork"</emphasis> is
incorrect. Try again!</para>
</description>
<internalRef internalRefId="ao_001">
</internalRef>
</lcFeedbackItem>
<lcFeedbackItem attemptMatch="1" feedbackStatus="fbIncorrect">
<description>
<para>
The answer <emphasis>"fork/handlebar"</emphasis> is incorrect.
Try again!
</para>
</description>
<internalRef internalRefId="ao_002">
</internalRef>
</lcFeedbackItem>
<lcFeedbackItem>
<description>
<para>Correct!</para>
</description>
<internalRef internalRefId="ao_003">
</internalRef>
</lcFeedbackItem>
<lcFeedbackItem attemptMatch="1" feedbackStatus="fbIncorrect">
<description>
<para>
The answer <emphasis>"frame/handlebar"</emphasis> is incorrect.
Try again!
</para>
</description>
<internalRef internalRefId="ao_004">
</internalRef>
</lcFeedbackItem>
<lcFeedbackItem attemptMatch="2" feedbackStatus="fbIncorrect">
<description>
<para>
The answer <emphasis>"headset/fork"</emphasis> is incorrect. The
correct answer is handlebar/headset.
</para>
</description>
<internalRef internalRefId="ao_001">
</internalRef>
</lcFeedbackItem>

```

```

<lcFeedbackItem attemptMatch="2" feedbackStatus="fbIncorrect">
  <description>
    <para>
      The answer <emphasis>"fork/handlebar"</emphasis> is incorrect.
      The correct answer is handlebar/headset.
    </para>
  </description>
  <internalRef internalRefId="ao_002">
  </internalRef>
</lcFeedbackItem>
<lcFeedbackItem attemptMatch="2" feedbackStatus="fbIncorrect">
  <description>
    <para>
      The answer <emphasis>"frame/handlebar"</emphasis> is incorrect.
      The correct answer is handlebar/headset.
    </para>
  </description>
  <internalRef internalRefId="ao_004">
  </internalRef>
</lcFeedbackItem>
</lcFeedbackItemGroup>

```

#### 2.4.1.4.1 Feedback item

**Description:** The element `<lcFeedbackItem>` contains the interaction performance information. Feedback information is displayed to assessment takers as the result of response attempts. Individual feedback items can be custom tailored to support complex, performance-based feedback scenarios for a range of user assessment interaction responses.

Linking of the feedback responses to the answer matching answer options is accomplished thru the element `<internalRef>`. As the markup example illustrates, feedback items can be linked to specific answer options to indicate correct and incorrect responses as well as to reflect feedback based on the number of the interaction attempts.

**Markup element:** `<lcFeedbackItem>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `attemptMatch` (O), the number of response attempts allowed for interactions.
- `feedbackStatus` (O), the type of feedback to be displayed for a response attempt. The type of feedback is conditional to the response status of the answer option. The attribute can have one of the following values:
  - `"fbCorrect"` - the feedback content of the `<lcFeedbackItem>` element will match a correct response
  - `"fbIncorrect"` - the feedback content of the `<lcFeedbackItem>` element will match an incorrect response
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- [<description>](#), the description for the element in which it is contained. Refer to [Chap 3.9.5.2.2](#).
- [<internalRef>](#), the cross-reference from one point in a data module to another point in the same data module. This is achieved by linking the attribute `internalRefId` to the target attribute `id`. Refer to [Para 2.4.1.4.2](#) and [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<lcFeedbackItem attemptMatch="1" feedbackStatus="fbCorrect">
  <description>
    <para>Correct!</para>
  </description>
  <internalRef internalRefId="ao_003">
  </internalRef>
</lcFeedbackItem>
```

#### 2.4.1.4.2 Internal reference

**Description:** The element [<internalRef>](#) is used to mark up a cross-reference from one point in a data module to another point in the same data module. This is achieved by linking the attribute `internalRefId` to the target attribute `id`. Refer to [Chap 3.9.5.2.1.2](#).

The element [<internalRef>](#) is used within the feedback group structure to link feedback items to their paired answer options. Linking is accomplished by setting the value of the attribute `internalRefId` to the matching value of the attribute `id` of the element

[<answerOption>](#).

#### Markup example:

```
<lcTrueFalse>
  <title />
  <lcQuestion>
    <description>
      <para>Select your answer, and then click NEXT.</para>
      <para>All bike tires require an inner tube?</para>
    </description>
  </lcQuestion>
  <lcAnswerOptionGroup>
    <lcAnswerOption id="ao_001" shuffle="1">
      <lcAnswerOptionContent>
        <description>
          <para>headset/fork</para>
        </description>
      </lcAnswerOptionContent>
    </lcAnswerOption>
  </lcAnswerOptionGroup>
  <lcFeedbackItemGroup>
    <lcFeedbackItem attemptMatch="1" feedbackStatus="fbIncorrect">
      <description>
        <para>The answer <emphasis>"headset/fork"</emphasis> is incorrect. Try again!</para>
      </description>
      <internalRef internalRefId="ao_001">
      </internalRef>
    </lcFeedbackItem>
  </lcFeedbackItemGroup>
```

```

</lcFeedbackItem>
</lcFeedbackItemGroup>
</lcTrueFalse>

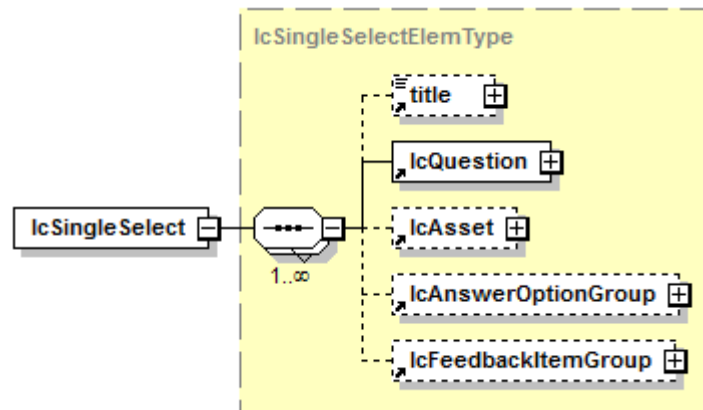

```

## 2.4.2

### Single select

**Description:** A single-select interaction presents the assessment taker with a question and three or more possible answers, only one of which is correct.

**Markup element:** `<lcSingleSelect>`

ICN-S3627-S1000D0671-001-01

Fig 6 Element `<lcSingleSelect>`

#### Note

The element `<lcSingleSelect>` contains the same content model as the element `<lcTrueFalse>` and the element `<lcMultipleSelect>`. Enter two or more elements `<lcAnswerOptionGroup>` for each possible correct answer.

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `lcName` (O), the assessment type. The default value is "lcSingleSelect" in the context of use of the element `<lcSingleSelect>`.
- `lcValue` (O), the value of the correct response
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`, the title of learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- `<lcQuestion>`. Refer to [Para 2.4.1.1](#).
- `<lcAsset>`. Refer to [Para 2.4.1.2](#).
- `<lcAnswerOptionGroup>`. Refer to [Para 2.4.1.3](#).
- `<lcFeedbackItemGroup>`. Refer to [Para 2.4.1.4](#).

**Markup example:**

```

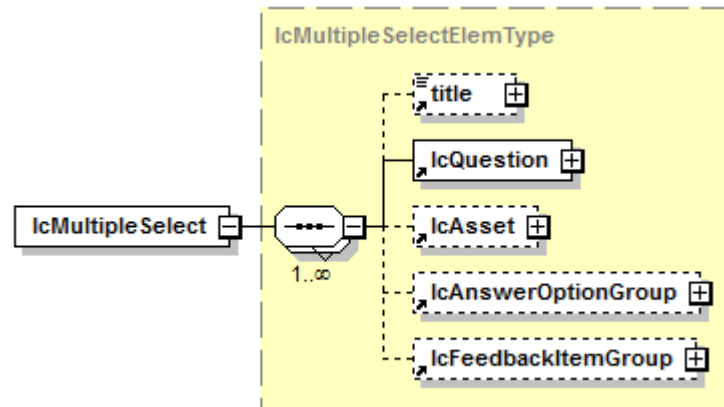

<lcSingleSelect>
<title/>
<lcQuestion>
<description>
<para>Select your answer, and then click NEXT.</para>
<para>What is the function of the valve attached to a bike's
inner tube?</para>

</lcSingleSelect>

```

**2.4.3 Multiple select**

**Description:** The element `<lcMultipleSelect>` contains a multiple-select interaction presents the assessment taker with a question and three or more possible answers, where two or more answers are correct.

**Markup element:** `<lcMultipleSelect>`

ICN-S3627-S1000D0672-001-01

Fig 7 Element `<lcMultipleSelect>`

#### Note

The element `<lcMultipleSelect>` contains the same content model as the element `<lcTrueFalse>` and the element `<lcSingleSelect>`. Enter three or more elements `<lcAnswerOptionGroup>` for each possible correct answer.

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `lcName` (O), the indication of the assessment type. The default value is "`lcMultipleSelect`" in the context of use of the element `<lcMultipleSelect>`.
- `lcValue` (O), the value of the correct response
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`, the title of learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- `<lcQuestion>`. Refer to [Para 2.4.1.1](#).
- `<lcAsset>`. Refer to [Para 2.4.1.2](#).
- `<lcAnswerOptionGroup>`. Refer to [Para 2.4.1.3](#).
- `<lcFeedbackItemGroup>`. Refer to [Para 2.4.1.4](#).

#### Markup example:

```
<lcMultipleSelect>
<title/>
<lcQuestion>
<description>
<para>Select all answers that apply, and then click NEXT.</para>
<para>Hard-to-clean areas on your bike include:</para>

```

#### 2.4.4 Sequencing

**Description:** The element [<lcSequencing>](#) contains the container for sequence interaction type content. The sequence interaction presents the assessment taker with a list of items or actions that must be put into a correct sequential order.

**Markup element:** [<lcSequencing>](#)

ICN-S3627-S1000D0673-001-01

Fig 8 Element *<lcSequencing>*

#### Note

The element *<lcSequencing>* contains the same basic content model as the element *<lcTrueFalse>*, the element *<lcSingleSelect>*, and the element *<lcMultipleSelect>* except that the element *<lcSequenceOptionGroup>* replaces the element *<lcAnswerOptionGroup>*.

#### Attributes:

- *id* (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- *changeType* (O), *changeMark* (O) and *reasonForUpdateRefIds* (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- *lcName* (O), the indication of the assessment type. The default value is "*lcSequencing*" in the context of use of the element *<lcSequencing>*.
- *lcValue* (O), the value giving the sequence order of the element *<lcSequencing>*.
- *authorityName* (O) and *authorityDocument* (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- *securityClassification* (O), *commercialClassification* (O), *caveat* (O) and *derivativeClassificationRefId* (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*, the title of the learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- *<lcQuestion>*. Refer to [Para 2.4.1.1](#).
- *<lcAsset>*. Refer to [Para 2.4.1.2](#).
- *<lcSequenceOptionGroup>*. Refer to [Para 2.4.4.1](#).
- *<lcFeedbackItemGroup>*. Refer to [Para 2.4.1.4](#).

**Markup example:**

```
<lcSequencing>
<!--PROGRAMMERS NOTE: Randomize the display order of sequence
options - lcValue attribute indicates correct order after user
sequencing-->

#### 2.4.4.1 Sequence option group

**Description:** The element [<lcSequenceOptionGroup>](#) contains the options for an assessment sequence interaction.

**Markup element:** [<lcSequenceOptionGroup>](#)

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- [<lcSequenceOption>](#). Refer to [Para 2.4.4.2](#).

##### Markup example:

```

<lcSequenceOptionGroup>
<lcSequenceOption>

```

```
<lcAnswerOptionContent>

</lcSequenceOption>
</lcSequenceOptionGroup>

```

#### 2.4.4.2 Sequence option

**Description:** This element [<lcSequenceOption>](#) contains a group of answer items to be sequenced within an assessment interaction.

**Markup element:** [<lcSequenceOption>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<lcAnswerOptionContent>](#). Refer to [Para 2.4.1.3.2](#).
- [<lcSequence>](#). Refer to [Para 2.4.4.2.1](#).

**Markup example:**

```

<lcSequenceOption>
<lcAnswerOptionContent>
<description>
<para>Reinstall the tube.</para>
</description>
</lcAnswerOptionContent>
<lcSequence lcName="lcSequence" lcValue="1"/>
</lcSequenceOption>

```

##### 2.4.4.2.1 Sequence

**Description:** The element [<lcSequence>](#) contains the position of a sequence option in a sequence in an assessment interaction.

**Markup element:** [<lcSequence>](#)

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- lcName (O), the indication of the assessment type. The default value is "lcSequence" in the context of use of the element <lcSequence>.
- lcValue (O), the value giving the sequence order of the element <lcSequenceOption>
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

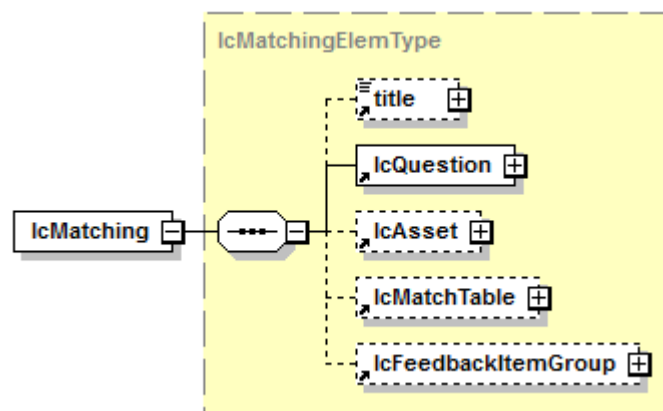

```
<lcSequence lcName="lcSequence" lcValue="7"/>
```

### 2.4.5

#### Matching

**Description:** The element <lcMatching> contains the answer items and their corresponding matching responses in the form of a match table. The matching interaction type provides the answer key information via the match table structure. The matching interaction asks the assessment taker to link two related items together from a list of multiple options.

**Markup element:** <lcMatching>

ICN-S3627-S1000D0674-001-01

Fig 9 Element <lcMatching>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<title>`, the title of the learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- `<lcQuestion>`. Refer to [Para 2.4.1.1](#).
- `<lcAsset>`. Refer to [Para 2.4.1.2](#).
- `<lcMatchTable>`. Refer to [Para 2.4.5.1](#).
- `<lcFeedbackItemGroup>`. Refer to [Para 2.4.1.4](#).

#### Markup example:

```
<lcMatching id="matching">
<title></title>

#### 2.4.5.1

##### Match table

**Description:** The element `<lcMatchTable>` contains a data table structure for the matching item and corresponding response items in a matching type assessment interaction. The `<lcMatchTable>` element identifies matching pairs of items and their corresponding responses. The `<lcMatchTable>` element defines matching response pairs thru child `<lcItem>` and `<lcMatchingItem>` elements.

**Markup element:** `<lcMatchTable>`

ICN-S3627-S1000D0647-001-01

Fig 10 Element `<lcMatchTable>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <lcMatchingHeader>. Refer to [Para 2.4.5.1.1](#).
- <lcMatchingPair>. Refer to [Para 2.4.5.1.4](#).

**Markup example:**

```

<lcMatchTable>
<lcMatchingHeader>
<lcItem>
<description>
<para>Question</para>
</description>
</lcItem>
<lcMatchingItem>
<description>

</description>
</lcMatchingItem>
</lcMatchingPair>
</lcMatchTable>

```

#### 2.4.5.1.1 Matching header

**Description:** The element `<lcMatchingHeader>` contains the column headings for items to be matched in a match table.

**Markup element:** `<lcMatchingHeader>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<lcItem>`. Refer to [Para 2.4.5.1.2](#).
- `<lcMatchingItem>`. Refer to [Para 2.4.5.1.3](#).

**Markup example:**

```

<lcMatchingHeader>
<lcItem>
<description>
<para>Question</para>
</description>
</lcItem>
<lcMatchingItem>
<description>
<para>Answer Menu</para>
</description>
</lcMatchingItem>
</lcMatchingHeader>

```

2.4.5.1.2 *Item*

**Description:** The element `<lcItem>` contains content for an item that corresponds to a `<lcMatchingItem>` response located within a `<lcMatchTable>` element.

**Markup element:** `<lcItem>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`, the description of the element in which it is contained. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcItem>
<description>
<para>Which part of the hub assembly is attached to the
dropouts?</para>
</description>
</lcItem>
```

2.4.5.1.3 *Matching item*

**Description:** The element `<lcMatchingItem>` contains content for the corresponding `<lcItem>` that comprises a matching pair of assessment items in a matching interaction.

**Markup element:** `<lcMatchingItem>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<description>`, the description of the element in which it is contained. Refer to [Chap 3.9.5.2.2](#).

**Markup example:**

```
<lcMatchingItem>
<description>
<para>Axle</para>
```

```
</description>
</lcMatchingItem>
```

#### 2.4.5.1.4 Matching pair

**Description:** The element `<lcMatchingPair>` contains a table row with the pair of items that comprise a correct match of corresponding `<lcItem>` and `<lcMatchingItems>` elements within a matching type interaction.

**Markup element:** `<lcMatchingPair>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<lcItem>`. Refer to [Para 2.4.5.1.2](#).
- `<lcMatchingItem>`. Refer to [Para 2.4.5.1.3](#).

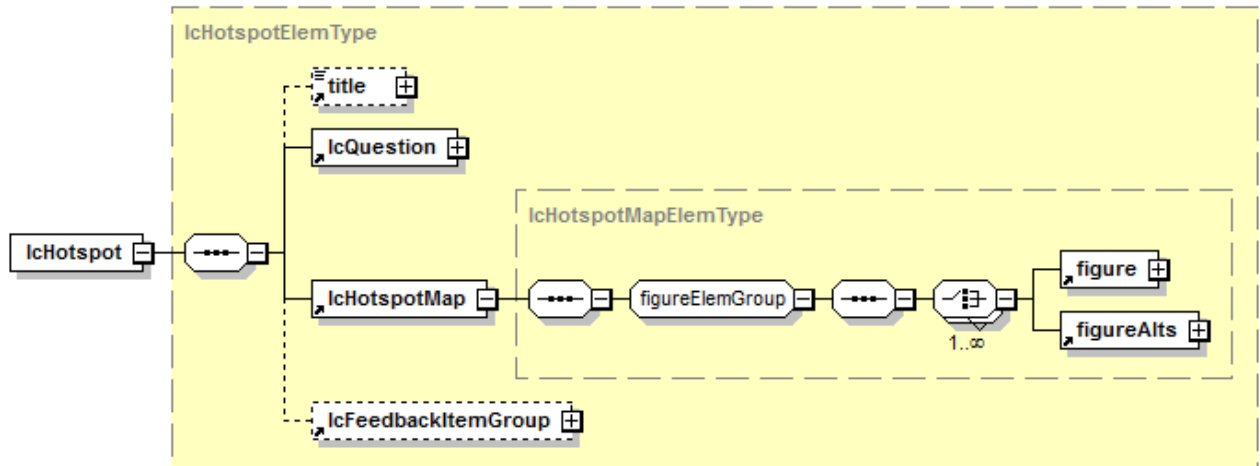

**Markup example:**

```
<lcMatchingPair>
  <lcItem>
    <description>
      <para>Which part of the hub assembly is attached to the
dropouts?</para>
    </description>
  </lcItem>
  <lcMatchingItem>
    <description>
      <para>Axle</para>
    </description>
  </lcMatchingItem>
</lcMatchingPair>
```

#### 2.4.6 Hotspot

**Description:** The element `<lcHotspot>` contains a container for hotspot interaction markup. The hotspot interaction asks the assessment taker to click on a region of the screen to indicate a choice. The hotspot assessment interaction uses coordinate mapping structures to define and locate interactive regions located within the viewing computer screen.

**Markup element:** `<lcHotspot>`

ICN-S3627-S1000D0648-001-01

Fig 11 Element *<lcHotspot>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<title>*, the title of the learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- *<lcQuestion>*. Refer to [Para 2.4.1.1](#).
- *<lcHotspotMap>*. Refer to [Para 2.4.6.1](#).
- *<lcFeedbackItemGroup>*. Refer to [Para 2.4.1.4](#).

#### Markup example:

```
<lcHotspot id="hotspotsAssessment001">
<title></title>
<lcQuestion>
<description>
<para>Identify the headset by clicking it in the image.</para>
</description>
</lcQuestion>
<lcHotspotMap>
<figure>
<title/>
<graphic id="hsa-001" infoEntityIdent="ICN-S1000DBIKE-AAA-

objectCoordinates="120,50,190,50,120,100,190,100">
</hotspot>
</graphic>
</figure>
</lcHotspotMap>
</lcHotspot>
```

#### 2.4.6.1 Hotspot map

**Description:** The element `<lcHotspotMap>` designates an action area or interactive region over a media object, allowing assessment takers to click in that region. The user's clicked selection is scored as a correct or an incorrect response to an interaction question. The interactive, or "hot", region is defined within the `<lcHotspotMap>` as a series of "x" and "y" Cartesian coordinates assigned as values of `objectCoordinate` attributes of the `<hotspot>` element. Refer to [Chap 3.9.5.2.1.8](#).

**Markup element:** `<lcHotspotMap>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<figureAlts>`. Refer to [Chap 3.9.5.2.1.7](#).

##### Markup example

```
<lcHotspotMap>
<figure>
<title/>
<graphic id="hsa-001" infoEntityIdent="ICN-S1000DBIKE-AAA-
DA20000-A-06RT9-00029-A-001-01" reproductionHeight="400pt"
reproductionWidth="400pt">
<hotspot id="hotspot001"
objectCoordinates="150,90,180,90,150,170,180,170">
<lcCorrectResponse lcName="hotspot001"/>
</hotspot>
<hotspot id="hotspot002"
objectCoordinates="200,180,230,180,200,380,230,380">
</hotspot>
<hotspot id="hotspot003"
objectCoordinates="120,50,190,50,120,100,190,100">
```

```

</hotspot>
</graphic>
</figure>
</lcHotspotMap>

```

## 2.4.7 Completion

**Description:** The element `<lcCompletion>` contains the completion type interactions. The completion interaction asks the assessment taker to supply missing information to complete an assessment item. The completion type assessment item is also commonly known as the "fill-in-the-blank" question type.

**Markup element:** `<lcCompletion>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `lcName` (O), the indication of the assessment type. The default value is "`lcCompletion`" in the context of use of the element `<lcCompletion>`.
- `lcValue` (O), the value giving the sequence order of the element `<lcCompletion>`.
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`, the title of the learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- `<lcQuestion>`. Refer to [Para 2.4.1.1](#).
- `<lcAsset>`. Refer to [Para 2.4.1.2](#).
- `<lcAnswerOptionGroup>`. Refer to [Para 2.4.1.3](#).
- `<lcFeedbackItemGroup>`. Refer to [Para 2.4.1.4](#).

### Markup example:

```

<lcCompletion>
<lcQuestion>
<description>
<para>Type the answer that best completes the statement in the
text box, and then click CHECK.</para>
<para>The stem attaches the_____ to the
handlebar.</para>
</description>
</lcQuestion>
<lcAnswerOptionGroup>
<lcAnswerOption>
<lcAnswerOptionContent>
<description>
<para>headset</para>
</description>
</lcAnswerOptionContent>
<lcCorrectResponse />
</lcAnswerOption>

```

```
</lcAnswerOptionGroup>
</lcCompletion>
```

## 2.4.8 Drag and drop

**Description:** The element `<lcDragAndDrop>` contains the drag-and-drop assessment interactions. The drag-and-drop interaction asks the assessment taker to drag related items using the mouse and drop them on designated embedded targets. The response is evaluated according to the match table content model.

### Note

Like the `<lcHotspot>` interaction, the `<lcDragAndDrop>` interaction relies on the `<lcMatchTable>` element to organize matching answer items. The `<lcDragAndDrop>` element is designed to indicate the need for users to complete the interaction by performing mouse selection and dragging of viewable objects to designated interactive drop targets. The drag-and-drop interaction uses matched pairs of `<lcItem>` and `<lcMatchingItem>` elements located within the `<lcMatchTable>` element. The item and matching item pairs provide the mechanisms for determining correct and incorrect answer attempts.

**Markup element:** `<lcDragAndDrop>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<title>`, the title of the learning assessment information. Refer to [Chap 3.9.5.2.1.5](#).
- `<lcQuestion>`. Refer to [Para 2.4.1.1](#).
- `<lcAsset>`. Refer to [Para 2.4.1.2](#).
- `<lcMatchTable>`. Refer to [Para 2.4.5.1](#).
- `<lcFeedbackItemGroup>`. Refer to [Para 2.4.1.4](#).

### Markup example:

```
<lcDragAndDrop>
<title></title>
<lcQuestion>
<description>
<para>Drag the answer options to the matching questions, and
then click CHECK.</para>
</description>
</lcQuestion>

```

## 2.5 Summary

**Description:** The element `<lcSummary>` contains a summary of the learning assessment.

**Markup element:** `<lcSummary>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- [<description>](#), the description of the element in which it is contained. Refer to [Chap 3.9.5.2.2](#).

## 1 General

The schedule Schema is used to capture and represent maintenance planning information but includes key elements to provide additional functionality. It provides the ability to reduce failure by providing a list of operations or checks to be performed for maintaining the Product. The schema can be used for checklist and inspection information such as scheduled inspection and maintenance conditions necessary to keep the equipment in serviceable condition. It includes a special category to identify in what instances the equipment is not ready or usable.

## 2 Checklist information

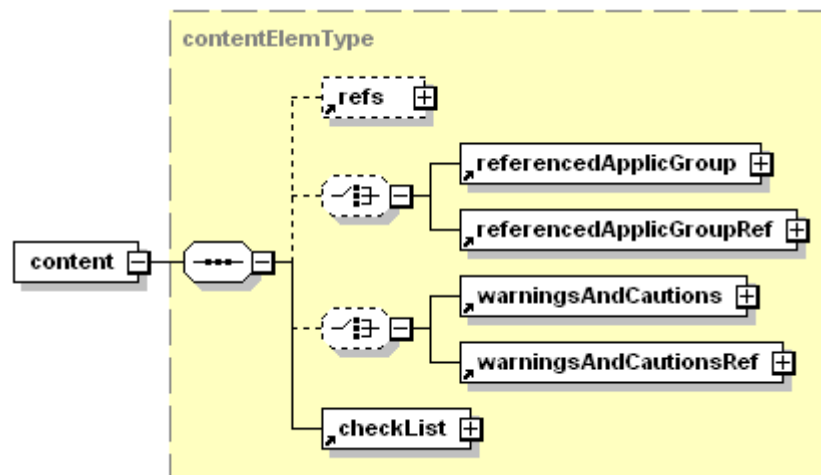

### 2.1 Schema basic rules

This Schema can be used when the maintenance data contains procedural tasks that must be presented with the maintenance data. These procedural tasks are not a full procedure like those contained in a procedural data module.

### 2.2 Content

**Description:** The checklist and maintenance planning Schema is robust enough that it can accommodate many forms of maintenance checklist data. It can be used for items such as Preventive Maintenance Checks and Services (PMCS) table, checking unpacked equipment conditions, preventive maintenance inspection form, and criteria for special inspections to name a few. The paragraphs that follow describe the elements in detail and include markup examples.

**Markup element:** <[content](#)>

ICN-07GB6-00100-001-01

Fig 1 Major elements in maintenance checklist and inspection content

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

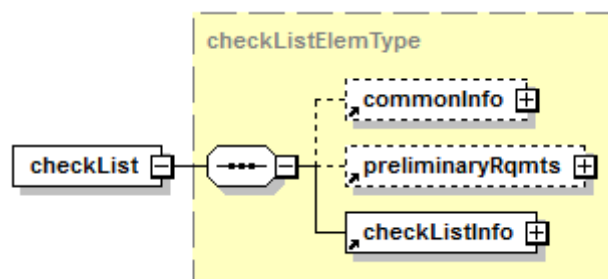

#### Child elements:

- <refs>. Refer to [Chap 3.9.5.2.1.2](#).
- <referencedApplicGroup>. Refer to [Chap 3.9.5.3](#).
- <referencedApplicGroupRef>. Refer to [Chap 3.9.5.3](#).
- <warningsAndCautions>. Refer to [Chap 3.9.3](#).
- <warningsAndCautionsRef>. Refer to [Chap 3.9.3](#).
- <checkList>. Refer to [Para 2.3](#).

## 2.3 Checklist and maintenance planning information

**Description:** The element <checkList> contains the checklist information. For each category identified, an organization or project can establish business rules for which elements to use and/or how to markup checklists for each category type.

**Markup element:** <checkList>

ICN-S3627-S1000D0629-001-01

Fig 2 Element <checklist>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- checkListType (O), the type of checklist
- checkListCategory (O), the type of checklist. The attribute can have one of the following values:
  - "clc01" thru "clc99". Refer to [Chap 3.9.6.1](#).
- worthinessLimit (O), indicates if the task is mandatory or recommended. Refer to [Chap 3.9.5.2.5](#).
- reducedMaint (O), indicates reduced maintenance information. Refer to [Chap 3.9.5.2.5](#).
- skillLevelCode (O), the skill level required to complete the task. Refer to [Chap 3.9.5.2.5](#).
- skillType (O), the category of skill for the task. Refer to [Chap 3.9.5.2.5](#).
- securityClassification (O), commercialClassification (O), and caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

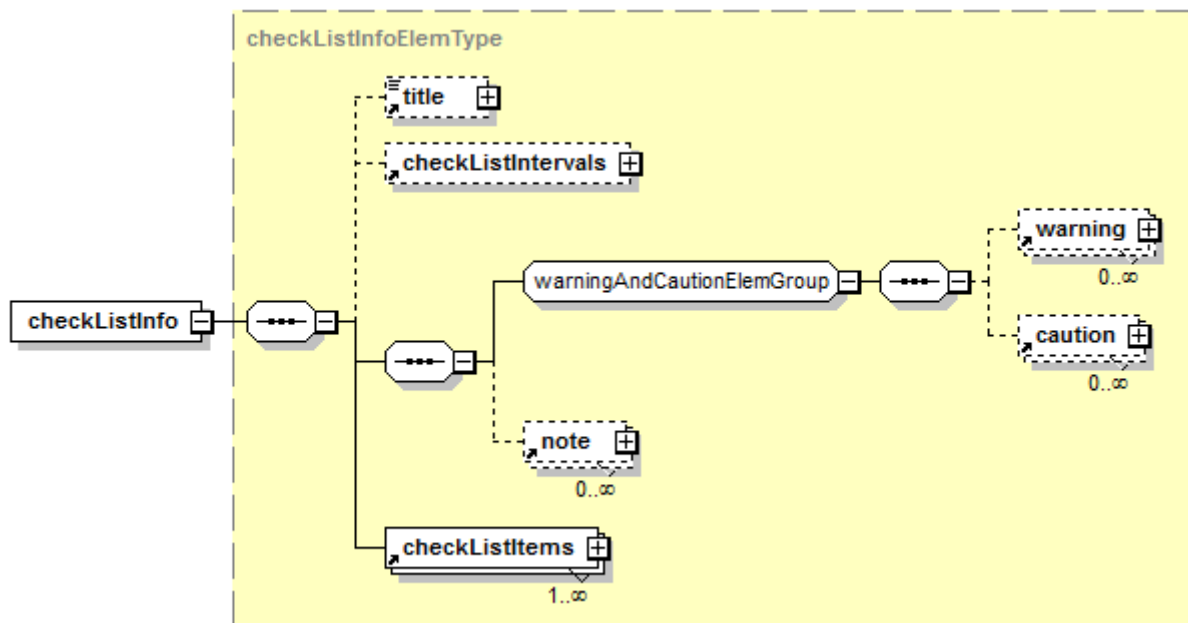

- <commonInfo>. Refer to [Chap 3.9.5.2.1.12](#).
- <preliminaryRqmts>. Refer to [Chap 3.9.5.2.1.9](#).
- <checkListInfo>, contains checklist items. Refer to [Para 2.3.1](#).

### 2.3.1

#### Checklist information

**Description:** The element <checkListInfo> contains information necessary to group the items that create the checklist data.

**Markup element:** <checkListInfo>

ICN-S3627-S1000D0630-001-01

Fig 3 Element <checkListInfo>

**Attributes:**

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- worthinessLimit (O), indicates if the task is mandatory or recommended. Refer to [Chap 3.9.5.2.5](#).
- reducedMaint (O), gives the reduced maintenance information. Refer to [Chap 3.9.5.2.5](#).
- skillLevelCode (O), the skill level required to complete the task. Refer to [Chap 3.9.5.2.5](#).
- skillType (O), the category of skill for the task. Refer to [Chap 3.9.5.2.5](#).
- securityClassification (O), commercialClassification (O), and caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <title>, the title for the element <checkListInfo>. Refer to [Chap 3.9.5.2.1.5](#).
- <checkListIntervals>, the maintenance intervals. Refer to [Para 2.3.1.1](#).
- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <checkListItems>, the items pertinent to the checklist. Refer to [Para 2.3.1.2](#).

## 2.3.1.1

## Checklist intervals

**Description:** The element <checkListIntervals> contains the various maintenance intervals used in an inspection or checklist. These intervals can be used to capture information for use with maintenance interval columns. For example, a table might have a column for 500 hours and a column for 1000 hours. These columns would then have a check mark in the appropriate task row to indicate when the maintenance should be performed.

**Markup element:** <checkListIntervals>

**Attributes:**

- None

**Child elements:**

- <checkListInterval>, used to capture the individual intervals corresponding to the checklist

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

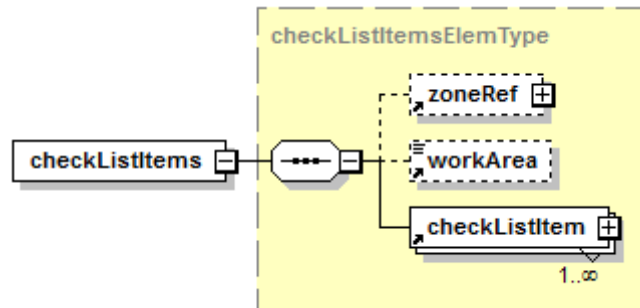

```
<checkListIntervals>
<checkListInterval id="cl01">500 h</checkListInterval>
<checkListInterval id="cl02">1000 h</checkListInterval>
</checkListIntervals>
```

## 2.3.1.2

## Checklist items

**Description:** The element `<checkListItem>` contains one or more individual checklist items (`<checkListItem>`).

**Markup element:** `<checkListItem>`

ICN-S3627-S1000D0631-001-01

Fig 4 Element `<checkListItem>`

**Attributes:**

- None

**Child elements:**

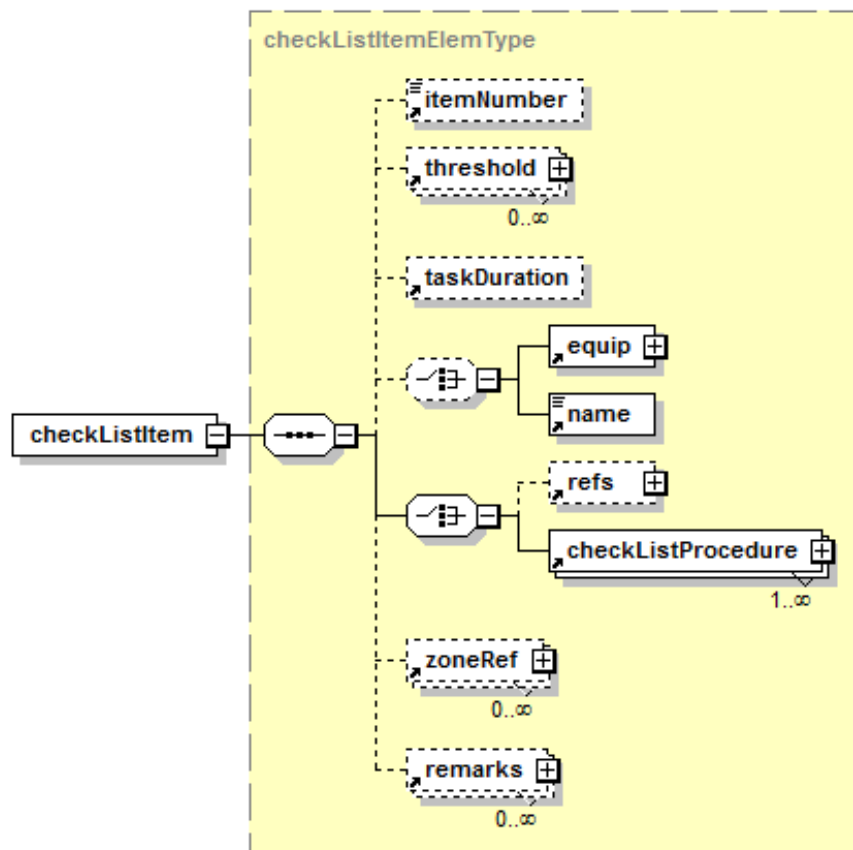

- `<zoneRef>`, the reference to the zone. Refer to [Chap 3.9.5.2.1.10](#).
- `<workArea>`, the descriptive identifier of the area where work is accomplished that cannot be deduced from the names of the collection of zones. Refer to [Chap 3.9.5.2.1.9](#).
- `<checkListItem>`, the individual items. Refer to [Para 2.3.1.3](#).

## 2.3.1.3

## Checklist item

**Description:** The element contains a number of elements used to capture individual items specific for an inspection or maintenance check. The element `<checkListItem>` presents an optional item number, followed by an optional threshold.

**Markup element:** `<checkListItem>`

ICN-S3627-S1000D0632-001-01

Fig 5 Element `<checkListItem>`

#### Attributes:

- None

#### Child elements:

- `<itemNumber>`. Refer to [Para 2.3.1.3.1](#).
- `<threshold>`, the threshold limits. Refer to [Chap 3.9.5.2.5](#).
- `<taskDuration>`, the elapsed time necessary to achieve the maintenance action. Refer to [Chap 3.9.5.2.1.9](#).
- `<equip>`, the identifier for the equipment. Refer to [Chap 3.9.5.2.5](#).
- `<name>`, the name of the equipment. Refer to [Chap 3.9.5.2.1.10](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<checkListProcedure>`, contains an individual procedures pertinent to the checklist. Refer to [Para 2.3.1.3.2](#).
- `<zoneRef>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<checkListItem>
<itemNumber>8</itemNumber>
<threshold thresholdType="interval"
thresholdUnitOfMeasure="th51">
<thresholdValue>After</thresholdValue>
```

```
</threshold>  
</checkListItem>
```

#### 2.3.1.3.1 *Item number*

**Description:** The element `<itemNumber>` is assigned to the checklist item for reference purposes. It is used to identify the line item or the row number for data presented in tabular format.

**Markup element:** `<itemNumber>`

**Attributes:**

- None

**Child elements:**

- None

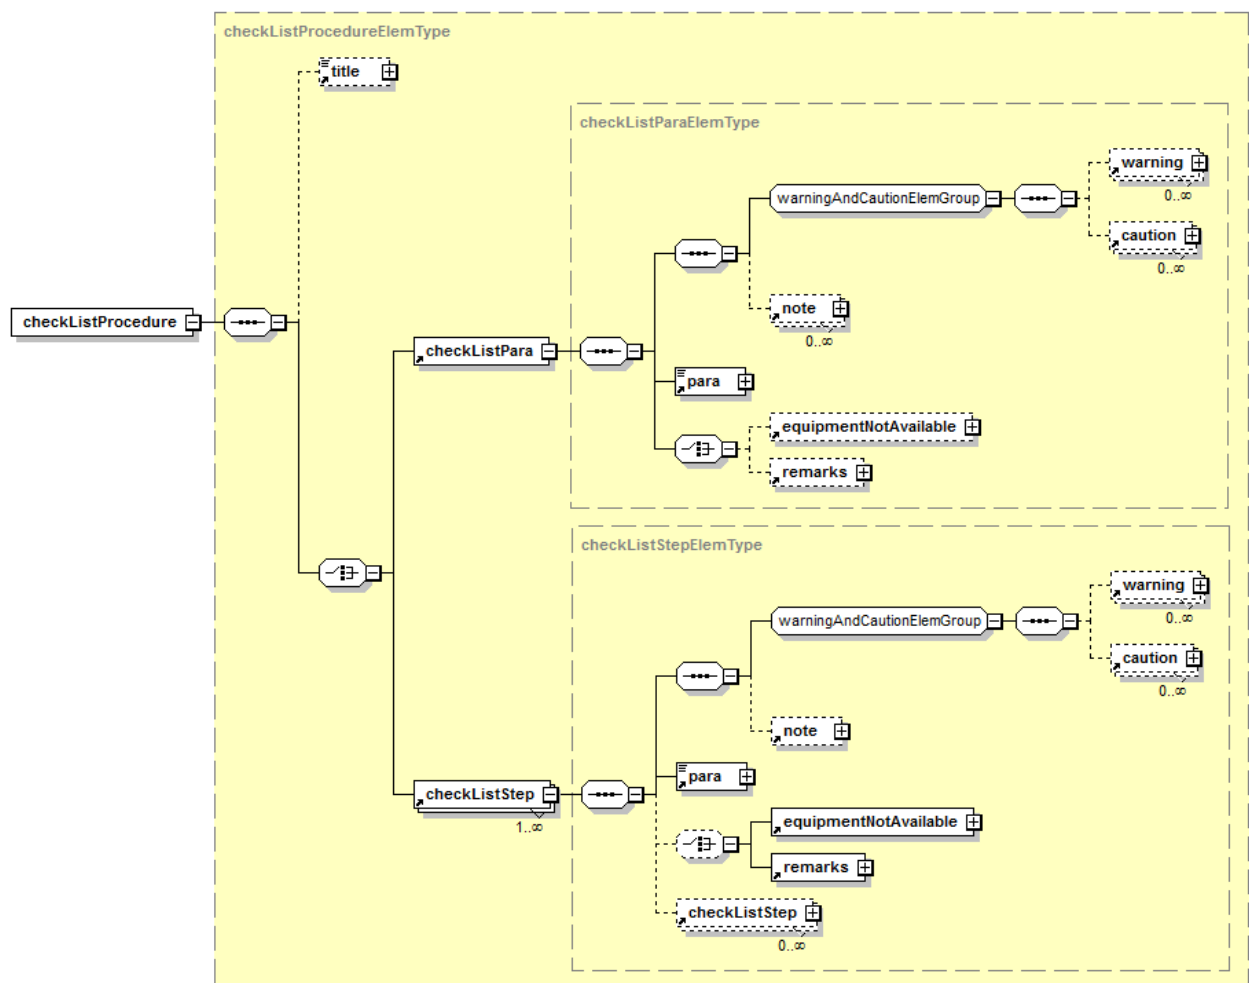

**Markup example:**

```
<itemNumber>8</itemNumber>
```

#### 2.3.1.3.2 *Checklist procedure*

**Description:** The element `<checkListProcedure>` contains a brief description of each check to be performed as well as any information required to accomplish a check or service. This element contains either paragraph text or a series of checklist steps.

**Markup element:** `<checkListProcedure>`

ICN-S3627-S1000D0633-001-01

Fig 6 Element `<checkListProcedure>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `independentCheck` (O), the procedure must be checked by for example a supervisor with a given qualification.
- `skillLevelCode` (O), the skill level required to complete the task. Refer to [Chap 3.9.5.2.5](#).
- `itemCharacteristic` (O), used to indicate characteristics of the item that is the subject of a given procedural step. The attribute can have one or more of the following values:
  - `"ic01"` thru `"ic99"`. Refer to [Chap 3.9.6.1](#).
- `crewMemberType` (O), the crew member type that will perform the procedure. The attribute can have one of the following values:
  - `"cm01"` thru `"cm99"`. Refer to [Chap 3.9.6.1](#).

- safeFlight (O), indicates if the equipment is safe for flight. The attribute can have one of the following values:
  - "0" - No, the equipment is not safe for flight
  - "1" - Yes, the equipment is safe for flight
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), and caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>, the title for the element <checkListProcedure>. Refer to [Chap 3.9.5.2.1.5](#).
- <checkListPara>, checklist paragraph. Refer to [Para 2.3.1.3.3](#).
- <checkListStep>, checklist step. Refer to [Para 2.3.1.3.5](#).

#### Markup example:

```
<checkListProcedure>
<checkListPara>
<para>Aircraft forms and records for recorded
discrepancies</para>
</checkListPara>
</checkListProcedure>
```

#### 2.3.1.3.3 Checklist paragraph

**Description:** The element <checkListPara> contains the statement necessary to indicate which check should be performed, when only one statement is needed.

#### Markup element: <checkListPara>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- independentCheck (O), the paragraph must be checked by for example a supervisor with a given qualification.
- skillLevelCode (O), the skill level required to complete the task. Refer to [Chap 3.9.5.2.5](#). This attribute can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).

- itemCharacteristic (O), used to indicate characteristics of the item that is the subject of a given procedural step. If used, this attribute can have one or more of the following values:
  - "ic01" thru "ic99". Refer to [Chap 3.9.6.1](#).
- crewMemberType (O). Refer to [Para 2.3.1.3.2](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), and caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <equipmentNotAvailable>, defines the condition of equipment. Refer to [Para 2.3.1.3.4](#).
- <remarks>. Refer to [Chap 3.9.5.1](#).

#### 2.3.1.3.4 Equipment not available

**Description:** The element <equipmentNotAvailable> contains the condition of the equipment (shortages, malfunctions, etc) that makes equipment not ready or not available for use. This element is aligned with the checklist item or paragraph for which the equipment not ready/available is applicable. This element includes a required element <para>.

**Markup element:** <equipmentNotAvailable>

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <para>. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<equipmentNotAvailable>
<para>Front hull plug missing</para>
</equipmentNotAvailable>
```

#### 2.3.1.3.5 Checklist step

**Description:** The element <checkListStep> contains the statements

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- independentCheck (O), the step must be checked for example by a supervisor with a given qualification
- skillLevelCode (O), the skill level required for complete procedure. Refer to [Chap 3.9.5.1](#). This attribute can have one of the following values:
  - "sk01" thru "sk99". Refer to [Chap 3.9.6.1](#).
- itemCharacteristic (O), used to indicate characteristics of the item that is the subject of a given procedural step. If used, this attribute can have one or more of the following values:
  - "ic01" thru "ic99". Refer to [Chap 3.9.6.1](#).
- keepWithNext (O), the indication whether a step is presented together with the next step, if possible. This attribute is intended for use only when absolutely necessary in a situation where for example scrolling is not practical for the user or the viewing device does not allow scrolling. This attribute can have one of the following values:
  - "0" (D) - No
  - "1" - Yes, the step is kept with the next sibling step (if one exists) and therefore, all children of the element for which the attribute is set should be kept together as well (if possible). This attribute has no meaning when placed on a final step.
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), and caveat (O), and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <warning>. Refer to [Chap 3.9.3](#).
- <caution>. Refer to [Chap 3.9.3](#).
- <note>. Refer to [Chap 3.9.3](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <equipmentNotAvailable>, the condition of equipment. Refer to [Para 2.3.1.3.4](#).
- <remarks>. Refer to [Chap 3.9.5.1](#).
- <checkListStep>

**Business rule decision point BRDP-S1-00279 - Define maximum number of steps levels in <checkListProcedure>:**

- Projects must decide the maximum number of step levels allowed.

## 3 Examples

This section includes markup examples to demonstrate how the checklist data module can be used to accommodate a variety of maintenance checklist and inspection forms. The examples include only a sampling of the items that can be marked up.

### 3.1 Example 1 - Preventive maintenance inspection form

The first of these examples is a preventive maintenance inspection form. Using the checklist data module, an inspection form can be marked up to identify which items must be inspected for several intervals such as Daily, Intermediate and Periodic. The following markup example demonstrates the use of the element `<checkList>` for this particular type of data. A sample display is included at the end for review purposes only. This does not dictate what it should look like. It is only included here to support the markup structure.

```
<checkList checkListCategory="clc01">
<checkListInfo>
<checkListIntervals>
<checkListInterval id="th51">D</checkListInterval>
<checkListInterval id="th52">I</checkListInterval>
<checkListInterval id="th53">P</checkListInterval>
</checkListIntervals>
<checkListItems>
<workArea>NOSE
AREA</workArea><checkListItem><itemNumber>1.1</itemNumber>
<threshold thresholdType="interval"
thresholdUnitOfMeasure="th51">
<thresholdValue>X</thresholdValue></threshold>
<threshold thresholdType="interval"
thresholdUnitOfMeasure="th52">
<thresholdValue>X</thresholdValue></threshold>
<threshold thresholdType="interval"
thresholdUnitOfMeasure="th53">
<thresholdValue>X</thresholdValue></threshold>
<checkListProcedure>
<checkListPara><para>Aircraft forms and records for recorded
discrepancies</para></checkListPara>
</checkListProcedure>
</checkListItem>
<!-- ... -->
<checkListItem>
<itemNumber>1.4</itemNumber>
<threshold thresholdType="interval"
thresholdUnitOfMeasure="th51">

### 3.2 Example 2 - PMCS data

This example demonstrates how to markup PMCS data. Using the checklist data module, PMCS data can be marked up and published in various formats for use by the maintainer. The following markup example demonstrates the use of the <checkList> element for this particular type of data. A sample display is included at the end for review purposes only. This does not dictate how the data should be presented. It is only serves to help interpret the markup structure.

```
<checkList checkListCategory="clc02">
<checkListInfo>
<checkListItems>
<checkListItem>
<itemNumber>7</itemNumber>
<threshold thresholdType="interval"
thresholdUnitOfMeasure="th02">
<thresholdValue>Before</thresholdValue>
</threshold>
```

```

<equip>
<name>Internal Fire Extinguishers</name>
<catalogSeqNumberRef itemSeqNumberValue="1" figureNumber="01"
item="001"/>
</equip>
<checkListProcedure crewMemberType="cm52">
<checkListStep>

## 1 General

The service bulletin Schema is used to capture and represent service bulletin information. Refer to [Chap 5.2.1.16](#) for Service bulletin information set.

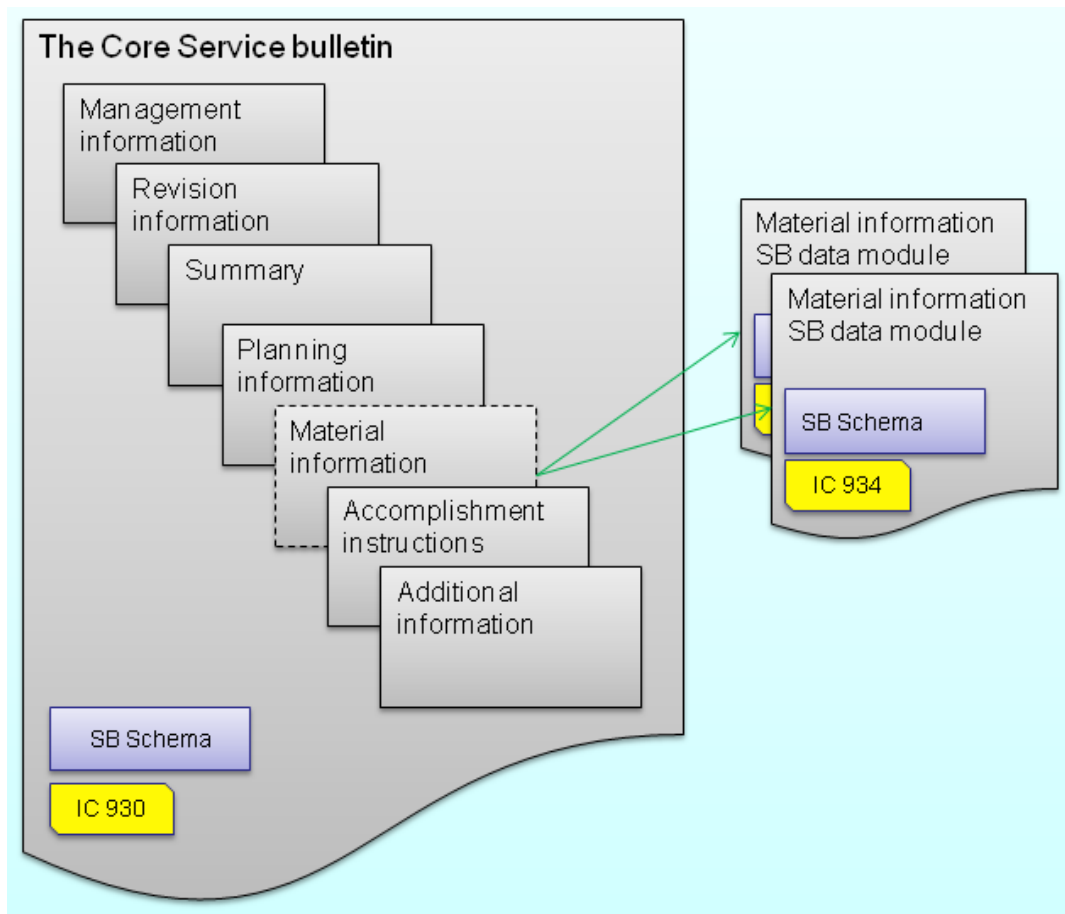

## 2 Service bulletin information

### 2.1 Schema basic rules

The Service bulletin Schema can contain either:

- the main topics of the core service bulletin data module (with IC 930)
- only the material information associated to a core service bulletin data module (with IC 934)

The following figure gives the two usages of the Service bulletin Schema.

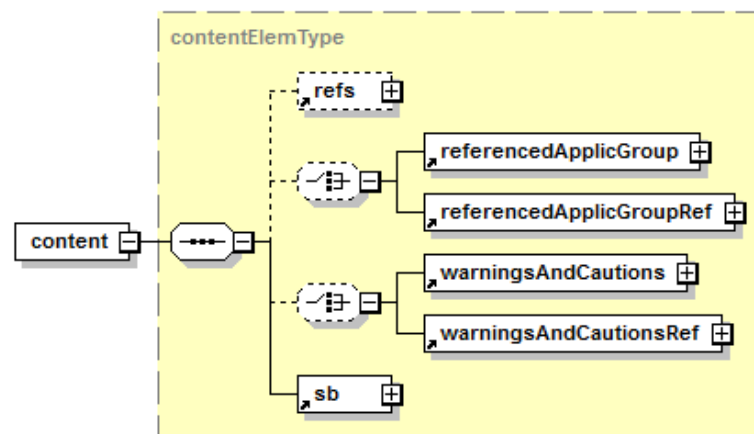

ICN-S1000D-A-03090502-B-FAPE3-00001-A-001-01

Fig 1 The two usages of the Service bulletin Schema

## 2.2 Content

**Description:** The element `<content>` contains the content section of the Service bulletin data module.

**Markup element:** `<content>`

ICN-FAPE3-S1000D0001-A-001-01

Fig 2 Element `<content>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

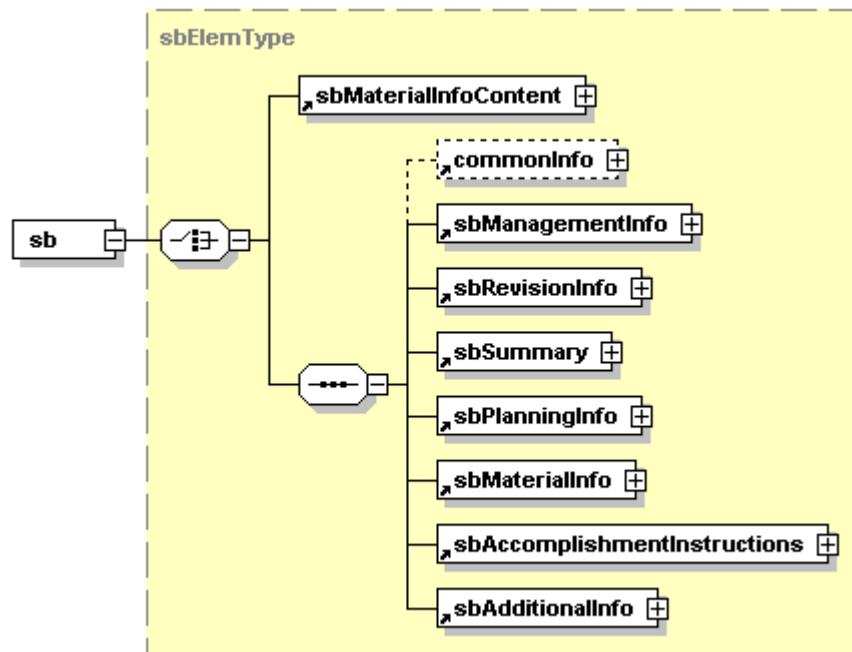

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<warningsAndCautions>`. Refer to [Chap 3.9.3](#).
- `<warningsAndCautionsRef>`. Refer to [Chap 3.9.3](#).
- `<sb>`. Refer to [Para 2.3](#).

## 2.3 Service bulletin

**Description:** The element `<sb>` contains the main topics of a full core Service bulletin or a single material information main topic.

**Markup element:** `<sb>`

ICN-S1000D-A-03090502-B-FAPE3-00003-A-001-01

Fig 3 Element `<sb>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `warningRefs` (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `cautionRefs` (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- `authorityName` (O) and `authorityDocument` (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <sbMaterialInfoContent>, used if the data module contains only material information. Refer to [Para 2.3.1](#).
- <commonInfo>. Refer to [Chap 3.9.5.2.1.12](#).
- <sbManagementInfo>. Refer to [Para 2.3.2](#).
- <sbRevisionInfo>. Refer to [Para 2.3.3](#).
- <sbSummary>. Refer to [Para 2.3.4](#).
- <sbPlanningInfo>. Refer to [Para 2.3.5](#).
- <sbMaterialInfo>. Refer to [Para 2.3.6](#).
- <sbAccomplishmentInstructions>. Refer to [Para 2.3.7](#).
- <sbAdditionalInfo>. Refer to [Para 2.3.8](#).

### 2.3.1 Service bulletin material information

This main topic is dedicated to Service bulletin material information. Refer to [Chap 3.9.5.2.15.2](#).

#### Note

When one or more data modules are dedicated for material information using the element <sbMaterialInfoContent> directly within the element <sb> they must have the IC 934. Refer to default BREX rule BREX-S1-00094. In addition, the Service bulletin core data module must contain references (using the element <refs> in the element <sbMaterialInfo>) to the data modules dedicated for material information.

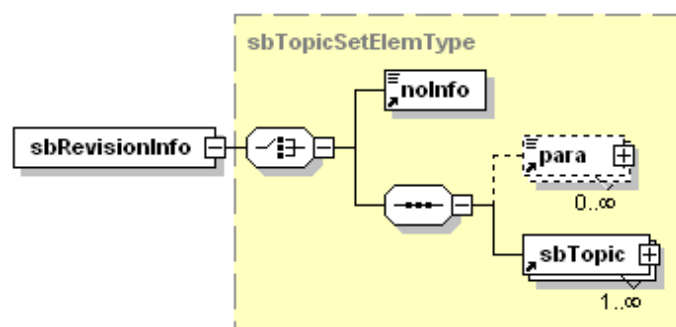

### 2.3.2 Service bulletin management information

This main topic is dedicated to Service bulletin management information. Refer to [Chap 3.9.5.2.15.1](#).

### 2.3.3 Service bulletin revision information

**Description:** The element <sbRevisionInfo> contains the information regarding the reason of the issuance of the current revision of the Service bulletin. It also summarizes the history of previous Service bulletin issues. It is made of topics of descriptive content.

**Markup element:** <sbRevisionInfo>

ICN- S1000D-A-03090502-B-FAPE3-00004-A-001-01

Fig 4 Element <sbRevisionInfo>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Para 2.3.3.1](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<sbTopic>`. Refer to [Para 2.3.3.2](#) and default BREX rule BREX-S1-00095.

#### Note

The attribute sbTopicType of element `<sbTopic>` must be populated in accordance with the main topic where the element `<sbTopic>` is used. In the element `<sbRevisionInfo>` the element `<sbTopic>` has a default value of "sbtt01" for the attribute sbTopicType. The value "sbtt01" is allowed only in this context. Revision information can contain topics with values that can include but are not limited to "sbtt21", "sbtt22", "sbtt23" and "sbtt24".

#### Markup examples:

Revision main topic without information

```
<sbRevisionInfo>
<noInfo>No revision information available</noInfo>
</sbRevisionInfo>
```

Revision main topic with revision information

```
<sbRevisionInfo>
<sbTopic sbTopicType="sbtt21">
<title>Additional Work</title>
<sbTopicContent>
...
</sbTopicContent>
</sbTopic>
<sbTopic sbTopicType="sbtt22">
<title>Reason</title>
<sbTopicContent>
...
</sbTopicContent>
</sbTopic>
<sbTopic sbTopicType="sbtt23">
<title>Revision history</title>
<sbTopicContent>
<para>This document is the first issue of the Service
bulletin</para>
</sbTopicContent>
</sbTopic>
<sbTopic sbTopicType="sbtt24">
<title>Revision sequence</title>
<sbTopicContent>
```

```
<para>Original issue date: April 14th,2010
</para>
</sbTopicContent>
</sbTopic>
</sbRevisionInfo>
```

#### Note

For allowed list of topic types refer to [Para 2.3.3.2](#).

#### 2.3.3.1 No information

**Description:** The element `<noInfo>` contains the marker for no information available in main topics, topics or material in a Service bulletin. Text is allowed to clarify the context where the element `<noInfo>` is used.

**Markup element:** `<noInfo>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

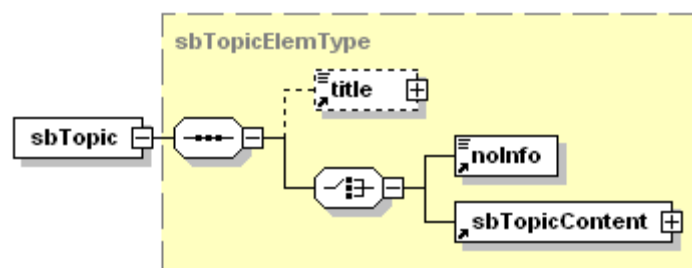

#### Child elements:

- None

#### 2.3.3.2 Service bulletin topic

**Description:** The element `<sbTopic>` contains the necessary information for descriptive Service bulletin main topics (revision information, summary, planning information and additional information).

**Markup element:** `<sbTopic>`

ICN-S1000D-A-03090502-B-FAPE3-00005-A-001-01

Fig 5 Element `<sbTopic>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbTopicType` (M), the topic type. Identifies the different topic types delivered within a Service bulletin. Attribute `sbTopicType` must be populated in accordance with the main topic where the element `<sbTopic>` is used. The attribute can have one of the following values:
  - "sbtt01" thru "sbtt99". Refer to [Chap 3.9.6.1](#) and default BREX rules BREX-S1-00095, BREX-S1-00096, BREX-S1-00097 and BREX-S1-00098.

- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <noInfo>. Refer to [Para 2.3.3.1](#).
- <sbTopicContent>. Refer to [Para 2.3.3.2.1](#).

#### Business rule decision point BRDP-S1-00280 - Use of the attribute sbTopicType in the element <sbTopic> within the element <sbRevisionInfo>:

- Decide which topic types are mandatory, which are optional, and on the sequence in which the corresponding element <sbTopic> must be given in the element <sbRevisionInfo>. Refer to [Chap 3.9.6.1](#).

#### 2.3.3.2.1 Service bulletin topic content

**Description:** The element <sbTopicContent> contains the descriptive content of a Service bulletin topic.

**Markup element:** <sbTopicContent>

The element <sbTopicContent> contains the same attributes and elements as the element <description>. Refer to [Chap 3.9.5.2.2](#).

#### 2.3.4 Service bulletin summary

**Description:** The element <sbSummary> contains the summary of the Service bulletin to give an overview of the purpose and content of the Service bulletin. It is made of topics of descriptive content.

**Markup element:** <sbSummary>

ICN-S1000D-A-03090502-B-FAPE3-00006-A-001-01

Fig 6 Element <sbSummary>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Para 2.3.3.1](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<sbTopic>`. Refer to [Para 2.3.3.2](#) and default BREX rule BREX-S1-00096.

#### Note

The attribute `sbTopicType` of element `<sbTopic>` must be populated in accordance with the main topic where it is used. In the element `<sbSummary>` the element `<sbTopic>` has a default value of "sbtt02" for the attribute `sbTopicType`. The value "sbtt02" is allowed only in this context. Summary can contain topics with values that can include but are not limited to "sbtt05" thru "sbtt09", "sbtt11" and "sbtt17" thru "sbtt20".

#### Business rule decision point BRDP-S1-00281 - Use of the attribute `sbTopicType` in element `<sbTopic>` within the element the element `<sbSummary>`:

- Decide which topic types are mandatory, which are optional, and on the sequence in which the corresponding element `<sbTopic>` must be given in the element `<sbSummary>`. Refer to [Chap 3.9.6.1](#).

#### Markup example:

```
<sbSummary>
<sbTopic sbTopicType="sbtt07">
<title>Reason</title>
<sbTopicContent>
<para>A lot of customers asked for the improvement of the front
hanging in order to use the bike in more severe
conditions.</para>
</sbTopicContent>
</sbTopic>
<sbTopic sbTopicType="sbtt08">
<title>Description</title>
<sbTopicContent>
<para>Replacement of the fork</para>
</sbTopicContent>
</sbTopic>
<sbTopic sbTopicType="sbtt19">
<title>General evaluation</title>
<sbTopicContent>
...
</sbTopicContent>
</sbTopic>
</sbSummary>
```

### 2.3.5 Service bulletin planning information

**Description:** The element `<sbPlanningInfo>` contains the information required to determine if the Service bulletin should be applied and to plan its accomplishment. It is made of topics of descriptive content.

Markup element: `<sbPlanningInfo>`

ICN-S1000D-A-03090502-B-FAPE3-00007-A-001-01

Fig 7 Element `<sbPlanningInfo>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Para 2.3.3.1](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<sbTopic>`. Refer to [Para 2.3.3.2](#) and default BREX rule BREX-S1-00097.

#### Note

The attribute `sbTopicType` of element `<sbTopic>` must be populated in accordance with the main topic where it is used. In the element `<sbPlanningInfo>` the element `<sbTopic>` has a default value of "sbtt03" for the attribute `sbTopicType`. The value "sbtt03" is allowed only in this context. Planning information can contain topics with values that can include but are not limited to "sbtt05" thru "sbtt17".

#### Business rule decision point BRDP-S1-00282 - Use of the attribute `sbTopicType` in the element `<sbTopic>` within the element the element `<sbPlanningInfo>`:

- Decide which topic types are mandatory, which are optional, and on the sequence in which the corresponding element `<sbTopic>` must be given in the element `<sbPlanningInfo>`. Refer to [Chap 3.9.6.1](#).

#### Markup example:

```
<sbPlanningInfo>
  <sbTopic sbTopicType="sbtt05">
    <title>Applicability</title>
    <sbTopicContent>
      ...
    </sbTopicContent>
```

```

</sbTopic>
<sbTopic sbTopicType="sbtt06">
<title>Concurrent Requirements</title>
<noInfo/>

</sbTopicContent>
</sbTopic>
...</sbPlanningInfo>

```

### 2.3.6 Service bulletin material information

**Description:** The element `<sbMaterialInfo>` contains information related to material set or individual material involved in Service bulletin accomplishment. It contains one or more references to data modules dedicated to material when material information is not delivered within the core Service bulletin data module.

**Markup element:** `<sbMaterialInfo>`

ICN-S1000D-A-03090502-B-FAPE3-00008-A-001-01

Fig 8 Element `<sbMaterialInfo>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Para 2.3.3.1](#).
- `<sbMaterialInfoContent>`, the material information needed during Service bulletin accomplishment, when material information is delivered within the Service bulletin core data module. Refer to [Chap 3.9.5.2.15.2](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<refs>`, the references to material dedicated data modules with IC 934 when material information is externalized from Service bulletin core data module. Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

Material information main topic referencing an external Service bulletin data module dedicated to material.

```
<sbMaterialInfo>
<para>To get the required material, refer to</para>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="01" disassyCode="00" disassyCodeVariant="AA"
infoCode="934" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</sbMaterialInfo>
```

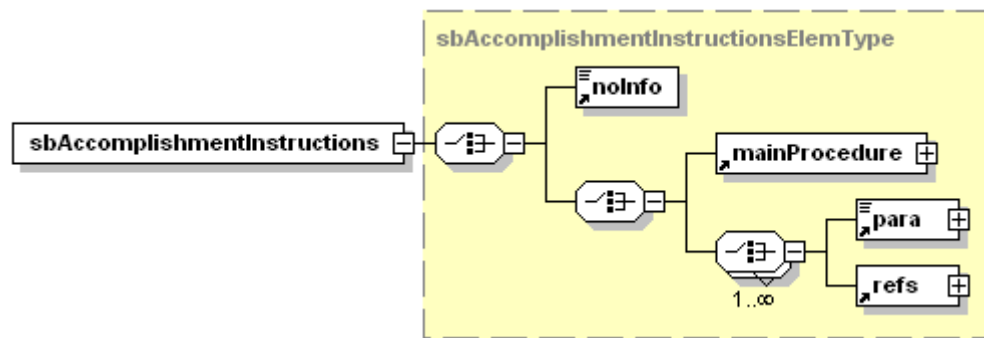

Material information main topic included in the core Service bulletin data module.

```
<sbMaterialInfo>
<sbMaterialInfoContent>
<sbMaterialSetList>
...
</sbMaterialSetList>
<sbSupportEquipsList>
...
</sbSupportEquipsList>
<sbSuppliesList>
...
</sbSuppliesList>
<sbSparesList>
...
</sbSparesList>
<sbRemovedSparesList>
...
</sbRemovedSparesList>
</sbMaterialInfoContent>
</sbMaterialInfo>
```

### 2.3.7 Service bulletin accomplishment instructions

**Description:** The element [<sbAccomplishmentInstructions>](#) contains references to procedural data modules supporting the description of step-by-step instructions. For very simple Service bulletin, it contains the detailed step-by-step instructions to do the work.

**Markup element:** [<sbAccomplishmentInstructions>](#)

ICN-S1000D-A-03090502-B-FAPE3-00009-A-001-01

Fig 9 Element `<sbAccomplishmentInstructions>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Para 2.3.3.1](#).
- `<mainProcedure>`, the detailed instruction for simple Service bulletin. Refer to [Chap 3.9.5.2.3](#).

#### Note

The element `<mainProcedure>` in the Service bulletin data module is similar to the same element found in procedural data modules. However, it contains the element `<para>`, which throughout the Service bulletin data module uses the same `textElementGroup` as in the descriptive data module. Refer to [Chap 3.9.5.2.1.10](#).

- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<refs>`, the references to procedural data modules supporting step-by-step instructions. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

Accomplishment instructions main topic referencing an external procedural data module dedicated to step-by-step instruction.

```
<sbAccomplishmentInstructions>
<para>To accomplish the step-by-step instructions, refer
to</para>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"

### 2.3.8 Service bulletin additional information

**Description:** The element `<sbAdditionalInfo>` contains the additional information to support the procedures or instructions that are in the Service bulletin. It is made of topics of descriptive content.

**Markup element:** `<sbAdditionalInfo>`

ICN-S1000D-A-03090502-B-FAPE3-00010-A-001-01

Fig 10 Element `<sbAdditionalInfo>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Para 2.3.3.1](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<sbTopic>`. Refer to [Para 2.3.3.2](#) and default BREX rule BREX-S1-00098.

#### Note

The attribute `sbTopicType` of element `<sbTopic>` must be populated in accordance with the main topic where it is used. In the element `<sbAdditionalInfo>` the element `<sbTopic>` has a default value of

"sbtt04" for the attribute `sbTopicType`. The value "sbtt04" is allowed only in this context. Additional information can contain topics with other values.

**Business rule decision point BRDP-S1-00283 - Use of the attribute `sbTopicType` in the element `<sbTopic>` within the element `<sbAdditionalInfo>`:**

- Decide which topic types are mandatory, which are optional, and on the sequence in which the corresponding element `<sbTopic>` must be given in the element `<sbAdditionalInfo>`. Refer to [Chap 3.9.6.1](#).

**Markup example:**

```
<sbAdditionalInfo>
<sbTopic sbTopicType="sbtt04">
<title>Additional information linked to the saw tool used in the
Service bulletin</title>
<sbTopicContent>
...
</sbTopicContent>
</sbTopic>
</sbAdditionalInfo>
```

## 1 General

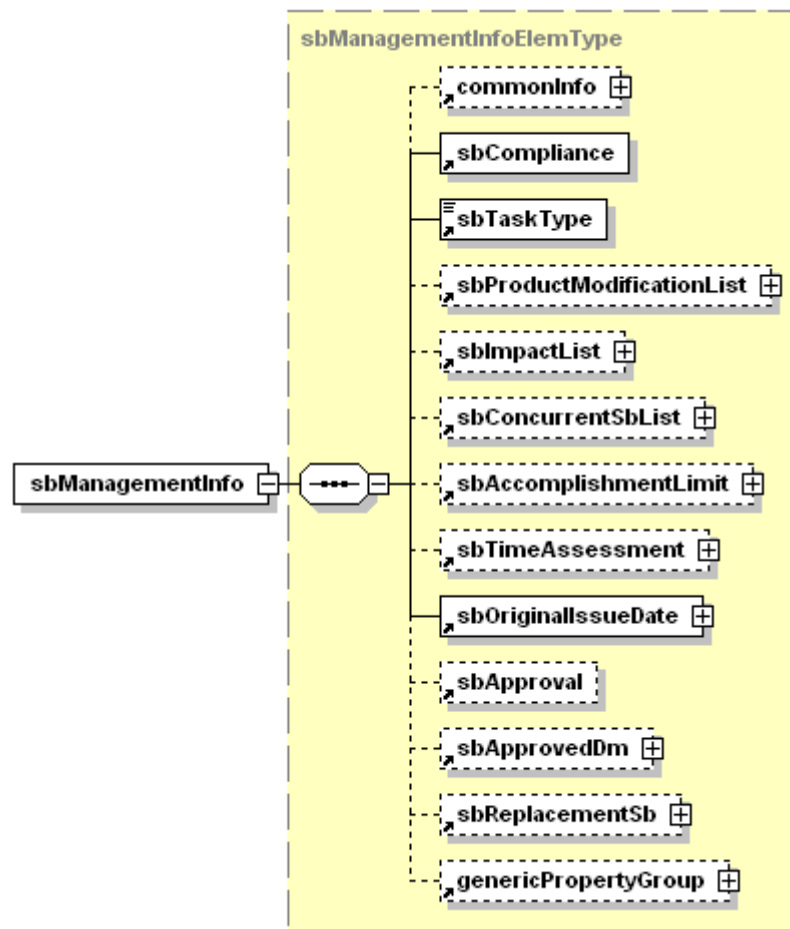

The Service bulletin management information main topic summarizes major Service bulletin characteristic or properties in a structured and retrievable form.

It is included within the core Service bulletin data module using the element <sbManagementInfo> accessible in the element <sb>. Refer to [Chap 3.9.5.2.15](#).

## 2 Service bulletin management information

**Description:** The element <sbManagementInfo> contains the metadata related to the Service bulletin management. It contains information that can be easily retrieved by IT tool and useful for user in order to help him to decide if and when to apply the Service bulletin.

**Markup element:** <sbManagementInfo>

ICN-S1000D-A-03090502-B-FAPE3-00016-A-001-01

Fig 1 Element *<sbManagementInfo>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<commonInfo>*. Refer to [Chap 3.9.5.2.1.12](#).
- *<sbCompliance>*. Refer to [Para 2.1](#).
- *<sbTaskType>*. Refer to [Para 2.2](#).
- *<sbProductModificationList>*. Refer to [Para 2.3](#).
- *<sbImpactList>*. Refer to [Para 2.4](#).
- *<sbConcurrentSbList>*. Refer to [Para 2.5](#).
- *<sbAccomplishmentLimit>*. Refer to [Para 2.6](#).
- *<sbTimeAssessment>*. Refer to [Para 2.7](#).

- `<sbOriginalIssueDate>`. Refer to [Para 2.8](#).
- `<sbApproval>`. Refer to [Para 2.9](#).
- `<sbApprovedDm>`. Refer to [Para 2.10](#).
- `<sbReplacementSb>`. Refer to [Para 2.11](#).
- `<genericPropertyGroup>`. Refer to [Para 2.12](#).

**Markup example:**

```
<sbManagementInfo>
<sbCompliance sbComplianceCategory="sbcc03"/>
<sbTaskType sbTaskCategory="sbtc01"/>
<sbOriginalIssueDate>
<issueDate year="2010" month="04" day="07"/>
</sbOriginalIssueDate>
</sbManagementInfo>
```

## 2.1 Compliance category

**Description:** The element `<sbCompliance>` contains the Service bulletin compliance category.

**Markup element:** `<sbCompliance>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbComplianceCategory` (M), the compliance category of the Service bulletin. The attribute can have one of the following values:
  - "sbcc01" thru "sbcc99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Markup example:**

```
<sbCompliance sbComplianceCategory="sbcc04"/>
```

**Note**

`sbComplianceCategory="sbcc04"` is defined as "Optional".

## 2.2 Service bulletin task type

**Description:** The element `<sbTaskType>` gives the main type of activity the Service bulletin describes.

**Markup element:** `<sbTaskType>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbTaskCategory` (M), the task type category of the Service bulletin. The attribute can have one of the following values:
  - "sbtc01" thru "sbtc99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Markup example:**

```
<sbTaskType sbTaskCategory="sbtc01"/>
```

**Note**

sbTaskCategory="sbtc01" is defined as "modification".

## 2.3 List of product modifications

**Description:** The element `<sbProductModificationList>` contains the list of the manufacturer's internal tracking numbers for product changes that are being described in the Service bulletin.

**Markup element:** `<sbProductModificationList>`

ICN-S1000D-A-03090502-B-FAPE3-00017-A-001-01

Fig 2 Element `<sbProductModificationList>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbProductModification>`. Refer to [Para 2.3.1](#).

**Markup example:**

```
<sbProductModificationList>
<sbProductModification applicRefId="app-0002"
sbModificationIdent="A2001"
sbModificationClassification="major">Installation of telescopic
fork with 140mm clearance</sbProductModification>
<sbProductModification applicRefId="app-0003"
sbModificationIdent="A2002"
sbModificationClassification="major">Installation of telescopic
fork with 100mm clearance</sbProductModification>
</sbProductModificationList>
```

### 2.3.1 Product modification

**Description:** The element `<sbProductModification>` contains the identifier of a "design change" defined by the manufacturer of the product and installed by the Service bulletin. The description of the design change can also be given.

**Markup element:** `<sbProductModification>`

**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbModificationIdent` (O), the design change or modification identifier
- `sbModificationClassification` (O), the classification of the modification. The attribute can have one of the following values:
  - "minor" - a change classified as minor
  - "major" - a change classified as major

**Note**

A "minor" change is one that has no appreciable effect on mass, balance, structural strength, reliability, operational characteristics, noise, fuel venting, exhaust emission or other characteristics affecting the operation of the product classified as minor. All changes other than "minor" are "major" changes.

**Child elements:**

- None

## 2.4

### Impacts list

**Description:** The element `<sbImpactList>` contains a list of impacts of accomplishment of the Service bulletin on the product.

**Markup element:** `<sbImpactList>`

ICN-S1000D-A-03090502-B-FAPE3-00018-A-001-01

Fig 3 Element `<sbImpactList>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbImpact>`. Refer to [Para 0](#).

**Markup example:**

```

<sbImpactList>
  <sbImpact applicRefId="app-0002" sbImpactType="sbit01">

```

```

<quantity quantityType="qty08">
<quantityGroup>
<quantityValue quantityUnitOfMeasure="kg">+0.5</quantityValue>
<quantityValue quantityUnitOfMeasure="lbm">+1.1</quantityValue>
</quantityGroup>
</quantity>
</sbImpact>
<sbImpact applicRefId="app-0003" sbImpactType="sbit01">
<quantity quantityType="qty08">
<quantityGroup>
<quantityValue quantityUnitOfMeasure="kg">+0.8</quantityValue>
<quantityValue quantityUnitOfMeasure="lbm">+1.7</quantityValue>
</quantityGroup>
</quantity>
</sbImpact>
</sbImpactList>

```

#### Note

sbImpactType="sbit01" is defined as "Weight".

quantityType="qty08" is defined as "Mass".

### 2.4.1

#### Service bulletin impact

**Description:** The element `<sbImpact>` contains the description and quantifies an impact of the Service bulletin on a specific product characteristic. The presence of the element `<sbImpact>` with an attribute sbImpactType means that the Service bulletin has a significant impact on the product, for instance impact on the product weight.

**Markup element:** `<sbImpact>`

ICN-S1000D-A-03090502-B-FAPE3-00019-A-001-01

Fig 4 Element `<sbImpact>`

#### Attributes:

- applicRefId (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sbImpactType (M), the type of the impact. The attribute can have one of the following values:
  - "sbit01" thru "sbit99". Refer to [Chap 3.9.6.1](#).

#### Child elements:

- `<quantity>`, the physical value of the impact. The child element `<quantityValue>` contains a numeric value and can contain a "+" or "-" sign as a textual content to indicate the positive or negative impact of a given type. Refer to [Chap 3.9.5.2.1.10](#).

## 2.5 List of concurrent Service bulletins

**Description:** The element `<sbConcurrentSbList>` contains the list of Service bulletins (and associated product modification) that must be accomplished before or simultaneously with the current one and a list of Service bulletins (and associated product modification) that must not be accomplished before the current one, based on applicability.

**Markup element:** `<sbConcurrentSbList>`

ICN-S1000D-A-03090502-B-FAPE3-00020-A-001-01

Fig 5 Element `<sbConcurrentSbList>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

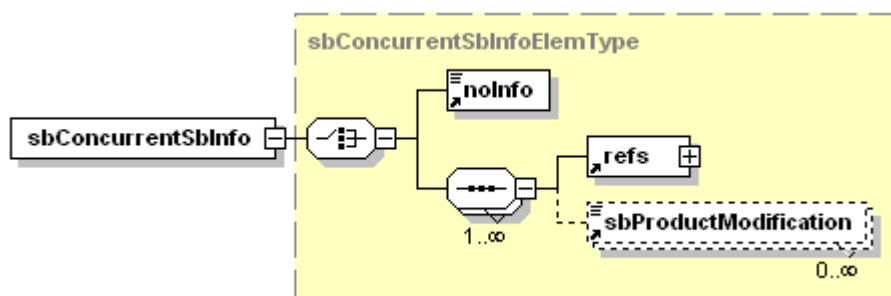

### Child elements:

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbConcurrentSbInfo>`. Refer to [Para 2.5.1](#).

## 2.5.1 Concurrent Service bulletin information

**Description:** The element `<sbConcurrentSbInfo>` contains the information about the Service bulletin and product modification that must be accomplished (or not) before or simultaneously with the current one.

**Markup element:** `<sbConcurrentSbInfo>`

ICN-S1000D-A-03090502-B-FAPE3-00021-A-001-01

Fig 6 Element `<sbConcurrentSbInfo>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- sbConcurrentStatus (M), indicates when and if the list of referenced Service bulletin must be accomplished with current Service bulletin. The attribute can have one of the following values:
  - "previousOrParallel" - the referenced Service bulletin must be done before or simultaneously with the current one
  - "previous" - the referenced Service bulletin must be done before the current one
  - "notPrevious" - the referenced Service bulletin must not have been done before the current one

#### Child elements:

- <noInfo>. Refer to [Chap 3.9.5.2.15](#).
- <refs>, the reference to the concurrent Service bulletin. Refer to [Chap 3.9.5.2.1.2](#).
- <sbProductModification>, any optional product modification reference. Refer to [Para 2.3.1](#).

#### Markup example:

```
<sbConcurrentSbInfo applicRefId="app-0001"
sbConcurrentStatus="previous">
  <refs>
    <dmRef>
      <dmRefIdent>
        <dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="02" disassyCode="00" disassyCodeVariant="AA"
infoCode="930" infoCodeVariant="A" itemLocationCode="A"/>
      </dmRefIdent>
    </dmRef>
  </refs>
</sbConcurrentSbInfo>
```

## 2.6 Accomplishment limit

**Description:** The element <sbAccomplishmentLimit> contains information on accomplishment time limit recommendation for the Service bulletin.

**Markup element:** <sbAccomplishmentLimit>

ICN-S1000D-A-03090502-B-FAPE3-00022-A-001-01

Fig 7 Element <sbAccomplishmentLimit>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

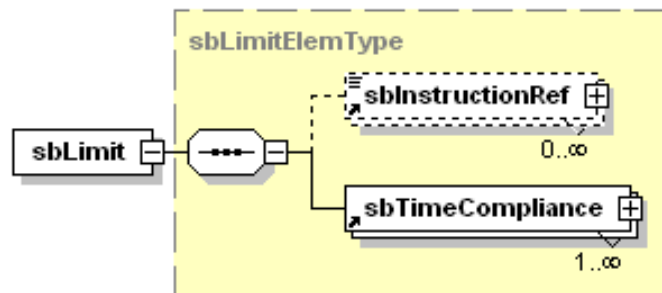

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbLimit>`. Refer to [Para 2.6.1](#).

### 2.6.1

#### Service bulletin limit

**Description:** The element `<sbLimit>` contains necessary information related to interval, threshold, and time limit to take into account when scheduling the Service bulletin accomplishment, based on applicability.

**Markup element:** `<sbLimit>`

ICN-S1000D-A-03090502-B-FAPE3-00023-A-001-01

Fig 8 Element `<sbLimit>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<sbInstructionRef>`. Refer to [Para 2.6.1.1](#).
- `<sbTimeCompliance>`. Refer to [Para 2.6.1.2](#).

#### Markup example:

```
<sbLimit applicRefId="app-0001">
  <sbInstructionRef>
    <refs>...
  </refs>
</sbInstructionRef>
  <sbTimeCompliance sbTimeComplianceType="sbtct01">
    <limit limitTypeValue="po">
      <threshold thresholdUnitOfMeasure="th02">
        <thresholdValue>1000</thresholdValue>
      </threshold>
    </limit>
  </sbTimeCompliance>
  <sbTimeCompliance sbTimeComplianceType="sbtct02">
    <limit limitTypeValue="po">
      <threshold thresholdUnitOfMeasure="th03">
        <thresholdValue>3</thresholdValue>
      </threshold>
    </limit>
  </sbTimeCompliance>
</sbLimit>
```

```

</threshold>
<remarks><simplePara>After issuance of the Service
bulletin</simplePara></remarks>
</limit>
</sbTimeCompliance>
</sbLimit>

```

#### Note

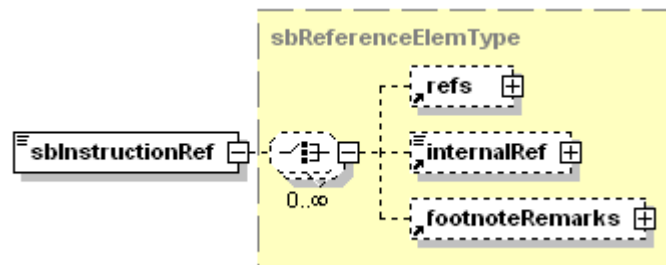

sbTimeComplianceType="sbtc01" is defined as "Basic limit".

sbTimeComplianceType="sbtc02" is defined as "Grace period".

#### 2.6.1.1 Instruction reference

**Description:** The element `<sbInstructionRef>` contains the work to be performed as a first step of the Service bulletin by referring to either an external procedure or an internal instruction in accomplishment instruction.

**Markup element:** `<sbInstructionRef>`

ICN-S1000D-A-03090502-B-FAPE3-00024-A-001-01

Fig 9 Element `<sbInstructionRef>`

#### Attributes:

- applicRefId (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.6.1.2 Time compliance

**Description:** The element `<sbTimeCompliance>` contains the limit to accomplish the Service bulletin (basic limit, grace period, repetitive interval).

**Markup element:** `<sbTimeCompliance>`

ICN-S1000D-A-03090502-B-FAPE3-00025-A-001-01

Fig 10 Element `<sbTimeCompliance>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbTimeComplianceType` (M), the type of compliance time. The attribute can have one of the following values:
  - `"sbtct01"` thru `"sbtct99"`. Refer to [Chap 3.9.6.1](#).
    - When used with the basic limit type `"sbtct01"`, the element `<sbTimeCompliance>` contains the threshold or trigger not to exceed for the accomplishment of the Service bulletin. The element `<limit>` defined in scheduled maintenance context is used to provide this information. The attribute `limitTypeValue` set to `"po"` must be used to indicate that the work has to be done once. Refer to default BREX rule BREX-S1-00099.
    - When used with the grace period type `"sbtct02"`, the element `<sbTimeCompliance>` contains an additional limit relative to the issuance of the Service bulletin. That is necessary when the basic limit is too short regarding the in-service life of the product at the issuance of the Service bulletin. This additional limit gives the customer enough time to organize the Service bulletin embodiment. The attribute `limitTypeValue` set to `"po"` must be used to indicate that the work has to be done once. Refer to default BREX rule BREX-S1-00100. The element `<sbTimeCompliance>` with attribute `sbTimeComplianceType` set to `"sbtct01"` and `"sbtct02"` must be taken into account whichever comes later.
    - When used with the repetitive interval type `"sbtct03"`, the element `<sbTimeCompliance>` contains the repetitive interval not to exceed to repeat accomplishment of the Service bulletin. The element `<sbTimeCompliance>` contains the element `<limit>` whose attribute `limitTypeValue="pe"` must be used to express a periodic accomplishment. Refer to default BREX rule BREX-S1-00101.

#### Child elements:

- `<limit>`. Contains the information required to determine when a Service bulletin must be performed. Refer to [Chap 3.9.5.2.5](#).

#### Markup examples:

Basic limit type

```
<sbTimeCompliance sbTimeComplianceType="sbtct01">
  <limit limitTypeValue="po">
    <threshold thresholdUnitOfMeasure="th02">
```

```
<thresholdValue>1000</thresholdValue>
</threshold>
</limit>
</sbTimeCompliance>
```

#### Grace period type

```
<sbTimeCompliance sbTimeComplianceType="sbtct02">
<limit limitTypeValue="po">
<threshold thresholdUnitOfMeasure="th03">
<thresholdValue>3</thresholdValue>
</threshold>
<remarks><simplePara>After issuance of the Service
bulletin</simplePara></remarks>
</limit>
</sbTimeCompliance>
```

#### Repetitive interval type

```
<sbTimeCompliance sbTimeComplianceType="sbtct03">
<limit limitTypeValue="pe">
<threshold thresholdUnitOfMeasure="th02">
<thresholdValue>200</thresholdValue>
</threshold>
</limit>
</sbTimeCompliance>
```

#### Note

sbTimeComplianceType="sbtct01" is defined as "Basic limit".

sbTimeComplianceType="sbtct02" is defined as "Grace period".

sbTimeComplianceType="sbtct03" is defined as "Repetitive interval".

limitTypeValue="po" is defined as "Perform once".

limitTypeValue="pe" is defined as "Perform periodically".

thresholdUnitOfMeasure="th02" is defined as "Flight cycles".

thresholdUnitOfMeasure="th03" is defined as "Months".

## 2.7 Time assessment

**Description:** The element <sbTimeAssessment> contains the time information (duration, elapsed time) necessary to perform the Service bulletin. Time information is related to the different product configurations described in within the Service bulletin.

**Markup element:** <sbTimeAssessment>

ICN-S1000D-A-03090502-B-FAPE3-00026-A-001-01

Fig 11 Element &lt;sbTimeAssessment&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

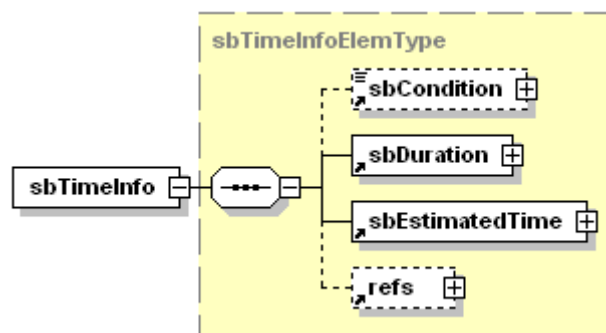

- <noInfo>. Refer to [Chap 3.9.5.2.15](#).
- <sbTimeInfo>. Refer to [Para 2.7.1](#).

### 2.7.1

#### Time information

**Description:** The element <sbTimeInfo> contains the time information like duration and elapsed time, based on applicability and task to perform.

**Markup element:** <sbTimeInfo>

ICN-S1000D-A-03090502-B-FAPE3-00027-A-001-01

Fig 12 Element &lt;sbTimeInfo&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sbAggregationLevelFlag (O), indicates whether the duration and workload represent the sum up of duration and workload of all referenced procedure from the current Service bulletin. The attribute can have one of the following values:
  - "1" - Yes, the duration and workload represent the sum up of duration and workload of all referenced procedure from the current Service bulletin

- "0" - No, the duration and workload do not represent the sum up of duration and workload of all referenced procedure from the current Service bulletin

#### Child elements:

- `<sbCondition>`, the reference to different options to complete the Service bulletin. Refer to [Para 2.7.1.1](#).
- `<sbDuration>`. Refer to [Para 2.7.1.2](#).
- `<sbEstimatedTime>`. Refer to [Para 2.7.1.3](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<sbTimeInfo applicRefId="app-0003" sbAggregationLevelFlag="1">
  <sbCondition>
    <refs>
      <dmRef>
        <dmRefIdent>
          <dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
            systemCode="D00" subSystemCode="0" subSubSystemCode="0"
            assyCode="01" disassyCode="00" disassyCodeVariant="AA"
            infoCode="933" infoCodeVariant="A" itemLocationCode="A"/>
        </dmRefIdent>
      </dmRef>
    </refs>
  </sbCondition>
  <sbDuration>
    <quantity quantityType="qty04">
      <quantityGroup>
        <quantityValue quantityUnitOfMeasure="h">3.0</quantityValue>
      </quantityGroup>
    </quantity>
  </sbDuration>
  <sbEstimatedTime>
    <quantity quantityType="qty04">
      <quantityGroup>
        <quantityValue quantityUnitOfMeasure="h">5.0</quantityValue>
      </quantityGroup>
    </quantity>
  </sbEstimatedTime>
</sbTimeInfo>
```

#### Note

In the example here above, if the task set (IC 933) referenced in the element `<sbCondition>` requires two people who work together simultaneously for two hours followed by another person who works alone for one hour to complete the task set, the element `<sbDuration>` would contain 3,0 h (hours) and the element `<sbEstimatedTime>` would contain 5,0 h (man-hours).

The attribute `sbAggregationLevelFlag` set to "1" indicates that duration and estimated time of any referenced procedure are included in these figures.

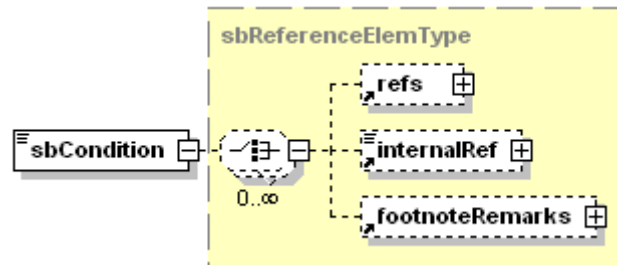

`quantityType="qty04"` is defined as "Time".

## 2.7.1.1

## Condition

**Description:** The element `<sbCondition>` contains the different options to complete the Service bulletin and return to service by referring to procedures or task set.

**Markup element:** `<sbCondition>`

ICN-S1000D-A-03090502-B-FAPE3-00028-A-001-01

Fig 13 Element `<sbCondition>`
**Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<sbCondition>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="01" disassyCode="00" disassyCodeVariant="AA"
infoCode="933" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</sbCondition>
```

## 2.7.1.2

## Duration

**Description:** The element `<sbDuration>` contains the elapsed time for performing the actions specified to complete the whole Service bulletin or to complete a Service bulletin task set.

The duration must be given in hours or days with maximum one decimal (eg, 2,4 h or 1,5 d).

**Markup element:** `<sbDuration>`

ICN-S1000D-A-03090502-B-FAPE3-00029-A-001-01

Fig 14 Element &lt;sbDuration&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- <quantity>. Refer to [Chap 3.9.5.2.1.10](#).

The attribute quantityUnitOfMeasure of the element <quantityValue> or the element <quantityGroup> must be filled with the values "h" for hours or "d" for days. Refer to default BREX rule BREX-S1-00102.

#### Markup example:

```
<sbDuration>
<quantity quantityType="qty04">
<quantityGroup>
<quantityValue quantityUnitOfMeasure="h">1.5</quantityValue>
</quantityGroup></quantity>
</sbDuration>
```

#### Note

quantityType="qty04" is defined as "Time".

#### 2.7.1.3

#### Estimated time

**Description:** The element <sbEstimatedTime> contains the estimated aggregated time to complete the whole Service bulletin or to complete a task set. Refer to <estimatedTime>, [Chap 3.9.5.2.1.9](#).

The estimated time must be given in man-hours with maximum one decimal (eg, 14,5 h).

**Markup element:** <sbEstimatedTime>

ICN-S1000D-A-03090502-B-FAPE3-00030-A-001-01

Fig 15 Element &lt;sbEstimatedTime&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- [<quantity>](#). Refer to [Chap 3.9.5.2.1.10](#).

The attribute quantityUnitOfMeasure of the element [<quantityValue>](#) or the element [<quantityGroup>](#) must be filled with the values "h" for (man-)hours. Refer to default BREX rule BREX-S1-00103.

#### Markup example:

```
<sbEstimatedTime>
<quantity quantityType="qty04">
<quantityGroup>
<quantityValue quantityUnitOfMeasure="h">1.5</quantityValue>
</quantityGroup>
</quantity>
</sbEstimatedTime>
```

#### Note

quantityType="[qty04](#)" is defined as "Time".

## 2.8

### Original issue date

**Description:** The element [<sbOriginalIssueDate>](#) contains the first issue date of the Service bulletin.

**Markup element:** [<sbOriginalIssueDate>](#)

ICN-S1000D-A-03090502-B-FAPE3-00031-A-001-01

Fig 16 Element [<sbOriginalIssueDate>](#)

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- [<issueDate>](#), the first issue date of the Service bulletin. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<sbOriginalIssueDate>
<issueDate year="2011" month="03" day="31"/>
</sbOriginalIssueDate>
```

## 2.9 Service bulletin approval

**Description:** The element `<sbApproval>` contains the approval identifier given by manufacturer approval authorities (eg, EASA, FAA).

**Markup element:** `<sbApproval>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbApprovalIdent` (M), the approval identifier given by manufacturer approval authorities

**Child elements:**

- None

**Markup example:**

```
<sbApproval sbApprovalIdent="EASA.21J.031" />
```

## 2.10 Service bulletin approved data modules

**Description:** The element `<sbApprovedDm>` contains the list of data modules approved in the frame of the current Service bulletin.

**Markup element:** `<sbApprovedDm>`

ICN-S1000D-A-03090502-B-FAPE3-00032-A-001-01

Fig 17 Element `<sbApprovedDm>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<refs>`, the references to approved data modules. Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<sbApprovedDm>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="01" disassyCode="00" disassyCodeVariant="AA"
```

```

infoCode="933" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="001" inWork="00"/>
</dmRefIdent>
</dmRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="3" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="01" disassyCode="00" disassyCodeVariant="AB"
infoCode="720" infoCodeVariant="A" itemLocationCode="A"/>
<issueInfo issueNumber="001" inWork="00"/>
</dmRefIdent>
</dmRef>
...
</refs>
</sbApprovedDm>

```

## 2.11 Service bulletin replacement

**Description:** The element [<sbReplacementSb>](#) contains the information about the Service bulletin that can replace the current one.

**Markup element:** [<sbReplacementSb>](#)

ICN-S1000D-A-03090502-B-FAPE3-00033-A-001-01

Fig 18 Element [<sbReplacementSb>](#)

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- [<noInfo>](#). Refer to [Chap 3.9.5.2.15](#).
- [<refs>](#), the references to a replacement Service bulletin. Refer to [Chap 3.9.5.2.1.2](#).

### Markup example:

```
<sbReplacementSb>
<refs>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="02" disassyCode="00" disassyCodeVariant="AA"
infoCode="930" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</refs>
</sbReplacementSb>
```

## 2.12 Generic property group

**Description:** The element `<genericPropertyGroup>` contains list of properties associated to the product or part of the product that are interesting to provide to the end user.

**Markup element:** `<genericPropertyGroup>`

ICN-S1000D-A-03090502-B-FAPE3-00034-A-001-01

Fig 19 Element `<genericPropertyGroup>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<genericProperty>`, a single property of the product or part of the product. Refer to [Para 2.12.1](#).

### 2.12.1 Generic property

**Description:** The element `<genericProperty>` contains a single property associated to the product.

**Markup element:** `<genericProperty>`

### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `genericPropertyType` (M), the type of the property. The attribute can have on of the following values:

- "gpt01" thru "gpt99". Refer to [Chap 3.9.6.1](#).

The use of the different values allowed for the attribute `genericPropertyType` depends on the context where the element `<genericPropertyGroup>` is present.

- `genericPropertyFlag` (O), indicates whether the generic property is applicable. The attribute can have one of the following values:
  - "1" - True, the generic property is applicable.
  - "0" - False, the generic property is not applicable.

#### Child elements:

- None

#### Markup example:

```
<genericPropertyGroup>
<genericProperty genericPropertyType="gpt01"
genericPropertyFlag="1"/>
<genericProperty genericPropertyType="gpt04"
genericPropertyFlag="1"/>
<genericProperty genericPropertyType="gpt06"
genericPropertyFlag="1"/>
</genericPropertyGroup>
```

#### Note

`genericPropertyType="gpt01"` is defined as "Passenger comfort affected".

`genericPropertyType="gpt04"` is defined as "Structural life extension".

`genericPropertyType="gpt06"` is defined as "Product operation affected".

## 1 General

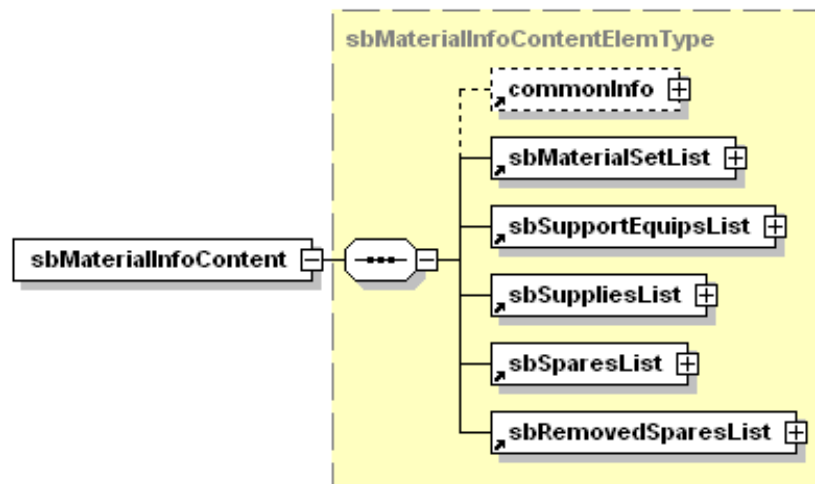

The service bulletin material information can be either:

- included within the core service bulletin data module using the element `<sbMaterialInfoContent>`, child of `<sbMaterialInfo>`. Refer to [Chap 3.9.5.2.15](#). Refer to [Para 2](#) for the content model description.
- a separate data module using the element `<sbMaterialInfoContent>` from the element `<sb>` of the Service bulletin Schema. Refer to [Para 2](#).

## 2 Service bulletin material information content

**Description:** The element `<sbMaterialInfoContent>` contains any information related to material involved in Service bulletin accomplishment.

**Markup element:** `<sbMaterialInfoContent>`

ICN-S1000D-A-03090502-B-FAPE3-00038-A-001-01

Fig 1 Element `<sbMaterialInfoContent>`

**Attributes:**

- None

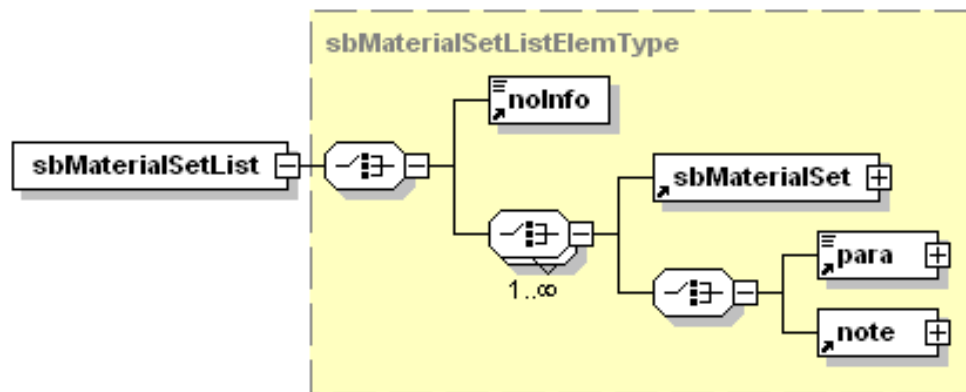

**Child elements:**

- `<commonInfo>`. Refer to [Chap 3.9.5.2.1.12](#).
- `<sbMaterialSetList>`. Refer to [Para 2.1](#).
- `<sbSupportEquipsList>`. Refer to [Para 2.2](#).
- `<sbSuppliesList>`. Refer to [Para 2.3](#).
- `<sbSparesList>`. Refer to [Para 2.4](#).
- `<sbRemovedSparesList>`. Refer to [Para 2.5](#).

### 2.1 List of material sets

**Description:** The element `<sbMaterialSetList>` contains the list of material (set, individual or external) involved in the Service bulletin. This topic provides a single place where to define the full list of references to material applicable to a set of product.

**Markup element:** `<sbMaterialSetList>`

ICN-S1000D-A-03090502-B-FAPE3-00039-A-001-01

Fig 2 Element &lt;sbMaterialSetList&gt;

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

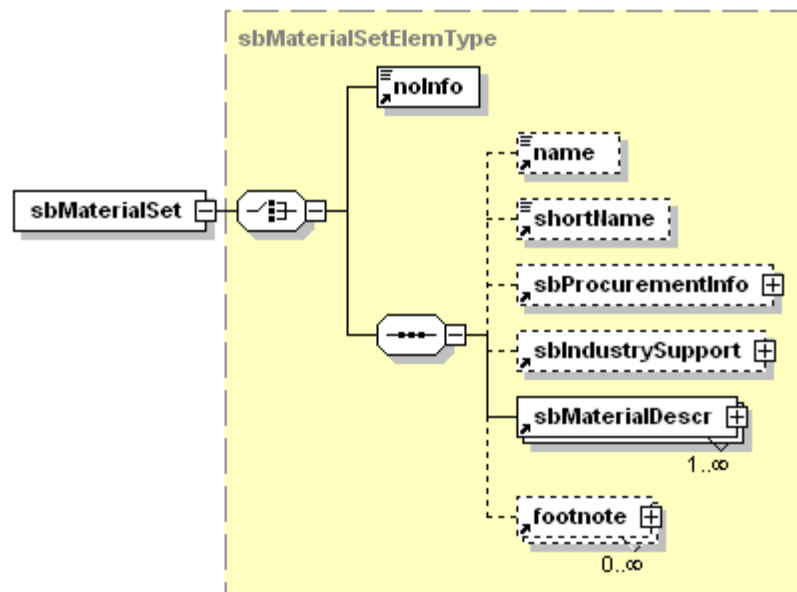

- <noInfo>. Refer to [Chap 3.9.5.2.15](#).
- <sbMaterialSet>. Refer to [Para 2.1.1](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <note>. Refer to [Chap 3.9.3](#).

### 2.1.1

#### Material set

**Description:** The element <sbMaterialSet> lists the references and quantity to any kind of set of material applicable to a set of product and involved in Service bulletin accomplishment.

**Markup element:** <sbMaterialSet>

ICN-S1000D-A-03090502-B-FAPE3-00040-A-001-01

Fig 3 Element &lt;sbMaterialSet&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sbMaterialType (O), the type of material used in the Service bulletin. The attribute can have one of the following values:
  - "sbmt01" thru "sbmt99". Refer to [Chap 3.9.6.1](#).
- sbMaterialIdent (O), the identifier of the set of material set references
- sbMaterialIssue (O), the issue of the set of material set references
- sbProcurableFlag (O), whether the set of material is procurable. The attribute can have one of the following values:
  - "0" - No, the set of material or individual material is not procurable.
  - "1" - Yes, the set of material or individual material is procurable.
- sbSupplierValue (O), the supplier of set or individual set. The attribute can have one of the following values:
  - "manufacturer" - the set of material or individual material is provided by the responsible partner company of the Service bulletin
  - "supplier" - the set of material or individual material is provided by a supplier different from the responsible partner company of the Service bulletin
  - "any" - the set of material or individual material can be provided by any suppliers
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<name>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<shortName>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<sbProcurementInfo>`. Refer to [Para 2.1.1.1](#).
- `<sbIndustrySupport>`. Refer to [Para 2.1.1.2](#).
- `<sbMaterialDescr>`. Refer to [Para 2.1.1.3](#).
- `<footnote>`. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

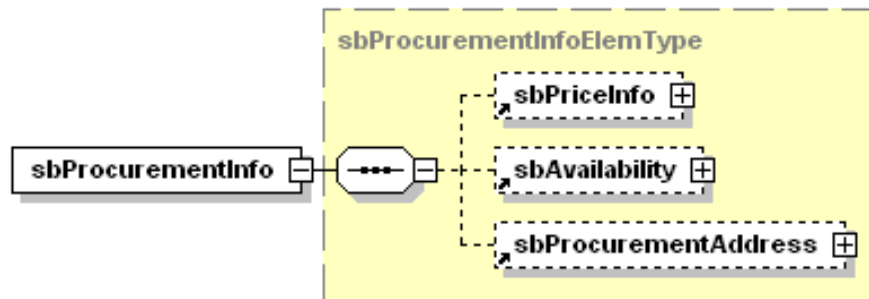

```
<sbMaterialSet>
  <sbMaterialDescr>
    <sbMaterialSetRef>
      <internalRef internalRefId="mat-0001"
        internalRefTargetType="irtt15"/>
    </sbMaterialSetRef>
    <reqQuantity unitOfMeasure="EA">1</reqQuantity>
  </sbMaterialDescr>
  <sbMaterialDescr>
    <sbMaterialSetRef>
      <internalRef internalRefId="mat-0002"
        internalRefTargetType="irtt15">Supply</internalRef>
    </sbMaterialSetRef>
  </sbMaterialDescr>
  <sbMaterialDescr>
    <sbMaterialSetRef>
      <internalRef internalRefId="mat-0003"
        internalRefTargetType="irtt15"/>
    </sbMaterialSetRef>
    <reqQuantity unitOfMeasure="EA">1</reqQuantity>
  </sbMaterialDescr>
  <sbMaterialDescr>
    <sbMaterialSetRef>
      <internalRef internalRefId="mat-0005"
        internalRefTargetType="irtt15">Removed spare set</internalRef>
    </sbMaterialSetRef>
  </sbMaterialDescr>
  <sbMaterialDescr>
    <sbMaterialSetRef>
      <internalRef internalRefId="mat-0007"
        internalRefTargetType="irtt15">Modified spare</internalRef>
    </sbMaterialSetRef>
  </sbMaterialDescr>
</sbMaterialSet>
```

## 2.1.1.1

## Procurement information

**Description:** The element `<sbProcurementInfo>` contains information about price, availability and procurement address of the element it is attached to.

**Markup element:** `<sbProcurementInfo>`

ICN-S1000D-A-03090502-B-FAPE3-00041-A-001-01

Fig 4 Element `<sbProcurementInfo>`

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<sbPriceInfo>`. Refer to [Para 2.1.1.1.1](#).
- `<sbAvailability>`. Refer to [Para 2.1.1.1.2](#).
- `<sbProcurementAddress>`. Refer to [Para 2.1.1.1.3](#).

**Business rule decision point BRDP-S1-00287 - Use of the element**

`<sbProcurementInfo>` in the element `<sbMaterialSet>`, the element `<sbSupportEquipSet>`, the element `<sbIndividualSupportEquip>`, the element `<sbSupplySet>`, the element: `<sbIndividualSupply>`, the element `<sbSpareSet>` and the element `<sbIndividualSpare>`:

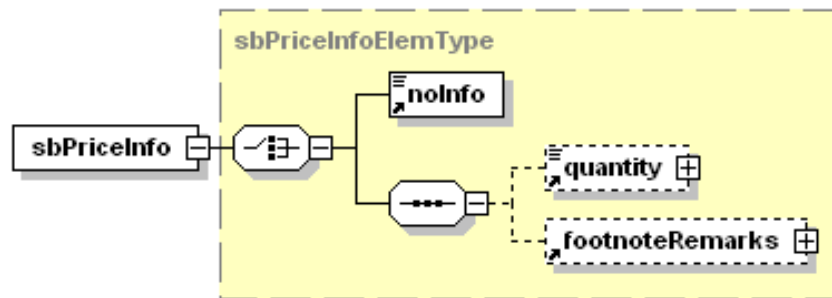

- Decide whether the use of the element `<sbProcurementInfo>` is allowed within
  - the element `<sbMaterialSet>`
  - the definitions of individual material sets (ie, `<sbSupportEquipSet>`, `<sbSupplySet>` and `<sbSpareSet>`)
  - the definitions of individual spares, supplies and support equipment (ie, `<sbIndividualSupportEquip>`, `<sbIndividualSupply>` and `<sbIndividualSpare>`)

## 2.1.1.1.1

## Price information

**Description:** The element `<sbPriceInfo>` contains the cost of the material set or individual material.

**Markup element:** `<sbPriceInfo>`

ICN-S1000D-A-03090502-B-FAPE3-00042-A-001-01

Fig 5 Element *<sbPriceInfo>*

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- *<noInfo>*. Refer to [Chap 3.9.5.2.15](#).
- *<quantity>*, the price of material expressed with currency. Refer to [Chap 3.9.5.2.1.10](#).
- *<footnoteRemarks>*. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<sbPriceInfo>
<quantity quantityType="qty02"
quantityTypeSpecifics="USD">150</quantity>
</sbPriceInfo>
```

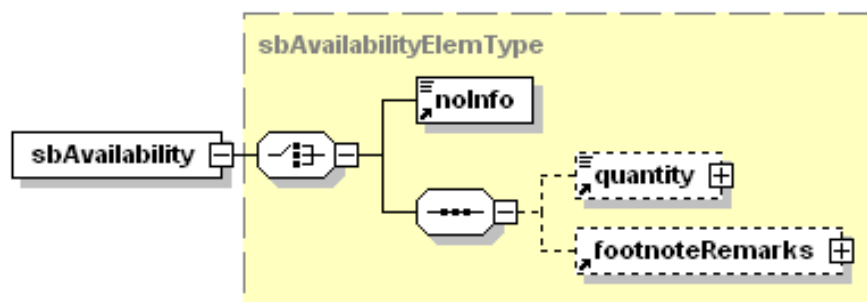

**Note**

quantityType="qty02" is defined as "Price".

2.1.1.1.2 *Availability*

**Description:** The element *<sbAvailability>* contains the lead time necessary to get the material set or individual material.

**Markup element:** *<sbAvailability>*

ICN-S1000D-A-03090502-B-FAPE3-00043-A-001-01

Fig 6 Element *<sbAvailability>*

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

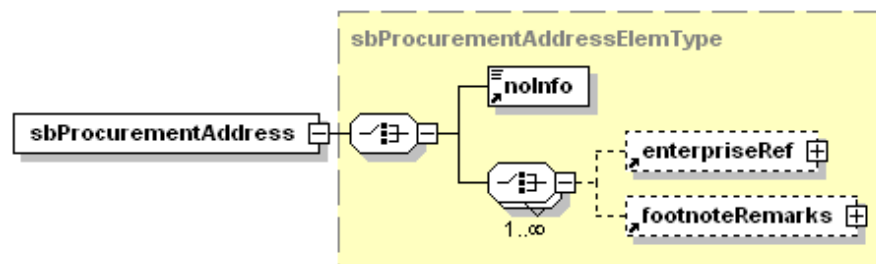

#### Child elements:

- <noInfo>. Refer to [Chap 3.9.5.2.15](#).
- <quantity>, the number of days or months to get the material. Refer to [Chap 3.9.5.2.1.10](#).
- <footnoteRemarks>. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.1.1.1.3 Procurement addresses

**Description:** The element <sbProcurementAddress> contains information where to procure the material.

**Markup element:** <sbProcurementAddress>

ICN-S1000D-A-03090502-B-FAPE3-00044-A-001-01

Fig 7 Element <sbProcurementAddress>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

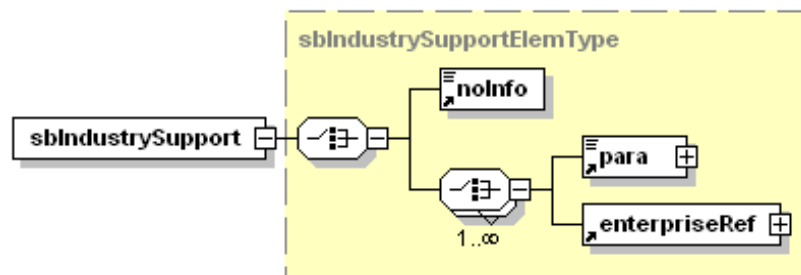

#### Child elements:

- <noInfo>. Refer to [Chap 3.9.5.2.15](#).
- <enterpriseRef>, the address where to procure the material or reference to the enterprise information CIR. Refer to [Chap 3.9.5.2.11.6](#).
- <footnoteRemarks>. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.1.1.2 Industry support

**Description:** The element <sbIndustrySupport> contains the information about any special assistance provided by the Service bulletin manufacturer (ie, information about a product retrofit campaign).

**Markup element:** <sbIndustrySupport>

ICN-S1000D-A-03090502-B-FAPE3-00046-A-001-01

Fig 8 Element *<sbIndustrySupport>*

#### Attributes:

- applicRefId (O), the applicability information by referencing the element *<applic>*. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- *<noInfo>*. Refer to [Chap 3.9.5.2.15](#).
- *<para>*. Refer to [Chap 3.9.5.2.1.10](#).
- *<enterpriseRef>*, the address where to procure the material or reference to the enterprise information CIR. Refer to [Chap 3.9.5.2.11.6](#).

#### Business rule decision point BRDP-S1-00288 - Use of the element

*<sbIndustrySupport>* in the element *<sbMaterialSet>*, the element *<sbSupportEquipSet>*, the element *<sbIndividualSupportEquip>*, the element *<sbSupplySet>*, the element *<sbIndividualSupply>*, the element *<sbSpareSet>*, the element *<sbIndividualSpare>*, the element *<sbRemovedSpareSet>*, the element *<sbIndividualRemovedSpare>*:

- Decide whether the use of the element *<sbIndustrySupport>* is allowed within
  - the element *<sbMaterialSet>*
  - the definitions of individual material sets (ie, *<sbSupportEquipSet>*, *<sbSupplySet>*, *<sbSpareSet>* and *<sbRemovedSpareSet>*)
  - the definitions of individual spares, supplies, support equipment and removed spares (ie, *<sbIndividualSupportEquip>*, *<sbIndividualSupply>*, *<sbIndividualSpare>* and *<sbIndividualRemovedSpare>*)

#### Markup example:

```
<sbIndustrySupport>
<para>Technical support can be requested at:</para>
<enterpriseRef manufacturerCodeValue="KZ666">
<name>World-Bike</name>
```

```

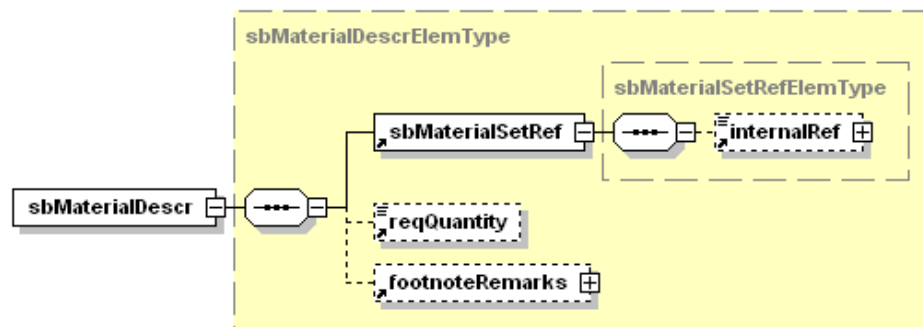

<businessUnit>
<businessUnitName>Customer support</businessUnitName>
<businessUnitAddress>
<street>100, Bike Street</street>
<city>London</city>
<country>UK</country>
</businessUnitAddress>
</businessUnit>
</enterpriseRef>
</sbIndustrySupport>

```

### 2.1.1.3 Material description

**Description:** The element `<sbMaterialDescr>` contains the reference to a material set or to an individual material or to an external material set necessary to accomplish the Service bulletin for a given applicability.

**Markup element:** `<sbMaterialDescr>`

ICN-S1000D-A-03090502-B-FAPE3-00047-A-001-01

Fig 9 Element `<sbMaterialDescr>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<sbMaterialSetRef>`. Refer to [Para 2.1.1.3.1](#).
- `<reqQuantity>`, the required quantity of the referenced material set in the current set of references. Refer to [Chap 3.9.5.2.1.9](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<sbMaterialDescr>
<sbMaterialSetRef>
<internalRef internalRefId="mat-0003"
internalRefTargetType="irtt15"/>
</sbMaterialSetRef>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</sbMaterialDescr>
```

**Note**

internalRefTargetType="irtt15" is defined as " Service bulletin material set, support equipment set, supply set, spare set or removed spare set (including individual and external material)".

2.1.1.3.1 *Material set reference*

**Description:** The element `<sbMaterialSetRef>` contains a reference to the definition of a material set. The reference can be made of any type of material set.

**Markup element:** `<sbMaterialSetRef>`

**Attributes:**

- applicRefId (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sbMaterialType (O), the type of the referenced material set in the Service bulletin. The attribute can have one of the following values:
  - "sbmt01" thru "sbmt99". Refer to [Chap 3.9.6.1](#).
- sbMaterialIdent (O), the identifier of the referenced material set
- sbMaterialIssue (O), the issue of the referenced material set
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<internalRef>`, the cross-reference to the set of material. Refer to [Chap 3.9.5.2.1.2](#).

**Markup example:**

```
<sbMaterialSetRef><internalRef internalRefId="mat-0004"
internalRefTargetType="irtt15"/>
</sbMaterialSetRef>
```

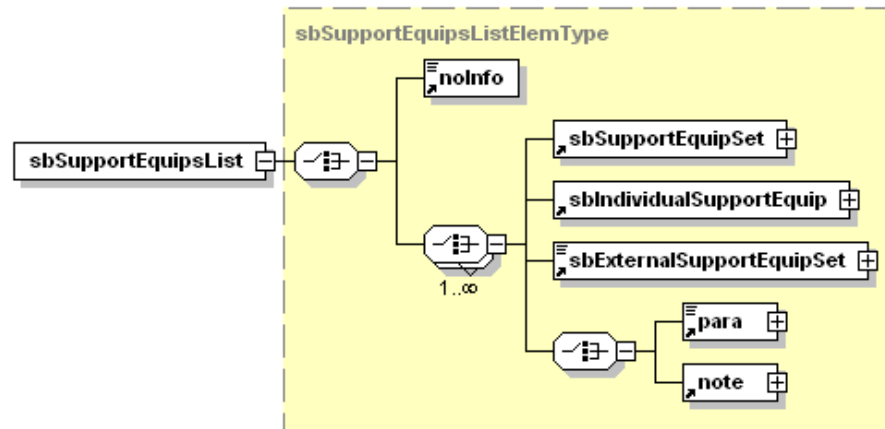

**Note**

internalRefTargetType="irtt15" is defined as " Service bulletin material set, support equipment set, supply set, spare set or removed spare set (including individual and external material)".

## 2.2 List of support equipment

**Description:** The element `<sbSupportEquipsList>` contains the list of support equipment (set, individual, external) involved in the Service bulletin.

**Markup element:** `<sbSupportEquipsList>`

ICN-S1000D-A-03090502-B-FAPE3-00048-A-001-01

Fig 10 Element `<sbSupportEquipsList>`

### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

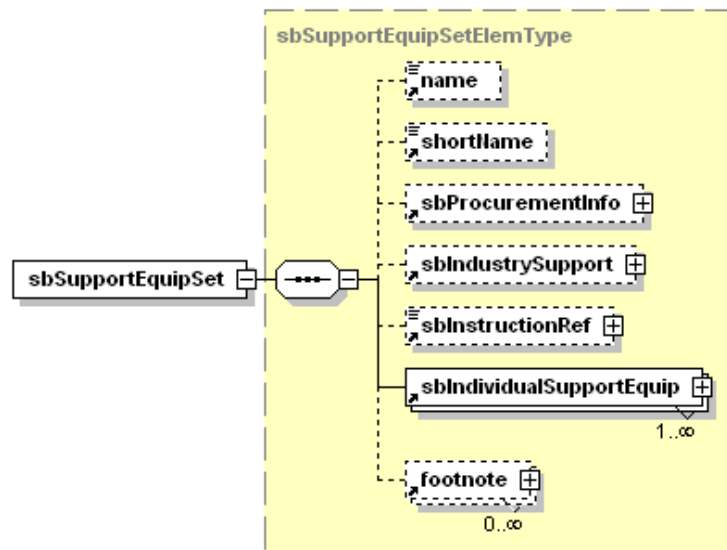

### Child elements:

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbSupportEquipSet>`. Refer to [Para 2.2.1](#).
- `<sbIndividualSupportEquip>`. Refer to [Para 2.2.2](#).
- `<sbExternalSupportEquipSet>`. Refer to [Para 2.2.3](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).

### 2.2.1 Support equipment set

**Description:** The element `<sbSupportEquipSet>` contains the information about support equipment grouped by set and involved in the Service bulletin.

**Markup element:** `<sbSupportEquipSet>`

ICN-S1000D-A-03090502-B-FAPE3-00049-A-001-01

Fig 11 Element *<sbSupportEquipSet>*

#### Attributes:

- The attributes and business rules are the same as for the element *<sbMaterialSet>*. Refer to [Para 2.1.1](#).

#### Child elements:

- *<name>*. Refer to [Chap 3.9.5.2.1.9](#).
- *<shortName>*. Refer to [Chap 3.9.5.2.1.9](#).
- *<sbProcurementInfo>*. Refer to [Para 2.1.1.1](#).
- *<sbIndustrySupport>*. Refer to [Para 2.1.1.2](#).
- *<sbInstructionRef>*. Refer to [Chap 3.9.5.2.15.1](#).
- *<sbIndividualSupportEquip>*. Refer to [Para 2.2.2](#).
- *<footnote>*. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<sbSupportEquipSet id="mat-0001" sbMaterialType="sbmt01"
sbMaterialIdent="BSK-TLST-200" sbMaterialIssue="001"
sbProcurableFlag="1" sbSupplierValue="manufacturer">
  <name>Saw tool set</name>
  <sbProcurementInfo>
    ...
  </sbProcurementInfo>
  <sbIndustrySupport>
    ...
  </sbIndustrySupport>
  <sbIndividualSupportEquip sbMaterialType="sbmt01">
    ...
  </sbIndividualSupportEquip>
  <sbIndividualSupportEquip sbMaterialType="sbmt01">
    ...
  </sbIndividualSupportEquip>
</sbSupportEquipSet>
```

```
</sbIndividualSupportEquip>
</sbSupportEquipSet>
```

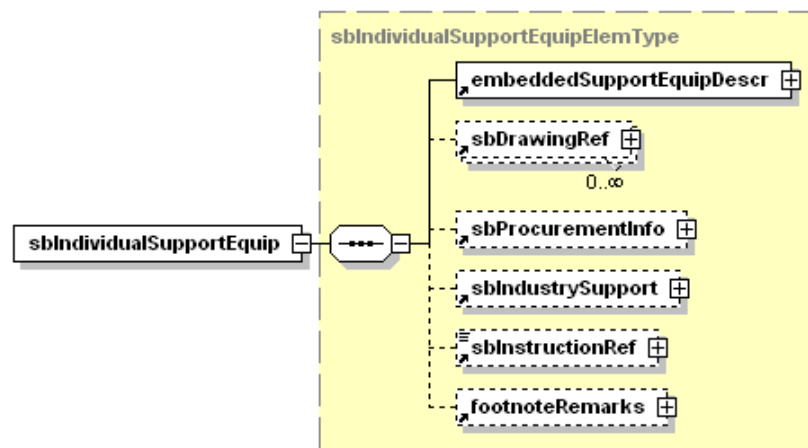

#### Note

sbMaterialType="sbmt01" is defined as "Set of material or individual material specific to the Service bulletin".

### 2.2.2 Individual support equipment

**Description:** The element `<sbIndividualSupportEquip>` contains the information about individual support equipment involved in the Service bulletin.

**Markup element:** `<sbIndividualSupportEquip>`

ICN-S1000D-A-03090502-B-FAPE3-00050-A-001-01

Fig 12 Element `<sbIndividualSupportEquip>`

#### Attributes:

- The attributes and business rules are the same as for the element `<sbMaterialSet>`. Refer to [Para 2.1.1](#).

#### Child elements:

- `<embeddedSupportEquipDescr>`. Description of the support equipment. Refer to [Chap 3.9.5.2.1.9](#).
- `<sbDrawingRef>`. Refer to [Para 2.2.2.1](#).
- `<sbProcurementInfo>`. Refer to [Para 2.1.1.1](#).
- `<sbIndustrySupport>`. Refer to [Para 2.1.1.2](#).
- `<sbInstructionRef>`. Refer to [Chap 3.9.5.2.15.1](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

#### Markup example:

```
<sbIndividualSupportEquip sbMaterialType="sbmt01">
  <embeddedSupportEquipDescr>
    <name>Saw tool</name>
    <identNumber>
    <manufacturerCode>KZ666</manufacturerCode>
    <partAndSerialNumber>
    <partNumber>BSK-TW-100</partNumber>
    </partAndSerialNumber>
```

```

</identNumber>
<reqQuantity unitOfMeasure="EA">1</reqQuantity>
</embeddedSupportEquipDescr>
</sbIndividualSupportEquip>

```

### 2.2.2.1 Drawing reference

**Description:** The element `<sbDrawingRef>` contains the reference to a drawing not being part of the Service bulletin data module.

**Markup element:** `<sbDrawingRef>`

ICN-S1000D-A-03090502-B-FAPE3-00051-A-001-01

Fig 13 Element `<sbDrawingRef>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `sbItem` (O), identifies the item in the drawing

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```

<sbDrawingRef sbItem="01">
<refs><externalPubRef>...</externalPubRef></refs>
</sbDrawingRef>

```

### 2.2.3 External support equipment set

**Description:** The element `<sbExternalSupportEquipSet>` contains references to external documentation referencing support equipment that are necessary for the Service bulletin accomplishment.

**Markup element:** `<sbExternalSupportEquipSet>`

ICN-S1000D-A-03090502-B-FAPE3-00052-A-002-01

Fig 14 Element `<sbExternalSupportEquipSet>`

**Attributes:**

- The attributes and business rules are the same as for the element `<sbMaterialSet>`. Refer to [Para 2.1.1](#).

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

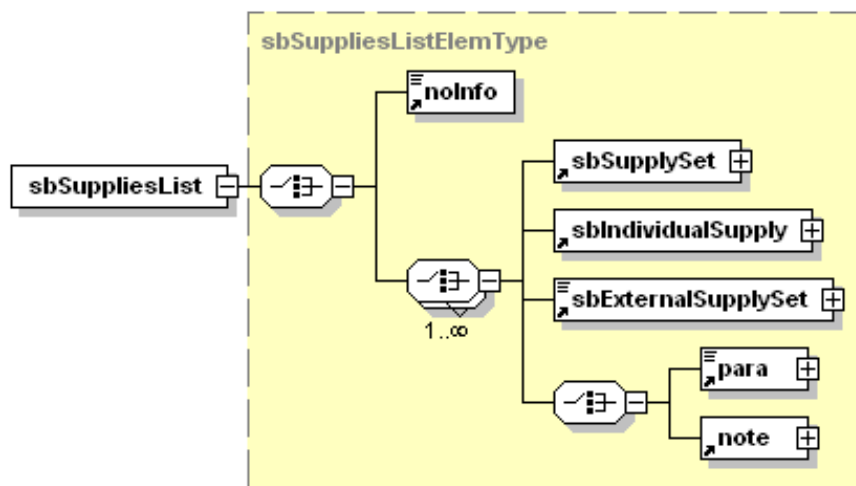

```
<sbExternalSupportEquipSet sbMaterialIdent="mat-0010">
<refs><dmRef>...</dmRef></refs>
</sbExternalSupportEquipSet>
```

## 2.3

### List of supplies

**Description:** The element `<sbSuppliesList>` contains the list of supplies (set of supplies, individual supplies or from external documentation supplies) involved in the Service bulletin.

**Markup element:** `<sbSuppliesList>`

ICN-S1000D-A-03090502-B-FAPE3-00053-A-001-01

Fig 15 Element `<sbSuppliesList>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

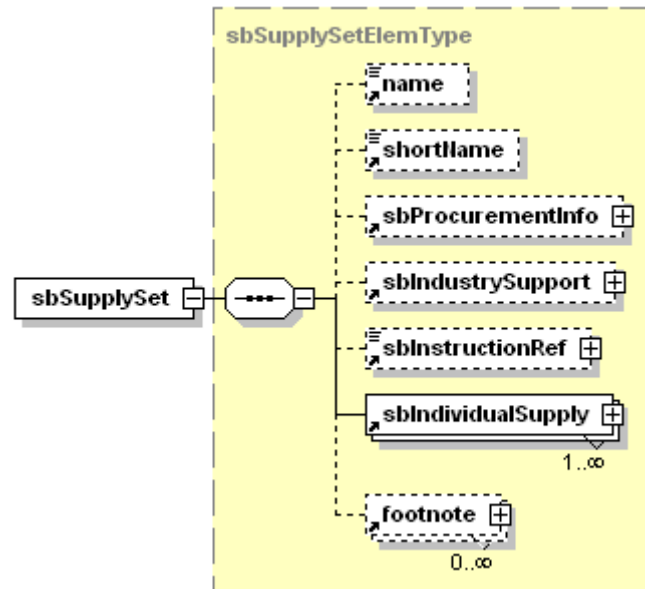

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbSupplySet>`. Refer to [Para 2.3.1](#).
- `<sbIndividualSupply>`. Refer to [Para 2.3.2](#).
- `<sbExternalSupplySet>`. Refer to [Para 2.3.3](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).

### 2.3.1

#### Supply set

**Description:** The element `<sbSupplySet>` contains the information about supplies grouped by set and involved in the Service bulletin.

**Markup element:** `<sbSupplySet>`

ICN-S1000D-A-03090502-B-FAPE3-00054-A-001-01

Fig 16 Element `<sbSupplySet>`

#### Attributes:

- The attributes and business rules are the same as for the element `<sbMaterialSet>`. Refer to [Para 2.1.1.](#)

#### Child elements:

- `<name>`. Refer to [Chap 3.9.5.2.1.9.](#)
- `<shortName>`. Refer to [Chap 3.9.5.2.1.9.](#)
- `<sbProcurementInfo>`. Refer to [Para 2.1.1.1.](#)
- `<sbIndustrySupport>`. Refer to [Para 2.1.1.2.](#)
- `<sbInstructionRef>`. Refer to [Chap 3.9.5.2.15.1.](#)
- `<sbIndividualSupply>`. Refer to [Para 2.3.2.](#)
- `<footnote>`. Refer to [Chap 3.9.5.2.1.10.](#)

#### Markup example:

```
<sbSupplySet id="mat-0018" sbMaterialType="sbmt01"
sbMaterialIdent="BSK-SPST-100" sbMaterialIssue="001"
sbProcurableFlag="1" sbSupplierValue="any">
<name>Clean up set</name>
<sbProcurementInfo>
...
</sbProcurementInfo>
<sbIndustrySupport>
...
</sbIndustrySupport>
```

```
<sbIndividualSupply sbMaterialType="sbmt01">
...
</sbIndividualSupply>
</sbSupplySet>
```

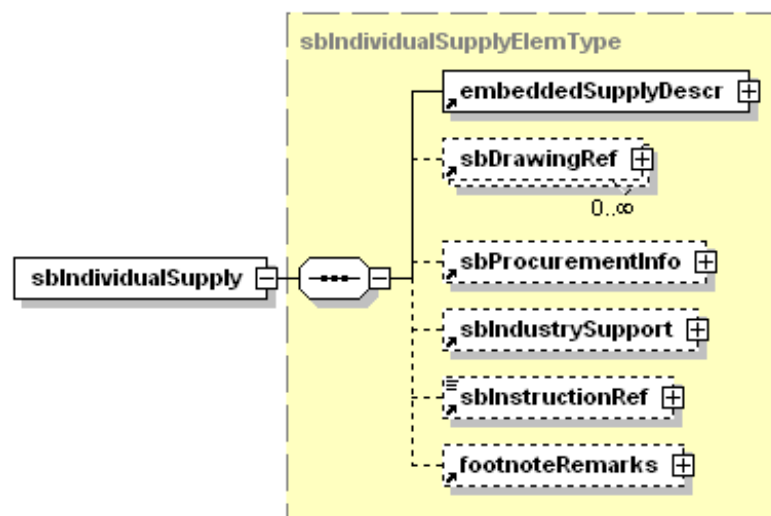

**Note**

sbMaterialType="sbmt01" is defined as "Set of material or individual material specific to the Service bulletin".

### 2.3.2 Individual supply

**Description:** The element `<sbIndividualSupply>` contains the information about individual supply involved in the Service bulletin. The supply is not present within a set of supplies.

**Markup element:** `<sbIndividualSupply>`

ICN-S1000D-A-03090502-B-FAPE3-00055-A-001-01

Fig 17 Element `<sbIndividualSupply>`

**Attributes:**

- The attributes and business rules are the same as for the element `<sbMaterialSet>`. Refer to [Para 2.1.1](#).

**Child elements:**

- `<embeddedSupplyDescr>`. Refer to [Chap 3.9.5.2.1.9](#).
- `<sbDrawingRef>`. Refer to [Para 2.2.2.1](#).
- `<sbProcurementInfo>`. Refer to [Para 2.1.1.1](#).
- `<sbIndustrySupport>`. Refer to [Para 2.1.1.2](#).
- `<sbInstructionRef>`. Refer to [Chap 3.9.5.2.15.1](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

**Markup example:**

```
<sbIndividualSupply id="mat-0002" sbMaterialType="sbmt02"
sbProcurementFlag="1" sbSupplierValue="any">
<embeddedSupplyDescr>
<name>General grease</name>
```

```

<identNumber>
<manufacturerCode>KZ222</manufacturerCode>
<partAndSerialNumber>
<partNumber>LL-005</partNumber>
</partAndSerialNumber>
</identNumber>
<reqQuantity>As required</reqQuantity>
</embeddedSupplyDescr>
</sbIndividualSupply>

```

#### Note

sbMaterialType="sbmt02" is defined as "Set of material or individual material not specially built for the Service bulletin".

### 2.3.3 External supply set

**Description:** The element [<sbExternalSupplySet>](#) contains references to external documentation referencing supplies that are necessary for the Service bulletin accomplishment.

**Markup element:** [<sbExternalSupplySet>](#)

ICN-S1000D-A-03090502-B-FAPE3-00056-A-001-01

Fig 18 Element [<sbExternalSupplySet>](#)

#### Attributes:

- The attributes and business rules are the same as for the element [<sbMaterialSet>](#). Refer to [Para 2.1.1](#).

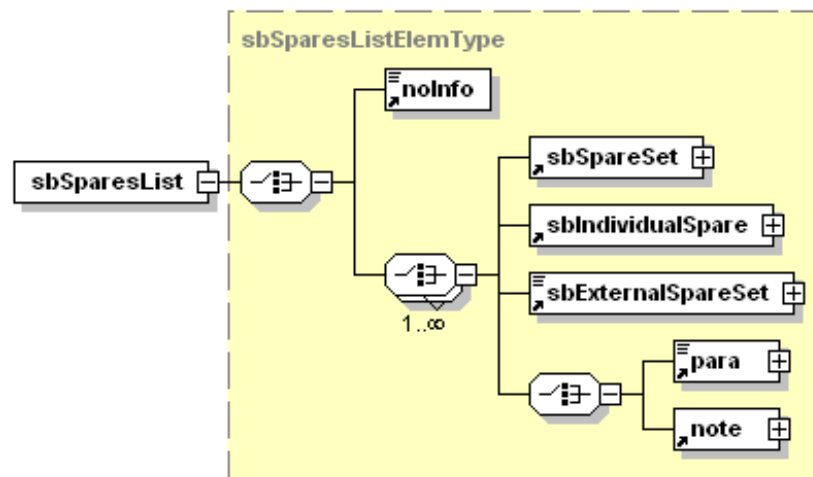

#### Child elements:

- [<refs>](#). Refer to [Chap 3.9.5.2.1.2](#).
- [<footnoteRemarks>](#). Refer to [Chap 3.9.5.2.1.9](#).

### 2.4 List of spares

**Description:** The element [<sbSparesList>](#) contains the list of spares (set, individual, external) involved in the Service bulletin.

**Markup element:** [<sbSparesList>](#)

ICN-S1000D-A-03090502-B-FAPE3-00057-A-001-01

Fig 19 Element `<sbSparesList>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

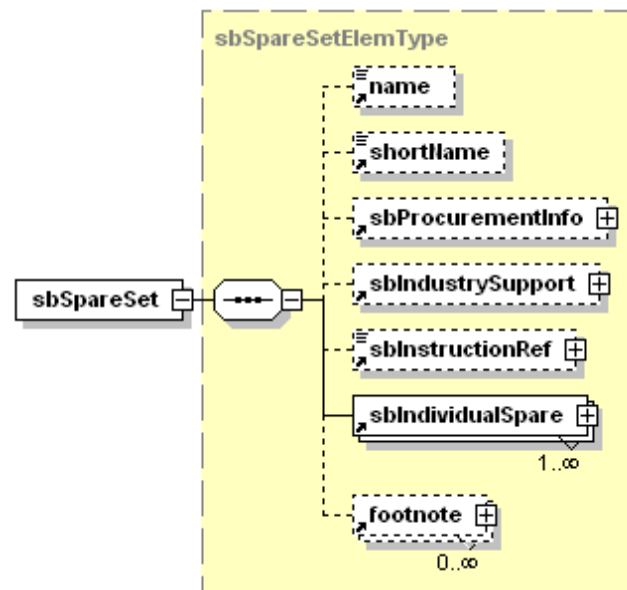

#### Child elements:

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbSpareSet>`. Refer to [Para 2.4.1](#).
- `<sbIndividualSpare>`. Refer to [Para 2.4.2](#).
- `<sbExternalSpareSet>`. Refer to [Para 2.4.3](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).

### 2.4.1 Spare set

**Description:** The element `<sbSpareSet>` contains the information about spares grouped by set and involved in the Service bulletin.

**Markup element:** `<sbSpareSet>`

ICN-S1000D-A-03090502-B-FAPE3-00058-A-001-01

Fig 20 Element &lt;sbSpareSet&gt;

#### Attributes:

- The attributes and business rules are the same as for the element <sbMaterialSet>. Refer to [Para 2.1.1](#).

#### Child elements:

- <name>. Refer to [Chap 3.9.5.2.1.9](#).
- <shortName>. Refer to [Chap 3.9.5.2.1.9](#).
- <sbProcurementInfo>. Refer to [Para 2.1.1.1](#).
- <sbIndustrySupport>. Refer to [Para 2.1.1.2](#).
- <sbInstructionRef>. Refer to [Chap 3.9.5.2.15.1](#).
- <sbIndividualSpare>. Refer to [Para 2.4.2](#).
- <footnote>. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<sbSpareSet id="mat-0003" sbMaterialType="sbmt01"
sbMaterialIdent="SPA-1000-1" sbMaterialIssue="001"
sbProcurableFlag="1" sbSupplierValue="manufacturer">
  <name>Fork set</name>
  <sbProcurementInfo>

### 2.4.3 External spare

**Description:** The element [<sbExternalSpareSet>](#) contains references to external documentation referencing spares that are necessary for the Service bulletin accomplishment.

**Markup element:** [<sbExternalSpareSet>](#)

ICN-S1000D-A-03090502-B-FAPE3-00060-A-001-01

Fig 22 Element [<sbExternalSpareSet>](#)

**Attributes:**

- The attributes and business rules are the same as for the element `<sbMaterialSet>`. Refer to [Para 2.1.1](#).

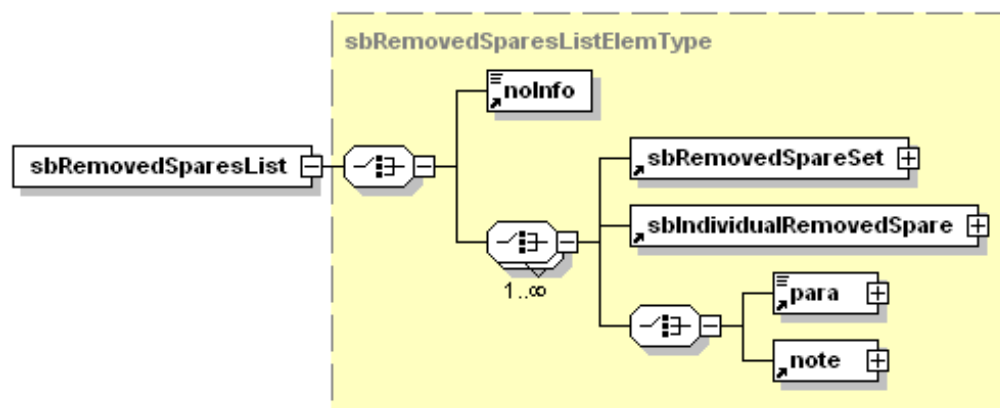

**Child elements:**

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

## 2.5 List of removed spares

**Description:** The element `<sbRemovedSparesList>` contains the list of removed spares (set, individual) used in the Service bulletin.

**Markup element:** `<sbRemovedSparesList>`

ICN-S1000D-A-03090502-B-FAPE3-00061-A-001-01

Fig 23 Element `<sbRemovedSparesList>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

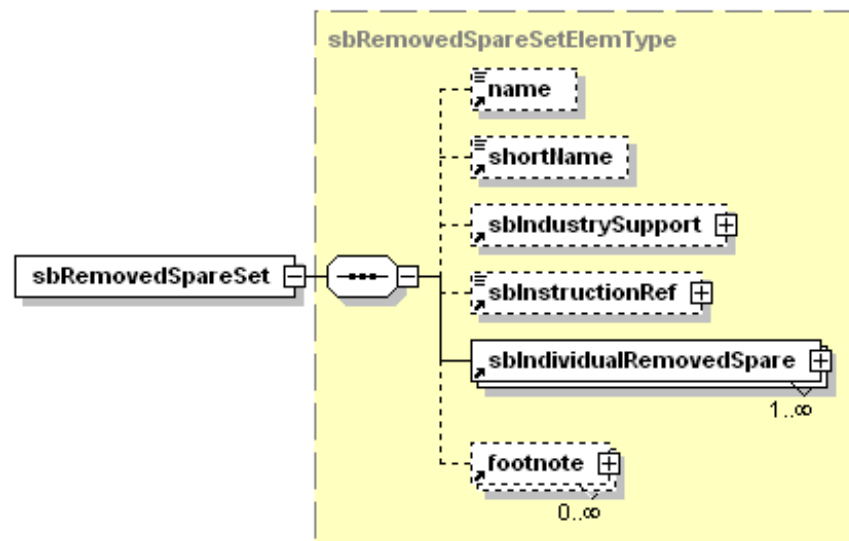

**Child elements:**

- `<noInfo>`. Refer to [Chap 3.9.5.2.15](#).
- `<sbRemovedSpareSet>`. Refer to [Para 2.5.1](#).
- `<sbIndividualRemovedSpare>`. Refer to [Para 2.5.2](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).

### 2.5.1 Removed spare set

**Description:** The element `<sbRemovedSpareSet>` contains the information about removed spares grouped by set and used in the Service bulletin.

**Markup element:** `<sbRemovedSpareSet>`

ICN-S1000D-A-03090502-B-FAPE3-00062-A-001-01

Fig 24 Element &lt;sbRemovedSpareSet&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sbMaterialType (O), the type of removed or modified material used in the Service bulletin. The attribute can have one of the following values:
  - "sbmt01" thru "sbmt99". Refer to [Chap 3.9.6.1](#).
- sbMaterialIdent (O), the identifier of the material set
- sbMaterialIssue (O), the issue of the material set
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

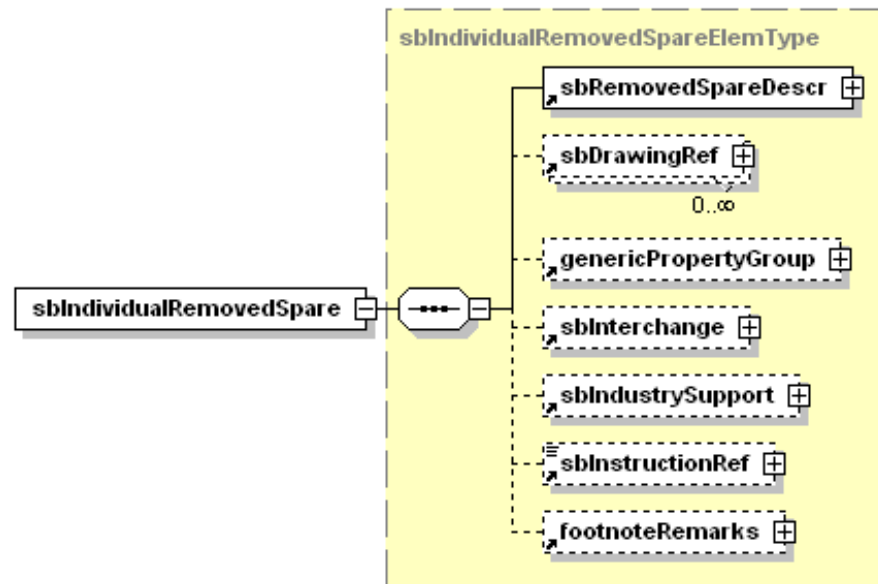

#### Child elements:

- <name>. Refer to [Chap 3.9.5.2.1.9](#).
- <shortName>. Refer to [Chap 3.9.5.2.1.9](#).
- <sbIndustrySupport>. Refer to [Para 2.1.1.2](#).
- <sbInstructionRef>. Refer to [Chap 3.9.5.2.15.1](#).
- <sbIndividualRemovedSpare>. Refer to [Para 2.5.2](#).
- <footnote>. Refer to [Chap 3.9.5.2.1.10](#).

### 2.5.2 Individual removed spare

**Description:** The element <sbIndividualRemovedSpare> contains the information about individual removed spare used in the Service bulletin. The removed spare is not present within a set of removed spares.

Markup element: `<sbIndividualRemovedSpare>`

ICN-S1000D-A-03090502-B-FAPE3-00063-A-001-01

Fig 25 Element `<sbIndividualRemovedSpare>`

#### Attributes:

- The attributes and business rules are the same as for the element `<sbRemovedSpareSet>`. Refer to [Para 2.5.1](#).

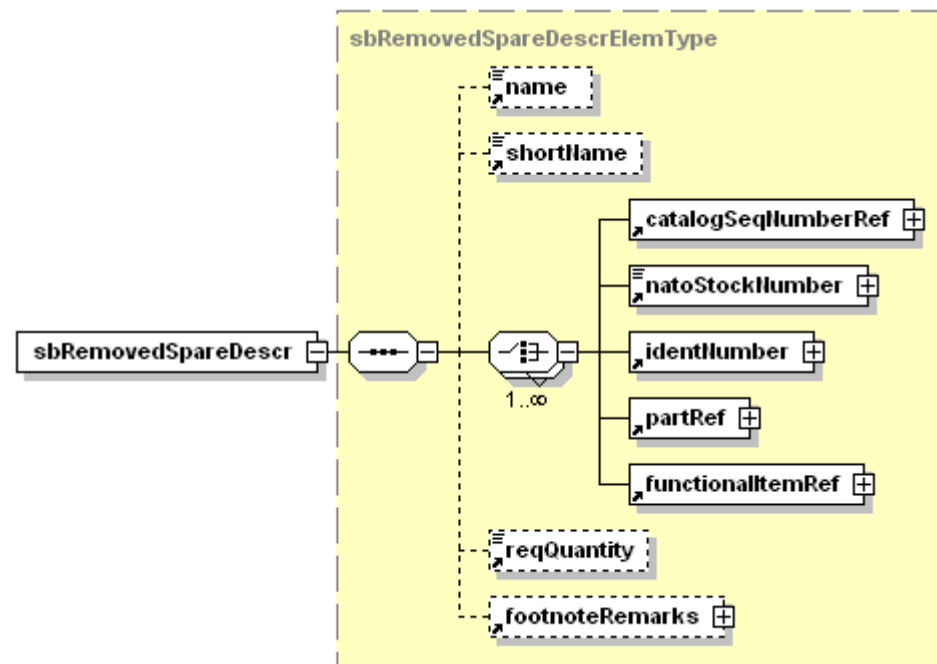

#### Child elements:

- `<sbRemovedSpareDescr>`. Refer to [Para 2.5.2.1](#).
- `<sbDrawingRef>`. Refer to [Para 2.2.2.1](#).
- `<genericPropertyGroup>`, contains `<genericProperty>` elements whose predefined values of the attribute `genericPropertyType` in this context are "gpt10" and "gpt11". Refer to [Chap 3.9.5.2.15.1](#).
- `<sbInterchange>`. Refer to [Para 2.5.2.2](#).
- `<sbIndustrySupport>`. Refer to [Para 2.1.1.2](#).
- `<sbInstructionRef>`. Refer to [Chap 3.9.5.2.15.1](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.5.2.1 Removed spare description

**Description:** The element `<sbRemovedSpareDescr>` contains the description of the removed spare.

Markup element: `<sbRemovedSpareDescr>`

ICN-S1000D-A-03090502-B-FAPE3-00064-A-001-01

Fig 26 Element &lt;sbRemovedSpareDescr&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- materialUsage (O), the qualification of the removed part. The attribute can have one of the following values:
  - "mu01" thru "mu99". Refer to [Chap 3.9.6.1](#) and default BREX rule BREX-S1-00104.

The values "mu01" (Discarded), "mu02" (Retained) and "mu06" (Modified to) can be used in this context.

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <name>. Refer to [Chap 3.9.5.2.1.9](#).
- <shortName>. Refer to [Chap 3.9.5.2.1.9](#).
- The identification by one or more of the elements <catalogSeqNumberRef> (refer to [Chap 3.9.5.2.7](#)), <natoStockNumber> (refer to [Chap 3.9.5.2.1.9](#)), <identNumber> (refer to [Chap 3.9.5.2.1.9](#)), <partRef> (refer to [Chap 3.9.5.2.1.10](#)) and <functionalItemRef> (refer to [Chap 3.9.5.1](#)).
- <reqQuantity>. Refer to [Chap 3.9.5.2.1.9](#).

- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

#### Markup example:

```
<sbRemovedSpareDescr>
<name>Fork</name>
<identNumber>
<manufacturerCode>KZ666</manufacturerCode>
<partAndSerialNumber>
<partNumber>FK-1000</partNumber>
</partAndSerialNumber>
</identNumber>
</sbRemovedSpareDescr>
```

#### 2.5.2.2 Interchangeability

**Description:** The element `<sbInterchange>` contains the information related to the new spare that replace the old one if applicable.

**Markup element:** `<sbInterchange>`

ICN-S1000D-A-03090502-B-FAPE3-00065-A-001-01

Fig 27 Element `<sbInterchange>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

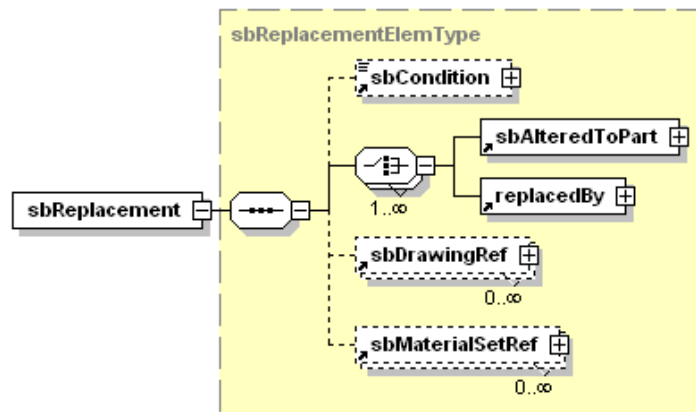

#### Child elements:

- `<sbReplacement>`. Refer to [Para 2.5.2.2.1](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#).

#### 2.5.2.2.1 Replacement part

**Description:** The element `<sbReplacement>` contains the information related to the replacement condition of the newly installed spare versus the removed spare.

**Markup element:** `<sbReplacement>`

ICN-S1000D-A-03090502-B-FAPE3-00066-A-001-01

Fig 28 Element &lt;sbReplacement&gt;

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- sbReplacementType (O), the specific condition applicable to the interchangeability condition. The attribute can have one of the following values:
  - "nominal" - no specific condition for its application
  - "conditional" - a specific condition is applicable to the interchangeability condition which is expressed in the element <sbCondition>. Refer to [Chap 3.9.5.2.15.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <sbCondition>, any specific condition applicable to current interchangeability instructions. Refer to [Chap 3.9.5.2.15.1](#).
- <sbAlteredToPart>, the replacing part in case of modification of an existing one. Refer to [Para 2.5.2.2.2](#).
- <replacedBy>, the replacing part in case of exchange of part. Refer to [Chap 3.9.5.2.7](#).
- <sbDrawingRef>, the reference to the drawing of the replacing part. Refer to [Para 2.2.2.1](#).
- <sbMaterialSetRef>, the reference to the material set containing the replacing part. Refer to [Para 2.1.1.3.1](#).

#### Markup examples:

Example with replacement of part

```
<sbReplacement>
  <replacedBy replacementCode="oneway">
```

```
<partRef manufacturerCodeValue="KZ666" partNumberValue="FK-TEL1001" />
</replacedBy>
</sbReplacement>
```

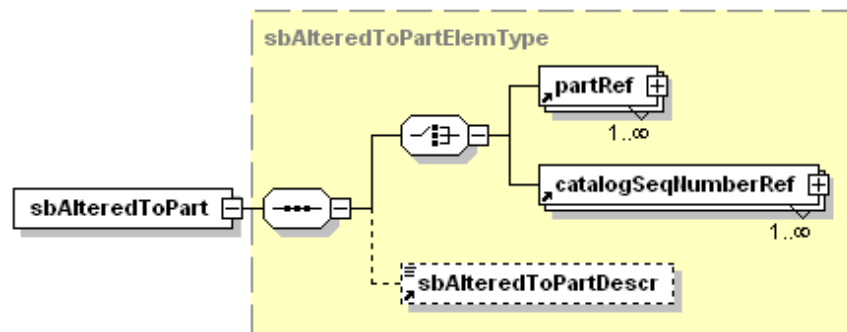

Example with modification of part

```
<sbReplacement>
<sbAlteredToPart>
<partRef manufacturerCodeValue="KZ666" partNumberValue="BSK-AXS-2001" />
</sbAlteredToPart>
</sbReplacement>
```

#### 2.5.2.2.2 Altered to part

**Description:** The element `<sbAlteredToPart>` contains the new part number given to the modified part when re-installed on the product after modification.

**Markup element:** `<sbAlteredToPart>`

ICN-S1000D-A-03090502-B-FAPE3-00067-A-001-01

Fig 29 Element `<sbAlteredToPart>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<partRef>`, the reference to the replacing part. Refer to [Chap 3.9.5.2.1.10](#).
- `<catalogSeqNumberRef>`, the identification of the replacing part in the IPD data module. Refer to [Chap 3.9.5.2.7](#).
- `<sbAlteredToPartDescr>`. Refer to [Para 2.5.2.2.3](#).

#### Markup example:

```
<sbAlteredToPart>
<partRef manufacturerCodeValue="KZ666" partNumberValue="BSK-AXS-2001" />
<sbAlteredToPartDescr>Mountain bike wheel
```

```
axis</sbAlteredToPartDescr>
</sbAlteredToPart>
```

#### 2.5.2.2.3 *Altered to part description*

**Description:** The element <sbAlteredToPartDescr> contains the description of the new part which is modified then re-installed on the product.

**Markup element:** <sbAlteredToPartDescr>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- None

## 1 General

Front matter information can be captured and represented by using different Schemas. In general, all Front matter data modules can use the descriptive Schema except for ACT, CCT and PCT which have their own Schemas.

The Front matter Schema described in this chapter can be used to minimize manual authoring and in most cases support auto-generation of the Front matter data modules.

This Schema is used to capture and represent the following Front matter information:

- Title page - TITLE
- Table of contents - TOC
- List of effective pages - LOEP
- List of effective data modules - LOEDM
- Highlights - HIGH

The Schema also supports the capturing and representation of publication list data modules for the List of applicable publications. Refer to [Chap 5.2.1.20](#).

**Note**

All other Front matter data module types than those given above must use the descriptive Schema.

**Note**

In future issues of the specification the remaining Front matter data module types (refer to [Chap 3.9.4](#)) will be included in the Front matter Schema.

The Front matter Schema has an Identification and status section and a Content section. The Identification and status section is used for managing the Front matter data module itself and is thus not used for presentation except for the headers and footers. The Content section consists of a set of branches for the different types of Front matter.

**Note**

The date in the footer is derived from the front matter data module element `<issueDate>` given in the element `<identAndStatusSection>`. Rules for data module issue dates are given in [Chap 3.9.5.1](#).

The Schema is designed to derive basic information, such as issue information (refer to [Para 2.3.1.4](#)) and Table of contents entries (refer to [Para 2.3.2.3.2](#)) from a source publication module.

The Front matter data modules are primarily designed to be used as customized modules, but the Schema allows treating them as master Front matter data modules by using applicability.

**Note**

A publication often comprises data modules and publication modules using different ACT, CCT and PCT, and also has different project rules for applicability which must be carefully managed.

The Front matter Schema also allows change marking. To avoid confusion and unnecessary change marking, it is recommended that care be taken when applying change marking. For example, change marking the introductory paragraph using the element `<reducedPara>` in a Table of contents data module when it is reworded or when the issue number is changed. Refer to [Chap 3.9.4](#).

The rules and guidance for S1000D standard page-oriented presentation of Front matter data modules are given in [Chap 6.2.3.1](#) together with several examples of Front matter data modules.

Markup examples of front matter data modules are given in [Chap 3.9.5.2.16.1](#). They are also provided as a download package (S1000D-4-2\_FM-Samples.zip), which contains XML, PDF representations of the XML and PDF presentation examples of each front matter data modules. The package can be downloaded from [www.s1000d.org](http://www.s1000d.org). Refer to [Para 3](#).

## 2 Front matter information

### 2.1 Schema basic rules

The Front matter Schema defines a dedicated structure for the content of Front matter data modules.

This Schema can be used for all types of Front matter (eg, TITLE, TOC and LOEDM). It can also be used for publication lists data modules for the List of applicable publications.

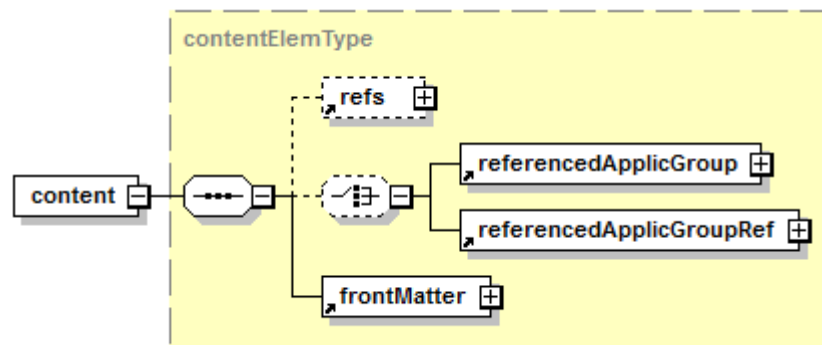

#### Note

The title to be presented on the front matter data modules, except for TITLE, is derived from the element `<infoName>`. Any content of the mandatory element `<techName>` is suppressed. Refer to the general rules in [Chap 6.2.3.1](#).

### 2.2 Content

**Description:** The element `<content>` contains the Content section of a Front matter data module.

**Markup element:** `<content>`

ICN-S3627-A10000D0603-001-01

Fig 1 Major elements in Front matter content

#### Attributes:

- `id` (O), the identifier of the element `<content>`. Refer to [Chap 3.9.5.2.1.2](#).

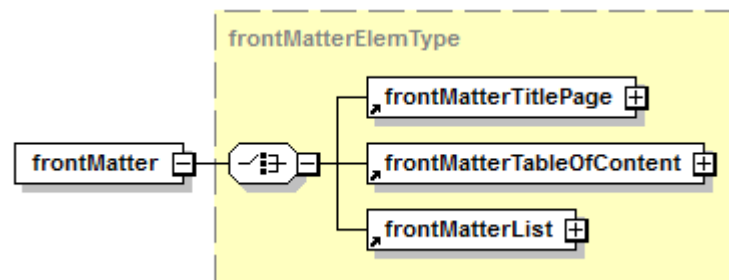

#### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<frontMatter>`. Refer to [Para 2.3](#).

### 2.3 Front matter

**Description:** The Front matter Schema contains three branches supporting the following Front matter types:

- Title page. Refer to [Para 2.3.1](#).
- Table of contents. Refer to [Para 2.3.2](#).
- Highlights and various Front matter lists. Refer to [Para 2.3.3](#).

ICN-S3627-S1000D0557-002-01

Fig 2 The three Front matter branches

### 2.3.1 Title page

**Description:** The element `<frontMatterTitlePage>` contains the title page information.

Rules for presentation of title pages in accordance with the S1000D standard page-oriented presentation is given in [Chap 6.2.3.1](#).

```

#### 2.3.1.2 Publication title and short publication title

**Description:** The elements `<pmTitle>` and `<shortPmTitle>` contain the full name and the short name, respectively, of the publication to be presented on the title page.

The content is authored or derived from the source publication module.

**Markup element:** `<pmTitle>` and `<shortPmTitle>`. Refer to [Chap 4.9.1.](#)

**Markup examples:**

```
<pmTitle>Advance maintenance publication - Pedals - Volume
16</pmTitle>
<shortPmTitle>AMP - Pedals - V16</shortPmTitle>
```

## 2.3.1.3 Publication code

**Description:** The element `<pmCode>` contains the publication code to be presented on the title page.

The content is authored or derived from the Identification and status section of the source publication module.

**Markup element:** `<pmCode>`. Refer to [Chap 4.9.2](#).

## 2.3.1.4 Issue information and date

**Description:** The elements `<issueInfo>` and `<issueDate>` contain the issue number, the inwork number and the issue date, respectively, of the publication to be presented on the title page.

The content is authored or derived from the source publication module.

**Note**

This issue date can be different from the date given in the `<identAndStatusSection>` of the front matter data module depending on project decisions. Refer to [Chap 3.9.5.1](#).

**Markup element:** `<issueInfo>` and `<issueDate>`. Refer to [Chap 3.9.5.1](#).

## 2.3.1.5 External publication codes

**Description:** The element `<externalPubCode>` contains a non-S1000D code, for example an ISBN.

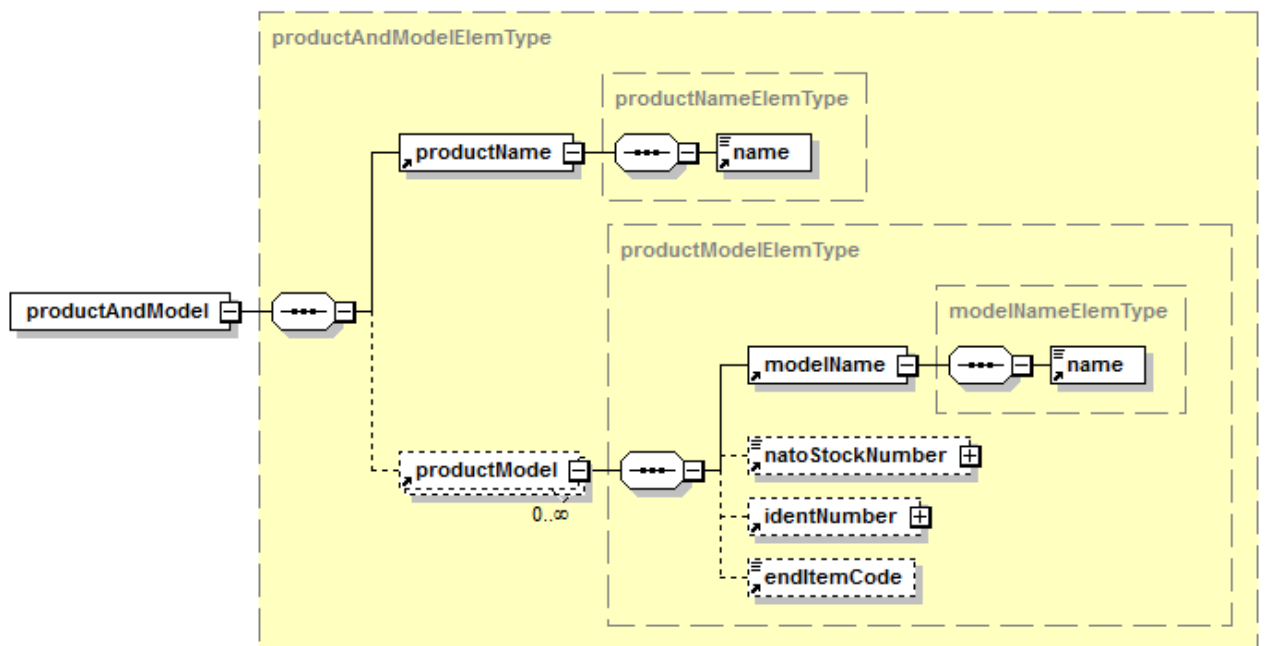

**Markup element:** `<externalPubCode>`. Refer to [Chap 3.9.5.2.1.2](#).

## 2.3.1.6 Product and model name

**Description:** The element `<productAndModel>` contains one or more product names and associated model names and their identifiers which are documented in the publication.

The content of the child elements are authored (as they are not stored in the source publication module).

**Markup element:** `<productAndModel>`

ICN-S3627-S1000D0559-002-01

Fig 6 Element `<productAndModel>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

#### Child elements:

- `<productName>`. Refer to [Para 2.3.1.6.1](#).
- `<productModel>`. Refer to [Para 2.3.1.6.2](#).

#### Business rule decision point BRDP-S1-00295 - Use of the element `<productAndModel>`:

- Decide whether and how to use the element `<productAndModel>` and its child elements.

##### 2.3.1.6.1 Product name

**Description:** The element `<productName>` contains the name of the product documented in the publication.

**Markup element:** `<productName>`

#### Attributes:

- None

#### Child elements:

- `<name>`. Refer to [Chap 3.9.5.2.1.10](#).

##### 2.3.1.6.2 Product model

**Description:** The element `<productModel>` contains the model name and its identifiers.

**Markup element:** `<productModel>`

**Attributes:**

- None

**Child elements:**

- `<modelName>`. Refer to [Para 2.3.1.6.3](#).
- `<natoStockNumber>`. Refer to [Para 2.3.1.6.4](#).
- `<identNumber>`. Refer to [Para 2.3.1.6.5](#).
- `<endItemCode>`. Refer to [Para 2.3.1.6.6](#).

**Markup example:**

```
<productModel>
<modelName><name>Mk I</name></modelName>
<natoStockNumber>6240-00-027-2059</natoStockNumber>
<identNumber>
<manufacturerCode>00000</manufacturerCode>
<partAndSerialNumber>
<partNumber>P/N 19283746</partNumber>
</partAndSerialNumber>
</identNumber>
<endItemCode>99A</endItemCode>
</productModel>
<productModel>
<modelName><name>Mk I De Luxe</name></modelName>
<natoStockNumber>6240-00-027-2063</natoStockNumber>
<identNumber>
<manufacturerCode>00000</manufacturerCode>
<partAndSerialNumber>
<partNumber>P/N 91827364</partNumber>
</partAndSerialNumber>
</identNumber>
<endItemCode>99B</endItemCode>
</productModel>
```

### 2.3.1.6.3 Model name

**Description:** The element `<modelName>` contains the model name of the product documented in the publication.

**Markup element:** `<modelName>`

**Attributes:**

- None

**Child elements:**

- `<name>`. Refer to [Chap 3.9.5.2.1.10](#).

### 2.3.1.6.4 NATO stock number

**Description:** The element `<natoStockNumber>` contains the NATO stock number of the model of the Product documented in the publication. Refer to [Chap 3.9.5.2.7](#).

**Markup element:** `<natoStockNumber>`. Refer to [Chap 3.9.5.2.7](#) with the following exceptions:

- The attribute `id` must not be used. Refer to default BREX rule BREX-S1-00105.

- The element `<refs>` must not be used. Refer to default BREX rule BREX-S1-00106.

#### 2.3.1.6.5 Identification number

**Description:** The element `<identNumber>` contains the manufacturer's identification information of the model of the product documented in the publication. Refer to [Chap 3.9.5.2.1.9](#).

**Markup element:** `<identNumber>`. Refer to [Chap 3.9.5.2.1.9](#) with the following exceptions:

- The element `<refs>` must not be used. Refer to default BREX rule BREX-S1-00107.

#### 2.3.1.6.6 End item code

**Description:** The element `<endItemCode>` contains the end item code which typically consists of a three-character alphanumeric code. The end item code is another type of identifier, similar to NSN, CAGE Code, part number, etc.

**Markup element:** `<endItemCode>`

**Attributes:**

- None

**Child elements:**

- None

#### 2.3.1.7 Security classification

**Description:** The element `<security>` contains the security classification and restrictive markings of the complete publication and its contained or associated illustrations.

This is the security classification which is presented on the Title page (in the header and the footer). Refer to [Chap 6.2.1](#).

**Note**

The security classification given in the Identification and status section of the title page data module is only valid for the title page data module itself.

**Markup element:** `<security>`. Refer to [Chap 3.9.5.1](#).

#### 2.3.1.8 Derivative classification

**Description:** The element `<derivativeClassification>` contains all derivative classification actions taken (eg, source material, date of action, action type) to the information in the complete publication.

**Note**

The derivative classification information given in the Identification and status section of the title page data module is only valid for the title page data module itself.

**Markup element:** `<derivativeClassification>`. Refer to [Chap 3.9.5.1](#).

#### 2.3.1.9 Restriction information - Copyright

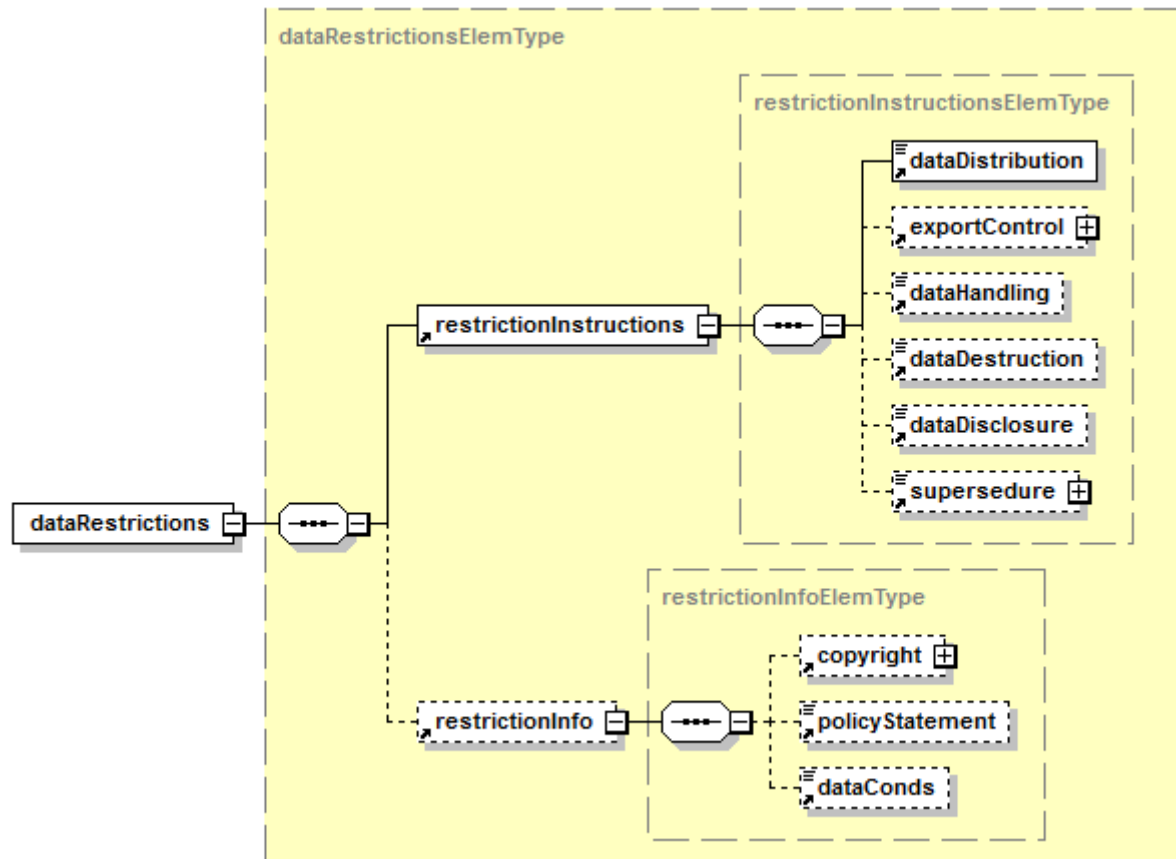

**Description:** The element `<dataRestrictions>` contains the instructions and information, applicable to the complete publication, that relate to the use, storage and handling.

The element is frequently used to include only a copyright statement using the element `<copyright>`. In these cases the element `<dataDistribution>` is left empty.

### Note

Any text to be presented in, for example bold, must be coded with corresponding attribute `emphasisType` value.

Markup element: `<dataRestrictions>`

ICN-S3627-S1000D0763-001-01

Fig 7 Element `<dataRestrictions>`

### Attributes:

Refer to [Chap 3.9.5.1](#) with the following exceptions:

- `id`, `authorityName` and `authorityDocument` must not be used. Refer to default BREX rule BREX-S1-00108.

### Child elements:

- `<restrictionInstructions>`. Refer to [Chap 3.9.5.1](#).
- `<restrictionInfo>`. Refer to [Chap 3.9.5.1](#).

### Business rule decision point BRDP-S1-00296 - Use of the element

`<dataRestrictions>` in the element `<frontMatterTitlePage>`:

- Decide whether and how to use the element `<dataRestrictions>` and its child elements.

## 2.3.1.10 Product illustration

**Description:** The element `<productIllustration>` contains illustrations of the product.

**Markup element:** `<productIllustration>`

ICN-S3627-S1000D0764-001-01

Fig 8 Element `<productIllustration>`

**Attributes:**

- None

**Child elements:**

- `<graphic>`. Refer to [Chap 3.9.5.2.1.7](#).

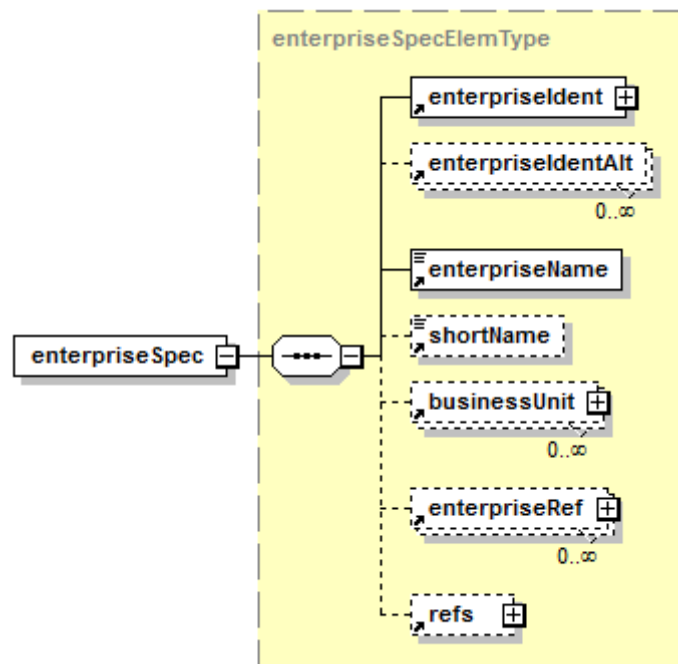

**Note**

The following attributes of the element `<graphic>` must not be used in this context: `id`, `authorityName`, `authorityDocument` and the `xlink` attributes. Refer to default BREX rule BREX-S1-00109.

## 2.3.1.11 Manufacturer

**Description:** The element `<enterpriseSpec>` contains information about the manufacturer of the product such as the enterprise name, the business unit and address.

**Markup element:** `<enterpriseSpec>`

ICN-S3627-S1000D0765-001-01

Fig 9 Element `<enterpriseSpec>`

#### Attributes:

Refer to [Chap 3.9.5.2.11.6](#) with the following exceptions:

- `id`, `authorityName` and `authorityDocument` must not be used. Refer to default BREX rule BREX-S1-00110.

#### Child elements:

Refer to [Chap 3.9.5.2.11.6](#) with the following Note:

#### Note

Typically only the following elements are used: `<enterpriseName>` and `<businessUnitName>` giving the manufacturers name and the business unit name, and `<businessUnitAddress>` giving the address. Technically the Schema demands the company's CAGE code in the attribute `manufacturerCodeValue`. If the company has no CAGE code, it is allowed to use the value "00000".

#### Business rule decision point BRDP-S1-00297 - Use of the element `<enterpriseSpec>` in the element `<frontMatterTitlePage>`:

- Decide whether and how to use the element `<enterpriseSpec>`.

#### Markup example:

```
<enterpriseSpec>
<enterpriseIdent manufacturerCodeValue="00000"/>
<enterpriseName>Greasy Bikes Co. Plc
</enterpriseName>
<businessUnit>
<businessUnitName>Heavy bikes</businessUnitName>
<businessUnitAddress>
```

```
<street>Off Road 66</street>
<postalZipCode>12587</postalZipCode>
<city>Noway</city>
<country>Atlantis</country>
</businessUnitAddress>
</businessUnit>
</enterpriseSpec>
```

### 2.3.1.12 Manufacturer's logotype

**Description:** The element `<enterpriseLogo>` contains logotypes of the manufacturer of the Product.

The first appearance of the element `<symbol>` will by default be the one presented on the title page. Refer to [Chap 6.2.3.1](#).

The content is authored or derived from the source publication module.

#### Note

As a publication module can include a number of symbols (in the element `<logo>` in the Identification and status section), a method has to be set up which logotype to be used as the Manufacturer's logo (eg, first logo to be used).

**Markup element:** `<enterpriseLogo>`

ICN-S3627-S1000D0766-001-01

Fig 10 Element `<enterpriseLogo>`

#### Attributes:

- None

#### Child elements:

- `<symbol>`. Refer to [Chap 3.9.5.2.1.10](#).

#### Note

The following attributes of the element `<symbol>` must not be used in this context: `id`, `authorityName`, `authorityDocument` and the `xlink` attributes. Refer to default BREX rule BREX-S1-00111.

**Business rule decision point BRDP-S1-00298 - Use of the element `<enterpriseLogo>`:**

- Decide whether to use the element `<enterpriseLogo>` and if it is populated from the element `<logo>` given in the Identification and status section.

### 2.3.1.13 Publisher

**Description:** The element `<responsiblePartnerCompany>` contains the name of the publisher - responsible company, organization or authority - of the publication. Refer to [Chap 3.9.5.1](#).

The content is authored or derived from the source publication module.

**Markup element:** `<responsiblePartnerCompany>`

ICN-S3627-S1000D0767-001-01

Fig 11 Element `<responsiblePartnerCompany>`

**Attributes:**

- `enterpriseCode` (O). Refer to [Chap 3.9.5.1](#).
- `id` must not be used. Refer to default BREX rule BREX-S1-00112.

**Child elements:**

- `<enterpriseName>`. Refer to [Chap 3.9.5.2.11.6](#).

**Note**

The element `<enterpriseName>` is mandatory in this context (the Schema gives it as optional) and thus governed by the default BREX data module. Refer to default BREX rule BREX-S1-00113.

**Markup example:**

```
<responsiblePartnerCompany enterpriseCode="I9005">
  <enterpriseName>Aerospace and Defence Industries Association of
  Europe</enterpriseName>
</responsiblePartnerCompany>
```

#### 2.3.1.14

#### Publisher's logotype

**Description:** The element `<publisherLogo>` contains logotypes of the publisher of the publication.

The first appearance of the element `<symbol>` will by default be the one presented on the title page. Refer to [Chap 6.2.3.1](#).

The content is authored or derived from the source publication module.

**Note**

As a publication module can include a number of symbols (in the element `<logo>` in the Identification and status section), a method has to be set up which logotype to be used as the Publisher's logo (eg, first logo to be used).

**Markup element:** `<publisherLogo>`

ICN-S3627-S1000D0768-001-01

Fig 12 Element `<publisherLogo>`

**Attributes:**

- None

**Child elements:**

- [<symbol>](#). Refer to [Chap 3.9.5.2.1.10](#).

**Note**

The following attributes of the element [<symbol>](#) must not be used in this context: `id`, `authorityName`, `authorityDocument` and the `xlink` attributes. Refer to default BREX rules BREX-S1-00111 and BREX-S1-00114.

**Business rule decision point BRDP-S1-00299 - Method of populating the element [<publisherLogo>](#):**

- Decide whether and how to use the element [<logo>](#) in the Identification and status section to populate the element [<publisherLogo>](#).

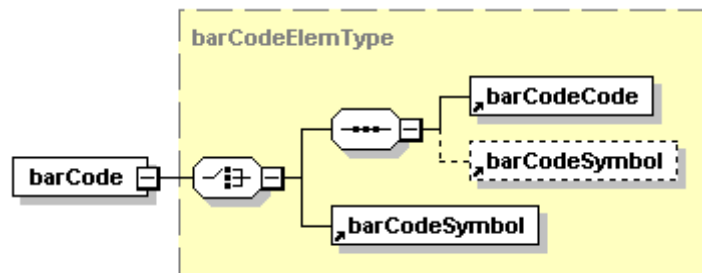

## 2.3.1.15

**Barcode**

**Description:** The element [<barCode>](#) contains the barcode information. Several barcodes can be used.

The first appearance of the element [<barCode>](#) will by default be the one presented on the title page. Refer to [Chap 6.2.3.1](#).

**Markup element:** [<barCode>](#)

ICN-S3627-S1000D0560-001-01

Fig 13 Element [<barCode>](#)

**Attributes:**

- `applicRefId` must not be used. Refer to default BREX rule BREX-S1-00115.

**Child elements:**

- [<barCodeCode>](#). Refer to [Para 2.3.1.15.1](#).
- [<barCodeSymbol>](#). Refer to [Para 2.3.1.15.2](#).

## 2.3.1.15.1

**Barcode value and symbology**

**Description:** The element [<barCodeCode>](#) contains the barcode value and the used symbology.

**Markup element:** [<barCodeCode>](#)

**Attributes:**

- `barCodeValue` (M), the value of the barcode

- `barCodeSymbology` (M), the symbology of the linear or the matrix barcode. The attribute can have one of the following values:
  - "bcs01" thru "bcs99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

**Business rule decision point BRDP-S1-00300 - Use of the attribute `barCodeSymbology`:**

- Decide whether to use the attribute `barCodeSymbology` and which barcode symbology to be used.

2.3.1.15.2 *Barcode symbol*

**Description:** The element `<barCodeSymbol>` contains the graphical representation of the barcode.

**Markup element:** `<barCodeSymbol>`

**Attributes:**

- `infoEntityIdent` (M). Refer to [Chap 3.9.5.2.1.7](#).
- `reproductionWidth` (M) and `reproductionHeight` (M), the presentation sizes for the presentation system
- `id` must not be used. Refer to default BREX rule BREX-S1-00116.

**Child elements:**

- None

2.3.1.16 *Miscellaneous information - Front matter information*

**Description:** The element `<frontMatterInfo>` contains miscellaneous Front matter information (eg, manufacturer's information, error reporting, availability statements or general purpose notices including an introductory title). Several sets of Front matter information and types can be given.

The titles must be coded with attribute `emphasisType` value `em01`.

**Markup element:** `<frontMatterInfo>`

ICN-S3627-S1000D0561-001-01

Fig 14 Element `<frontMatterInfo>`

**Attributes:**

- `frontMatterInfoType` (O), the type of Front matter information. The values of this attribute can be used to govern the presentation of the content and also give the title of the actual Front matter information. The attribute can have one of the following values:

- "fmi01" thru "fmi99". Refer to [Chap 3.9.6.1](#).

#### Child elements:

- `<title>`. Refer to [Para 2.3.1.16.1](#).
- `<reducedPara>`. Refer to [Para 2.3.1.16.2](#).

#### Business rule decision point BRDP-S1-00301 - Use of the element `<frontMatterInfo>`:

- Decide whether and how to use the element `<frontMatterInfo>` including the allowed values of the attribute `frontMatterInfoType` and their interpretation as titles at presentation. Refer to [Chap 3.9.6.1](#).

#### Note

The content given in the element `<title>` takes precedence over the interpretation of the value of the attribute `frontMatterInfoType`.

#### Markup examples:

This is an example of General information `frontMatterInfoType = "fmi01"` with an authored title:

```
<frontMatterInfo frontMatterInfoType="fmi01">
<title>Notice to the reader:</title>
<reducedPara>This publication contains highly sophisticated
stuff. Read it with:
<reducedRandomList listItemPrefix="pf03">
<reducedRandomListItem>
<reducedListItemPara>reflection</reducedListItemPara>
</reducedRandomListItem>
<reducedRandomListItem>
<reducedListItemPara>pride</reducedListItemPara>
</reducedRandomListItem>
</reducedRandomList>
</reducedPara>
</frontMatterInfo>
```

This is an example of Manufacturer's information `frontMatterInfoType = "fmi02"` with an auto-generated title derived from the meaning of "fmi02". The information is presented on the title page:

```
<frontMatterInfo frontMatterInfoType="fmi02">
<title>Manufacturer's information:</title>
<reducedPara>Greasy Bikes is a well-reputed bike manufacturer
famous for its reliable bikes. However, if something goes wrong,
don't blame us.</reducedPara>
<reducedPara>Any complaint shall be sent to:
<reducedRandomList>
<reducedRandomListItem>
<reducedListItemPara>AECME Bikes, Poste Restante,
Somewhere City, Utopia</reducedListItemPara>
</reducedRandomListItem>
<reducedRandomListItem>
<reducedListItemPara>Greasy Bikes, Off Road 66, Noway,
Atlantis</reducedListItemPara>
```

```

</reducedRandomListItem>
</reducedRandomList>
</reducedPara>
</frontMatterInfo>

```

#### 2.3.1.16.1 Title

**Description:** The element `<title>` contains the title of the Front matter information and must be presented before the content of the element `<reducedPara>`. As an alternative, the title can be derived from the attribute `frontMatterInfoType` if the element `<title>` is not used.

#### Note

Any title to be presented in, for example bold, must be coded with corresponding attribute `emphasisType` value.

**Markup element:** `<title>`

#### Attributes:

- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- Includes the same set of elements of the `textElemGroup` as used in the element `<para>` in descriptive data modules. Refer to [Chap 3.9.5.2.1.10](#).

**Business rule decision point BRDP-S1-00302 - Use of the element `<title>` in the element `<frontMatterInfo>`:**

- Decide whether to use the content of the element `<title>` or the interpretation of the value of the attribute `frontMatterInfoType` as the title of the Front matter information.

#### 2.3.1.16.2 Reduced paragraph

**Description:** The element `<reducedPara>` contains the Front matter information (eg, manufacturer's information, error reporting, availability statements or general purpose notices). Refer to [Chap 3.9.5.2.1.10](#).

### 2.3.2 Table of contents

**Description:** The element `<frontMatterTableOfContent>` contains the Table of contents information. Two types of Table of contents are possible:

- A non-hierarchical (flat) structure. Refer to [Fig 15](#).
- A hierarchical structure. Refer to [Fig 16](#).

Both types list the data modules and any publications or external publications in the order given by the source publication module.

#### Note

The front matter data module title to be presented is derived from the element `<infoName>`. The content of the element `<techName>` is suppressed. Refer to [Para 2.1](#) and the general rules in [Chap 6.2.3.1](#).

## Table of contents

The listed documents are included in issue 004, dated 2012-12-24, of this publication.

ICN-S3627-S1000D0607-003-01

Fig 16 Table of contents, hierarchical - S1000D standard page-oriented presentation, example

Markup element: `<frontMatterTableOfContent>`

ICN-S3627-S1000D0564-001-01

Fig 17 Element `<frontMatterTableOfContent>`

**Attributes:**

- None

**Child elements:**

- `<issueInfo>`. Refer to [Para 2.3.2.1](#).
- `<issueDate>`. Refer to [Para 2.3.2.1](#).
- `<reducedPara>`. Refer to [Para 2.3.2.2](#).
- `<tocList>`. Refer to [Para 2.3.2.3](#).

2.3.2.1 Issue information and date

**Description:** The elements `<issueInfo>` and `<issueDate>` contain the issue number, the inwork number and the issue date, respectively, of the publication to be presented in the introductory paragraph and the footer of the Table of contents.

The content is authored or derived from the source publication module.

**Markup element:** `<issueInfo>` and `<issueDate>`. Refer to [Chap 3.9.5.1](#).

2.3.2.2 Introductory paragraph

**Description:** The element `<reducedPara>` contains the introductory paragraph of the Table of contents.

For the S1000D standard page-oriented presentation, the following introductory paragraph is used:

"The listed documents are included in issue XXX, dated YYYY-MM-DD, of this publication."

"XXX" is the issue number given in the element `<issueInfo>` and "YYYY-MM-DD" is the issue date given in the element `<issueDate>`. Refer to [Para 2.3.2.1](#).

**Markup element:** `<reducedPara>`. Refer to [Chap 3.9.5.2.1.10](#).

**Business rule decision point BRDP-S1-00303 - Use the element `<reducedPara>` in the element `<frontMatterTableOfContent>`:**

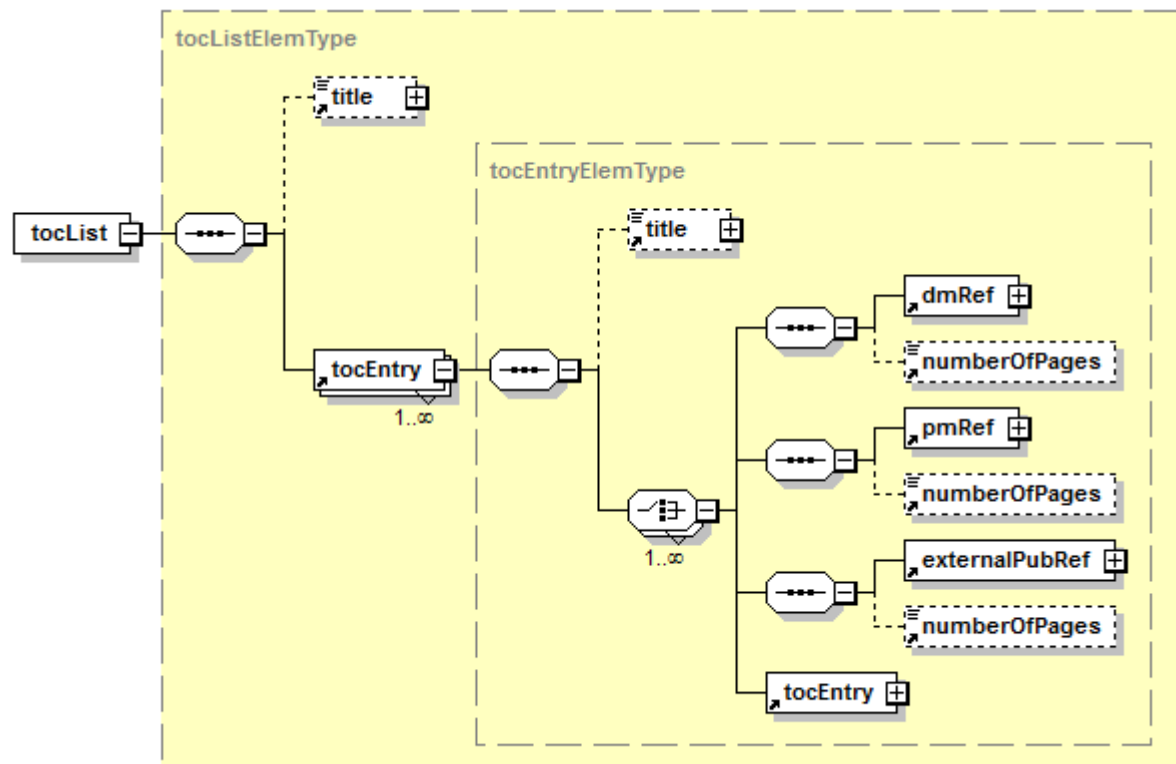

- Decide whether to use the introductory paragraph and on the wording of any standard phrase.

### 2.3.2.3 Table of contents list

**Description:** The element `<tocList>` contains the list of all documents (data modules, publication modules and non-S1000D publications) in the publication.

The list entries must be given in the order of appearance in the publication.

**Markup element:** `<tocList>`

ICN-S3627-S1000D0565-001-01

Fig 18 Element `<tocList>`

**Attributes:**

- None

**Child elements:**

- `<title>`. Refer to [Para 2.3.1.16.1](#).
- `<tocEntry>`. Refer to [Para 2.3.2.3.2](#).

#### 2.3.2.3.1 Table of contents entry title

**Description:** The element `<title>` contains the title for a group of entries in the Table of contents. The element `<title>` is used for the hierarchical Table of contents.

Several hierarchical levels can be included by using the element `<title>` in the element `<tocEntry>`.

The title can be derived from the element `<pmEntryTitle>` in the source publication module. Refer to [Chap 4.9.1](#).

**Markup element:** `<title>`. Refer to [Para 2.3.1.16.1](#).

#### 2.3.2.3.2 *Table of contents entry*

**Description:** The element `<tocEntry>` contains the document title, document code, issue information, number of pages and applicability for each entry in the Table of contents. It is also used to build the title hierarchy by only using the elements `<title>` and `<tocEntry>`.

The content is authored or derived from the source publication module.

##### **Note**

The titles can be derived from the element `<pmEntryTitle>` in the source publication module and replicate the hierarchy therein.

**Markup element:** `<tocEntry>`

##### **Attributes:**

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

##### **Note**

It is recommended not to use this attribute as the applicability for each entry (data module, publication module or non-S1000D publication) is given by the attribute `applicRefId` in the elements `<dmRef>`, `<pmRef>` and `<externalPubRef>`, respectively.

##### **Child elements:**

- `<title>`. Refer to [Para 2.3.1.16.1](#).
- `<dmRef>`. Refer to [Para 2.3.2.3.3](#).
- `<pmRef>`. Refer to [Para 2.3.2.3.4](#).
- `<externalPubRef>`. Refer to [Para 2.3.2.3.5](#).
- `<numberOfPages>`. Refer to [Para 2.3.2.3.6](#).
- `<tocEntry>`. Refer to [Para 2.3.2.3.2](#).

#### 2.3.2.3.3 *Data module entry*

**Description:** The element `<dmRef>` contains the entry details for the data modules that are presented in the Table of contents. The following elements must (M)/can (O) be populated:

- the data module title by the elements `<techName>` (M) and `<infoName>` (M). Refer to default BREX rule BREX-S1-00120.
- the data module identifier by the elements `<dmCode>` (M) and `<identExtension>` (O)
- the issue information by the element `<issueDate>` (O) and/or the element `<issueInfo>` (O)
- the applicability by the attribute `applicRefId` (M)

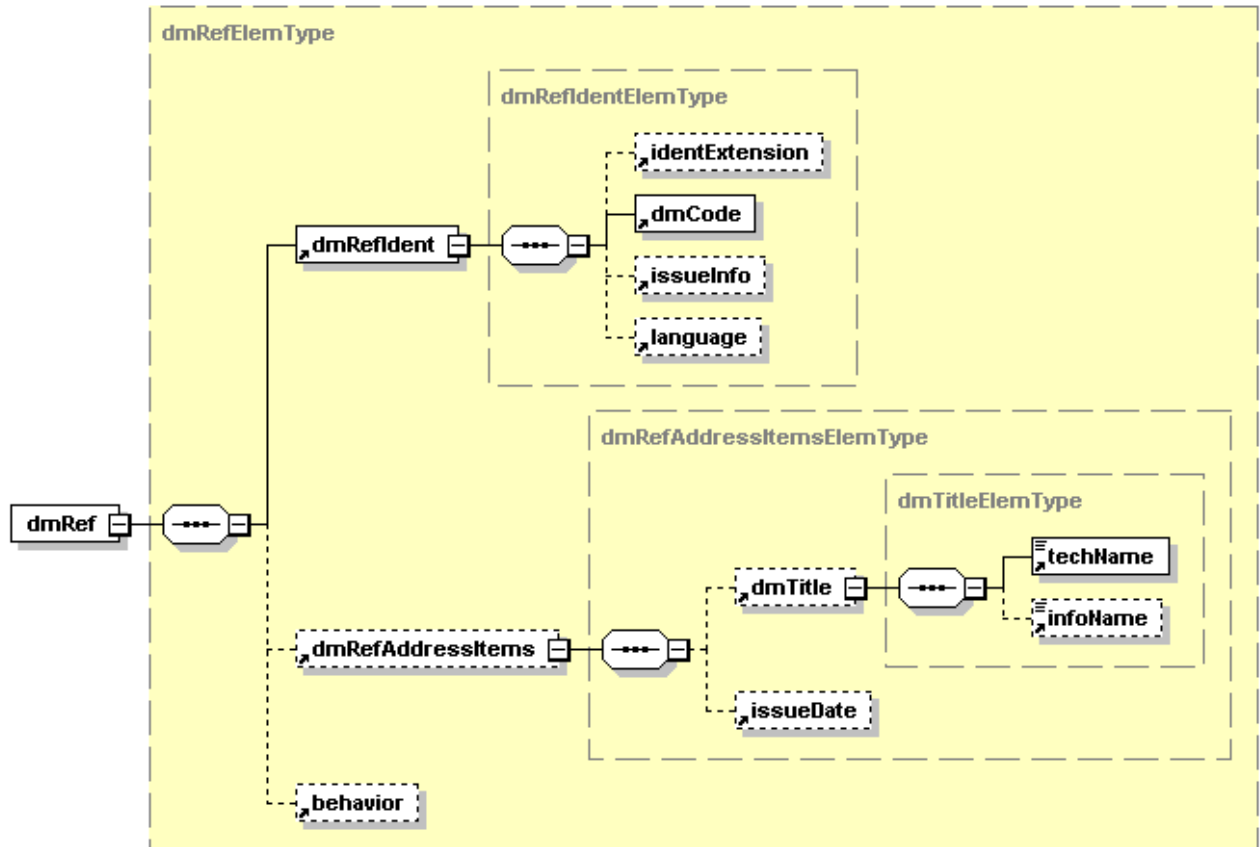

The attribute `applicRefId` is mandatory in this context (the Schema gives it as optional) and thus governed by the default BREX data module. Refer to default BREX rule BREX-S1-00121.

- the number of pages by the element `<numberOfPages>` (O). Refer to [Para 2.3.2.3.6](#).

### Note

The TOC must not include the Title page, LOEDM, LOEP, Change Record (CR) or TOC itself.

Markup element: [<dmRef>](#)

ICN-S3627-S1000D0584-001-01

Fig 19 Element [<dmRef>](#)

### Attributes:

Refer to [Chap 3.9.5.2.1.2](#) with the following exceptions:

- `applicRefId` (M), the applicability information by referencing the element [<applic>](#). Refer to [Chap 3.9.5.3](#).

**Recommendation:** It is recommended to use/present the element [<displayText>](#) when the Table of contents data module is intended for page-oriented presentation. This simplifies the complexity of the functionality of the page-layout application.

- `referredFragment`, `id`, `authorityName` and `authorityDocument` must not be used. Refer to default BREX rules BREX-S1-00122 and BREX-S1-00123.

### Child elements:

Refer to [Chap 3.9.5.2.1.2](#).

#### 2.3.2.3.4 Publication module entry

**Description:** The element [<pmRef>](#) contains the entry details for the publication modules to be presented in the Table of contents. The following elements must (M)/can (O) be populated:

- the publication module title by the elements `<pmTitle>` (M) and `<shortPmTitle>` (O)

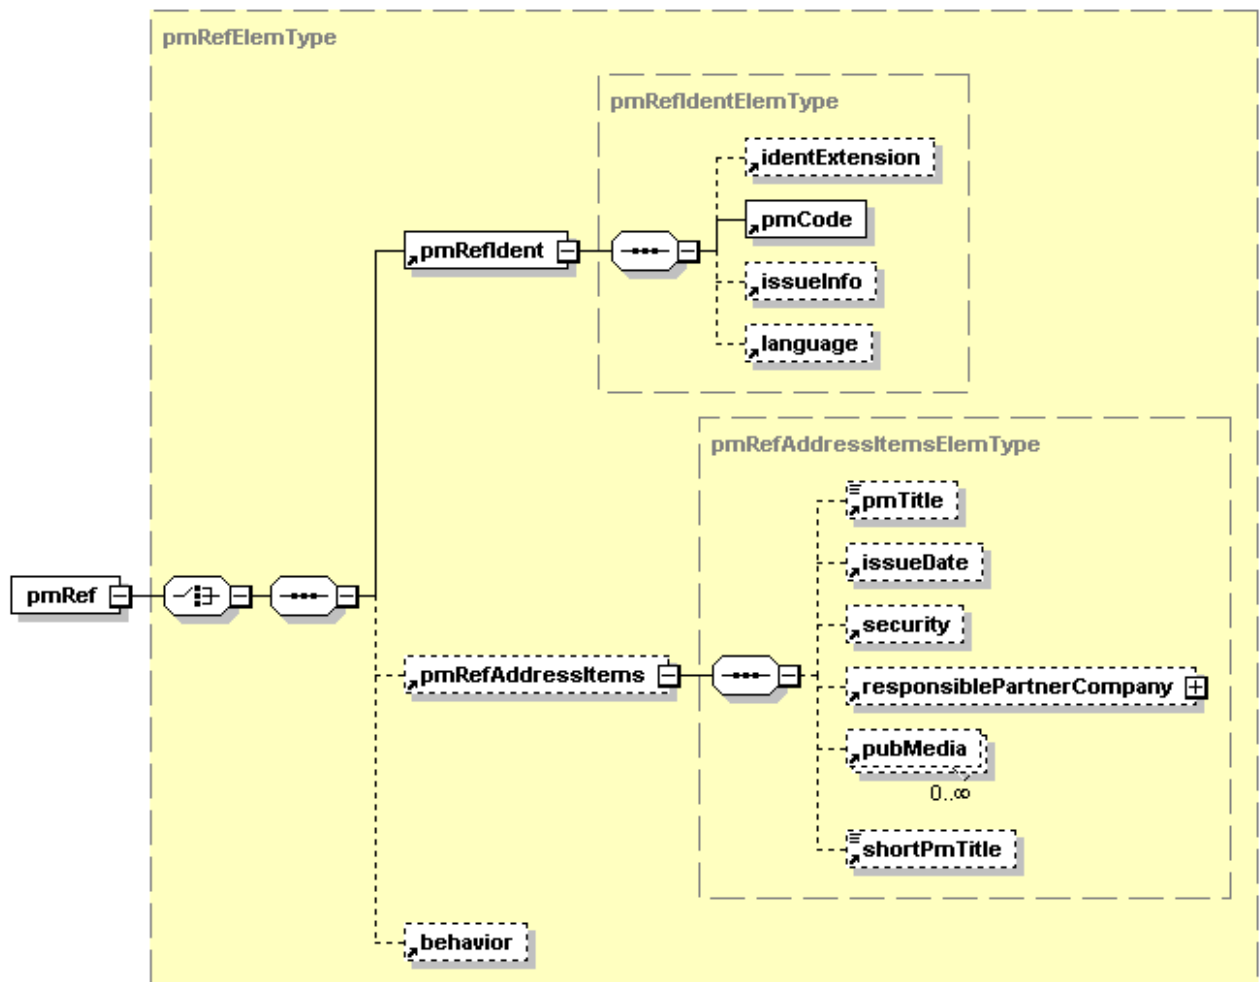

The publication module title (`<pmTitle>`) must be included as it must be presented. This is governed by the default BREX data module. Refer to default BREX rule BREX-S1-00124.

- the publication module identifier by the elements `<pmCode>` (M) and `<identExtension>` (O)
- the issue information by the element `<issueDate>` (O) and/or the element `<issueInfo>` (O)
- the applicability by the attribute `applicRefId` (M)

The attribute `applicRefId` is mandatory in this context (the Schema gives it as optional) and thus governed by the default BREX data module. Refer to default BREX rule BREX-S1-00125.

- the number of pages by the element `<numberOfPages>` (O). Refer to [Para 2.3.2.3.6](#).

**Markup element:** `<pmRef>`

ICN-S3627-S1000D0585-001-01

Fig 20 Element `<pmRef>`

#### Attributes:

Refer to [Chap 3.9.5.2.1.2](#) with the following exceptions:

- `applicRefId` (M), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

**Recommendation:** It is recommended to use/present the element `<displayText>` when the Table of contents data module is intended for page-oriented presentation. This simplifies the complexity of the functionality of the page-layout application.

- `id`, `authorityName` and `authorityDocument` must not be used. Refer to default BREX rule BREX-S1-00126.

#### Child elements:

Refer to [Chap 3.9.5.2.1.2](#).

#### 2.3.2.3.5 *Non-S1000D publication entry (external publication entry)*

**Description:** The element `<externalPubRef>` contains the entry details for the non-S1000D publications (external publications) to be presented in the Table of contents. The following elements must (M)/can (O) be populated:

- the non-S1000D publication title by the elements `<externalPubTitle>` (M) and `<shortExternalPubTitle>` (O)
- the non-S1000D publication identifier by the element `<externalPubCode>` (M)

The identifier must be included as it must be presented. This is governed by the default BREX data module. Refer to default BREX rule BREX-S1-00127.

- the issue information by the element `<externalPubIssueDate>` (O) and/or the element `<externalPubIssueInfo>` (O)
- the applicability by the attribute `applicRefId` (M)

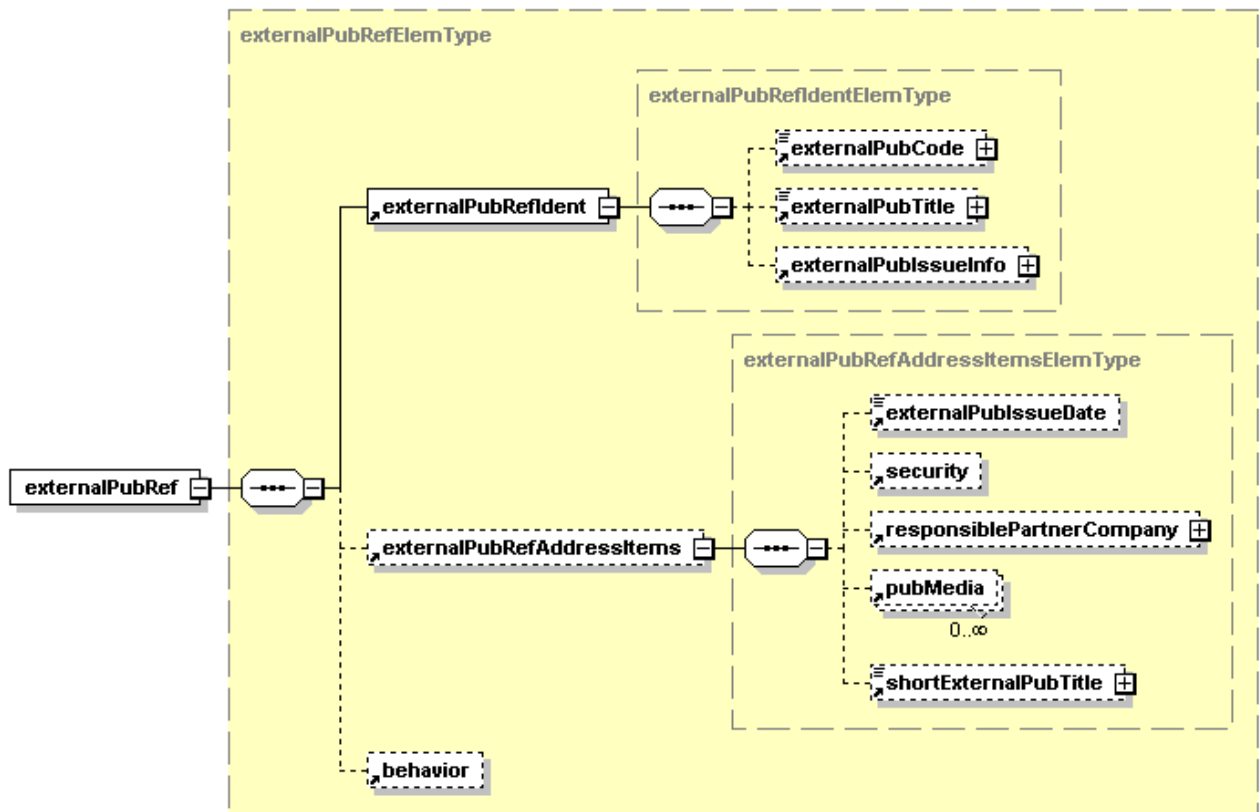

The attribute `applicRefId` is mandatory in this context (the Schema gives it as optional) and thus governed by the default BREX data module. Refer to default BREX rule BREX-S1-00128.

- the number of pages by the element `<numberOfPages>` (O). Refer to [Para 2.3.2.3.6](#).

#### Note

The classification of the elements and attributes above is based on the rules given in [Chap 3.9.4](#).

Markup element: `<externalPubRef>`

ICN-S3627-S1000D0586-001-01

Fig 21 Element `<externalPubRef>`

#### Attributes:

Refer to [Chap 3.9.5.2.1.2](#) with the following exceptions:

- `applicRefId` (M), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

**Recommendation:** It is recommended to use/present the element `<displayText>` when the Table of contents data module is intended for page-oriented presentation. This simplifies the complexity of the functionality of the page-layout application.

- `id`, `authorityName` and `authorityDocument` must not be used. Refer to default BREX rule BREX-S1-00129.

#### Child elements:

Refer to [Chap 3.9.5.2.1.2](#).

#### 2.3.2.3.6 Number of pages

**Description:** The element `<numberOfPages>` contains the number of pages in the entries for data modules, publications and non-S1000D publications in LOEDM and HIGH.

When used for LOEP this element contains the page number.

Markup element: `<numberOfPages>`

#### Attributes:

Applicable to: All

S1000D-A-03-09-0502-16A-040A-A

Chap 3.9.5.2.16

- None

#### Child elements:

- None

### 2.3.3 Front matter lists

**Description:** The element `<frontMatterList>` contains the information for the:

- List of effective pages - LOEP
- List of effective data modules - LOEDM
- Highlights - HIGH

The Schema also supports the capturing and representation of publication lists for the List of applicable publications.

## List of effective pages

This publication includes the following pages after insertion of issue 004, dated 2012-12-24.

C = Changed page

N = New page

Data module code	Page	Issue date	Applicable to
X4-A-00-00-00-00A-001A-A	1	C 2012-12-24	All

## Highlights

### Issue 004

The listed changes are introduced in issue 004, dated 2012-12-24, of this publication.

Data module	Reason for update
X4-A-00-00-00-01A-021A-A	Copyright and data restrictions introduced
X4-A-00-00-00-03A-040A-A	Flywheel and piston modified
X4-A-00-41-01-00A-040A-A	New

## Updating instruction

Remove or insert data modules as listed in [Table 1](#).

I = Insert data module

R = Remove data module

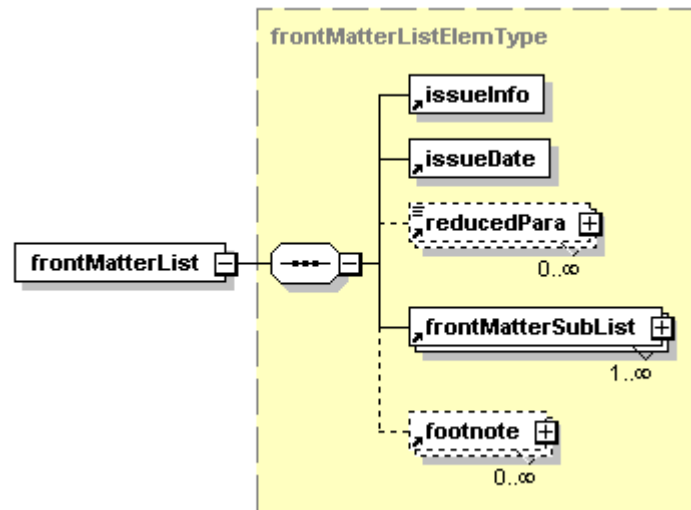

*Table 1. Data modules to be removed or inserted*

*Fig 24 HIGH with updating instruction - S1000D standard page-oriented presentation, example*

Markup element: `<frontMatterList>`

ICN-S3627-S1000D0587-001-01

Fig 25 Element `<frontMatterList>`

#### Attributes:

- `frontMatterType` (M), the type of Front matter (eg, HIGH, LOEDM). The values of this attribute can be used to govern the presentation of the content and also give the title of the actual Front matter. The attribute can have one of the following values:
  - "fm01" thru "fm99". Refer to [Chap 3.9.6.1](#).

#### Child elements:

- `<issueInfo>`. Refer to [Para 2.3.2.1](#).
- `<issueDate>`. Refer to [Para 2.3.2.1](#).
- `<reducedPara>`. Refer to [Para 2.3.3.1](#).
- `<frontMatterSubList>`. Refer to [Para 2.3.3.2](#).
- `<footnote>`. Refer to [Para 2.3.3.3](#).

#### 2.3.3.1 Introductory paragraph

**Description:** The element `<reducedPara>` contains the introductory paragraph of the actual Front matter.

For the S1000D standard page-oriented presentation, the following introductory paragraphs are used:

#### LOEP (value "fm01"):

"This publication includes the following pages after insertion of issue XXX, dated YYYY-MM-DD.

C = Changed page

N = New page"

#### LOEP (value "fm02"):

"The listed data modules are included in issue XXX, dated YYYY-MM-DD, of this publication.

C = Changed data module

N= New data module"

**HIGH** (value "**fm03**" and "**fm04**"):

"The listed changes are introduced in issue XXX, dated YYY-MM-DD, of this publication."

"XXX" is the issue number given the element [<issueInfo>](#) and "YYYY-MM-DD" is the issue date given in the element [<issueDate>](#) Refer to [Para 2.3.1.4](#).

**Markup element:** [<reducedPara>](#). Refer to [Para 2.3.1.16.2](#).

**Business rule decision point BRDP-S1-00309 - Use the element [<reducedPara>](#) in the element [<frontMatterList>](#):**

- Decide whether to use the introductory paragraph and on the wording of any standard phrase for each of the front matter list.

### 2.3.3.2 Front matter sublist

**Description:** The element [<frontMatterSubList>](#) contains the information for the:

- List of effective pages - LOEP. Refer to [Para 2.3.3.2.1](#).
- List of effective data modules - LOEDM. Refer to [Para 2.3.3.2.2](#).
- Highlights - HIGH (without and with updating instructions). Refer to [Para 2.3.3.2.3](#) and [Para 2.3.3.2.4](#).

The entries can be grouped in one or more front matter lists ([<frontMatterSubList>](#)) each having a title ([<title>](#)) and one or more introductory paragraphs ([<reducedPara>](#)).

#### 2.3.3.2.1 Front matter sublist - LOEP

When used for LOEP, every data module has to be broken down to pages with each page being represented by an entry ([<frontMatterDmEntry>](#)). If, by project decision, publication modules have to be included in the LOEP they are represented in their entirety by an entry ([<frontMatterPmEntry>](#)). The same applies to non-S1000D publications.

#### 2.3.3.2.2 Front matter sublist - LOEDM

When used for LOEDM, every data module is being represented by an entry ([<frontMatterDmEntry>](#)). If, by project decision, publication modules have to be included in the LOEP they are represented in their entirety by an entry ([<frontMatterPmEntry>](#)). The same applies to non-S1000D publications.

#### 2.3.3.2.3 Front matter sublist - HIGH

When used for HIGH, every data module having content in the element [<reasonForUpdate>](#) has to be listed as an entry ([<frontMatterDmEntry>](#)) in the first appearance of the element [<frontMatterSubList>](#).

This sublist is also used for Highlights with updating instructions.

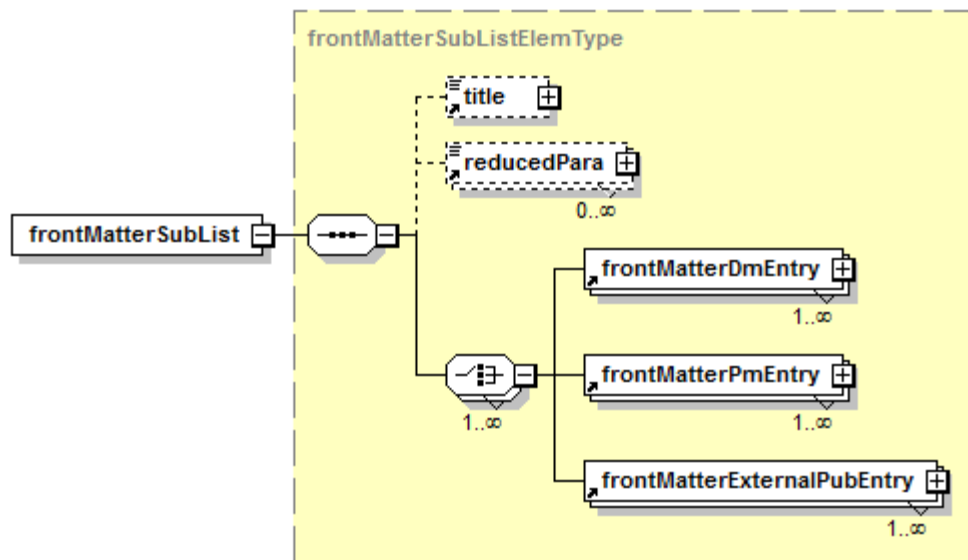

#### 2.3.3.2.4 Front matter sublist - HIGH with updating instructions

When used for Highlights with updating instructions, the second appearance of the element [<frontMatterSubList>](#) includes a fixed title and an introductory paragraph for the Updating instruction. Refer to [Para 2.3.3.2.5](#) and [Para 2.3.3.2.6](#) respectively.

- All data modules having a value given for the attribute `issueType` must have an entry ([<frontMatterDmEntry>](#)).

- All entries with attribute `issueType = "revised"/"changed"/"status"` (data modules to be inserted) must be preceded by an entry with attribute `issueType = "deleted"` of the revised/changed/status data module (data modules to be removed).
- The elements `<dmCode>`, `<dmTitle>` and `<numberOfPages>`, and depending on project decision, the element `<issueDate>` or the element `<issueInfo>` are populated. The attribute `applicRefId` is optional.

**Markup element:** `<frontMatterSubList>`

ICN-S3627-S1000D0588-001-01

Fig 26 Element `<frontMatterSubList>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).

#### Child elements:

- `<title>`. Refer to [Para 2.3.3.2.5](#).
- `<reducedPara>`. Refer to [Para 2.3.3.2.6](#).
- `<frontMatterDmEntry>`. Refer to [Para 2.3.3.2.7](#).
- `<frontMatterPmEntry>`. Refer to [Para 2.3.3.2.8](#).
- `<frontMatterExternalPubEntry>`. Refer to [Para 2.3.3.2.9](#).

#### 2.3.3.2.5 Sublist title

**Description:** The element `<title>` contains the title for a group of entries (a sublist). When used for Highlights with updating instructions the fixed title "Updating instruction" must be used in the second appearance of the of `<frontMatterSubList>`.

**Markup element:** `<title>`. Refer to [Para 2.3.1.16.1](#).

#### 2.3.3.2.6 Introductory paragraphs to sublists, etc

Refer to [Para 2.3.1.16.2](#).

When used for Highlights with updating instructions (value "fm04") and S1000D standard page-oriented presentation, the following introductory paragraphs are used:

"Remove or insert data modules as listed in [Table 1](#).

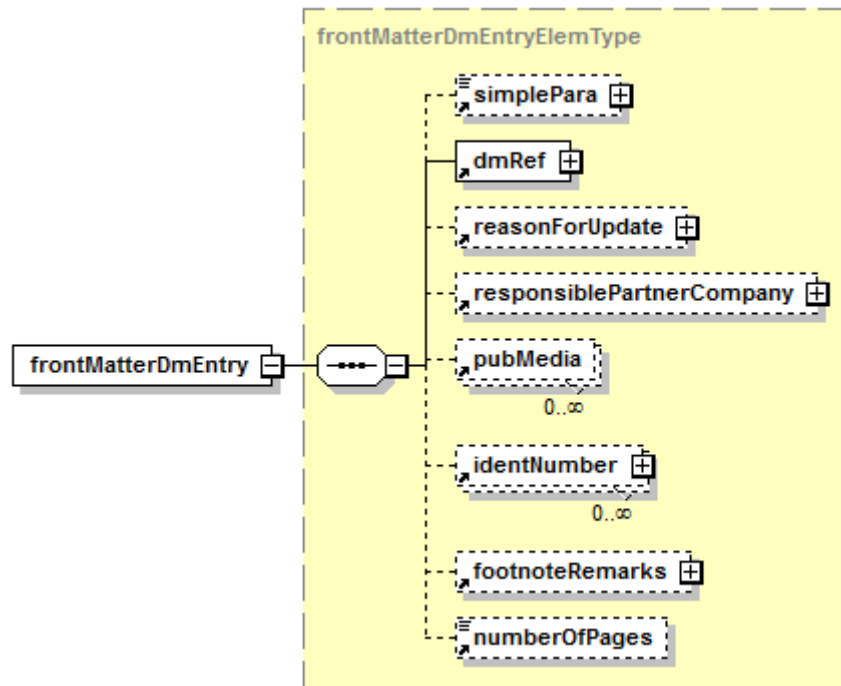

I = Insert data module

R = Remove data module"

#### 2.3.3.2.7 Front matter data module entry

**Description:** The element `<frontMatterDmEntry>` contains the data module entry. The order of the front matter data module entries must follow structure of the publication (= TOC).

**Markup element:** `<frontMatterDmEntry>`

ICN-S3627-S1000D0589-001-01

Fig 27 Element `<frontMatterDmEntry>`

#### Attributes:

- `issueType` (O). Refer to [Para 2.3.3.2.10](#).
- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#) and [Para 2.3.3.2.11](#).

#### Child elements:

- `<simplePara>`. Used for simple statements. Not specifically required by any of the Front matter types. Refer to [Chap 3.9.5.2.1.10](#).
- `<dmRef>`. Used for "Title", "Data module code", issue information ("Issue date" and/or "Issue No.") in LOEP, LOEDM and HIGH, and for "Language" in publication lists for the List of applicable publications (LOAP). Refer to [Para 2.3.2.3.3](#).

#### Note

[Para 2.3.2.3.3](#) gives the mandatory and optional elements related to the Table of contents.

The information is authored or derived from the source publication module.

Mandatory elements, depending on the Front matter type, are given in [Chap 3.9.4](#). For Highlights with updating instructions, refer to [Para 2.3.3.2.4](#).

- [<reasonForUpdate>](#). Used for "Reason for update" in HIGH where it is mandatory. This is governed by the default BREX data module.

The information is authored or derived from the data module referenced in the source publication module.

Refer to [Chap 3.9.5.2.1.1](#).

- [<responsiblePartnerCompany>](#). Used for "Publisher" in publication lists for the List of applicable publications.

The information is authored or derived from the data module referenced in the source publication module.

Refer to [Para 2.3.1.13](#).

- [<pubMedia>](#). Used for "Media information" in publication lists for the List of applicable publications.

The information is authored as there is no information on delivery media which can be derived from the data module referenced in the source publication module.

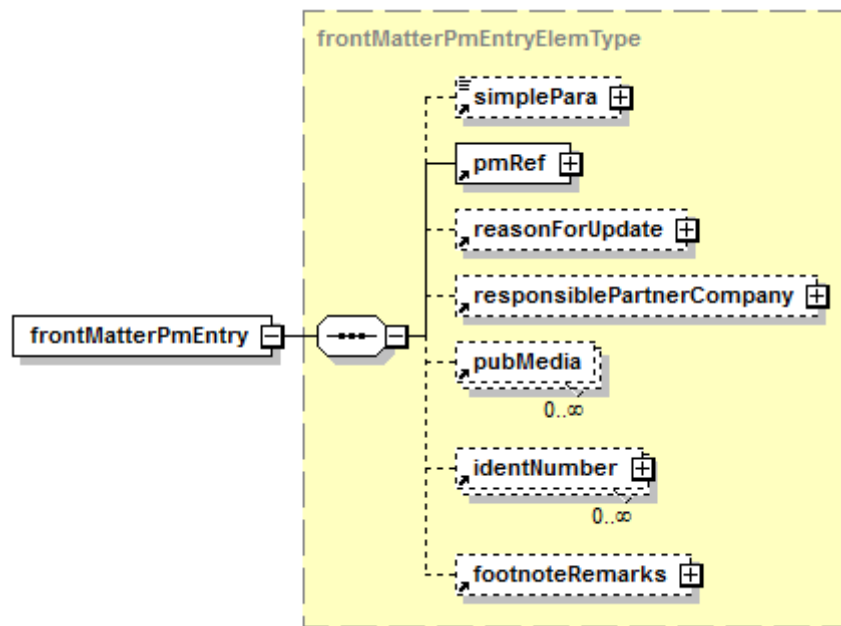

Refer to [Chap 4.9.1](#).

- [<identNumber>](#). Refer to [Para 2.3.1.6.5](#).
- [<footnoteRemarks>](#). Refer to [Chap 3.9.5.2.1.9](#).
- [<numberOfPages>](#). The total number of pages in the data module when used for "No. of pages" in the LOEDM and the HIGH with updating procedures. The individual page number when used for "Page" in the LOEP. Refer to [Para 2.3.2.3.6](#).

#### 2.3.3.2.8 *Front matter publication module entry*

**Description:** The element [<frontMatterPmEntry>](#) contains the publication module entry.

**Markup element:** [<frontMatterPmEntry>](#)

ICN-S3627-S1000D0590-001-01

Fig 28 Element &lt;frontMatterPmEntry&gt;

#### Attributes:

- issueType (O). Refer to [Para 2.3.3.2.10](#).
- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#) and to [Para 2.3.3.2.11](#).

#### Child elements:

- <simplePara>. Used for simple statements. Not specifically required by any of the Front matter types. Refer to [Chap 3.9.5.2.1.10](#).
- <pmRef>. Used for "Title", "Publication module code", issue information "Issue date" and/or Issue No." in LOEP, LOEDM and HIGH, and for "Language" in publication lists for the List of applicable publications (LOAP). Refer to [Para 2.3.2.3.4](#).

#### Note

[Para 2.3.2.3.4](#) contains the mandatory and optional elements related to Table of contents.

The information is authored or derived from the source publication module.

Mandatory elements, depending on the Front matter type, are given in [Chap 3.9.4](#).

- <reasonForUpdate>. Used for "Reason for update" in HIGH where it is mandatory. This is governed by the default BREX data module.

The information is authored or derived from the publication module referenced in the source publication module.

Refer to [Chap 3.9.5.2.1.1](#).

- <responsiblePartnerCompany>. Used for "Publisher" in publication lists for the List of applicable publications.

The information is authored or derived from the publication module referenced in the source publication module.

Refer to [Para 2.3.1.13](#).

- `<pubMedia>`. Used for "Media information" in publication lists for the List of applicable publications.

The information is authored or derived from the publication module referenced in the source publication module.

Refer to [Chap 4.9.1](#).

- `<identNumber>`. Refer to [Para 2.3.1.6.5](#).
- `<footnoteRemarks>`. Refer to [Chap 3.9.5.2.1.9](#). By project decision, the element can be used to store the total number of pages to be presented in LOEDM if the LOEDM includes publications.

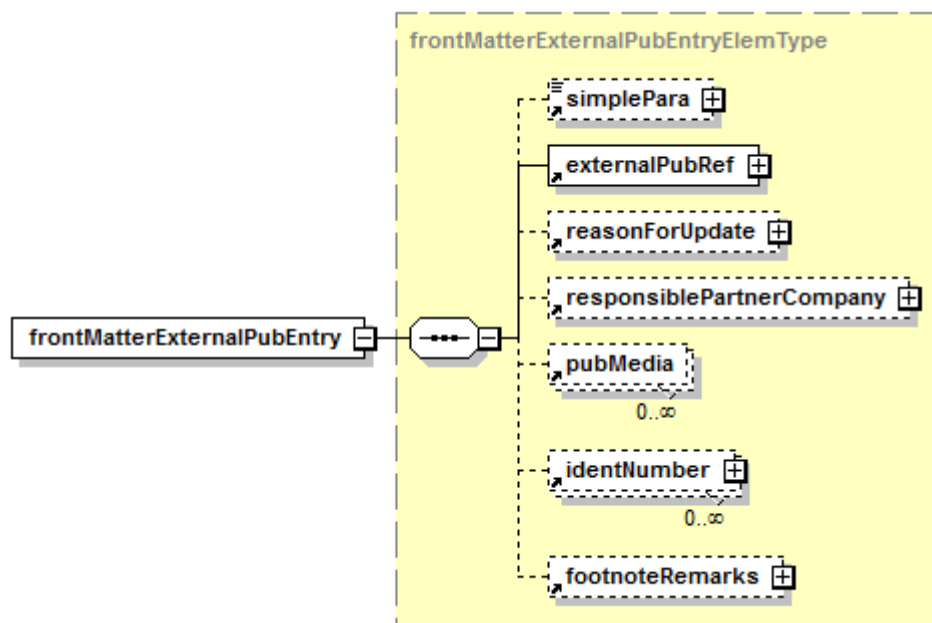

#### Business rule decision point BRDP-S1-00310 - How to store total number of pages for S1000D publications:

- Decide on the use of `<footnoteRemarks>` to store the total number of pages for a complete S1000D publication.

#### 2.3.3.2.9 Front matter non-S1000D publication entry

**Description:** The element `<frontMatterExternalPubEntry>` contains the non-S1000D publication (external publication) entry.

**Markup element:** `<frontMatterExternalPubEntry>`

ICN-S3627-S1000D0591-001-01

Fig 29 Element `<frontMatterExternalPubEntry>`

#### Attributes:

- `issueType` (O). Refer to [Para 2.3.3.2.10](#).
- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#) and to [Para 2.3.3.2.11](#).

#### Child elements:

- [<simplePara>](#). Used for simple statements. Not specifically required by any of the Front matter types. Refer to [Chap 3.9.5.2.1.10](#).
- [<externalPubRef>](#). Used in LOEP, LOEDM and HIGH for:
  - "Titles" ([<externalPubTitle>](#))
  - "Publication module code" ([<externalPubCode>](#))
  - issue information
    - "Issue date" ([<externalPubIssueDate>](#))

and/or

- "Issue No." ([<externalPubIssueInfo>](#))

Can also be used for "Language" in publication lists for the List of applicable publications.

The information is authored or derived from the external publication referenced in the source publication module.

#### Note

"Language" has to be authored as it is not available in the current construct of the element [<externalPubRefIdent>](#).

Refer to [Para 2.3.2.3.5](#).

#### Note

[Para 2.3.2.3.5](#) gives the mandatory and optional related to Table of contents.

Mandatory elements, depending on the Front matter type, are given in [Chap 3.9.4](#).

- [<reasonForUpdate>](#). Used for "Reason for update" in HIGH where it is mandatory. This is governed by the default BREX data module.

The information is authored or derived from the external publication referenced in the source publication module.

Refer to [Chap 3.9.5.2.1.1](#).

- [<responsiblePartnerCompany>](#). Used for "Publisher" in publication lists for the List of applicable publications.

The information is authored or derived from the external publication referenced in the source publication module.

Refer to [Para 2.3.1.13](#).

- [<pubMedia>](#). Used for "Media information" in publication lists for the List of applicable publications.

The information is authored or derived from the external publication referenced in the source publication module.

Refer to [Chap 4.9.1](#).

- [<identNumber>](#). Refer to [Para 2.3.1.6.5](#).
- [<footNoteRemarks>](#). Refer to [Chap 3.9.5.2.1.9](#). By project decision, the element can be used to store the total number of pages to be presented in LOEDM if the LOEDM includes publications.

#### Business rule decision point BRDP-S1-00311 - How to store total number of pages for non-S1000D publications:

- Decide on the use of `<footnoteRemarks>` to store the total number of pages for a complete non-S1000D publication.

#### 2.3.3.2.10 Issue type

The attribute `issueType` contains the issue status of the entry and can be used to generate the value to be presented on the LOEP, LOEDM and HIGH.

#### 2.3.3.2.11 Applicability of Front matter lists entries

Care must be taken on the use of the attribute `applicRefId` as it appears on several levels. If there is a mismatch, the lowest level must take precedence as this is the value given in the referenced data module, publication and non-S1000D publication.

#### 2.3.3.3 Footnotes

The element `<footnote>` must not include any lists or make references to other footnotes. Refer to default BREX rule BREX-S1-00130.

Refer to [Chap 3.9.5.2.1.10](#).

### 3 Markup examples

The markup behind [Fig 3](#) and [Fig 4](#) (also presented in [Chap 6.2.3.1](#)), S1000DBIKE-AAA-DA2-20-0000-00A-001A-A is given in [Chap 6.2.3.1](#).

Markup examples of front matter data modules originated from publication module PMC-X4-B6865-AMP00-00\_004-01 are given in [Chap 6.2.3.1](#) and include:

- title page - TITLE
- non-hierarchical table of contents - TOC
- hierarchical table of contents - TOC

#### Note

This TOC is originated from PMC-E2-B6865-EMP72-00\_016-00.

- list of effective data modules - LOEP
- list of effective data modules - LOEDM
- change record - CR
- a highlight page - HIGH
- highlight page with updating instructions - HIGH
- technical standard record - TSR

### References

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.2.16</a>	Content section - Front matter
<a href="#">Chap 6.2.3.1</a>	Layout rules and examples - Front matter data modules

## 1 General

This chapter contains the XML markup of the element `<content>` behind:

- the title page, S1000DBIKE-AAA-DA2-20-0000-00A-001A-A, as presented in and [Chap 3.9.5.2.16](#) and [Chap 6.2.3.1](#). Refer to [Para 2.1](#).
- a set of front matter data modules originated from publication module PMC-X4-B6865-AMP00-00\_004-01 as presented in [Chap 6.2.3.1](#) and include:
  - title page - TITLE. Refer to [Para 2.2.1](#).
  - non-hierarchical table of contents - TOC. Refer to [Para 2.2.2](#).
  - hierarchical table of contents - TOC. Refer to [Para 2.2.3](#).

#### Note

This TOC is originated from PMC-E2-B6865-EMP72-00\_016-00.

- list of effective data modules - LOEP. Refer to [Para 2.2.4](#).

- list of effective data modules - LOEDM. Refer to [Para 2.2.5](#).
- change record - CR. Refer to [Para 2.2.6](#).
- highlight page - HIGH. Refer to [Para 2.2.7](#).
- highlight page with updating instructions - HIGH. Refer to [Para 2.2.8](#).
- technical standard record - TSR. Refer to [Para 2.2.9](#).

The Front matter data modules are provided as a download package (S1000D-4-2\_FM-Samples.zip), which contains XML, PDF representations of the XML and PDF presentation examples of each front matter data module. The package can be downloaded from [www.s1000d.org](http://www.s1000d.org).

The set of Front matter data modules XML files, originated from the publication module PMC-X4-B6865-AMP00-00\_004-01, can be used for setting up an and test an automated process to produce the basic front matter data modules.

## 2 Markup examples

### 2.1 Example of a basic title page

This example shows the markup of S1000DBIKE-AAA-DA2-20-0000-00A-001A-A:

## 2.2 Front matter example package

The following markup examples show a set of Front matter data modules. The set can be used for setting up an automated process to produce the basic front matter data modules originated from the publication module PMC-X4-B6865-AMP00-00\_004-01. The Front matter example package is available for download at [www.s1000d.org](http://www.s1000d.org). Their page-oriented presentations are given in [Chap 6.2.3.1](#).

### 2.2.1 Example of a title page - TITLE

This example shows a title page, X4-A-00-00-00-00A-001A-A.

Chap 3.9.5.2.17

## 1 General

This chapter describes the Schema which is used to capture and represent SCO content information.

The granularity of SCO content data modules must follow the breakdown reflected by the SNS and the information codes, and must reflect the necessity of training information.

## 2 SCO content information

### 2.1 Schema basic rules

The SCO content Schema is composed of elements used to provide references to external SCO or S1000D managed references defining a hierarchy of training steps.

The SCO content Schema is used to define the aggregation of training information.

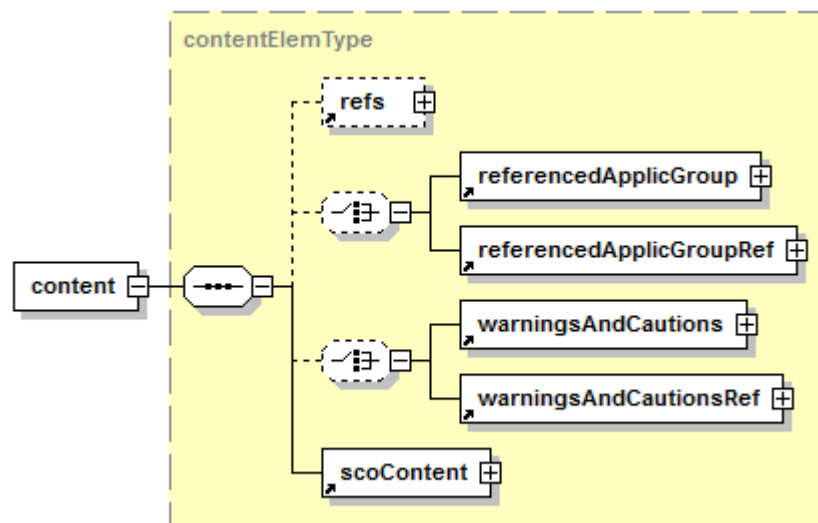

#### Note

An external SCO is an existing aggregation of SCORM conformant content managed outside of S1000D. A training step is a grouping of related training content and can be defined by references to one or more data modules, or by references to portions of data module content.

### 2.2 Content

**Description:** The element `<content>` contains the Content section of the SCO content data module.

**Markup element:** `<content>`

ICN-AH019-S1000D0001-001-01

Fig 1 Major elements in SCO content

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

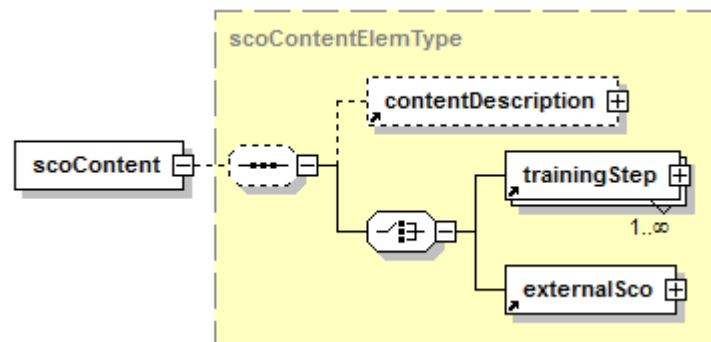

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).

- <referencedApplicGroupRef>. Refer to [Chap 3.9.5.3](#).
- <warningsAndCautions>. Refer to [Chap 3.9.3](#).
- <warningsAndCautionsRef>. Refer to [Chap 3.9.3](#).
- <scoContent>. Refer to Para [2.3](#).

## 2.3 SCO content

**Description:** The element <scoContent> is the container for SCORM content data of the SCO content data module. This element can be populated with references to external SCO (not defined using S1000D data), or by a sequence of training steps.

**Markup element:** <scoContent>

ICN-AH019-S1000D0002-001-01

Fig 2 Element <scoContent>

### Attributes:

- scoEntryType (O), the categorization of the type of SCO. The type of SCO can be assigned by the needs of the project or the organization, or by the SCORM asset type definitions. The attribute can have one of the following values:
  - "scot01" thru "scot99". Refer to [Chap 3.9.6.1](#).
- warningRefs (O), the warning reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).
- cautionRefs (O), the caution reference to the warnings and cautions collection. Refer to [Chap 3.9.3](#).

### Child elements:

- <contentDescription>. Refer to Para [2.3.1](#).
- <trainingStep>. Refer to Para [2.3.2](#).
- <externalSco>. Refer to Para [2.3.3](#).

**Business rule decision point BRDP-S1-00313 - Use of the element <contentDescription> in the element <scoContent>:**

- Decide whether and how to use the element <contentDescription> (eg, to add information about the training resource).

**Business rule decision point BRDP-S1-00314 - Use of the element <contentDescription> in the element <trainingStep>:**

- Decide whether and how to use the element <contentDescription> (eg, to add information about the content defined in the training step).

### 2.3.1 Content description

**Description:** The element `<contentDescription>` supports the insertion of annotations concerning the content of the SCO content data module.

**Markup element:** `<contentDescription>`

ICN-AH019-S1000D0003-001-01

Fig 3 Element `<contentDescription>`

**Attributes:**

- None

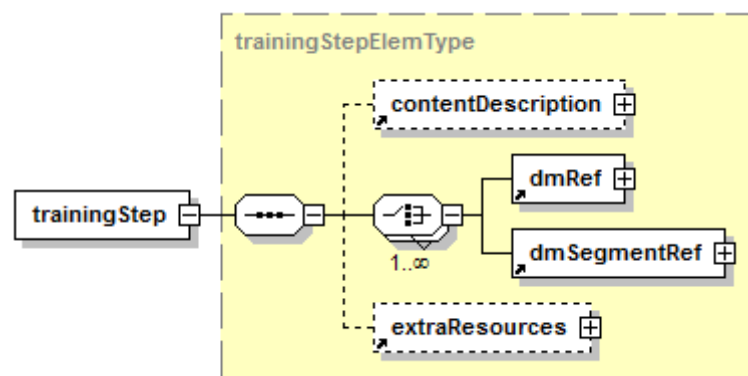

**Child elements:**

- `<simplePara>`. Refer to [Chap 3.9.5.2.1.10](#).

### 2.3.2 Training step

**Description:** The element `<trainingStep>` is used for the arrangement of SCO content data module content into sections of related training content to be presented as a unit.

**Markup element:** `<trainingStep>`

ICN-AH019-S1000D0004-001-01

Fig 4 Element `<trainingStep>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

**Child elements:**

- `<contentDescription>`, supports the insertion of annotations concerning the content of the training step. Refer to Para [2.3.1](#).
- `<dmRef>`, establishes a reference to an existing data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<dmSegmentRef>`, establishes a reference to a portion of an existing data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<extraResources>`. Refer to Para [2.3.2.1](#).

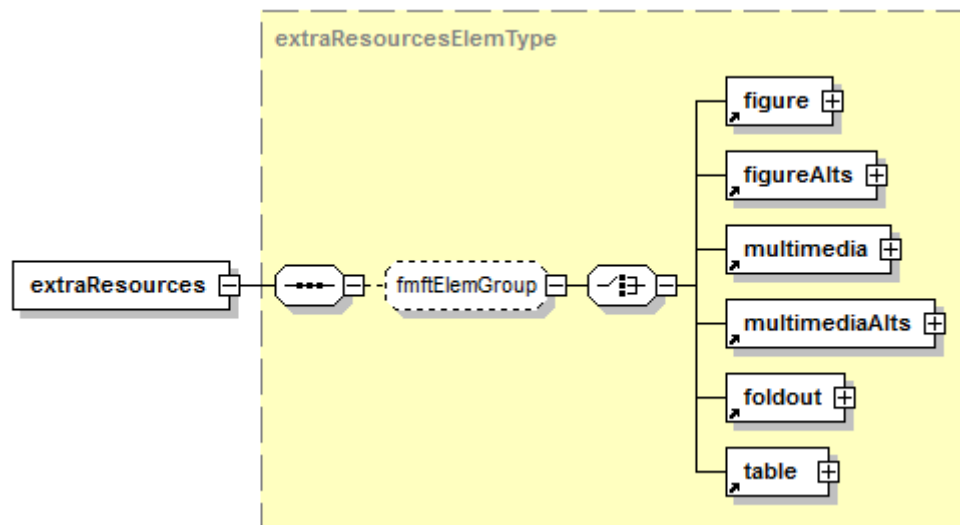

**Business rule decision point BRDP-S1-00315 - Use of the element**  
**<contentDescription>:**

- Decide whether the optional element <contentDescription> must be used to add information about the content defined in the training step.

### 2.3.2.1 Extra resources

**Description:** The element <extraResources> is used to refer to figures, tables and multimedia objects required by the training step.

**Markup element:** <extraResources>

ICN-AH019-S1000D0005-001-01

Fig 5 Element <extraResources>

**Attributes:**

- None

**Child elements:**

- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).

### 2.3.3 External SCO

**Description:** The element <externalSco> is used within a SCO content data module to establish data links to existing SCO that are not managed in accordance with S1000D. The linking mechanism is the same as that used to refer from a data module to any non-S1000D publication or document.

**Markup element:** <externalSco>

ICN-AH019-S1000D0006-001-01

Fig 6 Element `<externalSco>`
**Attributes:**

- None

**Child elements:**

- `<externalPubRef>`, contains the identification of a referenced non-S1000D publication or document. Refer to [Chap 3.9.5.2.1.2](#).

### 3

#### 3.1

## Examples

### Example using training steps definition

The following is a markup example of a SCO content data module that defines the learning object by referring to existing S1000D data.

```
<scoContent>
<trainingStep>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="041" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef>
</trainingStep>
<trainingStep>
<dmSegmentRef
targetPath="/dmodule/content/description/levelledPara[2]/
levelledPara[2]">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="043" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmSegmentRef>
<dmSegmentRef
targetPath="/dmodule/content/description/levelledPara[2]/
levelledPara[4]">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="043" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmSegmentRef>
```

```
<dmSegmentRef
targetPath="/dmodule/content/description/levelledPara[2]/
levelledPara[3]">
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="043" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmSegmentRef>
</trainingStep>
</scoContent>
```

### 3.2 Example using external SCO invocation

The following is a markup example of a SCO content data module by referring to an external SCO that is not defined using S1000D data.

```
<scoContent>
<externalSco>
<externalPubRef>
<externalPubRefIdent>
<externalPubTitle>History of cycling</externalPubTitle>
</externalPubRefIdent>
<externalPubRefAddressItems>
<externalPubIssueDate day="16" month="04" year="2010"/>
<responsiblePartnerCompany enterpriseCode="AH019">
<enterpriseName>Isselnord</enterpriseName>
</responsiblePartnerCompany>
</externalPubRefAddressItems>
</externalPubRef>
</externalSco>
</scoContent>
```

## 1 General

Applicability information allows the technical author to specify which data is appropriate in what situations. The S1000D applicability model supports simple to very complex implementations. [Chap 4.14](#) and subchapters provide an overview of applicability. It is recommended that these chapters have been read and the concepts understood before reading this chapter and subchapters.

This chapter covers general applicability implementation issues and the implementation of applicability annotations that are used within data modules.

- [Chap 3.9.5.3.1](#) covers the authoring and implementation of the Applicability Cross-reference Table (ACT) data module
- [Chap 3.9.5.3.2](#) covers the authoring and implementation of the Conditions Cross-reference Table (CCT) data module
- [Chap 3.9.5.3.3](#) covers the authoring and implementation of the Products Cross-reference Table (PCT) data module

## 2 Applicability

### 2.1 Overall concepts

#### 2.1.1 Data module applicability versus content applicability

The data module applicability (specified in the data module identification and status section) for the whole data module always applies to all parts of the content.

Within the content section, however, it is often necessary to indicate applicability at a more granular level than the data module as a whole. This is known as the content applicability and is used to restrict the applicability for a substructure of the data module, compared to that of the whole data module.

The description, known as an applicability annotation, of the content applicability limitations is collected in the element `<referencedApplicGroup>` within the element `<content>` of the data module or in the applicability annotations Common Information Repository (CIR) data module in case of externalized applicability.

When an element is affected by a content applicability, the attribute `applicRefId` (or `applicRefIds` in some contexts) is used to provide a link to its applicability annotation. This applicability annotation applies to the complete substructure of the element. Duplication within that substructure is, therefore, not required as it will have no effect.

However, different applicability annotations can be applied within substructures. In these cases the following rules apply:

- content applicability must not conflict with or contradict the data module applicability
- content applicability applied within the substructure of an element must not conflict with or contradict the applicability of that element's applicability
- when an internal reference is made within a data module, the content applicability of both the source and target of the reference must not conflict with or contradict each other

#### Note

When using a content applicability within a data module, the presentation system's capability to display (or not display) applicability annotations must be taken into account.

### 2.1.2 Applicability branches

An applicability annotation is stored in the element `<applic>` and has the same construct whether applied to the whole data module or to a part of the content and whether externalized or not.

The element `<applic>` has two logical branches (three branches for process data modules) which are used for separate purposes:

- A human-readable applicability annotation, which consists of the element `<displayText>` that provides human-readable applicability information. This branch can be used in conjunction with either of the other two branches as required.
- A computable applicability annotation, which consists of the elements `<assert>` and `<evaluate>` that provide applicability information in a computable format which can be used to support dynamic display of the annotated content.
- Process data module applicability expression, which consists of the element `<expression>` that provides an applicability expression for the logic engine with the process data module. This branch is used only within process data modules.

This three-branched model is intended to aid the author in simplifying the structure and easily identifying which branch is used for what purpose. The actual applicability S1000D model is more complex than three branches with some elements duplicated. This more complex model enforces strict validation.

### 2.1.3 Collecting content applicability

Content applicability must be collected directly under the element `<content>`, using the element:

- `<referencedApplicGroup>`, meaning the content applicability is directly collected into the data module, or
- `<referencedApplicGroupRef>`, meaning the applicability is externalized and collected into the applicability annotations CIR data module

When the applicability annotations CIR data module is used, the elements `<applicRef>` (in the CIR data module identification and status section) and `<referencedApplicGroupRef>` (in the CIR data module content section) must be used to externalize the data module applicability and the referenced applicability.

#### Note

There is an exception to the above for the applicability annotations CIR data module itself (refer to default BREX rule BREX-S1-00131), in which elements `<applic>` (in the data module status) and `<referencedApplicGroup>` (in the data module content) must be used (refer to default BREX rule BREX-S1-00132).

When the applicability annotations CIR data module is not used, the elements `<applic>` (in the identification and status section of the data module affected by the applicability) and `<referencedApplicGroup>` (in the data module content section) must be used.

### 2.1.3.1 Intra-data module collection

**Description:** The element `<referencedApplicGroup>` provides a container for collecting the applicability annotations that apply to various parts of the data module. When collected into the data module where the applicability annotations are used, the element `<referencedApplicGroup>` (within element `<content>`) must be used.

Applicability annotations collected in the element `<referencedApplicGroup>` can be specified once while referred to many times from within the data module content.

**Markup element:** `<referencedApplicGroup>`

ICN-S1000D-A-03090503-A-FAPE3-00001-A-001-01

Fig 1 Element `<referencedApplicGroup>`

**Attributes:**

- None

**Child elements:**

- `<applic>`, the applicability annotations. Refer to [Para 2.2](#).

### 2.1.3.2 Extra-data module collection

**Description:** The element `<referencedApplicGroupRef>` provides a container for defining references to the externalized applicability annotations that apply to various parts of the data module. When the applicability annotations are externalized (ie, collected into the applicability annotations CIR data module) from the data modules where they are used, the element `<referencedApplicGroupRef>` (within element `<content>`) must be used.

**Markup element:** `<referencedApplicGroupRef>`

ICN-S1000D-A-03090503-A-FAPE3-00002-A-001-01

Fig 2 Element `<referencedApplicGroupRef>`

**Attributes:**

- None

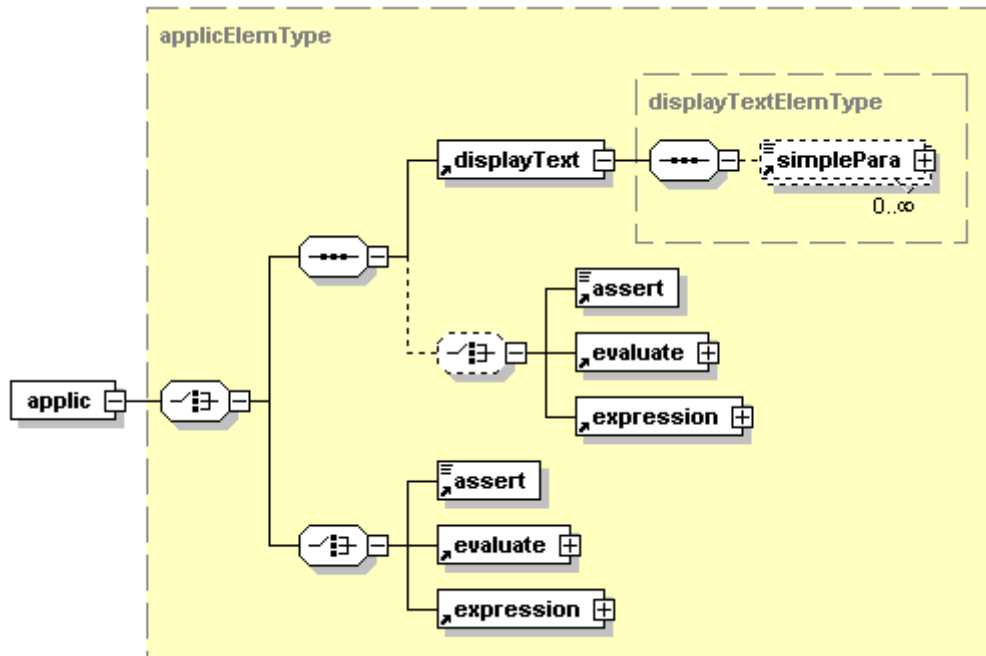

**Child elements:**

- `<applicRef>`, the references to the externalized applicability annotations. Refer to [Chap 3.9.5.2.1.13](#).

## 2.2 Applicability model

**Description:** The element `<applic>` contains the applicability limitations and any text that is displayed (or not) to the user. It is populated by the technical author or generated by the production system during initial authoring and updating activity of the data module.

**Markup element:** `<applic>`

ICN-B6865-S1000D0014-001-01

Fig 3 Element `<applic>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `applicConfiguration` (O), the type of applicability for a given part used only in IPD data modules. The attribute can have one of the following values:
  - `"allowed"` - the part can be installed (with conditions or not) at a given function-position on a given Product
  - `"built"` - the part was installed at a function-position on a Product when it left the factory
  - `"designed"` - the part is included in the engineering configuration
  - `"installed"` - the part is theoretically installed (actual or scheduled) at a given function-position on a given Product
  - `"manufactured"` - the part is included in the manufacturing configuration
  - `"supported"` - the part is included in the support configuration
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<displayText>`, a simple textual annotation. Refer to [Para 2.2.1](#).
- `<assert>`, to perform a single test. Refer to [Para 2.2.2.1](#).
- `<evaluate>`, to create a sub-grouping of additional tests. Refer to [Para 2.2.2.2](#).
- `<expression>`, expression to be evaluated by the logic engine. Refer to [Para 2.2.3](#).

The element `<applic>` must contain one of the following options for content:

- `<displayText>`
- `<assert>` with optional `<displayText>`
- `<evaluate>` with optional `<displayText>`
- `<expression>` with optional `<displayText>` (this option is available only in the process data module). Refer to default BREX rule BREX-S1-00134.

#### Business rule decision point BRDP-S1-00316 - Use of the element `<applic>` in the data module status and content:

- Decide how to use the element `<applic>` and to populate its child elements and attributes across the project or the organization.

### 2.2.1

#### Human-readable applicability annotation branch

**Description:** The element `<displayText>` provides a human-readable and printable branch of the applicability annotation.

For those projects or organizations that do not require computable applicability, the display text is the only part of the applicability annotation needed. For annotations, the repeatable simple paragraph element `<simplePara>` can be used. Refer to [Chap 7.8](#) for the recommended format for the content of element `<displayText>`.

It is possible that auto-generated applicability statements are not completely consistent between processors. In projects or organizations deciding to use both the human-readable branch and one of the computable branches, the applicability annotation represented in both branches must match. In determining whether to populate the `<displayText>` a project or an organization must weigh this fact with the cost of maintaining authored `<displayText>`. Refer to [Chap 7.8](#).

**Markup element:** `<displayText>`. Refer to [Fig 3](#).

#### Attributes:

- None

#### Child elements:

- `<simplePara>`, the text of the applicability annotation. Refer to [Chap 3.9.5.2.1.10](#).

#### Business rule decision point BRDP-S1-00317 - Use of the element `<displayText>` in the element `<applic>`:

- Decide whether the element `<displayText>` is populated by the technical author or generated from the computable branch or some other source when using the human-readable branch of applicability.

**Markup example:**

```
<applic>
<displayText><simplePara>Mountain bicycle, either:</simplePara>
<simplePara>Mountain storm Mkl or Brook trekker
Mk9</simplePara></displayText>
</applic>
```

**2.2.2 Computable applicability annotation branch**

The computable applicability annotation branch is constructed with a set of individual tests which are grouped together to form a computable expression. Each individual test is represented with an element `<assert>` which specifies the product attribute or condition to test and the values to test against. Each grouping is represented with an element `<evaluate>` which associates the child elements together along with a logical operation to perform, either an "and" or an "or" operation. Groupings can contain other groupings and individual tests, thus allowing construction of very complicated expressions where needed.

**2.2.2.1 Single applicability test - assert**

**Description:** The element `<assert>` provides for a single test for the computable branch of the applicability annotation. The assert annotation specifies the product attribute or condition to test and a set of values and/or ranges to test against. The result of evaluating an assert annotation will be a Boolean value of "true" or "false".

In the case where an assert cannot be evaluated due to lack of a value to test against or the case where only a textual annotation is provided (not referencing a product attribute or condition) then the result must be considered the Boolean value "true".

The element `<assert>` can be used to represent a textual applicability annotation which does not have an associated product attribute or condition, meaning there is no test to perform. Examples of textual annotations include "volcanic conditions" and "wind speed over 30 knots". The textual content of element `<assert>` is used to represent the annotation and the attributes `applicPropertyIdent`, `applicPropertyType` and `applicPropertyValues` are not used.

**Markup element:** `<assert>`

**Attributes:**

- `applicPropertyIdent` (O), the identifier of either the product attribute (element `<productAttribute>` attribute `id` from the ACT data module) or the condition (element `<cond>` attribute `id` from the CCT data module) to test. Not used if the element `<assert>` contains text only.
- `applicPropertyType` (O), indicates whether the attribute `applicPropertyIdent` references a product attribute or a condition. This attribute is mandatory if the attribute `applicPropertyIdent` is used, otherwise not used. The attribute can have one of the following values:
  - `"prodattr"` - indicates the attribute `applicPropertyIdent` references a product attribute
  - `"condition"` - indicates the attribute `applicPropertyIdent` references a condition
- `applicPropertyValues` (O), the values and/or ranges to test against. This attribute is mandatory if attribute `applicPropertyIdent` is used, otherwise not used. Refer to [Para 2.2.4](#) for additional information including formatting requirements.

- `applicDisplayClass` (O), provides information that can be used to format the applicability annotation. This can be used by publication systems when generating text in element `<displayText>` or by viewers when printing or displaying the content. Refer to [Chap 7.8](#).

#### Child elements:

- None

#### Markup examples:

Assert textual applicability annotation:

```
<assert>In icy conditions</assert>
```

Assert product attribute test:

```
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker" />
```

Single assert condition test:

```
<applic>
<assert applicPropertyIdent="SB-S001"
applicPropertyType="condition" applicPropertyValues="post" />
</applic>
```

Single assert use of the attribute `applicDisplayClass`:

The following example illustrates an applicability annotation where the project or the organization has decided that hardware configuration related items should be displayed with a certain formatting. The project or the organization has decided to indicate which items get the special formatting by setting the attribute `applicDisplayClass` to the value "`configitem`". This decision, along with the specific formatting, must be documented in the project or the organization business rules.

```
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker" applicDisplayClass="configitem" />
```

#### 2.2.2.2 Grouping applicability tests - evaluate

**Description:** The element `<evaluate>` is used to group tests together and provide the logical operation to apply to the test results. The element `<evaluate>` must be used whenever more than one test, element `<assert>`, is required. The element `<evaluate>` can contain other instances of the element `<evaluate>` and is therefore recursive. This allows for very complicated applicability annotations to be represented with a simple structure consisting of only two element types.

To process the element `<evaluate>` all child elements are evaluated, each providing a Boolean value of "true" or "false". Then the logical "and" or "or" operation is performed on the results, providing a single Boolean result. A result of the value "true" means the associated content is valid and a result of the value "false" means the associated content is not valid. The method of presenting validity is a project or an organization decision. Some projects or organizations will remove invalid content while others will want to de-emphasize the invalid content in some way.

**Markup element:** `<evaluate>`

ICN-S1000D-A-03090503-A-FAPE3-00006-A-001-01

Fig 4 Element &lt;evaluate&gt;

#### Attributes:

- andOr (M), specifies the logical operation to perform on the results of all child elements. The attribute can have one of the following values:
  - "and" - Logical "and". All child element values of true results in the value "true", otherwise "false".
  - "or" - Logical "or". Any child element value of true results in the value "true", otherwise "false".
- applicDisplayClass (O). Refer to [Para 2.2.2.1](#).

#### Child elements:

- <assert>, to perform a single test. Refer to [Para 2.2.2.1](#).
- <evaluate>, to create a sub-grouping of additional tests

#### Business rule decision point BRDP-S1-00318 - Use of the attribute applicDisplayClass within the element <applic>:

- Decide whether to use the attribute applicDisplayClass when using the computable applicability annotation branch.

#### Business rule decision point BRDP-S1-00319 - Use of textual applicability annotations in the element <assert> in the element <evaluate>:

- Decide if textual applicability annotations are allowed in the element <assert> when using the computable applicability annotation branch or if every element <assert> must reference a declared product attribute or condition.

#### Markup examples:

The following example illustrates an applicability annotation where two product attributes are being tested and both must be the Boolean value "true" for the entire applicability to result in the Boolean value "true". The model must be "Brook trekker" and the version must be "Mk9". If either the model or version test results in the Boolean value "false", then the entire applicability results in the Boolean value "false".

```
<applic>
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker"/>
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="Mk9"/>
</evaluate>
</applic>
```

The following example illustrates an applicability annotation where the outer evaluate has a logical "or" operation which means if either of the inner evaluate annotations result in the Boolean value "true" then the entire applicability results in the Boolean value "true". This applicability annotation tests for either a "Mountain storm Mk1" or a "Brook trekker Mk9".

```
<applic>
<evaluate andOr="or">
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Mountain
storm"/>
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="Mk1"/>
</evaluate>
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Brook
trekker"/>
<assert applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValues="Mk9"/>
</evaluate>
</evaluate>
</applic>
```

### 2.2.3 Process data module applicability expression branch

The process data module expression branch is only available in the process data module. The expression structure and authoring considerations are detailed in [Chap 3.9.5.2.10](#). Refer to default BREX rule BREX-S1-00134.

### 2.2.4 Values and ranges (attribute `applicPropertyValues`)

The attribute `applicPropertyValues` provides a single place to define any combination of values and ranges. Two special characters are required to separate values, namely the tilde [~] used to separate values within a range and the vertical bar [|] used to separate values and ranges. These two characters cannot be used as part of a value, but other punctuation characters (eg, slash [/] or hyphen [-]) can be used to express values.

Each individual value or values used in a range must adhere to the value type of the product attribute or condition being tested. The associated product attribute declaration in the ACT data module and the condition declaration in the CCT data module must specify the data type for the product attribute or condition (attribute `valueDataType`, default value "string"). The different data types are detailed in [Chap 3.9.5.3.1](#) and [Chap 3.9.5.3.2](#).

If the associated product attribute declaration in the ACT data module or condition declaration in the CCT data module contains the attribute `valuePattern`, then each value must be compliant to the specified pattern. This pattern must be followed for both individual values and for values used in ranges.

Values and ranges examples:

- To represent the single integer value "1":

```
applicPropertyValues="1"
```

- To represent multiple integer values "1", "3". and "5":

```
applicPropertyValues="1 | 3 | 5"
```

- To represent a range of integer values "1" thru "5":  
`applicPropertyValues="1~5"`
- To represent multiple ranges of integer values "1" thru "5" and "7" thru "10":  
`applicPropertyValues="1~5 | 7~10"`
- To represent a mix of integer values and ranges "1" and "3" thru "5" and "7" and "10" and "15" thru "999":  
`applicPropertyValues="1 | 3~5 | 7 | 10 | 15~999"`
- To represent multiple string values "F/A-18C" and "F/A-18D":  
`applicPropertyValues="F/A-18C | F/A-18D"`
- To represent a range of string values from "F/A-18A" thru "F/A-18D":  
`applicPropertyValues="F/A-18A~F/A-18D"`

#### Note

It is recommended that projects or organizations consider the use of ranges on values that are not numerical sequences. Ranges on some alphanumeric values, if used in the human-readable display text, can be difficult to understand and can be misinterpreted by users.

## 3

### 3.1

## Examples

### Referenced applicability

The following examples illustrate the use of the element `<referencedApplicGroup>` within element `<content>` and the use of attribute `applicRefId` within the content section.

Example 1: The following example is primarily used for explanation of how to display the applicability statements.

The example sets the data module applicability to Serial Numbers (SN) 1 thru 100. Also, four applicability groups (`applic_1-50`, `applic_1-10`, `applic_11-20` and `applic_21-100`) are defined which will be referenced by the markup example. The presentation of this example is given in [Chap 6.2.2](#).

#### Note

For simplicity reasons, this example uses only the element `<proceduralStep>`. For an example where the element `<proceduralStepAlts>` is used, refer to S1000DBIKE-AAA-D00-00-00-00AA-258B-A which is technically the same procedure as S1000DBIKE-AAA-D00-00-00-00AA-258A-A not using the alternates concept.

## 3.2 Applicability annotations

Example 1: An applicability annotation based on model, version and maintenance level criteria.

The applicability annotation indicates that the associated technical data is:

- applicable for "Mountain storm Mk1" bicycles at maintenance level 1 or 2
- applicable for "Brook trekker Mk9" bicycles

```

<applic>
<displayText><simplePara>Type: Mountain bicycle (Model: Mountain
storm Version: Mk1 Maintenance level: 1, 2) or (Model: Brook
trekker Version: Mk9)</simplePara></displayText>
<evaluate andOr="and">
<assert applicPropertyIdent="type" applicPropertyType="prodattr"
applicPropertyValues="Mountain bicycle"/>
<evaluate andOr="or">
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValues="Mountain
storm"/>

```

```
<assert applicPropertyIdent="version"
applicPropertyType="prodattrib" applicPropertyValues="Mk1"/>
<assert applicPropertyIdent="mntlvl"
applicPropertyType="condition"
applicPropertyValues="ml01|ml02"/>
</evaluate>
<evaluate andOr="and">
<assert applicPropertyIdent="model"
applicPropertyType="prodattrib" applicPropertyValues="Brook
trekker"/>
<assert applicPropertyIdent="version"
applicPropertyType="prodattrib" applicPropertyValues="Mk9"/>
</evaluate>
</evaluate>
</evaluate>
</applic>
```

Example 2: An applicability annotation based on individual Product information criteria (from Serial number "1" thru "10").

The applicability annotation indicates that the associated technical data is:

- applicable for Serial numbers "1", "2" and "5" thru "10" (no technical conditions or operational conditions need be considered)
- applicable under condition for Serial numbers "3" and "4" if Service Bulletin SB-0001 has been applied

```
<applic>
<displayText><simplePara>SN: 1-2, 5-10 or (SN: 3-4 Post SB SB-
0001)</simplePara></displayText>
<evaluate andOr="or">
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattrib" applicPropertyValues="1~2|5~10"/>
<evaluate andOr="and">
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattrib" applicPropertyValues="3~4"/>
<assert applicPropertyIdent="SB-0001"
applicPropertyType="condition" applicPropertyValues="Post"/>
</evaluate>
</evaluate>
</applic>
```

### 3.3 Tying it all together

The following example illustrates how the components of applicability work together to build an applicability annotation from the technical authoring viewpoint.

#### Note

This example illustrates a manual process for finding the information needed to build an applicability annotation.

In this scenario, a technical author has been instructed to add an applicability annotation to the content of an element `<proceduralStep>` within a procedural data module. The applicability annotation represents the condition where serial number is "1B070643" thru "1B070699" and Service bulletin "S001" is installed (post).

The technical author must first identify the product attribute or condition identifiers associated with the serial number and the Service bulletin "S001". The referenced ACT data module is located by looking in the status section of the procedural data module for the element `<applicCrossRefTableRef>`.

```
<applicCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</applicCrossRefTableRef>
```

Within the ACT data module, the technical author looks for product attributes (element `<productAttribute>`) which represent the serial number and the Service bulletin "S001". The child elements `<name>` and `<descr>` provide the information needed to make this decision. Within the ACT data module, the following product attribute declaration is found for the serial number.

#### Note

In this example, the product attribute is also a primary identifier. Refer to [Chap 3.9.5.3.1](#) for more information on the attribute `productIdentifier`.

```
<productAttribute id="serialno" productIdentifier="primary">
<name>Serial number</name>
<displayName>SN</displayName>
<descr>Serial number etched on the frame</descr>
</productAttribute>
```

The technical author notes the value "serialno" of attribute `id`, which is needed to build the applicability annotation. No product attribute is found which represents Service bulletin "S001", so the technical author must next look in the CCT data module for a condition representing Service bulletin "S001". The referenced CCT data module is located by looking in the content section of the ACT data module for the element `<condCrossRefTableRef>`.

```
<condCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00Q" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</condCrossRefTableRef>
```

Within the CCT data module, the technical author looks for conditions (element `<cond>`) which represent the Service bulletin "S001". The child elements `<name>` and `<descr>` provide the information needed to make this decision. Within the CCT data module, the following condition declaration is found for the Service bulletin "S001":

```
<cond condTypeRefId="SB" id="SB-S001">
<name>Service bulletin S001 - Chain guard</name>
<descr>Service bulletin S001 for the installation of the chain
guard</descr>
</cond>
```

The technical author notes the value "SB-S001" of attribute `id`, which is needed to build the applicability annotation.

The applicability annotation can now be constructed using the product attribute and condition identifiers from the ACT and CCT data modules and the known values to test for. The following applicability annotation is added to the status section element

`<referencedApplicGroup>` of the procedural data module:

```
<referencedApplicGroup>
...
<applic id="appl-006">
<evaluate andOr="and">
<assert applicPropertyIdent="serialno"
applicPropertyType="prodattr"
applicPropertyValues="1B070643~1B070699"/>
<assert applicPropertyIdent="SB-S001"
applicPropertyType="condition" applicPropertyValues="post"/>
</evaluate>
</applic>
...
</referencedApplicGroup>
```

Finally, the applicability annotation is applied to the appropriate content within the procedural data module:

```
<proceduralStep applicRefId="appl-006">
...
</proceduralStep>
```

## 1 General

The Applicability Cross-reference Table (ACT) data module is used to declare product attributes. A product attribute is a property of the Product that has an effect on the applicability of technical data. Product attributes are properties of the Product that are typically set at the time of manufacture of a product instance and will usually not change throughout the service life of a product instance. Examples of product attributes are model, series and serial number.

The ACT data module serves as the central point of reference for applicability declarations. It provides references to the Conditions Cross-reference Table (CCT) and Products Cross-reference Table (PCT) data modules. By referencing the ACT data module in the status section, all other data modules will be able to access all declarations of product attributes and conditions as well as actual values for product instances.

[Chap 4.14](#) and subchapters provide an overview of applicability. It is recommended that these chapters have been read and the concepts understood before reading this chapter.

The ACT XML Schema contains two branches:

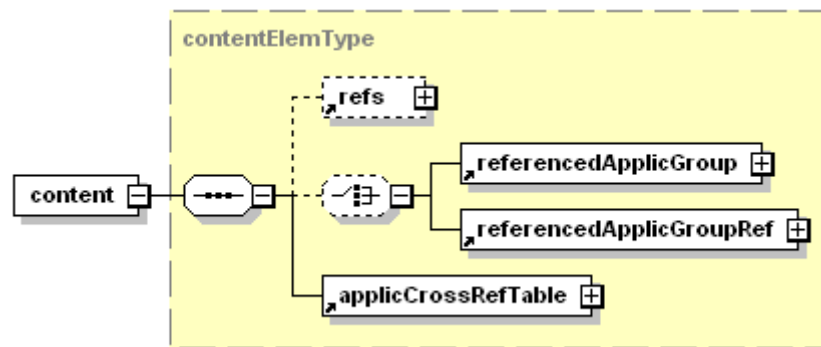

- the applicability cross-reference table catalog (element `<applicCrossRefTableCatalog>`). Refer to [Chap 3.9.5.3.4](#).
- the applicability cross-reference table data module itself, which is described in this chapter. There are three components of the ACT data module:
  - Product attributes - element `<productAttributeList>`, to define the product attributes
  - Reference to the CCT data module - element `<condCrossRefTableRef>`
  - Reference to the PCT data module - element `<productCrossRefTableRef>`

## 2 ACT data module content

### 2.1 Content

**Description:** The element `<content>` contains the content section of the ACT data module or the ACT catalog data module.

**Markup element:** `<content>`

ICN-S1000D-A-03090503-A-FAPE3-00036-A-001-01

Fig 1 Major elements in ACT content

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

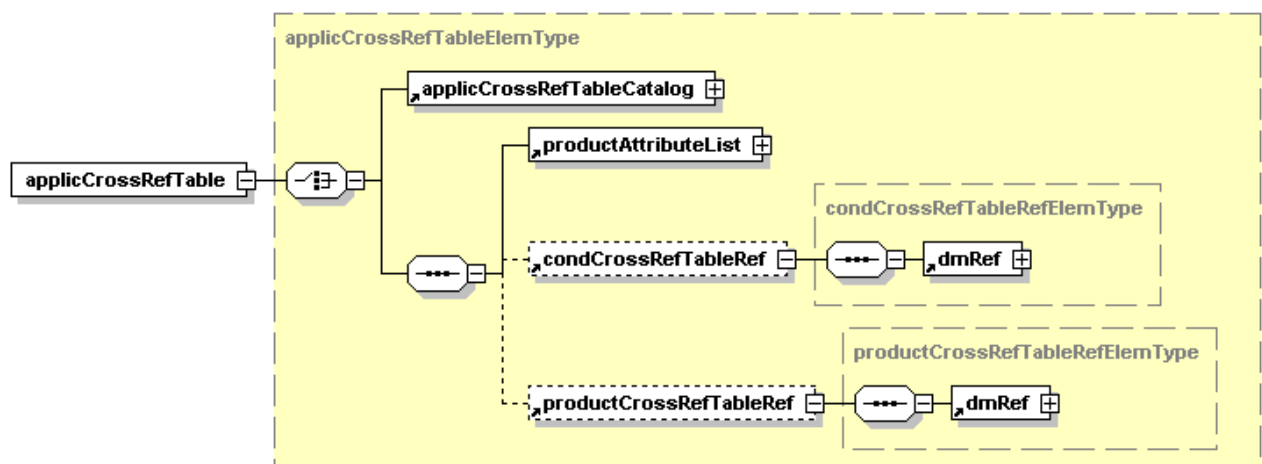

#### Child elements:

- `<refs>`, the references to data modules, publication modules and non-S1000D publications or documents given in the data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`, the applicability annotations directly collected in the data module. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`, the applicability annotations collected in the data module using the applicability annotations CIR. Refer to [Chap 3.9.5.3](#).
- `<applicCrossRefTable>`. Refer to [Para 2.2](#).

## 2.2 Applicability cross-reference table

**Description:** The element `<applicCrossRefTable>` contains the content of the ACT data module or the ACT catalog data module.

**Markup element:** `<applicCrossRefTable>`

ICN-B6865-S1000D0015-001-01

Fig 2 Applicability cross-reference table

#### Attributes:

- None

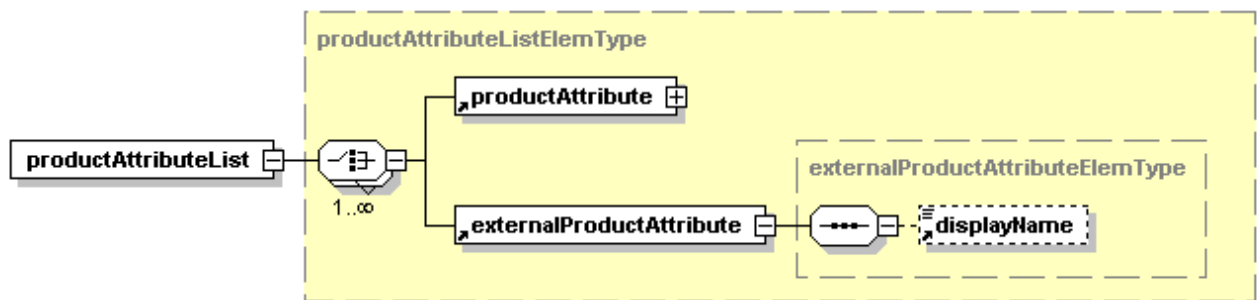

#### Child elements:

- [<applicCrossRefTableCatalog>](#), the ACT catalog. Refer to [Chap 3.9.5.3.4](#).
- [<productAttributeList>](#). Refer to [Para 2.3](#).
- [<condCrossRefTableRef>](#). Refer to [Para 2.4](#).
- [<productCrossRefTableRef>](#). Refer to [Para 2.5](#).

## 2.3 Product attributes

**Description:** The element [<productAttributeList>](#) contains a list of attributes of the Product. The values for product attributes will typically not change throughout the service life of product instance.

**Markup element:** [<productAttributeList>](#)

ICN-B6865-S1000D0016-001-01

Fig 3 Element [<productAttributeList>](#)

#### Attributes:

- None

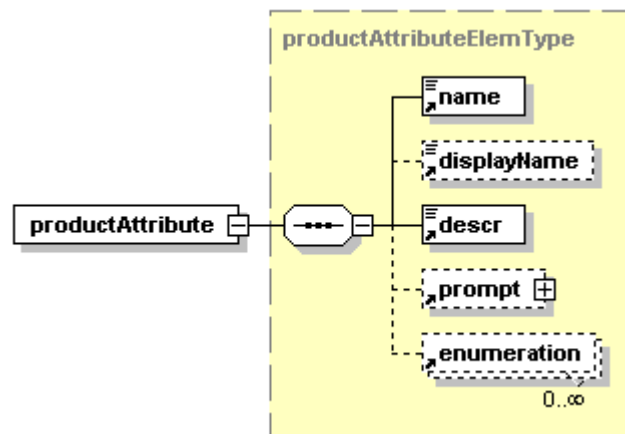

#### Child elements:

- [<productAttribute>](#). Refer to [Para 2.3.1](#).
- [<externalProductAttribute>](#). Refer to [Para 2.3.2](#).

### 2.3.1 Product attribute

**Description:** The element [<productAttribute>](#) is used to declare a single attribute of the Product, such as "serial number" or "model".

**Markup element:** [<productAttribute>](#)

ICN-B6865-S1000D0005-001-01

Fig 4 Element `<productAttribute>`

#### Attributes:

- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `valueDataType` (O), the data type of the product attribute. The attribute can have one of the following values:
  - `"string"` (D) - for classical character chains
  - `"boolean"` - for Boolean values (`"true"` or `"false"`)
  - `"integer"` - for integer values, which are numeric and contain no decimal point
  - `"real"` - for real values, which are numeric and contain a decimal point
- `valuePattern` (O), a pattern specifying the allowable structure for each value in the attribute `applicPropertyValues` in the element `<enumeration>`. The attribute `valuePattern` must only be used when the attribute `valueDataType` has the value `"string"` (refer to default BREX rule BREX-S1-00135). The pattern follows the XML Schema regular expression rules as described in the specification "REC-xmlschema-2-20041-28 W3C Recommendation: XML Schema Part 2: Datatypes Second Edition (2004 Second Edition)".
- `productIdentifier` (O), indicates whether this specific product attribute is a unique identifier for a specific product instance. An example might be a "serial number" product attribute. The attribute can have one of the following values:
  - `"no"` (D), indicates that the product attribute cannot be used to identify a specific product instance
  - `"primary"` - indicates that the specific product attribute is the preferred attribute to use for selecting a specific product instance. When a product attribute is identified as a primary Product identifier, it must be included in the PCT.
  - `"secondary"` - indicates an optional search key for identifying a specific product instance. When a product attribute is identified as a secondary Product identifier, it can be included in the PCT product description, but it is not required.
- `aliasFlag` (O), indicates that the product attribute has an equivalent product attribute within another ACT. This attribute must only be used by projects or organizations implementing the ACT catalog. Refer to [Chap 4.14.4](#). In this case, the ACT catalog must

provide the corresponding alias relationship. The attribute can have one of the following values:

- "1" - Yes, for a product attribute with an alias relationship defined in the ACT catalog
- "0" - No, for a product attribute with no alias relationship

#### Child elements:

- `<name>`, the name of the product attribute. Refer to [Chap 3.9.5.2.1.10](#).
- `<displayName>`. Refer to [Para 2.3.1.1](#).
- `<descr>`. Refer to [Para 2.3.1.2](#).
- `<prompt>`. Refer to [Para 2.3.1.3](#).
- `<enumeration>`. Refer to [Para 2.3.1.4](#).

#### Business rule decision point BRDP-S1-00320 - Use of the attribute `valuePattern` and the element `<enumeration>` or to use open text when using ACT:

- Decide whether to specify the allowable values for a product attribute achieved by using both the attribute `valuePattern` and the element `<enumeration>` or to allow open text without using the attribute `valuePattern` and the element `<enumeration>`.

#### Markup example:

```
<productAttribute id="serialNumber">
  <name>Serial number</name>
  <displayName>SN</displayName>
  <descr>Serial number etched on the bicycle frame</descr>
  <prompt>
    <paraBasic>Serial Number (locate under the bottom bracket where
    the two pedal cranks meet)</paraBasic>
  </prompt>
</productAttribute>
```

#### 2.3.1.1

##### Display name

**Description:** The element `<displayName>` defines text which can be used to help automated generation of the human-readable display text on an applicability annotation. Refer to [Chap 7.8](#).

**Markup element:** `<displayName>`

#### Attributes:

- None

#### Child elements:

- None

#### Business rule decision point BRDP-S1-00321 - Use of the element `<displayName>` in the element `<productAttribute>` when using ACT:

- Decide whether to use the element `<displayName>`.

#### Markup example:

```
<displayName>SN</displayName>
```

2.3.1.2 Description  
**Description:** The element <descr> contains further clarification of the meaning of the product attribute. This value can be used to assist the technical author in the selection of the appropriate product attribute when building an applicability annotation.

**Markup element:** <descr>

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

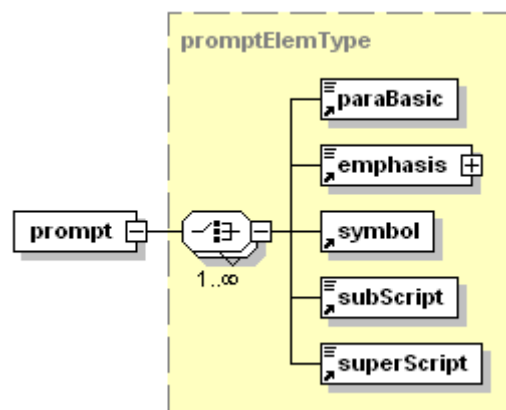

- None

**Markup example:**

```
<descr>Serial number etched on the bicycle frame</descr>
```

2.3.1.3 Prompt  
**Description:** The element <prompt> contains specific text that can be used to create a dialog in order to obtain values for product attributes or conditions from an end user. It is recommended for projects or organizations to provide a prompt in order for the viewer to present a complete and coherent dialog when eliciting the value of the attribute from the user.

**Markup element:** <prompt>

ICN-S1000D-A-03090503-A-FAPE3-00011-A-001-01

Fig 5 Element <prompt>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- textDisplayPosition (O), the text display placement in relationship to the data entry or selection. The attribute can have one of the following values:
  - "top" - the prompt is positioned above the data entry information
  - "bottom" - the prompt is positioned below the data entry information
  - "right" - the prompt is positioned right of the data entry information
  - "left" - the prompt is positioned left of the data entry information

**Child elements:**

- <paraBasic>, a line of text. Refer to [Chap 3.9.5.2.10.3](#).

- `<emphasis>`, text that is intended to be presented highlighted. Refer to [Chap 3.9.5.2.1.10](#).
- `<symbol>`, symbols. Refer to [Chap 3.9.5.2.1.10](#).
- `<subScript>`, text that is intended to be presented subscripted. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`, text that is intended to be presented superscripted. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<prompt>
<paraBasic>Serial Number (locate under the bottom bracket where
the two pedal cranks meet)</paraBasic>
</prompt>
```

#### 2.3.1.4 Enumeration

**Description:** The element `<enumeration>` contains the allowable values for the product attribute. The allowable values can be used to assist the technical author in creating applicability annotations.

The element `<enumeration>` is optional and repeatable. If there are multiple values and ranges to define, several methods can be employed, including the following:

- single element `<enumeration>` with attribute `applicPropertyValues` representing the entire set of values and ranges
- multiple element `<enumeration>` with attribute `applicPropertyValues` representing a single value or range

**Markup element:** `<enumeration>`

**Attributes:**

- `applicPropertyValues` (M), defines the values and ranges of values that are allowed for this product attribute. If the parent element `<productAttribute>` includes the attribute `valuePattern`, the individual values used in the attribute `applicPropertyValues` must be compliant to the specified pattern. Refer to [Chap 3.9.5.3](#) for more information on the usage of this attribute.
- `enumerationLabel` (O), defines the display label in an interactive selection dialog for the value defined by the attribute `applicPropertyValues`. If `enumerationLabel` is specified, the attribute `applicPropertyValues` cannot specify a range or list of values. Refer to default BREX rule BREX-S1-00136. It is recommended for projects or organizations to provide enumeration labels in order for the viewer to present a complete and coherent dialog when eliciting the value of the attribute from the user.
- `aliasFlag` (O), indicates that the product attribute value has an equivalent product attribute value within another ACT. This attribute must be used only by projects or organizations implementing the ACT catalog. Refer to [Chap 4.14.4](#). In this case, the ACT catalog must provide the corresponding alias relationship. The attribute can have one of the following values:
  - "1" - Yes, for a product attribute value with an alias relationship defined in the ACT catalog
  - "0" - No, for a product attribute value with no alias relationship

#### Child elements:

- None

**Business rule decision point BRDP-S1-00322 - Method of defining multiple values or ranges for the element [<enumeration>](#) in the ACT:**

- Decide whether to use a single element [<enumeration>](#) containing the entire set or to use multiple elements [<enumeration>](#) which each contains only one value or range.

#### Markup example:

```
<enumeration applicPropertyValues="Mk1|Mk9"/>
```

## 2.3.2

### External product attribute

**Description:** The element [<externalProductAttribute>](#) specifies a product attribute defined in another ACT. This element must be used only by projects or organizations implementing the ACT catalog. Refer to [Chap 4.14.4](#). In this case, the ACT catalog must provide the reference to the product attribute definition.

**Markup element:** [<externalProductAttribute>](#). Refer to [Fig 3](#).

#### Attributes:

- id (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- [<displayName>](#). Refer to [Para 2.3.1.1](#).

#### Markup example:

```
<externalProductAttribute id="serialNumber">
  <displayName>SN</displayName>
</externalProductAttribute>
```

## 2.4

### CCT reference

**Description:** The element [<condCrossRefTableRef>](#) provides a reference to the CCT data module for this project.

**Markup element:** [<condCrossRefTableRef>](#). Refer to [Fig 2](#).

#### Attributes:

- None

#### Child elements:

- [<dmRef>](#). Data module references must be populated in accordance with [Chap 3.9.5.2.1.2](#).

## 2.5

### PCT reference

**Description:** The element [<productCrossRefTableRef>](#) provides a reference to the PCT data module for this project.

**Markup element:** [<productCrossRefTableRef>](#). Refer to [Fig 2](#).

**Attributes:**

- None

**Child elements:**

- [<dmRef>](#). Data module references must be populated in accordance with [Chap 3.9.5.2.1.2](#).

### 3

## Examples

Example 1: Declaration of a product attribute representing the serial number of the bicycle.

Since there is neither an attribute `valuePattern` nor an element [<enumeration>](#) defined, so the allowable values are not restricted. The attribute `valueDataType` is not defined, therefore this product attribute defaults to the "string" data type. The element [<displayName>](#) is included which provides a hint when generating a human-readable form of an applicability annotation to identify serial numbers with "SN". For example, to represent serial numbers "1B070622" thru "1B070799": "SN 1B070622-1B070799".

```
<productAttribute id="serialNumber">
  <name>Serial number</name>
  <displayName>SN</displayName>
  <descr>Serial number etched on the bicycle frame</descr>
</productAttribute>
```

Example 2: Declaration of a product attribute representing the version of the bicycle.

The attribute `valuePattern` restricts the allowable values to the characters "Mk" followed by either "1" or "9". The element [<enumeration>](#) restricts the allowable values to either "Mk1" or "Mk9". The attribute `valueDataType` is not defined, therefore this product attribute defaults to the string data type. In this example the attribute `valuePattern` and element [<enumeration>](#) are overlapping. Only one is needed, although the overlap is not harmful. The element [<displayName>](#) is included and is empty which provides a hint that no text is needed when generating a human-readable form of an applicability annotation. For example, to represent a model of "Brook trekker" (with the value of the attribute `displayName` set to ["Model"](#)) and a version of "Mk1": "Model Brook trekker Mk1".

```
<productAttribute id="version" valuePattern="Mk(1|9)">
  <name>Version</name>
  <displayName></displayName>
  <descr>Version of the bike</descr>
  <enumeration applicPropertyValues="Mk1|Mk9"/>
</productAttribute>
```

Example 3: Declaration of a product attribute representing the version rank of the bicycle.

The attribute `valueDataType` declares this product attribute as having a data type of "integer". The use of attribute `valuePattern` is not allowed. The element [<enumeration>](#) further restricts the allowable values to "1" thru "3". This illustrates a case where both the attribute `valuePattern` and element [<enumeration>](#) contribute to limiting the allowable values.

```
<productAttribute id="versrank" valueDataType="integer">
  <name>Version rank</name>
  <displayName>series</displayName>
```

```
<descr>Version rank</descr>
<enumeration applicPropertyValues="1~3"/>
</productAttribute>
```

Example 4: Content section from the ACT for the bicycle sample data modules and combining the above examples.

Four product attributes are declared as well as references to the PCT and CCT data modules.

```
<applicCrossRefTable>
<productAttributeList>
<productAttribute id="serialno">
<name>Serial number</name>
<displayName>SN</displayName>
<descr>Serial number etched on the bicycle frame</descr>
</productAttribute>
<productAttribute id="model" valuePattern=".*">
<name>Model</name>
<displayName></displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Brook trekker|Mountain
storm"/>
</productAttribute>
<productAttribute id="version" valuePattern="Mk(1|9)">
<name>Model</name>
<displayName></displayName>
<descr>Model of the bike</descr>
<enumeration applicPropertyValues="Mk1|Mk9"/>
</productAttribute>
<productAttribute id="versrank" valueDataType="integer">
<name>Version rank</name>
<displayName>series</displayName>
<descr>Version rank</descr>
<enumeration applicPropertyValues="1~3"/>
</productAttribute>
</productAttributeList>
<condCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00Q" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</condCrossRefTableRef>
<productCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00P" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
```

```
</dmRef>
</productCrossRefTableRef>
</applicCrossRefTable>
```

Example 5: Declaration of two product attributes where the technical author provided text to be used by a viewer to generate a prompt in order to obtain Product values from the end user.

The product attribute "serialno" uses prompt:

"Serial Number (locate under the bottom bracket where the two pedal cranks meet)"

The product attribute version has two possible values: "Mk1" and "Mk9". Each version has a prompt associated with the value of the attribute enumerationLabel.

```
<productAttributeList>
<productAttribute id="serialno">
<name>Serial number</name>
<descr>Serial number</descr>
<prompt>
<paraBasic>Serial Number (locate under the bottom bracket where
the two pedal cranks meet)</paraBasic>
</prompt>
</productAttribute>
<productAttribute id="version" valuePattern="Mk(1|9)">
<name>Version</name>
<descr>Version of the bike</descr>
<enumeration applicPropertyValues="Mk1" enumerationLabel="Mk 1
Version (Mountain storm Only)"/>
<enumeration applicPropertyValues="Mk9" enumerationLabel="Mk 9
Version (Brook Trekker Only)"/>
</productAttribute>
</productAttributeList>
```

## 1 General

The Conditions Cross-reference Table (CCT) data module is used to declare any condition that can affect applicability of data. Conditions can be technical, operational, environmental, or any other type that can affect technical data.

Technical conditions are typically tied to the configuration of the Product, such as Service bulletins or modifications. The state of technical conditions can change throughout the service life of a product instance.

Where projects or organizations define and use conditions in their applicability, there are situations where dependencies exist between some of the defined conditions. For example, for Service Bulletin "B" to be implemented on a product, Service Bulletin "A" must first be implemented. Another example is, to accomplish Test A the airplane must be connected to ground power and for the airplane to be connected to ground power, it must first be on the ground.

Examples of operational and environmental conditions are location of maintenance, availability of support equipment, regulatory rules, temperature, wind speed and sandy conditions.

The CCT data module is divided into three sections: a definition of common types of conditions, a definition of specific conditions and an optional incorporation status list for technical conditions.

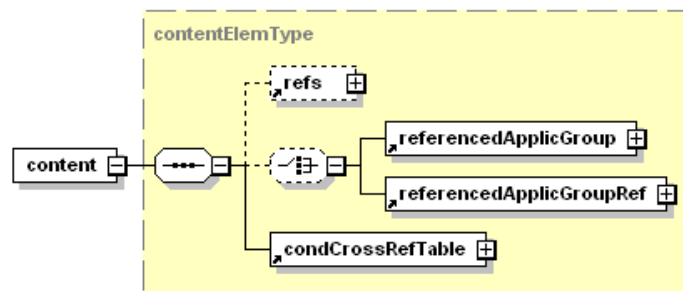

[Chap 4.14](#) and subchapters provide an overview of applicability. It is recommended that these chapters have been read and the concepts understood before reading this chapter. Refer to [Chap 7.8](#) for information about how dependency data can be used at runtime by an IETP.

## 2 CCT data module content

### 2.1 Content

**Description:** The element `<content>` contains the content section of the CCT data module.

**Markup element:** `<content>`

ICN-S1000D-A-03090503-A-FAPE3-00038-A-001-01

Fig 1 Major elements in CCT content

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

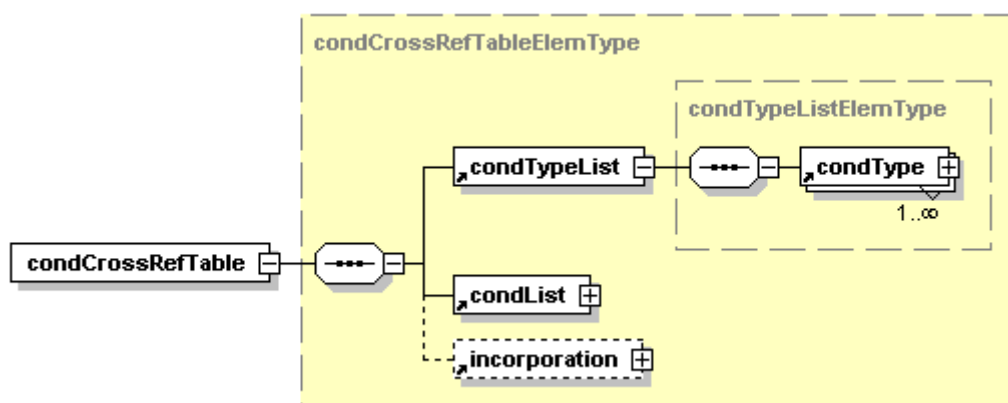

- `<refs>`, the references to data modules, publication modules and non-S1000D publications or documents given in the data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`, the applicability annotations directly collected in the data module. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`, the applicability annotations collected in the data module using the applicability annotations CIR. Refer to [Chap 3.9.5.3](#).
- `<condCrossRefTable>`. Refer to [Para 2.2](#).

## 2.2 Conditions cross-reference table

**Description:** The element `<condCrossRefTable>` is used to provide the content of the CCT data module, which is divided into three components:

- Condition type list, to define common types of conditions
- Condition list, to define specific conditions
- Incorporation status list, to document incorporated technical conditions

**Markup element:** `<condCrossRefTable>`

ICN-B6865-S1000D0017-001-01

Fig 2 Conditions cross-reference table

#### Attributes:

- None

#### Child elements:

- `<condTypeList>`. Refer to [Para 2.3](#).
- `<condList>`. Refer to [Para 2.4](#).
- `<incorporation>`. Refer to [Para 2.5](#).

## 2.3 Condition types list

**Description:** The element `<condTypeList>` contains a list of common types of conditions which will be used as a basis for defining specific conditions.

**Markup element:** `<condTypeList>`. Refer to [Fig 2](#).

#### Attributes:

- None

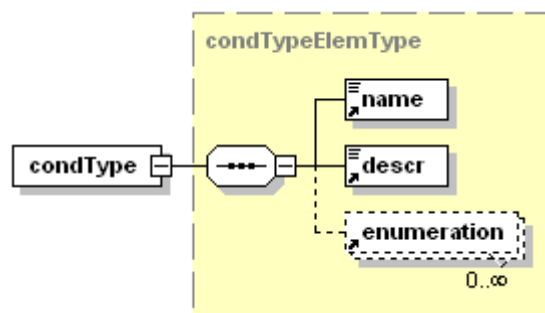

#### Child elements:

- `<condType>`. Refer to [Para 2.3.1](#).

### 2.3.1 Condition type

**Description:** The element `<condType>` defines a single condition type of the Product.

**Markup element:** `<condType>`

ICN-S1000D-A-03090503-A-FAPE3-00017-A-001-01

Fig 3 Element `<condType>`

#### Attributes:

- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `valueDataType` (O), the data type of the product attribute. The attribute can have one of the following values:
  - `"string"` (D) - for classical character chains
  - `"boolean"` - for Boolean values (`"true"` or `"false"`)
  - `"integer"` - for integer values, which are numeric and do not contain a decimal point
  - `"real"` - for real values, which are numeric and contain a decimal point
- `valuePattern` (O), a pattern specifying the allowable structure for each value in the attribute `applicPropertyValues` in the element `<enumeration>`. The attribute `valuePattern` must only be used when the attribute `valueDataType` has the value `"string"` (refer to default BREX rule BREX-S1-00137). The pattern follows the XML Schema regular expression rules as described in the specification "REC-xmlschema-

2-20041-28 W3C Recommendation: XML Schema Part 2: Datatypes Second Edition (2004 Second Edition)".

#### Child elements:

- `<name>`, the name of the condition type. Refer to [Chap 3.9.5.2.1.10](#).
- `<descr>`. Refer to [Para 2.3.1.1](#).
- `<enumeration>`. Refer to [Para 2.3.1.2](#).

#### Business rule decision point BRDP-S1-00323 - Use of the attribute `valuePattern` and the element `<enumeration>` or to use open text when using CCT:

- Decide whether to specify the allowable values for a product attribute achieved by using both the attribute `valuePattern` and the element `<enumeration>` or to allow open text without using the attribute `valuePattern` and the element `<enumeration>`.

#### Markup example:

```
<condType id="SB">
  <name>Service bulletin</name>
  <descr>Generic Service bulletin type</descr>
  <enumeration applicPropertyValues="Pre|Post"/>
</condType>
```

#### 2.3.1.1

##### Description

**Description:** The element `<descr>` contains further clarification of the meaning of the condition type. This value can be used to assist the technical author in the selection of the appropriate condition type when defining a condition.

#### Markup element: `<descr>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- None

#### Markup example:

```
<descr>Generic Service bulletin type</descr>
```

#### 2.3.1.2

##### Enumeration

**Description:** The element `<enumeration>` contains the allowable values for the condition type. The allowable values can be used to assist the technical author in creating applicability annotations.

The element `<enumeration>` is optional and repeatable. If there are multiple values and ranges to define, several methods can be employed, including the following:

- single element `<enumeration>` with attribute `applicPropertyValues` representing the entire set of values and ranges
- multiple element `<enumeration>` with attribute `applicPropertyValues` representing a single value or range

**Markup element:** `<enumeration>`

**Attributes:**

- `applicPropertyValues` (M), defines the values and ranges of values that are allowed for this condition type. If the parent element `<condType>` includes the attribute `valuePattern`, the individual values used in the attribute `applicPropertyValues` must be compliant to the specified pattern. Refer to [Chap 3.9.5.3](#) for more information on the usage of this attribute.
- `enumerationLabel` (O), defines the display label in an interactive selection dialog for the value defined by the attribute `applicPropertyValues`. If `enumerationLabel` is specified, the attribute `applicPropertyValues` cannot specify a range or list of values. It is recommended for projects or organizations to provide enumeration labels in order for the viewer to present a complete and coherent dialog when eliciting the value of the attribute from the user.
- `aliasFlag`, not used in the context of `<condType>`

**Child elements:**

- None

**Business rule decision point BRDP-S1-00324 - Method of defining multiple values or ranges for the element `<enumeration>` in the CCT:**

- Decide whether to use a single element `<enumeration>` containing the entire set or to use multiple elements `<enumeration>` which each contain only one value or range.

**Markup example:**

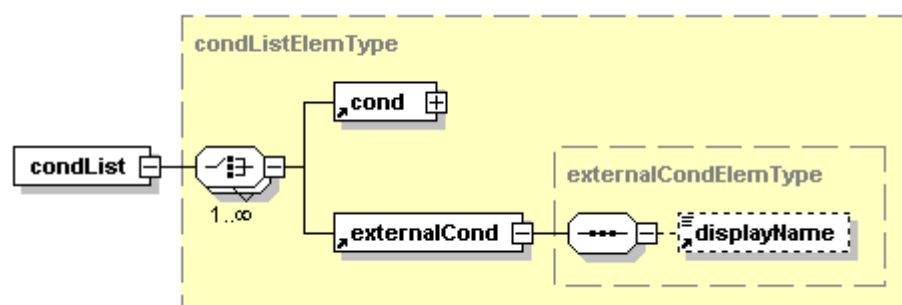

```
<enumeration applicPropertyValues="Pre|Post"/>
```

## 2.4

### Conditions list

**Description:** The element `<condList>` contains a list of specific conditions which have an effect on the applicability of technical data.

**Markup element:** `<condList>`

ICN-B6865-S1000D0018-001-01

Fig 4 Element `<condList>`

**Attributes:**

- None

**Child elements:**

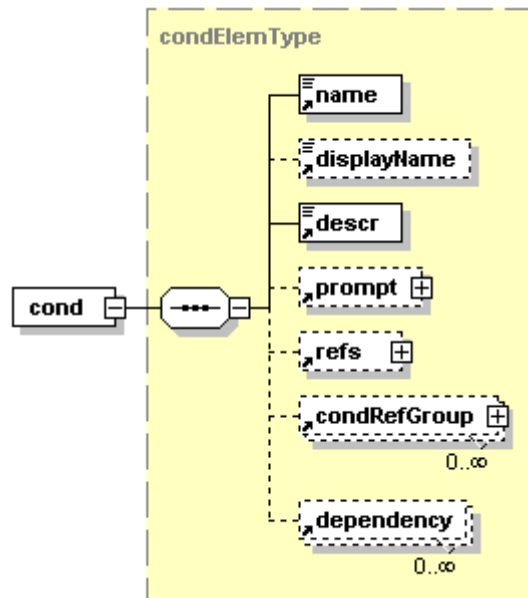

- `<cond>`. Refer to [Para 2.4.1](#).

- `<externalCond>`. Refer to [Para 2.4.2](#).

#### 2.4.1 Condition

**Description:** The element `<cond>` declares a single condition of the Product.

**Markup element:** `<cond>`

ICN-B6865-S1000D0004-001-01

Fig 5 Element `<cond>`

#### Attributes:

- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `condTypeRefId` (M), reference to a declared condition type (element `<condType>`) which this element represents by using the mechanism for internal links described in [Chap 3.9.5.2.1.2](#)
- `aliasFlag` (O), indicates that the condition has an equivalent condition within another CCT. This attribute must be used only by projects or organizations implementing the ACT catalog. Refer to [Chap 4.14.4](#). In this case, the ACT catalog must provide the corresponding alias relationship. The attribute can have one of the following values:
  - "1" - Yes, for a condition with an alias relationship defined in the ACT catalog
  - "0" - No, for a condition with no alias relationship

#### Child elements:

- `<name>`, the name of the condition. Refer to [Chap 3.9.5.2.1.10](#).
- `<displayName>`. Refer to [Para 2.4.1.1](#).
- `<descr>`. Refer to [Para 2.4.1.2](#).
- `<prompt>`. Refer to [Para 2.4.1.3](#).
- `<refs>`. Refer to [Para 2.4.1.4](#).
- `<condRefGroup>`. Refer to [Para 2.4.1.5](#).
- `<dependency>`. Refer to [Para 2.4.1.6](#).

**Markup example:**

```
<cond condTypeRefId="SB" id="SB-S001">
<name>Service bulletin S001 - Chain guard</name>
<descr>Service bulletin S001 for the installation of the chain
guard</descr>
</cond>
```

## 2.4.1.1 Display name

**Description:** The element [<displayName>](#) defines text which can be used to help automated generation of the human-readable display text on an applicability annotation. Refer to [Chap 7.8](#).

**Markup element:** [<displayName>](#)

**Attributes:**

- None

**Child elements:**

- None

**Business rule decision point BRDP-S1-00325 - Use of the element [<displayName>](#) in the element [<productAttribute>](#) when using CCT:**

- Decide whether to use the element [<displayName>](#).

**Markup example:**

```
<displayName>SB-S001 (Chain guard)</displayName>
```

## 2.4.1.2 Description

**Description:** The element [<descr>](#) contains further clarification of the meaning of the condition. This value can be used to assist the technical author in the selection of the appropriate condition when building an applicability annotation.

**Markup element:** [<descr>](#)

**Attributes:**

- [changeType](#) (O), [changeMark](#) (O) and [reasonForUpdateRefIds](#) (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- None

**Markup example:**

```
<descr>Service bulletin S001 for the installation of the chain
guard</descr>
```

## 2.4.1.3 Prompt

The element [<prompt>](#) is used to contain specific text that can be used to create a dialog in order to obtain values for product attributes or conditions from an end user. Refer to [Chap 3.9.5.3.1](#).

## 2.4.1.4

## References

The element `<refs>` contains the standard referencing mechanism to associate additional material with the condition. For example, a Service bulletin condition can include a reference to the Service bulletin publication which incorporates the Service bulletin. Refer to [Chap 3.9.5.2.1.2](#).

## 2.4.1.5

## Group of referenced conditions

**Description:** The element `<condRefGroup>` refers to other conditions linked to the described conditions. It is possible to refer to a defined condition using the element `<condRef>` or to another condition using the element `<condDescr>`.

**Markup element:** `<condRefGroup>`

ICN-S1000D-A-03090503-A-FAPE3-00023-A-001-01

Fig 6 Element `<condRefGroup>`
**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `condRefGroupType` (M), the type of relationship with the other condition

**Child elements:**

- `<condRef>`. Refer to [Para 2.4.1.5.1](#).
- `<condDescr>`. Refer to [Para 2.4.1.5.2](#).

**Markup example:**

```
<condRefGroup condRefGroupType="customerWorkOrder">
...
</condRefGroup>
```

## 2.4.1.5.1

## Condition reference

**Description:** The element `<condRef>` identifies a single condition that is defined in the CCT condition list using the element `<cond>` or the element `<externalCond>`.

**Markup element:** `<condRef>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

- condRefId (M), reference to a declared condition (element [<cond>](#) or [<externalCond>](#)) which this element represents by using the mechanism for internal links described in [Chap 3.9.5.2.1.2](#)

**Child elements:**

- None

**Markup example:**

```
<condRef condRefId="SB-S001" />
```

#### 2.4.1.5.2 Condition description

**Description:** The element [<condDescr>](#) specifies a condition that is not defined in the CCT.

**Markup element:** [<condDescr>](#)

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<condDescr>EO28-53000X</condDescr>
```

#### 2.4.1.6 Dependency

**Description:** The element [<dependency>](#) identifies a condition that is dependent on the existence of another condition.

**Markup element:** [<dependency>](#)

**Attributes:**

- forCondValues (M), contains the values of the condition which has a dependency on another condition identified by the attribute dependencyTest. The allowed values are defined in the condition types list. Refer to [Para 2.3](#).
- dependencyTest (M), a reference to an applicability annotation that expresses the dependency

**Child elements:**

- None

**Business rule decision point BRDP-S1-00326 - Constraining conditions by use of the element [<dependency>](#) in the element [<cond>](#) in the CCT:**

- Decide whether to constrain allowable conditions based on other condition values by use of the element [<dependency>](#).

**Markup example:**

```
<dependency forCondValues="POST" dependencyTest="app-0001" />
```

**Note**

The dependency above is populated in the context of its parent condition, SB-B, shown here:

```
<cond id="SB-B" condTypeRefId="A-CT01">
<name>SB-B</name>
<descr>Service Bulletin B</descr>
<dependency forCondValues="POST" dependencyTest="app-0001" />
</cond>
```

The dependency above refers to the applicability "[app-00001](#)", asserting that SB-A has been incorporated (is set to POST) as shown below:

```
<applic id="app-00001">
<assert applicPropertyIdent="SB-A"
applicPropertyType="condition" applicPropertyValues="POST" />
</applic>
```

In this example the author put a constraint on SB-B enforcing that SB-A must be set to "POST" for SB-B to be set to "POST". An example of why one might do this is if SB-B modifies a widget on the Product that was added to the Product by SB-A. This constraint applies to one of the possible results when tested against the state of a product instance:

Table 2 Allowed and invalid dependency results

SB-B	SB-A	Result
POST (widget modified on Product)	POST (widget added to Product)	allowed
POST (widget modified on Product)	PRE (widget not on Product)	invalid
PRE (widget not modified)	POST (widget added to Product)	allowed
PRE (widget not modified)	PRE (widget not on Product)	allowed

## 2.4.2

### External condition

**Description:** The element `<externalCond>` specifies a condition defined in another CCT. This element must be used only by projects or organizations implementing the ACT catalog. Refer to [Chap 4.14.4](#). In this case, the ACT catalog must provide the reference to the condition definition.

**Markup element:** `<externalCond>`. Refer to [Fig 4](#).

#### Attributes:

- `id` (M), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `condTypeRefId` (M), reference to a declared condition type (element `<condType>`) which this element represents by using the mechanism for internal links described in [Chap 3.9.5.2.1.2](#)

#### Child elements:

- `<displayName>`. Refer to [Para 2.4.1.1](#).

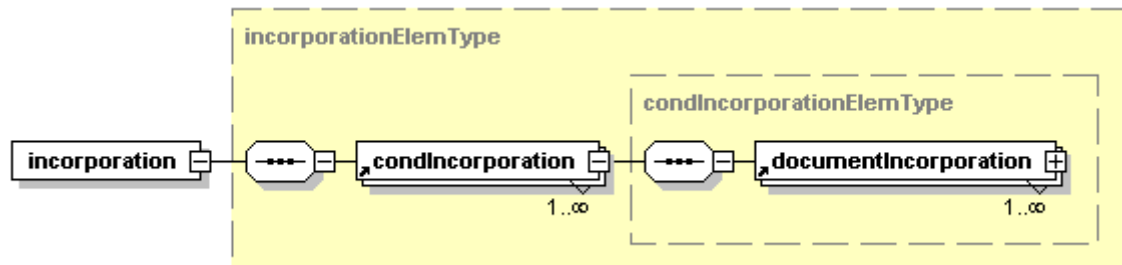

#### Markup example:

```
<externalCond id="SB-S023" condTypeRefId="SB">
<displayName>SB S023</displayName>
</externalCond>
```

## 2.5 Incorporation status list

**Description:** The element `<incorporation>` contains the incorporation status of technical conditions in the documentation.

**Markup element:** `<incorporation>`

ICN-B6865-S1000D0019-001-01

Fig 7 Element `<incorporation>`

**Attributes:**

- None

**Child elements:**

- `<condIncorporation>`. Refer to [Para 2.5.1](#).

### 2.5.1 Condition incorporation

**Description:** The element `<condIncorporation>` represents a technical condition that has or is planned to be incorporated into the technical data. It can reference a declared condition (element `<cond>`) and consists of a list of documents affected by the technical condition.

**Markup element:** `<condIncorporation>`. Refer to [Fig 7](#).

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `condRefId` (O), reference to a declared condition (element `<cond>`) which this element represents by using the mechanism for internal links described in [Chap 3.9.5.2.1.2](#)
- `condIssueNumber` (O), specifies the issue number of the technical condition for which the incorporation status is given

**Child elements:**

- `<documentIncorporation>`. Refer to [Para 2.5.1.1](#).

#### 2.5.1.1 Document incorporation

**Description:** The element `<documentIncorporation>` lists the data modules and publications that this technical condition affects.

**Markup element:** `<documentIncorporation>`

ICN-S1000D-A-03090503-A-FAPE3-00030-A-001-01

Fig 8 Element `<documentIncorporation>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<refs>`. Refer to [Para 2.5.1.1.1](#).
- `<incorporationStatus>`. Refer to [Para 2.5.1.1.2](#).

#### Markup example:

```
<documentIncorporation>
<incorporationStatus incorporationStatus="incorporated"/>
</documentIncorporation>
```

#### 2.5.1.1.1 References

The element `<refs>` is used to reference publications and data modules associated with this technical condition. It must be populated in accordance with [Chap 3.9.5.2.1.2](#).

#### 2.5.1.1.2 Incorporation status

**Description:** The element `<incorporationStatus>` is used to define the status of the incorporation of a technical condition.

**Markup element:** `<incorporationStatus>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `incorporationStatus` (M), the incorporation status. The attribute can have one of the following values:
  - `"inprogress"` - for a technical condition which is partially incorporated into the data module or publication content
  - `"incorporated"` - for a technical condition which is completely incorporated into the data module or publication content
  - `"noeffect"` - for a technical condition which has no impact on the data module or publication content

- year (O), month (O) and day (O), the date of the incorporation. These attributes are mandatory if the attribute incorporationStatus has the value "incorporated".
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup example:

```
<incorporationStatus incorporationStatus="incorporated"/>
```

## 3 Examples

Example 1: Definition of a generic Service bulletin condition type.

The type is given an identifier of "SB" and the allowable values for a Service bulletin are defined to be "Pre" and "Post". Display labels for an interactive selection dialog for each allowable value are provided in order to aid the end user in the selection.

```
<condType id="SB">
  <name>Service bulletin</name>
  <descr>Generic Service bulletin type</descr>
  <enumeration applicPropertyValues="Pre" enumerationLabel="Not
  incorporated" />
  <enumeration applicPropertyValues="Post"
  enumerationLabel="Incorporated" />
</condType>
```

Example 2: Declaration of a condition specifically for the Service bulletin called "S001" for installing a chain guard on the bicycle.

The condition is given an identifier of "SB-S001", it is of condition type "SB", referring to the above example, which means it inherits the allowable values of "Pre" and "Post".

```
<cond condTypeRefId="SB" id="SB-S001">
  <name>Service bulletin S001 - Chain guard</name>
  <descr>Service bulletin S001 for the installation of the chain
  guard</descr>
</cond>
```

Example 3: Incorporation status for the above declared technical condition.

It provides a reference to the condition with identifier of "SB-S001", references the data module with was affected and provides the status of "incorporated" and the effective date.

```
<condIncorporation condRefId="SB-S001">
  <documentIncorporation>
    <refs><dmRef>
      <dmRefIdent>
        <dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
        systemCode="DA0" subSystemCode="2" subSubSystemCode="0"
        assyCode="00" disassyCode="00" disassyCodeVariant="AA"
        infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
      </dmRefIdent>
    </dmRef>
  </refs>
  <incorporationStatus incorporationStatus="incorporated" />
  <effectiveDate />
</condIncorporation>
```

```

</dmRef></refs>
<incorporationStatus incorporationStatus="incorporated"
year="2007" month="07" day="31"/>
</documentIncorporation>
</condIncorporation>

```

Example 4: Complete content section of a CCT data module by combining the three examples from this paragraph above.

```

<condCrossRefTable>
<condTypeList>
<condType id="SB">
<name>Service bulletin</name>
<descr>Generic Service bulletin type</descr>
<enumeration applicPropertyValues="Pre|Post"/>
</condType>
</condTypeList>
<condList>
<cond condTypeRefId="SB" id="SB-S001">
<name>Service bulletin S001 - Chain guard</name>
<descr>Service bulletin S001 for the installation of the chain
guard</descr>
</cond>
</condList>
<incorporation>
<condIncorporation condRefId="SB-S001">
<documentIncorporation>
<refs><dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="DA0" subSystemCode="2" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="520" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent>
</dmRef></refs>
<incorporationStatus incorporationStatus="incorporated"
year="2007" month="07" day="31"/>

## 1 General

The Products Cross-reference Table (PCT) data module is a repository for defining product instances and associating values to product attributes and conditions for each product instance. A product instance is an actual physical Product, for example a Brook trekker Mk9 bicycle with serial number 1B070643.

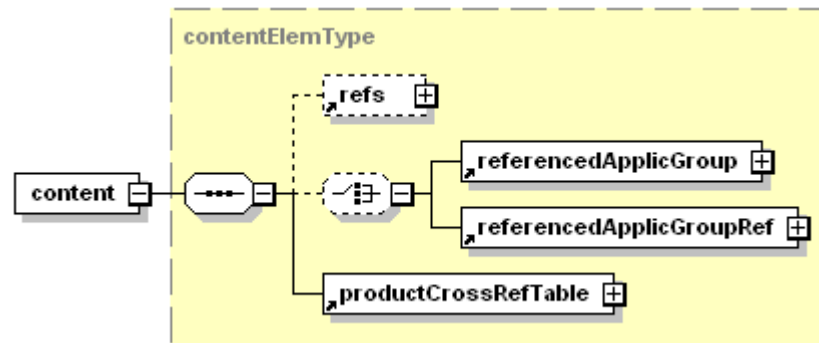

[Chap 4.14](#) and subchapters provide an overview of applicability. It is recommended that these chapters have been read and the concepts understood before reading this chapter.

## 2 PCT data module content

### 2.1 Content

**Description:** The element `<content>` contains the content section of the PCT data module.

**Markup element:** `<content>`

ICN-S1000D-A-03090503-A-FAPE3-00040-A-001-01

Fig 1 Major elements in PCT content

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

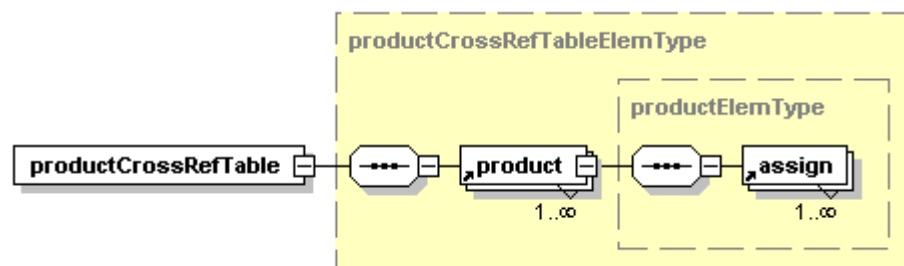

**Child elements:**

- `<refs>`, the references to data modules, publication modules and non-S1000D publications or documents given in the data module. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`, the applicability annotations directly collected in the data module. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`, the applicability annotations collected in the data module using the applicability annotations CIR. Refer to [Chap 3.9.5.3](#).
- `<productCrossRefTable>`. Refer to [Para 2.2](#).

### 2.2 Products cross-reference table

**Description:** The element `<productCrossRefTable>` contains the content of the PCT data module, which is a list of product instances.

**Markup element:** `<productCrossRefTable>`

ICN-B6865-S1000D0020-001-01

Fig 2 Products cross-reference table

**Attributes:**

- None

#### Child elements:

- `<product>`. Refer to [Para 2.3](#).

## 2.3 Product

**Description:** The element `<product>` identifies an individual product instance.

**Markup element:** `<product>`. Refer to [Fig 2](#).

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<assign>`. Refer to [Para 2.3.1](#).

### 2.3.1 Assign

**Description:** The element `<assign>` associates a value with a product attribute or condition.

**Markup element:** `<assign>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `applicPropertyIdent` (M), the identifier of either the product attribute (element `<productAttribute>` attribute `id` from the Applicability Cross-reference Table (ACT) data module) or the condition (element `<cond>` attribute `id` from the Conditions Cross-reference Table (CCT) data module)
- `applicPropertyType` (O), indicates whether the attribute `applicPropertyIdent` references a product attribute or a condition. The attribute can have one of the following values:
  - `"prodattr"` - indicates the attribute `applicPropertyIdent` references a product attribute
  - `"condition"` - indicates the attribute `applicPropertyIdent` references a condition
- `applicPropertyValue` (M), the value to assign to the referenced product attribute or condition. The value cannot contain the characters tilde [~] or vertical bar [|] as these characters will be interpreted as separators when used as a value in the attribute `applicPropertyValues` elsewhere in the applicability model.

#### Child elements:

- None

**Business rule decision point BRDP-S1-00327 - Product attributes and conditions to include in the PCT:**

- Decide which product attributes and conditions to include in the PCT. Conditions that represent operational or environmental properties will usually not be included in the PCT as they are not associated with a product instance.

**Markup example:**

```
<assign applicPropertyIdent="serialno"
applicPropertyType="prodattr" applicPropertyValue="1B070643"/>
```

### 3 Examples

The following markup example illustrates the definition of three product instances.

```
<productCrossRefTable>
<product>
<assign applicPropertyIdent="serialno"
applicPropertyType="prodattr" applicPropertyValue="1B070643"/>
<assign applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValue="Brook
trekker"/>
<assign applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValue="Mk9"/>
<assign applicPropertyIdent="versrank"
applicPropertyType="prodattr" applicPropertyValue="2"/>
<assign applicPropertyIdent="SB-S001"
applicPropertyType="condition" applicPropertyValue="Pre"/>
</product>
<product>
<assign applicPropertyIdent="serialno"
applicPropertyType="prodattr" applicPropertyValue="1B070644"/>
<assign applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValue="Brook
trekker"/>
<assign applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValue="Mk9"/>
<assign applicPropertyIdent="versrank"
applicPropertyType="prodattr" applicPropertyValue="1"/>
<assign applicPropertyIdent="SB-S001"
applicPropertyType="condition" applicPropertyValue="Post"/>
</product>
<product>
<assign applicPropertyIdent="serialno"
applicPropertyType="prodattr" applicPropertyValue="1B070701"/>
<assign applicPropertyIdent="model"
applicPropertyType="prodattr" applicPropertyValue="Mountain
storm"/>
<assign applicPropertyIdent="version"
applicPropertyType="prodattr" applicPropertyValue="Mk1"/>
<assign applicPropertyIdent="versrank"
applicPropertyType="prodattr" applicPropertyValue="1"/>
<assign applicPropertyIdent="SB-S001"
applicPropertyType="condition" applicPropertyValue="Pre"/>
</product>
</productCrossRefTable>
```

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 3.9.5.3</a>	Data modules - Applicability
<a href="#">Chap 3.9.5.3.1</a>	Applicability - Applicability cross-reference table
<a href="#">Chap 4.14.4</a>	Applicability - Applicability cross-reference table catalog

## 1 General

The Applicability cross-reference table (ACT) catalog is a dedicated data module type to be used in the context of projects with several ACT data modules. The purpose of this ACT catalog data module is to coordinate different ACT/CCT sets in the same project, in order to adequately address this scenario from a content management and IETP rendering perspective. Refer to [Chap 4.14.4](#) for more information about the ACT catalog principles.

The ACT schema contains two branches:

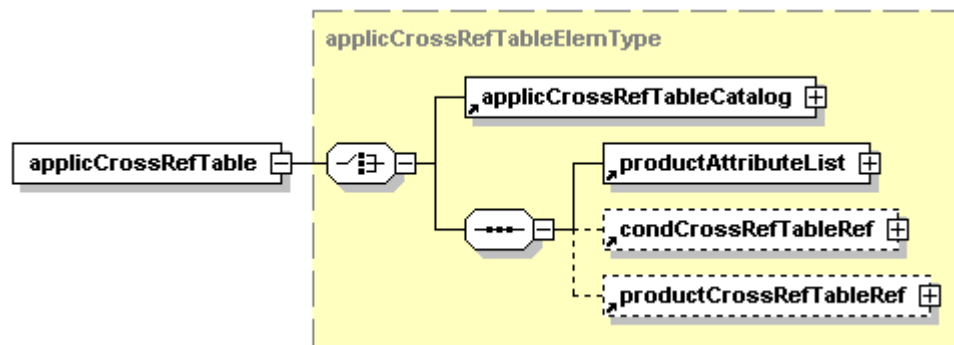

- One for the ACT catalog data module (element `<applicCrossRefTableCatalog>`), which is described in this chapter
- One for the ACT data module. Refer to [Chap 3.9.5.3.1](#) for more information on the content of this data module

## 2 ACT Catalog content

### 2.1 Applicability cross-reference table

**Description:** The element `<applicCrossRefTable>` is used to provide the content of the ACT data module or the ACT catalog data module.

**Markup element:** `<applicCrossRefTable>`

ICN-S1000D-A-03090503-A-FAPE3-00037-A-001-01

Fig 1 Applicability cross-reference table

**Attributes:**

- None

**Child elements:**

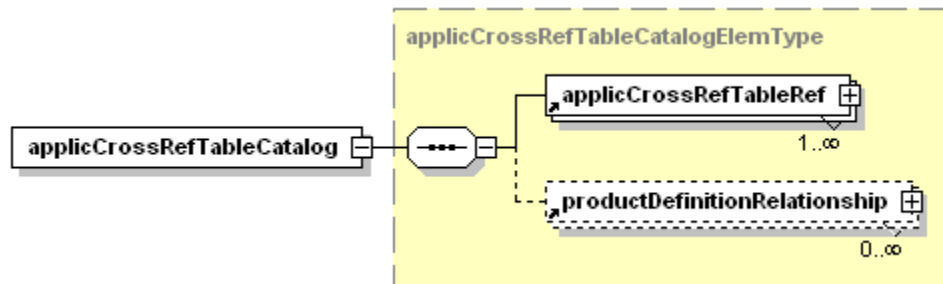

- `<applicCrossRefTableCatalog>`. Refer to [Para 2.2](#).
- `<productAttributeList>`. Refer to [Chap 3.9.5.3.1](#).
- `<condCrossRefTableRef>`. Refer to [Chap 3.9.5.3.1](#).
- `<productCrossRefTableRef>`. Refer to [Chap 3.9.5.3.1](#).

### 2.2 Applicability cross-reference table catalog

**Description:** The element `<applicCrossRefTableCatalog>` contains the whole ACT catalog. This is the parent element for the ACT catalog data module. The ACT catalog contains two parts:

- The list of ACT data modules in the project
- The relationships between the different ACT/CCT sets

**Markup element:** `<applicCrossRefTableCatalog>`

ICN-S1000D-A-03090503-A-FAPE3-00032-A-001-01

Fig 2 Element `<applicCrossRefTableCatalog>`

#### Attributes:

- None

#### Child elements:

- `<applicCrossRefTableRef>`, the different ACT data modules used by the project. Refer to [Chap 3.9.5.1](#).
- `<productDefinitionRelationship>`. Refer to [Para 2.2.1](#).

#### Markup example:

```
<applicCrossRefTableCatalog>
<applicCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</applicCrossRefTableRef>
<applicCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="BRAKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</applicCrossRefTableRef>
<productDefinitionRelationship>
...
</productDefinitionRelationship>
</applicCrossRefTableCatalog>
```

### 2.2.1 Product definition relationships

**Description:** The element `<productDefinitionRelationship>` is used to make relationships between two or more product attributes, product attribute values or conditions coming from different ACT/CCT sets.

Markup element: `<productDefinitionRelationship>`

ICN-S1000D-A-03090503-A-FAPE3-00033-A-001-01

Fig 3 Element `<productDefinitionRelationship>`

Attributes:

- None

Child elements:

- `<externalAssert>`. Refer to [Para 2.2.2](#).
- `<associate>`. Refer to [Para 2.2.3](#).

## 2.2.2

### External assertions

**Description:** The element `<externalAssert>` is based on the element `<assert>`. Refer to [Chap 3.9.5.3](#). An external assertion identifies a product attribute, a product attribute value or a condition defined in an ACT data module using the element `<applicCrossRefTableRef>`.

Markup element: `<externalAssert>`

ICN-S1000D-A-03090503-A-FAPE3-00034-A-001-01

Fig 4 Element `<externalAssert>`

Attributes:

- `applicPropertyIdent` (M), for the identifier of either the product attribute (element `<productAttribute>` attribute id from the ACT data module) or condition (element `<cond>` attribute id from the CCT data module) to test
- `applicPropertyType` (M), indicates whether the value of the attribute `applicPropertyIdent` references a product attribute or a condition. The attribute can have one of the following values:
  - `"prodattr"` - indicates the attribute `applicPropertyIdent` references a product attribute
  - `"condition"` - indicates the attribute `applicPropertyIdent` references a condition
- `applicPropertyValues` (O), for the values and/or ranges to test against. Refer to [Chap 3.9.5.3](#) for additional information including formatting requirements. This attribute is used only when referencing a product attribute value or a condition.

#### Child elements:

- `<applicCrossRefTableRef>`. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<externalAssert applicPropertyIdent="brakeModel"
applicPropertyType="prodattr">
  <applicCrossRefTableRef>
    <dmRef>
      <dmRefIdent>
        <dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D"/>
      </dmRefIdent>
    </dmRef>
  </applicCrossRefTableRef>
</externalAssert>
```

### 2.2.3 Associating external assertions

**Description:** The element `<associate>` is used to associate an external assertion (product attribute, product attribute value or condition as defined within a specific ACT data module) to one or several other ones. There are two types of association:

- The "reference", associating an external product attribute or condition to the full definition of this product attribute or condition within another ACT/CCT data module (external definition)
- The "alias", associating several product attributes, or product attribute values or conditions, that represents the same thing but are defined in several ACT/CCT data modules (equivalent definition)

The association is made between the external assertion as defined as the child of the product relationship (element `<productDefinitionRelationship>`) and the external assertion(s) as defined under the association (element `<association>`)

Example:

Product definition relationship

External assertion #1

Associate Type = "Alias"

External assertion #2

means that External assertion #1 and #2 are linked by an "alias" association.

**Markup element:** `<associate>`

ICN-S1000D-A-03090503-A-FAPE3-00035-A-001-01

Fig 5 Element `<associate>`

#### Attributes:

- associationType (O). The attribute can have one of the following values:
  - "extref" - for external definitions
  - "alias" - for equivalent definitions

**Child elements:**

- <externalAssert>. Refer to [Para 2.2.2](#).

**Markup example:**

```
<productDefinitionRelationship>
<externalAssert applicPropertyIdent="brakeSerialNo"
applicPropertyType="prodattr">
<applicCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent></dmRef>
</applicCrossRefTableRef>
</externalAssert>
<associate associationType="alias">
<externalAssert applicPropertyIdent="serialNo"
applicPropertyType="prodattr">
<applicCrossRefTableRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="BRAKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00W" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
</applicCrossRefTableRef>
</externalAssert>
</associate>
</productDefinitionRelationship>
```

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.9.6.1</a>	Attributes - Project configurable values
<a href="#">Chap 3.9.6.2</a>	Attributes - Fixed values

## 1 General

### 1.1 Scope

This chapter regards attributes that contain specific enumerated sets of predefined allowable values. Other attributes (eg, attributes used to contain non-specific character strings) are not concerned herein.

### 1.2 Purpose

The chapter introduces different classes of attributes and gives the principles for how these are populated. Specifically, the chapter describes how to code project configurable attributes.

## 2 Attribute principles

### 2.1 Attribute classes

In the Schemas, supplied with this specification, there are three classes of attributes with predefined allowable sets of values:

These classes are characterized as follows:

- Class 1 - Specific (for a project)

These attributes are used to represent information of project related character. They reflect facts and circumstances that do not have any relevance for the general function of the

specification. To some extent these attributes can be tailored to meet the needs of a specific project etc.

**Note**

In order to avoid ambiguities, it is crucial to consider the entire environment where the attributes will be involved and to make sure that tailoring is not in conflict with the overall interoperability requirements as agreed within the project.

- Class 2 - Generic (within scope of the specification)

These attributes represent characteristics and properties of general interest and relevance within the scope of the specification. They carry facts and circumstances that are essential to the function of the specification and its application. Therefore they must be applied strictly in accordance with the specification where their intended use is described.

- Class 3 - Public (inherited from other Schemas, etc)

These attributes are incorporated due to reuse of structures, elements and attributes created in contexts outside S1000D. An example would be the "align" attribute of the (CALS) table structure.

## 2.2 General coding principles

Under the interoperability constraint, attributes of class 1 can be tailored to specific projects as needed. [Chap 3.9.6.1](#) and [Chap 3.9.6.2](#) list these attributes, including their ranges of allowable values, and the S1000D interpretation of these values. Interpretations are provided in English.

A project can, by project decision, translate the "S1000D interpretation" given to the allowable values listed. The translation must be a direct translation without any deviations in its meaning.

### **Business rule decision point BRDP-S1-00328 - Translation of the "S1000D interpretation" of configurable attribute values:**

- Decide whether to translate and use the "S1000D interpretation" of configurable attribute values in the languages adopted by the project.

**Note**

At no time must a project allocate values outside the ranges given in the subchapters.

Attributes belonging to classes 2 and 3 are not available for project specific use.

## 2.3 Attributes available for tailoring

The attributes that are available for tailoring are defined in the following subchapters:

- [Chap 3.9.6.1](#) - Attributes - Project configurable values
- [Chap 3.9.6.2](#) - Attributes - Fixed values

## Chapter 3.9.6.1

## References

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.6</a>	Information generation - Security and data restrictions
<a href="#">Chap 3.9.1</a>	Authoring - General writing rules
<a href="#">Chap 7.3.1.5</a>	Schema - Configuration of attributes

## 1 General

This chapter describes the group of attributes for which the set of allowable values to some extent can be adjusted to the specific needs of a project. The attributes are listed and their respective sets of allowable coded values are defined.

Other attributes (eg, attributes used to contain non-specific character strings) are not concerned herein.

## 2 Attributes available for tailoring

The tables below specify those attributes available for project tailoring. For each attribute there is a description of what range of values is allocated to that attribute (allowable values). Refer to default BREX rules BREX-S1-00181 thru BREX-S1-00243, BREX-S1-00251 thru BREX-S1-00260, BREX-S1-00262, BREX-S1-00263 and BREX-S1-00264.

### Note

If an attribute and its value are not listed in these tables, it is not allowed.

For advice on how to technically configure attribute value sets to the project specific needs, refer to [Chap 7.3.1.5](#).

All tailoring of attribute values must be agreed to within a project and documented in the project or organization business rules. Furthermore, interpretation of attribute values must be exchanged and agreed upon between all parties.

### Business rule decision point BRDP-S1-00329 - Application of project specific values for configurable attributes:

- Decide whether to use any project specific attribute values, which values to use and allocate suitable definitions and interpretations.

### Note

There are specific business rules decision points for some of the configurable attributes given in the authoring chapters. Refer to [Chap 3.9.5](#) and its subchapters.

The attributes available for tailoring are:

- Access point type - attribute `accessPointTypeValue`
- Type of acronym or abbreviation - attribute `acronymType`
- Classification action – attribute `actionIdentType`
- Type of barcode - attribute `barCodeSymbology`
- Business rule decision point priority - attribute `brDecisionPointPriority`
- Business rule breach severity level - attribute `brSeverityLevel`
- Business rule quality assurance status - attribute `brStatus`
- Caption for Dialog cancel function - attribute `cancelCaption`

- National caveat - attribute caveat
- Check list category - attribute checkListCategory
- Type of circuit breaker reference - attribute circuitBreakerRefType
- Type of circuit breaker - attribute circuitBreakerType
- Caption color - attribute color
- Priority level of a comment - attribute commentPriorityCode
- Commercial security classification - attribute commercialClassification
- Type of crew member required for drill or procedural step - attribute crewMemberType
- Crew step condition - attribute crewStepCondition
- Default business rule breach severity level - attribute defaultBrSeverityLevel
- Type of aircrew drill - attribute drillType
- Type of emphasis - attribute emphasisType
- Type of front matter information - attribute frontMatterInfoType
- Type of front matter - attribute frontMatterType
- Maintenance function - attribute function
- Type of functional item reference - attribute functionalItemRefType
- Type of functional item - attribute functionalItemType
- Generic property type - attribute genericPropertyType
- Value of hazardous class - attribute hazardousClassValue
- Type of ICN metadata item - attribute icnInfoItemType
- Type of resource files associated to the ICN - attribute icnResourceFileType
- Type of source files associated to the ICN - attribute icnSourceFileType
- Type of equipment install location - attribute installationLocationType
- Type of target of the internal reference - attribute internalRefTargetType
- Item characteristic - attribute itemCharacteristic
- Origin of item - attribute itemOriginator
- Limit type - attribute limitUnitType
- Prefix of <randomList> items - attribute listItemPrefix
- Lowest authorized level - attribute lowestLevel
- Maintenance level code - attribute maintLevelCode
- Material usage - attribute materialUsage
- Operation type - attribute operationType
- Part characteristic - attribute partCharacteristic
- Part status for the item sequence number - attribute partStatus
- Part usage code - attribute partUsageCode
- Publication module entry type - attribute pmEntryType
- Type of publication in a publication module - attribute pmType
- Product category - attribute productCategory
- Type of product item - attribute productItemType
- Quantity type - attribute quantityType
- Refer to type - attribute refType
- Required condition category - attribute reqCondCategory
- Required technical information category - attribute reqTechInfoCategory
- Caption for Dialog reset function - attribute resetCaption
- Type of response to a comment - attribute responseType
- Service bulletin compliance category - attribute sbComplianceCategory
- Service bulletin impact type - attribute sbImpactType
- Service bulletin material type - attribute sbMaterialType

- Category of the Service bulletin task - attribute sbTaskCategory
- Service bulletin time compliance type - attribute sbTimeComplianceType
- Service bulletin topic type - attribute sbTopicType
- Type of SCO entry – attribute scoEntryType
- Security classification - attribute securityClassification
- Paragraph significant data type - attribute significantParaDataType
- Personnel skill level - attribute skillLevelCode
- Personnel skill category - attribute skillType
- Software classification - attribute softwareClassificationValue
- Software customization status - attribute softwareCustomizationStatusValue
- Source criticality - attribute sourceCriticality
- Source type code - attribute sourceTypeCode
- Part sourcing type - attribute sourcingTypeValue
- Caption for Dialog submit function - attribute submitCaption
- Supervisor level - attribute supervisorLevelCode
- Type of supply number - attribute supplyNumberType
- Task code - attribute taskCode
- Unit of measure for the threshold interval - attribute thresholdUnitOfMeasure
- Update reason type for reason for update - attribute updateReasonType
- Style/class of verbatim text - attribute verbatimStyle

Table 2 *accessPointTypeValue* - Access point type

Allowable values	S1000D interpretation
"accpnl01"	Door
"accpnl02"	Panel
"accpnl03"	Electrical panel
"accpnl04"	Hatch
"accpnl05"	Fillet
"accpnl51" - "accpnl99"	Available for projects

Table 3 *acronymType* - Type of acronym or abbreviation

Allowable values	S1000D interpretation
"at01" (default value)	Acronym (Candidate for list of abbreviations)
"at02"	Term (Candidate for list of terms)
"at03"	Symbol (Candidate for list of symbols)

Allowable values	S1000D interpretation
"at04"	Spec (Candidate for list of applicable specs)
"at51" - "at99"	Available for projects

Table 4 *actionIdentType* - Classification action

Allowable values	S1000D interpretation
"ai01"	Classified On
"ai02"	Declassify On
"ai03"	Downgrade On
"ai04"	Upgrade On
"ai05"	Downgrade securityClassification to 03
"ai06"	Downgrade securityClassification to 04
"ai07"	Downgrade securityClassification to 05
"ai08"	Upgrade securityClassification to 03
"ai09"	Upgrade securityClassification to 04
"ai10"	Upgrade securityClassification to 05
"ai51" - "ai99"	Available for projects

Table 5 *barCodeSymbology* - Type of barcode

Allowable values	S1000D interpretation
"bcs01"	Codabar
"bcs02"	Code 11
"bcs03"	EAN-13
"bcs04"	EAN-8
"bcs05"	Industrial 2 of 5
"bcs06"	Interleaved 2 of 5
"bcs07"	MSI
"bcs08"	Plessey
"bcs09"	POSTNET
"bcs10"	UPC-A

Allowable values	S1000D interpretation
"bcs11"	Standard 2 of 5
"bcs12"	UPC-E
"bcs13"	Code 128
"bcs14"	Code 39
"bcs15"	Code 93
"bcs16"	LOGMARS
"bcs17"	PDF417
"bcs18"	DataMatrix
"bcs19"	Maxicode
"bcs20"	QR Code
"bcs21"	Data Code
"bcs22"	Code 49
"bcs23"	16K
"bcs24"	Bookland EAN
"bcs25"	ISSN and the SISAC Barcode
"bcs26"	OPC
"bcs27"	UCC/EAN-128
"bcs28"	UPC Shipping Container Symbol: ITF-14
"bcs29"	PLANET
"bcs30"	Intelligent Mail (USPS4CB)
"bcs51" - "bcs99"	Available for projects

Table 6 *brDecisionPointPriority* - Business rule decision point priority

Allowable values	S1000D interpretation
"brpr01"	Highest BR priority
"brpr02"	Next lower level of BR priority
"brpr03"	Next lower level of BR priority
"brpr04"	Next lower level of BR priority
"brpr05"	Lowest level of BR priority

Allowable values	S1000D interpretation
"brpr51" - "brpr99"	Available for projects

*Table 7 brSeverityLevel - Business rule breach severity level*

Allowable values	S1000D interpretation
"brsl01"	Most severe
"brsl02"	Medium severity
"brsl03"	Least severe
"brsl51" - "brsl99"	Available for projects

#### Note

Allowable values for this attribute must comply with the values of attribute defaultBrSeverityLevel.

*Table 8 brStatus - Business rule quality assurance status*

Allowable values	S1000D interpretation
"brst01"	Unverified
"brst02"	First verified
"brst03"	Second verified
"brst51" - "brst99"	Available for projects

*Table 9 cancelCaption - Caption for Dialog cancel function*

Allowable values	S1000D interpretation
"ca01"	Sets the caption to "CANCEL"
"ca02"	Sets the caption to "ABORT"
"ca03"	Sets the caption to "NO"
"ca04"	Sets the caption to "END"
"ca05"	Sets the caption to "QUIT"
"ca51" - "ca99"	Available for projects

*Table 10 caveat - National caveat*

Allowable values	S1000D interpretation
"cv51" - "cv99"	Available for projects

Table 11 *checkListCategory* - Check list category

Allowable values	S1000D interpretation
"clc01"	Preventive maintenance inspection form
"clc02"	Preventive maintenance checks and services
"clc03"	Schematic
"clc51" - "clc99"	Available for projects

Table 12 *circuitBreakerRefType* - Type of circuit breaker reference

Allowable values	S1000D interpretation
"cbr01"	Reference to the primary circuit breaker
"cbr02"	Reference to the provisioned circuit breaker (for a dummy circuit breaker)
"cbr51" - "cbr99"	Available for projects

Table 13 *circuitBreakerType* - Type of circuit breaker

Allowable values	S1000D interpretation
"cbt01"	Electronic circuit breaker
"cbt02"	Electromechanical circuit breaker
"cbt03"	Clipped circuit breaker
"cbt51" - "cbt99"	Available for projects

Table 14 *color* - Caption color

Allowable values	S1000D interpretation
"co00"	None
"co01"	Green
"co02"	Amber
"co03"	Yellow
"co04"	Red
"co07"	White
"co08"	Grey

Allowable values	S1000D interpretation
"co09" (default value)	Clear
"co10"	Black
"co51" - "co99"	Available for projects

Table 15 *commentPriorityCode* - Priority level of a comment

Allowable values	S1000D interpretation
"cp01"	Routine
"cp02"	Emergency
"cp03"	Safety critical
"cp51" - "cp99"	Available for projects

Table 16 *commercialClassification* - Commercial security classification

Allowable values	S1000D interpretation
"cc51" - "cc99"	Available for projects

Table 17 *crewMemberType* - Type of crew member required for drill or procedural step

Allowable values	S1000D interpretation
"cm01"	All
"cm02"	Pilot
"cm03"	Co-pilot
"cm04"	Navigator
"cm05"	Engineer
"cm06"	Ground crew
"cm07"	Load master
"cm08"	Cabin supervisor
"cm51" - "cm99"	Available for projects

Table 18 *crewStepCondition* - Crew step condition

Allowable values	S1000D interpretation
"csc01"	Equipment is installed or available
"csc02"	A detailed procedure for the step is located in the performance section of the condensed checklist
"csc03"	Performance of the step is mandatory for all through-flights used for combat/tactical operations
"csc04"	A step that is mandatory for night flights
"csc05"	A task or step required by the operator's manual
"csc51" - "csc99"	Available for projects

Table 19 *defaultBrSeverityLevel* - Default business rule breach severity level

Allowable values	S1000D interpretation
"brsl01"	Most severe
"brsl02"	Medium severity
"brsl03"	Least severe
"brsl51" - "brsl99"	Available for projects

#### Note

Allowable values for this attribute must comply with the values of attribute `brSeverityLevel`.

Table 20 *drillType* - Type of aircrew drill

Allowable values	S1000D interpretation
"dt00" (default value)	None
"dt01"	Green
"dt02"	Amber
"dt03"	Yellow
"dt04"	Red
"dt05"	Orange
"dt06"	Blue
"dt51" - "dt99"	Available for projects

Table 21 *emphasisType* - Type of emphasis

Allowable values	S1000D interpretation
"em01" (default value)	Bold
"em02"	Italic (only for legacy data, refer to Chap 3.9.1)
"em03"	Underline (only for legacy data, refer to Chap 3.9.1)
"em04"	Overline (only for marking vectors)
"em05"	Strikethrough (not to be used to mark deleted text)
"em51" - "em99"	Available for projects

Table 22 *frontMatterInfoType* - Type of front matter information

Allowable values	S1000D interpretation
"fmi01"	Generic front matter information
"fmi02"	Manufacturer's information
"fmi03"	Reporting errors and recommending improvements statement
"fmi04"	Availability statement
"fmi05"	Preventive maintenance service warning
"fmi06"	General purpose notice
"fmi07"	Ozone depleting chemical information
"fmi08"	Hazardous materials information
"fmi51" - "fmi99"	Available for projects

Table 23 *frontMatterType* - Type of front matter

Allowable values	S1000D interpretation
"fm01"	LOEP - List of effective pages
"fm02"	LOEDM - List of effective data modules
"fm03"	HIGH - Highlights
"fm04"	HIGH - Highlights with updating instructions
"fm05"	Publication list data modules
"fm06"	LOI - List of illustrations
"fm07"	LOA - List of abbreviations

Allowable values	S1000D interpretation
"fm08"	LOT - List of terms
"fm09"	LOS - List of symbols
"fm10"	TSR - Technical standard record
"fm11"	LOM - List of modifications
"fm12"	LOASD - List of applicable specifications and documentation
"fm13"	LOW - List of warnings
"fm14"	LOC - List of cautions
"fm15"	LOSE - List of support equipment
"fm16"	LOSU - List of supplies
"fm17"	LOSP - List of spares
"fm18"	LOV - List of vendors
"fm51" - "fm99"	Available for projects

Table 24 *function* - Maintenance function

Allowable values	S1000D interpretation
"ft00"	None
"ft01"	Inspect
"ft02"	Test
"ft03"	Service
"ft04"	Adjust
"ft05"	Align
"ft06"	Calibrate
"ft07"	Remove/Install
"ft08"	Replace
"ft09"	Repair
"ft10"	Overhaul
"ft11"	Rebuild
"ft51" - "ft99"	Available for projects

Table 25 *functionalItemRefType* - Type of functional item reference

Allowable values	S1000D interpretation
"fir01"	Reference to the card functional item
"fir02"	Reference to soft functional item (for hard functional items)
"fir03"	Reference to LRI functional items (for LRU functional items)
"fir04"	Reference to the shunt functional item (for a Circuit breaker)
"fir05"	Reference to the mate equipment/connector functional item (for another equipment/connector functional item)
"fir06"	Reference to the equipment functional item, electrically protected by a given circuit breaker
"fir07"	Reference to the harness functional item, for an equipment functional item
"fir51" - "fir99"	Available for projects

Table 26 *functionalItemType* - Type of functional item

Allowable values	S1000D interpretation
"fit01"	Exact functional item = A functional item representing a component with only one position
"fit02"	Family functional item = A functional item with generic code representing a component which has more than one position (eg, seats, lights)
"fit51" - "fit99"	Available for projects

Table 27 *genericPropertyType* - Generic property type

Allowable values	S1000D interpretation
"gpt01"	Passenger comfort affected
"gpt02"	Reliability affected
"gpt03"	Cost saving
"gpt04"	Structural life extension
"gpt05"	Cancels inspection Service bulletin
"gpt06"	Product operation affected
"gpt07"	LROPS affected
"gpt08"	ETOPS affected
"gpt09"	Potential Airworthiness Directive

Allowable values	S1000D interpretation
"gpt10"	Disposition for removed spare that can be on customer shop
"gpt11"	Support code for removed spare
"gpt51" - "gpt99"	Available for projects

Table 28 *hazardousClassValue* - Value of hazardous class

Allowable values	S1000D interpretation
"hz01"	Explosive
"hz02"	Compressed gases
"hz03"	Flammable liquids
"hz51" - "hz99"	Available for projects

Table 29 *icnInfoItemType* - Type of ICN metadata item

Allowable values	S1000D interpretation
"iit01"	Unspecified
"iit02"	Size in kb
"iit03"	Duration in s
"iit04"	Default width in mm
"iit05"	Default height in mm
"iit06"	Transcript
"iit07" - "iit50"	Not available for projects
"iit51" - "iit99"	Available for projects

Table 30 *icnSourceFileType* - Type of source files associated with the ICN

Allowable values	S1000D interpretation
"isft01"	Unspecified
"isft02" - "isft50"	Not available for projects
"isft51" - "isft99"	Available for projects

Table 31 *icnResourceFileType* - Type of resource files associated with the ICN

Allowable values	S1000D interpretation
"irft01"	Unspecified
"irft02" - "irft50"	Not available for projects
"irft51" - "irft99"	Available for projects

Table 32 *installationLocationType* - Type of equipment install location

Allowable values	S1000D interpretation
"instloctyp02"	Section
"instloctyp03"	Station
"instloctyp04"	Water line
"instloctyp05"	Buttock line
"instloctyp51" - "instloctyp99"	Available for projects

Table 33 *internalRefTargetType* - Type of target of the internal reference

Allowable values	S1000D interpretation
"irtt01"	Figure
"irtt02"	Table
"irtt03"	Multimedia
"irtt04"	Supply
"irtt05"	Support equipment
"irtt06"	Spare
"irtt07"	Paragraph
"irtt08"	Step
"irtt09"	Graphic
"irtt10"	Multimedia object
"irtt11"	Hotspot
"irtt12"	Parameter
"irtt13"	Zone
"irtt14"	Work location

Allowable values	S1000D interpretation
"irtt15"	Service bulletin material set, support equipment set, supply set, spare set or removed spare set (including individual and external material)
"irtt16"	Access point
"irtt51" - "irtt99"	Available for projects

Table 34 *itemCharacteristic* - Item characteristic

Allowable values	S1000D interpretation
"ic01"	Step related to hardness critical process
"ic02"	Step related to electrostatic discharge
"ic03"	Step with a quality assurance effect
"ic51" - "ic99"	Available for projects

Table 35 *itemOriginator* - Origin of item

Allowable values	S1000D interpretation
"orig01"	Manufacturer
"orig02"	Vendor
"orig03"	Partner
"orig51" - "orig99"	Available for projects

Table 36 *limitUnitType* - Limit type

Allowable values	S1000D interpretation
"lt01"	Time between overhaul
"lt02"	Hard time
"lt03"	Since last maintenance
"lt04"	Out time limit
"lt05"	On condition
"lt06"	Check maintenance
"lt07"	Functional check
"lt51" - "lt99"	Available for projects

Table 37 *listItemPrefix* - Prefix for list items of random/unordered lists

Allowable values	S1000D interpretation
"pf01"	Simple (No prefix, only indent)
"pf02" (default value)	Unorder [-], [•], [-] (Depending on list level, prefix with short dash for first level, bullet for second, and short dash for third level - ISOpub: bull, dash)
"pf03"	Dash [-] (short dash - ISOpub: dash)
"pf04"	Disc [⊙] (filled circle in circle - ISOamsb: ocir)
"pf05"	Circle [○] (outline - ISOpub: cir)
"pf06"	Square [□] (outline - ISOftech: square)
"pf07"	Bullet [•] (outline - ISOpub: bull)
"pf51" - "pf99"	Available for projects

#### Note

For a basic (standard) S1000D implementation, use "pf02".

Table 38 *lowestLevel* - Lowest authorized level

Allowable values	S1000D interpretation
"la01"	None
"la02"	Field (Service) level
"la03"	Field/ASB maintenance can remove, replace, and use the item.
"la04"	Below depot sustainment maintenance can remove, replace, and use the item.
"la05"	Specialized repair activity/TASMG can remove, replace, and use the item.
"la06"	Afloat and ashore intermediate maintenance can remove, replace, and use the item.
"la07"	Contractor facility can remove, replace, and use the item.
"la08"	Item is not authorized to be removed, replaced, or used at any maintenance level.
"la09"	Depot can remove, replace, and use the item.
"la51" - "la99"	Available for projects

Table 39 *maintLevelCode* - Maintenance level code

Allowable values	S1000D interpretation
"ml01"	Level 1
"ml02"	Level 2
"ml03"	Level 3
"ml04"	Level 4
"ml05"	Level 5
"ml51" - "ml99"	Available for projects

Table 40 *materialUsage* - Material usage

Allowable values	S1000D interpretation
"mu01"	Discarded
"mu02"	Retained
"mu03"	Modified from
"mu04"	Referenced
"mu05"	Material set
"mu06"	Modified to
"mu51" - "mu99"	Available for projects

Table 41 *operationType* - Operation type

Allowable values	S1000D interpretation
"op01"	ETOPS (Refer to <a href="#">Chap 9.2.2</a> )
"op02"	RNP (Required Navigation Performance) system
"op03"	OMTS (On-board Mobile Telephony System)
"op51" - "op99"	Available for projects

Table 42 *partCharacteristic* - Part characteristic

Allowable values	S1000D interpretation
"pc01"	A hardness critical item
"pc02"	Flight safety and critical aircraft part

Allowable values	S1000D interpretation
"pc03"	Mandatory replacement part
"pc04"	Critical safety item
"pc05"	Test equipment
"pc06"	Part with electrostatic discharge sensitivity
"pc51" - "pc99"	Available for projects

Table 43 *partStatus* - Part status for the item sequence number

Allowable values	S1000D interpretation
"pst01"	Basic part
"pst02"	Oversize/Undersize
"pst03"	Select from
"pst04"	Interchangeable
"pst05"	Alternative
"pst51" - "pst99"	Available for projects

Table 44 *partUsageCode* - Part usage code

Allowable values	S1000D interpretation
"pu01"	Standard part
"pu02"	Expendable part
"pu03"	Components of end-item parts
"pu04"	Basic issue item parts
"pu05"	Item required to operate equipment
"pu06"	Tool item
"pu07"	Special tool
"pu8"	Standard mechanical hardware items
"pu9"	Hardware
"pu10"	Line replaceable item
"pu11"	Anesthetics/Medical chemicals
"pu12"	Module
"pu13"	Ammunition with dangerous substances

Applicable to: All

S1000D-A-03-09-0601-00A-040A-A

Chap 3.9.6.1

Allowable values	S1000D interpretation
"pu14"	Modification leaflet
"pu15"	Medical supplies
"pu16"	Modification set
"pu17"	None of the other codes applies

Chap No./Document No.	Title
<a href="#">Chap 7.3.1.5</a>	Schema - Configuration of attributes
ISO/IEC 80000-2	Quantities and units - Part 2. Mathematical signs and symbols to be used in the natural sciences and technology

## 1 General

This chapter describes how to code project configurable attributes that have as their basis a set of fixed values.

The description regards attributes that are supposed to apply specified sets of predefined allowable values. Other attributes, for example, attributes containing not pre-defined character strings, are not concerned herein.

## 2 Attributes available for tailoring

The tables below specify the set of fixed values, and the values available for project tailoring, that apply to the attribute concerned. Refer to default BREX rule BREX-S1-00244.

For advice on how to technically configure attribute value sets to the project specific needs, refer to [Chap 7.3.1.5](#).

All tailoring of attribute values must be agreed to within a project and documented in the project business rules. Furthermore, interpretation of attribute values must be exchanged and agreed upon between all parties concerned.

**Business rule decision point BRDP-S1-00330 - Application of project specific values for the attribute quantityUnitOfMeasure:**

- Decide whether any project specific attribute values are needed for the attribute quantityUnitOfMeasure. If needed, decide which project specific values to use

for the attribute `quantityUnitOfMeasure` and allocate suitable project interpretations.

The quantity unit of measure attribute available for tailoring is:

#### Attributes:

- `quantityUnitOfMeasure`

#### Note

An XML document of the S1000D units of measure is provided as part of the S1000D™ suite of information and is available for download from the S1000D web site. For each unit, this document includes the name, the type or types of quantity (which is not the same as the "Quantity data type") that the unit represents, the annotation to be used in the markup (= "Allowable value"), and the relationship to a base unit (for derived units).

#### Note

For SI units, it is highly recommended that the unit of measure is displayed in accordance with the ISO/IEC 80000-2 Quantities and units - Part 2.

#### Note

The common symbols for Volts Alternating Current (AC) and Volts Direct Current (DC) must be presented as "V AC" and "V DC".

Table 2 *quantityUnitOfMeasure* - Quantity data unit of measure

Allowable values	S1000D interpretation
"%"	percent
"(dyne/cm) 4/gcm3"	dynes/centimeter fourth/gram cm cubed
"(N/m) 4/kg.m3"	newton/meter fourth/kilogram meter cubed
"1/a"	per annum
"1/angstrom"	per angstrom
"1/bar"	per bar
"1/bbl"	per barrel
"1/cm"	per centimeter
"1/d"	per day
"1/degC"	per degree Celsius
"1/degF"	per degree Fahrenheit
"1/degR"	per degree Rankine
"1/ft"	per foot
"1/ft2"	per square foot
"1/ft3"	per cubic foot
"1/g"	per gram

Allowable values	S1000D interpretation
"1/galUK"	per UK gallon
"1/galUS"	per US gallon
"1/H"	inverse henry
"1/h"	per hour
"1/in"	per inch
"1/K"	per kelvin
"1/kg"	per kilogram
"1/km2"	per square kilometer
"1/kPa"	per kilopascal
"1/L"	per liter
"1/lbf"	per pound force
"1/lbm"	per pound
"1/m"	per meter
"1/m2"	per square meter
"1/m3"	per cubic meter
"1/mi"	per mile
"1/mi2"	per square mile
"1/min"	per minute
"1/mm"	per millimeter
"1/N"	per newton
"1/nm"	per nanometer
"1/Pa"	per pascal
"1/pPa"	per picopascal
"1/psi"	per pounds per square inch
"1/s"	per second
"1/upsi"	per micropounds per square inch
"1/uV"	per microvolt
"1/V"	per volt
"1/wk"	per week

Allowable values	S1000D interpretation
"1/yd"	per yard
"1000ft <sup>3</sup> "	thousand cubic feet
"1000ft <sup>3</sup> /bbl"	thousand cubic feet per barrel
"1000ft <sup>3</sup> /d"	thousand cubic feet per day
"1000ft <sup>3</sup> /d.ft"	thousand cubic feet per day per foot
"1000ft <sup>3</sup> /psi.d"	thousand cubic feet per day per psi
"1000m <sup>3</sup> /d"	thousand cubic meters per day
"1000m <sup>3</sup> /d.m"	thousand cubic meter per day per meter
"1000m <sup>3</sup> /h"	thousand cubic meters per hour
"1000m <sup>3</sup> /h.m"	thousand cubic meters per hour per meter
"1000m <sup>4</sup> /d"	thousand (cubic meter per day)-meter
"100ka"	100000 years
"10Mg/m <sup>3</sup> "	ten thousand kilograms per cubic meter
"A"	ampere
"a"	annum
"A.h"	ampere hour
"A.m <sup>2</sup> "	amperes meters squared
"A/cm <sup>2</sup> "	ampere per square centimeter
"A/ft <sup>2</sup> "	ampere per square foot
"A/m"	Amperes per meter
"A/m <sup>2</sup> "	amperes per square meter
"A/mm"	ampere per millimeter
"A/mm <sup>2</sup> "	ampere per square millimeter
"acre"	acre
"acre.ft"	acre foot
"acre.ft/MMstb"	acre feet per million stock tank barrels, 60 degree Fahrenheit
"ag"	attogram
"aJ"	attojoule
"angstrom"	Angstrom

Allowable values	S1000D interpretation
"at"	technical atmosphere
"atm"	atmosphere
"atm/ft"	atmospheres per feet
"atm/h"	atmospheres per hour
"atm/hm"	atmospheres per hundred meter
"atm/m"	atmospheres per meter
"B"	bel
"b"	barn
"b/cm <sup>3</sup> "	barns per cubic centimeter
"b/elec"	barns per electron
"B/m"	bels per meter
"B/O"	bels per octave
"bar"	bar
"bar/h"	bars per hour
"bar/km"	bars per kilometer
"bar/m"	bars per meter
"bar <sup>2</sup> "	bar squared
"bar <sup>2</sup> /cP"	bar squared per centipoise
"bbl"	barrel
"bbl/100bbl"	barrels per hundred barrel
"bbl/acre"	barrels per acre
"bbl/acre.ft"	barrels per acre foot
"bbl/bbl"	barrels per barrel
"bbl/cP.d.psi"	barrels per centipoise day psi
"bbl/d"	barrel per day
"bbl/d.acre.ft"	barrels per day acre foot
"bbl/d.ft"	barrels per day foot
"bbl/d.ft.psi"	barrels per day foot pounds per square inch
"bbl/d.psi"	barrel per day pounds per square inch

Allowable values	S1000D interpretation
"bbl/d2"	barrels per day per day
"bbl/ft"	barrels per foot
"bbl/ft3"	barrels per cubic foot
"bbl/hr"	barrels per hour
"bbl/hr2"	barrels per hour per hour
"bbl/in"	barrels per inch
"bbl/k(ft3)"	barrels per thousand cubic feet
"bbl/kPa.d"	barrels per day per kilopascal
"bbl/M(ft3)"	barrels per million cubic feet
"bbl/mi"	barrels per mile
"bbl/min"	barrel per minute
"bbl/MMscf(60F)"	barrels per million standard cubic feet, 60 degree Fahrenheit
"bbl/psi.d"	barrels per day per psi
"bbl/stb(60F)"	barrels per stock tank barrel, 60 degree Fahrenheit
"bbl/tonUK"	barrel per U.K. ton
"bbl/tonUS"	barrel per U.S. ton
"bcf"	billion cubic feet
"Bd"	baud
"bit"	bit
"Bq"	becquerel
"Bq/kg"	becquerels per kilogram
"Btu"	British thermal unit
"Btu(million)/hr"	million British thermal units per hour
"Btu.in/hr.ft2.F"	British thermal units per hour foot squared degree Fahrenheit per inch
"Btu/bbl"	British thermal units per barrel
"Btu/bhp.hr"	British thermal units per brake-horsepower hour
"Btu/ft3"	British thermal units per cubic foot
"Btu/galUK"	British thermal units per U.K. gallon

Allowable values	S1000D interpretation
"Btu/galUS"	British thermal units per U.S. gallon
"Btu/hr"	British thermal units per hour
"Btu/hr.ft.degF"	British thermal units per hour foot degree Fahrenheit
"Btu/hr.ft2"	British thermal unit per hour per square foot
"Btu/hr.ft2.degF"	British thermal units per hour foot squared degree Fahrenheit
"Btu/hr.ft2.degR"	British thermal units per hour foot squared degree Rankine
"Btu/hr.ft3"	British thermal units per hour cubic foot
"Btu/hr.ft3.degF"	British thermal units per hour foot cubed degree Fahrenheit
"Btu/hr.m2.degC"	British thermal units per hour meter squared degree Celsius
"Btu/lbm"	British thermal units per pound mass
"Btu/lbm.degF"	British thermal units per pound mass degree Fahrenheit
"Btu/lbm.degR"	British thermal units per pound mass degree Rankine
"Btu/min"	British thermal units per minute
"Btu/mol(lbm)"	British thermal units per pound mass mol
"Btu/mol(lbm).F"	British thermal unit per pound mass mol degree Fahrenheit
"Btu/s"	British thermal units per second
"Btu/s.ft2"	British thermal units per second square foot
"Btu/s.ft2.degF"	British thermal unit per second per square foot degree Fahrenheit
"Btu/s.ft3"	British thermal unit per second per cubic foot
"Btu/s.ft3.degF"	British thermal unit per second per cubic foot degree Fahrenheit
"byte"	byte
"C"	coulomb
"c"	cycle
"C.m"	coulomb meters
"C/cm2"	coulombs per square centimeter
"C/cm3"	coulombs per cubic centimeter

Allowable values	S1000D interpretation
"C/g"	coulombs per gram
"C/kg"	coulombs per kilogram
"C/m2"	coulombs per square meter
"C/m3"	coulombs per cubic meter
"C/mm2"	coulombs per square millimeter
"C/mm3"	coulombs per cubic millimeter
"c/s"	cycles per second
"cal"	calorie
"cal/cm3"	calories per cubic centimeter
"cal/g"	calories per gram
"cal/g.K"	calories per gram kelvin
"cal/h.cm.degC"	calories per hour centimeter degree Celsius
"cal/h.cm2"	calories per hour centimeter squared
"cal/h.cm2.degC"	calories per hour square centimeter degree Celsius
"cal/h.cm3"	calories per hour cubic centimeter
"cal/kg"	calories per kilogram
"cal/lbm"	calories per pound mass
"cal/mL"	calories per milliliter
"cal/mm3"	calories per cubic millimeter
"cal/mol(g).degC"	calories per gram mol degree Celsius
"cal/s.cm.degC"	calories per second centimeter degree Celsius
"cal/s.cm2.degC"	calories per second square centimeter degree Celsius
"cal/s.cm3"	calories per second cubic centimeter
"ccgr"	centesimal second
"cd"	candela
"cd/m2"	candelas per square meter
"cEuc"	centiEuclid
"cgr"	centesimal minute
"ch"	ch

Allowable values	S1000D interpretation
"ch.h"	ch hour
"chBnA"	benoit chain (1895 A)
"chBnB"	benoit chain (1895 B)
"chCla"	clarke chain
"chSe"	sears chain
"Chu"	chus
"chUS"	US survey chain
"Ci"	curie
"cL"	centiliter
"cm"	centimeter
"cm/a"	centimeters per year
"cm/s"	centimeters per second
"cm/s <sup>2</sup> "	centimeters per second per second
"cm <sup>2</sup> "	square centimeter
"cm <sup>2</sup> /g"	centimeters squared per gram
"cm <sup>2</sup> /s"	centimeters squared per second
"cm <sup>3</sup> "	cubic centimeter
"cm <sup>3</sup> /30min"	cubic centimeters per thirty minutes
"cm <sup>3</sup> /cm <sup>3</sup> "	cubic centimeters per cubic centimeters
"cm <sup>3</sup> /g"	cubic centimeters per gram
"cm <sup>3</sup> /h"	cubic centimeters per hour
"cm <sup>3</sup> /m <sup>3</sup> "	cubic centimeters per cubic meter
"cm <sup>3</sup> /min"	cubic centimeters per minute
"cm <sup>3</sup> /s"	cubic centimeters per second
"cm <sup>4</sup> "	centimeters fourth
"cmH <sub>2</sub> O (4degC)"	cm of water at 4 degree Celsius
"cP"	centipoise
"cs"	ten millisecond
"cSt"	centistoke

Allowable values	S1000D interpretation
"ct"	carat
"cu"	capture unit
"cu ft"	cubic feet
"cu in"	cubic inch
"cu yd"	cubic yard
"cubem"	cubic mile
"curie"	curie
"CV"	cheval vapeur
"CV.h"	cheval vapeur hour
"cwtUK"	UK hundredweight
"cwtUS"	US hundredweight
"D"	darcy
"d"	day
"D.ft"	darcy foot
"D.m"	darcy meter
"d/bbl"	days per barrel
"d/ft3"	days per cubic foot
"d/k(ft3)"	days per thousand cubic feet
"d/m3"	days per cubic meter
"daN"	decanewton
"daN.m"	decanewton meter
"dAPI"	API gravity
"dB"	decibel
"dB/100m"	decibels per 100meter
"dB/ft"	decibels per foot
"dB/km"	decibels per kilometer
"dB/m"	decibels per meter
"dB/O"	decibels per octave
"ddegC"	change in degrees Celsius

Allowable values	S1000D interpretation
"ddegF"	change in degrees Fahrenheit
"ddegK"	change in kelvin
"ddegR"	change in degrees Rankine
"dega"	degree of an angle
"dega/100ft"	degrees of an angle per 100 feet
"dega/30ft"	degrees of an angle per thirty feet
"dega/30m"	degrees of an angle per 30 meters
"dega/ft"	degrees of an angle per foot
"dega/ft(100)"	degrees of an angle per 100 feet
"dega/h"	degrees of an angle per hour
"dega/m"	degrees of an angle per meter
"dega/m(30)"	degrees of an angle per 30 meters
"dega/min"	degrees of an angle per minute
"dega/s"	degrees of an angle per second
"degC"	degrees Celsius
"degC.m <sup>2</sup> .h/kcal"	degrees Celsius square meters hours per kilocalorie
"degC/100m"	degrees Celsius per hundred meter
"degC/ft"	degrees Celsius per foot
"degC/h"	degrees Celsius per hour
"degC/km"	degrees Celsius per kilometer
"degC/m"	degrees Celsius per meter
"degC/min"	degrees Celsius per minute
"degC/s"	degrees Celsius per second
"degF"	degree Fahrenheit
"degF.ft <sup>2</sup> .h/Btu"	degrees Fahrenheit square feet hours per British thermal units
"degF/100ft"	degrees Fahrenheit per 100 feet
"degF/ft"	degrees Fahrenheit per foot
"degF/ft(100)"	degrees Fahrenheit per 100 feet
"degF/h"	degrees Fahrenheit per hour

Allowable values	S1000D interpretation
"degF/m"	degrees Fahrenheit per meter
"degF/min"	degrees Fahrenheit per minute
"degF/s"	degrees Fahrenheit per second
"degR"	degrees Rankine
"dL"	deciliter
"dm"	decimeter
"dm/s"	decimeter per second
"dm3"	cubic decimeter
"dm3/100km"	cubic decimeters per 100 kilometers
"dm3/kg"	cubic decimeters per kilogram
"dm3/km(100)"	cubic decimeters per 100 kilometers
"dm3/kW.h"	cubic decimeters per kilowatt hour
"dm3/m"	cubic decimeters per meter
"dm3/m3"	cubic decimeters per cubic meter
"dm3/MJ"	cubic decimeters per megajoule
"dm3/mol(kg)"	cubic decimeters per kilogram mole
"dm3/s"	cubic decimeters per second
"dm3/s2"	cubic decimeters per second per second
"dm3/t"	cubic decimeters per ton
"dN.m"	decinewton meter
"dyne"	dyne
"dyne.cm2"	dyne centimeter squared
"dyne.s/cm2"	dyne seconds per square centimeter
"dyne/cm"	dynes per centimeter
"dyne/cm2"	dynes per square centimeter
"ehp"	electric horsepower
"EJ"	exajoule
"EJ/a"	exajoules per year
"eq"	equivalent

Allowable values	S1000D interpretation
"eq/kg"	equivalent per kilogram
"eq/L"	equivalents per liter
"eq/m3"	equivalents per cubic meter
"erg"	erg
"erg/a"	ergs per year
"erg/cm2"	ergs per square centimeter
"erg/cm3"	ergs per cubic centimeter
"erg/g"	ergs per gram
"erg/kg"	ergs per kilogram
"erg/m3"	ergs per cubic meter
"Euc"	euclid
"eV"	electron volt
"F"	farad
"F/m"	farads per meter
"fathom"	fathom
"fC"	femtocoulomb
"fl ozUK"	UK fluid ounce
"fl ozUS"	US fluid ounce
"flops"	flops
"flozUK"	UK fluid ounce
"flozUS"	US fluid ounce
"fm"	femtometer
"footcandle"	footcandle
"footcandle.s"	footcandle second
"ft"	foot
"ft.lbf"	foot pounds force
"ft.lbf/bbl"	foot pounds force per barrel
"ft.lbf/galUS"	foot pounds force per US gallon
"ft.lbf/lbm"	foot pounds force per pound mass

Allowable values	S1000D interpretation
"ft.lbf/min"	foot pounds force per minute
"ft.lbf/s"	foot pounds force per second
"ft.lbm"	foot pound mass
"ft/100ft"	feet per 100 feet
"ft/bbl"	feet per barrel
"ft/d"	feet per day
"ft/degF"	feet per degree Fahrenheit
"ft/ft"	feet per feet
"ft/ft <sup>3</sup> "	feet per cubic foot
"ft/galUS"	feet per US gallon
"ft/h"	feet per hour
"ft/in"	feet per inch
"ft/m"	feet per meter
"ft/mi"	feet per mile
"ft/min"	feet per minute
"ft/ms"	feet per millisecond
"ft/s"	feet per second
"ft/s <sup>2</sup> "	feet per second squared
"ft/us"	feet per microsecond
"ft <sup>2</sup> "	square foot
"ft <sup>2</sup> /h"	square feet per hour
"ft <sup>2</sup> /in <sup>3</sup> "	square feet per cubic inch
"ft <sup>2</sup> /s"	square feet per second
"ft <sup>3</sup> "	cubic feet
"ft <sup>3</sup> (std, 60F)"	cubic feet at standard conditions
"ft <sup>3</sup> /bbl"	cubic feet per barrel
"ft <sup>3</sup> /d"	cubic feet per day
"ft <sup>3</sup> /d.ft.psi"	cubic feet per day foot psi
"ft <sup>3</sup> /d <sup>2</sup> "	cubic feet per day per day

Allowable values	S1000D interpretation
"ft3/ft"	cubic feet per foot
"ft3/ft3"	cubic feet per cubic foot
"ft3/h"	cubic feet per hour
"ft3/h2"	cubic feet per hour per hour
"ft3/kg"	cubic feet per kilogram
"ft3/lbm"	cubic feet per pound mass
"ft3/min"	cubic feet per minute
"ft3/min.ft2"	cubic feet per min square foot
"ft3/min2"	cubic feet per minute per minute
"ft3/mol(lbm)"	cubic feet per mole (pound mass)
"ft3/s"	cubic feet per second
"ft3/s.ft2"	cubic feet per second square foot
"ft3/s2"	cubic feet per second per second
"ft3/sack94"	cubic feet per 94 pound sack
"ft3/scf(60F)"	cubic feet per standard cubic foot, 60 degree Fahrenheit
"ftBnA"	British foot (Benoit 1895 A)
"ftBnB"	British foot (Benoit 1895 B)
"ftBr(65)"	British foot 1865
"ftCla"	imperial foot
"ftGC"	gold coast foot
"ftInd"	indian foot
"ftInd(37)"	indian foot, 1937
"ftInd(62)"	indian foot, 1962
"ftInd(75)"	indian foot, 1975
"ftMA"	modified American foot
"ftSe"	sears foot
"ftUS"	US survey foot
"g"	gram
"g.ft/cm3.s"	gram feet per cubic centimeter second

Allowable values	S1000D interpretation
"g/cm3"	grams per cubic centimeter
"g/cm4"	grams per centimeter fourth
"g/dm3"	grams per cubic decimeter
"g/galUK"	grams per UK gallon
"g/galUS"	grams per US gallon
"g/kg"	grams per kilogram
"g/L"	grams per liter
"g/m3"	grams per cubic meter
"g/s"	grams per second
"Ga"	gigayear
"Gal"	galileo
"gal/sack"	US gallons per 94 pounds sack
"galUK"	UK gallon
"galUK/d"	UK gallons per day
"galUK/ft3"	UK gallons per cubic foot
"galUK/hr"	UK gallons per hour
"galUK/hr.ft"	UK gallons per hour foot
"galUK/hr.ft2"	UK gallons per hour square foot
"galUK/hr.in"	UK gallons per hour inch
"galUK/hr.in2"	UK gallons per hour square inch
"galUK/hr2"	UK gallons per hour per hour
"galUK/kgalUK"	UK gallons per thousand UK gallons
"galUK/lbm"	UK gallons per pound mass
"galUK/Mbbl"	UK gallons per 1000 barrels
"galUK/mi"	UK gallons per mile
"galUK/min"	UK gallons per minute
"galUK/min.ft"	UK gallons per minute foot
"galUK/min.ft2"	UK gallons per minute square foot
"galUK/min2"	UK gallons per minute per minute

<b>Allowable values</b>	<b>S1000D interpretation</b>
"galUS"	US gallon
"galUS/10bbl"	US gallons per ten barrels
"galUS/bbl"	US gallons per barrels
"galUS/d"	US gallons per day
"galUS/ft"	US gallons per foot
"galUS/ft3"	US gallons per cubic foot
"galUS/hr"	US gallons per hour
"galUS/hr.ft"	US gallons per foot hour
"galUS/hr.ft2"	US gallons per hour square foot
"galUS/hr.in"	US gallons per hour inch
"galUS/hr.in2"	US gallons per hour square inch
"galUS/hr2"	US gallons per hour per hour
"galUS/kgalUS"	US gallons per thousand US gallons
"galUS/lbm"	US gallons per pound mass
"galUS/Mbbl"	US gallons per 1000 barrels
"galUS/mi"	US gallons per mile
"galUS/min"	US gallons per minute
"galUS/min.ft"	US gallons per minute foot
"galUS/min.ft2"	US gallons per minute square foot
"galUS/min2"	US gallons per minute per minute
"galUS/Mscf(60F)"	US gallons per 1000 standard cubic feet, 60 degree Fahrenheit
"galUS/sack94"	US gallons per 94 pounds sack
"galUS/tonUK"	US gallons per UK ton
"galUS/tonUS"	US gallons per US ton
"gamma"	gamma
"gAPI"	API gamma ray unit
"gauss"	gauss
"GBq"	gigabecquerel
"GeV"	billions of electron volts

Applicable to: All

**S1000D-A-03-09-0602-00A-040A-A**

**Chap 3.9.6.2**

Allowable values	S1000D interpretation
"gf"	gram force
"GHz"	gigahertz
"GJ"	gigajoule
"gn"	gravity
"Gohm"	gigaohm
"gon"	gons
"GPa"	gigapascal
"GPa/cm"	gigapascals per centimeter
"GPa2"	gigapascals squared
"gr"	grad
"Grad"	gigaradian
"grain"	grain
"grain/100ft3"	grains per 100 cubic feet
"grain/ft3"	grains per cubic foot
"grain/ft3(100)"	grains per 100 cubic feet
"grain/galUS"	grains per US gallon
"GS"	gigasiemens
"Gsm3"	giga standard cubic meters 15 degree Celsius
"gu"	gas unit
"GW"	gigawatt
"GW.h"	gigawatt hour
"Gy"	gray
"H"	henry
"h"	hour
"h/ft3"	hours per cubic foot
"h/kft"	hours per thousand foot
"h/km"	hours per kilometer
"H/m"	henries per meter
"h/m3"	hours per cubic meter

Allowable values	S1000D interpretation
"ha"	hectare
"ha.m"	hectare meter
"hbar"	hectobar
"hhp"	hydraulic horsepower
"hhp/in2"	(hydraulic) horsepower per square inch
"hL"	hectoliter
"hp"	horsepower
"hPa"	hectopascal
"hp.hr"	horsepower hour
"hp.hr/bbl"	horsepower hours per barrel
"hp.hr/lbm"	horsepower hours per pound mass
"hp/ft3"	horsepower per cubic foot
"hp/in2"	horsepower per square inch
"hs"	hundred second
"Hz"	hertz
"in"	inch
"in/10"	tenth of an inch
"in/16"	16th of an inch
"in/32"	32nd of an inch
"in/64"	64th of an inch
"in/a"	inches per year
"in/in.degF"	inches per inch degree Fahrenheit
"in/min"	inches per minute
"in/s"	inches per second
"in2"	square inch
"in2/ft2"	square inches per square foot
"in2/in2"	square inches per square inch
"in2/s"	square inches per second
"in3"	cubic inch

Allowable values	S1000D interpretation
"in3/ft"	cubic inches per foot
"in4"	inches to the fourth
"inH2O(39.2F)"	inches of water at 39.2 degree Fahrenheit
"inH2O(60F)"	inches of water at 60 degree Fahrenheit
"inHg(32F)"	inches of mercury at 32 degree Fahrenheit
"inHg(60F)"	inches of mercury at 60 degree Fahrenheit
"inUS"	US survey inch
"J"	joule
"J/cm2"	joules per square centimeter
"J/dm3"	joules per cubic decimeter
"J/g"	joules per gram
"J/g.K"	joules per gram kelvin
"J/K"	joules per delta kelvin
"J/kg"	joules per kilogram
"J/kg.K"	joules per kilogram kelvin
"J/m"	joules per meter
"J/m2"	joules per square meter
"J/m3"	joules per cubic meter
"J/mol"	joules per mole
"J/mol.K"	joules per mole kelvin
"J/s.m2.degC"	joules per second square meter degree Celsius
"K"	kelvin
"K.m2/kW"	degrees kelvin square meters per kilowatt
"K.m2/W"	kelvin meters squared per watt
"K/m"	degrees kelvin per meter
"K/s"	kelvin per second
"K/W"	delta kelvin per watt
"kA"	kiloampere
"kbb1/d"	thousand barrels per day

Allowable values	S1000D interpretation
"kbyte"	kilobyte
"kC"	kilocoulomb
"kcal"	kilocalorie
"kcal.m/cm2"	kilocalorie meters per square centimeter
"kcal/cm3"	kilocalories per cubic centimeter
"kcal/g"	kilocalories per gram
"kcal/h"	kilocalories per hour
"kcal/h.m.degC"	kilocalories per hour meter degree Celsius
"kcal/h.m2.degC"	kilocalories per hour square meter degree Celsius
"kcal/kg"	kilocalories per kilogram
"kcal/kg.degC"	kilocalories per kilogram degree Celsius
"kcal/m3"	kilocalories per cubic meter
"kcal/mol(g)"	kilocalories per mole (gram)
"kcd"	kilocandela
"kdyne"	kilkodyne
"kEuc/s"	thousand per second
"keV"	kiloelectron volt
"kft.lbf"	thousand feet pounds force
"kft/h"	thousand feet per hour
"kft/s"	thousand feet per second
"kg"	kilogram
"kg.m"	kilogram meter
"kg.m/cm2"	kilogram meters per square centimeter
"kg.m/s"	kilogram meters per second
"kg.m2"	kilogram meter squared
"kg/d"	kilograms per day
"kg/dm3"	kilograms per cubic decimeter
"kg/dm4"	kilograms per decimeter fourth
"kg/h"	kilograms per hour

Allowable values	S1000D interpretation
"kg/J"	kilograms per joule
"kg/kg"	kilograms per kilogram
"kg/kW.h"	kilograms per kilowatt hour
"kg/L"	kilogram per liter
"kg/m"	kilograms per meter
"kg/m.s"	kilograms per meter second
"kg/m2"	kilograms per square meter
"kg/m2.s"	kilograms per square meter seconds
"kg/m3"	kilograms per cubic meter
"kg/m4"	kilograms per meter fourth
"kg/min"	kilograms per min
"kg/MJ"	kilograms per megajoule
"kg/s"	kilograms per second
"kg/sack94"	kilograms per 94 pound sack
"kgf"	kilogram force
"kgf.m"	kilogram force meters
"kgf.m/cm2"	kilogram force meters per square centimeter
"kgf.m/m"	kilograms force meters per meter
"kgf.m2"	kilogram force meters squared
"kgf.s/m2"	kilograms force seconds per square meter
"kgf/cm"	kilograms force per centimeter
"kgf/cm2"	kilograms per square centimeter
"kgf/kgf"	kilogram force per kilogram force
"kgf/mm2"	kilogram force per square millimeter
"kHz"	kilohertz
"kJ"	kilojoule
"kJ.m/h.m2.K"	kilojoule meters per hour square meter kelvin
"kJ/dm3"	kilojoules per cubic decimeter
"kJ/h.m2.K"	kilojoules per hour square meter kelvin

Allowable values	S1000D interpretation
"kJ/kg"	kilojoules per kilogram
"kJ/kg.K"	kilojoules per kilogram kelvin
"kJ/m <sup>3</sup> "	kilojoules per cubic meter
"kJ/mol(kg)"	kilojoules per mole (kilogram)
"kJ/mol(kg).K"	kilojoules per mole (kilogram) kelvin
"klbf"	thousand pounds force
"klbm"	thousand pounds mass
"klbm/in"	thousand pounds mass per inch
"klx"	kilolux
"km"	kilometer
"km/cm"	kilometers per centimeter
"km/dm <sup>3</sup> "	kilometers per cubic decimeter
"km/h"	kilometers per hour
"km/L"	kilometers per liter
"km/s"	kilometers per second
"km <sup>2</sup> "	square kilometer
"km <sup>3</sup> "	cubic kilometer
"kmol"	kilomole
"kN"	kilonewton
"kN.m"	kilonewton meter
"kN.m <sup>2</sup> "	kilonewton meters squared
"kN/m"	kilonewtons per meter
"kN/m <sup>2</sup> "	kilonewtons per square meter
"knot"	knot
"kohm"	kilohm
"kohm.m"	kiloohm meter
"kPa"	kilopascal
"kPa.s/m"	kilopascal seconds per meter
"kPa/100m"	kilopascals per hundred meter

Allowable values	S1000D interpretation
"kPa/h"	kilopascals per hour
"kPa/m"	kilopascals per meter
"kPa/min"	kilopascals per min
"kPa <sup>2</sup> "	kilopascal squared
"kPa <sup>2</sup> /cP"	kilopascal squared per centipoise
"kPa <sup>2</sup> /kCp"	kilopascal squared per thousand centipoise
"kpsi"	thousand pounds per square inch
"kpsi <sup>2</sup> "	thousand pound per square inch, squared
"krad"	kiloradian
"kS"	kilosiemens
"ksm <sup>3</sup> "	kilo standard cubic meters 15 degree Celsius
"ksm <sup>3</sup> /d"	kilo standard cubic meters per day
"ksm <sup>3</sup> /sm <sup>3</sup> "	kilo standard cubic meters per standard cubic meter
"kV"	kilovolt
"kW"	kilowatt
"kW.h"	kilowatt hour
"kW.h/dm <sup>3</sup> "	kilowatt hours per decimeter
"kW.h/kg"	kilowatt hours per kilogram
"kW.h/kg.degC"	kilowatt hours per kilogram degree Celsius
"kW.h/m <sup>3</sup> "	kilowatt hours per cubic meters
"kW/cm <sup>2</sup> "	kilowatts per square centimeter
"kW/m <sup>2</sup> "	kilowatts per square meter
"kW/m <sup>2</sup> .K"	kilowatts per square meter kelvin
"kW/m <sup>3</sup> "	kilowatts per cubic meter
"kW/m <sup>3</sup> .K"	kilowatts per cubic meter kelvin
"L"	liter
"L/100kg"	liters per hundred kilogram
"L/100km"	liters per 100 kilometers
"L/10bbl"	liters per ten barrel

Allowable values	S1000D interpretation
"L/bar.min"	liters per minute per bar
"L/h"	liters per hour
"L/kg"	liters per kilogram
"L/km(100)"	liters per 100 kilometers
"L/m"	liters per meter
"L/m3"	liters per cubic meter
"L/min"	liters per minute
"L/mol(g)"	liters per mole (gram)
"L/mol(kg)"	liters per mole (kilogram)
"L/s"	liters per second
"L/s2"	liters per second/second
"L/t"	liters per tonne
"L/tonUK"	liters per UK ton
"lbf"	pounds force
"lbf.ft"	foot pounds force
"lbf.ft/bbl"	foot pounds force per barrel
"lbf.ft/in"	pounds force feet per inch
"lbf.ft/in2"	foot pounds force per square inch
"lbf.ft/lbm"	foot pounds force per pound mass
"lbf.in"	inch pounds force
"lbf.in/in"	pounds force inches per inch
"lbf.in2"	pounds force inches squared
"lbf.s/ft2"	pounds force seconds per square foot
"lbf.s/in2"	pounds force seconds per square inch
"lbf/100ft"	pounds force per hundred foot
"lbf/100ft2"	pounds force per 100 square foot
"lbf/30m"	pounds force per thirty meters
"lbf/ft"	pounds force per foot
"lbf/ft2"	pounds force per square foot

Allowable values	S1000D interpretation
"lbf/ft <sup>2</sup> (100)"	pounds force per 100 square foot
"lbf/ft <sup>3</sup> "	pounds force per cubic foot
"lbf/galUS"	pounds force per US gallon
"lbf/in"	pounds force per inch
"lbf/in <sup>2</sup> "	pounds force per square inch
"lbf/lbf"	pounds force per pound force
"lbm"	pounds mass
"lbm(million)/yr"	million pounds mass per year
"lbm.ft/s"	foot pounds mass per second
"lbm.ft <sup>2</sup> "	pounds mass square feet
"lbm.ft <sup>2</sup> /s <sup>2</sup> "	pounds mass square feet per second squared
"lbm/1000galUK"	pounds mass per 1000 UK gallons
"lbm/1000galUS"	pounds mass per 1000 US gallons
"lbm/100ft <sup>2</sup> "	pounds mass per hundred square foot
"lbm/10bbl"	pounds mass per 10 barrel
"lbm/bbl"	pounds mass per barrel
"lbm/d"	pounds mass per day
"lbm/ft"	pounds mass per foot
"lbm/ft.h"	pounds mass per foot hour
"lbm/ft.s"	pounds mass per foot second
"lbm/ft <sup>2</sup> "	pounds mass per square foot
"lbm/ft <sup>3</sup> "	pounds mass per cubic foot
"lbm/ft <sup>4</sup> "	pounds mass per foot fourth
"lbm/galUK"	pounds mass per UK gallon
"lbm/galUK(1000)"	pounds mass per 1000 UK gallons
"lbm/galUK.ft"	pounds mass per UK gallon foot
"lbm/galUS"	pounds mass per US gallon
"lbm/galUS(1000)"	pounds mass per 1000 US gallons
"lbm/galUS.ft"	pounds mass per US gallon foot

Allowable values	S1000D interpretation
"lbm/h"	pounds mass per hour
"lbm/h.ft"	pounds mass per hour foot
"lbm/h.ft <sup>2</sup> "	pounds mass per hour square foot
"lbm/hp.h"	pounds mass per horsepower hour
"lbm/in <sup>3</sup> "	pounds mass per cubic inch
"lbm/Mbbl"	pounds mass per 1000 barrels
"lbm/min"	pounds mass per minute
"lbm/s"	pounds mass per second
"lbm/s.ft"	pounds mass per second foot
"lbm/s.ft <sup>2</sup> "	pounds mass per second square foot
"lkBnA"	British link 1895 A
"lkBnB"	British link 1895 B
"lkCla"	clarke link
"lkSe"	sears link
"lkUS"	US survey link
"lm"	lumen
"lm.s"	lumen second
"lm/m <sup>2</sup> "	lumens per square meter
"lm/W"	lumens per watt
"lx"	lux
"lx.s"	lux second
"m"	meter
"M(ft <sup>3</sup> )"	million cubic feet
"M(ft <sup>3</sup> )/acre.ft"	million cubic feet per acre-foot
"M(ft <sup>3</sup> )/d"	million cubic feet per day
"M(m <sup>3</sup> )"	million cubic meters
"M(m <sup>3</sup> )/d"	million cubic meters per day
"m/30m"	meters per thirty meters
"m/cm"	meters per centimeter

Allowable values	S1000D interpretation
"m/d"	meters per day
"m/h"	meters per hour
"m/K"	meters per kelvin
"m/km"	meters per kilometer
"m/m"	meters per meter
"m/m.K"	meters per meter kelvin
"m/m3"	meters per cubic meter
"m/min"	meters per minute
"m/ms"	meters per millisecond
"m/s"	meters per second
"m/s2"	meters per second squared
"m2"	square meter
"m2/cm3"	square meters per cubic centimeter
"m2/d.kPa"	square meters per day kilopascal
"m2/g"	square meters per gram
"m2/h"	square meters per hour
"m2/kg"	square meters per kilogram
"m2/m2"	square meters per square meter
"m2/m3"	square meters per cubic meter
"m2/mol"	square meters per mol
"m2/Pa.s"	square meters per second pascal
"m2/s"	square meters per second
"m3"	cubic meter
"m3(std,0C)"	cubic meters at standard condition (0 degree Celsius)
"m3(std,15C)"	cubic meters at standard condition (15 degree Celsius)
"m3/bar.d"	cubic meters per day per bar
"m3/bar.h"	cubic meters per hour per bar
"m3/bar.min"	cubic meters per minute per bar
"m3/cP.d.kPa"	cubic meters per centipoise day kilopascal

Allowable values	S1000D interpretation
"m3 / cP . Pa . s"	cubic meters per centipoise pascal second
"m3 / d"	cubic meters per day
"m3 / d . kPa"	cubic meters per day kilopascal
"m3 / d . m"	cubic meters per day per meter
"m3 / d2"	cubic meters per day per day
"m3 / g"	cubic meters per gram
"m3 / h"	cubic meters per hour
"m3 / h . m"	cubic meters per hour per meter
"m3 / ha . m"	cubic meters per hectare meter
"m3 / J"	cubic meters per joule
"m3 / kg"	cubic meters per kilogram
"m3 / km"	cubic meters per kilometer
"m3 / kPa . d"	cubic meters per day per kilopascal
"m3 / kPa . h"	cubic meters per hour per kilopascal
"m3 / kW . h"	cubic meters per kilowatt hour
"m3 / m"	cubic meters per meter
"m3 / m2"	cubic meters per square meter
"m3 / m3"	cubic meters per cubic meter
"m3 / min"	cubic meters per minute
"m3 / mol"	cubic meters per mole
"m3 / mol ( kg )"	cubic meters per mole (kilogram)
"m3 / Pa . s"	cubic meters per second pascal
"m3 / Pa / s"	(cubic meters per second) per pascal
"m3 / Pa2 . s2"	cubic meters per pascal second squared
"m3 / psi . d"	cubic meters per day per (pound per square inch)
"m3 / s"	cubic meters per second
"m3 / s . ft"	cubic meters per second per foot
"m3 / s . m"	cubic meters per second meter
"m3 / s . m2"	cubic meters per second square meter

Allowable values	S1000D interpretation
"m3 / s2"	cubic meters per seconds squared
"m3 / scm ( 0C )"	cubic meters per standard cubic meters, 0 degree Celsius
"m3 / scm ( 15C )"	cubic meters per standard cubic meters, 15 degree Celsius
"m3 / t"	cubic meters per tonne
"m3 / tonUK"	cubic meters per UK ton
"m3 / tonUS"	cubic meters per US ton
"m4"	meters fourth
"m4 / s"	meters fourth per second
"mA"	milliampere
"Ma"	megayear
"MA"	megaampere
"mA / cm2"	milliamperes per square centimeter
"mA / ft2"	milliamperes per square foot
"mbar"	millibar
"Mbb1"	thousand barrel
"Mbb1 . ft / d"	thousand barrels feet per day
"Mbb1 / d"	thousand barrels per day
"MBq"	megabecquerel
"MBtu / hr"	million British thermal units per hour
"Mbyte"	megabyte
"mC"	millicoulomb
"mC / m2"	millicoulombs per square meter
"Mcf"	thousand cubic feet
"mCi"	millicurie
"mcurie"	millicurie
"mD"	millidarcy
"mD . ft"	millidarcy foot
"mD . ft2 / lbf . s"	millidarcy square feet per pound force second

Allowable values	S1000D interpretation
"mD.in <sup>2</sup> /lbf.s"	millidarcy square inches per pound force second
"mD.m"	millidarcy meter
"mD/cP"	millidarcies per centipoise
"mD/Pa.s"	millidarcies per pascal second
"meq"	milliequivalent
"meq/100g"	milliequivalents per hectogram
"meq/cm <sup>3</sup> "	milliequivalents per cubic centimeter
"meq/g"	milliequivalents per gram
"mEucl"	millieuclid
"MeV"	millions of electron volts
"Mflops"	megaflops
"Mg"	megagram
"mg"	milligram
"Mg/a"	megagrams per year
"Mg/d"	megagrams per day
"mg/dm <sup>3</sup> "	milligrams per cubic decimeter
"mg/galUS"	milligrams per US gallon
"Mg/h"	megagrams per hour
"Mg/in"	thousand kilograms per inch
"mg/J"	milligrams per joule
"mg/kg"	milligrams per kilogram
"mg/L"	milligrams per liter
"Mg/m <sup>2</sup> "	megagrams per square meter
"mg/m <sup>3</sup> "	milligrams per cubic meter
"Mg/m <sup>3</sup> "	thousand kilograms per cubic meter
"mGal"	milligalileo
"mgauss"	milligauss
"mGer"	German legal meter
"Mgf"	thousand kilograms force

Allowable values	S1000D interpretation
"mgn"	milligravity
"mGy"	milligray
"mH"	millihenry
"mho"	mho
"mho/m"	mhos per meter
"MHz"	megahertz
"mHz"	millihertz
"mi"	mile
"mi/galUK"	miles per UK gallon
"mi/galUS"	miles per US gallon
"mi/h"	miles per hour
"mi/in"	miles per inch
"mi2"	square mile
"mi3"	cubic mile
"mil"	mil, a thousandth of an inch
"mil/yr"	mils per year
"mila"	mil_6400
"min"	minute
"min/ft"	minutes per foot
"min/m"	minutes per meter
"mina"	minutes angular
"miUS"	U.S. survey mile
"miUS2"	U.S. survey square mile
"MJ"	megajoule
"mJ"	millijoule
"MJ/a"	megajoules per year
"mJ/cm2"	millijoules per square centimeter
"MJ/kg"	megajoules per kilogram
"MJ/m"	megajoules per meter

Allowable values	S1000D interpretation
"mJ / m <sup>2</sup> "	millijoules per square meter
"MJ / m <sup>3</sup> "	megajoules per cubic meter
"MJ / mol ( kg )"	megajoules per mole (kilogram)
"mK / m"	millidegrees kelvin per meter
"mL"	milliliter
"mL / galUK"	milliliters per UK gallon
"mL / galUS"	milliliters per US gallon
"mL / mL"	milliliters per milliliter
"Mlbm / yr"	million pounds mass per year
"mm"	millimeter
"Mm"	megameter
"mm / a"	millimeters per year
"mm / mm . K"	millimeters per millimeter kelvin
"mm / s"	millimeters per second
"mm <sup>2</sup> "	square millimeter
"mm <sup>2</sup> / mm <sup>2</sup> "	square millimeters per square millimeter
"mm <sup>2</sup> / s"	square millimeters per second
"mm <sup>3</sup> "	cubic millimeter
"mm <sup>3</sup> / J"	cubic millimeters per joule
"MMbbl"	million barrels
"MMbbl / acre . ft"	million barrels per acre foot
"MMcf"	million cubic feet
"mmHg ( 0C )"	millimeters of Mercury at 0 degree Celsius
"mmho / m"	millimhos per meter
"mmol"	millimole
"MMscf ( 60F )"	million standard cubic feet at 60 degree Fahrenheit
"MMscf ( 60F ) / d"	million standard cubic feet per day
"MMscf60 / stb60"	million standard cubic feet per stock tank barrel
"MMscm ( 15C )"	million standard cubic meters, 15 degree Celsius

<b>Allowable values</b>	<b>S1000D interpretation</b>
"MMscm(15C)/d"	million standard cubic meters, 15 degree Celsius per day
"MMstb(60F)"	million stock tank barrels, 60 degree fahrenheit
"MMstb(60F)/d"	million stock tank barrels, 60 degree fahrenheit per day
"MMstb/acre"	million stock tank barrels 60 degree fahrenheit per acre
"MMstb/acre.ft"	million stock tank barrels, 60 degree fahrenheit per acre foot
"MN"	meganeutron
"mN"	millineutron
"mN.m2"	millineutron meters squared
"mN/km"	millineutrons/kilometer
"mN/m"	millineutrons/meter
"Mohm"	megaohm
"mohm"	milliohm
"mohm/m"	milliohms per meter
"mol"	mole
"mol(g)"	mole (gram)
"mol(kg)"	mole (kilogram)
"mol(kg)/h"	moles (kilogram) per hour
"mol(kg)/m3"	moles (kilogram) per cubic meter
"mol(kg)/s"	moles (kilogram) per second
"mol(lbm)"	moles (pounds mass)
"mol(lbm)/ft3"	moles (pounds mass) per cubic foot
"mol(lbm)/galUK"	moles (pounds mass) per UK gallon
"mol(lbm)/galUS"	moles (pounds mass) per US gallon
"mol(lbm)/h"	moles (pounds mass) per hour
"mol(lbm)/h.ft2"	moles (pounds mass) per hour square foot
"mol(lbm)/s"	moles (pounds mass) per second
"mol(lbm)/s.ft2"	moles (pounds mass) per second square foot
"mol/m2"	moles per square meter
"mol/m2.s"	moles per square meter second

Applicable to: All

**S1000D-A-03-09-0602-00A-040A-A**

**Chap 3.9.6.2**

Allowable values	S1000D interpretation
"mol / m <sup>3</sup> "	moles per cubic meter
"mol / s"	moles per second
"mPa"	millipascal
"MPa"	megapascals
"mPa . s"	millipascal seconds
"MPa . s / m"	megapascal seconds per meter (megarayl)
"MPa / h"	megapascals per hour
"MPa / m"	megapascals per meter
"Mpsi"	mega pounds per square inch
"mrad"	milliradian
"Mrad"	megaradian
"mrem"	millirem
"mrem / h"	millirems per hour
"mS"	millisiemens
"ms"	millisecond
"ms / 2"	half a millisecond
"ms / cm"	milliseconds per centimeter
"ms / ft"	milliseconds per foot
"ms / in"	milliseconds per inch
"mS / m"	millisiemens per meter
"ms / m"	milliseconds per meter
"ms / s"	milliseconds per second
"Mscf ( 60F )"	thousand cubic feet, 60 degree Fahrenheit
"Mscf ( 60F ) / d"	thousand standard cubic feet per day
"Mscf60 / stb60"	thousand standard cubic feet per stock tank barrel
"Mscm ( 15C ) / d"	thousand standard cubic meters, 15 degree Celsius/day
"mseca"	milliseconds angular
"Msm <sup>3</sup> "	mega standard cubic meters, 15 degree Celsius
"Mstb ( 60F )"	thousand stock tank barrels, 60 degree Fahrenheit

Allowable values	S1000D interpretation
"Mstb ( 60F ) / d"	thousand stock tank barrels, 60 degree Fahrenheit/day
"mSv"	millisievert
"mSv / h"	millisieverts per hour
"mT"	millitesla
"MV"	megavolt
"mV"	millivolt
"mV / ft"	millivolts per foot
"mV / m"	millivolts per meter
"MW"	megawatt
"mW"	milliwatt
"MW . h"	megawatt hour
"MW . h / kg"	megawatt hours per kilogram
"MW . h / m <sup>3</sup> "	megawatt hours per cubic meter
"mW / m <sup>2</sup> "	milliwatts per square meter
"mWb"	milliweber
"MY"	megayear
"N"	newton
"N . m"	newton meter
"N . m / m"	newton meters per meter
"N . m <sup>2</sup> "	newton square meter
"N . s / m <sup>2</sup> "	newton seconds per meter squared
"N / 30m"	newtons per thirty meters
"N / m"	newtons per meter
"N / m <sup>2</sup> "	newtons per square meter
"N / m <sup>3</sup> "	newtons per cubic meter
"N / mm <sup>2</sup> "	newtons per square millimeter
"N <sup>4</sup> / kg . m <sup>7</sup> "	newtons fourth meters per kilogram
"nA"	nanoampere
"nAPI"	API neutron unit

Allowable values	S1000D interpretation
"nautmi"	nautical mile
"nC"	nanocoulomb
"nCi"	nanaocurie
"ncurie"	nanocurie
"nEuc"	nanoeuclid
"nH"	nanohenry
"nJ"	nanojoule
"nm"	nanometer
"nm/s"	nanometers per second
"nohm"	nanohm
"ns"	nanosecond
"ns/ft"	nanoseconds per foot
"ns/m"	nanoseconds per meter
"nT"	nanotesla
"nW"	nanowatt
"O"	octave
"Oe"	oersted
"ohm"	ohm
"ohm.cm"	ohms centimeter
"ohm.m"	ohms meter
"ohm/km"	ohms per kilometer
"ohm/m"	ohms per meter
"oz(av)"	avoirdupois ounce
"oz(troy)"	troy ounce
"ozf"	ounce force
"ozm"	ounce mass
"P"	poise
"Pa"	pascal
"pA"	picoampere

Allowable values	S1000D interpretation
"Pa(g)"	pascal gauge
"Pa.s"	pascal second
"Pa.s/m3"	pascal seconds per cubic meter
"Pa.s/m6"	pascal seconds per cubic meter squared
"Pa.s2/m3"	pascal seconds squared per cubic meter
"Pash"	pascals per hour
"Pa/m"	pascals per meter
"Pa/m3"	pascals per cubic meter
"Pa/s"	pascals per second
"Pa2"	pascals squared
"pC"	picocoulomb
"pCi"	picocurie
"pCi/g"	picocurie per gram
"pcurie"	picocurie
"pdl"	poundal
"pdl.cm2"	poundal centimeter squared
"pdl.ft"	foot poundal
"pdl/cm"	poundals per centimeter
"permil"	per mille
"pF"	picrofarad
"pH"	phenry
"pm"	picometer
"pPa"	picopascal
"ppdk"	parts per ten thousand
"ppk"	parts per thousand
"ppm"	parts per million
"ppm/degC"	parts per million per degree Celsius
"ppm/degF"	parts per million per degree Fahrenheit
"ps"	picosecond

Allowable values	S1000D interpretation
"ps"	picosiemens
"psf"	pounds per square foot
"psi"	pounds per square inch
"psi.d/bbl"	pounds per square inch days per barrel
"psi.s"	pounds per square inch second
"psi/100ft"	pounds per square inch per 100 feet
"psi/ft"	pounds per square inch per foot
"psi/ft(100)"	pounds per square inch per 100 feet
"psi/h"	pounds per square inch per hour
"psi/kft"	pounds per square inch per thousand feet
"psi/m"	pounds per square inch per meter
"psi/min"	pounds per square inch per minute
"psi2"	pounds per square inch squared
"psi2.d/cP.ft3"	pounds per square inch squared days per centipoise cubic foot
"psi2.d/cp.ft3"	pounds per square inch squared days per centipoise cubic foot
"psi2.d2/cP.ft6"	(psi days per cubic foot)squared per centipoise
"psi2.d2/cp.ft6"	(psi days per cubic foot)squared per centipoise
"psi2/cP"	pounds per square inch squared per centipoise
"psia"	pounds per square inch absolute
"psig"	pounds per square inch gauge
"ptUK"	UK pint
"ptUK/hp.hr"	UK pints per horsepower hour
"ptUK/Mbbl"	UK pints per 1000 barrels
"ptUS"	US pint
"ptUS/10bbl"	US pints per ten barrel
"qtUK"	UK quart
"qtUS"	US quart
"quad"	quad

Allowable values	S1000D interpretation
"quad/yr"	quads per year
"rad"	radian
"rad/ft"	radians per foot
"rad/ft <sup>3</sup> "	radians per cubic foot
"rad/m"	radians per meter
"rad/m <sup>3</sup> "	radians per cubic meter
"rad/s"	radians per second
"rad/s <sup>2</sup> "	radians per second squared
"rd"	rad
"rem"	rem
"rem/h"	rems per hour
"rev/min"	revolutions/minute
"rev/s"	revolutions/second
"rpm"	revolutions/minute
"rpm/s"	revolutions/minute per second
"S"	siemens
"s"	second
"s/cm"	seconds per centimeter
"s/ft"	seconds per foot
"s/ft <sup>3</sup> "	seconds per cubic foot
"s/in"	seconds per inch
"s/L"	second per liter
"S/m"	siemens per meter
"s/m"	seconds per meter
"s/m <sup>3</sup> "	seconds per cubic meter
"s/qtUK"	second per UK quart
"s/qtUS"	second per US quart
"sack94"	sack
"scf ( 60F )"	standard cubic feet at 60 degree Fahrenheit

Allowable values	S1000D interpretation
"scf ( 60F ) / bbl"	standard cubic feet at 60 degree Fahrenheit/barrel
"scf ( 60F ) / d"	standard cubic feet per day
"scf ( 60F ) / ft 2"	standard cubic feet at 60 degree Fahrenheit per square foot
"scf ( 60F ) / ft 3"	standard cubic feet at 60 degree Fahrenheit per cubic foot
"scm ( 0C )"	standard cubic meters at 0 degree Celsius
"scm ( 0C ) / m2"	standard cubic meters at 0 degree Celsius per square meter
"scm ( 0C ) / m3"	standard cubic meters at 0 degree Celsius per cubic meter
"scm ( 15C )"	standard cubic meters at 15 degree Celsius
"scm ( 15C ) / d"	standard cubic meters at 15 degree Celsius per day
"scm ( 15C ) / m2"	standard cubic meters at 15 degree Celsius per square meter
"scm ( 15C ) / m3"	standard cubic meters at 15 degree Celsius per cubic meter
"scm ( 15C ) / s"	standard cubic meters at 15 degree Celsius per second
"scm15/stb60"	standard cubic meters per stock tank barrel
"seca"	seconds angular
"sigma"	capture unit
"sm3/ksm3"	standard cubic meters per 1000 standard cubic meter
"sm3/sm3"	standard cubic meters per standard cubic meters
"sq ft"	square foot
"sq in"	square inch
"sq mi"	square mile
"sq yd"	square yard
"sr"	steradian
"stb ( 60F )"	stock tank barrel at 60 degree Fahrenheit
"stb ( 60F ) / acre"	stock tank barrels, 60 degree Fahrenheit per acre
"stb ( 60F ) / bbl"	stock tank barrels, 60 degree Fahrenheit per barrel
"stb ( 60F ) / d"	stock tank barrels, 60 degree Fahrenheit per day

Allowable values	S1000D interpretation
"stb60/MMscf60"	stock tank barrels per million standard cubic feet
"stb60/MMscm15"	stock tank barrels per million standard cubic meters
"stb60/Mscf60"	stock tank barrels per 1000 standard cubic feet
"stb60/Mscm15"	stock tank barrels per 1000 standard cubic meters
"stb60/scm15"	stock tank barrels per standard cubic meter
"Sv"	sievert
"Sv/h"	sieverts per hour
"Sv/s"	sieverts per second
"T"	tesla
"t"	tonne
"t/a"	tonnes per year
"t/d"	tonnes per day
"t/h"	tonnes per hour
"t/min"	tonnes per minute
"talbot"	talbot
"TBq"	terabecquerel
"tcf"	trillion cubic feet
"TeV"	tera electron volts
"therm"	therm
"therm/ft3"	therms per cubic foot
"therm/galUK"	therms per UK gallon
"therm/lbm"	therms per pound mass
"TJ"	terajoule
"TJ/a"	terajoules per year
"Tohm"	teraohm
"ton of refrigeration"	tons of refrigeration
"tonfUK"	UK tons force
"tonfUK.ft2"	UK ton feet squared
"tonfUK/ft"	UK tons force per foot

Allowable values	S1000D interpretation
"tonfUK/ft <sup>2</sup> "	UK tons force per square foot
"tonfUS"	US tons force
"tonfUS.ft"	US tons force feet
"tonfUS.ft <sup>2</sup> "	US tons force feet squared
"tonfUS.mi"	US tons force miles
"tonfUS.mi/bbl"	US ton force miles per barrel
"tonfUS.mi/ft"	US tons force miles per foot
"tonfUS/ft"	US tons force per foot
"tonfUS/ft <sup>2</sup> "	US tons force per square foot
"tonfUS/in <sup>2</sup> "	US tons force per square inch
"tonUK"	UK tons
"tonUK/a"	UK tons per year
"tonUK/d"	UK tons per day
"tonUK/h"	UK tons per hour
"tonUK/min"	UK tons per minute
"tonUS"	US tons
"tonUS/a"	US tons per year
"tonUS/d"	US tons per day
"tonUS/ft <sup>2</sup> "	US tons per square foot
"tonUS/h"	US tons per hour
"tonUS/min"	US tons per minute
"torr"	torr
"TW"	terawatt
"TW.h"	terrawatt hour
"uA"	microampere
"uA/cm <sup>2</sup> "	microamperes per square centimeter
"uA/in <sup>2</sup> "	microamperes per square inch
"ubar"	microbar
"uC"	microcoulomb

Allowable values	S1000D interpretation
" <a href="#">u</a> cal / s . cm2"	microcalories per second square centimeter
" <a href="#">u</a> Ci "	microcurie
" <a href="#">u</a> curie"	microcurie
" <a href="#">u</a> Euc"	microeuclid
" <a href="#">u</a> F"	microfarad
" <a href="#">u</a> F / m"	microfarads per meter
" <a href="#">u</a> g"	microgram
" <a href="#">u</a> g / cm3 "	micrograms per cubic centimeter

#### 1 General

This chapter deals with the authoring of learning data modules to be used for human performance technology and training information. Refer to [Chap 3.9.5.2.13](#).

The scope and depth of the information reflects the associated maintenance data modules and the level of training information to be supplied. This latter aspect is based on the level of maintenance to be conducted and the complexity of the Product.

## **2 Human performance technology and training Information**

### **2.1 Human performance technology**

#### **2.1.1 Performance analysis**

When engineering any type of system, requirements must be established to ensure the final product will meet its purpose. In the process of defining such requirements, factors within the greater system, or system of systems, in which a product will reside must be analyzed to ensure successful integration. Human Performance Technology (HPT) accounts for the human performance system and its interaction with the product that is subject of an S1000D project.

Central to the human performance system is the worker. Performance Analysis (PA) studies factors and interactions in the worker's external and internal environments that influence desired system output to ensure appropriate performance requirements are defined, and the target system is not adversely affected by the introduction of a new or changed component.

The use of the HPT learning data modules within a project allows life cycle systems engineers to capture critical information from a performance analysis, and allow human performance system requirements to be established and managed throughout the life cycle of the project.

##### **2.1.1.1 Scope of human performance technology performance analysis information**

Data and requirements from five common types of HPT analyses can be captured within learning data modules that use the learning plan information model of the learning schema. Refer to [Chap 3.9.5.2.13.1](#).

##### **2.1.1.1.1 Organizational analysis**

Provides information needed to derive requirements of the organization that will use the product. This analysis will provide the vision, mission and values of the organization. It will also define the organization's measureable goal and objectives in relation to the product.

##### **2.1.1.1.2 Gap analysis**

Provides key human performance requirements that must be met in order for the organization's goal and objectives for the product (within the system) to be achieved.

##### **2.1.1.1.3 Organizational environment analysis**

Provides information about internal and external forces that can influence the sponsoring organization's ability to meet its vision, mission, goals and objectives through the product. Some examples could include: political activist groups, environmental laws, and conventions or norms of the incumbent culture.

##### **2.1.1.1.4 Work environment analysis**

Provides information about work design factors that can influence the sponsoring organization's workers' abilities to meet its vision, mission, goals and objectives through the product. Such factors are external to the workers performing jobs. Some examples could include:

- availability of required material resources or tools
- work processes
- job hierarchy
- work location or area layout
- standard operating procedures

##### **2.1.1.1.5 Performer analysis**

Provides information about factors internal to the sponsoring organization'

s workforce that can influence its abilities to meet its vision, mission, goals and objectives through the product of the project. Some examples could include:

- employee knowledge
- skills
- motivation
- physical capabilities
- aptitude

### 2.1.2 Cause analysis

Data and requirements from an HPT cause analyses can be captured within learning data modules that use the learning plan information model of the learning schema. Refer to [Chap 3.9.5.2.13.1](#).

This analysis provides information about the root causes (internal or external to the job performers) of a performance deficiency that is preventing the sponsoring organization from achieving its vision, mission, goals and objectives. Such causes may have been the catalyst for the product or may be a result of introducing that product into the organization's system.

### 2.1.3 Intervention definition

Requirements of an intervention needed to support successful integration and use of the product can be captured within learning data modules that use the learning plan information model of the learning schema. Refer to [Chap 3.9.5.2.13.1](#).

An intervention may consist of training or non-training type, and multiple intervention types may be required to support product integration. Requirements for the intervention are derived from a performance analysis, and are designed to remedy the causes of a potential or current human performance gap.

#### 2.1.3.1 Non-training interventions

Learning data modules that define the requirements for a non-training intervention designed to positively affect the human performance system in which the product is used. For example, as a result of the product, the job procedure for a specific worker may require changes. The requirements and specifications for that job procedure change, such as work responsibilities, placement within the organization, or reporting structure, are defined in a learning data module.

#### 2.1.3.2 Training interventions

Learning data modules that define the requirements for a training intervention designed to positively affect the human performance system in which the product is used. For example, as a result of the product, the use of a new tool may become required of a specific worker. The training requirements and training product specifications needed to support the worker's skill development are defined in a learning data module.

### 2.1.4 Intervention implementation

Requirements to implement an intervention successfully within the target system can be captured within learning data modules that use the learning plan information model of the learning schema. Refer to [Chap 3.9.5.2.13.1](#).

In addition to, but logistically separate from, the requirements and specifications for the production of an intervention, requirements to ensure proper integration and use of the intervention may be required. For example, a training intervention may require that the trainer receives training prior to the implementation. Any such logistical, change management, or other factors critical to the intervention implementation are defined in a learning data module.

### 2.1.5 Performance evaluation

Requirements and associated criteria of an evaluation instrument to be used to assess an intervention's success within the target system can be captured within learning data modules that use the learning plan information model of the learning schema. Refer to [Chap 3.9.5.2.13.1](#).

A performance evaluation instrument can be used to complete a formative assessment during the development and testing of an intervention to determine how successful an intervention will be before its final release or implementation. It can also be used to complete summative assessments of an intervention's impact on the worker, job, or organizational performance.

## 2.2 Training information

### 2.2.1 Writing for maintenance

Maintenance information data modules are written to a scope and depth that reflect the project requirements, the skill level of the maintainer and the activity to be conducted. These data modules tend to be written to detail the procedure to be conducted in the least ambiguous format and define the sequence to be followed.

### 2.2.2 Writing for training

Training information, by its very nature, is written from a supporting context, it is provided in some cases as support to the maintenance information to allow further breakdown of the elements of the task so that learning can be achieved. The style of writing training information reflects the requirement to transfer knowledge to the student, as opposed to maintenance which is written to instruct the maintainer to carry out a procedure. In other cases it is used to establish an initial knowledge of the Product to aid understanding prior to maintenance activities being conducted.

The design requirements for a training intervention can be captured within learning data modules that use the learning plan information model of the learning schema. The content and information to be delivered within a training intervention can be captured within the overview, content, summary and assessment information models of the learning schema. Refer to [Chap 3.9.5.2.13.1](#).

#### 2.2.2.1 Scope of training information

Five information model types exist to allow learning information to be presented these are:

- learning plan information
- learning overview information
- learning summary information
- learning content information
- learning assessment information

##### 2.2.2.1.1 *The learning plan information model type*

The learning plan information type describes a training intervention's instructional design requirements.

##### 2.2.2.1.2 *The learning overview information model type*

The learning overview information model type contains information used in the introductory part of a training intervention.

##### 2.2.2.1.3 *The learning summary information model type*

The learning summary information model type contains information used in the culminating activities of training intervention to reinforce the learning process.

##### 2.2.2.1.4 *The learning content information model type*

The learning content information model type provides the information and assets used to create the content of a training intervention. A learning data module using the learning content information model may be comprised of a set of self-contained content required to meet single learning objective.

##### 2.2.2.1.5 *The learning assessment information model type*

The learning assessment information model type contains information used to create activities that measure learner progress, encourage recall, and reinforce the learning process during a training intervention. For example, a learning data module using the learning assessment

information model can contain information used in a pre-assessment test, comprehension checks during instructional activities, or as a post-assessment test.

#### 2.2.2.2 Harmonizing issues

When a project has a requirement to support integration of the product into the end organization's system, or produce training information in data modules, they must ensure that there is consistency and coherence within the project. This means that the creation and management of human performance technology and the training data modules are an integral part of the project technical information. This will involve these data modules being included in project aspects such as business rules, data module requirements list and must identify aspects such as PA and Training Needs Analysis (TNA) as information drivers.

#### 2.2.2.3 Effects on maintenance and training information production

To ensure that there is consistency and coherence, the project must align, at the earliest possible stages, any information requirements for human performance, training and maintenance. This will allow the project to identify any information requirement dependencies. This aspect must also take into consideration how the information will be used by the end user and life cycle support personnel.

In the case of training interventions, the activity of verification, whether it is maintenance or training data module verification, must ensure that the data modules work together as a coherent group and align with the human performance system requirements, prior to the publishing activity.

#### 2.2.2.4 Granularity of training data modules

Often training information needs to be produced at a much finer level of granularity than maintenance data modules might normally be written to. In order to achieve the best fit for granularity, it is essential that the requirements of granularity, for both training and maintenance information are addressed before any data modules are produced. The results of a PA, and information and requirements captured in HPT data modules, can help guide this process. This will establish an environment where the maintenance data modules used within a training intervention are used as created; allowing them to be used, as the trainee will use them in a maintenance environment.

It has to be noted that training data modules must be written with maintenance data modules as the "driver" for the task being taught.

### 2.2.3 Presentation issues

This aspect will depend on the project infrastructure and how it delivers technical data. [Chap 6.4](#) details functionality required from a technical data viewpoint. If a project wishes to integrate its IETP with a Learning Management System (LMS) or an Electronic Performance Support System (EPSS), functionality that enables this interaction must be contracted for. The functionality must also take cognizance of how the training activation is to be conducted, for example, a named maintainer having a training profile inherent within the IETP to ensure training was invoked at the appropriate time and appropriate to the maintainer's profile.

### 2.2.4 Linking

When producing HPT or training information as data modules, linking can be achieved either at the data module level or at deeper levels within the data modules.

#### 2.2.4.1 Linking at the data module level

Linking at data module level is achieved using the element `<dmRef>` as defined in [Chap 3.9.5.2.1.2](#).

- 2.2.4.2      **Linking at deeper levels**  
The linking at deeper levels applies only from training information to maintenance information. This is only to be used when maintenance data modules cannot be broken down to meet the granularity requirements of training.
- There can be situations where, for example, because of safety reasons, maintenance data modules cannot be broken down to the exact level of granularity required by training objectives. When linking into lower levels within a maintenance data module, care must be taken not to compromise any safety related information at a higher level. The mechanism for this is described in [Chap 3.9.5.2.1.2](#).
- 2.2.5      **Data module code**  
Data modules using the learning schema are coded using a learn code and learn event code. Refer to [Chap 4.3.9](#) and [Chap 4.3.10](#).
- The rules for the preparation and coding for training information are described in [Chap 5.2.1.19](#).
- 2.2.6      **Preplanning**  
2.2.6.1      Introduction  
Preplanning for a project aims to leverage the potential economies of integrating human performance system requirements, technical data and technical training data into S1000D, and encompasses three major areas:
- scope guidance. Refer to [Para 2.2.6.1.1](#).
  - business issues guidance. Refer to [Para 2.2.6.1.2](#).
  - process guidance. Refer to [Para 2.2.6.1.3](#).
- Preplanning addresses some of the organizational, project management, and business issues that require advance consideration in order to minimize problems later in the project. Preplanning also serves to focus the project planning toward the long-term cost savings of an integrated approach.
- The following sections identify possible guidance areas:
- 2.2.6.1.1      *Scope guidance*  
Possible guidance areas are:
- major components of Scope
  - requirements: List types of technical publications and training required to support the intended purpose of the system
  - requirements: Describe the end-users requirements of the documentation and training
  - requirements: Understand the performance environment
  - presentation: Identify the general format of the presentations
  - presentation: Identify media used for presentations of training content (media choices may need to work for both training and tech data in different presentation environments)
  - presentation: Identify factors that will affect the contexts of instruction and technical documentation
  - presentation: Identify content to be covered
  - presentation: Identify project access to sources
  - requirements: Identify organizational and environmental constraints that can influence design decisions
  - establish relationship between SCO and S1000D content
- 2.2.6.1.2      *Business issues guidance*  
Possible guidance areas are:
- who pays for each activity?
  - who owns content?
  - who can use the content?

- who must pay for content?
- when an update to one requires an update to the other, who pays for it?

#### 2.2.6.1.3 *Process guidance*

This is relative to stages of: identify content, design and develop, authorize, publish/disseminate, and use. Possible guidance areas are:

- all stages: Obey the fundamental rule that constraints can direct a project but that multiple options exist
- all stages: Assign roles in the process
- all stages: Describe the process
- identify content: Search existing training content. Some organizations are implementing guidelines that require the registry of training materials along with policies that require new projects to identify suitable existing materials in order to maximize reuse and minimize cost).
- identify content: Integrate for efficiency
- identify content: Establish synergy with other deliverables such as Parts data
- design and develop: Determine linking and embedding approach
- design and develop: Establish a common data module coding strategy that satisfies the granularity
- design and develop: Determine grain size
- design and develop: Use a consistent language style
- design and develop: Address safety issues
- design and develop: Choose a data flow model for instructional content sourced from technical publications
- design and develop: Decide how to insert content
- publish: Make general project decisions about the publication process and the dissemination flow for both instructional and tech data products to identify conflicts and redundancies
- design and develop: Identify requirements of both training and maintenance
- design and develop: Establish link-back to storyboards
- design and develop: Analyze analysis for commonality
- design and develop: Establish synergy with logistic database

## Chapter 4

## 1 General

Information management is comprised of the addressing, storage and handling of information objects such as data modules, illustrations and publications that enables the production and use of common technical publications within a project.

This chapter provides an overview of the chapters that give the rules for information management in an S1000D project.

## 2 Content

[Chap 4.2](#) gives an overview of the CSDB concept, the information objects and the standards that are used.

[Chap 4.3](#) describes the details of the coding of data modules and [Chap 4.4](#) describes the details of the coding of illustrations or associated data. The data module lists used for planning, management and control of the CSDB content are described in [Chap 4.5](#). The handling of comments on data modules and publications are contained in [Chap 4.6](#). Version control of data modules is described in [Chap 4.7](#), and the interchange of data modules, publication modules and SCORM content package modules is described in [Chap 4.8](#).

[Chap 4.9](#) explains the managements of publication modules built from the data modules in the CSDB together with the methods of coding, building and updating of publications.

[Chap 4.10](#) contains a description of recording and exchange of business rules within projects.

[Chap 4.11](#) gives an explanation of the concept and management of the process data module. The issue of occurrences of multiple instances of data modules is contained in [Chap 4.12](#).

[Chap 4.13](#) deals with optimization and reuse and [Chap 4.14](#) explains the concept and management of applicability.

[Chap 4.15](#) explains the managements of Shareable Content Object Reference Model (SCORM) content package modules, built from the data modules in the CSDB together with the methods of coding, building and updating of SCORM content package modules.

[Chap 4.16](#) introduces the concepts of contents specific and quantity data.

The internal structures of the information objects are described in [Chap 7](#), which deals with information processing.

## 1 General

The key element in information management is the CSDB. It is an information store and management tool for all objects required to produce the technical publications within projects. CSDB information objects are based on the identified standards. Refer to [Chap 2.2](#).

The major objectives for a CSDB are:

- support the technical publication process
- support the controlled authoring
- support the QA process
- support the data exchange with partners, suppliers and customers

- support the delivery of technical publications on various media independent from the source storage format

## 2 Concepts

The central object in the CSDB is the data module. It is the smallest self-contained information unit within a technical publication. Data modules control and contain text, illustrations, multimedia, and data. They have defined neutral structures based on international standards. Illustrations, multimedia and other data are not directly stored inside the data modules, but referenced.

Careful planning of the breakdown of technical information into data modules is important to ensure efficient data use and reuse. It is recommended that chains of references be avoided.

## 3 CSDB design

S1000D does not specify the design and implementation rules for a CSDB. It only specifies the data structure of the information objects, which is independent from any software implementation.

The information objects to be stored and managed in the CSDB are the following addressable and exchangeable units:

- data modules, refer to [Chap 3.9.5](#)
- illustrations, multimedia, and other data associated with and called up by data modules, refer to [Chap 3.9.2](#)
- ICN metadata file, refer to [Chap 3.9.2.7](#)
- data management lists, refer to [Chap 4.5](#)
- comments, refer to [Chap 4.6](#)
- publication modules, refer to [Chap 4.9](#)
- data update file, refer to [Chap 4.13.2.2](#)
- data dispatch notes, refer to [Chap 7.5](#)

## 4 XML objects

The S1000D information objects, listed above, with the exception of illustrations, multimedia and other data, must be produced in XML.

<a href="#">Chap 4.3.11</a>	Data module code - Summary
<a href="#">Chap 4.12</a>	Information management - Multiple instances of CSDB objects

## 1 General

The data module code is the standardized and structured identifier of a data module. It is contained in the identification section of the data module. The data module code is part of the

unique identifier of the data module. The data module code is used to manage data modules in the CSDB, to retrieve them or to gain access to them in an electronic environment.

The element <dmCode> is used to store the data module code. Refer to [Chap 3.9.5.1](#).

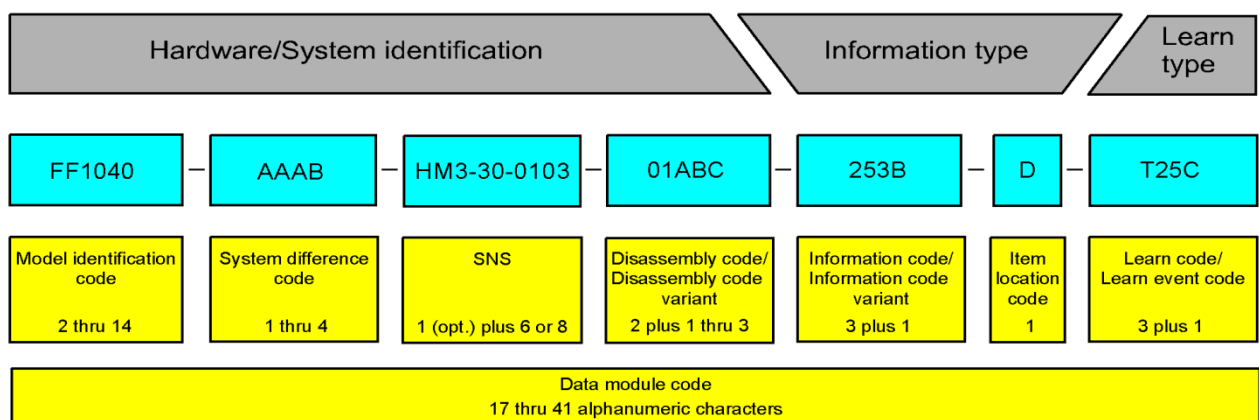

A summary of the data module code is given [Chap 4.3.11](#).

If there is a need for multiple instances of any data module issue the data module code is extended with two proceeding attributes and the identifier of the data module code becomes an extended data module code. Refer to [Chap 4.12](#).

## 2 Data module code

### 2.1 Data module code structure

The data module code comprises up to 41 alphanumeric characters and is built up as shown in [Fig 1](#). The minimum length is 17 alphanumeric characters as given in [Fig 2](#).

ICN-1654N-S1000D00002-001-01

Fig 1 Generic structure of the data module code

A single project can require the use of multiple model identification codes in data module codes, which can contain a SNS with the same characters but with a different definition. The additional optional character, called the material item category code, within the SNS, shown in [Fig 1](#), is used to indicate the different SNS. To avoid a complete renumbering of the data modules where multiple SNS are used it is allowable for the material item category code to be used where applicable. This means that it is not required to populate the data module code elements to a consistent length in such projects.

#### Business rule decision point BRDP-S1-00331 - Data module coding strategy:

- Decide on the data module coding strategy to use for the Product and/or the project.

### 2.2 Data module code partitions

Breakdown details for the three partitions "hardware/system identification", "information type" and "learn type" are given in [Table 2](#), [Table 3](#) and [Table 4](#).

Table 2 Hardware/System identification

Breakdown	Rule
Model identification code	2 thru 14 uppercase alphanumeric characters
System difference code	1 thru 4 uppercase alphanumeric characters

Breakdown	Rule
Standard numbering System	1 (optional material item category code) plus 6 or 8 uppercase alphanumeric characters
– System	– 1 (optional material item category code) plus 2 uppercase alphanumeric characters
– Subsystem + sub-subsystem	– 2 (1+1) uppercase alphanumeric characters
– Unit or assembly	– 2 or 4 uppercase alphanumeric characters
Disassembly code	2 uppercase alphanumeric characters
Disassembly code variant	1 thru 3 uppercase alphanumeric characters

*Table 3 Information type*

Breakdown	Rule
Information code	3 uppercase alphanumeric characters
Information code variant	1 uppercase alphanumeric character
Item location code	1 uppercase alphanumeric character

*Table 4 Learn type*

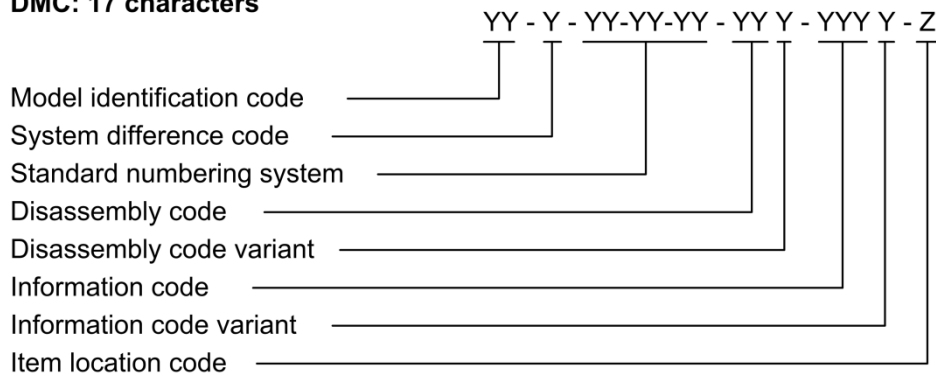

Breakdown	Rule
Learn code	3 uppercase alphanumeric characters
Learn event code	1 uppercase alpha character

The learn type information applies to human performance technology or training data modules.

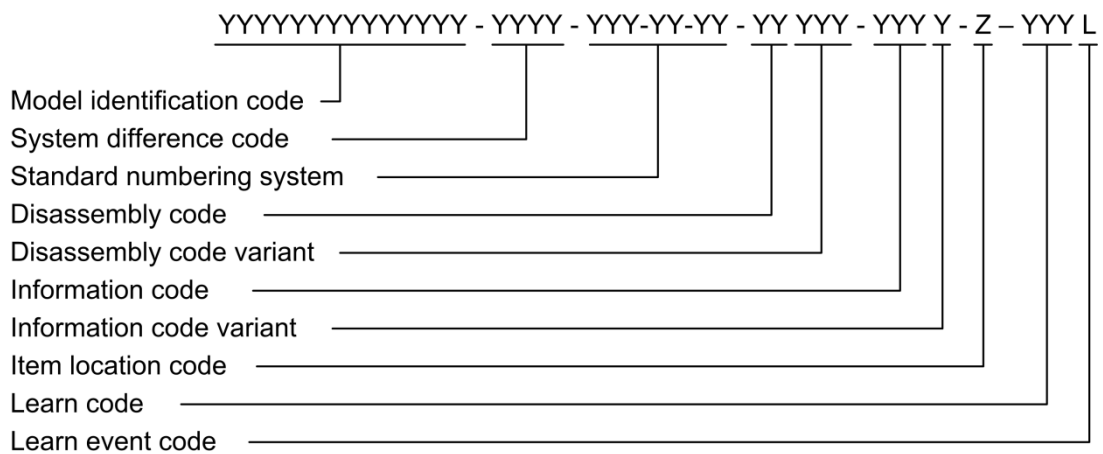

[Chap 4.3.1](#) to [Chap 4.3.8](#) describe the 17 alphanumeric character data module code without learn type information and the 41 alphanumeric characters data module code with learn type information as given in [Fig 2](#). The minimum length of the data module code without learn type information is 17 alphanumeric characters, the minimum length of the data module code with learn type information is 21 alphanumeric characters. The maximum length of the data module code without learn type information is 37 alphanumeric characters, the maximum length of the data module code with learn type information is 41 alphanumeric characters.

Learn type information is described in [Chap 4.3.9](#) and [Chap 4.3.10](#).

### DMC: 17 characters

### DMC: 41 characters

ICN-AE-A-040300-0-C0419-00002-A-005-01

Fig 2 Data module code for a Product

## 2.3 Use of hyphens

The data module code must be presented with hyphens [-] in the positions as shown in [Fig 2](#) and without spaces in between. The hyphens delimit the contents of the codes, as shown, but are not included within the population of the data module code attributes. This rule applies also to cases where the data module code is given as a single string.

### Note

For ease of reading, spaces are used in coding examples in this specification.

<a href="http://www.nspa.nato.int">www.nspa.nato.int</a>	NATO Support and Procurement Agency (NSPA)

## 1 General

The model identification code is identified in the data module code by the highlighted characters:

**YY** - Y - YY - YY - YY - YYY - YYYY - Z (17 characters)

thru

**YYYYYYYYYYYYYYY** - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYL (41 characters)

The attribute `modelIdentCode` of the element `<dmCode>` is used to store the model identification code. Refer to [Chap 3.9.5.1](#).

The model identification code is variable with a minimum of two and a maximum of 14 alphanumeric characters.

## 2 Model identification code

### 2.1 General

The model identification code identifies the Product to which the data applies and is the point of reference for all applicability information. The model identification code includes all related model variants. The variable length of the model identification code enables a coupling between a Product or project name (eg, a 10 character End Item Acronym Code, (EIAC)) and a Product or project variant (eg, a one thru four character "end item Usable On Code", (UOC)) from a logistics database (eg, Logistics Support Analysis Record, (LSAR)).

The decision on how to use the model identification code in this way is a project or organization decision and must be documented in the project or organization business rules.

Projects must apply to North Atlantic Treaty Organization (NATO) Support and Procurement Agency (NSPA) for the allocation of the model identification code and must specify the number of model identification codes the user wishes to reserve for models or variants. If applicable, the project or the organization must ensure that the model identification codes are harmonized between the users of S1000D and S2000M.

In order to control the available sequences and prevent duplications, the model identification codes must be registered with:

S2000M Administrator

NATO Support and Procurement Agency (NSPA)

L-8325 CAPELLEN

G.-D. Luxembourg

Email: [spec2000m@nspa.nato.int](mailto:spec2000m@nspa.nato.int)

When applying for a code, indicate the name and title of the requester, company name and postal address, telephone, fax number and e-mail address. If not self-evident, please indicate the type of Product (aircraft, engine, missile, radar, ship, tank, vehicle, etc) for which the code is being requested. If the name of the system is not in English, please provide also an English translation. In principle the project or the organization can propose a code.

By maintaining a central database, NSPA will ensure the global uniqueness of the model identification codes. A new model identification code will be taken into use at the discretion of the project whenever a new type/model or variant is thought to need specific identification.

When this is necessary, the project or the organization will establish their own arrangements for cross-indexing. It is suggested that if this requirement can be foreseen, the project or the organization can allocate the first model identification code of a block to be the common or baseline.

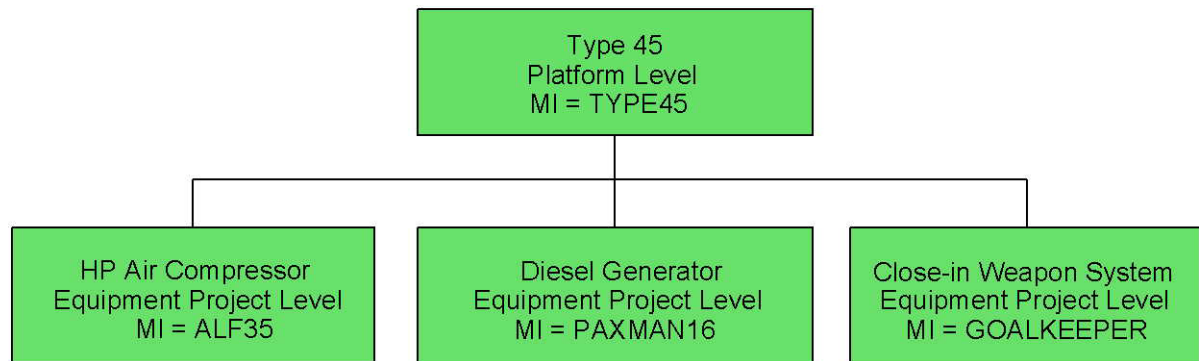

The allocation of a model identification code for a Product does not imply that all data modules and publications applicable to a project have to use the same code. Data modules on the platform level as shown in [Fig 1](#) can contain interface data modules to reference to other model identification codes. Therefore individual data modules and publication modules can be used on several projects. This allows the use of existing data without change or recoding. The model identification code in itself has no significance outside the project.

#### **Business rule decision point BRDP-S1-00332 - Allocation of Product model identification code:**

- Decide which model identification codes to use for the Product and/or project.

**Business rule decision point BRDP-S1-00333 - Allow the use of one or several model identification codes:**

- Decide whether to allow the use of one or several model identification codes.

ICN-AE-A-040301-0-C0419-00010-A-02-1

*Fig 1 Multiple model identification code within a project*

## 2.2 Allocated model identification codes

A list of all allocated model identification codes can be found at [www.nspa.nato.int](http://www.nspa.nato.int). The list is common for both S1000D and S2000M.

---	------------------------------	---

### **References**

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section

## 1 General

The system difference code is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - YY - YYY - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYYL (41 characters)

The attribute `systemDiffCode` of the element `<dmCode>` is used to store the system difference code. Refer to [Chap 3.9.5.1](#).

The system difference code is variable between one and four characters each of which can be alphanumeric.

## 2 System difference code

The system difference code identifies alternative versions of the system and subsystem/sub-subsystem identified by the SNS without affecting the type, model or variant identity.

The variable length of the system difference code enables for example, a relationship between the system difference codes and the one thru four alphanumeric characters of the "System level Usable On Code (UOC)" from a logistics database (eg, Logistic Support Analysis Record (LSAR)).

When set to one character it is important to positively identify the system/subsystem variant and the applicability of the related information. The initial or basic installation is coded to the project defined default and assigned successively as variants are specified. The value "A" is always used for the first configuration, the value "B" for the second and so on.

An example of how the system difference code would differentiate two navigation systems is shown in [Fig 1](#).

#### Example:

There can be more than one system variant available (eg, system 34 (Navigation), sub-subsystem 41 (Navigation radar)). This can be used to identify the independent positioning determining installation in the air vehicle. However it can be that there are several types of Navigation radar available.

#### Business rule decision point BRDP-S1-00334 - Allocation of system difference code:

- Decide which system difference code values to be used for the Product.

## 2.1

### Specific use of the system difference code

For data modules valid for several configurations, the project or the organization must define the assignment of the system difference code.

For projects assigning a UOC to each configuration, they can assign as many system difference code values as actual combinations of configurations.

*Table 2 Example for UOC assignment*

Configuration	UOC
Conf 1	A
Conf 2	B
Conf 3	C

*Table 3 Example for system difference code assignment*

Combinations of configuration	System difference code
Conf 1	A0
Conf 2	B0
Conf 3	C0
Conf 1 + Conf 2	A1
Conf 1 + Conf 3	A2
Conf 1 + Conf 2 + Conf 3	A3
Conf 2 + Conf 3	B1

---

In these examples, the system difference code value "A3" defined for the combination of all the configurations can be used in the data module code for all valid configurations.

**Business rule decision point BRDP-S1-00335 - UOC as system difference code:**

- Decide whether to use UOC as the system difference code.

## Variant A

YY-A-34-41-00-YXA-XXXXA-A

Consisting of:

YY-A-34-41-10-YXA-XXXXA-A

<a href="#">Chap 8.2.8</a>	Maintained SNS - General sea vehicles
<a href="#">S2000M</a>	International specification for material management - Integrated data processing

## 1 General

SNS is applicable in the data module code to the characters identified as follows:

YY - Y - YY - YY - YY - YYY - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYL (41 characters)

## 2 Standard numbering system

### 2.1 General

The SNS specified for publications and database information consists of three groups of characters. This system is designed to provide standardization in the arrangement or addressing of the Product.

[Chap 8.2](#) contains maintained SNS for air vehicles, land and sea systems. It allocates and provides definitions for the system, subsystem and in some cases for the sub-subsystem.

Users of the specification can allocate a project specific SNS at their own discretion. Each project or organization must define the SNS structure being used in its business rules. The same SNS numbering scheme must apply across the project disciplines.

In some of the information sets given in [Chap 5](#) a specific use of the SNS elements is defined, for example in [Chap 5.2.1.6](#) for maintenance planning and [Chap 5.3.1.3](#) for illustrated parts data.

#### Business rule decision point BRDP-S1-00336 - Product SNS structure:

- Decide which SNS structure to use for the Product.

### 2.2 SNS structure

#### 2.2.1 System

The system is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - YY - YYY - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYL (41 characters)

The attribute `systemCode` of the element `<dmCode>` is used to store the system. Refer to [Chap 3.9.5.1](#).

The system represents the general systems and the basic structure of the Product and is populated with two or three alphanumeric characters.

The system is identified by two alphanumeric characters. In case a project or an organization requires the indication of the type of SNS used, an additional single alphanumeric character can be placed in front of the SNS as part of the attribute `systemCode`. This character is called the material item category code.

### 2.2.2 Material item category code

The material item category code is used to indicate different SNS coding structures that are applicable to an individual project at the system, subsystem and sub-subsystem level within the SNS. The material item category code is also used to differentiate between different definitions within the same SNS.

The example below shows where a civil aircraft includes a military aircraft system with the same SNS and the military definition is to be used for System 42. These data modules can then be uniquely identified within the CSDB. This differentiation is established when identifying the data module requirements.

Civil aircraft system: YYYYYYYYYYYYYY - YYYY - J42 - YY - YY - YYYYY - YYYY - Z

Military aircraft system: YYYYYYYYYYYYYY - YYYY - E42 - YY - YY - YYYYY - YYYY - Z

The following list gives the allocation of the material item category code.

- "A" - Generic SNS, refer to [Chap 8.2.1](#)
- "B" - Support and training equipment SNS, refer to [Chap 8.2.2](#)
- "C" - Ordnance SNS, refer to [Chap 8.2.3](#)
- "D" - General communications SNS, refer to [Chap 8.2.4](#)
- "E" - Air vehicle, engines and equipment SNS, refer to [Chap 8.2.5](#)
- "F" - Tactical missiles SNS, refer to [Chap 8.2.6](#)
- "G" - General surface vehicles SNS, refer to [Chap 8.2.7](#)
- "H" - General sea vehicles SNS, refer to [Chap 8.2.8](#)
- "J" - Civil aircraft deviations from E
- "K" thru "S" - Not available for projects
- "T" thru "Y" - Available for projects.
- "Z" is used for non-chapterized illustrated parts data modules, refer to [Fig 2](#)
- "0" thru "9" - Available for projects

Refer to default BREX rule BREX-S1-00145.

Refer to [Chap 1.3](#) for the definitions of "Not available for projects" and "Available for projects".

#### Business rule decision point BRDP-S1-00337 - Use of the material item category code:

- Decide whether to use the material item category code.

### 2.2.3 Subsystem/sub-subsystem

Subsystem/sub-subsystem describes the further breakdown of system. The subsystem/sub-subsystem is identified in the data module code by the highlighted characters:

YY - Y - YY - **YY** - YY - YYY - YYYYY - Z (17 characters)

thru

YYYYYYYYYYYYYY - YYYYY - YYY - **YY** - YYYYY - YYYYY - YYYYY - Z - YYYYL (41 characters)

The subsystem and sub-subsystem of the data module code are stored in the following attributes. Refer to [Chap 3.9.5.1](#).

- subsystem: attribute subSystemCode of the element <dmCode>
- sub-subsystem: attribute subSubSystemCode of the element <dmCode>

Each attribute is populated with a single alphanumeric character.

The specification contains only allocations for the first attribute unless provision has been made in the detailed specification of the information sets. The definitions for sub-subsystems are allocated by the project/manufacturer, depending on the complexity and are to be provided in the project or organization business rules. Refer to [Fig 1](#).

#### Note

When the sub-subsystem is zero (eg, 26-20-00), the two digits "20" represent the subsystem as a whole.

### 2.2.4 Unit or assembly

The unit or assembly is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - **YY** - YYY - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - **YYYY** - YYYYY - YYYY - Z - YYYYL (41 characters)

The attribute assyCode of the element <dmCode> is used to store the unit or assembly. Refer to [Chap 3.9.5.1](#).

Unit or assembly is populated with two or four alphanumeric characters. The use of four characters provides identification for units in complex systems. An extension to four characters must not be used to give a further hierarchical breakdown. Refer to [Fig 1](#).

#### Business rule decision point BRDP-S1-00338 - Number of characters in assembly code:

- Decide whether to use two or four characters for unit or assembly.

ICN-AE-A-040303-0-C0419-00004-A-03-1

Fig 1 SNS structure

## 2.3 Use of SNS for illustrated parts data modules

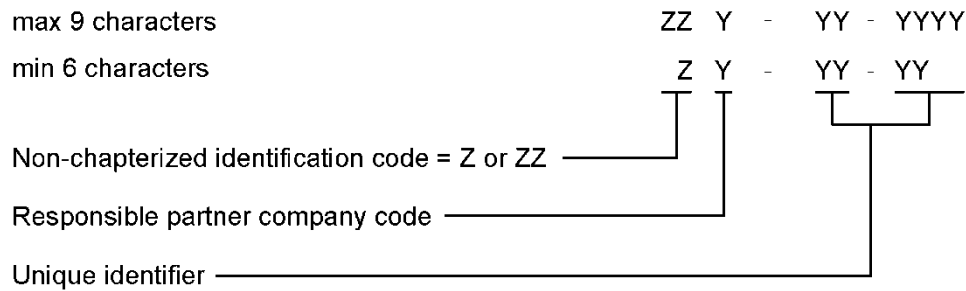

### 2.3.1 Chapterized illustrated parts data modules

For chapterized illustrated parts data modules the SNS attributes are allocated as described in [Para 2.2](#).

Certain items which are required to be contained in separate figures (eg, raw material, rivets, consumables) should be listed in subsystem/sub-subsystem "01" or "99" for each system.

### 2.3.2 Non-chapterized illustrated parts data modules, S2000M

For non-chapterized illustrated parts data modules the SNS attributes must be coded with the following specific rules. Refer to [Fig 2](#).

ICN-AE-A-040303-0-C0419-00005-A-04-1

Fig 2 SNS for non-chapterized illustrated parts data modules

#### Note

For non-chapterized illustrated parts data modules only this structure of the SNS is allowed.

#### Business rule decision point BRDP-S1-00339 - Responsible partner company codes for non-chapterized illustrated parts data modules:

- Decide which responsible partner company codes to use for non-chapterized illustrated parts data modules.

For S2000M projects, the unique identifier must be the last four digits of the initial provisioning project number. For a six digits unique identifier, the writing rule is "YY-YY00".

### 2.3.3 Non-chapterized illustrated parts data modules, non-S2000M

For non-chapterized illustrated parts data modules, where S2000M is not used, the SNS attributes must be coded as given in [Fig 2](#) with project defined values and follow the rules for chapterized illustrated parts data modules.

#### Business rule decision point BRDP-S1-00340 - Responsible partner company codes for non-chapterized, non-S2000M illustrated parts data modules:

- Decide which responsible partner company codes to use for non-chapterized, non-S2000M illustrated parts data modules.

#### Business rule decision point BRDP-S1-00341 - Unique identifier for non-chapterized, non-S2000M illustrated parts data modules:

- Decide which unique identifiers to use for non-chapterized, non-S2000M illustrated parts data modules.

## Chapter 4.3.4

### *Data module code - Disassembly code*

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.8</a>	Information generation - Disassembly principles
<a href="#">Chap 5</a>	Information sets and publications

#### 1 General

The disassembly code is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - YY - **YYY** - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - **YYYYY** - YYYY - Z - YYYL (41 characters)

The attribute `disassyCode` of the element `<dmCode>` is used to identify the breakdown condition of an assembly to which maintenance information applies.

The disassembly code consists of two alphanumeric characters.

#### 2 Disassembly code

The disassembly code identifies the breakdown condition of an assembly to which maintenance information applies. The generic disassembly principles are explained in [Chap 3.8](#).

The characters are typically numeric. However they can be extended when more than 99 identifiers are needed. The extension must commence "A1" to "A9", "B1" to "B9" and so on until "Z9" continuing with "AA" to "AZ", "BA" to "BZ" and so on until "ZZ".

The disassembly code is also used for sequential numbering of data modules when more than one data module is used for the same SNS. Refer to rules given in the subchapters of [Chap 5](#).

### References

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 5.3.1.3</a>	Common requirements - Illustrated parts data
<a href="#">S2000M</a>	International specification for material management - Integrated data processing

#### 1 General

The disassembly code variant is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - YY - YYY - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYYL (41 characters)

The attribute `disassyCodeVariant` of the element `<dmCode>` designates alternative items of equipment or components differing slightly in design.

The disassembly code variant is populated with one, two or three alphanumeric characters.

#### 2 Disassembly code variant

The disassembly code variant designates alternative items of equipment or components differing slightly in design, but not enough to warrant a change of the system difference code. The characters are typically alpha characters.

The variable length of the disassembly code variant allows the use of the "Alternate Logistic Control number (ALC)" or the "Alternate Indentured Product Code (AIPC)" from LSA records. Whenever possible, the disassembly code variant starts with an alphabetic character. The decision on how to use the disassembly code variant in this way is a project or organization decision and has to be documented in the project or organization business rules.

---

**Business rule decision point BRDP-S1-00342 - Use of the disassembly code variant:**

- Decide whether to use one, two or three characters for the disassembly code variant and how to populate.

The disassembly code variant is also used for figure number variants when IPD data modules are generated from an S2000M provisioning database. Refer to [Chap 5.3.1.3](#).

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section

#### **1 General**

The information code variant is identified in the data module code by the highlighted character:

YY - Y - YY - YY - YY - YYY - YYYY - Z (17 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYL (41 characters)

The attribute `infoCodeVariant` of the element `<dmCode>` is used to store the information code variant. Refer to [Chap 3.9.5.1](#).

The information code variant is populated with one alphanumeric character.

#### **2 Information code variant**

The information code variant identifies any variation in the activity defined by the information code. The characters are typically alpha characters.

The default information code variant is always coded "A". Successive variants are coded "B" thru "Z" followed by the numeric values "0" thru "9" if necessary.

<a href="#">Chap 4.3.9</a>	Data module code - Learn code
<a href="#">Chap 4.3.10</a>	Data module code - Learn event code
<a href="#">Chap 5.2.1.19</a>	Common information sets - Training

## 1 General

The item location code is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - YY - YYY - YYYY - **Z** (17 characters)

thru

YYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - **Z** - YYYYL (41 characters)

The attribute `itemLocationCode` of the element `<dmCode>` is used to store the item location code. Refer to [Chap 3.9.5.1](#).

The item location code is populated with one alpha character.

## 2 Item location code

The item location code identifies the situation to which the information is applicable, for example where the maintenance task will be carried out in terms of a Product.

The attribute can have one of the following values:

- "A" - information related to items installed on the Product
- "B" - information related to items installed on a major assembly removed from the Product
- "C" - information related to items on the bench. In this context, it does not matter, for example, whether an item has been removed from the Product.
- "D" - information related to all three locations A, B, and C. No other combinations are allowed.
- "T" - information related to training data module, refer to [Para 2.1](#)

Refer to default BREX rule BREX-S1-00138.

This specification uses "Z" in the information sets and publication chapters to indicate that one of the values "A", "B", "C", "D" or "T" must be used.

### 2.1 Training information

The item location code for a training data module depends on the use of learn code and learn event code. Refer to [Chap 4.3.9](#) and [Chap 4.3.10](#).

- Training data modules that do not use learn code and learn event code must use item location code value "T".
- Training data modules that use learn code and learn event code can have one of the item location code values "A", "B", "C", "D" or "T". Refer to [Chap 5.2.1.19](#).

*Table 1 References*

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 4.3.10</a>	Data module code - Learn event code
<a href="#">Chap 8.5.1</a>	Learn codes - Human performance technology codes
<a href="#">Chap 8.5.2</a>	Learn codes - Training codes

## 1 General

The learn code is an optional code that is applied to human performance technology and training data modules for projects that wish to use the functionality brought about by the learn code. The code describes the type of human performance technology or training information that is in the content of the data module. Each learn code represents a category of human performance technology or training information. When used, the learn code must be used with a learn event code. Refer to [Chap 4.3.10](#).

There are two types of learn codes:

- human performance technology
- training

The learn code is identified in the data module code by the highlighted characters:

YY - Y - YY - YY - YY - YYY - YYYY - Z - **YYL** (21 characters)

thru

YYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - **YYL** (41 characters)

Where:

- **YYY** is the learn code (HYY or TYY). Refer to [Para 2](#).
- **L** is the learn event code ([A](#), [B](#), [C](#), [D](#), or [E](#)). Refer to [Chap 4.3.10](#).

The attribute `learnCode` of the element `<dmCode>` is used to store the learn code. Refer to [Chap 3.9.5.1](#).

The learn code is populated with three alphanumeric characters.

## 2 Learn code

The first character of the learn code must be set to either "H" for human performance technology codes or "T" for training codes. Refer to the default BREX rule BREX-S1-000139.

### 2.1 Human performance technology

For human performance technology data modules, the last two characters define the specific learn code for the human performance technology information contained in the data module. Refer to [Chap 8.5.1](#) and the default BREX rule BREX-S1-000139.

Example data module code for a human performance technology learning data module:

- S1000DBIKE-A-00-00-00-00A-234A-A-H18A

### 2.2 Training content

For training data modules, the last two characters define the specific learn code for the training information contained in the data module. Refer to [Chap 8.5.2](#) and the default BREX rule BREX-S1-000139.

Example data module code for a training learning data module:

- S1000DBIKE-A-10-10-00-00A-520A-A-T25A

## Chapter 4.3.10

### *References*

*Table 1 References*

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 3.9.5.2.13</a>	Content section - Learning data module
<a href="#">Chap 4.3.9</a>	Data module code - Learn code

## 1 General

The learn event code is an optional code that is applied only to human performance technology or training data modules for projects that wish to use the functionality brought about by the learn event code. Whenever a learn code is used, the learn event code must be used. Refer to [Chap 4.3.9](#) and default BREX rule BREX-S1-00140.

There are five branches in the learn Schema associated with the learn event code. Refer to [Chap 3.9.5.2.13](#).

The learn schema supports five types of learning information identified below. Each type is supported by a unique branch in the learning data module schema. Only one branch can be used per learn learning data module instance.

- Learning plan
- Learning overview
- Learning content
- Learning summary
- Learning assessment

The learn event code is identified in the data module code by the highlighted character:

YY - Y - YY - YY - YY - YYY - YYYY - Z - YYYYL (21 characters)

thru

YYYYYYYYYYYYYYY - YYYY - YYY - YY - YYYY - YYYYY - YYYY - Z - YYYYL (41 characters)

The attribute `learnEventCode` of the element `<dmCode>` is used to store the learn event code. Refer to [Chap 3.9.5.1](#).

The learn event code is populated with one alpha character.

## 2 Learn event code

The learn event code identifies which branch of the learn Schema is being used.

The attribute `learnEventCode` can have one of the following values:

- "A" - Learning plan
- "B" - Product overview
- "C" - Learning content
- "D" - Learning summary
- "E" - Learning assessment

Refer to the default BREX rule BREX-S1-000141.

This specification uses "L" in the information sets and publication chapters to indicate that one of the values "A", "B", "C", "D" or "E" must be used.

**Chap 4.4**

Chap No./Document No.	Title
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system

## 1 General

Each illustration sheet, multimedia object or other data attached to a data module must be identified by an ICN assigned by the originator. This chapter specifies the coding required for the control number. In a CSDB, the ICN is the unique identifier of an illustration sheet, multimedia object, or attached data, and is used to establish the relationship to one or more data modules. The ICN is independent of the file format.

## 2 Information control numbering methods

The unique ICN can be based on:

- a company/organization code - CAGE code

or on:

- a project code - model identification code

**Business rule decision point BRDP-S1-00344 - Use of CAGE code and/or model identification code based ICN:**

- Decide which method to be used for the ICN.

The security classification, the last part of the ICN, is not part of the unique identifier

The ICN addresses an illustration sheet, multimedia object, or other attached data including its update status independent of the status of a data module. The ICN is contained in the following markup elements:

```
<graphic infoEntityIdent="ICN-...">
<symbol infoEntityIdent="ICN-...">
<multimediaObject infoEntityIdent="ICN-...">
```

For human-readability and due to the variable length of the subfields, the ICN must be written with hyphens [-] and with the term "ICN" exactly as shown in [Fig 1](#) and [Fig 2](#). An exception is the content of element `<entityControlNumber>` within data dispatch notes, where the prefix "ICN-", is not included.

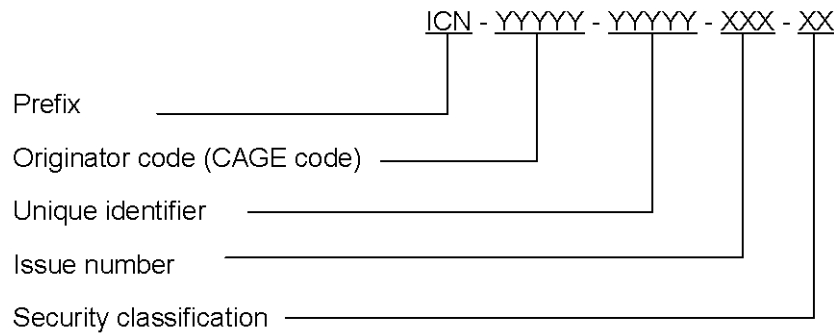

The allocation of an ICN with a certain model identification code, system difference code, SNS and responsible partner company does not imply that the addressed illustrations, symbols, multimedia objects, or other data must be re-identified when usable in several data modules. This allows the reuse of data without recoding.

Refer to [Chap 1.3](#) for the permissible characters.

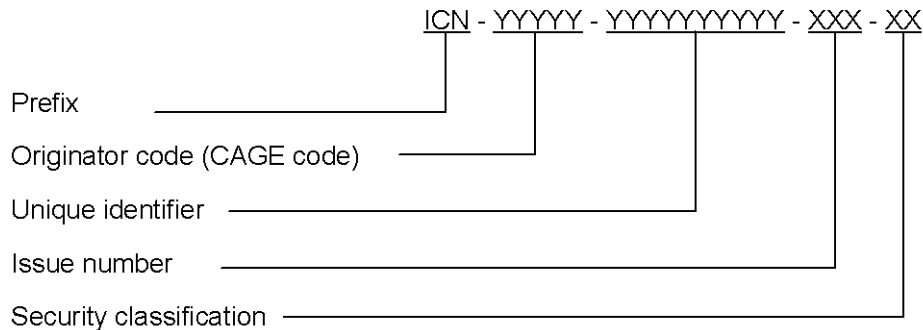

### 2.1 ICN - CAGE code based

The CAGE code based ICN comprises five parts, including the prefix "ICN-", and is built as follows. Refer to [Fig 1](#).

### ICN – min 5 character unique identifier:

### ICN – max 10 character unique identifier:

ICN-S3627-S1000D0493-001-01

Fig 1 ICN - CAGE code based

#### 2.1.1 Originator code

The originator code contains the originator of an illustration, multimedia object or other data. It consists of five alphanumeric characters. The code is the originator's CAGE code.

#### 2.1.2 Unique identifier

The unique identifier consists of minimum five and maximum 10 alphanumeric characters. The identifier must be unique for each originator code.

#### 2.1.3 Issue number

The issue number is a three digit numerical value with leading zeros. It starts from 001 for each basic illustration, multimedia object or other data or variant thereof, and must be incremented each time the illustration, multimedia object or other data is updated.

#### 2.1.4 Security classification

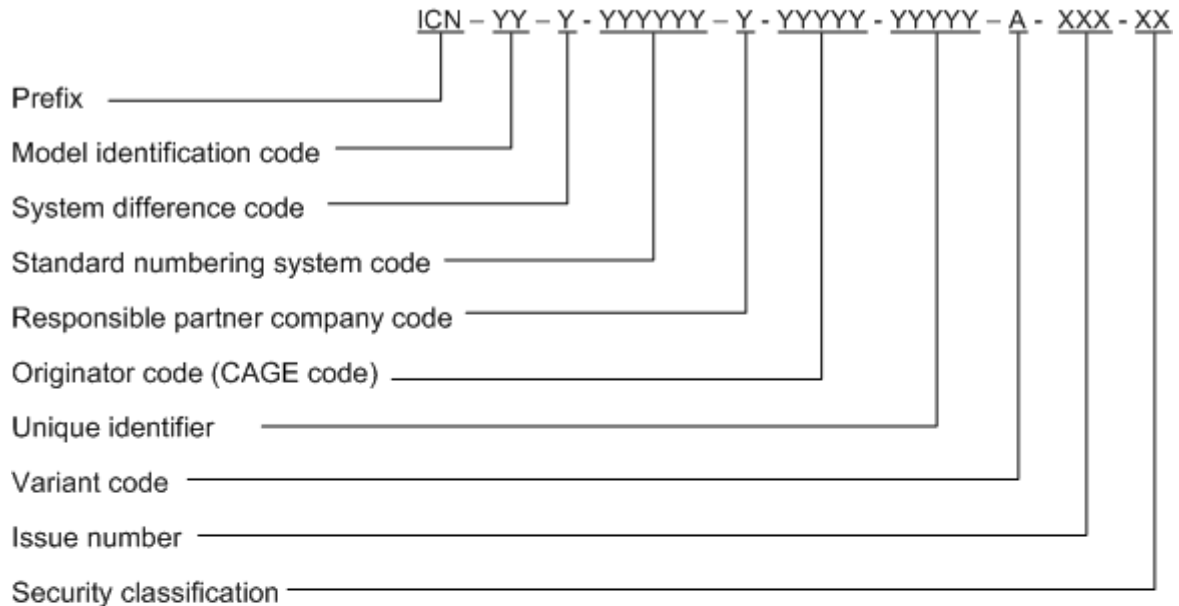

The security classification of the illustration or the multimedia object is identified by a two digit number. The illustration, multimedia object or other data has its individual security classification independent of where it is used and must use the security classification values as the project. Refer to BRDP-S1-00012.

If an illustration, multimedia object or other data is reclassified, it must be given a new issue number.

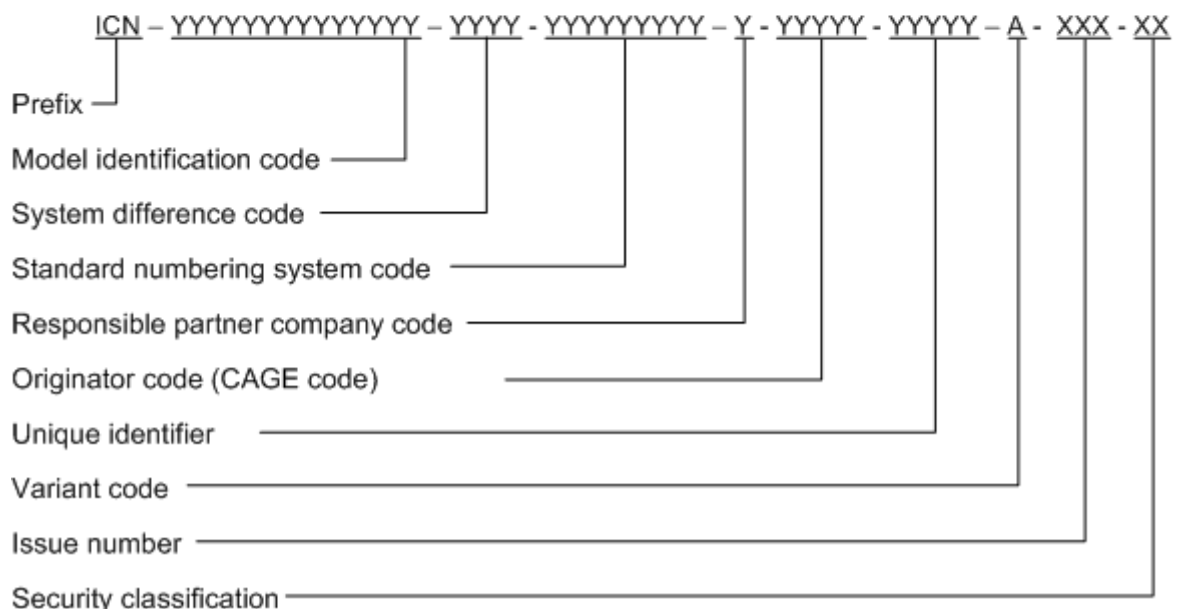

## 2.2 ICN - Model identification code based

The model identification code based ICN comprises 10 parts, including the prefix "ICN-", and is built as follows. Refer to [Fig 2](#).

ICN – min 29 characters:

ICN – max 47 characters:

ICN-S3627-S1000D0494-003-01

Fig 2 ICN - Model identification code based

### 2.2.1 Model identification code

The code is identical in construction to the model identification code used for data module code. Refer to [Chap 4.3.1](#).

Applicable to: All

S1000D-A-04-04-0000-00A-040A-A

Chap 4.4

- 2.2.2 System difference code**  
The code is identical in construction to the system difference code used for data module code. Refer to [Chap 4.3.2](#).
- 2.2.3 SNS code**  
The code is identical in construction to the SNS code used for data module code. Refer to [Chap 4.3.3](#).
- 2.2.4 Responsible partner company code**  
The responsible partner company is the company or organization responsible for the illustration, multimedia object or other data independent of its use in data modules. The responsible partner company code must be defined by the project or organization.
- Business rule decision point BRDP-S1-00348 - Allocation of responsible partner company codes for model identification code based ICN:**
- Decide which values on responsible partner company codes to be used.
- 2.2.5 Originator code**  
Refer to [Para 2.1.1](#).
- 2.2.6 Unique identifier**  
The unique identifier consists of five alphanumeric characters. For each model identification code, the identifier must be unique for each originating company.
- 2.2.7 Variant code**  
The variant code is a single alphabetic character, which identifies the variants of a basic illustration, multimedia object or other data. The variant code "A" identifies a basic illustration, multimedia object or other data and "B" identifies the first variant. A variant is a supplemented, scaled, cropped, rotated, mirrored and/or annotated basic illustration, multimedia object or other data.
- 2.2.8 Issue number**  
Refer to [Para 2.1.3](#).
- Note**  
Illustrations, multimedia objects or other data using a two digit issue number in the ICN based on an S1000D Issue before 4.0 can still be used.
- 2.2.9 Security classification**  
Refer to [Para 2.1.4](#).
- Note**  
Illustrations, multimedia objects or other data using a one digit security classification number in the ICN based on an S1000D Issue before 4.0 can still be used. The value "1" is then equivalent to security classification "01", "2" to "02", etc, as given in [Chap 3.9.6.1](#).
- 3 Examples**
- 3.1 CAGE code based ICN**  
ICN - minimum 18 characters (excluding hyphens):
- ICN-U8025-12345-001-01
- ICN - maximum 23 characters (excluding hyphens):
- ICN-S3627-S1000D0494-001-01

---

### 3.2 Model identification code based ICN

ICN - minimum 29 characters (excluding hyphens):

– ICN-AE-A-004004-G-S3627-00355-A-002-01

ICN - maximum 47 characters (excluding hyphens):

– ICN-S1000DLIGHTING-ABCD-D00000000-0-U8025-54321-A-001-01

## 1 General

For the planning, management and control of the content of the CSDB for individual projects the use of the following data management lists are recommended:

- Data Management Requirement List (DMRL), refer to [Para 2](#)
- CSDB Status List (CSL), refer to [Para 3](#)

Both are implemented in one and the same Schema. For information about markup requirements, refer to [Chap 7.5.2](#) and [Para 4](#).

## 2 Data management requirement list

### 2.1 Definition

A Data Management Requirement List (DMRL) is used to identify the required data modules and, by project decision, publication modules for a project. The data management requirement list supports planning, reporting, production and configuration control, especially in a work share environment. A data management requirement list can be generated in parts (eg, by partner companies for later merging) or in a complete form.

The DMRL is normally created at the start of a project and is constantly updated during the life of the project. It contains all the data modules and publication modules that are expected to be created, and hence at a given time, it will contain data modules and publication modules that exist and do not yet exist in the CSDB. This is where it differs from the CSDB status list.

#### Business rule decision point BRDP-S1-00350 - Use of data management requirement list:

- Decide whether to use the data management requirement list for specification and exchange of CSDB planning information.

Under normal circumstances, a DMRL must not contain illustrations or multimedia objects. The exceptions are IPD illustrations for a project where the IPD data modules are created by one partner using the illustrations generated by the other partners (for example, where the IP data itself is transferred between the partners by non-S1000D mechanisms as in S2000M).

#### Note

A DMRL must not contain comments or other data management lists. Refer to default BREX rule BREX-S1-00001.

#### Business rule decision point BRDP-S1-00351 - Object types to be listed in the data management requirement list:

- Decide whether to list publication modules and/or IPD illustrations in the data management requirement list.

The DMRL must contain the titles and details of the responsible partner company for each of the data modules and publication modules. If required, the security classification of the entries can also be recorded. Refer to default BREX rule BREX-S1-00002.

As the DMRL does not contain the issue information of its contained objects, it does not change as data modules or publication modules are created or up-issued, unless there is a change to the titles or other details, or the requirement for new data modules is realized. Refer to default BREX rule BREX-S1-00003.

#### Note

In certain circumstances, the entries in a DMRL can contain issue information - for example when a data module issue applies to a certain customer and previous issues did not.

Special consideration must be given to deleted data modules and publication modules as their issues are increased and normally will be removed from the DMRL later.

## 2.2 Merging management requirement lists

In a multi-partner project, each partner is responsible for the maintenance of their portion of the complete DMRL (for data modules and publication modules that cover the items that are their responsibility). These DMRL are called "partial".

There must be only one entry for each CSDB object in the DMRL, and care must be taken when considering applicability effects - such as a new issue of a data module having a new applicability value.

In such a multi-partner project, one partner is normally responsible for merging the partial DMRLs into a complete DMRL for the entire project (this DMRL has the attribute `dmlType` set to "c"), and this involves processing the DMRL portions and comparing the entries in each. Typical problems that occur and have to be resolved are:

- sometimes different partners "claim" the same data module (or publication module) as the same DMC appears in different partial DMRL
- entries for the data modules / publication modules that are different to the exchanged versions of the data modules / publication modules
- missing entries for data modules / publication modules that have already been exchanged and are not deleted status

These issues have to be resolved before the complete DMRL can be created and published.

## 3 CSDB status list

### 3.1 Definition

The purpose of a CSDB Status List (CSL) is to exchange information about the status of the CSDB. For example, in a multi-partner project, the CSL is used to check that the CSDB objects (data modules, illustrations, etc) that have been sent by one partner have been successfully loaded by another, or the data received by a customer is what has been sent by the project.

At all times, the CSDB at the originating company is the definitive source of data for which that company has responsibility. To ensure that all CSDB in a multi-partner project are built up

without divergence, it is recommended that each enterprise/company will produce and exchange a periodic reference listing of all CSDB objects that it has issued for interchange.

**Business rule decision point BRDP-S1-00352 - Use of CSDB status list:**

- Decide whether to use the CSDB status list for exchange of CSDB status information.

**Business rule decision point BRDP-S1-00353 - Objects types to be tracked by the CSDB status list:**

- Decide what CSDB objects types must be tracked in the CSDB status list, and at a minimum these must be data modules, illustrations/multimedia objects and publication modules.

The CSL must contain the issue numbers of the CSDB objects it contains. Refer to default BREX rule BREX-S1-00004.

## 3.2 Processing a CSDB status list

The CSL can be checked by a program (which can be a part of the CSDB management system) that reads the received CSL and compares content against the CSDB. The program can produce an error report that lists any discrepancies, for example:

- a CSDB object loaded in the CSDB is not listed in the CSL
- an object listed in the CSL is not loaded into the CSDB
- the details of a CSDB object listed in the CSL are different from those loaded in the CSDB

In what follows, the term receiver CSDB indicates the CSDB of the partner/customer who has received the CSL and is performing the CSL check, and the term sender CSDB is the creator of the CSL that is being checked by the receiver.

### 3.2.1 Discrepancy reporting

#### 3.2.1.1 A CSDB object loaded in the CSDB is not listed in the CSL

This means that a CSDB object that has been loaded into the receiver CSDB is not recorded in the sender's CSL. This indicates that the receiver has either:

- loaded a CSDB object from another partner that has not also been loaded by the sender of the CSL

or

- the receiver has created a CSDB object and sent it, but it has not been loaded by the sender

**Note**

In some CSDB implementations, where one partner acts as the holder of the master CSDB, there will be CSDB objects that are not the sender of the CSL responsibility to load to the master CSDB, and in this model of operation, this will not be an error.

#### 3.2.1.2 An object listed in the CSL is not loaded into the CSDB

This means that a CSDB object that has been loaded into the sender's CSDB (and recorded in the CSL) is not loaded into the receiver's CSDB. This indicates that the receiver has either not received the data module or has failed to load it.

#### 3.2.1.3 The details of a CSDB object listed in the CSL are different from those loaded in the CSDB

This means that the metadata that is in the CSDB for the CSDB object are different to the details for the same CSDB object in the CSL. This normally indicates a potential discrepancy between the data loaded in both the sender and receiver CSDB. For data modules, the differences could be in data module title, the security classification, and the responsible partner company and the issue date.

### 3.2.2 Dealing with data module issue numbers in the CSL

Unlike a DMRL, a CSL must always include the CSDB object's issue number (and if applicable to the CSDB object, the "inwork" number).

**Business rule decision point BRDP-S1-00354 - CSDB object issues to be included in the CSDB status list:**

- Decide whether to include only the latest issues of CSDB objects or all issues in the CSDB status list.

### 3.2.3 Selection of data modules for inclusion in the CSL

The CSDB objects that must be listed in the CSL from a sender to a receiver depend on the CSDB interchange process and requirements as well as the relationship between the sender and receiver. Several models can apply, such as:

- All partners and their customers have identical CSDB
- The sender CSDB contains a subset of the receiver CSDB

#### 3.2.3.1 All partners and their customers have identical CSDB

In this model, each of the partners and customers:

- must have the same issued data loaded
- must have the same data in the CSDB
- the CSL created by the sender will include all CSDB objects (that are of the types that is agreed to be included in the CSL) created by all partners and suppliers that have been either created by the sender or received by the sender from other partners or suppliers. In this case the CSDB objects listed in the CSL must match the CSDB objects listed in the CSDB.

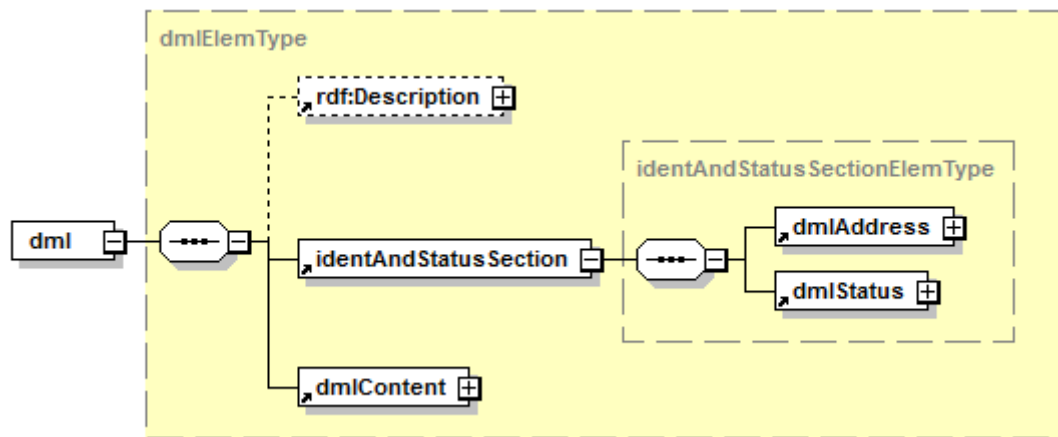

#### 3.2.3.2 The sender CSDB contains a subset of the receiver CSDB

Examples of this type of model are when the sender is a supplier to the receiver, and the receiver is holding the master CSDB on behalf of other partners. In this model, the CSDB objects (that are of the type that are agreed to be in the CSL) from the sender, and held in the receiver CSDB, will be a subset of the CSDB objects held in the receiver's CSDB. The CSL processing will only check the CSDB objects that the sender is responsible for, and that the sender does not have any CSDB objects that they are not responsible for (exceptions to this rule are shared CSDB objects - for example warning logos).

## 4 Data management lists - markup requirements

The data management list (DML) consists of two main sections:

- The identification and status section, using the element `<identAndStatusSection>`. Refer to [Para 4.1](#).
- The main body of the data management list, using the element `<dmlContent>`. Refer to [Para 4.2](#).

ICN-S1000D-A-040500-N4701-00001-A-001-01

Fig 1 DML structure

#### 4.1 Identification and status section

**Description:** The element `<identAndStatusSection>` contains the identification and status information of the data management list, refer to [Fig 1](#).

**Attributes:**

- None

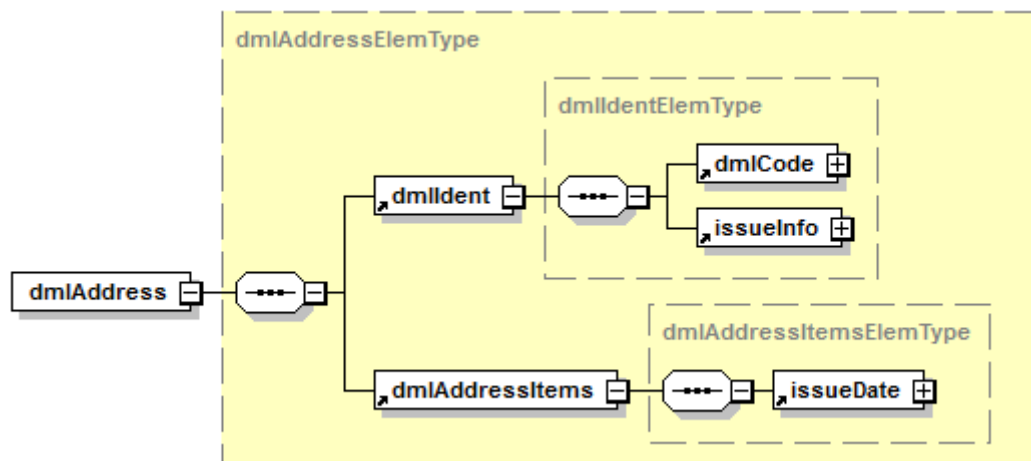

**Child elements:**

- `<dmlAddress>`. Refer to [Para 4.1.1](#).
- `<dmlStatus>`. Refer to [Para 4.1.2](#).

##### 4.1.1 Data management list address

**Description:** The element `<dmlAddress>` consists of two blocks of information items used to uniquely address the data management list object.

**Markup element:** `<dmlAddress>`

ICN-S1000D-A-040500-N4701-00002-A-001-01

Fig 2 Element `<dmlAddress>`

**Attributes:**

- None

**Child elements:**

- [<dmlIdent>](#), which uses the element [<dmlCode>](#) (refer to [Para 4.1.1.1](#)) and [<issueInfo>](#) (refer to [Para 4.1.1.1.6](#)) to establish the unique identity of a data management list object
- [<dmlAddressItems>](#), which uses the element [<issueDate>](#) (refer to [Para 4.1.1.2](#)) to support identification of a data management list object

#### 4.1.1.1 Data management list code

**Description:** The element [<dmlCode>](#) contains the data management list code. Together with the issue information, it gives an identification that is unique within the S1000D domain.

The data management list code is comprised of up to 29 alphanumeric characters and is built up as shown in [Table 2](#). The minimum length is 17 characters.

Data management lists must be coded:

YY - YYYYY - A - XXXX - NNNNN (17 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - A - XXXX - NNNNN (29 characters)

*Table 2 Data management list code*

Breakdown	Rule
Model identification code	2 thru 14 uppercase alphanumeric characters
Originator	5 uppercase alphanumeric characters
Type of the data management list	1 alpha character ("P", "C" or "S")
Issue year	4 numeric characters
Sequential number per year	5 numeric characters

**Markup element:** [<dmlCode>](#)
**Attributes:**

- `modelIdentCode` (M). Refer to [Table 2](#) and [Para 4.1.1.1.1](#).
- `senderIdent` (M). Refer to [Table 2](#) and [Para 4.1.1.1.2](#).
- `dmlType` (M). Refer to [Table 2](#) and [Para 4.1.1.1.3](#).
- `yearOfDataIssue` (M). Refer to [Table 2](#) and [Para 4.1.1.1.4](#).
- `seqNumber` (M). Refer to [Table 2](#) and [Para 4.1.1.1.5](#).

**Child elements:**

- None

**Markup example:**

The following example shows the 21st CSDB status list sent by the organization with CAGE code K0378 in the year 2010 for the project that has model identification code E2.

```
<dmlCode modelIdentCode="E2" senderIdent="K0378" dmlType="s"
yearOfDataIssue="2010" seqNumber="00021" />
```

#### 4.1.1.1.1 Model identification code

**Description:** The model identification code is given in the data management list code by the highlighted characters as follows:

YY - YYYYYY - A - XXXX - NNNNN (17 characters)

thru

YYYYYYYYYYYYYYYY - YYYYYY - A - XXXX - NNNNN (29 characters)

The model identification code is contained in the attribute `modelIdentCode`. Refer to [Chap 4.3.1](#).

#### 4.1.1.1.2 Originator

**Description:** The CAGE code of the originator (sender) is given in the data management list code by the highlighted characters as follows:

YY - YYYYYY - A - XXXX - NNNNN (17 characters)

thru

YYYYYYYYYYYYYYYY - YYYYYY - A - XXXX - NNNNN (29 characters)

The CAGE code of the originator (sender) is contained in the attribute `senderIdent`.

#### Note

The CAGE code used in this attribute must be a registered CAGE code.

#### 4.1.1.1.3 Data management list type

**Description:** The data management list type is given in the data management list code by the highlighted character as follows:

YY - YYYYYY - **A** - XXXX - NNNNN (17 characters)

thru

YYYYYYYYYYYYYYYY - YYYYYY - **A** - XXXX - NNNNN (29 characters)

The following types are used:

- "P" - a partial data management requirement list, value "**p**"
- "C" - a complete data management requirement list, value "**c**"
- "S" - a CSDB status list, value "**s**"

The data management list type is contained in the attribute `dmlType`.

#### 4.1.1.1.4 Issue year

**Description:** The issue year of the data management list is given in the data management list code by the highlighted characters as follows:

YY - YYYYYY - A - **XXXX** - NNNNN (17 characters)

thru

YYYYYYYYYYYYYYYY - YYYYYY - A - **XXXX** - NNNNN (29 characters)

The issue year of the data management list is contained in the attribute `yearOfDataIssue`.

#### 4.1.1.1.5 Sequential number per year

**Description:** The sequential number per year is given in the data management list code by the highlighted characters as follows:

YY - YYYYYY - A - XXXX - **NNNNN**

thru

YYYYYYYYYYYYYYY - YYYYYY - A - XXXX - **NNNNN**

The sequential number of the data management list per year is contained in the attribute `seqNumber`.

The sequential number per year starts from **00001**.

#### 4.1.1.1.6 Issue information

**Description:** The element `<issueInfo>` contains the issue information.

**Markup element:** `<issueInfo>`

**Attributes:**

- `issueNumber` (M), the issue number of the data management list. Every issue of a data management list receives a consecutive number. The initial issue is numbered 001. Refer to [Para 5](#) and default BREX rule BREX-S1-00005.
- `inWork` (M), the inwork number. Refer to [Para 5](#).

**Child elements:**

- None

#### 4.1.1.2 Issue date

**Description:** The element `<issueDate>` contains the issue date of the data management list in the format: YYYY-MM-DD.

**Markup element:** `<issueDate>`

The issue date is the input date of the data management list (the date it was released to CSDB), the cut-off date for the information, the planning date or some other more appropriate date, as decided by the project or the organization.

Refer to [Chap 3.9.5.1](#).

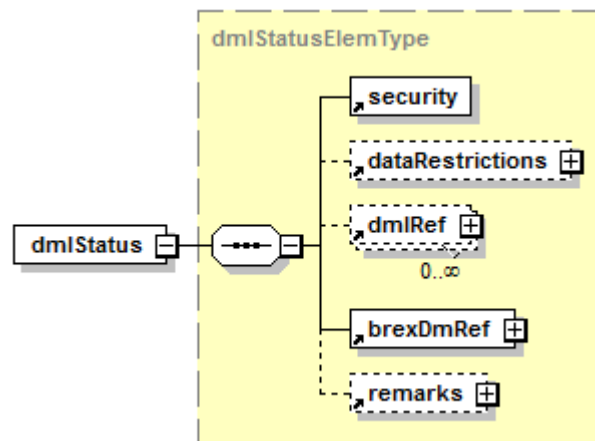

**Business rule decision point BRDP-S1-00355 - Data management requirement list issue date:**

- Decide whether the issue date of a data management requirement list must be the input date (the release to CSDB date), the cut-off date for the information, the planning date or some other more appropriate date.

#### 4.1.2 Data management list status

**Description:** The element `<dmlStatus>` contains information about the status of the list.

**Markup element:** `<dmlStatus>`

ICN-S1000D-A-040500-N4701-00003-A-001-01

Fig 3 Element &lt;dmlStatus&gt;

#### Attributes:

- `issueType` (O), the issue status of the data management list. Refer to [Chap 3.9.5.1](#).

#### Child elements:

- <security>, contains the security classification of the complete data management list. Refer to [Chap 3.9.5.1](#).
- <dataRestrictions>, contains the data instructions applicable to the data management list. This element can contain applicability information. Refer to [Chap 3.9.5.1](#).
- <dmlRef>. Refer to [Para 4.1.2.1](#).
- <brexDmRef>. Refer to [Chap 3.9.5.1](#).
- <remarks>. Refer to [Para 4.1.2.2](#).

#### 4.1.2.1 Data management list reference

**Description:** The element <dmlRef> contains any references to other data management lists (eg, for partial data management requirement list).

The references can be given by using the element <dmlRefIdent> within the element <dmlRef>. The element <dmlRefIdent> is similar to the element <dmlIdent> with the exception of an optional child element <issueInfo>.

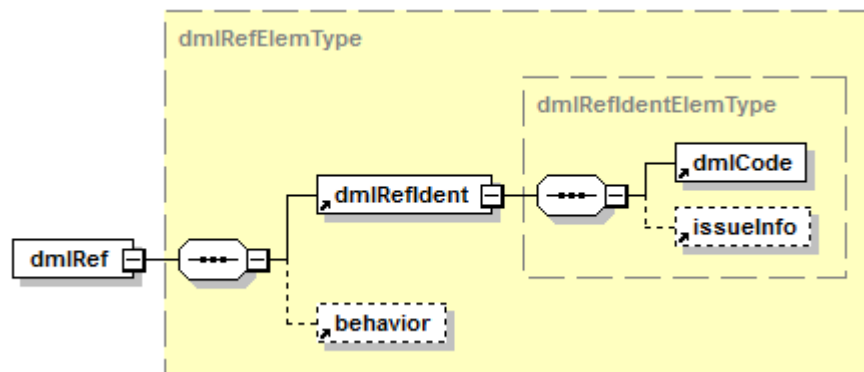

#### Note 1

The element <dmlRef> can also be used in the body of the DML in order to list DML that are in the CSDB. Refer to [Para 4.2.1](#)

#### Note 2

References in a CSDB status list must only refer to other CSDB status list. Refer to default BREX rule BREX-S1-00006.

**Markup element:** <dmlRef>

ICN-S1000D-A-040500-N4701-00004-A-001-01

Fig 4 Element `<dmlRef>`

#### Attributes:

The element includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- `<dmlCode>`, the data management list code. Refer to [Para 4.1.1.1](#).
- `<issueInfo>`, the data management list issue information. Refer to [Para 4.1.1.1.6](#).
- `<behavior>`, specifies how a link corresponding to the reference operates, which must not be used in this context.

#### 4.1.2.2 Remarks

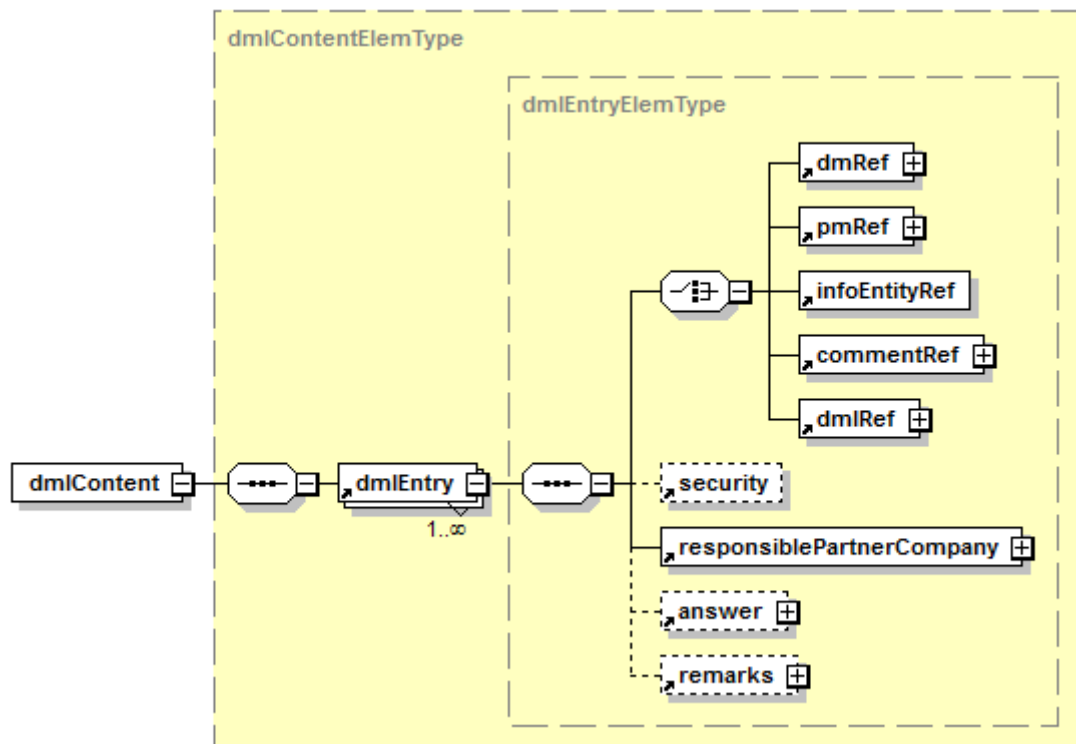

**Description:** The element `<remarks>` contains any general remarks to the data management list.

**Markup element:** `<remarks>`. Refer to [Chap 3.9.5.1](#).

## 4.2 Data management list content

**Description:** The content of the data management list, contained in element `<dmlContent>`, consists of one or several `<dmlEntry>` subelements. Each of these subelements contains a CSDB object entry.

**Markup element:** `<dmlEntry>`

ICN-S1000D-A-040500-N4701-00005-A-001-01

Fig 5 Element &lt;dmlContent&gt;

#### Attributes:

- dmlEntryType (O), specifies the type of entry (compared to the last issue of the DML). The attribute can have one of the following values:
  - "n" - new
  - "c" - changed
  - "d" - deleted
- issueType (O), the issue type (new, changed, revised, deleted, reinstated, etc) of the CSDB object represented by the <dmlEntry>. Refer to [Chap 3.9.5.1](#).

#### Child elements:

- <dmRef>, the reference to the data module concerned. Refer to [Chap 3.9.5.2.1.2](#).

#### Note

The element includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism, which must not be used.

- <pmRef>, the reference to the publication module concerned. Refer to [Chap 3.9.5.2.1.2](#).

#### Note

The element includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism, which must not be used.

- <infoEntityRef>, the reference to the illustration or multimedia concerned. Refer to [Para 4.2.1](#).
- <commentRef>, the reference to the comment form concerned. Refer to [Para 4.2.2](#).
- <dmlRef>, the reference to the data management list concerned. Refer to [Para 4.2.3](#).
- <security>, the security classification of the entry. Refer to [Chap 3.9.5.1](#).

- `<responsiblePartnerCompany>`, the responsible partner company for the entry. Refer to [Chap 3.9.5.1](#).
- `<answer>`, the data management requirement answer for the entry. Applies to a DMRL only. Refer to [Para 4.2.4](#).
- `<remarks>`, general remarks for the entry as required by the project or the organization. Refer to [Chap 3.9.5.1](#).

#### 4.2.1 ICN reference

**Description:** The element `<infoEntityRef>` contains a reference to an illustration/multimedia included in the data management list.

**Markup element:** `<infoEntityRef>`

**Attributes:**

- `infoEntityRefIdent` (M), the ICN (the unique identifier) of a graphic, symbol or multimedia object, always entered with the initial "ICN-". Refer to [Chap 4.4](#).

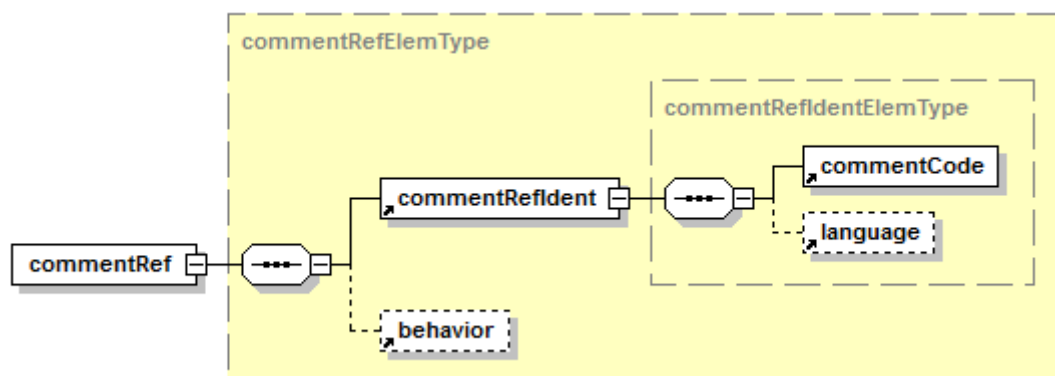

**Child elements:**

- None

#### 4.2.2 Comment form reference

**Description:** The element `<commentRef>` contains a reference to a comment form included in the data management list.

**Markup element:** `<commentRef>`

ICN-SYU52-AASER00024-001-01

Fig 6 Element `<commentRef>`

**Attributes:**

- None

**Child elements:**

- `<commentRefIdent>`, the identification of the referred comment form. Refer to [Para 4.2.2.1](#).
- `<behavior>`, the appearance/behavior of the referred comment form. Refer to [Chap 3.9.5.2.1.2](#).

##### 4.2.2.1 Comment form reference identity

**Description:** The element `<commentRefIdent>` is used to provide the identity of a comment form to which a comment form reference is pointing.

**Markup element:** `<commentRefIdent>`

**Attributes:**

- None

**Child elements:**

- `<commentCode>`, contains the items constituting the unique identity of a comment form.. Refer to [Chap 4.6.1](#).
- `<language>`. Refer to [Chap 3.9.5.1](#).

#### 4.2.3 Data management list reference

**Description:** The element `<dmlRef>` contains a reference to a DML included in the data management list. Refer to [Para 4.1.2.1](#).

#### 4.2.4 Data management requirement list answer

**Description:** The element `<answer>` can be used to insert comments on a DMRL entry. This element must not be used in a CSL, and must only be used for data module entries. Refer to default BREX rules BREX-S1-00007 and BREX-S1-00008.

Examples of use of the element `<answer>`:

The element `<answer>` can be used to get an answer from the CSDB owner when an industry partner or customer asks for a data module code to be reserved in the CSDB. The requestor sends a DMRL containing the requested data module code and receives it back with an entry for each data module code which could be the value "y" or value "n" in the attribute `answerToEntry`. This typically indicates the fact that the data module code was free or already reserved, and if needed a justification (generally in case of rejection) in the element `<remarks>`.

In the DMRL from the CSDB owner, the proposed changes for the next issue of the documentation, each entry can be marked as changed, deleted or new by using the attribute `dmlEntryType`. As a reply the partner or customer can agree with the proposed changes or not by using the attribute `answerToEntry` (value "y" or value "n"). If the customer does not agree to the proposed change, the customer can give a short reason or comment using the element `<remarks>`.

**Markup element:** `<answer>`

**Attributes:**

- `answerToEntry` (O), the indicator of that there are comments to the entry. The attribute can have one of the following values:
  - "y" (D) - Yes
  - "n" - No

**Child elements:**

- `<remarks>`, used to provide a narrative answer, when needed. Refer to [Chap 3.9.5.1](#).

## 5 Data management list issues

There are rules that determine the values of the sequential number, the issue number and the inwork number of DMRL and CSL. The rules for DMRL are given in [Para 5.1](#) and the rules for CSL are given in [Para 5.2](#). Refer to [Chap 3.9.5.1](#) for further information about issue numbering. Note that more than one data management list can exist with the same sequential number

provided that the combination of model identification code, sender identification, data management list type and year make it a unique data management list code in the CSDB.

## 5.1 DMRL issue numbering

When DMRL are delivered, the first delivery of the year is given the sequential number 00001 and issue number 001 (inwork 00) and the second delivery of the DMRL in the year is given the sequential number 00002 issue number 001 (inwork 00). Refer to default BREX rule BREX-S1-00009. The issue number is used to indicate consecutive DMRL versions and the inwork number is used to allow draft versions. This is shown in the following example. The first two deliveries in the example represent the DMRL merging requirements in a 2 partner project:

DML-E2-K0378-P-2015-00001-001-00 - the first partial DMRL from K0378 in 2015

DML-E2-D3309-P-2015-00001-001-00 - the first partial DMRL from D3309 in 2015

DML-E2-K0378-C-2015-00001-001-00 - the merged first complete DMRL in 2015 that contains both D3309 and K0378 data (K0378 is responsible for the merging)

DML-E2-K0378-C-2015-00002-000-01 - a draft of the second complete DMRL in 2015 from K0378

DML-E2-K0378-C-2015-00002-001-00 - the official issue of the second DMRL from K0378 in 2015

DML-E2-K0378-C-2015-00002-002-00 - an update to the second DMRL from K0378 in 2015

DML-E2-K0378-C-2015-00003-001-00 - the official issue of the third DMRL from K0378 in 2015

## 5.2 CSL issue numbering

CSL follow a similar coding scheme to DMRLs. Refer to default BREX rule BREX-S1-00009. The issue number is used when a CSL is updated due to errors or problems found when the receiver processed the CSL.

DML-E2-K0378-S-2015-00003-001-00 - the third CSL from K0378 in 2015

DML-E2-K0378-S-2015-00003-002-00 - the second issue of the third CSL from K0378 in 2015 (which has been updated as a result of changes made to K0378's CSDB following errors detected by the receiver).

<a href="#">Chap 7.4.1.1.2</a>	Generation process - Metadata

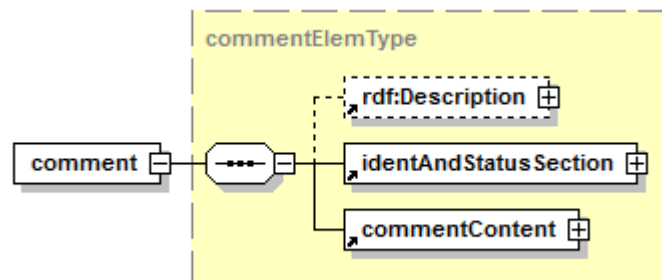

#### 1 General

Commenting and reporting on issues raised on data modules or publication modules during the verification process and the in-service phase of the Product can be done using the comment form. This form is compiled by the commenting authority and sent to the issuing authority of the data modules or publication modules. The comment form is also used to provide a response to the originator of the comment. The commenting process itself is explained in [Chap 3.7](#).

#### 2 Comment form

**Description:** The comment form consists of two main sections of information: the identification and status section, and the content section.

**Markup element:** <[comment](#)>

ICN-SYU52-AASER00023-001-01

Fig 1 Element `<comment>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- `<rdf:Description>`. Refer to [Chap 7.4.1.1.2](#)
- `<identAndStatusSection>`. Refer to [Chap 4.6.1](#).
- `<commentContent>`. Refer to [Chap 4.6.2](#).

#### Business rule decision point BRDP-S1-00356 - Use of the comment form:

- Decide whether to use the comment form.

### 3 Example

```
<comment>
<identAndStatusSection>
<commentAddress>
<commentIdent>
<commentCode senderIdent="AAAAA" yearOfDataIssue="2016"
modelIdentCode="AA" commentType="q" seqNumber="00001"/>
<language countryIsoCode="AA" languageIsoCode="aa"/>
</commentIdent>
<commentAddressItems>
<issueDate day="08" month="01" year="2016"/>
<commentOriginator>
<dispatchAddress>
<enterprise>
<enterpriseName>...</enterpriseName>
</enterprise>
<dispatchPerson>
<lastName>...</lastName>
</dispatchPerson>
<address>
<city>...</city>
<country>...</country>
</address>
</dispatchAddress>
</commentOriginator>
</commentAddressItems>
</commentAddress>
<commentStatus>
```

```
<security securityClassification="01"/>
<commentPriority commentPriorityCode="cp01"/>
<commentResponse responseType="rt01"/>
<commentRefs>
<ddnRefGroup>
<ddnRef>
<ddnRefIdent>
<ddnCode senderIdent="AAAAA" yearOfDataIssue="2016"
modelIdentCode="AA" receiverIdent="AAAAB" seqNumber="00001"/>
</ddnRefIdent>
</ddnRef>
</ddnRefGroup>
</commentRefs>
<brexDmRef>
<dmRef>...</dmRef>
</brexDmRef>
<remarks>...</remarks>
</commentStatus>
</identAndStatusSection>
<commentContent>
<simplePara>...</simplePara>
<attachmentRef attachmentNumber="01" fileExtension="PDF"/>
</commentContent>
</comment>
```

## 1 General

Similar to data modules, the comment form contains two main sections, the identification and status section and the content section. This chapter contains the details regarding the identification and status section.

## 2 Comment form identification and status - markup requirements

**Description:** The element `<identAndStatusSection>` contains the identification elements to address and control the comment form. It also provides status elements for information on the security, quality and technical status together with the applicability of the overall content.

**Markup element:** `<identAndStatusSection>`

ICN-S3627-S1000D0634-001-01

Fig 1 Element `<identAndStatusSection>`

### Attributes:

- None

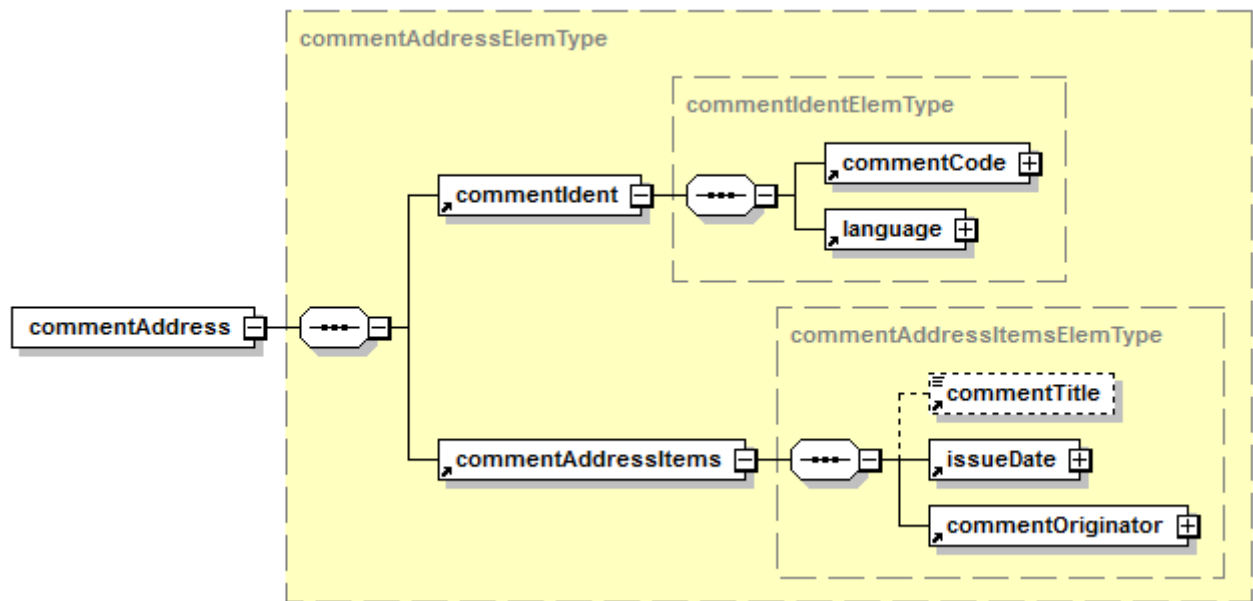

### Child elements:

- `<commentAddress>`. Refer to [Para 2.1](#).
- `<commentStatus>`. Refer to [Para 2.2](#).

### 2.1 Comment address

**Description:** The element `<commentAddress>` consists of two blocks of information items used to address the comment object, the comment identification and the supplementary comment address items.

**Markup element:** `<commentAddress>`

ICN-S3627-S1000D0635-001-01

Fig 2 Element `<commentAddress>`

#### Attributes:

- None

#### Child elements:

- `<commentIdent>`. Refer to [Para 2.1.1](#).
- `<commentAddressItems>`. Refer to [Para 2.1.2](#).

### 2.1.1 Comment identification

**Description:** The element `<commentIdent>` contains the unique identity of a comment object.

**Markup element:** `<commentIdent>`

#### Attributes:

- None

#### Child elements:

- `<commentCode>`. Refer to [Para 2.1.1.1](#).
- `<language>`. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```

<commentIdent>
<commentCode senderIdent="AAAAA" yearOfDataIssue="2012"
modelIdentCode="AA" commentType="q" seqNumber="00001"/>
<language countryIsoCode="AA" languageIsoCode="aa"/>
</commentIdent>

```

#### 2.1.1.1 Comment code

**Description:** The element `<commentCode>` contains the comment code. Together with the issue information, it gives an identification that is unique within the S1000D domain.

The comment code is comprised of up to 29 alphanumeric characters and is built up as shown in [Table 2](#). The minimum length is 17 characters.

YY - YYYYY - XXXX - NNNNN - A (17 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - XXXX - NNNNN - A (29 characters)

Table 2 Comment code

Breakdown	Rule
Model identification code	2 thru 14 uppercase alphanumeric characters
Issuing authority	5 uppercase alphanumeric characters
Issue year	4 numeric characters
Sequential number per year	5 numeric characters
Type of comment	1 alpha character - Q, I or R

**Markup element:** `<commentCode>`

**Attributes:**

- `modelIdentCode` (M). Refer to [Table 2](#) and Para [2.1.1.1.1](#).
- `senderIdent` (M). Refer to [Table 2](#) and Para [2.1.1.1.2](#).
- `yearOfDataIssue` (M). Refer to [Table 2](#) and Para [2.1.1.1.3](#).
- `seqNumber` (M). Refer to [Table 2](#) and Para [2.1.1.1.4](#).
- `commentType` (M). Refer to [Table 2](#) and Para [2.1.1.1.5](#).

**Child elements:**

- None

**Markup example:**

The following example shows the markup corresponding to the final response, AA-AAAA-2012-00001-R, to a comment that was raised previously.

```
<commentCode senderIdent="AAAA" yearOfDataIssue="2012"
modelIdentCode="AA" commentType="r" seqNumber="00001"/>
```

#### 2.1.1.1.1 Model identification code

**Description:** The model identification code is given in the comment code by the highlighted characters as follows:

- YY - YYYYY - XXXX - NNNNN - A (17 characters)
- thru
- YYYYYYYYYYYYYYY - YYYYY - XXXX - NNNNN - A (29 characters)

The model identification code is contained in the attribute `modelIdentCode`. Refer to [Chap 4.3.1](#).

#### 2.1.1.1.2 Issuing authority of the comment

**Description:** The CAGE code of the issuing authority of the comment is given in the comment code by the highlighted characters as follows:

Applicable to: All

S1000D-A-04-06-0100-00A-040A-A

Chap 4.6.1

YY - **YYYYY** - XXXX - NNNNN - A (17 characters)

thru

YYYYYYYYYYYYYYY - **YYYYY** - XXXX - NNNNN - A (29 characters)

The CAGE code of the issuing authority is contained in the attribute `senderIdent`.

#### Note

The CAGE code used in this attribute must be a registered CAGE code.

#### 2.1.1.1.3 Issue year

**Description:** The issue year of the comment is given in the comment code by the highlighted characters as follows:

YY - YYYYY - **XXXX** - NNNNN - A (17 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - **XXXX** - NNNNN - A (29 characters)

The issue year is contained in the attribute `yearOfDataIssue`.

#### 2.1.1.1.4 Sequential number per year

**Description:** The number of the comment per year is identified in the comment code by the highlighted characters as follows:

YY - YYYYY - XXXX - **NNNNN** - A (17 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - XXXX - **NNNNN** - A (29 characters)

The sequential number of the comment per year is contained in the attribute `seqNumber`.

The sequential number per year starts with 00001. Refer to default BREX rule BREX-S1-00010.

#### 2.1.1.1.5 Type of comment

**Description:** The type of comment is given in the comment code by the highlighted character as follows:

YY - YYYYY - XXXX - NNNNN - **A** (17 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - XXXX - NNNNN - **A** (29 characters)

The following types of comment are permitted:

- Q - Query (raised comment), value "q"
- I - Interim response, value "i"
- R - Final response, value "r"

The type of comment is contained in the attribute `commentType`.

#### Note

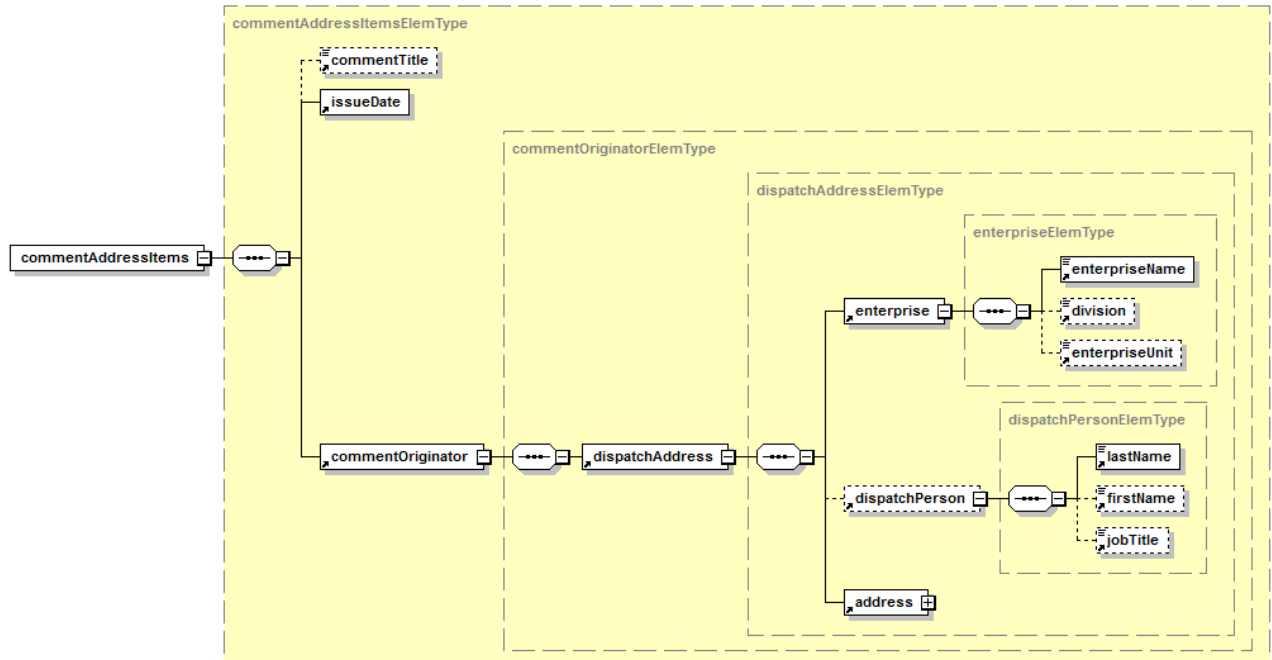

There is a maximum of two responses (interim and final) allowed to a raised comment/query to avoid unlimited chaining up of comments. The comment code of the response is taken from the query and differs only in the attribute `commentType`. This links query and response together. Any reaction to a response must result in generating a new comment/query.

## 2.1.2 Comment address items

**Description:** The element `<commentAddressItems>` contains the complementary address items, supporting identification of a comment object.

**Markup element:** `<commentAddressItems>`

ICN-S3627-S1000D0636-001-01

Fig 3 Element `<commentAddressItems>`

### Attributes:

- None

### Child elements:

- `<commentTitle>`, the title of the comment, given as a simple text string.
- `<issueDate>`, the date when the comment or response was issued. Refer to [Chap 3.9.5.1](#).
- `<commentOriginator>`. Refer to [Para 2.1.2.1](#).

### 2.1.2.1 Originator

**Description:** The element `<commentOriginator>` contains information about the originator of the comment.

**Markup element:** `<commentOriginator>`

### Attributes:

- None

### Child elements:

- `<dispatchAddress>`. Refer to [Para 2.1.2.1.1](#).

#### 2.1.2.1.1 Dispatch address

**Description:** The element `<dispatchAddress>` contains information about the originator of the comment such as the enterprise name, point of contact and the address from where the comment/response is sent.

**Markup element:** `<dispatchAddress>`

**Attributes:**

- None

**Child elements:**

- `<enterprise>`, the name of the sending enterprise. Refer to [Para 2.1.2.1.2](#).
- `<dispatchPerson>`, the name of the sending person. Refer to [Para 2.1.2.1.3](#).
- `<address>` the address of the sending enterprise or person. Refer to [Para 2.1.2.1.4](#).

#### 2.1.2.1.2 Enterprise

**Description:** The element `<enterprise>` contains the name of the enterprise, and when applicable, the body within an enterprise, from where the comment/response is sent.

**Markup element:** `<enterprise>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- `<enterpriseName>`, the name of the sending enterprise, given as a simple text string
- `<division>`, the sending division of the enterprise, given as a simple text string
- `<enterpriseUnit>`, the business unit of the division, given as a simple text string

#### 2.1.2.1.3 Dispatch person

**Description:** The element `<dispatchPerson>` contains information about the dispatch person who is the point of contact at the sending enterprise.

**Markup element:** `<dispatchPerson>`

**Attributes:**

- `personPrefix` (O), the title or prefix added to a person's name to signify veneration, an official position or a professional or academic qualification (eg, colonel, doctor, officer, lady, Mr, Mrs, Ms, Dr)

**Child elements:**

- `<lastName>`, the surname of the dispatch person, given as a simple text string
- `<firstName>`, the first or given name of the dispatch person, given as a simple text string
- `<jobTitle>`, the job title or position held by the dispatch person, given as a simple text string

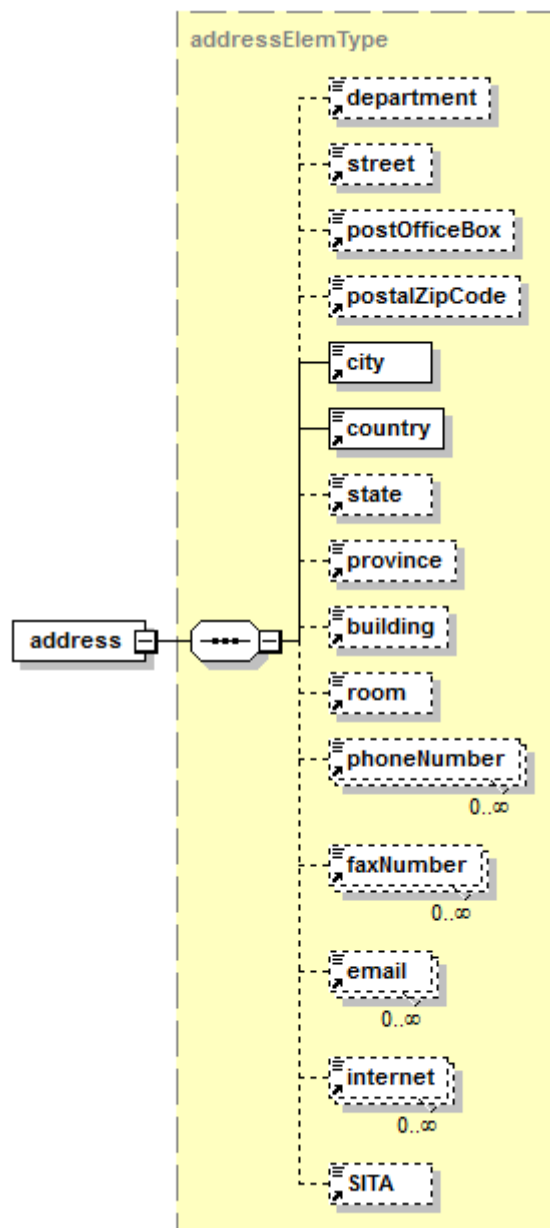

### Markup example:

```
<dispatchPerson>
<lastName>Smiley</lastName>
<firstName>Jonathon</firstName>
<jobTitle>Morale Booster</jobTitle>
</dispatchPerson>
```

#### 2.1.2.1.4 Address

**Description:** The element `<address>` contains the postal address from where the comment/response is sent.

**Markup element:** `<address>`

ICN-S3627-S1000D0637-001-01

Fig 4 Element `<address>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), and caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <department>, the functional or territorial department of the comment/response originator, given as a simple text string
- <street>, the physical location (eg, road or street name/number, or similar), given as a simple text string
- <postOfficeBox>, the post office box, given as a simple text string
- <postalZipCode>, the postal zip code, given as a simple text string
- <city>, the city or town name, given as a simple text string
- <country>, the name of the country, given as a simple text string
- <state>, the name of the state, given as a simple text string
- <province>, the name of the province, given as a simple text string
- <building>, the building number or name, given as a simple text string
- <room>, the room identification, given as a simple text string
- <phoneNumber>, the phone number, given as a simple text string. Optionally this element contains the attribute contactRole giving the professional role of the point of contact.
- <faxNumber>, the fax number, given as a simple text string. Optionally this element contains the attribute contactRole giving the professional role of the point of contact.
- <email>, the email address, given as a simple text string. Optionally this element contains the attribute contactRole giving the professional role of the point of contact.
- <internet>, the internet address (website address) of the comment/response originator, given as a simple text string. Optionally this element contains the attribute contactRole giving the professional role of the point of contact.
- <SITA>, the SITA address of the enterprise

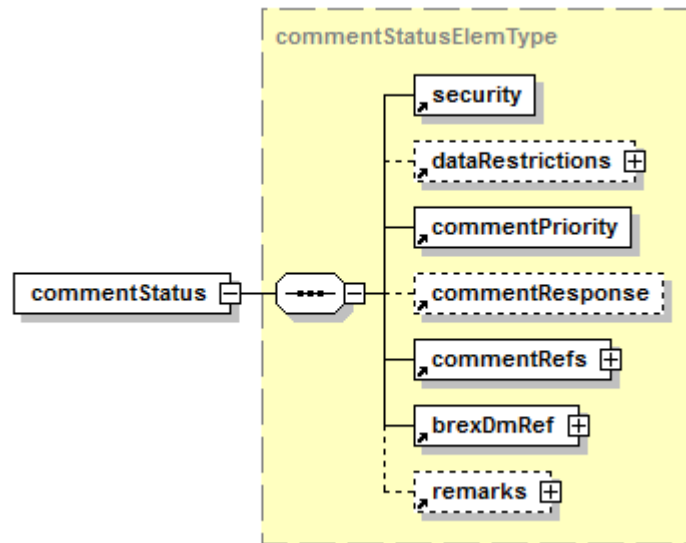

#### Markup example:

```
<address>
<street>Heaven street</street>
<postalZipCode>99999</postalZipCode><city>Saint Vitus</city>
<country>UTOPIA</country>
<phoneNumber>111 222 333 444</phoneNumber>
<faxNumber>111 222 333 445</faxNumber>
<email>customers_services@utopia.com</email>
<email>info@utopia.com</email>
<internet>www.utopia.customers.services.online.com</internet>
<internet>www.utopia.online.com</internet>
</address>
```

## 2.2 Comment status

**Description:** The element <commentStatus> contains the status information for the comment form.

Markup element: `<commentStatus>`

ICN-S3627-S1000D0638-002-01

Fig 5 Element `<commentStatus>`

#### Attributes:

- `issueType` (O). Refer to [Chap 3.9.5.1](#).

#### Child elements:

- `<security>`. Refer to [Chap 3.9.5.1](#).
- `<dataRestrictions>`. Refer to [Chap 3.9.5.1](#).
- `<commentPriority>`. Refer to [Para 2.2.1](#).
- `<commentResponse>`. Refer to [Para 2.2.2](#).
- `<commentRefs>`. Refer to [Para 2.2.3](#).
- `<brexDmRef>`. Refer to [Chap 3.9.5.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

#### Markup example:

```
<commentStatus>
<security securityClassification="01"/>
<commentPriority commentPriorityCode="cp01"/>
<commentRefs>
<noReferences/>
</commentRefs>
<brexDmRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000D" systemDiffCode="E"
systemCode="04" subSystemCode="1" subSubSystemCode="0"
assyCode="0301" disassyCode="00" disassyCodeVariant="A"
infoCode="022" infoCodeVariant="A" itemLocationCode="D"/>
</dmRefIdent>
</dmRef>
```

</brefDmRef>  
</commentStatus>

### 2.2.1 Comment priority

**Description:** The element `<commentPriority>` contains the priority code of the comment.

**Markup element:** `<commentPriority>`

**Attributes:**

- `commentPriorityCode` (M), used to store the priority of the comment in coded form. The attribute can have one of the following values:
  - "cp01" thru "cp99". Refer to [Chap 3.9.6.1](#)

**Child elements:**

- None

### 2.2.2 Comment response

**Description:** The element `<commentResponse>` contains the type code of response to the comment.

**Markup element:** `<commentResponse>`

**Attributes:**

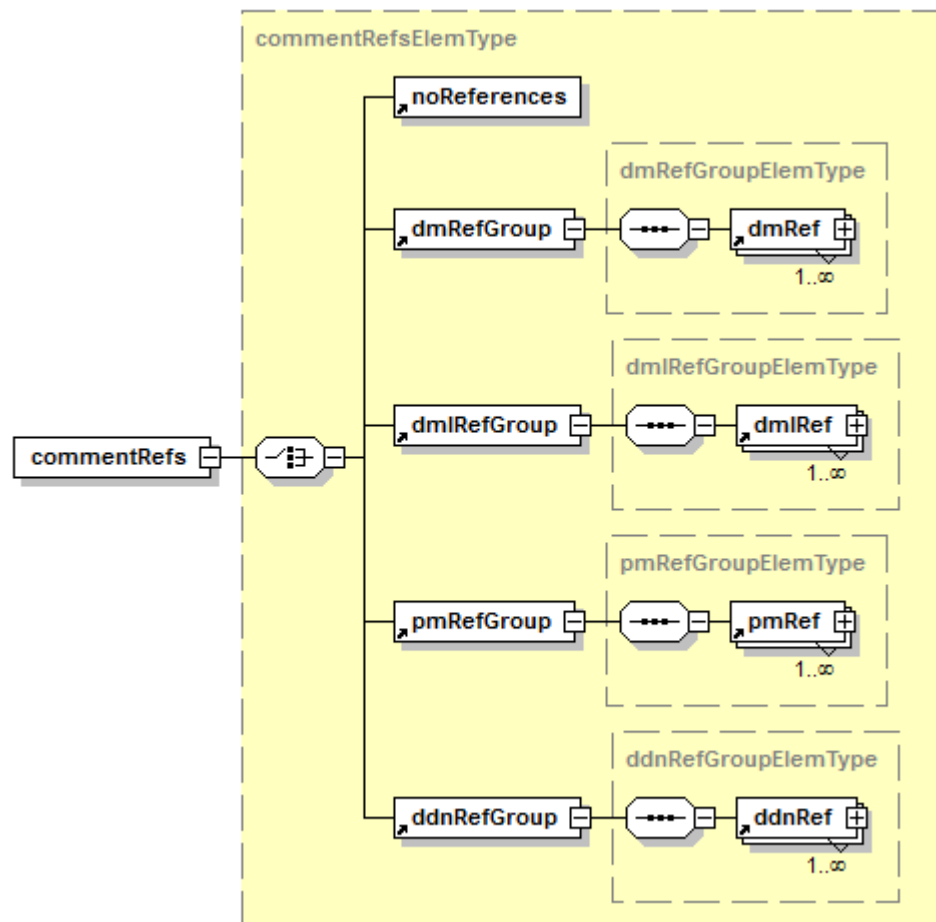

- `responseType` (M), used to store the type of response in coded form. The attribute can have one of the following values:
  - "rt01" thru "rt99". Refer to [Chap 3.9.6.1](#).

**Child elements:**

- None

### 2.2.3 Comment references

**Description:** The element `<commentRefs>` contains the reference to the information the comment is referring to. References are allowed to publication modules (including the entire publication set via list of applicable publications), data modules, data management lists or data dispatch notes. For each comment raised, there must be at least one reference. Comments to the comments are not permitted (use the element `<noReferences>` when a response to a comment is submitted).

ICN-SYU52-AASER00022-001-01

Fig 6 Element `<commentRefs>`

**Note**

For a comment related to a data or publication module instance identified by the use of the data or publication module code extension, the reference must include the element `<identExtension>` contained in element `<dmRef>` or `<pmRef>` within this block of references. Refer to default BREX rule BREX-S1-00011.

**Markup element:** `<commentRefs>`

**Attributes:**

- None

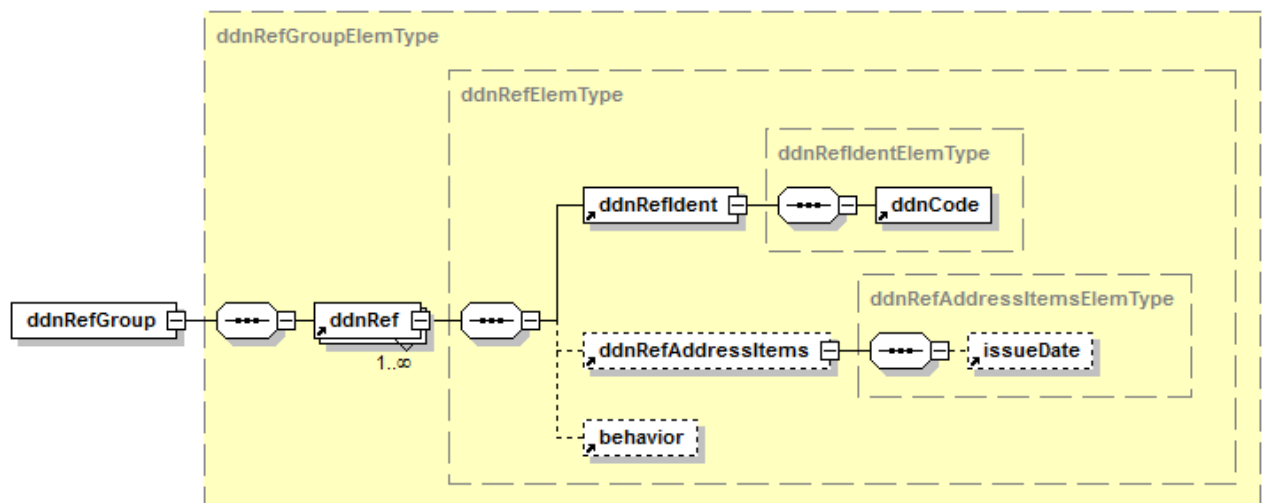

**Child elements:**

One of the following must be selected:

- `<noReferences>`, used to indicate that there are no references
- `<dmRefGroup>`, the references to data modules. Refer to [Para 2.2.3.1](#).
- `<dmlRefGroup>`, the references to data management lists. Refer to [Para 2.2.3.2](#).
- `<pmRefGroup>`, the references to publication modules. Refer to [Para 2.2.3.3](#).
- `<ddnRefGroup>`, the references to data dispatch notes. Refer to [Para 2.2.3.4](#).

- 2.2.3.1 Data module reference group  
**Description:** The element `<dmRefGroup>` contains one or several references to data modules to which the comment relates.  
**Markup element:** `<dmRefGroup>`  
**Attributes:**  
– None  
**Child elements:**  
– `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).  
**Markup example:**  
– Refer to [Chap 4.6](#).
- 2.2.3.2 Data management list reference group  
**Description:** The element `<dmlRefGroup>` contains one or several references to data management lists to which the comment relates.  
**Markup element:** `<dmlRefGroup>`  
**Attributes:**  
– None  
**Child elements:**  
– `<dmlRef>`. Refer to [Chap 4.5](#).  
**Markup example:**  
– Refer to [Chap 4.6](#).
- 2.2.3.3 Publication module reference group  
**Description:** The element `<pmRefGroup>` contains one or several references to publication modules to which the comment relates.  
**Markup element:** `<pmRefGroup>`  
**Attributes:**  
– None  
**Child elements:**  
– `<pmRef>`. Refer to [Chap 3.9.5.2.1.2](#).  
**Markup example:**  
– Refer to [Chap 4.6](#).
- 2.2.3.4 Data dispatch note reference group  
**Description:** The element `<ddnRefGroup>` contains one or several references to data dispatch notes to which the comment relates.  
**Markup element:** `<ddnRefGroup>`

ICN-S3627-S1000D0639-002-01

Fig 7 Element &lt;ddnRefGroup&gt;

#### Attributes:

- None

#### Child elements:

- <ddnRef>. Refer to [Para 2.2.3.4.1](#).

#### Markup example:

```
<ddnRefGroup>
<ddnRef>
<ddnRefIdent>
<ddnCode senderIdent="AAAAA" yearOfDataIssue="2016"
modelIdentCode="AA" receiverIdent="AAAAB" seqNumber="00001"/>
</ddnRefIdent>
</ddnRef>
</ddnRefGroup>
```

#### 2.2.3.4.1 Data dispatch note reference

**Description:** The element <ddnRef> contains a reference to a data dispatch note to which the comment relates.

#### Markup element: <ddnRef>

#### Attributes:

- The element also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#).

#### Child elements:

- <ddnRefIdent>. Refer to [Para 2.2.3.4.2](#).
- <ddnRefAddressItems>. Refer to [Para 2.2.3.4.4](#).
- <behavior>. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

- Refer to [Chap 4.6](#).

#### 2.2.3.4.2 Data dispatch note reference identity

**Description:** The element `<ddnRefIdent>` contains the unique identity of a referred data dispatch note.

**Markup element:** `<ddnRefIdent>`

**Attributes:**

- None

**Child elements:**

- `<ddnCode>`. Refer to [Para 2.2.3.4.3](#).

**Markup example:**

- Refer to [Chap 4.6](#).

#### 2.2.3.4.3 Data dispatch note identification code

**Description:** This element `<ddnCode>` contains the code identifying the referred data dispatch note.

**Markup element:** `<ddnCode>`

**Attributes:**

- `modelIdentCode` (M). Refer to [Chap 3.9.5.1](#).
- `senderIdent` (M), the CAGE code of the sender of the comment
- `receiverIdent` (M), the CAGE code of the receiver of the comment
- `yearOfDataIssue` (M), the year (YYYY) when the issue was raised
- `seqNumber` (M), the sequence number of the comment, related to `senderIdent` and `yearOfDataIssue`

**Child elements:**

- None

**Markup example:**

- Refer to [Chap 4.6](#).

#### 2.2.3.4.4 Supplementary addressing information pertinent to a dispatch note

**Description:** The element `<ddnRefAddressItems>` contains a references to a data dispatch note to which the comment relates.

**Markup element:** `<ddnRefAddressItems>`

**Attributes:**

- None

**Child elements:**

- `<issueDate>`. Refer to [Chap 3.9.5.1](#).

**Markup example:**

- Refer to [Chap 4.6](#)

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.2.1.10</a>	Common constructs - Text elements
<a href="#">Chap 7.7.4</a>	Guidance and examples - XLink

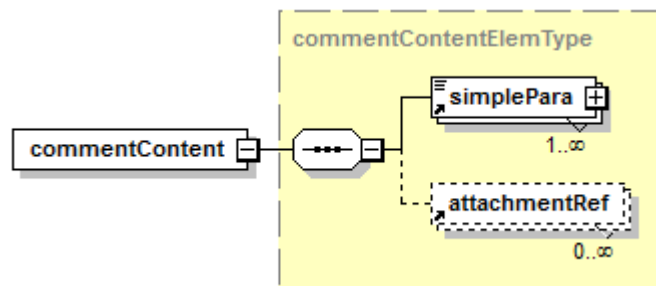

## 1 General

Similar to data modules the comment form contains two main sections, the identification and status section and the content section. This chapter contains the details regarding the content section.

## 2 Comment form content section - markup requirements

**Description:** The element <commentContent> contains the comment and/or the response to a comment and references to attachments.

**Markup element:** <commentContent>

ICN-S3627-S1000D0640-001-01

Fig 1 Element `<commentContent>`

#### Attributes:

- None

#### Child elements:

- `<simplePara>`. Refer to [Para 2.1](#).
- `<attachmentRef>`. Refer to [Para 2.2](#).

## 2.1 Simple paragraph

This element contains the description of the comment/response. This description must be in paragraph form. A reference to an attachment only is not sufficient. Refer to [Chap 3.9.5.2.1.10](#).

## 2.2 Reference to an attachment

**Description:** The element `<attachmentRef>` contains the file name of the attachment.

The full file name consists of the prefix "COM", the comment code (ie, the attributes of the element `<commentCode>`) and the attachment number, all items separated by dashes. The file name ends with a separation character (usually ".") and the file type extension (eg, PDF, ZIP, XLS).

COM-YY-YYYYY-XXXX-NNNNN-A-MM.EXT

or

COM-YYYYYYYYYYYYYYY-YYYYY-XXXX-NNNNN-A-MM.EXT

Where:

- "MM" is the attachment number starting with "01"
- "EXT" is the file type extension

#### Note

The allowed file types must be defined by the project or the organization and must be supported by the viewing systems.

**Markup element:** `<attachmentRef>`

#### Attributes:

- `attachmentNumber` (M), a two digit sequential attachment number
- `fileExtension` (M), the file type extension

#### Note

The element also includes five attributes normally populated by the authoring application to make use of the W3C XLink mechanism. Refer to [Chap 7.7.4](#)

---

**Child elements:**

- None

**Business rule decision point BRDP-S1-00359 - Allowed file types for attachments to comment forms:**

- Decide which file types are allowed for attachments to comment forms.

**Markup example:**

```
<attachmentRef attachmentNumber="01" fileExtension="PDF"/>
```

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section

### 1 General

Updating of data modules, publication modules and SCORM content package modules are driven by changes to the Product or due to the technical publication process. This chapter gives the rules for the version control of data modules, publication modules and SCORM content package modules.

### 2 Version control

#### 2.1 Issue and inwork number

The issue information is used to record and control the issue information of data modules, publication modules and SCORM content package modules. Any published update of a these, cause the issue date to change and the issue number to increase. A consecutive three digit sequential number indicates every issue of a data module, publication module or a SCORM content package module.

#### 2.2 Change of a data module, publication module or a SCORM content package module

Any published update of a data module, publication module or a SCORM content package module is identified with the type of update. The type of update is captured by using the attribute `issueType` of the element `<dmStatus>`. There are eight values for the attribute `issueType`. Refer to [Chap 3.9.5.1](#).

## 1 General

This chapter details the requirements and provides background for implementation of data interchange. The means for data interchange described herein are not limited to the interchange of data modules. They can also be used for technical information interchange in general.

To achieve an orderly and systematic digital interchange of data modules and other related CSDB information, it is necessary to work within a set of formal data interchange standards and procedures.

While certain conditions are presumed valid at the time of writing, technology is moving forward so that the interchange procedures detailed in this chapter have to be taken only as a basis.

Actual implementation must be defined on the agreed optimum means available to a project during its lifecycle. The security regulations must conform to the applicable project or organization security instructions.

## 2 Data interchange

### 2.1 Interchange data format

The basic interchange unit defined in this chapter is a data module. For all types of data modules the references to illustrations, multimedia and other associated data are given within the data module text.

In order to allow cross references from data module text to documents stored in Adobe PDF, the data format PDF is used. Both multimedia and PDF files are treated like an illustration when referenced, stored and interchanged.

#### 2.1.1 Data module text

The logical structure of an S1000D data module is defined in the XML Schema in accordance with the corresponding W3C recommendations. The S1000D XML Schema for data modules are described in [Chap 7.3.1](#). The Schema defines the structure of the content of a data module, not the actual presentation or output.

#### 2.1.2 Data module illustrations, multimedia and other associated data

The illustrations referenced within a data module are normally line drawings in vector and/or raster form. If agreed by the project, photographs (half tones) can also be used provided they meet all requirements to show clear details.

##### Business rule decision point BRDP-S1-00545 - File formats for information objects:

- Decide which file formats to use.

##### 2.1.2.1 CGM graphics

The basic data standard for 2-dimensional graphics is the CGM standard as defined in International Standards Organization ISO/IEC 8632. A dedicated S1000D CGM profile is given in [Chap 7.3.2](#), which defines a subset of the WebCGM profile.

WebCGM is a full CGM V4 profile based on the proforma and model profile of ISO/IEC 8632:1999-1 (second edition: 1999-12-15), "Functional specification". It has the additional value that there is an associated product certification testing service.

##### Note

CGM provides a raster graphics capability, which enables the integration of other raster encoding such as Comité Consultatif Internationale de Télégraphique et Téléphonique-4 (CCITT-4), Portable Network Graphics (PNG) and Joint Photographic Experts Group (JPEG) embedded in metafiles. Therefore, the CGM standard can be used for all types of illustrations.

##### 2.1.2.2 Raster graphics

The data standard for binary (ie, monochrome) raster graphics is either:

- Continuous Acquisition and Life-cycle Support (CALS) raster CCITT Gr 4 as defined in MIL-PRF-28002, but limited here to data subtype "Type 1 - untiled". The preferred resolution is 300 dpi. Other resolutions can be decided by project regulations.
- Tagged Image File Format (TIFF) based on the definition given in [Chap 7.3.2](#) of this specification.

##### Note

Colored raster graphics in TIFF format as defined in the Adobe TIFF 6.0 specification using the loss-less Lempel-Ziv-Welch (LZW) compression method is also permitted in S1000D.

**Business rule decision point BRDP-S1-00360 - Raster graphic resolution:**

- Decide which resolution to use for raster graphics.

## 2.1.2.3

**Photographs and artwork**

The data standard for color and grey scale photographic images and artwork is:

- JPEG as defined in ISO/IEC 10918
- GIF as defined in CompuServe GIF 89a
- PNG as defined in REC-PNG-20031110

The preferred resolution is 300 dpi

**Business rule decision point BRDP-S1-00361 - Use of photographs:**

- Decide whether photographs will be used. If used, for what purposes.

## 2.1.2.4

**Multimedia**

The multimedia within a data module can be of any type defined in the project's business rules. Guidance on the use of multimedia is given in [Chap 7.3.3](#), and authoring rules are given in [Chap 3.9.2](#).

## 2.1.2.5

**ICN metadata files**

If agreed in a project, illustrations and multimedia objects can be accompanied by separate ICN metadata files (IMF), ie, objects containing metadata pertinent to a graphics or multimedia object. Refer to [Chap 3.9.2.7](#) for details about the IMF object.

**2.2****Interchange (transfer) package structure**

An S1000D CSDB interchange (transfer) package consists of one data dispatch note as given in [Chap 7.5](#) and at least one of the following data categories:

- one or more data modules, illustrations, multimedia, ICN metadata files and other data
- one or more data management lists
- one or more comment forms and associated attachments
- one or more Publication or SCORM content package modules
- one or more Data update files

There is an associated Schema for each of these data categories, except for the categories CSDB status list and data module requirements list. Both of these lists are handled with the single data module list Schema. The Schemas are described in [Chap 7](#) together with examples.

**Note**

Electronic copies of the Schemas are available for downloading from the S1000D web site at [www.s1000d.org](http://www.s1000d.org).

**2.3****File based transfer**

The file based transfer method and the file name conventions are given in [Chap 7.5.1](#).

<a href="#">Chap 4.9.3</a>	Publication management - Building publications
<a href="#">Chap 4.9.4</a>	Publication management - Updating publications

#### 1      **General**

In order to define, prepare and manage publications generated of data modules, S1000D uses the publication module.

#### 2      **Content**

The publication module is built similar to data modules with an identifier, a status section and a content section. The content section contains the references to data modules, legacy technical publications or other publication modules in the order and the structure the publication is delivered.

[Chap 4.9.1](#) gives the structure of the publication module and [Chap 4.9.2](#) defines the publication module code. The building of publications is explained in [Chap 4.9.3](#) and the updating of publications is described in [Chap 4.9.4](#).

## 1 General

The publication module defines the content and the structure of a publication. It is to contain one or more references to:

- data modules (including front matter data modules and access illustration data modules)
- publication modules
- legacy technical publications

The publication module Schema is defined in [Chap 7.4.2](#).

ICN-AE-A-040901-0-C0419-00011-A-01-1

Fig 1 Publication module concept

## 2 Content of the publication module

**Description:** The element `<pm>` defines the content and structure of a publication.

**Markup element:** `<pm>`

ICN-1654N-S1000D0009-001-01

Fig 2 Element `<pm>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `pmType` (O), the type of publication. The attribute can have one of the following values:
  - `"pt01"` thru `"pt99"`. Refer to [Chap 3.9.6.1](#).

### Child elements:

- `<rdf:Description>`. Refer to [Chap 7.4.1.1.2](#).
- `<identAndStatusSection>`. Refer to [Para 2.1](#).
- `<content>`. Refer to [Para 2.2](#).

### 2.1 Identification and status section

**Description:** The element `<identAndStatusSection>` contains the identification and status of the publication module.

**Markup element:** `<identAndStatusSection>`

ICN-1654N-S1000D0010-001-01

Fig 3 Element `<identAndStatusSection>`

### Attributes:

- None

### Child elements:

- `<pmAddress>`. Refer to [Para 2.1.1](#).
- `<pmStatus>`. Refer to [Para 2.1.2](#).

#### 2.1.1 Publication module address

**Description:** The element `<pmAddress>` contains the publication module address information.

Markup element: `<pmAddress>`

ICN-1654N-S1000D0011-001-01

Fig 4 Element `<pmAddress>`

Attributes:

- None

Child elements:

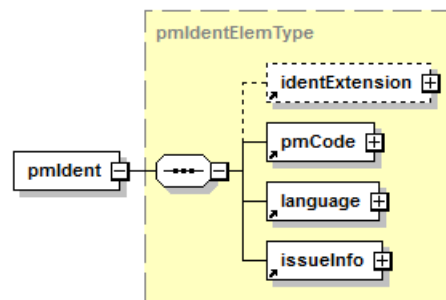

- `<pmIdent>`. Refer to [Para 2.1.1.1](#).
- `<pmAddressItems>`. Refer to [Para 2.1.1.2](#).

#### 2.1.1.1

Publication module identification

**Description:** The element `<pmIdent>` contains the publication module identification information.

Markup element: `<pmIdent>`

ICN-1654N-S1000D0012-001-01

Fig 5 Element `<pmIdent>`

Attributes:

- None

Child elements:

- `<identExtension>`. Refer to [Chap 4.12](#).
- `<pmCode>`. Refer to [Chap 4.9.2](#).
- `<language>`. Refer to [Chap 3.9.5.1](#).
- `<issueInfo>`. Refer to [Chap 3.9.5.1](#).

Markup example:

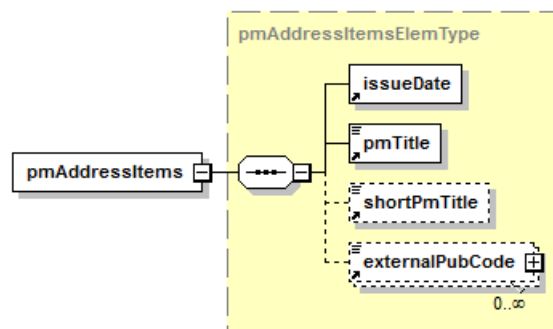

```
<pmIdent>
  <pmCode modelIdentCode="S1000D" pmIssuer="I9005"
    pmNumber="01000" pmVolume="00"/>
  <language languageIsoCode="sx" countryIsoCode="US"/>
```

```
<issueInfo issueNumber="001" inWork="00"/>
</pmIdent>
```

#### 2.1.1.2 Publication module address items

**Description:** The element `<pmAddressItems>` contains additional information about a publication module.

**Markup element:** `<pmAddressItems>`

ICN-1654N-S1000D0013-001-01

Fig 6 Element `<pmAddressItems>`

#### Attributes:

- None

#### Child elements:

- `<issueDate>`. Refer to [Chap 3.9.5.1](#).
- `<pmTitle>`. Refer to [Para 2.1.1.2.1](#).
- `<shortPmTitle>`. Refer to [Para 2.1.1.2.2](#).
- `<externalPubCode>`. Refer to [Chap 3.9.5.2.1.2](#).

#### Markup example:

```
<pmAddressItems>
<issueDate day="01" month="08" year="2008"/>
<pmTitle>International specification for technical publications
utilizing a common source database</pmTitle>
<externalPubCode pubCodingScheme="XFILEID">S9XXX-X4-ZZZ-
010</externalPubCode>
</pmAddressItems>
```

#### 2.1.1.2.1 Publication module title

**Description:** The element `<pmTitle>` gives the meaning of the publication and is defined by the project.

**Markup element:** `<pmTitle>`

#### Attributes:

- None

#### Child elements:

- None

**Markup example:**

```
<pmTitle>International specification for technical publications  
using a common source database</pmTitle>
```

**2.1.1.2.2**    *Short publication module title*

**Description:** The element `<shortPmTitle>` contains the short title of the publication or an extension to the publication title like "- Volume No. 2" defined by the project.

**Markup element:** `<shortPmTitle>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

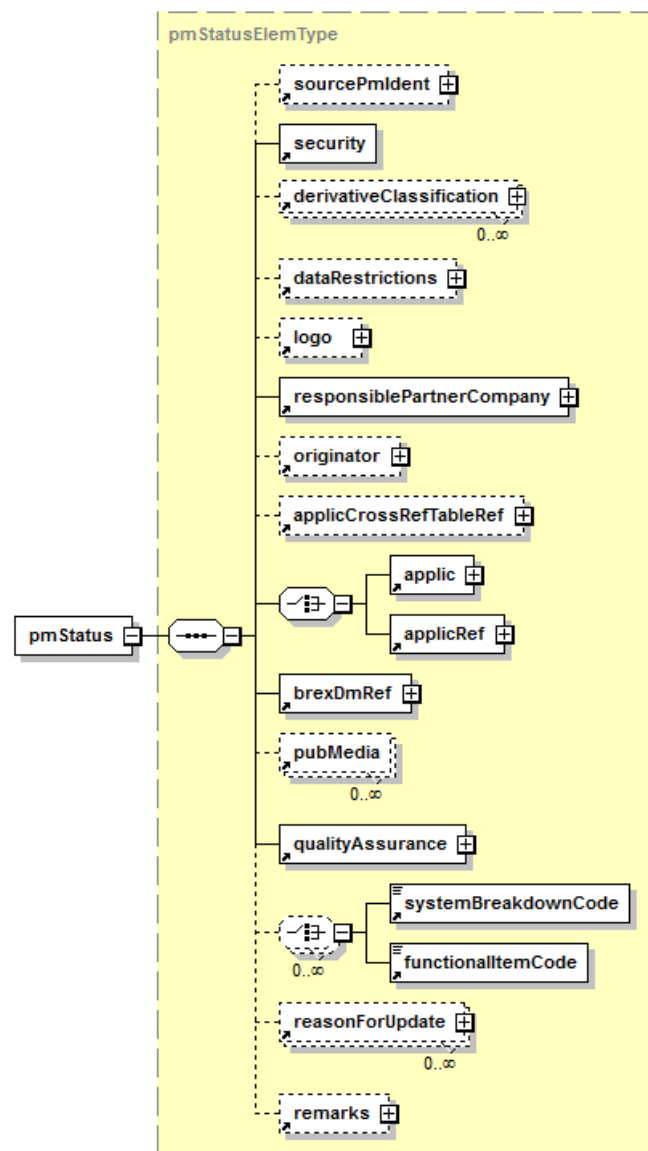

```
<shortPmTitle>S1000D</shortPmTitle>
```

**2.1.2**    **Publication module status information**

**Description:** The element `<pmStatus>` contains the publication module status information.

**Markup element:** `<pmStatus>`

ICN-1654N-S1000D0014-002-01

Fig 7 Element &lt;pmStatus&gt;

#### Attributes:

- <functionalItemCode>. Refer to [Chap 3.9.5.1](#).
- <reasonForUpdate>. Refer to [Para 2.1.2.11](#).
- <remarks>. Refer to [Para 2.1.2.12](#).

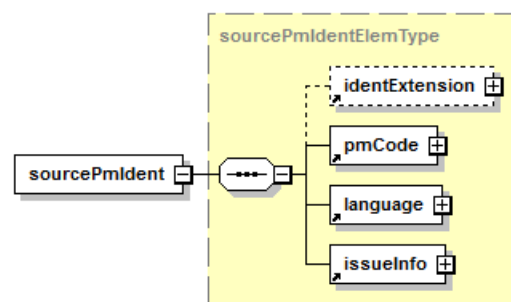

#### Markup example:

```
<pmStatus>
<security securityClassification="01"/>
<responsiblePartnerCompany enterpriseCode="B6865">
<enterpriseName>ASD</enterpriseName>
</responsiblePartnerCompany>
<applic>
<displayText>
<simplePara>ALL</simplePara>
</displayText>
</applic>
<brexDmRef>...</brexDmRef>
<qualityAssurance>
<unverified/>
</qualityAssurance>
</pmStatus>
```

#### 2.1.2.1 Source publication module identification

**Description:** The element <sourcePmIdent> contains the source publication module identification information such as publication module code, language and issue information.

**Markup element:** <sourcePmIdent>

ICN-1654N-S1000D0015-001-01

Fig 8 Element <sourcePmIdent>

#### Attributes:

- None

#### Child elements:

- <identExtension>. Refer to [Chap 4.12](#).
- <pmCode>. Refer to [Chap 4.9.2](#).
- <language>. Refer to [Chap 3.9.5.1](#).
- <issueInfo>. Refer to [Chap 3.9.5.1](#).

**Markup example:**

```
<sourcePmIdent>
<pmCode modelIdentCode="S1000D" pmIssuer="I9005"
pmNumber="01000" pmVolume="00"/>
<language countryIsoCode="US" languageIsoCode="sx"/>
<issueInfo issueNumber="005" inWork="00"/>
</sourcePmIdent>
```

## 2.1.2.2 Security classification

**Description:** The element [<security>](#) contains the security classification and restrictive marking of the complete publication module and its contained or associated illustrations.

**Markup element:** [<security>](#). Refer to [Chap 3.9.5.1](#).

## 2.1.2.3 Derivative classification

**Description:** The element [<derivativeClassification>](#) contains all derivative classification actions taken (eg, source material, date of action, action type) to the information in the complete publication module.

**Markup element:** [<derivativeClassification>](#). Refer to [Chap 3.9.5.1](#).

## 2.1.2.4 Data restrictions

**Description:** The element [<dataRestrictions>](#) contains the instructions and information, applicable to the publication module, that relate to the use, storage and handling.

**Markup element:** [<dataRestrictions>](#). Refer to [Chap 3.9.5.1](#).

## 2.1.2.5 Logotype

**Description:** The element [<logo>](#) contains the reference to the manufacturer's, project's or sponsor's logotype.

**Note**

The element [<logo>](#) can be used in front matter data modules. Refer to [Chap 3.9.5.2.16](#).

**Markup element:** [<logo>](#)

**Attributes:**

- None

**Child elements:**

- [<symbol>](#). Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<logo>
<symbol infoEntityIdent="ICN-S3627-S1000D0494-001-01"/>
</logo>
```

## 2.1.2.6 Responsible partner company

**Description:** The element [<responsiblePartnerCompany>](#) contains the company, organization or authority responsible for the publication module.

**Markup element:** [<responsiblePartnerCompany>](#). Refer to [Chap 3.9.5.1](#).

- 2.1.2.7      Originator  
**Description:** The element `<originator>` contains the originating company or organization responsible for the production of the publication module.  
**Markup element:** `<originator>`. Refer to [Chap 3.9.5.1](#).
- 2.1.2.8      Applicability cross-reference table reference  
**Description:** The element `<applicCrossRefTableRef>` contains a reference to the Applicability Cross-reference Table (ACT) data module that applies to the publication module. Applicability and the ACT data module and related aspects are described in [Chap 3.9.5.3.1](#), [Chap 4.14](#), and [Chap 7.8](#).  
**Markup element:** `<applicCrossRefTableRef>`. Refer to [Chap 3.9.5.3.1](#).
- 2.1.2.9      Publication media  
**Description:** The element `<pubMedia>` contains the information about the media on which the publication is delivered.  
**Markup element:** `<pubMedia>`  
**Attributes:**
  - `pubMediaType` (M), the media type on which the publication module is delivered (eg, paper, CD-ROM, DVD, online)
  - `pubMediaCode` (M), the media identification (label)
  - `volumeNumber` (O), the identifier of the volume of the media, defined by two numeric characters. It is used when the information needs to be separated into several volumes due to media restrictions. It is not related to the attribute `pmVolume` within the publication module code.
  - `mediaLocation` (O), the location of the media**Child elements:**
  - None**Markup example:**

```
<pubMedia pubMediaCode="DVD01" pubMediaType="DVD" />
```
- 2.1.2.10      Quality assurance status  
**Description:** The element `<qualityAssurance>` contains details of the status of the quality assurance process as required by the project. The publication module must be identified as either being unverified or verified. The element `<qualityAssurance>` can contain applicability information to indicate the applicability of the quality assurance information. This applicability information must be a subset of the mandatory applicability settings for the complete publication module. This applies equally to the element `<qualityAssurance>` and all its child elements.  
**Markup element:** `<qualityAssurance>`. Refer to [Chap 3.9.5.1](#).
- 2.1.2.11      Reason for update  
**Description:** The element `<reasonForUpdate>` contains a short explanation of the reason for updating the publication module.  
**Markup element:** `<reasonForUpdate>`. Refer to [Chap 3.9.5.2.1.1](#).

### 2.1.2.12 Remarks

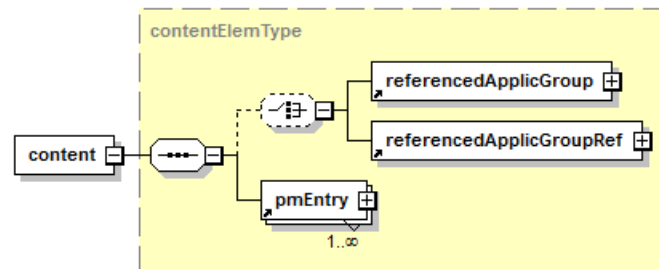

**Description:** The element `<remarks>` is used for inserting general remarks if required by the project. Compliance category of service bulletins are to be given under this heading.

**Markup element:** `<remarks>`. Refer to [Chap 3.9.5.1](#).

## 2.2 Publication module content section

**Description:** The element `<content>` contains the content section of the publication module.

**Markup element:** `<content>`

ICN-1654N-S1000D0016-001-01

Fig 9 Element `<content>`

#### Attributes:

- None

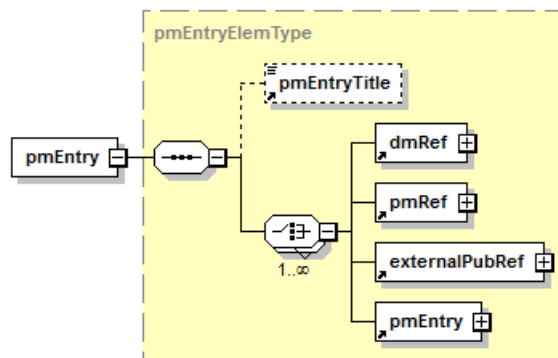

#### Child elements:

- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<pmEntry>`. Refer to [Para 2.2.1](#).

### 2.2.1 Publication module entry

**Description:** The element `<pmEntry>` contains references to one or more data modules, publications, non-S1000D publications or publication module entries. The publication module entry is central for a publication module and can be defined recursively. This allows publication module structures in variable depth.

**Markup element:** `<pmEntry>`

ICN-1654N-S1000D0017-001-01

Fig 10 Element `<pmEntry>`

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- pmEntryType (O), the publication module entry type. The attribute can have one of the following values:
  - "pmt01" thru "pmt99". Refer to [Chap 3.9.6.1](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <pmEntryTitle>. Refer to [Para 2.2.2](#).
- <dmRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <pmRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <externalPubRef>. Refer to [Chap 3.9.5.2.1.2](#).
- <pmEntry>. Refer to [Para 2.2.1](#).

## 2.2.2

### Title of the publication module entry

**Description:** The element <pmEntryTitle> contains the title of the publication entry for one or more data modules, publications, non-S1000D publications or publication module entries. The title can be used to populate the element <title> in the element <tocEntry> in the hierarchical structured table of contents. Refer to [Chap 3.9.5.2.16](#).

**Markup element:** <pmEntryTitle>

#### Attributes:

- None

#### Child elements:

- None

#### Markup example:

```
<pmEntryTitle>Introduction</pmEntryTitle>
```

Chap No./Document No.	Title
<a href="#">Chap 4.3.1</a>	Data module code - Model identification code
<a href="#">Chap 7.5.1</a>	Information interchange - File based transfer

## 1 General

The publication module code is the standardized and structured identifiers of a publication module or a final deliverable publication product. It is an element of the status section of the publication module package.

The publication module code is part of the unique identifier of the publication module. The publication module code is used to manage publication modules in the CSDB, to retrieve them or to gain access to them in an IETP environment, as an entry in the list of applicable publications and as a reference in data modules and publications.

## 2 Content

### 2.1 Publication module code

**Description:** The element [<pmCode>](#) contains the publication module code. Together with the issue information, it gives an identification that is unique within the S1000D domain.

The publication module code is part of the unique identifier of the publication module and is comprised of up to 26 alphanumeric characters and is built up as shown in [Table 2](#). The minimum length is 14 characters.

YY - YYYYY - YYYYY - NN (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - YYYYY - NN (26 characters)

Table 2 Publication module code

Breakdown	Rule
Model identification code	2 thru 14 uppercase alphanumeric characters
Issuing authority	5 uppercase alphanumeric characters
Number of the publication	5 uppercase alphanumeric characters
Volume number	2 numeric characters

**Markup elements:** `<pmCode>`

**Attributes:**

- `modelIdentCode` (M). Refer to [Para 2.1.1](#).
- `pmIssuer` (M). Refer to [Para 2.1.2](#).
- `pmNumber` (M). Refer to [Para 2.1.3](#).
- `pmVolume` (M). Refer to [Para 2.1.4](#).

**Child elements:**

- None

### 2.1.1 Model identification code

**Description:** The model identification code is given in the publication module code by the highlighted characters as follows:

YY - YYYYY - YYYYY - NN (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - YYYYY - NN (26 characters)

The model identification code is contained in the attribute `modelIdentCode`. Refer to [Chap 4.3.1](#).

### 2.1.2 Issuing authority

**Description:** The CAGE code of the publication module issuing authority is given in the publication module code by the highlighted characters as follows:

YY - **YYYYY** - YYYYY - NN (14 characters)

thru

YYYYYYYYYYYYYYY - **YYYYY** - YYYYY - NN (26 characters)

The CAGE code of the issuing authority is contained in the attribute `pmIssuer`.

---

**Business rule decision point BRDP-S1-00365 - Use of the attribute pmIssuer:**

- Decide on the use of the attribute pmIssuer.

**2.1.3 Number of the publication module**

**Description:** The number of the publication module is given in the publication module code by the highlighted characters as follows:

YY - YYYYY - **YYYYY** - NN (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - **YYYYY** - NN

The issuing authority assigns the number of the publication module. The number of the publication module is a unique alphanumeric identifier for a given on the model identification code (attribute modelIdentCode) and issuing authority (attribute pmIssuer).

The number of the publication module is contained in the attribute pmNumber.

**2.1.4 Volume of the publication**

**Description:** The volume is given in the publication module code by the highlighted characters as follows:

YY - YYYYY - YYYYY - **NN**

thru

YYYYYYYYYYYYYYY - YYYYY - YYYYY - **NN**

This element is used in cases where a publication has to be separated into volumes without assigning a new number. Default value is "00" if only one volume exists.

The volume of the publication is contained in the attribute pmVolume.

**2.2 Presentation of the publication module code**
**2.2.1 Use of hyphens**

The publication module code must be presented with hyphens [-] in the positions as shown in the examples and without spaces in between. The hyphens delimit the contents of the codes, as shown, but are not included within the population of the publication module code elements. This rule applies also to cases where the publication module code is given as a single string.

**2.2.2 Example for the publication module code**

On output, (eg, on paper, CD-ROM), the publication module code must be presented for proper identification of the pages or the media.

**Note**

For clarification, for example when data module codes and publication module codes are presented it can be useful to add the prefix "PMC-" or "PME-" to the code.

Example of publication module codes:

- A1-C0149-00111-01
- A1-C0149-00111-02

Example of extended publication module codes:

- SF518-USER001-A1-C0149-00111-01
- SF518-USER001-A1-C0149-00111-02

The output media, contained in the status section of the publication module in the attribute `pubMediaType`, can be added if required by the project. For example, when a publication is delivered on different media. In this case the following abbreviations are recommended.

- P = paper
- CD = CD-ROM
- W = webURL
- DVD = Digital Versatile Disc

Example of publication module codes:

- A1-C0149-00111-01-W
- A1-C0149-00111-01-P

Example of extended publication module codes:

- SF518-USER001-A1-C0149-00111-01-W
- SF518-USER001-A1-C0149-00111-01-P

The media must not be printed on the pages in paper publications when used as a reference.

**Note**

Refer to [Chap 7.5.1](#) for file naming conventions.

<a href="#">Chap 4.9.1</a>	Publication management - Publication module
<a href="#">Chap 5.3.1.1</a>	Common requirements - Front matter

## 1 General

The publication module allows the building of the publication to be independent of the end user presentation software. The preparation of the publication module is an authoring process.

## 2 Content

### 2.1 Publication construction

#### 2.1.1 Status information

The status section contains the identification elements required to address and control the publication module as defined in [Chap 4.9.1](#). The elements of the status section are similar to the elements of the status section of the data module as defined in [Chap 3.9.5.1](#).

#### 2.1.2 Content information

The content of the publication module is primarily built of data modules extracted from the CSDB. This includes the required front matter as given in [Chap 5.3.1.1](#).

The structure of the publication module is defined by the publication module entries. These can be recursively defined and give the table of contents of the final publication. An additional method of navigating thru an IETP can be achieved by the use of access illustrations.

Each publication module entry must have a title and references to one or more elements of the following type:

- data module
- publication module
- legacy technical publication

The generation of a publication module facilitates a top down design for the publication structure of the Product. The publication structure can be defined at an early stage of a project prior to population of the content.

### 3 Example

The following markup example represents a valid publication module fragment in XML format:

```
<pm xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 5.3.1.1</a>	Common requirements - Front matter

## 1 General

Publications are represented by publication modules. Consequently, needs to update a publication will normally induce an update to the corresponding publication module instance, due to changes as to which entries are contained or due to changes to the referenced elements of the publication modules (eg, the data modules of the Product). Updates of publications can be prepared as complete publication modules, including all referenced elements or partly by updating the constituent publication modules and the referenced changed elements. The update of a publication must be reflected in the front matter data modules (eg, change record, highlights) as defined in [Chap 5.3.1.1](#).

Updating of publication modules includes the element `<issueInfo>` in the element `<pmIdent>` and attribute `issueType` in the element `<pmStatus>` and follows the same rules as of data modules. Refer to [Chap 3.9.5.1](#).

Chap No./Document No.	Title
<a href="#">Chap 4.10.1</a>	Business rules exchange - Business rules document data module
<a href="#">Chap 4.10.2</a>	Business rules exchange - BREX data module

#### 1 General

This chapter describes the CSDB support for creation and management of business rules in S1000D.

Two dedicated data module types are provided for this purpose, the Business rules document data module and the BREX data module.

#### 2 Business rules document data module

The data module provides a means to create and manage the business rules developed by a project, enterprise, etc. The basic structure is inherited from the descriptive data module, however enhanced to facilitate a structured representation of business rules and business rules decision points, as well as information valuable in the business rules development process. The data module is described in [Chap 4.10.1](#).

#### 3 BREX data module

The data module provides a means to represent adopted business rules in a formal way that enables unambiguous automatic processing of the rules. Such processing includes, without being restricted to, verification that the XML objects in the CSDB fulfill the requirements expressed in the business rules. The data module is described in [Chap 4.10.2](#).

## 1 General

This chapter describes the purpose and the structure of the business rules document data module. It is divided into three main areas:

- data module coding
- data module structure
- template data module

### 1.1 Primary purpose

A business rules document data module is one of a set of data modules that define all the business rules together with descriptions and examples that are required to support an organization and/or project. This includes the rules and requirements regarding how S1000D XML files must be configured and all of the other types of rules defined in [Chap 2.5.1](#). This includes the entities, notations, elements, and attributes that are allowed and any restrictions on their values. The intent is to provide S1000D implementation guidance to authors, editors, and Information Technology personnel, who are responsible for the creation and development of valid content conforming to the design considerations of project managers and information architects (in accordance with contractual obligations and corporate, organization, and/or customer guidelines). Refer to [Chap 2.5.1](#).

All S1000D Business Rules Decision Points (BRDP) are included in the business rules document data module. Decisions are recorded using the element `<brDecision>`. Refer to [Chap 2.5.2](#) and [Chap 2.5.3](#).

#### Note

This guidance can be captured in various project or organization specific documents. Refer to [Chap 2.5.2](#).

**Note**

Data module codes are allocated in accordance with [Chap 4.3](#) and [Para 3](#).

**1.2 Document structure**

The business rules document data module Schema is based on the descriptive Schema, but modified to satisfy the specific requirement for the business rules document. The Schema structure provides references to other publications. Refer to [Para 4](#) and [Chap 3.9.5.2.1.2](#).

**1.3 Template**

A business rules template data module is provided by the specification. The template presents all BRDP defined by the specification. Refer to [Para 5](#).

**2 Concept****2.1 Use as method of governing the business rule in the life cycle of the project**

The business rules document data module provides unambiguous descriptions of business rules decisions for a project. A project can decide to exclusively use the business rules document data module or use another means to capture the business rules.

Business rules document data modules provide:

- a place to record decisions
- a means of exchanging business rules between concerned parties while rules are being developed
- provide a reference to business rules in various documents
- reduced risk of any misinterpretations and misunderstandings through formal descriptions of the business rules
- governance and capturing of business rule decisions including explanations and guidance through the life of the project and/or organization
- a means to record the priority and severity information for each business rule decision. Refer to [Para 4](#).
- a means of identifying the business rules decisions to capture in a BREX data module. Refer to [Chap 4.10.2](#).
- a means of indicating relationships between various BRDP and various constructs defined by S1000D
- a method of tracking the required dates for business rules development and recording the progress of business rules development

**2.2 Layered business rules document data module**

Business rules document data modules can be layered in various ways depending on the requirements of the project. It can also indicate the corresponding BREX layering. Refer to [Chap 2.5.1](#), [Chap 2.5.2](#), [Chap 4.10.2](#) and [Chap 7.9](#).

**2.3 Single and multiple business rules document data modules**

A single business rules document data module can be created covering all business rule decisions for a project. An alternative is to create a collection of business rules document data modules, which belong to the same layer of the business rules. The decision on what information goes in which data module, is the responsibility of the project. In this case, these data modules should include, but not be limited to, projects containing multiple model identification codes, system difference codes, SNS, and/or disassembly codes.

---

**Business rule decision point BRDP-S1-00564 - Single or multiple business rules document:**

- Decide whether to use a single or multiple business rules document data module to capture business rules. If multiple data modules are needed, identify which rules will go into which data module. Refer to [Para 3.1](#).

### 3 Coding

The information code for a business rules document data module is IC 024, and the item location code is set to D. Refer to BREX-S1-00265. Coding business rules document data modules is the same as all other data modules, with the exception of the following.

#### 3.1 Coding for single business rules documents data module

When business rules for the whole Product are contained in a single business rules document data module. It must be coded:

YY-A-00-00-00-00A-024A-D (17 characters)

thru

YYYYYYYYYYYYYYY-AAAA-Y00-00-0000-00AAA-024A-D (37 characters)

Where "YY" and "YYYYYYYYYYYYYYY" are the Product's model identifier. Refer to [Chap 4.3.1](#).

#### 3.2 Coding for multiple business rules documents data modules at the Product level

When business rules for the whole Product are contained in multiple business rules document data modules. They must be coded:

YY-A-00-00-00-NN A-024A-D (17 characters)

thru

YYYYYYYYYYYYYYY-AAAA-Y00-00-0000-NNAAA-024A-D (37 characters)

Where:

- "YY" and "YYYYYYYYYYYYYYY" are the Product's model identifier. Refer to [Chap 4.3.1](#).
- "NN", in the disassembly code, is a sequential number starting from "00".

#### 3.3 Coding for business rules documents data modules at the system level

When business rules apply to a specific system of a Product they can be contained in one or more business rules document data modules. They must be coded:

YY-A-SS-00-00-NN A-024A-D (17 characters)

thru

YYYYYYYYYYYYYYY-AAAA-YSS-00-0000-NNAAA-024A-D (37 characters)

Where:

- "YY" and "YYYYYYYYYYYYYYY" are the Product's model identifier. Refer to [Chap 4.3.1](#).
- "SS" is the system code. Refer to [Chap 4.3.3](#).
- "NN", in the disassembly code, is a sequential number for each system, starting from "00".

### 4 Schema basic rules

The business rules data module has a structure based on the descriptive Schema. Additionally, it contains a business rules paragraph structure, which allows the BRDP and business rules

decisions to be recorded. A business rules data module can also include the audit and status (refer to [Para 4.12.4](#)), and provide an indication of the relationships between various BRDP definitions, business rule decisions, S1000D text, S1000D Schemas, business rules categories, configurable attributes, and project/organization specific remarks.

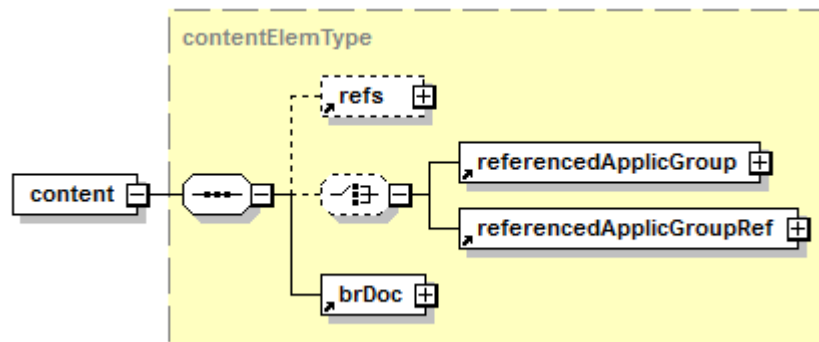

The descriptive structure of the business rules data module Schema permits simple conversion of project and organizational business rules documents into an XML format and an efficient addition for the maintenance of business rules and related information.

The alternates concept (refer to [Chap 4.13.3](#)) is not used in the business rules data module Schema.

## 4.1 Content

**Description:** The element `<content>` captures all types of information related to business rules documentation. Through its descriptive structure, the business rules data module Schema can be used to create project and/or organization business rules. It can also be used to create any kind of documentation related to business decisions and business rules. For elements and attributes similar to the descriptive data module structure, refer to [Chap 3.9.5.2.2](#).

**Markup element:** `<content>`

ICN-I9005-0410010001-001-01

Fig 1 Element `<content>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

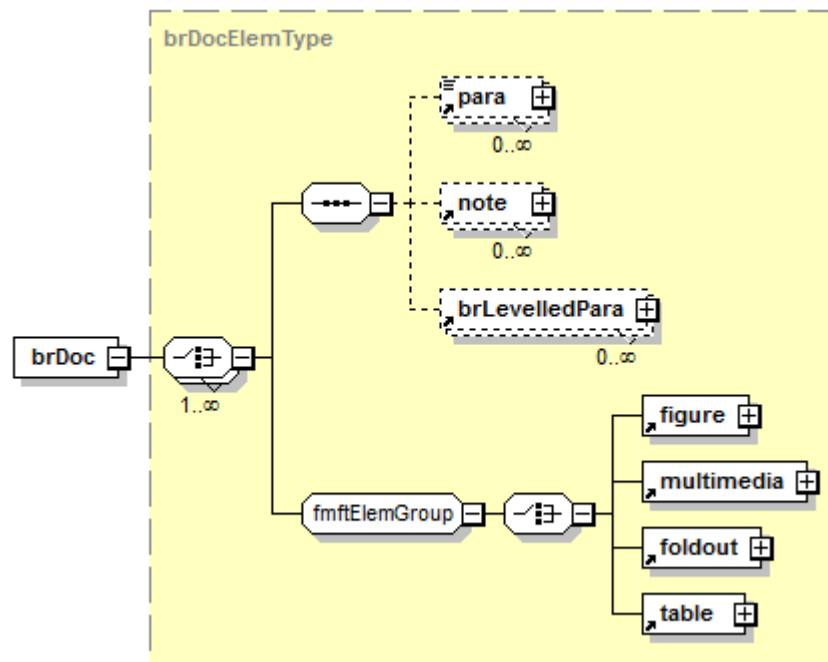

### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<referencedApplicGroup>`. Refer to [Chap 3.9.5.3](#).
- `<referencedApplicGroupRef>`. Refer to [Chap 3.9.5.3](#).
- `<brDoc>`. Refer to [Para 4.2](#).

## 4.2 Business rules document

**Description:** The element `<brDoc>` has a similar structure to the main content of descriptive data modules with the exception of `warningAndCautionElemGroup`, which is not included in the Business rules document data module. Refer to [Chap 3.9.5.2.2](#). There are additional elements and attributes provided in the element `<brLevelledPara>` for recording business rules information.

**Markup element:** `<brDoc>`

ICN-I9005-0410010002-001-01

Fig 2 Element `<brDoc>`

#### Attributes:

- `defaultBrSeverityLevel` (0), the default business rules severity level which indicates the severity level of any rules which have no explicit severity specified for that rule. Refer to [Para 4.4](#).

#### Child elements:

- `<para>`, unnumbered paragraphs used for an introduction before the business rules document starts. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).
- `<brLevelledPara>`. Refer to [Para 4.3](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).

#### Markup example:

Refer to [Para 6.2](#).

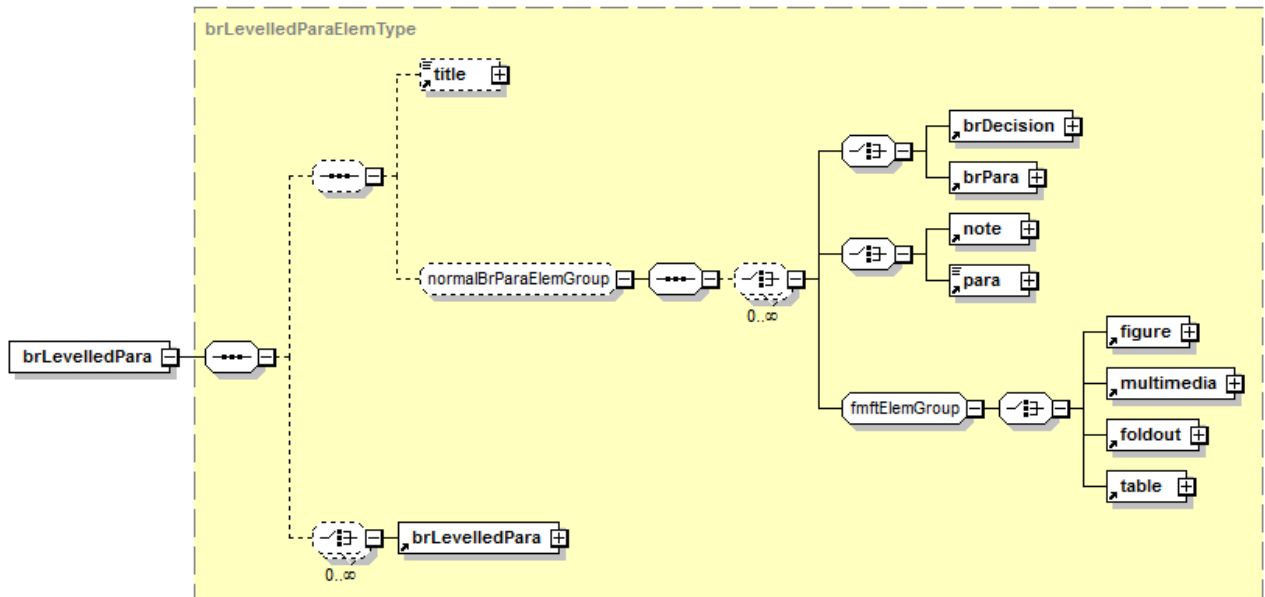

### 4.3 Business rule levelled paragraph

**Description:** The element `<brLevelledPara>` is the equivalent of a headed paragraph and can also contain subparagraphs. Similar to the element `<levelledPara>` in a descriptive data module, the element `<brLevelledPara>` can have one or more occurrences of the element `<brLevelledPara>` nested within it. The depth of this structure is unlimited, however, it is recommended to not exceed five levels of depth.

When a `<brLevelledPara>` contains a nested `<brLevelledPara>`, it is recommended for two or more of this element be provided at the same level, otherwise

standard heading rules can be violated for the project. Rules and recommendations for <levelledPara> in descriptive data modules apply here. Refer to [Chap 3.9.5.2.2](#).

Markup element: <brLevelledPara>

ICN-I9005-0410010003-001-01

Fig 3 Element <brLevelledPara>

#### Attributes:

- applicRefId (O), the applicability information by referencing the element <applic>. Refer to [Chap 3.9.5.3](#).
- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <title>. Refer to [Chap 3.9.5.2.1.5](#).
- <note>. Refer to [Chap 3.9.3](#).
- <brDecision>. Refer to [Para 4.4](#).
- <brPara>. Refer to [Para 4.6](#).
- <para>. Refer to [Chap 3.9.5.2.1.10](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <foldout>. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- <table>. Refer to [Chap 3.9.5.2.1.6](#).
- <brLevelledPara>

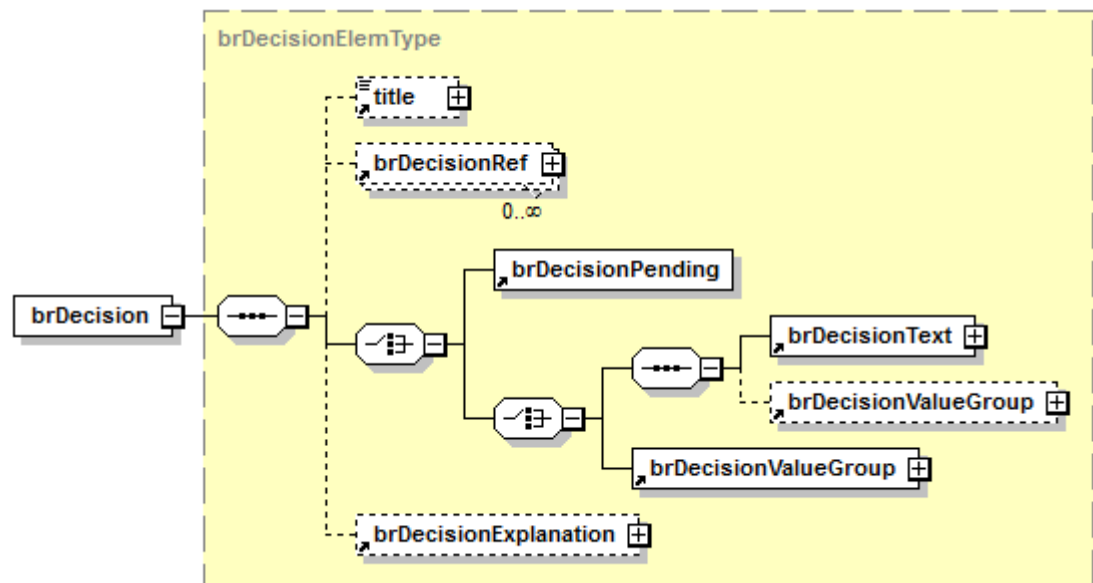

## Business rule decision point BRDP-S1-00565 - Level of depth of business rules document data modules:

- Decide whether to exceed five levels of depth for new data.

### 4.4 Business rule decision

**Description:** The element `<brDecision>` contains a single decision applicable to the project or organization. A decision is not limited to authoring or publishing, but can contain anything related to the organization or project. These decisions can be included in whole or in part and addressed throughout the lifecycle of the product.

**Markup element:** `<brDecision>`

ICN-I9005-0410010004-001-01

Fig 4 Element `<brDecision>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brDecisionIdentifierNumber` (M), the unique identifier of the element `<brDecision>`. It must be used when at least one element `<brDecisionText>` and/or element `<brDecisionValueGroup>` is populated. The only allowed case for not including the attribute `brDecisionIdentifierNumber` is when the mandatory choice is element `<brDecisionPending>` is used. The coding scheme of the attribute `brDecisionIdentifierNumber` is a project/organizational decision. It must be defined in such a way that inter-project, inter-program or inter-organizational referencing is possible by using solely the identifier coded by this attribute. For example, model identifier, as well as originator's CAGE code can be included as a part of the `brDecisionIdentifierNumber`. The project and/or organization must ensure the uniqueness of the identifiers captured by the attribute `brDecisionIdentifierNumber`. Refer to BREX-S1-00266.

- `brexRuleFlag` (O), indicates whether the business rule decision must or must not be captured in a BREX data module. When used, the textual information captured in the element `<brDecisionText>` must go into the textual response definitions of the element `<objectUse>` inside a BREX data module. These can be identified and automatically imported if needed.
- `brSeverityLevel` (O), the indicator of the severity of not implementing the business rule decision with its definition. The concept of business rules severity level is described in [Chap 2.5.2](#). This attribute can have one of the following values:
  - "brsl01" thru "brsl99". Refer to [Chap 3.9.6.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Business rule decision point BRDP-S1-00566 - Identification numbering:

- Decide on the numbering scheme for the attribute `brDecisionIdentNumber` and the attribute `id` as applicable.

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<brDecisionRef>`. Refer to [Para 4.4.1](#).
- `<brDecisionPending>`. Refer to [Para 4.4.2](#).
- `<brDecisionText>`. Refer to [Para 4.4.3](#).
- `<brDecisionValueGroup>`. Refer to [Para 4.4.4](#).
- `<brDecisionExplanation>`. Refer to [Para 4.5](#).

#### Markup example:

```
<brDecision brDecisionIdentNumber="K0378-00124"
brexRuleFlag="1">
<brDecisionText>
<para>(Prohibited inclusion of the element <note> within
the element <commonInfo>. Content must be authored using
the element <commonInfoDescrPara>.) The element
<commonInfo> has one branch that contains <note>,
<para>, and <commonInfoDescrPara> and one branch
that contains only <commonInfoDescrPara>. The branch
containing <note>, <para>, and
<commonInfoDescrPara> shall not be used in all except BREX
DM. There it is allowed.</para>
</brDecisionText>
<brDecisionExplanation>
<para>Occasionally, it is necessary to include a figure
(optionally with a primary title). For this reason, the titles
and figures are allowed under commonInfo. </para>
<para>The path "//commonInfo/para" must be prohibited to prevent
a <para> and a <commonInfoDescrPara> from appearing
at the same level.</para>
```

```
</brDecisionExplanation>
</brDecision>
```

#### 4.4.1 Business rule decision reference

**Description:** The element `<brDecisionRef>` defines a reference of a business rule decision or another element to a business rule decision. The direct reference from a business rule decision to itself is not allowed.

**Markup element:** `<brDecisionRef>`

ICN-I9005-0410010005-001-01

Fig 5 Element `<brDecisionRef>`

##### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brDecisionIdentNumber` (O), the unique identifier of the element `<brDecision>` being referred to. It is used for the purpose of implicit referencing. Refer to [Para 4.4](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

##### Child elements:

- `<refs>`. Used together with the attribute `referredFragment` and attribute `id` on the element `<brDecision>` for explicit referencing. Refer to [Para 0](#) and [Chap 3.9.5.2.1.2](#).

##### Markup example:

```
<brDecision brDecisionIdentNumber="K0378-00124">
...
</brDecision>
<brDecision brDecisionIdentNumber="K0378-00125"
brSeverityLevel="brsl03">
<brDecisionRef brDecisionIdentNumber="K0378-00124"/>
...
</brDecision>
```

#### 4.4.2 Business rule decision pending

**Description:** The empty element `<brDecisionPending>` indicates that a business rule decision, or its part on a BRDP, has not been determined and is "to be defined".

**Markup element:** `<brDecisionPending>`

**Attributes:**

- None

**Child elements:**

- None

**Markup example:**

```
<brDecision brDecisionIdentNumber="K0378-00124">
<brDecisionText>...</brDecisionText>
</brDecision>
<brDecision brDecisionIdentNumber="K0378-00125"
brSeverityLevel="brsl03">
<brDecisionRef brDecisionIdentNumber="K0378-00124"/>
<brDecisionPending/>
</brDecision>
```

**4.4.3**
**Business rule decision text**

**Description:** The element `<brDecisionText>` defines the exact wording of a business rule decision taken for a BRDP.

**Markup element:** `<brDecisionText>`

ICN-I9005-0410010006-001-01

Fig 6 Element `<brDecisionText>`

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<brDecisionText>
<para>(Prohibited the use of the element <note> within the
element <commonInfo>. Content must be authored using the
element <commonInfoDescrPara>.) The element
<commonInfo> has one branch that contains <note>,
<para>, and <commonInfoDescrPara> and one branch
that contains only <commonInfoDescrPara>. The branch
containing <note>, <para>, and
<commonInfoDescrPara> shall not be used in all except BREX
DM. There it is allowed.</para>
</brDecisionText>
```

#### 4.4.4 Business rule decision value group

**Description:** The element `<brDecisionValueGroup>` contains the allowed value, if any. The allowed values can be defined by the project (eg, CAGE code), or the values can be selected from the defined values in the business rule decision point value group (element `<brDecisionPointValueGroup>`) (eg, language). Refer to [Para 4.12.2](#).

**Markup element:** `<brDecisionValueGroup>`

ICN-I9005-0410010007-001-01

Fig 7 Element `<brDecisionValueGroup>`

##### Attributes:

- None

##### Child elements:

- `<brDecisionValue>`. Refer to [Para 4.4.4.1](#).

##### Markup example:

The following example shows all CAGE codes used for the project. The corresponding enterprise name is included for information only in the paragraph (element `<para>`).

```
<brDecisionValueGroup>
<brDecisionValue brDecisionValueRegistered="SF815">
<para>SIOM</para>
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="U8025">
<para>UK MoD</para>
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="1L6T4">
<para>LOGSA</para>
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="07GB6">
<para>BTAS COE</para>
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="0DVT5">
<para>EMC Corporation</para>
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="06RT9">
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="FAPE3">
<para>Airbus</para>
</brDecisionValue>
<brDecisionValue brDecisionValueRegistered="C3002">
<para>ESG</para>
</brDecisionValue>
</brDecisionValueGroup>
```

The following example shows the decided language for the project. The International Standards Organisation (ISO) 639 defined value is spelled out in the paragraph (element [<para>](#)).

```
<brDecisionValueGroup>
<brDecisionValue brDecisionValueRegistered="en">
<para>English</para>
</brDecisionValue>
</brDecisionValueGroup>
```

#### 4.4.4.1 Business rule decision value

**Description:** The element [<brDecisionValue>](#) defines the type and, where required, the content of a business rules decision within the range and definitions of BRDP values as a recorded decision taken for a BRDP. Refer to [Para 4.12.2.1](#).

**Markup element:** [<brDecisionValue>](#)

ICN-I9005-0410010008-001-01

Fig 8 Element [<brDecisionValue>](#)

#### Attributes:

- `brDecisionValueRegistered` (M), the recorded value of a business rules decision. If a business rules decision is made for a certain BRDP and is not a stand-alone business rules decision, then this value must be within the range and of the type of the corresponding BRDP value. In case of a stand-alone business rules decision, the business rules decision values are already available in the legacy business rules documentation and (correspondingly) need to be captured in the business rules data module using the attribute `brDecisionValueRegistered`.

#### Child elements:

- [<para>](#). Refer to [Chap 3.9.5.2.1.10](#).

#### Business rule decision point BRDP-S1-00567 - Standardized responses to describe business rules decision values:

- Decide whether to use standardized sentences to describe business rules decision values or not. If the decision is to use standardized responses, decide which responses must be taken from text describing BRDP values defined in the specification or by the project/organization. It is also necessary to identify which responses must be defined beyond what is already defined within the specification. If standardized responses for business rules decision values are defined, decide whether all possible business rules decision values are covered or whether there will be cases when a business rules author will need to define text for business rules decision values during business rules production.

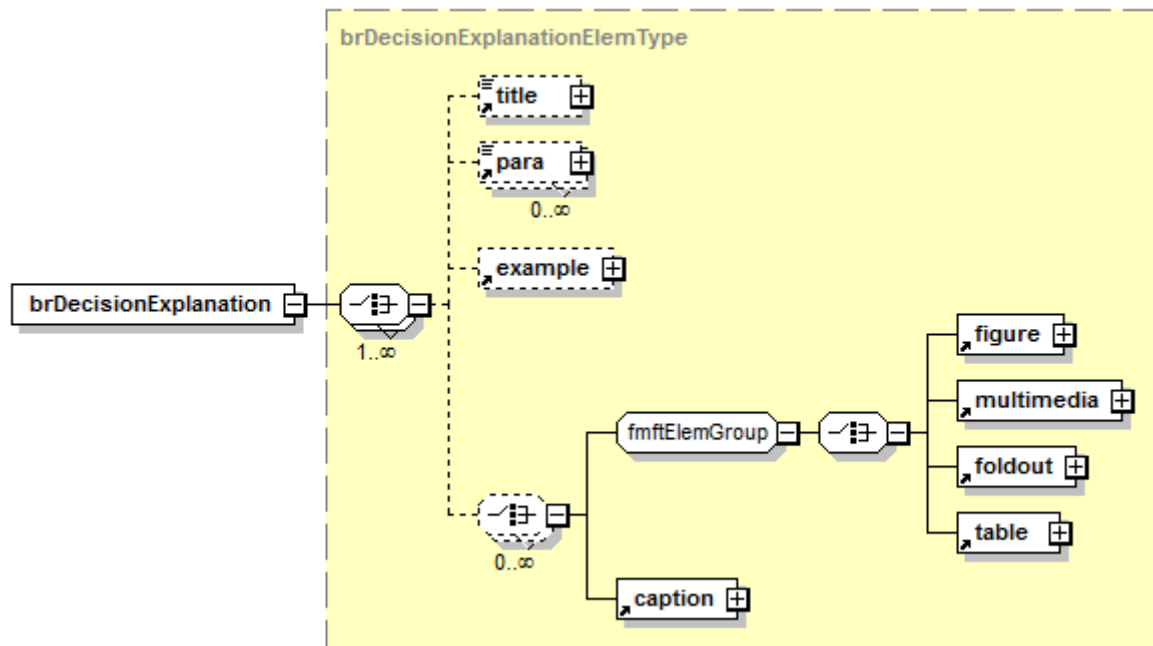

#### Markup example:

```
<brDecisionValue brDecisionValueRegistered="01">
<para>01 (Unclassified)</para>
</brDecisionValue>
```

## 4.5 Business rules decision explanation

**Description:** The element `<brDecisionExplanation>` provides additional information for a business rules definition which was not defined by the element `<brDecisionText>`. This can be information taken from the specification or any other information formulated by the project or organization. For example, these could be markup examples, extracts from the specification or data/documents from other projects or organizations. The purpose of this added explanation is to enhance the reader's understanding of the decision made for a BRDP.

**Markup element:** `<brDecisionExplanation>`

ICN-I9005-0410010009-001-01

Fig 9 Element `<brDecisionExplanation>`

### Attributes:

- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<example>`. Refer to [Para 4.5.1](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).
- `<caption>`. Refer to [Chap 3.9.5.2.1.4](#).

### Markup example:

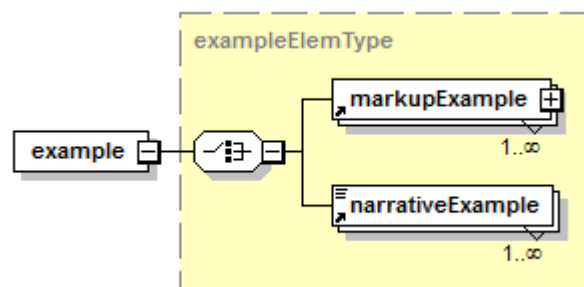

```
<brDecisionExplanation>
<para>Occasionally, it is necessary to include a figure
(optionally with a primary title). For this reason, the path
```

"//commonInfo/title" and the path "//commonInfo/figure" are not prohibited.</para>  
 <para>The path "//commonInfo/para" must be prohibited to prevent a <para> and a <commonInfoDescrPara> from appearing at the same level.</para>  
 </brDecisionExplanation>

#### 4.5.1 Example

**Description:** The element <example> provides markup and/or narrative examples illustrating the effect of the business rule decisions with a corresponding definition.

**Markup element:** <example>

ICN-I9005-0410010010-001-01

Fig 10 Element <example>

#### Attributes:

- None

#### Child elements:

- <markupExample>, captures one or more markup examples by use of the element <verbatimText>. Refer to [Chap 3.9.5.2.1.10](#).
- <narrativeExample>, captures one or more narrative examples for the business rules definition

#### Markup example:

```
<example>
<markupExample>
<verbatimText>
<exportControl exportRegulationType="EAR"
governmentAuthority="GB">
...
</exportControl>
</verbatimText>
</markupExample>
</example>
```

#### 4.6 Business rule paragraph

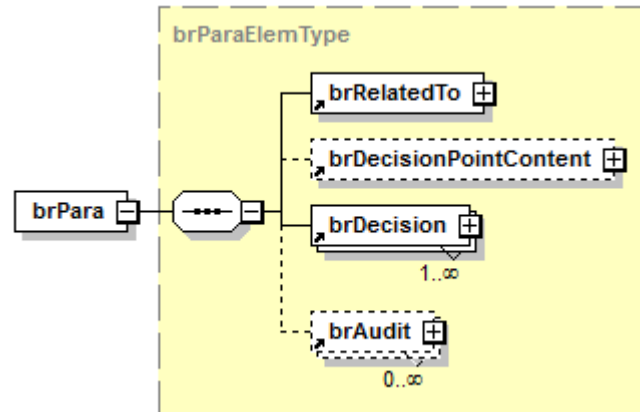

**Description:** The element <brPara> is a child of element <brLevelledPara> in the descriptive structure of a business rules data module. It contains information about:

- a business rule that includes the definition of a BRDP
- a business rule decision that has been made

- an indication of the relationship of the business rule to various concepts and constructs defined by the specification
- the audit information on the BRDP and/or business rules decisions taken upon it

This includes possible open actions, as well as the closing date when the decisions must be, or were, made.

**Markup element:** `<brPara>`

ICN-I9005-0410010011-001-01

Fig 11 Element `<brPara>`

#### Attributes:

- `applicRefId` (O), the applicability information by referencing the element `<applic>`. Refer to [Chap 3.9.5.3](#).
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brDecisionPointUniqueIdent` (M), the unique identifier of a BRDP. Refer to [Chap 2.5.3](#) and [Para 4.8](#).
- `brDecisionPointPriority` (O), indicates the priority of the BRDP for a project or organization. The setting of the BRDP priority can assist the project and/or organization by identifying which business rules should be defined first. This attribute has five predefined values. Refer to [Chap 3.9.6.1](#).
- `authorityName` (O) and `authorityDocument` (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<brRelatedTo>`. Refer to [Para 4.7](#).
- `<brDecisionPointContent>`. Refer to [Para 4.12](#).
- `<brDecision>`. Refer to [Para 4.4](#).
- `<brAudit>`. Refer to [Para 4.12.4](#).

#### Markup example:

```
<brPara brDecisionPointUniqueIdent="BRDP-S1-00253"
brDecisionPointPriority="brpr03">
```

```

<brRelationship>
...
</brRelationship>
<brDecisionPointContent>
...
</brDecisionPointContent>
<brDecision>
...
</brDecision>
</brPara>

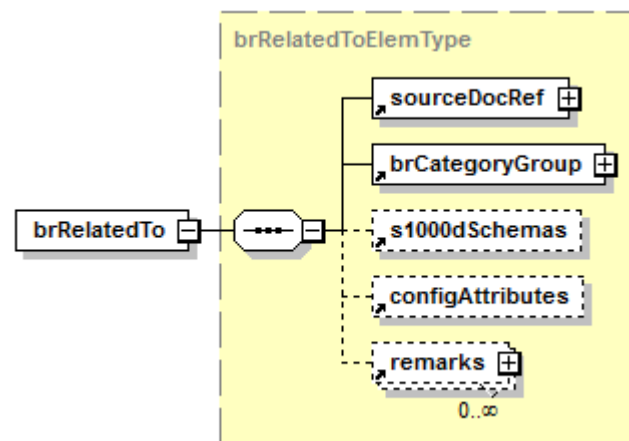

```

## 4.7 Business rule decision point relationship

**Description:** The element `<brRelatedTo>` indicates where in the source document the definition of the BRDP can be found and how the BRDP relates to decisions by the project or organization with respect to:

- business rules categories
- Schemas
- configurable attributes
- remarks

**Markup element:** `<brRelatedTo>`

ICN-I9005-0410010012-001-01

Fig 12 Element `<brRelatedTo>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

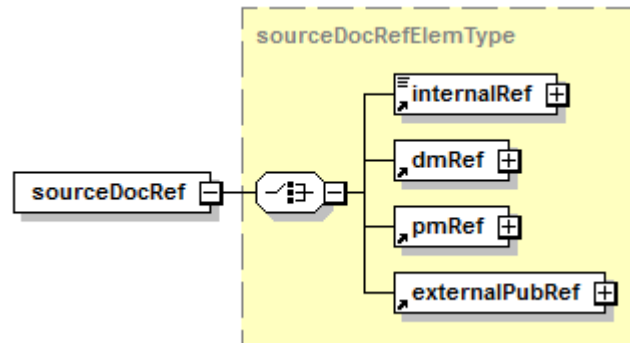

### Child elements:

- `<sourceDocRef>`. Refer to [Para 4.8](#).
- `<brCategoryGroup>`. Refer to [Para 4.9](#).
- `<s1000dSchemas>`. Refer to [Para 4.10](#).
- `<configAttributes>`. Refer to [Para 4.11](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

## 4.8 Business rules document reference

**Description:** The element `<sourceDocRef>` indicates where the information for the BRDP is defined. This reference can point to a place inside the same business rules data module, a data module with related business rule information or external documents in a non-S1000D or non-XML format.

**Markup element:** `<sourceDocRef>`

ICN-I9005-0410010013-001-01

Fig 13 Element `<sourceDocRef>`

### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

### Child elements:

- `<internalRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<pmRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<externalPubRef>`. Refer to [Chap 3.9.5.2.1.2](#).

### Markup example:

```
<sourceDocRef>
<dmRef referredFragment="Para-0204">
<dmRefIdent>
<dmCode assyCode="00" disassyCode="00" disassyCodeVariant="00A"
infoCode="040" infoCodeVariant="A" itemLocationCode="A"
modelIdentCode="S1000D" subSubSystemCode="6" subSystemCode="0"
systemCode="03" systemDiffCode="A"/>
</dmRefIdent>
</dmRef>
</sourceDocRef>
```

## 4.9 Business rule category group

**Description:** The element `<brCategoryGroup>` indicates the whole group of business rules categories to which the BRDP relates. Refer to [Chap 2.5.1](#).

**Markup element:** `<brCategoryGroup>`

ICN-I9005-0410010014-001-01

Fig 14 Element `<brCategoryGroup>`
**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<brCategory>`. Refer to [Para 4.9.1](#).

**Markup example:**

```
<brCategoryGroup>
<brCategory brCategoryNumber="1">
<title>General</title>
<brCategoryDescription>
<para>General business rules cover all decisions made by a
project or an organization that are not covered by any of the
specific business rule categories below. They serve as overall
decisions for the implementation of S1000D.</para>
</brCategoryDescription>
</brCategory>
</brCategoryGroup>
```

#### 4.9.1

**Business rule category**

**Description:** The element `<brCategory>` indicates the relationship of the BRPD to a certain business rules category. For example, a decision on "model identifiers" belongs to the business rules category 2, "Product business rules". Refer to [Chap 2.5.1](#).

**Markup element:** `<brCategory>`

ICN-I9005-0410010015-001-01

Fig 15 Element `<brCategory>`
**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brCategoryNumber` (O), the number of the business rules category. Refer to [Chap 2.5.1](#).

#### Child elements:

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<brCategoryDescription>`. Refer to [Para 4.9.2](#).

#### Markup example:

```
<brCategory brCategoryNumber="1">
<title>General</title>
<brCategoryDescription>
<para>General business rules cover all decisions made by a
project or an organization that are not covered by any of the
specific business rule categories below. They serve as overall
decisions for the implementation of S1000D.</para>
</brCategoryDescription>
</brCategory>
```

### 4.9.2 Business rule category description

**Description:** The element `<brCategoryDescription>` provides a description of the related business rules category. Refer to [Chap 2.5.1](#). A project or organization can add any information to assist with understanding and relating to the business rules category or categories.

**Markup element:** `<brCategoryDescription>`

ICN-I9005-0410010016-001-01

Fig 16 Element `<brCategoryDescription>`

#### Attributes:

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

#### Child elements:

- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).

#### Markup example:

```
<brCategoryDescription>
<para>General business rules cover all decisions made by a
project or an organization that are not covered by any of the
specific business rule categories below. They serve as overall
decisions for the implementation of S1000D.</para>
</brCategoryDescription>
```

### 4.10 S1000D Schemas

**Description:** The element `<s1000dSchemas>` defines the relationship between a BRDP to one or a number of Schemas defined by S1000D. The identification of this relationship results in mapping of the BRDP to S1000D Schemas.

**Markup element:** <s1000dSchemas>

**Attributes:**

The attributes can have one of the following values:

- "1", the BRDP relates to the Schema identified by this attribute
- "0" or omission of this attribute, "Not related"
- appliccrossreftableXsd (O), relation to, or choice of, applicability crossreference table data module. The attribute can have the values as given above.
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- brDocXsd (O), relation to, or choice of, business rules data module. The attribute can have the values as given above.
- brexXsd (O), relation to or choice of, BREX data module. The attribute can have the values as given above.
- checklistXsd (O), relation to, or choice of, checklist and maintenance planning data module. The attribute can have the values as given above.
- commentXsd (O), relation to, or choice of comment Schema. The attribute can have the values as given above.
- comrepXsd (O), relation to, or choice of, common repository data module. The attribute can have the values as given above.
- condcrossreftableXsd (O), relation to or choice of conditions crossreference table data module. The attribute can have the values as given above.
- containerXsd (O), relation to or choice of container data module. The attribute can have the values as given above.
- crewXsd (O), relation to or choice of crew data module. The attribute can have the values as given above.
- ddnXsd (O), relation to or choice of data dispatch note Schema. The attribute can have the values as given above.
- descriptXsd (O), relation to or choice of descriptive data module. The attribute can have the values as given above.
- dmlXsd (O), relation to or choice of data management list Schema. The attribute can have the values as given above.
- faultXsd (O), relation to or choice of fault data module. The attribute can have the values as given above.
- frontmatterXsd (O), relation to or choice of front matter data module. The attribute can have the values as given above.
- icnMetadataXsd (O), relation to or choice of the ICN metadata file Schema. The attribute can have the values as given above.
- ipdXsd (O), relation to or choice of illustrated parts data module. The attribute can have the values as given above.
- learningXsd (O), relation to or choice of learning data module. The attribute can have the values as given above.
- pmXsd (O), relation to or choice of publication modules Schema. The attribute can have the values as given above.
- prdcrossreftableXsd (O), relation to or choice of product crossreference table data module. The attribute can have the values as given above.
- procedXsd (O), relation to or choice of procedural data module. The attribute can have the values as given above.
- processXsd (O), relation to or choice of process data module. The attribute can have the values as given above.

- sbXsd (O), relation to or choice of service bulletin data module. The attribute can have the values as given above.
- schedulXsd (O), relation to or choice of maintenance planning data module. The attribute can have the values as given above.
- scocontentXsd (O), relation to or choice of SCO content data module. The attribute can have the values as given above.
- scormcontentpackageXsd (O), relation to or choice of SCORM content package Schema. The attribute can have the values as given above.
- updateXsd (O), relation to or choice of update file Schema. The attribute can have the values as given above.
- wrngdataXsd (O), relation to or choice of wiring data module. The attribute can have the values as given above.
- wrngfldsXsd (O), relation to or choice of wiring fields data module. The attribute can have the values as given above.

#### Child elements:

- None

#### Markup example:

```
<s1000dSchemas containerXsd="1" descriptXsd="1" dmlXsd="1"
ddnXsd="1" brexXsd="1" frontmatterXsd="1" procedXsd="1"
crewXsd="1" sbXsd="1" comrepXsd="1" pmXsd="1" updateXsd="1"/>
```

## 4.11 Relation to configurable attributes

**Description:** The element `<configAttributes>` indicates the relationship of the BRDP to configurable attributes (ie, to the attributes defined both in [Chap 3.9.6.1](#) and [Chap 3.9.6.2](#)). By filtering BRDP for configurable attributes, it is possible to identify specific context dependent values for each configurable attribute. It is also possible to identify if these attributes can have the same range of values for all elements and for all contexts.

**Markup element:** `<configAttributes>`

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

The configurable attributes indicating a BRDP has a relationship include the text "AttRelation" at the end of each attribute name. This is done to avoid redefinition of the types for configurable attributes defined in various S1000D Schemas. These attributes can have one the following values:

- "1", the BRDP relates to the Schema identified by this attribute
- "0" or omission of this attribute, "Not related"
- accessPointTypeValueAttRelation (O)
- acronymTypeAttRelation (O)
- actionIdentTypeAttRelation (O)
- barCodeSymbologyAttRelation (O)
- brDecisionPointPriorityAttRelation (O)
- brSeverityLevelAttRelation (O)
- brStatusAttRelation (O)
- cancelCaptionAttRelation (O)

- caveatAttRelation (O)

## 4.12 Business rule decision point content

**Description:** The element `<brDecisionPointContent>` provides information for a BRDP. It includes the BRDP title and definition, BRDP values and their meaning, plus explanation of the BRDP of interest.

**Markup element:** `<brDecisionPointContent>`

ICN-I9005-0410010017-001-01

Fig 17 Element `<brDecisionPointContent>`

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<brDecisionPointText>`. Refer to [Para 4.12.1](#).
- `<brDecisionPointValueGroup>`. Refer to [Para 4.12.2](#).
- `<brDecisionPointExplanation>`. Refer to [Para 4.12.3](#).

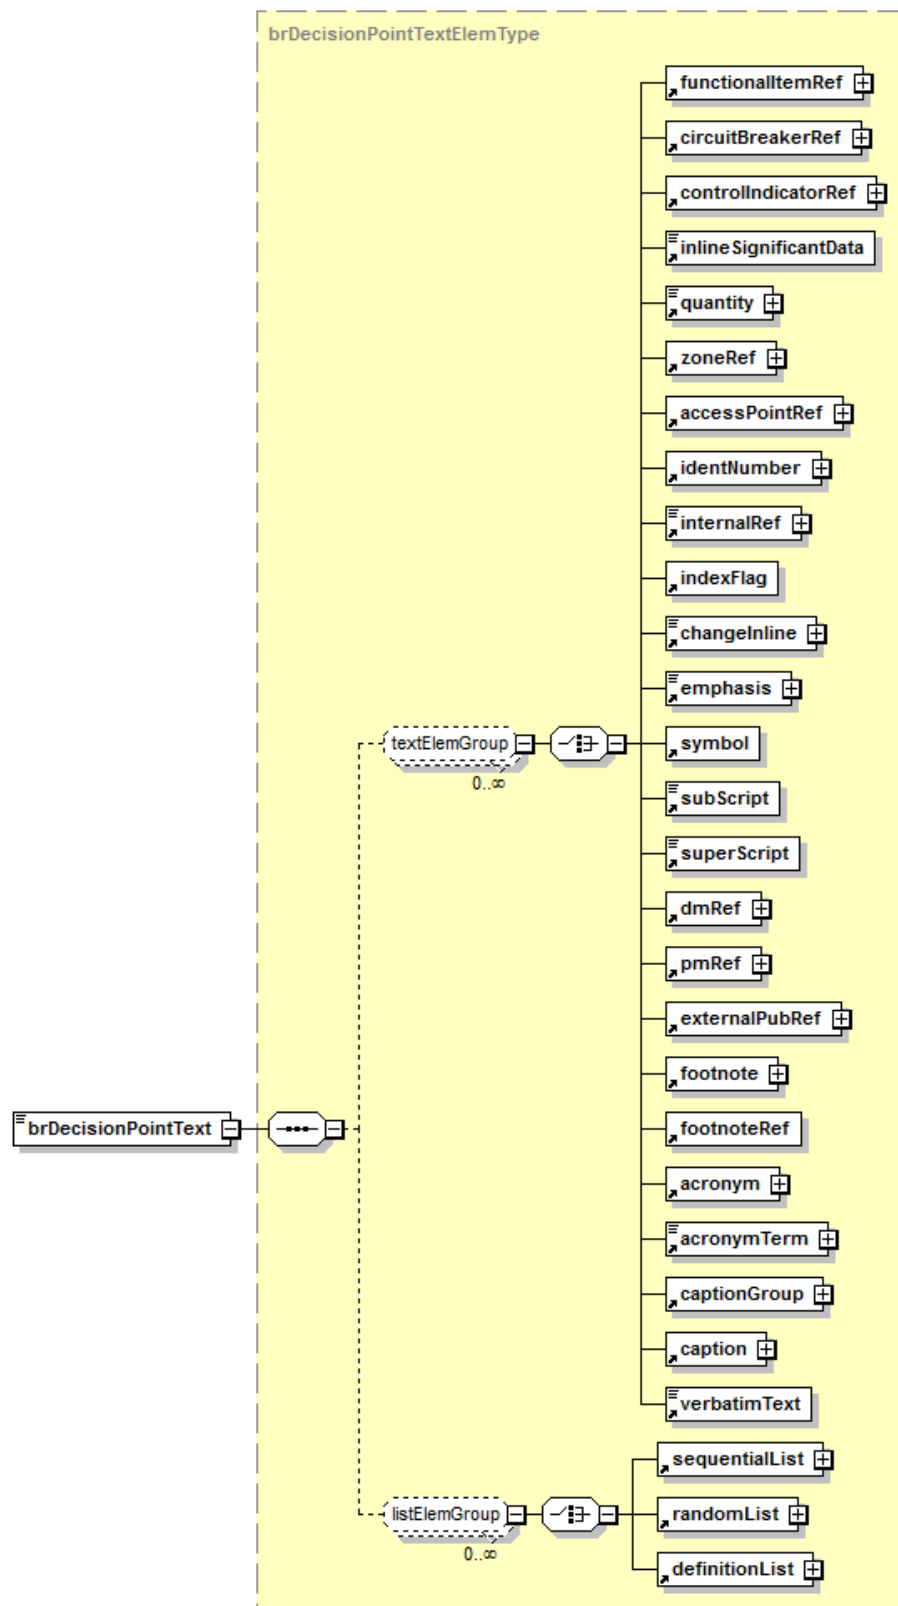

**Markup example:**

```
<brDecisionPointContent>
<title>Use of the optional element <commonInfo></title>
<brDecisionPointText>Decide whether to use the element
<commonInfo>, when to use the element, and give guidance
and rules that will make sure it is consistently
used.&#xd;</brDecisionPointText>
<brDecisionPointValueGroup brDecisionValueSelection="single"/>
<brDecisionPointExplanation>
<para>The <commonInfo> structure allows for multiple
methods of authoring. In order for a publication to maintain
consistent authoring (benefiting style sheets and user-
legibility), authoring methods should be kept to a
minimum.</para>
</brDecisionPointExplanation>
</brDecisionPointContent>
```

#### 4.12.1 Business rule decision point text

**Description:** The element `<brDecisionPointText>` defines a BRDP for the business rule. For all business rule decision points that have unique identifiers starting with "BRDP-S1-", the text captured in `<brDecisionPointText>` must be the text defined by this specification. Refer to [Chap 2.5.3](#). The only extension allowed for these BRDP is the reference to the place in the specification where the BRDP is defined. Any explanatory information is to be captured in `<brDecisionPointExplanation>`. Refer to [Para 4.12.3](#). The text of a project/organizational specific BRDP must be defined specifically for the needs of the project and/or organization. Refer to [Chap 2.5.3](#).

**Markup element:** `<brDecisionPointText>`

ICN-I9005-0410010018-001-01

Fig 18 Element `<brDecisionPointText>`

**Attributes:**

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- Includes the same set of elements of the [textElemGroup](#) and [listElemGroup](#) as used in the element `<para>` in descriptive data modules. Refer to [Chap 3.9.5.2.1.10](#).

**Markup example:**

```
<brDecisionPointText>Decide whether to use the element
&lt;commonInfo&gt;, when to use the element, and give guidance
and rules that will make sure that it is consistently used
(Refer to Chap 3.9.5.2.3, Para 2.3).</brDecisionPointText>
```

#### 4.12.2 Business rule decision point value group

**Description:** The element `<brDecisionPointValueGroup>` specifies what the BRDP is about. For example, business rules decision points can be about the choice of available values, or about allowing the use of a concept, an element, or an attribute in a certain context. It can also be used to define new values, etc. S1000D provides BRDP values for BRDP defined in the specification and captured inside the business rules template data module. Refer to [Chap 2.5.3](#) and [Para 5](#). The information mapped in the business rules template data module is based on S1000D text, Schemas and the default BREX.

**Markup element:** `<brDecisionPointValueGroup>`

ICN-I9005-0410010019-001-01

Fig 19 Element `<brDecisionPointValueGroup>`

**Attributes:**

- brDecisionValueSelection (M), identifies whether a single or multiple (ie, one or more) values can be chosen when deciding upon the BRDP. The attribute can have one of the following values:
  - "single"
  - "multiple"

**Child elements:**

- `<brDecisionPointValue>`. Refer to [Para 4.12.2.1](#).

**Markup example:**

```
<brDecisionPointValueGroup brDecisionValueSelection="single"/>
```

#### 4.12.2.1 Business rule decision point value

**Description:** The element `<brDecisionPointValue>` provides information on separate values for the BRDP.

Markup element: `<brDecisionPointValue>`

ICN-I9005-0410010020-001-01

Fig 20 Element `<brDecisionPointValue>`

#### Attributes:

- `brDecisionValueAllowed` (M), the allowed value for the BRDP. Multiple values can be defined and this attribute defines each value.

#### Child elements:

- `<para>`, defines textual information about the value. For BRDP, the unique business rule prefix "BRDP-S1-", is provided by the specification inside the business rules template data module. Refer to [Chap 2.5.3](#), and [Chap 3.9.5.2.1.10](#).

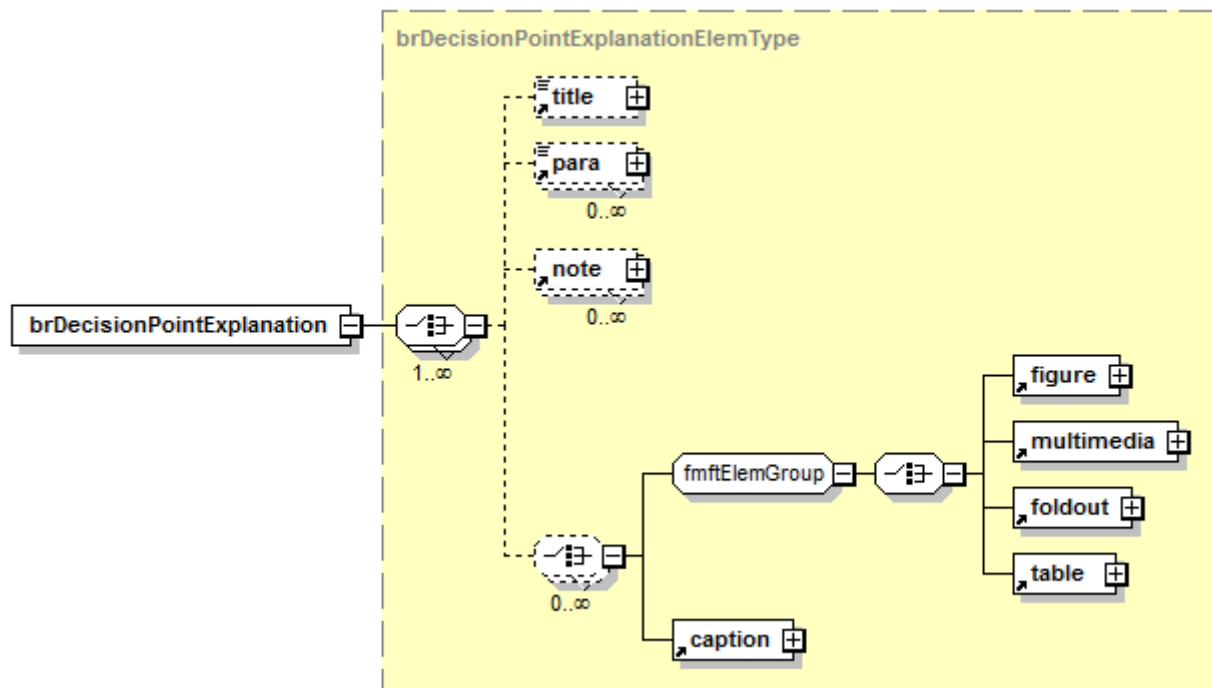

#### Markup example:

```
<brDecisionPointValue brDecisionValueAllowed="dml">
<para>Data module list</para>
</brDecisionPointValue>
```

### 4.12.3 Business rule decision point explanation

**Description:** The element `<brDecisionPointExplanation>` provides additional information on a BRDP, to that provided in the element `<brDecisionPointText>`. This can be information taken from the specification or any other information required by the project or organization. For example, this could be questions arising when making a decision for a BRDP in a specific context of the project and/or organization.

Markup element: `<brDecisionPointExplanation>`

ICN-I9005-0410010021-001-01

Fig 21 Element `<brDecisionPointExplanation>`

**Attributes:**

- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).

**Child elements:**

- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).
- `<caption>`. Refer to [Chap 3.9.5.2.1.4](#).

**Markup example:**

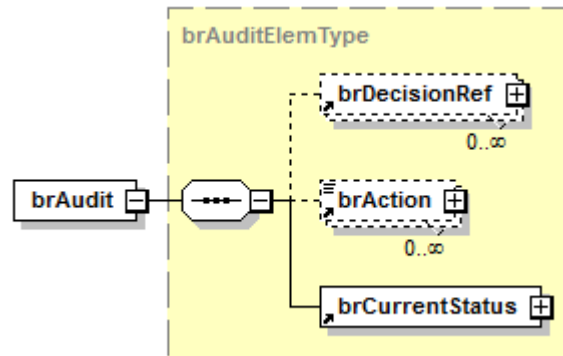

```
<brDecisionPointExplanation>
<para>The <commonInfo> structure allows for multiple
methods of authoring. In order for a publication to maintain
consistent authoring (benefiting style sheets and user-
legibility), authoring methods should be kept to a
minimum.</para>
</brDecisionPointExplanation>
```

#### 4.12.4 Business rule audit

**Description:** The element `<brAudit>` captures the audit status on the BRDP and/or business rules decisions defined for it, including possible actions to be accomplished in order to come to a satisfying decision and the status with required date of completion. If one or more

child elements `<brDecisionRef>` are defined, then the element `<brAudit>` refers both to the BRDP it applies to and to one or more of its business rules decisions. If the `<brDecisionRef>` is missing, then `<brAudit>` is attributed only to the BRDP defined under the `<brPara>`. Multiple elements `<brAudit>` within a `<brPara>` make it possible to capture status not only per BRDP but also per business rules decision. Recording of one `<brAudit>` for a group of business rules decisions defined within the same `<brPara>` is allowed.

**Markup element:** `<brAudit>`

ICN-I9005-0410010022-001-01

Fig 22 Element `<brAudit>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<brDecisionRef>`. Refer to [Para 4.4.1](#).
- `<brAction>`. Refer to [Para 4.12.4.1](#).
- `<brCurrentStatus>`. Refer to [Para 4.12.4.2](#).

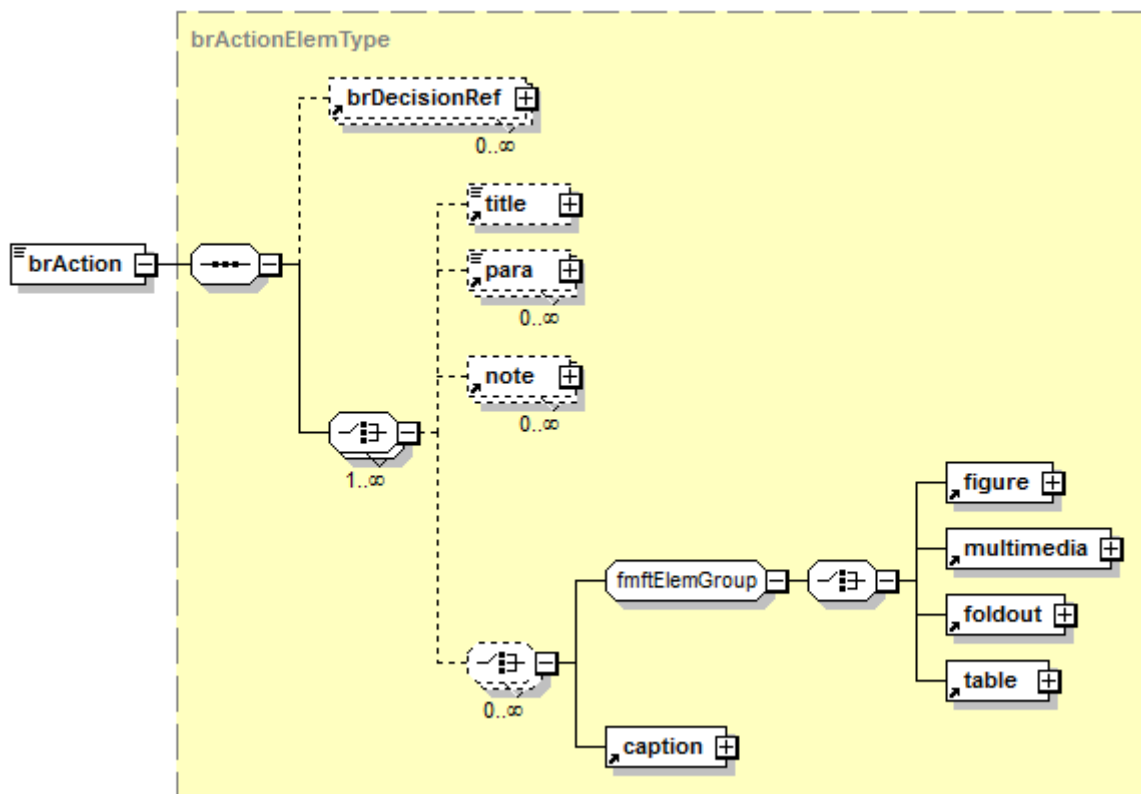

#### Markup example:

```
<brAudit>
<brDecisionRef brDecisionIdentNumber="K0378-00125"/>
<brAction brActionOwner="K0378-PSmith" brActionCompleted="1">
<para>Clarify whether all partners in the project agree to use
common info. Clarify the pro and con reasons and communicate the
result to the project management at all partners
sides.</para></brAction>
<brCurrentStatus brStatus="brst01">
<brStatusDate year="2015" month="05" day="25"/>
</brCurrentStatus>
</brAudit>
```

## 4.12.4.1 Business rule action

**Description:** The element `<brAction>` defines an action that is to be fulfilled to define a complete set of business rules decisions for the BRDP. The information provided under the element `<brAction>` identifies the owner of the action and if it is complete or not. If one or more child elements `<brDecisionRef>` are defined, then the element `<brAudit>` refers both to the BRDP it applies to and to one or more of its business rules decisions. If the `<brDecisionRef>` is missing, then `<brAction>` is attributed only to the BRDP defined under the `<brPara>`. Multiple elements `<brAction>` within `<brPara>` make it possible to capture actions not only per BRDP but also per business rules decision. Recording of one `<brAction>` for a group of business rules decisions defined within the same `<brPara>` is allowed.

**Markup element:** `<brAction>`

ICN-I9005-0410010023-001-01

Fig 23 Element `<brAction>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O) and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brActionOwner` (M), the action owner. The text marked up with this attribute can be a person's name, an organization name, CAGE code or combination of various. This can be decided case by case.
- `brActionCompleted` (O), of "yes" or "no" type, shows whether the action has been completed or not at the required date defined inside `<brCurrentStatus>`. Refer to [Para 4.12.4.2](#). The absence of this attribute indicates the required date for the business

rules is not reached yet, or the action has not been reviewed and evaluated since the last review.

- authorityName (O) and authorityDocument (O), the controlled content indications. Refer to [Chap 3.9.5.2.1.11](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<brDecisionRef>`. Refer to [Para 4.4.1](#).
- `<title>`. Refer to [Chap 3.9.5.2.1.5](#).
- `<para>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<note>`. Refer to [Chap 3.9.3](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- `<foldout>`. Refer to [Chap 3.9.5.2.1.7](#) and [Chap 3.9.5.2.1.6](#).
- `<table>`. Refer to [Chap 3.9.5.2.1.6](#).
- `<caption>`. Refer to [Chap 3.9.5.2.1.4](#).

#### Markup example:

In the examples below both actions are captured inside the same `<brAudit>` for the BRDP with the unique ID = BRDP-S1-00177.

```
<brAction id="brAction-S1-00177-01" brActionOwner="K0378-
NClarkson" brActionCompleted="1">
<para>Clarify whether all partners in the project agree to use
common info. Clarify the reasons and communicate the result to
the project management at all partners sides.</para></brAction>

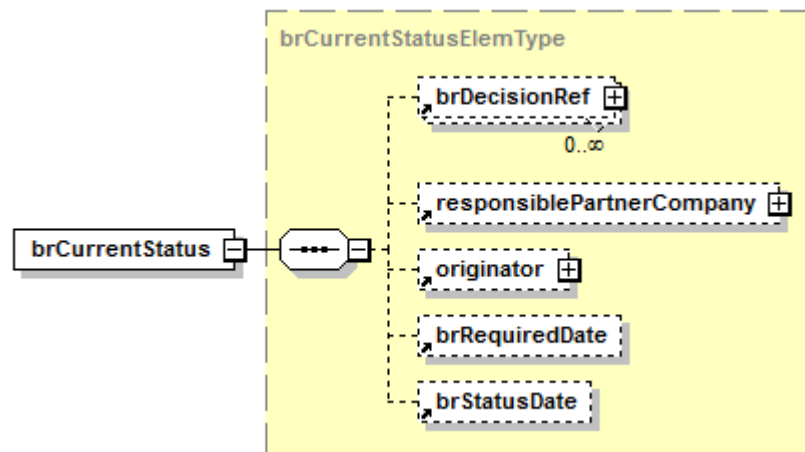

<brAction id="brAction-S1-00177-02" brActionOwner="D5067-
DEmerson" brActionCompleted="1">
<para>Capture the information gathered for <internalRef
internalRefId="brAction-S1-00177-01"/> inside
<brDecisionExplanation> for business rules decision(s) on
the BRDP.</para></brAction>
```

#### 4.12.4.2 Business rule current status

**Description:** The element `<brCurrentStatus>` gives the status of the BRDP and/or related business rules decisions. The business rules data module Schema defines only one `<brCurrentStatus>` for each element `<brAudit>`. Therefore, if the `<brAudit>` does not contain a reference to business rules decisions, then the business rules status also refers to the BRDP as a whole. If there is an element `<brAudit>` for each business rules decision (or separate group of business rules decisions), then the status also describes a separate business rules decision (or a separate group of business rules decisions).

**Markup element:** `<brCurrentStatus>`

ICN-I9005-0410010024-001-01

Fig 24 Element *<brCurrentStatus>*

#### Attributes:

- changeType (O), changeMark (O) and reasonForUpdateRefIds (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- brStatus (M), indicates the status of the BRDP and/or business rules decisions to which the audit status applies. This attribute can have one of the following values:
  - "brst01" thru "brst99". Refer to [Chap 3.9.6.1](#).

#### Child elements:

- *<brDecisionRef>*. Refer to [Para 4.4.1](#).
- *<responsiblePartnerCompany>*. Refer to [Chap 3.9.5.1](#).
- *<originator>*. Refer to [Chap 3.9.5.1](#).
- *<brRequiredDate>*. Refer to [Para 4.12.4.2.1](#).
- *<brStatusDate>*. Refer to [Para 4.12.4.2.2](#).

#### Markup example:

```
<brCurrentStatus brStatus="brst01">
<brDecisionRef brDecisionIdentNumber="K0378-Miller"/>
<brStatusDate year="2014" month="05" day="25"/>
</brCurrentStatus>

...
<brCurrentStatus brStatus="brst02">
<brRequiredDate year="2014" month="12" day="31"/>
<brStatusDate year="2014" month="05" day="25"/>
</brCurrentStatus>
```

#### 4.12.4.2.1 Business rule required date

**Description:** The element *<brRequiredDate>* indicates the date when the business rules decision must be taken and/or the date that the BRDP must be addressed. The business rules data module Schema defines only one *<brCurrentStatus>* for each element *<brAudit>*. Therefore, if the element *<brAudit>* does not contain any reference to business rules decisions, then the required date also refers to the BRDP as a whole. If there is an element *<brAudit>* for each business rules decision (or separate group of business rules decisions), then the required date also applies to a separate business rules decision (or a separate group of business rules decisions).

**Markup element:** `<brRequiredDate>`

**Attributes:**

- year (M). Refer to [Chap 3.9.5.1](#).
- month (M). Refer to [Chap 3.9.5.1](#).
- day (M). Refer to [Chap 3.9.5.1](#).

**Child elements:**

- None

**Markup example:**

```
<brRequiredDate year="2014" month="12" day="31"/>
```

#### 4.12.4.2.2 Business rule status date

**Description:** The element `<brStatusDate>` indicates the date when the business rules status was recorded. The business rules data module Schema defines only one `<brCurrentStatus>` for each element `<brAudit>`. Therefore, if the element `<brAudit>` does not contain any reference to business rules decisions, then the status date also refers to the BRDP as a whole. If there is an element `<brAudit>` for each business rules decision (or separate group of business rules decisions), then the status date also applies to a separate business rules decision (or a separate group of business rules decisions).

**Markup element:** `<brStatusDate>`

**Attributes:**

- year (M). Refer to [Chap 3.9.5.1](#).
- month (M). Refer to [Chap 3.9.5.1](#).
- day (M). Refer to [Chap 3.9.5.1](#).

**Child elements:**

- None

**Markup example:**

```
<brStatusDate year="2012" month="05" day="25"/>
```

## 5 Template data module

The business rules template data module includes all BRDP applicable to, and defined by, the current issue of the specification. While the same BRDP are included in [Chap 2.5.3](#), the business rules template data module provides complete and extensive information for each BRDP defined by S1000D, as follows:

- the unique ID, as defined by S1000D relationship information:
  - the source location (ie, the Chap and Para numbers, providing where and in which context the BRDP can be found)
  - the applicable business rules category or categories, defined in [Chap 2.5.1](#)
  - relationship to the S1000D Schemas, where applicable
  - relationship to configurable attributes defined by S1000D Schemas, where applicable
  - the BRDP title and text (as defined throughout this specification, as well as, in [Chap 2.5.3](#))
  - the predefined values for the BRDP, if any

- the placeholder for the project or organization business rules decision. This is completed when the business rules template data module is implemented as it applies to the project or organization business rule set.

The business rules template data module can be expanded by including additional BRDP specific to a project or organization. The inclusion of additional BRDP must follow the formatting requirements defined in [Chap 2.5.3](#) for organization-specific IDs for BRDP.

The data module code of the S1000D provided business rules template is DMC-S1000D-Y-04-10-0102-00A-024A-D, where:

- the system difference code, here indicated by "Y", is used to distinguish between business rules templates related to, and published with, different issues of the specification

For Issue 4.2, the system difference code "F" applies. Refer to [Chap 4.10.3](#).

## 6

### Examples

#### 6.1

#### Excerpt from business rule template data module

Using BRDP-S1-0001 as an example, the BRDP requires projects or organizations to decide whether or not to allow the use of the alpha characters "I" or "O" in codes (eg, data module codes, publication module codes, learn codes, learn event codes, data management lists).

```

## 1 General

This chapter describes the BREX mechanism provided by the specification.

The mechanism is a means to communicate business rules that have been developed and agreed upon within a project or enterprise.

## 2 The BREX concept

### 2.1 Introduction

Generally, business rules agreed upon within a project or enterprise can be of different characters, some of which are concerned with how the XML structures must be used in the CSDB objects. To facilitate a formalized and machine readable representation of how such rules apply to the XML structures, a corresponding BREX data module can be used. BREX data modules are stored in the CSDB.

Examples of use of the BREX data module include:

- recording and exchanging rules while they are being developed in a project or enterprise. The possibility to make a formal description of the business rules decreases the risk of misinterpretations and misunderstandings.
- supporting a correct interpretation of CSDB objects. This is of particular significance for security and safety related information (for example classification and units of measure for threshold intervals).
- enabling validation of the CSDB objects against agreed upon rules, for example when applying automated methods

Every data module must refer to a BREX data module containing the business rules that apply to the content of that data module. Each data module is written in accordance with one and only one BREX data module and the layers of BREX subsequently referred to. The BREX data module provides the rules that govern the production of the data module. If a data module must be changed, changes must be in accordance with its associated BREX data module.

#### Note

Only in extraordinary circumstances would a data module be changed to reference a new BREX data module. A data module is considered re-authored if it is altered to reflect a new BREX data module. If a data module is changed to be associated with a new BREX data module, the data module can need changes in content to conform to the requirements of the associated BREX data module.

If a project or enterprise chooses to encompass all the constructs laid out by S1000D, and not to diverge or refine from any of the applicable rules, the data modules can refer to a default BREX data module. If a project or enterprise decides to apply its own set of business rules it must also develop its own BREX data module.

In many cases, the business rules for a project or an enterprise will include several documents constituting the entire batch of rules that apply. If so, the BREX data module can be a document that summarizes the complete set of rules. It is possible to refer from any rule given in the BREX data module to any background documentation that can contain full descriptions and explanations of the reasons for the rule.

The rules for the data module codes of BREX data modules are given in [Chap 4.10.2.4](#).

The detailed structure of the BREX data module is described in [Chap 4.10.2](#).

The default BREX data module is described in [Chap 4.10.3](#).

## 2.2 Layered BREX data modules

A layered business rules structure can be reflected in a corresponding layered BREX data module hierarchy. Refer to [Chap 2.5.1](#).

For example, a data module in a project can refer to a project BREX data module defining the rules for the project. This project BREX data module can be based on and refer to an enterprise BREX data module. The enterprise BREX data module can itself be based on and refer to a set of even more general rules defined for a higher level enterprise (eg, a BREX data module for the civil aviation industry). At the top level are the S1000D default BREX data module and the XML schemas, which reflect the rules that are imposed by the specification itself.

Any layered BREX data module must only contain restrictions to the rules defined by the BREX data module on which it is based. For example, if an enterprise BREX restricts a certain value to be a capital letter A thru M, a project BREX based on that enterprise BREX must not allow values out of the range A thru M. However, it can restrict the allowed values to (eg, A thru H).

The project or the enterprise must ensure that there are no conflicts between various business rules within a hierarchical BREX data module structure. The rules given in a certain BREX data module must be based on the rules given in the BREX data module to which it refers (ie, rules of the layer above). In case there are conflicts between the rules in the two modules then the referred upper-layer BREX data module takes precedence. For rules and guidance regarding conflicting business rules, refer to [Chap 2.5.1](#). For guidance regarding how to verify that layered BREX rules are not in conflict with each other, refer to [Chap 7.9](#).

It must be noted that a BREX data module in a layered hierarchy does not have to repeat the rules given in the BREX data module on which it is based. It is sufficient that it contains only the additional specific restrictions that apply in its own layer. Therefore, to ensure that a full set of BREX encoded rules is provided for a data module of interest, it is necessary to provide the whole hierarchy of BREX data modules, throughout the layers to the S1000D default BREX.

Any layered BREX hierarchy ends in the S1000D default BREX data module. Refer to [Chap 4.10.3](#). This hierarchy reflects a corresponding layering in the business rules, where the basis for any defined complex of business rules (layered or not) is S1000D itself.

### Note

A BREX data module for any specific environment does normally define the rules that apply to it, regardless of whether these rules are generic within the environment, or if they apply specifically to the BREX data module. The procedure of verifying a BREX data module can therefore deviate slightly from verification of data modules in general, since it can be verified against the rules it contains in addition to the rules contained in the BREX data module to which it refers.

### Business rule decision point BRDP-S1-00367 - Use of layered BREX data modules:

- Decide whether to apply a layered BREX data module structure. This decision is related to, but not entirely dependent on, whether a layered business rules structure applies.

## 2.3 BREX data module structure

The BREX data module contains the business rules applicable to a project. It can contain:

- specifications of SNS that apply to the context concerned
- specifications of elements and attributes that must or must not be applied to CSDB objects generated for the project

- definitions of which values are allowed/used for specified elements and/or attributes and how these values are to be interpreted
- descriptions of the purpose of markup elements and attributes

Like other data modules the BREX data module has an identification and status section contained within the markup element `<identAndStatusSection>` as described in [Chap 3.9.5.1](#).

For technical information about the BREX Schema, refer to [Chap 7.3](#).

The default BREX data module provided with the specification shows how the data module is to be marked up.

### 2.3.1 Content section

The content section is contained within the markup element `<content>`.

### 2.3.2 References

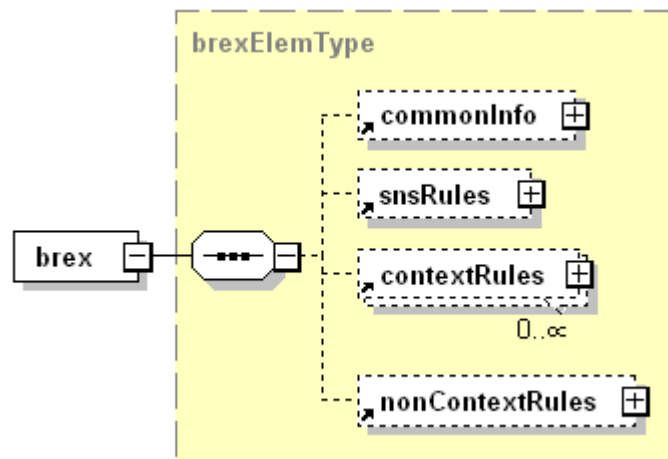

A BREX data module can refer to other supporting data modules or publications. Refer to [Chap 3.9.5.2.1.2](#).

Markup element: `<refs>`

### 2.3.3 Exchange business rules

**Description:** The element `<brex>` contains all business rules specified by a BREX data module.

Markup element: `<brex>`

ICN-83007-0000000013-002-01

Fig 1 Element `<brex>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), the change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `defaultBrSeverityLevel` (O). Refer to [Chap 4.10.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <commonInfo>. Contains an introduction to the data module, describing for example the background of and general notes on when it is to be applied. It is recommended to include in this element references to additional data modules, and/or other external document, specifying further business rules information related to the BREX data module. Refer to [Chap 3.9.5.2.1.12](#).
- <snsRules>. Refer to [Chap 4.10.2.1](#).
- <contextRules>. Refer to [Chap 4.10.2.2](#).
- <nonContextRules>. Refer to [Chap 4.10.2.3](#).

#### Business rule decision point BRDP-S1-00369 - Use of the BREX data module to exchange SNS:

- Decide whether to use the BREX data module for exchange of information on the applied SNS.

## 3 Examples

The following example shows a BREX data module for a project "PRODUCT". This module constitutes a number of restrictions compared to a parent layer applying a BREX data module identified by the model identification code "PRODUCTGROUP".

The example below gives a brief view of how to represent an SNS definition in a BREX data module. It also includes a number of common structural rules, including rules on formats/notations, applicable to all Schemas. Further, it defines one structural rule applicable to one specific Schema, the Comment Schema, and notation rules that apply to IPD and Process data modules.

#### Note

The example given below does not intend to provide a complete realistic BREX data module. Normally, the rules contained in a BREX data module will be far more extensive than is reflected in the example.

## 1 General

The BREX data module content section consists of three main blocks of rules, one of which is the block of SNS rules described below. The other two blocks contain:

- context related rules. Refer to [Chap 4.10.2.2](#).
- context independent rules. Refer to [Chap 4.10.2.3](#).

## 2 SNS rules

**Description:** The element `<snsRules>` contains descriptions of one or several SNS systems that apply to the project concerned.

**Markup element:** `<snsRules>`

ICN-83007-0000000014-003-01

Fig 1 Element `<snsRules>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brSeverityLevel` (O). Refer to [Chap 4.10.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

### Child elements:

- `<brDecisionRef>`. Refer to [Chap 4.10.1](#).
- `<snsDescr>`. Refer to [Para 2.1](#).

## 2.1 SNS description

**Description:** The element `<snsDescr>` provides a description of each specific SNS system.

**Markup element:** `<snsDescr>`

ICN-83007-0000000015-002-01

Fig 2 Element `<snsDescr>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

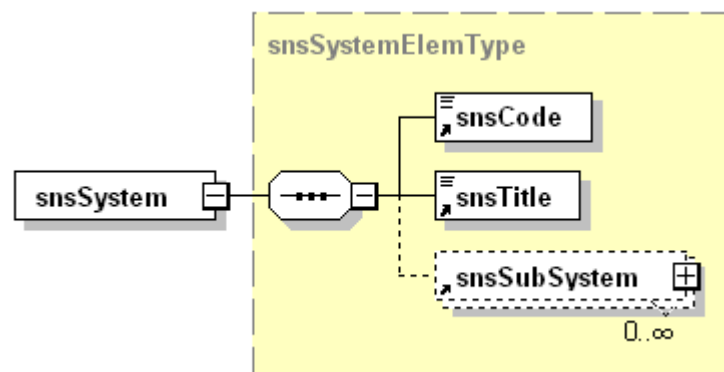

**Child elements:**

- `<snsSystem>`. Refer to [Para 2.1.1](#).

**2.1.1**
**SNS system code**

**Description:** The element `<snsSystem>` contains the specification of each system defined for the SNS.

**Markup element:** `<snsSystem>`

ICN-83007-0000000016-002-01

Fig 3 Element `<snsSystem>`

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

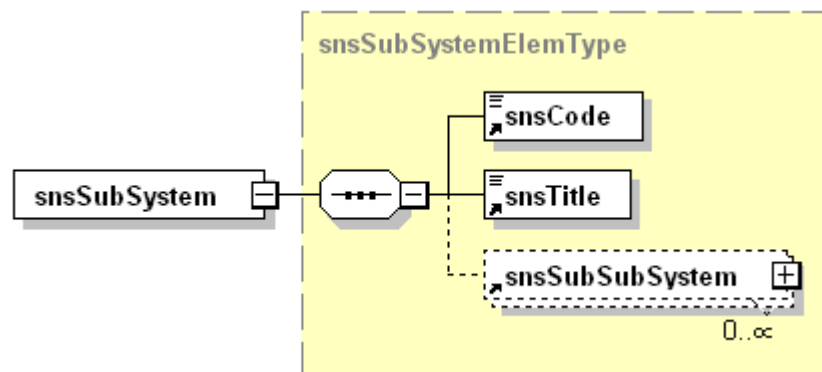

**Child elements:**

- `<snsCode>`. Refer to [Para 2.1.5](#) and default BREX rule BREX-S1-000145.
- `<snsTitle>`. Refer to [Para 2.1.6](#).
- `<snsSubSystem>`. Refer to [Para 2.1.2](#).

**2.1.2**
**SNS subsystem code**

**Description:** The element `<snsSubSystem>` contains the specification of each subsystem defined for the SNS system.

**Markup element:** `<snsSubSystem>`

ICN-83007-0000000017-002-01

Fig 4 Element <snsSubSystem>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

**Child elements:**

- <snsCode>. Refer to [Para 2.1.5](#) and default BREX rule BREX-S1-000146.
- <snsTitle>. Refer to [Para 2.1.6](#).
- <snsSubSubsystem>. Refer to [Para 2.1.3](#).

**2.1.3**

**SNS sub-subsystem code**

**Description:** The element <snsSubSubsystem> contains the specification of each sub-subsystem defined for the SNS subsystem concerned.

**Markup element:** <snsSubSubsystem>

ICN-83007-0000000018-002-01

Fig 5 Element <snsSubSubsystem>

**Attributes:**

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <snsCode>. Refer to [Para 2.1.5](#) and default BREX rule BREX-S1-000147.
- <snsTitle>. Refer to [Para 2.1.6](#).
- <snsAssy>. Refer to [Para 2.1.4](#).

### 2.1.4 SNS assembly code

**Description:** The element <snsAssy> contains the specification of each assembly defined for the SNS sub-subsystem concerned.

**Markup element:** <snsAssy>

ICN-83007-0000000019-002-01

Fig 6 Element <snsAssy>

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeMark (O), changeType (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- <snsCode>. Refer to [Para 2.1.5](#) and default BREX rule BREX-S1-000148.
- <snsTitle>. Refer to [Para 2.1.6](#).

### 2.1.5 SNS code

**Description:** The element <snsCode> contains a code used to define a component in an SNS structure. The code concerned is represented as text content. Depending on the context it can be either the code of a system, a subsystem, a sub-subsystem or an assembly.

**Markup element:** <snsCode>

#### Attributes:

- None

#### Child elements:

- None

2.1.6

**SNS title**

**Description:** The element <snsTitle> contains a title corresponding to a code used to define a component in an SNS structure. The title is represented as text content. Depending on the context it can be either the title of a system, a subsystem, a sub-subsystem or an assembly.

**Markup element:** <snsTitle>

**Attributes:**

- None

**Child elements:**

- None

<a href="#">Chap 4.10.2.1</a>	BREX data module - SNS rules
<a href="#">Chap 4.10.2.3</a>	BREX data module - Context independent rules
REC-xmlschema-2-20041028	W3C Recommendation: XML Schema Part 2: Datatypes Second Edition

## 1 General

The BREX data module content section consists of three main blocks of rules, one of which is the block of context related rules described below. The other two blocks contain:

- SNS rules. Refer to [Chap 4.10.2.1](#).
- Context independent rules. Refer to [Chap 4.10.2.3](#).

## 2 Rules related to context

**Description:** The element `<contextRules>` contains rules that can be related to one or more Schema contexts (ie, rules regarding the use of elements in various Schemas).

The element can be repeated to give rules that are specific to different Schemas, where the Schema concerned is identified by the attribute `rulesContext`. If the attribute is not specified the contained rules will commonly apply to all objects, regardless of Schema.

Rules given for a specific Schema override rules applicable to all Schema contexts. Rules specific to a Schema must be true restrictions to commonly applicable rules.

**Markup element:** `<contextRules>`

ICN-83007-0000000020-002-01

Fig 1 Element `<contextRules>`

**Attributes:**

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeMark` (O), `changeType` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `rulesContext` (O), specifies the context (ie, the Schema) to which the contained rules apply. Context must be specified by the applicable URL of the Schema for XML encoded CSDB objects (eg, [http://www.s1000d.org/S1000D\\_4-2/xml\\_schema\\_flat/descriptSchema.xsd](http://www.s1000d.org/S1000D_4-2/xml_schema_flat/descriptSchema.xsd)).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<structureObjectRuleGroup>`. Refer to [Para 2.1](#).
- `<notationRuleList>`. Refer to [Para 2.2](#).

## 2.1

### Structure rules

**Description:** The element `<structureObjectRuleGroup>` specifies all rules about the project-specific use of elements and attributes for all the various document types (Schema) used within the project.

**Markup element:** `<structureObjectRuleGroup>`

ICN-83007-0000000021-002-01

Fig 2 Element `<structureObjectRuleGroup>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

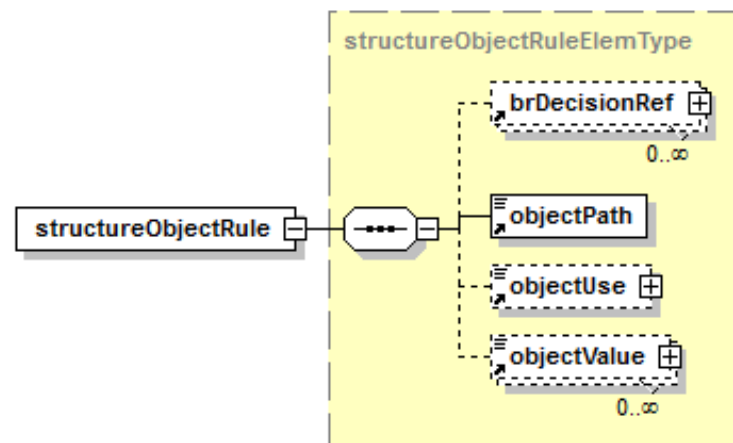

- `<structureObjectRule>`, each occurrence representing a rule regarding one object. Refer to [Para 2.1.1](#).

## 2.1.1

### Structure object rule

**Description:** The element `<structureObjectRule>` contains rules that apply to an element or an attribute, which must be given when the intended use of that object does not fully coincide with the specification, for instance by being more restrictive.

**Markup element:** `<structureObjectRule>`

ICN-83007-0000000022-003-01

Fig 3 Element `<structureObjectRule>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brSeverityLevel` (O). Refer to [Chap 4.10.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<brDecisionRef>`. Refer to [Chap 4.10.1](#).
- `<objectPath>`. Refer to [Para 2.1.2](#).
- `<objectUse>`. Refer to [Para 2.3](#).
- `<objectValue>`. Refer to [Para 2.1.3](#).

### 2.1.2

#### Object path

**Description:** The element `<objectPath>` contains an XPath address defining where the element or attribute occurs in the Schema structure. This must be identified for an element or attribute for which rules are given.

**Markup element:** `<objectPath>`

#### Attributes:

- `allowedObjectFlag` (O), defines if and how the object is applied within the organization or the project. The attribute must always be included. Refer to default BREX rule BREX-S1-00149. The attribute can have one of the following values:
  - "0" - No, the object must not be used in the context concerned
  - "1" - Yes, the object must be included in the context concerned
  - "2" (D) - the object can optionally be used in the context concerned, however, fully in accordance with the specification text and the Schemas
- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).

- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- None

#### Markup examples:

The following example shows a rule expressing a narrative statement concerning the use of an element - neither is the use of the element mandated, nor is the use prohibited.

```
<structureObjectRule>
<objectPath
allowedObjectFlag="2">//graphic/@boardno</objectPath>
<objectUse>Responsible partner company code in ICN must be an
uppercase A</objectUse>
</structureObjectRule>
```

The following example shows how the use of either the element [<systemBreakdownCode>](#) or the element [<functionalItemCode>](#) (in the status section) is mandated (or rather, their absence is prohibited).

```
<structureObjectRule>
<objectPath
allowedObjectFlag="0">not(//dmStatus/systemBreakdownCode or
//dmStatus/functionalItemCode)</objectPath>
<objectUse>The use of element systemBreakdownCode or element
functionalItemCode is required</objectUse>
</structureObjectRule>
```

The following example shows how the attribute learnCode is mandated in the identification of a data module.

```
<structureObjectRule>
<objectPath
allowedObjectFlag="1">//dmIdent/dmCode/@learnCode</objectPath>
<objectUse>Learn code must always be included in the data module
identifications</objectUse>
</structureObjectRule>
```

### 2.1.3 Object value

**Description:** The element [<objectValue>](#) contains the description of the intended meaning.

When relevant, each specific single value, range of values, or pattern value that is applicable to an element or attribute within a project or organization must be given. In addition, there should be a short description of each single value, value range, or pattern value to explain the intended meaning of the value.

Since this element is repeatable, it is possible to specify multiple and/or single values, ranges of values, or pattern values for a specific element or attribute.

Markup element: `<objectValue>`

ICN-83007-0000000023-002-01

Fig 4 Element `<objectValue>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `valueTailoring` (O), specifies if and how the given values can be tailored by a lower level BREX data module. The attribute can have one of the following values:
  - `"restrictable"` - a BREX at a lower level can impose further restrictions to the given value by changing the textual interpretation to reflect that restriction
  - `"lexical"` - a BREX at a lower level can adjust the text string constituting the interpretation, however, only in respects that do not in any way change the conceptual and semantic meaning of the interpretation
  - `"closed"` (D) - a BREX at a lower level must not in any way restrict or alter the interpretation of a value declared at this level
- `valueForm` (O), specifies the type of content contained in the attribute `valueAllowed`. The attribute can have one of the following values:
  - `"single"` - a single value applies to the object
  - `"range"` - a range of values applies to the object
  - `"pattern"` - a pattern value applies to the object
- `valueAllowed` (O), contains the specification for the single value, range of values or pattern value applicable to the object. A range should be specified in the format defined in [Chap 3.9.5.3](#). A pattern should be provided as a regular expression in accordance with "REC-xmlschema-2-20041028 "W3C Recommendation: XML Schema Part 2: Datatypes Second Edition (2004 Second Edition)"
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- textual content. Refer to [Chap 3.9.5](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).

## 2.2 Notation rules

**Description:** The element `<notationRuleList>` contains rules concerning which types of CSDB objects are allowed to contain illustrations or multimedia objects of specified formats/notations.

The element can be used to define a base set of formats/notations commonly allowable to all CSDB object types. However, as described below it is also used to specify restrictions of the base set when such restrictions are suitable to any specific CSDB object type (eg, an IPD data module).

A project or an organization can specify the base set of formats/notations (ie, the total project scope of acceptable formats/notations) by listing the allowed formats/notations using the element `<notationRuleList>` where its parent structure (ie, the element `<contextRules>`) does not name any specific CSDB object type (refer to [Para 2](#)). Since no particular CSDB object type is given, the listed formats/notations will be commonly applicable to all CSDB object types.

Sometimes there is a need in specific CSDB object types (ie, written to a certain Schema) to impose restrictions from the base set of allowable formats/notations commonly adopted by a project or an organization. This can be achieved by specifying the desired restrictions using the element `<notationRuleList>` in the context(s) concerned, where context is specified in the parent element `<contextRules>`.

#### Note

It is recommended that projects and/or organizations use the applicable BREX data module(s) to specify which formats/notations are allowed. If this is not the case, the scope of allowable formats/notations must be specified by using other means, especially since S1000D leaves an option open for users to include formats/notations not named in the specification text.

**Markup element:** `<notationRuleList>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<notationRule>`. Refer to [Para 2.2.1](#).

**Business rule decision point BRDP-S1-00370 - Include restrictions in using various illustration, multimedia object or other data information formats:**

- Decide whether to use the BREX data module to impose any restrictions in the use of various formats for illustrations, multimedia objects or other data.

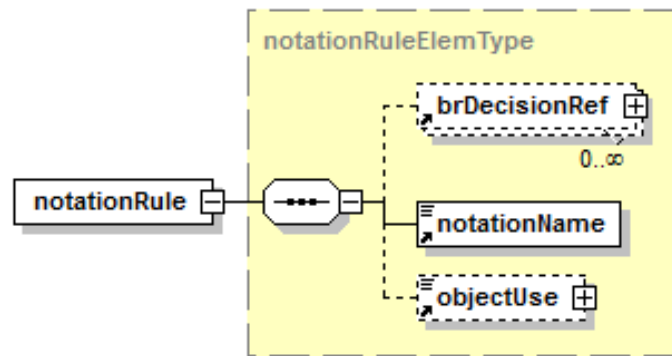

### 2.2.1

#### Notation specific rule

**Description:** The element `<notationRule>` contains the rule for one specific format/notation. Typically, the element is used to include an allowable format/notation in an explicitly specified set of formats/notations. In addition, when applied for a specified Schema/context the element can be used to explicitly exclude the use of a specified format/notation from a certain type of CSDB objects.

**Markup element:** `<notationRule>`

Each occurrence of the element represents its own notation.

ICN-83007-0000000024-003-01

Fig 5 Element `<notationRule>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- `changeType` (O), `changeMark` (O), and `reasonForUpdateRefIds` (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- `brSeverityLevel` (O). Refer to [Chap 4.10.1](#).
- `securityClassification` (O), `commercialClassification` (O), `caveat` (O) and `derivativeClassificationRefId` (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- `<brDecisionRef>`. Refer to [Chap 4.10.1](#).
- `<notationName>`. Refer to [Para 2.2.2](#).
- `<objectUse>`. Refer to [Para 2.3](#).

## 2.2.2

### Notation name

**Description:** The element `<notationName>` contains a specific format/notation name. Each format/notation, for which special project rules are given, must be specified and its intended use explained.

**Markup element:** `<notationName>`

#### Attributes:

- `allowedNotationFlag` (O), declares if and how the format/notation is applied within the context concerned. The declaration is always relative to the base set of formats/notations. Given the commonly allowable base set of formats/notations, the attribute `allowedNotationFlag` is used to further specify the applicability of various formats/notations in various contexts. The attribute can have one of the following values:
  - "0" - No, the format/notation must not be used within the project in the context concerned. Thus, by using this attribute value it is possible to exclude the use of the named format/notation from a specified CSDB object type, even though the format/notation can be allowed in other CSDB object types.
  - "1" - Yes, the format/notation is one among those that must be used in the context concerned. When no explicit context is given for the parent structure, assigning this value includes the named format/notation in the base set of allowable formats/notations. When an explicit context is given, the set of notations for that context is redefined and the format/notation will be one allowed for the context concerned. Regardless of whether the context is the base set or a Schema specific

context, several such inclusions mean that all of the included formats/notations are equally allowed.

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

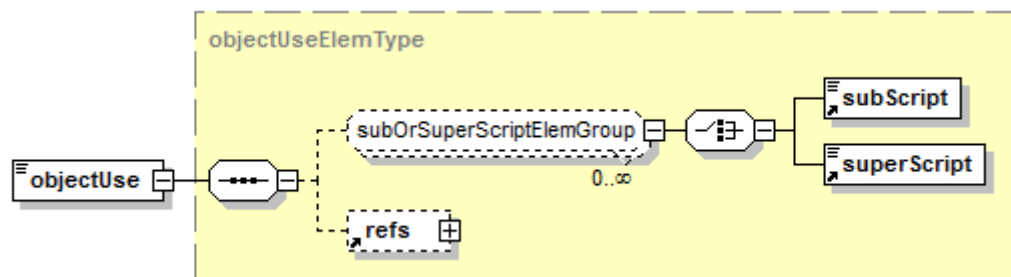

- None

## 2.3 Object use

**Description:** The element `<objectUse>` contains a specific description and intended use for each element, attribute, or notation that is recorded in the BREX data module.

The description should be a short narrative explanation of the use to the extent that interpretation of the object is perfectly clear. This description can contain references to supporting data modules and/or other technical publications, by use of the optional sub-element `<refs>` as described in [Chap 3.9.5.2.1.2](#).

**Markup element:** `<objectUse>`

ICN-N4701-AASER00023-001-01

Fig 6 Element `<objectUse>`

#### Attributes:

- id (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).
- changeType (O), changeMark (O), and reasonForUpdateRefIds (O), change indications. Refer to [Chap 3.9.5.2.1.1](#).
- securityClassification (O), commercialClassification (O), caveat (O) and derivativeClassificationRefId (O), the security and restrictive marking. Refer to [Chap 3.6](#).

#### Child elements:

- textual content. Refer to [Chap 3.9.5](#).
- `<subScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<superScript>`. Refer to [Chap 3.9.5.2.1.10](#).
- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).

## 1 General

The BREX data module content section consists of three main blocks of rules, one of which is the block of context independent rules described below. The other two blocks contain:

- SNS rules. Refer to [Chap 4.10.2.1](#).
- Context related rules. Refer to [Chap 4.10.2.2](#).

## 2 Rules not related to context

**Description:** The element `<nonContextRules>` contains the set of project-specific business rules which cannot be related to any particular schema/context or any particular elements and attributes in the schema structures.

### Note

The element must not be used for general comments.

**Markup element:** `<nonContextRules>`

ICN-N4701-AASER00006-001-01

Chap No./Document No.	Title
<a href="#">Chap 4.3</a>	Information management - Data module code
<a href="#">Chap 4.3.1</a>	Data module code - Model identification code
<a href="#">Chap 4.3.3</a>	Data module code - Standard numbering system

## 1 General

The BREX data module is stored in the CSDB. This chapter explains the data module code for a BREX data module. The general principles for the data module code are given in [Chap 4.3](#).

## 2 The BREX data module code

A BREX data module contains information about a whole Product or some part of a Product and must apply the data module code accordingly.

The model identification code for a BREX data module will in most production situations be the model identification code of the project concerned. However, BREX data modules can be developed on a higher level (eg, national or enterprise level) in order to constitute a platform for developing modules for several projects. In this situation, the organization has to allocate/apply for a model identification code that will serve the organization purposes.

The SNS code must not be applied below sub-subsystem level. The unit of assembly code of the BREX data module code must always be "00" or "0000". The disassembly code is applied as described below. As far as employment of material item category code is appropriate, depending on the scope of a BREX data module, it can be used in the BREX data module code.

The information code for a BREX data module is 022, and the item location code is set to D.

It is recommended that a project applies the same set of business rules to all data modules, and therefore has one BREX data module for the project. If this is not possible, it is recommended that the project or the organization keeps the number of BREX data modules to a minimum.

#### Note

There can be only one BREX referred to by each CSDB XML object, reflecting the business rules that apply to that particular object. Nevertheless, a CSDB object can of course fulfil the rules in several differing BREX data modules.

#### Business rule decision point BRDP-S1-00368 - Applicable sets of business rules:

- Decide which set or sets of business rules are allowed within the given project or the organization. Accordingly, decide which BREX data modules will be used to reflect those business rules.

## 2.1 Coding for single business rules documents data module

When business rules for the whole Product are contained in a single business rules document data module, that data module must be coded:

**YY-A-00-00-00-00A-022A-D** (17 characters)

thru

**YYYYYYYYYYYYYY-AAAA-Y00-00-0000-00AAA-022A-D** (37 characters)

Where "YY" and "YYYYYYYYYYYYYY" are the Product's model identifier. Refer to [Chap 4.3.1](#).

## 2.2 Coding for multiple business rules documents data modules at the Product level

When business rules for the whole Product are contained in multiple business rules document data modules, these must be coded:

**YY-A-00-00-00-NN-022A-D** (17 characters)

thru

**YYYYYYYYYYYYYY-AAAA-Y00-00-0000-NNAAA-022A-D** (37 characters)

Where:

"YY" and "YYYYYYYYYYYYYY" are the Product's model identifier. Refer to [Chap 4.3.1](#).

"NN", in the disassembly code, is a sequential number starting from "00".

Example:

Two different BREX variants are needed within a project. They both apply to the Product level. They are coded:

**XX - A - 00 - 00 - 00 - 00A - 022A - D** (17 characters)

**XX - A - 00 - 00 - 00 - 01A - 022A - D** (17 characters)

## 2.3 Coding for business rules documents data modules at the system level

When business rules apply to a specific system of a Product they can be contained in one or more business rules document data modules. They must be coded:

**YY-A-SS-00-00-NN-022A-D** (17 characters)

thru

**YYYYYYYYYYYYYY-AAAA-YSS-00-0000-NNAAA-022A-D** (37 characters)

Where:

"YY" and "YYYYYYYYYYYYYY" are the Product's model identifier. Refer to [Chap 4.3.1](#).

"SS" is the system code. Refer to [Chap 4.3.3](#).

"NN", in the disassembly code, is a sequential number for each system, starting from "00".

S1000D-F-04-10-0301-00A-022A-D	Default BREX data module

## 1 General

This chapter describes the default BREX data module provided by the specification.

## 2 The default BREX data module

Since business rules carry information essential for the correct interpretation of the content of the CSDB, the rules must be carefully recorded in a BREX data module. The project or the organization should examine the default data module to conclude if it meets the project or the organization requirements.

This default BREX data module specifies a number of rules generally applicable to the current issue of the specification. These are:

- the predefined value sets of the configurable attributes as specified as these in [Chap 3.9.6.1](#)
- the allowable information codes as these are specified in [Chap 8.4.1](#)
- the allowable learn codes as these are specified in [Chap 8.5.1](#) and [Chap 8.5.2](#)
- a collection of rules not possible to reflect directly in the Schemas

Each rule mandated by S1000D but not captured by Schema constructs corresponds to a default BREX rule, which is identified as BREX-S1-NNNNN, where:

- S1 indicates that the given rule is defined by S1000D
- NNNNN is a unique persistent number assigned by S1000D to each default BREX rule. This number will not change between Issues of this specification. Any new default BREX rule will be assigned a completely new unique default BREX rule number.

The default BREX data module specifies itself as the applicable BREX data module.

The data module code of the default BREX is S1000D-Y-04-10-0301-00A-022A-D, where:

- the system difference code, here indicated by "Y", is used to distinguish between default BREX data modules related to, and published with, different issues of the specification

For this issue, Issue 4.2, the system difference code "F" applies.

#### Note

Normally, the data module code of a BREX data module will be at the top level of the product structure (system code, subsystem code, etc, will all be zeros). The default BREX data module, since also serving as an example of how a BREX module can be marked up, is assigned a data module code distinguishing it as a part of [Chap 4.10](#).

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.2.10</a>	Content section - Process data module
<a href="#">Chap 8.4</a>	SNS, information and learn codes - Information codes

## 1 General

This chapter gives an overview of the process data module.

## 2 Process data module

### 2.1 Principle

The S1000D process data module represents a procedural flow consisting of several data modules and/or steps that are sequenced. Decision points (branching), looping, and selective filtering are supported. An interface to external applications which can return results to direct procedural flow is supported. The process data module can be considered a procedural flow script.

The process data module can be used to represent any level of granularity of information except for an entire publication. Typically, a process data module represents a small discrete task and

is simply an alternate method to markup procedural data, descriptive data, fault data, etc. A process data module can also be used to sequence several "smaller" data modules and therefore represents larger overall processes.

The process data module can be used to represent most types of information. It is especially well suited to represent procedural data, fault data and descriptive data. It is not well suited to represent wiring data, parts data and schedule data.

The conceptual logic engine component of S1000D reads a process data module as an input and executes instructions contained within. In computing terms, it acts as an interpreter on the process data module. In an IETP implementation, the logic engine can be a separate software component, or it can be directly contained within the viewer.

The process data module uses variables to control branching and looping, and to support context filtering, passing data to external applications, and providing state information to the IETP user. It is necessary to maintain the values assigned to the declared variables and to evaluate expressions containing them in support of decision points and context filtering. The variables and associated values are referred to as state information.

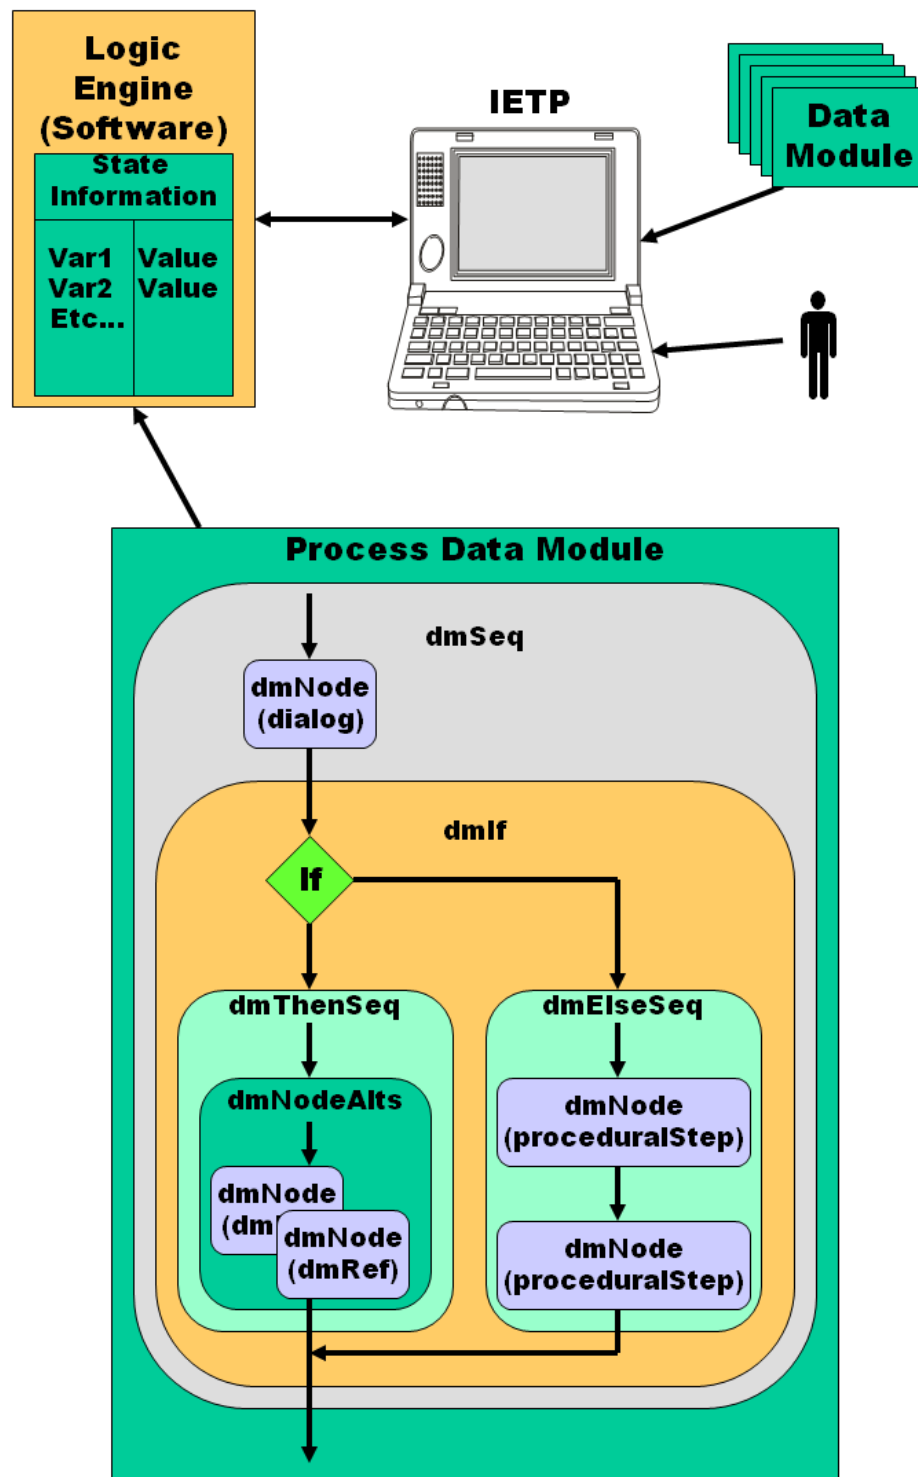

Variables can have global or local scope. Local variables are declared and initialized within the process data module in which they are to be used. Local variables are unavailable to any other data module. Global variables are defined in the ACT and CCT as applicability properties and conditions and can be initialized in the PCT. They are used for applicability processing as well as global variables in process data modules. Global variables are available to any data module.

There are several ways for variables to obtain values. Values can be directly assigned to variables within the process data module content using presets and postsets. Dialogs can be used to ask questions of the user and assign values depending on the user's answer, and external applications can return values which get assigned to variables.

The user is presented with data modules, steps and dialogs as they are sequenced within the process data module. The logic engine and the process data module work together, in the background, to guide the procedural flow. In order to allow the user to navigate thru the process data module, two functions are available:

- the "Next" function, which instructs the logic engine to continue executing the process data module until a new data module, step or dialog is to be presented
- the "Previous" function, which instructs the logic engine to return to the previous data module, step or dialog

[Fig 1](#) provides a conceptual overview of the process data module, its interaction with other data modules, the logic engine and the user.

ICN-S1000D-A-070201-A-D0216-00011-A-003-01

Fig 1 Process data module conceptual diagram

In Fig 1, a process data module sequences (one or) several occurrences of element **<dmNode>** which include an element **<dialog>**, two occurrences of element **<dmRef>**,

and two occurrences of element `<proceduralStep>`. The user interacts with the logic engine thru navigation functions ("Next" and "Previous") which instruct the logic engine to proceed or return, and thru dialog functions which collect state information values. Refer to [Chap 3.9.5.2.10](#) for more details.

The architecture in [Fig 1](#) implies that the logic engine and the IETP are separate components. This architecture is used only for illustration purposes and is not mandated by S1000D. Any number of architectures can provide the same functionality.

A typical sequence of operation includes:

- 1 The logic engine starts executing the process data module.  
The element `<dmNode>` (dialog) is executed.  
The logic engine sends the dialog fragment to the IETP for display to the user.
- 2 The user answers the dialog in the IETP.  
The IETP sends the user response to the logic engine.  
The logic engine updates the appropriate variable in the state information table.
- 3 The element `<dmIf>` is executed.  
The logic engine evaluates the (IF) expression against variables in the state table.  
The logic engine determines which path to take.
- 4 Assuming the element `<dmThenSeq>` branch:
  - 4.1 The element `<dmNodeAlts>` is executed.  
The applicability expression of each element `<dmNode>` within element `<dmNodeAlts>` is evaluated against variables in the state table.  
The first element `<dmNode>` with its applicability expression evaluated to TRUE is executed.
  - 4.2 The element `<dmNode>` (containing an element `<dmRef>`) is executed.  
The logic engine notifies the IETP to display the referenced data module.  
The IETP locates the data module and displays it to the user.
- 5 Assuming the element `<dmElseSeq>` branch:
  - 5.1 The element `<dmNode>` (proceduralStep) is executed.  
The logic engine sends the element `<proceduralStep>` fragment to the IETP for display to the user.
  - 5.2 The user activates the "Next" function within the IETP.  
The IETP notifies the logic engine to move NEXT.
  - 5.3 The second element `<dmNode>` (proceduralStep) is executed.  
The logic engine sends the element `<proceduralStep>` fragment to the IETP for display to the user.

## 2.2 Benefits

The process data module adds some advanced capability not available from other data module types. The cost of these advanced capabilities is complexity, both in the applications to create and display the data, and in the data itself. A project or an organization must carefully consider the requirements for these advanced capabilities and use them where the benefits will outweigh the additional effort.

### 2.2.1 Applicability processing model

The process data module provides for the use of expressions within applicability. The element `<expression>` has all the capabilities of the standard applicability structure. It contains the element `<assert>` and can thus employ applicability properties/global variables anywhere within it. In addition, expressions provide access to local variables and higher math functions. As a result, the IETP can customize the display to the user based on known product configuration, operating conditions, or any previously collected information.

### 2.2.2 Interaction with the user

The process data module can be much more interactive than other data module types. Dialogs can ask the user questions and store the answer for further use. These answers can be used to direct the maintenance flow and the customized display. State information can also be displayed to the user in paragraphs, prompts, and other structures.

### 2.2.3 External application interface

An external application interface is provided that allows for initiating a software program external to the IETP, sending information to that external application and retrieving results. One of the more powerful uses of this is to interface with automated test equipment or even the Product itself to retrieve information that will further direct the maintenance flow. This works much the same as the interaction with the user, but it is a machine interface.

### 2.2.4 Branching and looping

If-then-else branching is supported in the process data module along with conditional looping. The point of branching is to simplify the maintainer's navigation thru a procedure by ensuring everything he sees is applicable to him in his current circumstance. Looping can ensure that a user performs a complicated series of actions repeatedly until some goal is achieved. Conditional constructs such as these make navigation through the same data potentially different every time it is used dependent on equipment configuration, equipment failure conditions, operating conditions or any number of variables created within the data module.

## 2.3 Identification of a process data module

A process data module must always be written with a maintenance or operational goal in mind. As such, the standard method of assigning data module codes must be applied. In the case where an information code cannot be found to express the maintenance or operational goal, the generic process information code 951 is available. Refer to [Chap 8.4](#). The implication of using this method is that the maintenance or operational goal represented by the process data module is not available.

## 1 General

This chapter describes the management of multiple instances of the "same" CSDB object. There are several situations where multiple instances can be required, which adds another level of complexity to the identification of the objects concerned.

The most prominent need for multiple instances of a CSDB object is in the relation between a manufacturer and his customers. Normally manufacturers have to maintain information, ie, data modules, for all configurations of a product whereas a specific customer, who owns and operates a limited number of product configurations, is only concerned with the information that is applicable to his specific configurations.

For example, there can be a need to create one data module instance per customer. Instances will be derived from the master data module by filtering mechanisms based on applicability, where filtering includes removal of information applicable to product configurations (which do not belong to the considered customer). This strategy is often referred to as the master-customized concept.

The various CSDB object types that can appear in several instances are:

- the data module
- the publication module
- the SCORM content package module
- the data update file

For a more thorough definition of the term applicability, refer to [Chap 3.9.5.3](#).

## 2 The conceptual model

The discussion below describes the incentives for allowing multiple instances of data modules and how unique identities and object traceability are achieved. It should be recognized, though, that the principles of the discussion applies similarly to all the objects that can exist in multiple instances, regardless of their type.

When allowing multiple instances (refer to business rule decision point in [Para 3.1](#)) the object identifier is extended with two preceding attributes (refer to [Para 3.4](#)) and the object code is renamed as follows:

- the data module code (DMC) becomes the Extended data module code (Data Module code - Extended (DME))
- the publication module code (PMC) becomes the Extended publication module code (Publication Module code - Extended (PME))
- the SCORM content package module code, also known as SCORM Module Code, (SMC) becomes the Extended SCORM content package module code (SCORM content package Module code - Extended (SME))
- the data UPdate File code (UPF) becomes the data Extended update file code (data UPdate file code - Extended (UPE))

The conceptual model of identifying multiple instances of data modules is detailed in [Para 3](#). The same applies to all the objects listed above.

For detailed information about file names, refer to [Chap 7.5.1](#).

## 3 Conceptual model applied to data modules

The data module is a central concept in S1000D. It is the smallest independent piece of data that is administered by S1000D.

### 3.1 Data module instances

A data module can be instantiated in several instances (customer variants etc). For example, this could be due to needs for:

- an updated and new issue of the data module
- ongoing updating that generate a new in-work version
- a data module variant in a second, third, etc, language
- a data module variant in a particular (country related) dialect of a language
- a variant marked up using a different S1000D version
- a self-contained instance derived from a data module - dependent on Common Information Repository (CIR) data module(s) - and the associated CIR data module(s). Refer to [Chap 4.13.1](#).
- instances that for other reasons than above are generated to the specific needs of a particular user community, for example a tailored for certain customer's product versions

The first two examples represent the normal situation, typically information about a Product that needs updating for various reasons during the product lifecycle. The other examples represent a feature in S1000D that is frequently used when there are multiple customers for a single data module.

Different customers of a Product often have different configurations of that Product and so, the supporting information must reflect those configurations. S1000D provides the means to filter a master data module to generate several customer specific instances - applicable to the various configurations and effective to the various customers' needs. Such filtering is based on the metadata provided with the data module and, in particular, based on the applicability given for the master data module as a whole and optionally for fragments of those data modules that use referenced applicability. Refer to [Chap 3.9.5.3](#).

A specific instance can also be generated by resolving the references to CIR from a master CIR-dependent data module, and thereby insert the target fragments into the generated instance. Such a generation is managed by the publication process.

It is important to understand that even though an instance of a data module can be derived from another data module (eg, a source/master) it is managed as an independent data module in the same way as its source. For example, even though it is not normally the case, a source data module can be deleted while the instances derived from it still exist.

Even though a data module instance can be derived as the result of a filtering process where data is extracted based on referenced applicability markings, there are cases when this is not possible, and each instance must be created and managed separately.

#### Business rule decision point BRDP-S1-00373 - Use of multiple instances of CSDB object:

- Decide whether to generate multiple instances of CSDB objects to generate several customized instances of any one object issue. If so, decide how the attributes `extensionProducer` and `extensionCode` must be used.

### 3.2 Applicability and sensitivity

#### 3.2.1 Applicability

Applicability is used to indicate which configuration of a Product that data module supports. The range and scope of a data module's applicability is declared in the identification and status section (Refer to [Chap 3.9.5.1](#)) and the specific applicability for various configurations is declared in the content section, using referenced applicability. Refer to [Chap 3.9.5.3](#).

#### 3.2.2 Sensitivity

When there are multiple customers, it is possible that any one (or more) of those customers do not wish to take delivery of information that supports a configuration of the Product that they have not received. Further, there can be cases where a particular customer does not wish other

customers to know that he has taken delivery of a particular configuration of the Product and, therefore, not even reveal that he receives the supporting data modules for that configuration. In cases like this, applicability within S1000D can be used to filter the information.

### 3.3 Data module identification

A data module is identified by the parameters specified in its identification and status section. In several cases it is sufficient to use only a subset of these parameters to uniquely identify a data module globally. The most applied subset consists of the data module code but it is quite common that issue and inwork numbers and language/country codes are added to provide the unique identification.

[Chap 7.5.1](#) describes how data module files are named based on the following parameters (with subparameters) in order to achieve globally unique identities in a web environment:

- data module code, element [<dmCode>](#) with attributes
- language, element [<language>](#) with attributes
- issue number, element [<issueInfo>](#) with attributes

### 3.4 Data module instance identification

#### 3.4.1 Data module code extension

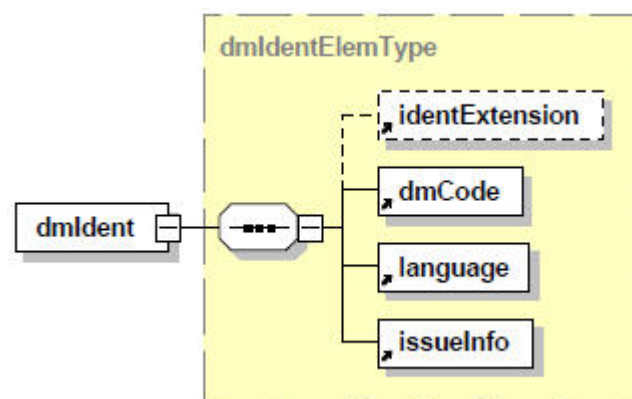

When there are several instances of a data module, the instances must be properly and uniquely identified.

To ensure that uniqueness of the identity is always achieved, there is an extended identification scheme available for instances of a data module. This scheme ensures that unique identities are provided, regardless of the reasons or situation that requires the extended identification.

The identification scheme adds two attributes that contain extra parameters in addition to those mentioned in [Para 3.3](#).

**Description:** The element [<identExtension>](#) establishes a producer unique subdomain for instance identification. The data module identification extension gives the additional parameters needed to establish a unique identification of a data module in those cases when data module code, issue and in-work numbers together with the language and country are insufficient to form a universally unique identity.

**Markup element:** [<identExtension>](#)

ICN-N4701-AASER00009-001-01

Fig 1 Element [<identExtension>](#)

**Attributes:**

- `extensionProducer` (M), the CAGE code of the producer of the data module instance
- `extensionCode` (M), the data module extended code. The value is decided by the data module producer. Typically, but not necessarily, it will contain a customer related content. When it is used, it must contain uppercase alphabetic (A-Z) and numeric (0-9) characters.

**Child elements:**

- None

**3.4.2 Basic identification items**

The basic identification parameters, contained in the element `<dmCode>`, the element `<language>` and the element `<issueInfo>` are applied in the same way to all instances. An implication is that issue numbering is specific to each instance, and the increase in issue numbers does not have to be synchronized between various instances and their sources.

**3.4.3 Data module code extension interchange**

[Chap 7.5.1](#) explains how this extended identification scheme is applied to interchange file names.

**3.5 Instance traceability**

To ensure the traceability of the master data module, related to its instances, it is possible to record the identification of the source data module from which an instance has been derived. When an instance is created from a master data module, the content of the element `<dmAddress>` of the source is copied into the corresponding element `<sourceDmIdent>` within the status section of the new instance.

When the instance is derived from a CIR-dependent master data module, the content of the element `<dmAddress>` of the associated CIR data modules is copied into the optional and multiple element `<repositorySourceDmIdent>` within the status section of the new instance.

The element `<dmAddress>`, of the new instance is updated to reflect its particular properties, if these differ from the source. Typically, element `<identExtension>` (containing attribute `extensionProducer` and attribute `extensionCode`) as well as element `<issueInfo>` must be updated.

**3.6 Instance referencing**

Usually, it is not of interest to address a particular instance of a data module in a data module reference, since the use case will keep track of which instance that is the relevant one.

However, there can be cases when a direct reference to a particular instance, out of several possible, needs to be addressed. In order to enable such referencing, the element `<dmRef>` is supplied with sufficient parameters to point at any instance using the regular or the extended identification scheme. [Chap 3.9.5.2.1.2](#) describes how `<dmRef>` can be populated.

## 1 General

### 1.1 The common information repository concept

The Common Information Repository (CIR) data modules are listing common information objects of a certain type (eg, parts, zones, warnings) with their description. Each object is accompanied with an extensive set of properties (eg, name, short name in the parts or the zones CIR), its full wording (eg, warning text and caution text in the warnings and the cautions CIR) or applicability annotations (applicability statements in the applicability annotations CIR).

The CIR concept supports the concepts of optimizing, non-redundancy and re-use of information.

This concept can be implemented in the CSDB by setting up internal databases based on the content and structure of the CIR data modules. These internal databases can then be used to generate the CIR data modules upon request for internal use, for delivery (eg, in the case of data exchange) or for publication.

The CIR concept supports the two basic uses of the S1000D (refer to [Chap 1.3](#)):

- Publishing
- Data consistency and exchange

A project can use the CIR concept for publishing as well as data consistency and exchange or only for one of these purposes.

The CIR data module structure is described in one single XML Schema, the Common repository XML Schema (comrep.xsd), which includes a branch for each of the following object types:

- Functional items
- Circuit breakers
- Parts
- Zones
- Access points

- Support equipment
- Enterprises
- Supplies
- Supply requirements
- Functional and/or physical areas
- Controls and indicators
- Applicability annotations
- Warnings
- Cautions

Refer to [Chap 3.9.5.2.11](#) for detailed information about each common information type.

This chapter gives an overview of the CIR concept, why to use it and how to implement it.

## 1.2 Publishing

A CIR data module can be published as a data module in a page-oriented publication or be used in an IETP.

## 1.3 Classical data modules and common information objects

As regards to classical data modules (procedures, IPD data modules, etc), some common information object properties consists of additional information. For example, the zone properties are not mandatory information for a maintenance task. Simple references to the zone properties can be interesting and enough to fulfill the maintenance task without getting any further properties of the object than the zone number itself. The maintenance task data module remains self-standing without the zone properties. For more information on self-standing data modules, refer to [Chap 1.3](#).

Some other common information objects consist of mandatory information for the classical data modules, which are not self-standing anymore without this information. It is the case for the applicability of a data module for example. Such data modules, from which a piece of information is externalized into a CIR data module, are called the "CIR-dependent" data modules. Refer to [Para 6](#).

When publishing page-oriented publications, the data modules must be self-standing (ie, normalized). This means, that only a limited set of mandatory data from the CIR data modules is included (not linked) in the data modules delivered to the customer or end user. For example, applicability annotations and warnings must be included in the data modules for page-oriented publications and not linked to CIR data modules.

When publishing an IETP, CIR-dependent data modules can be used. It means that mandatory data from the CIR data modules are not necessarily included in the data modules prior to delivery to the customer or end user.

## 1.4 Data consistency and exchange

A CIR data module can be used in the production process either:

- as an "internal repository" for a certain type of information objects, or
- for data exchange between project partners' CSDB or for delivery to customers' CSDB

The use as an "internal repository" supports the consistency of basic data and enables a "late" inclusion of some of the common information into data modules before delivering self-standing data modules. The "late" inclusion minimizes unnecessary updates of data modules before final approval and delivery. For example, the inclusion of name and short name can be automatically included before delivery or publishing process.

### Note

For most of the common information types (except warnings, cautions, applicability annotations and parts), the exchange of CIR data modules enables exchanging more

properties than the late inclusion into self-standing data modules due to XML Schema limitation.

## 1.5 General business rule decisions

The use of CIR concept and data modules is optional. If the CIR concept is used, decisions on its implementation, types and publishing must be made.

### **Business rule decision point BRDP-S1-00374 - Use of the CIR concept (internal databases for common information):**

- Decide whether to use the CIR concept.

### **Business rule decision point BRDP-S1-00376 - Internal/External use of CIR data modules:**

- Decide whether the CIR data modules must be used only internally to the manufacturer or integrator, as part of the production/integration environment ("internal repositories") or if the CIR data modules are also a deliverable to the customer.

### **Business rule decision point BRDP-S1-00377 - Types of CIR data modules to be used:**

- Decide which CIR data module types to be used. In order to avoid any redundancy and inconsistency, care must be paid on some types, depending on other project specific decisions, for example tailoring of the S2000M (IPD data modules vs parts CIR data module).

### **Business rule decision point BRDP-S1-00378 - Delivery of CIR-dependent data module:**

- Decide whether CIR-dependent data modules are delivered to customer, as it implies a specific process to retrieve the self-standing data modules from the CIR-dependent data module and the CIR data module.

### **Business rule decision point BRDP-S1-00379 - Publishing of CIR data modules:**

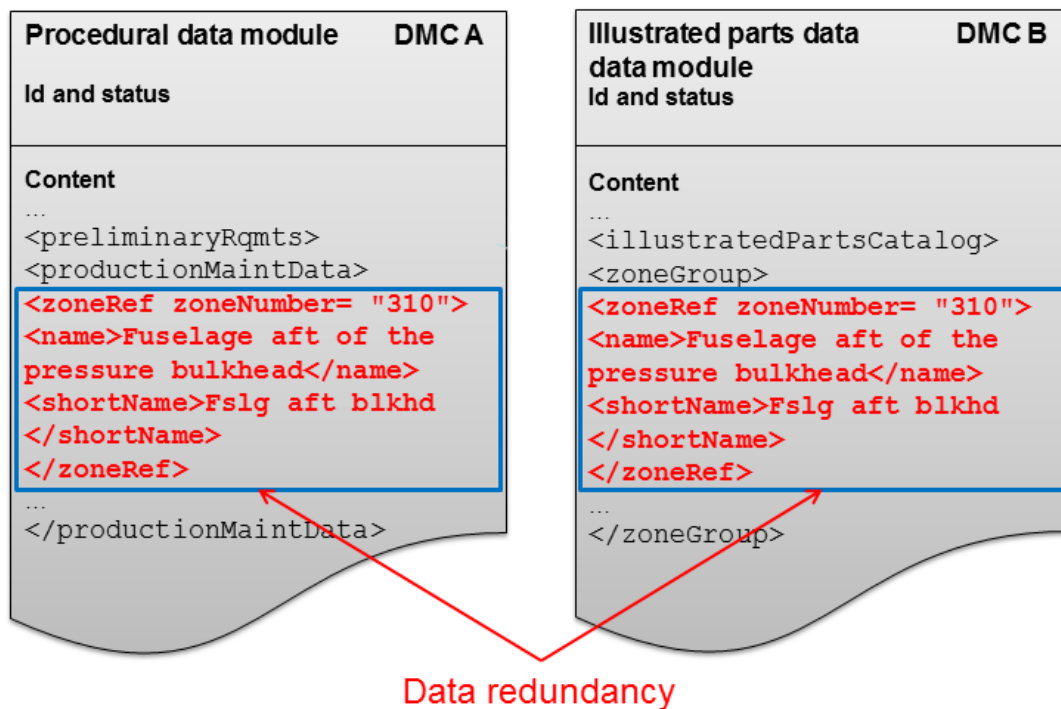

- Decide whether and which CIR data module types to be published.

## 2 Common information repository principle

The CIR data modules are database-oriented data modules, which contain common information objects with their associated properties. A CIR data module follows the same configuration rules as any other type of data module (eg, data module coding, data module issue number update and data module status).

They are database-oriented because of their structure (list of entries with properties) and because they can be generated from internal databases in the production environment. For instance the zones CIR is basically a list of zones with their associated properties (eg, zone number, description, boundaries, contained zones, illustrations).

These common information objects can be used in many places in many data modules. For example, zones appear several times within data modules and across data modules (eg, procedural data modules, IPD data modules). If not using a zones CIR data module, the zone properties would have to be repeated each time the zone is used. It means duplication of data, as shown in [Fig 1](#).

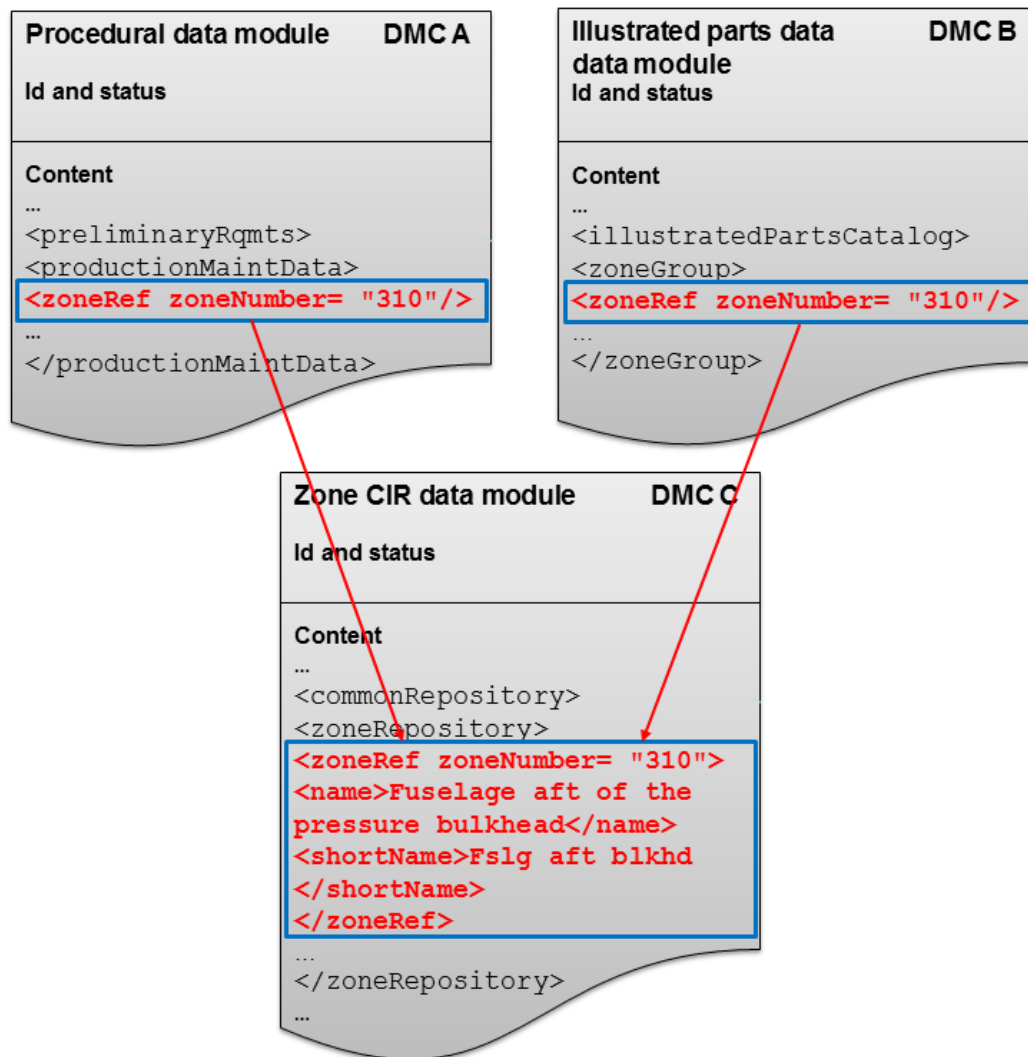

ICN-S3627-S1000D0596-001-01

Fig 1 Data redundancy

The duplication of data can lead to data inconsistency and adds complexity for data receivers modifying the data and thus having to perform the same modification in several places.

Instead of duplicating the zone properties each time the zone is used and to avoid complicating the data modules with too much information, the CIR concept has been introduced. It is a neutral place where these properties are stored only once and avoids the duplication of information, as shown in [Fig 2](#).

ICN-S3627-S1000D0597-001-01

Fig 2 The CIR data module concept

The concept also enables the implementation of a data module describing zoning information following a dedicated XML Schema. This zones CIR data module can then be published to provide general zoning information in the publications. Refer to [Para 3.2](#).

### 3 Reasons for using common information repositories

#### 3.1 Data consistency and exchange optimization

The use of CIR data modules in a data exchange context supports the following purposes:

- Reducing information redundancy and increasing data consistency within the publication package
- Reducing the data exchange volume
- Easing data exchange between partner companies, subcontractors and customers who want to process and modify the data

Instead of duplicating properties of a common information object each time it is used within a data module, the CIR data module enables gathering these properties in one place. When these

properties are used in maintenance data modules, a link can be made to the CIR data module. The non-duplication supports data consistency within the publications.

#### Note

The CIR concept supports the data consistency with the management of internal repositories within the production environment for repeated information. This is commonly used for support equipment, consumables, warnings, etc.

Reducing the data exchange volume helps:

- Speed-up the online data loading. The data can be downloaded online by the customers that will then work on it. There can also be a need to load the data for example onboard an aircraft. The need to speed-up the loading is especially essential in this context where the technology used is different and less effective.
- Reduce processing time and guaranteeing data consistency for customers who would like to extract and load common information data into databases. For example:
  - The implementation of the applicability annotations CIR data module can significantly reduce the volume of exchanged data, as the applicability annotations are stored once in the CIR data module and referenced from all other data modules. For projects or organizations, which data modules are often revised only because of applicability annotation changes, the use of the applicability annotations CIR avoids delivering the data modules when only their applicability has changed.
  - Delivering the warnings with the warnings CIR data module will enable customers who want to translate the warnings into a specific language to translate it once in the warnings CIR data module, instead of several times in each data module where the warnings are used.

## 3.2 Publishing

CIR data modules can be used to publish structured information based on the dedicated Common repository XML Schema. Using this dedicated XML Schema gives semantic tagging of the information which can be associated to advanced functionalities in an IETP.

For example, using the zones CIR data module will enable publishing of detailed zone information as a document in a page-oriented publication. The zones CIR can then be seen as a consolidated list for zone information for the publication or publication package. In the case of publishing a CIR data module, the project or the organization can provide an introductory text by populating the element `<commonInfo>` within the CIR data module.

If the publication is distributed in PDF format, any links to a specific zone can direct the user to the detailed information in the published zones CIR. The same zones CIR can be used in an IETP to support the same basic linking of information as in the PDF publication, but there can be several more advanced functions in the IETP for, for example, searching and presenting the information.

## 4 Common information repository data module coding

CIR data modules are allocated data module codes in the same way as other data modules. Refer to [Chap 4.3](#).

A specific information code is allocated for each CIR data module type. Refer to [Chap 8.4](#) for the information code definitions.

For each of the CIR types, it is recommended to have only one data module within a project or an organization (or at least for a specific model identification code). In the case of several data modules for a dedicated CIR data module type, the granularity of these data modules can be determined by the application of the Standard Numbering System (SNS). Refer to [Chap 4.3.3](#).

Using a single CIR data module for the Product means that the CIR data module is valid for a whole publication package or a whole CSDB. For this type of implementation setting the value of the SNS to 00-00-00 is recommended.

An example of data module coding for the parts CIR data module, when only one parts CIR data module is used (SNS: D00-00-00) is:

DMC-S1000DLIGHTING-AAA-D00-00-00-00AA-00GA-D

Where "00G" is the information code for a parts CIR data module

**Business rule decision point BRDP-S1-00380 - Use of one or several data modules for a CIR type:**

- Decide whether there is one single or several data modules for a dedicated type of CIR data module within a project or an organization, or for a specific model identification code.

## 5 References to common information repository data modules

References from maintenance data modules to common information objects and their properties in a CIR data module are made using content specific data elements (eg, [<zoneRef>](#), [<partRef>](#), refer to [Chap 3.9.5.2.1.10](#) and to [Chap 4.16](#)). Two alternate methods can be used:

- Implicit, which uses the object identifier only
- Explicit, which uses the object identifier and a reference to the CIR data module

In order to cover the two reference methods, content specific data elements share a similar definition, comprising:

- a mandatory object identifier uniquely identifying the object. This identifier is represented by one or several semantic attributes. For example, the part is identified by the attributes `partNumber` and `manufacturerCodeValue` of the element [<partIdent>](#) in the CIR part data module and the associated element [<partRef>](#) in maintenance data modules.
- an optional CIR data module identifier, using the element [<dmRef>](#)

### Note

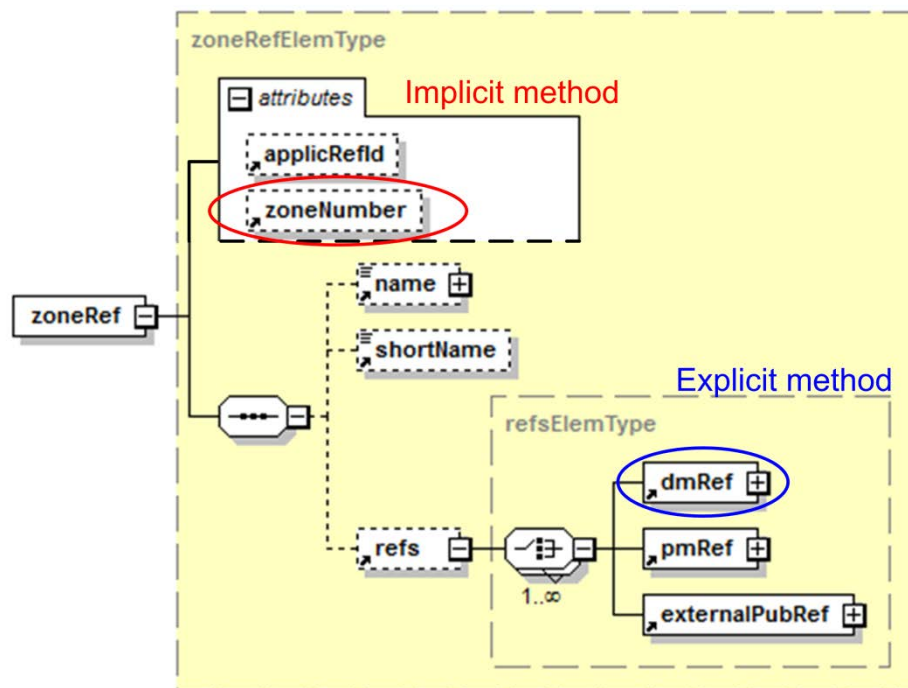

It is possible to make a reference to a particular common information object within a CIR data module using the attribute `referredFragment` in the element [<dmRef>](#).

When referencing a common information object from another data module, different IETP display methods can be applied. For example:

- embedded into the referencing data module text
- displayed as a fragment in a pop-up window
- whole CIR data module shown in the main window

The element [<behavior>](#) can be used to specify which display method has to be used, when explicit references to CIR data module are made.

ICN-S3627-S1000D0600-001-01

Fig 3 Reference methods

## 5.1 Reference methods

### 5.1.1 Implicit referencing

The reference is resolved by using only the attribute values of the identifier of the information type, for example, the value of the attribute `zoneNumber`, in the element `<zoneRef>`, or the value of the attribute `partNumberValue` and the value of the attribute `manufacturerCode` in the element `<partRef>`.

### 5.1.2 Explicit referencing

The reference is resolved by both the element `<dmRef>` (referring to the corresponding CIR data module) and the attribute value of the identifier of the considered information type element, for example the value of the attribute `zoneNumber` in the element `<zoneRef>`, or the value of the attribute `partNumberValue` and the value of the attribute `manufacturerCode` in the element `<partRef>`. An alternative to use the attribute value of the identifier must use the attribute `referredFragment` on the element `<dmRef>`.

**Business rule decision point BRDP-S1-00381 - Use of implicit or explicit reference method to CIR data module:**

- Decide whether to use implicit or explicit references, or both, between content specific data elements and the CIR data modules.

#### Note

It is recommended to use only one method to avoid difficulties which can appear during the publishing process.

## 6 CIR-dependent data module

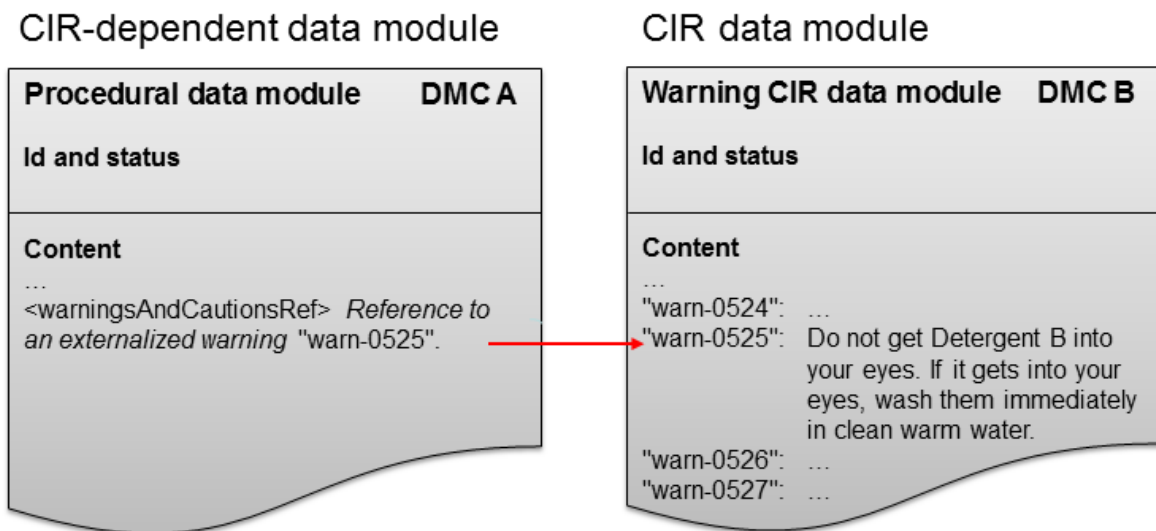

### 6.1 Definition

The CIR-dependent data modules are data modules from which a piece of mandatory information has been externalized to a CIR data module. This concerns the following CIR types:

- warnings
- cautions
- applicability annotations

Warnings and cautions contribute to the safety and can be mandatory in, for example, a procedure. Thus special attention must be paid to the use of CIR data modules for warnings and cautions due to the potential safety impact.

The references from CIR-dependent data modules to CIR data modules are inclusions, as opposed to simple references. Refer to [Para 1.3](#). By definition these data modules are not self-standing anymore as a piece of information has been "removed" and externalized into a CIR. Refer to [Fig 4](#).

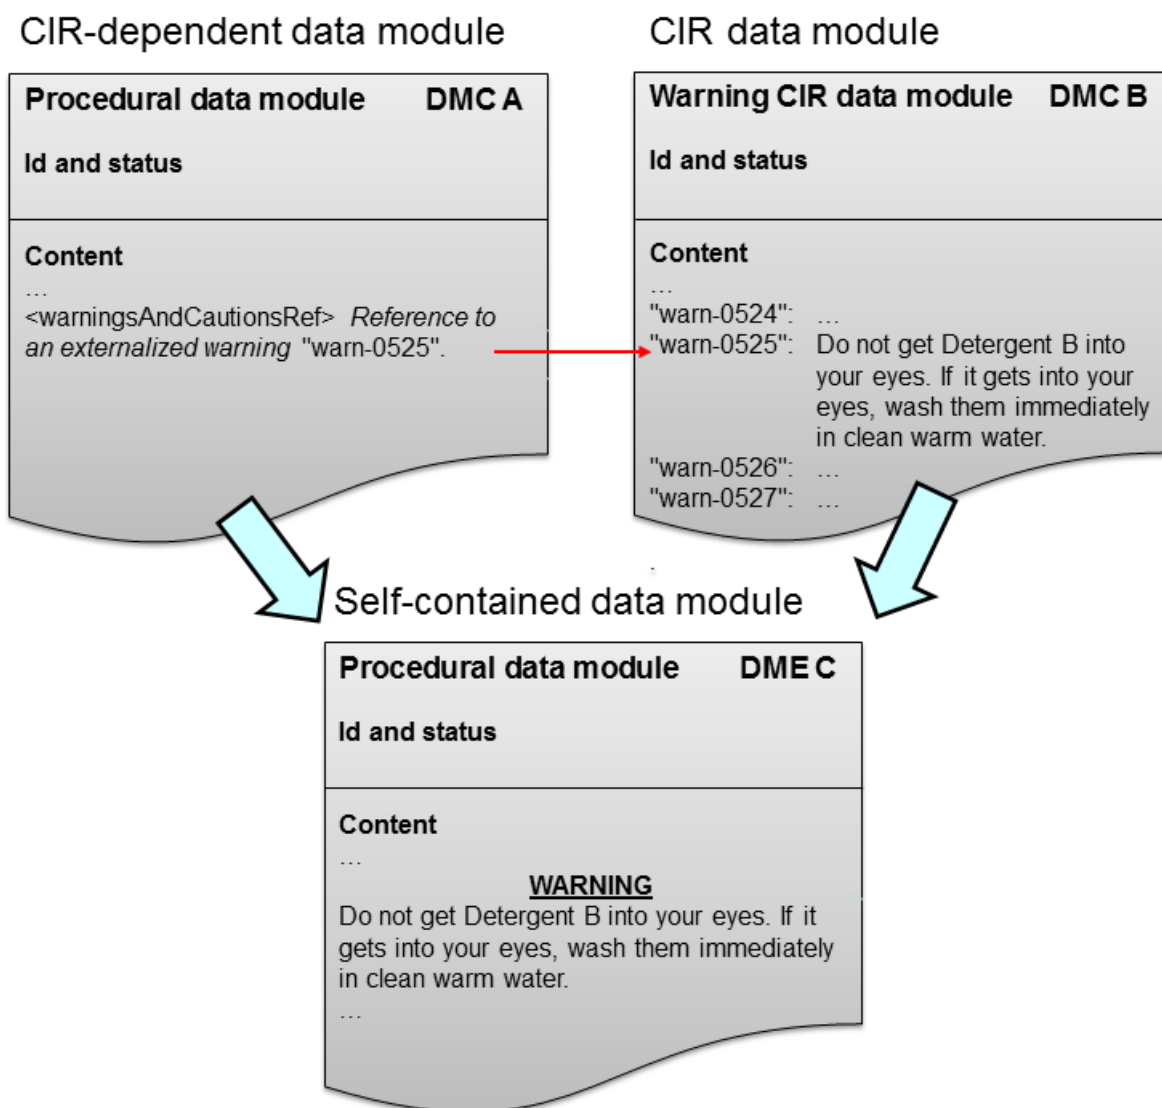

ICN-S3627-S1000D0598-001-01

Fig 4 CIR-dependent data module

### 6.2 Externalization principle

The externalization is a mechanism that can be used by projects or organizations exchanging data, as opposed to projects or organizations exchanging publications only (refer to [Chap 1.3](#)) and striving to optimize the data exchange by reducing the volume of the "CSDB interchange package".

For publishing, the externalization can, and in most of the cases must, be resolved. It means that a self-standing data module can always be retrieved from the CIR-dependent data module and the CIR data module as presented in [Fig 5](#).

ICN-S3627-S1000D0599-001-01

Fig 5 Externalization principle

## 7 Building self-standing data modules from CIR-dependent data modules

### 7.1 General

Self-standing customized publications (publications without use of CIR data modules) are built from CIR-dependent and CIR data modules creating self-standing data modules. These self-standing data modules are called "publication self-standing data modules".

#### Note

Data modules which are not depending of any CIR content are also self-standing data modules.

To build publication self-standing data modules, the publication manager must use the master-customer concept. Refer to [Chap 4.12](#). Applying this concept to a CIR-dependent data module makes the self-standing data module a "customer" instance of the CIR-dependent data module (master).

## 7.2 Identification of a publication of self-standing data modules

The first time a publication is built from CIR-dependent data modules and when corresponding publication self-standing data modules are created, it is necessary to:

- retrieve the list of CIR-dependent data modules and create the corresponding publication self-standing data modules
- assign DMC and extension code (DME, refer to [Chap 4.12](#)) to the publication self-standing data modules based on the DMC of the CIR-dependent data modules
- indicate in the elements `<sourceDmIdent>` (for CIR-dependent data module) and `<repositorySourceDmIdent>` (for CIR data module) from which master data modules these self-standing data modules have been built. The issue numbers of the master data modules must be indicated.
- assign the issue number "001" to the publication self-standing data module and the status "New"

The next time the publication is updated:

- Existing publication self-standing data modules awaiting update must be retrieved. Refer to [Para 7.3](#).
  - If the publication self-standing data modules must be updated, then the publication self-standing data module content must be updated (refer to [Para 7.4](#)) and its issue number incremented
  - If the publication self-standing data modules do not need to be updated, the existing publication self-standing data module issues can be published as is
- New publication self-standing data modules have to be created from any new CIR-dependent data modules.

## 7.3 Deciding which publication self-standing data modules need updating

This step occurs when a publication has to be updated, for example when a new CSDB interchange package is received.

An existing publication self-standing data module must be updated if any of the following applies:

- Its CIR-dependent master data module has a new issue number
- One of the externalized information objects has been updated in the CIR data module

## 7.4 Publication self-standing data module content

Publication self-standing data modules must be updated if:

- the CIR-dependent data module has been updated since previous publication. The new issue of the CIR-dependent data module must be used to create a new issue of the publication self-standing data module. Then links to externalized common information objects must be resolved. Refer to [Para 7.5](#).
- the CIR-dependent data module has not been updated since previous publication. The publication self-standing data module must be duplicated and its issue number must be incremented as well as the issue status has to be set to revised. Then links to externalized common information objects must be resolved. Refer to [Para 7.5](#).

## 7.5 Adding externalized information objects

In the publication self-standing data modules, the element `<xxxRef>` (eg, `<warningRef>`) branches indicating a reference to externalized data in the CIR-dependent data module, must be superseded by the element `<xxx>` branch (eg, `<warning>`), which will contain the actual content (eg, the warning text).

The following examples indicate how to resolve the links from the CIR-dependent data module and the CIR data module to make a CIR-dependent data module a publication self-standing data module.

#### Example 1: CIR-dependent data module

```
<content>
<warningsAndCautionsRef>
<warningRef id="warn-0001" warningIdentNumber="warn-
00525"><dmRef><dmRefIdent><dmCode
modelIdentCode="S1000DLIGHTING" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="0A3" infoCodeVariant="A" itemLocationCode="A"/>
</dmRefIdent></dmRef>
</warningRef>
</warningsAndCautionsRef>
<procedure>...</procedure>
</content>
```

#### Example 2: Warnings CIR

```
<commonRepository>
<warningRepository>
<warningSpec changeType="modify">
<warningIdent warningIdentNumber="warn-00525"></warningIdent>
<warningAndCautionPara>Make sure that the bulb is cool before
you replace it.</warningAndCautionPara>
</warningSpec>
...
</warningRepository>
</commonRepository>
```

#### Example 3: Publication self-standing data module (links resolved)

```
<warningsAndCautions>
<warning id="warn-0001" changeType="modify">
<warningAndCautionPara>Make sure that the bulb is cool before
you replace it.</warningAndCautionPara>
</warning>
</warningsAndCautions>
<procedure>...</procedure>
</content>
```

The following rules must be applied, when resolving the links and adding externalized data:

- The attribute `id` of the element `<xxxRef>` must be reported to the element `<xxx>`, so that the intra-data module collection of warnings, cautions and applicability annotations works. Refer to [Chap 3.9.3](#) for warnings and cautions and [Chap 3.9.5.3](#) for applicability annotations. In the previous example, attribute `id "warn-0001"` to the element `<warningRef>` is reported on the element `<warning>`.
- The attribute `changeType` (and the associated attribute `reasonForUpdateRefIds` and the attribute `changeMark` information) from the element `<xxxSpec>` in the CIR data module must be reported to the element `<xxx>`. In

---

the previous example, the attribute `changeType` "modify" from the element `<warningSpec>` is reported to the element `<warning>`.

Therefore, the indication of change for the publication self-standing data module is provided by the CIR data module. When this is implemented, the project or the organization must manage change marks within the CIR data modules.

## 1 General

The Data update file is a dedicated type of CSDB object. This file can be used to deliver fragments from a given Common Information Repository (CIR) data module. These fragments correspond to the ones that have been added, deleted, modified or reinstated since a previous issue of the CIR data module. Refer to [Chap 4.13.1](#).

#### Note

The use of the Data update file is limited to the update of CIR data modules and it can be used in the context of data exchange only.

It avoids delivering a whole data module. The advantage of using the Data update file is to optimize the data exchange by reducing the volume of the "CSDB interchange package". Refer to [Chap 4.13](#).

This chapter provides more information about the Data update file concept:

- CIR incremental update principles. Refer to [Chap. 4.13.2.1](#).
- Data update file content. Refer to [Chap. 4.13.2.2](#).

## 1 General

Common Information Repository (CIR) data modules can become huge throughout their life cycle. Typically, a source CIR data module is changed and delivered to the data receiver, who can, for example, use it to for loading into databases.

The increasing volume of CIR data modules can cause data exchange problems, such as:

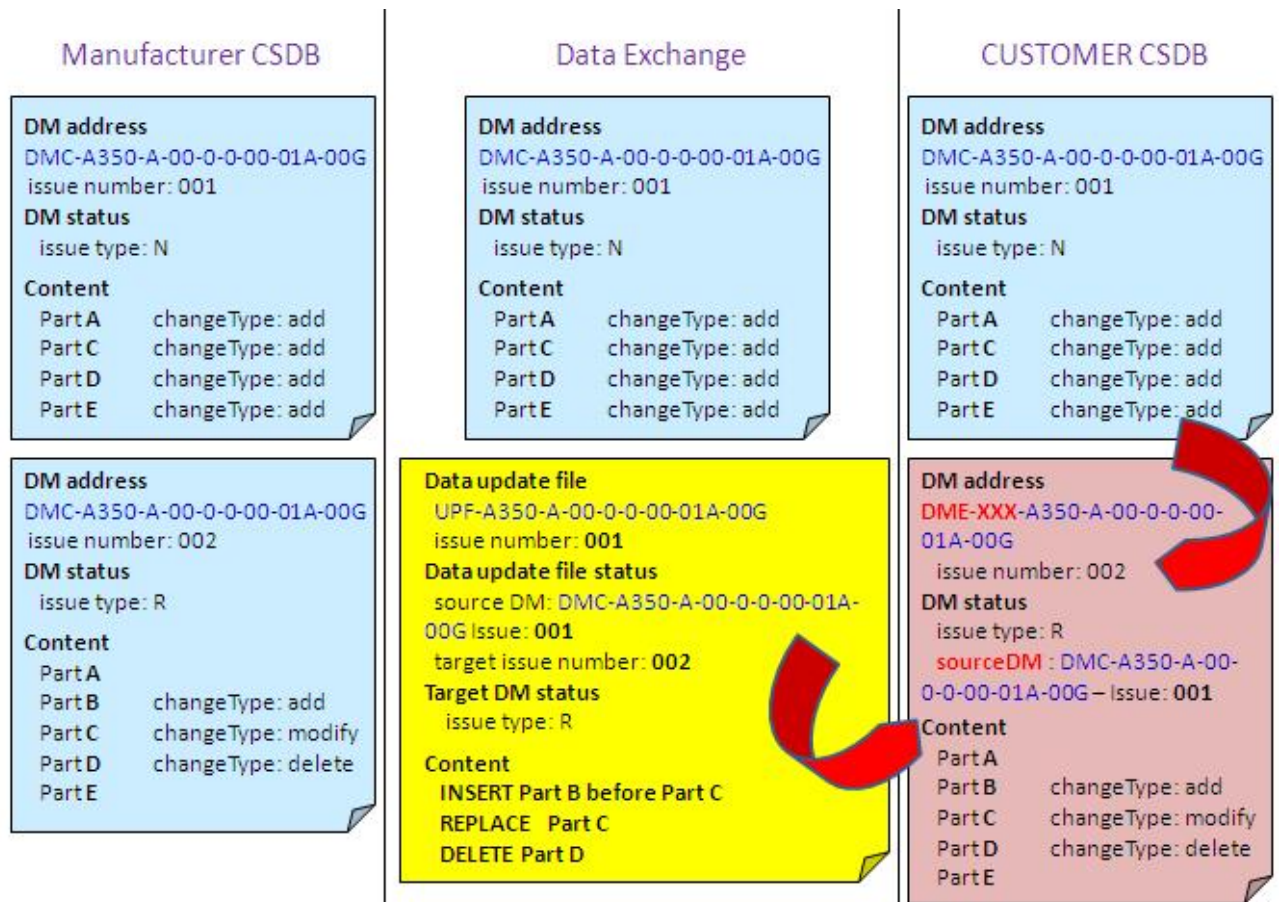

- Increased online data exchange times:
  - Data can be downloaded online by data receivers who can then work on it
  - Data can be uploaded onboard a platform. For aircraft for example, the upload time is critical because increased upload time generally means increased aircraft turnaround times.
- Increased processing times for those customers who need to extract the changed data into databases:
  - Guaranteeing data consistency and integrity between a data sender and a data receiver
  - Guaranteeing configuration and control of the data
- Poor support of on-demand, scheduled or regular data exchanges

To improve this situation, a concept for indicating to data receivers only what has changed in a CIR data module is introduced. This concept is called incremental update, which uses a new S1000D data exchange object called the data update file.

## 2 Data update file principle

### 2.1 Data exchange

The CIR incremental update supports the concept of optimizing and reuse of information, however, use of a data update file is limited to the exchange of CIR data module information only. Typically, a data update file is auto-generated from a data sender's CIR data module, which, from that point on, is known as a source CIR data module. Upon receipt of a data update file, a data receiver would update his CIR data module within his own data module management system. From this point on, the data receiver's CIR data module is known as a target CIR data module. Using a data update file, enables a project or an organization to incrementally update a CIR data module by exchanging only the information that has changed. Refer to [Fig 1](#).

ICN-S1000D-A-04130201-A-FAPE3-00001-A-001-01

Fig 1 Data update file principle

## 2.2 Data configuration control, consistency and integrity

### 2.2.1 Configuration control

The data update file uses the same naming convention as data modules. Refer to [Chap 7.5.1](#). To identify the file as an update file the prefix "UPF" is used. The control number is then exactly the same as the source and target CIR data modules. For example:

Parts CIR data module code: DMC-S1000DLIGHTING-AAA-D00-00-00-00AA-00GA-D

Corresponding data update file code: UPF-S1000DLIGHTING-AAA-D00-00-00-00AA-00GA-D

The issue numbers of the data update file, the source CIR data module and the target data module also play an important part in maintaining configuration control. When a source data module is changed, it is up-issued in the normal way. The changes are recorded in the data update file, which has its own issue number, the issue number of the source data module at which the changes were made and the issue number and type that the target data module will become, once the changes indicated in the data update file are incorporated.

For example, a new source CIR data module has issue number "001", inwork "00" and issue type "new". The data receiver's CIR data module issue details have the same values. Changes are made and the resulting source CIR data module has issue number "002", inwork "00" and issue type "revised".

A data update file is auto-generated to contain only the changes made in the source CIR data module made between issue "001" and issue "002". Since this is the first change to the source

CIR data module, the data update file is new. So, it has an issue number "001", inwork "00" and issue type "new".

The data update file also contains the issue number ("002") and issue type ("revised") that the target CIR data module will become, once the changes in the data update file are incorporated. So, the data receiver incorporates the changes in his target CIR data module, up-issues it to issue number "002", inwork "00" and issue type "revised", as indicated in the metadata in the data update file.

It is the combination of the control number and the issue details that guarantee configuration control.

## 2.2.2 Consistency and integrity

The data update file contains metadata about the individual changes, which leads the data receiver directly to the element and/or attribute that is being changed. The consistency and integrity of the CIR data is achieved by the metadata having values in the data update file that are the same values in both the source and target CIR data module. Refer to [Para 2.3.1](#).

## 2.3 Relationship with the CIR data modules

### 2.3.1 Fragments

Incremental update introduces the use of extracts from a data module called fragments. All the available fragment types are pre-defined by the data update file XML Schema. These are all the elements and attributes that are child elements of:

- element `<insertObject>`
- element `<replaceObject>`
- element `<deleteObject>`
- element `<reinstateObject>`

The data module extracts that are eligible to be a fragment are not arbitrary.

These fragments are self-standing fragments that can be managed and understood without relying on other fragments. (eg, a Part fragment that contains all the information about that part does not rely on any other Part fragments because it already has all the information itself).

They have a mandatory identifier that must be persistent over time. Because this is important in the context of incremental update, the value of a fragment identifier is exactly the same as the target fragment in the CIR data module. It is this value, together with the identical control numbers in the file name, that provides the relationship between a data update file and its target CIR data module. The fragment identifiers are:

- element `<partIdent>` for a Part fragment
- element `<zoneIdent>` for a Zone fragment
- element `<functionalItemId>` for a Functional Item fragment
- element `<circuitBreakerIdent>` for a Circuit Breaker fragment
- element `<accessPointIdent>` for an Access Point fragment
- element `<toolIdent>` for a Tool or Support Equipment fragment
- element `<enterpriseIdent>` for an Enterprise fragment
- element `<supplyIdent>` for a Supply fragment
- element `<supplyRqmtIdent>` for a Supply Requirement fragment
- element `<functionalPhysicalAreaIdent>` for a Functional or Physical Area fragment
- element `<controlIndicatorIdent>` for a Controls and indicators fragment
- element `<applicSpecIdent>` for an Applicability Annotation fragment
- element `<warningIdent>` for a Warning fragment

- element `<cautionIdent>` for a Caution fragment
- attribute `id` for figure, figure alternate group, multimedia, multimedia alternate group, applicability annotation, externalized applicability annotation

The fragments must not have any meaningful and mandatory sequential relationships with the rest of the content of a data module. For example, the element `<partSpec>` must not have a mandated element that must follow it.

The relationship between a data update file and a CIR data module is that a data update file can only be associated with one and only one CIR data module. Both the fragment and the CIR data module must also be of the same type. For example, one Part data update file is directly related to one and only one parts CIR data module. Within that constraint, a data update file can also update other information within that CIR data module. This information is limited to:

- Applicability annotations and applicability references
- Figures and alternate figures
- Multimedia and alternate multimedia

Refer to default BREX rules BREX-S1-00014 to BREX-S1-00026.

## 2.4 Change indicators

### 2.4.1 Indication types

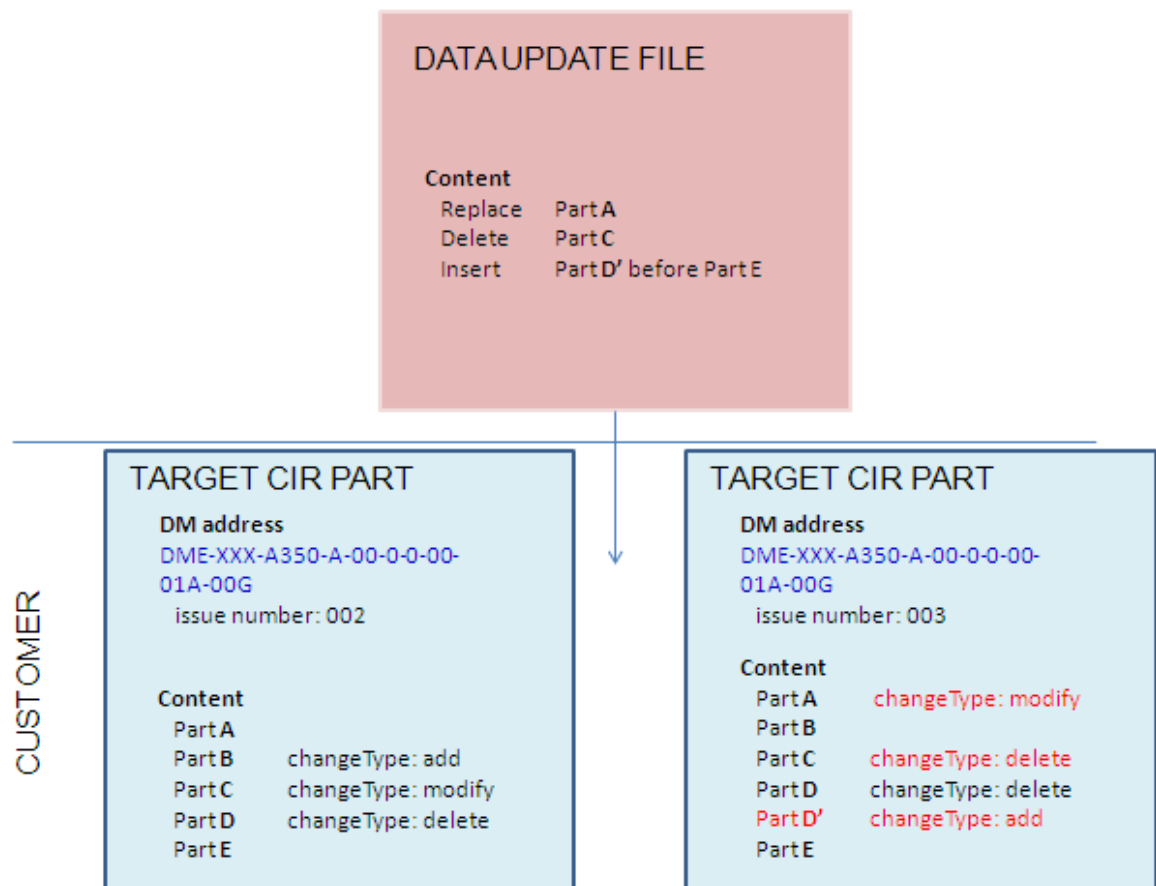

The fragment changes in the source CIR data module are indicated in the data update file as follows:

- New fragments that were added in the source CIR data module must be inserted into the target CIR data module. These are stored in the `<insertObjectGroup>` branch of the data update file.
- Existing fragments that were modified in the source CIR data module must be replaced in the target CIR data module. These are stored in the `<replaceObjectGroup>` branch of the data update file.
- Existing fragments that were deleted in the source CIR data module must be deleted in the target CIR data module. These are stored in the `<deleteObjectGroup>` branch of the data update file.
- Fragments that were deleted in a previous issue of a source CIR data module and reinstated in the target data module. These are stored in the `<reinstateObjectGroup>` branch of the data update file.

### 2.4.2 Indication differences

The way indication types "insert" and "reinstate" indicate changes differs slightly from that of the indication types "replace" and "delete":

- For indication types "insert" and "reinstate", the place (eg, at element `<xxx>`) and order (before or after) are given because the fragment does not exist in the previous issue of the target CIR data module. Refer to [Fig 2](#).
- For indication types "replace" and "delete", the place and order is not given because the fragment already exists in the previous issue of the CIR data module. These two indication types use the mandatory fragment identifier to indicate which fragment must be replaced or deleted. Refer to [Para 2.3.1](#).

ICN-S1000D-A-04130201-A-FAPE3-00002-A-001-01

Fig 2 Indication types - principle

## 2.5 Implementation

This section explains how the data receiver can incrementally update his self-contained target CIR data module using the data update file.

### 2.5.1 Source data modules

To do this, the data receiver must use:

- The received data update file
- The previous issue's status of the target CIR data module, whose issue number is indicated in the data update file's status section, within the element `<sourceDmIdent>`.

For example, the receiver of the data receiving this data update file

```
<dataUpdateFile>
<updateIdentAndStatusSection>
<updateAddress>...</updateAddress>
<updateStatus>
<sourceDmIdent>
<dmCode modelIdentCode="S1000DLIGHTING" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
```

```
infoCode="00G" infoCodeVariant="A" itemLocationCode="D"/>
<language languageIsoCode="en" countryIsoCode="US"/>
<issueInfo issueNumber="001" inWork="00"/>
</sourceDmIdent>
...
</updateStatus>
...
</updateIdentAndStatusSection>
...
</dataUpdateFile>
```

must use this data update file and issue 001 of the target CIR data module

DMC-S1000DLIGHTING-AAA-D00-00-00-00AA-00GA-D

to incrementally update the target CIR data module.

#### Note

Any problems regarding the issue number of the target data module must be resolved between the data sender and the data receiver.

## 2.5.2 Target data modules

To incrementally update the target data module, the data receiver has to perform the following actions on the previous issue of the target data module:

### 2.5.2.1 Target data module identification

The data module code of the target data module remains the same and it is up-issued in the normal way.

However, it is recommended that the data receiver to use the data module code extension, indicating that the data module is retrieved by the data receiver from a source data module. Refer to [Chap 4.13.2](#).

The issue number of the target CIR data module is indicated in the status section of the source CIR, in element `<targetDmIssueInfo>`.

For example, the data receiver receiving this data update file:

```
<dataUpdateFile>
<updateIdentAndStatusSection>
<updateAddress>...</updateAddress>
<updateStatus>
...
<targetDmIssueInfo inWork="00" issueNumber="002"/>
...
</updateStatus>
...
</updateIdentAndStatusSection>
...
</dataUpdateFile>
```

must assign issue number "002" to its target CIR data module.

### 2.5.2.2 Target data module address items

The target CIR data module language and title do not change when updates are performed using the data update file.

The issue date of the target CIR data module is changed to be the same as the Data update file.

#### 2.5.2.3 Target data module status

The required status of the target CIR data module is indicated in the element `<targetDmStatus>` within the data update file. This is achieved by the data receiver updating the target CIR data module by replacing the entire contents of the element `<dmStatus>`, in the target CIR data module, with the entire content of the element `<targetDmStatus>` in the data update file, including the value of its attribute `issueType`.

#### 2.5.2.4 Target data module content

Concerning the content of the target data module, the data receiver must apply the updates on the previous target data module issue content. This means that the content of the previous issue of the target CIR data module is incrementally updated to include the content of the data update file.

Before updating the content, the data receiver must delete all the change marking information from the target CIR data module content by removing the values of the attributes `changeType`, `changeMark` and `reasonForUpdateRefIds`.

#### 2.5.2.5 Fragment usage

There are four different types of updates:

##### 2.5.2.5.1 Fragments to insert

One occurrence of the element `<insertObject>` within the element `<insertObjectGroup>` contains a single occurrence of a fragment, the content of which must be inserted in the target CIR data module. When there are multiple fragments of the same type, multiple occurrences of the element `<insertObject>` are used.

The attributes `targetPath` and `insertionOrder` indicate where the element must be inserted using an XPath expression.

#### Note

It is recommended that the data sender populate these two attributes so that the target CIR data module has the same sequential order as the source CIR data module, which is at the same issue. If the attributes are not populated, the data receiver must insert the fragments at the end of the content section of the target CIR data module.

For example:

Target data module previous issue:

```
<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0009">...</partSpec>
```

Data update file:

```
<insertObject targetPath="//partSpec[@id='part-0009']"
insertionOrder="before">
<partSpec id="part-0008" changeType="add">...</partSpec>
</insertObject>
```

Target data module:

```
<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0008" changeType="add">...</partSpec>
<partSpec id="part-0009">...</partSpec>
```

#### 2.5.2.5.2 Fragments to replace

One occurrence of the element `<replaceObject>` within the element `<replaceObjectGroup>` contains a single occurrence of a fragment, the content of which must be replaced in the target CIR data module. When there are multiple fragments of the same type, multiple occurrences of the element `<replaceObject>` are used.

For example:

Target data module previous issue:

```
<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0008">...</partSpec>
<partSpec id="part-0009">...</partSpec>
```

Data update file:

```
<replaceObject>
<partSpec id="part-0008" changeType="modify">...</partSpec>
</replaceObject>
```

Target data module:

```
<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0008" changeType="modify">...</partSpec>
<partSpec id="part-0009">...</partSpec>
```

#### 2.5.2.5.3 Fragments to delete

One occurrence of the element `<deleteObject>` within the element `<deleteObjectGroup>` contains a single occurrence of a fragment, the content of which must be deleted from the target CIR data module. When there are multiple fragments of the same type, multiple occurrences of the element `<deleteObject>` are used.

The project or the organization must decide what actions are performed on deleted objects. Refer to [Chap 3.9.5.2.1.1](#).

#### Note

If the decision is to remove the deleted elements from the up-issued data modules, the data receiver physically removes the element from the target CIR data module that has the same identifier as that in the data update file.

For example:

Target data module previous issue:

```
<partSpec id="part-0007">
<partIdent partNumberValue="part0007"
manufacturerCodeValue="XXXXX"/>
...</partSpec>
<partSpec id="part-0008">
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>
</partSpec>
<partSpec id="part-0009">
<partIdent partNumberValue="part0009"
```

```
manufacturerCodeValue="XXXXX"/>
...</partSpec>
```

Data update file:

```
<deleteObject>
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>
</deleteObject>
```

Target data module:

```
<partSpec id="part-0007">
<partIdent partNumberValue="part0007"
manufacturerCodeValue="XXXXX"/>
...</partSpec>
<partSpec id="part-0009">
<partIdent partNumberValue="part0009"
manufacturerCodeValue="XXXXX"/>
...</partSpec>
```

#### Note

If the decision is to keep the change marks on deleted elements, the data receiver must apply change marking. Refer to [Chap 3.9.5.2.1.1](#).

For example:

Target data module previous issue:

```
<partSpec id="part-0007">
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>
...</partSpec>
<partSpec id="part-0008">
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>
</partSpec>
<partSpec id="part-0009">
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>
...</partSpec>
```

Data update file:

```
<deleteObject>
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>...</partSpec>
</replaceObject>
```

Target data module:

```
<partSpec id="part-0007">
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX"/>
...</partSpec>
<partSpec id="part-0008" changeType="delete">
<partIdent partNumberValue="part0008"
```

```

manufacturerCodeValue="XXXXX" />
...</partSpec>
<partSpec id="part-0009">
<partIdent partNumberValue="part0008"
manufacturerCodeValue="XXXXX" />
...</partSpec>

```

#### 2.5.2.5.4 Fragments to reinstate

One occurrence of the element `<reinstateObject>` within the element `<reinstateObjectGroup>` contains a single occurrence of a fragment, the content of which must be reinstated in the target CIR data module. When there are multiple fragments of the same type, multiple occurrences of the element `<reinstateObject>` are used.

Depending on the project or the organization decision on marking deletions (refer to [Chap 3.9.5.2.1.1](#)), the following rules apply for reinstating an object:

- If deleted elements are physically removed, then apply the same rule as for elements to insert. Refer to [Para 2.5.2.5.1](#).

The attributes `targetPath` and `insertionOrder` indicate where the element must be reinstated using an XPath expression.

#### Note

It is recommended that the data sender populate these two attributes so that the target CIR data module has the same sequential order as the source CIR data module, which is at the same issue. If the attributes are not populated, the data receiver must insert the fragments at the end of the content section of the target CIR data module.

For example:

Target data module previous issue:

```

<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0009">...</partSpec>

```

Data update file:

```

<reinstateObject targetPath="//partSpec[@id='part-0009']"
insertionOrder="before">
<partSpec id="part-0008" changeType="add">...</partSpec>
</reinstateObject>

```

Target data module:

```

<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0008" changeType="add">...</partSpec>
<partSpec id="part-0009">...</partSpec>

```

If deleted elements are marked as deleted, then apply the same rule as for elements to replace. Refer to [Para 2.5.2.5.2](#).

#### Note

In this case, there is no need for the data provider to populate the two attributes `targetPath` and `insertionOrder`.

For example:

Target data module previous issue:

---

```
<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0008" changeType="deleted">...</partSpec>
<partSpec id="part-0009">...</partSpec>
```

Data update file:

```
<reinstateObject>
<partSpec id="part-0008" changeType="modify">...</partSpec>
</insertObject>
```

Target data module:

```
<partSpec id="part-0007">...</partSpec>
<partSpec id="part-0008" changeType="modify">...</partSpec>
<partSpec id="part-0009">...</partSpec>
```

## 1 General

The Data update file Schema must be used to implement the CIR incremental update. Many of the elements and attributes used in this schema are unique due to the schema's specialized application. For more information about the CIR incremental update general implementation, refer to [Chap 4.13.2.1](#).

## 2 Data update file

**Description:** The element `<dataUpdateFile>` contains the complete data update file. The data update file is not a data module so it has its own definition. But like data modules, the data update file is split into two parts:

- the data update file identification and status section
- the data update file content section

**Markup element:** `<dataUpdateFile>`

ICN-S1000D-A-04130202-A-FAPE3-00001-A-001-01

Fig 1 Element `<dataUpdateFile>`

#### Attributes:

- None

#### Child elements:

- `<updateIdentAndStatusSection>`. Refer to [Para 2.1](#).
- `<content>`. Refer to [Para 2.2](#).

## 2.1

### Data update file identification and status section

**Description:** The element `<updateIdentAndStatusSection>` is used to provide the data update file identification (data update file address), the data update file status and the status of the data module to be updated.

**Markup element:** `<updateIdentAndStatusSection>`

ICN-S1000D-A-04130202-A-FAPE3-00002-A-001-01

Fig 2 Element `<updateIdentAndStatusSection>`

#### Attributes:

- None

#### Child elements:

- `<updateAddress>`. Refer to [Para 2.1.1](#).
- `<updateStatus>`. Refer to [Para 2.1.2](#).
- `<targetDmStatus>`. The status of the target data module to be retrieved from the data update file. This element contains the same elements and attributes as the status section of a normal data module. Refer to [Chap 3.9.5.1](#).

### 2.1.1

#### Data update file address

**Description:** The element `<updateAddress>` contains the identification and issue date of the data update file.

**Markup element:** `<updateAddress>`

ICN-S1000D-A-04130202-A-FAPE3-00003-A-001-01

Fig 3 Element &lt;updateAddress&gt;

**Attributes:**

- None

**Child elements:**

- <updateIdent>. Refer to [Para 2.1.1.1](#).
- <issueDate>. Refer to [Chap 3.9.5.1](#).

## 2.1.1.1 Data update file identification

**Description:** The element <updateIdent> contains the unique identification of the data update file.

**Markup element:** <updateIdent>

ICN-S1000D-A-04130202-A-FAPE3-00004-A-001-01

Fig 4 Element &lt;updateIdent&gt;

**Attributes:**

- None

**Child elements:**

- <identExtension>. Refer to [Chap 3.9.5.1](#).
- <updateCode>. Refer to [Para 2.1.1.2](#).
- <language>. Refer to [Chap 3.9.5.1](#).
- <issueInfo>. Refer to [Chap 3.9.5.1](#).

**Markup example:**

```
<updateIdent>
<updateCode objectIdentCode="UPF"
modelIdentCode="S1000DLIGHTING" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
```

```
infoCode="00G" infoCodeVariant="A"
itemLocationCode="D"/><language languageIsoCode="sx"
countryIsoCode="US"/>
<issueInfo issueNumber="001" inWork="00"/>
</updateIdent>
```

#### 2.1.1.2 Data update file code

**Description:** The element `<updateCode>` contains the code that identifies the data update file. The data update file code is based on the data module code of the target data module. For example, the data update file address of the part CIR data module must be based on the part CIR data module code (see markup example).

**Markup element:** `<updateCode>`

##### Attributes:

- `objectIdentCode` (M), the file object type. It enables distinguishing the data update file from other CSDB objects (data modules, publication modules etc). For data update file, this attribute must be set to:
  - "UPF", meaning data update file
- `modelIdentCode` (M), the model identification code. Refer to [Chap 4.3.1](#).
- `systemDiffCode` (M), the system difference code. Refer to [Chap 4.3.2](#).
- `systemCode` (M), the system code (part of the SNS). Refer to [Chap 4.3.3](#).
- `subSystemCode` (M), the subsystem code (part of the SNS). Refer to [Chap 4.3.3](#).
- `subSubSystemCode` (M), the sub-subsystem code (part of the SNS). Refer to [Chap 4.3.3](#).
- `assyCode` (M), the assembly code. Refer to [Chap 4.3.3](#).
- `disassyCode` (M), the disassembly code. Refer to [Chap 4.3.4](#).
- `disassyCodeVariant` (M), the disassembly code variant. Refer to [Chap 4.3.5](#).
- `infoCode` (M), the information code. The use of the data update file is limited to CIR data modules. This limits the information codes to those defined for CIR data modules. Refer to default BREX rule BREX-S1-00179. Refer to [Chap 4.3.6](#).
- `infoCodeVariant` (M), the information code variant. Refer to [Chap 4.3.7](#).
- `itemLocationCode` (M), the item location code. Refer to [Chap 4.3.8](#).

##### Child elements:

- None

##### Markup example:

```
<dataUpdateFile>
<updateIdentAndStatusSection>
<updateAddress>
<updateIdent>
<updateCode objectIdentCode="UPF"
modelIdentCode="S1000DLIGHTING" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00G" infoCodeVariant="A" itemLocationCode="D"/>
...
<language languageIsoCode="sx" countryIsoCode="US"/>
...
```

```

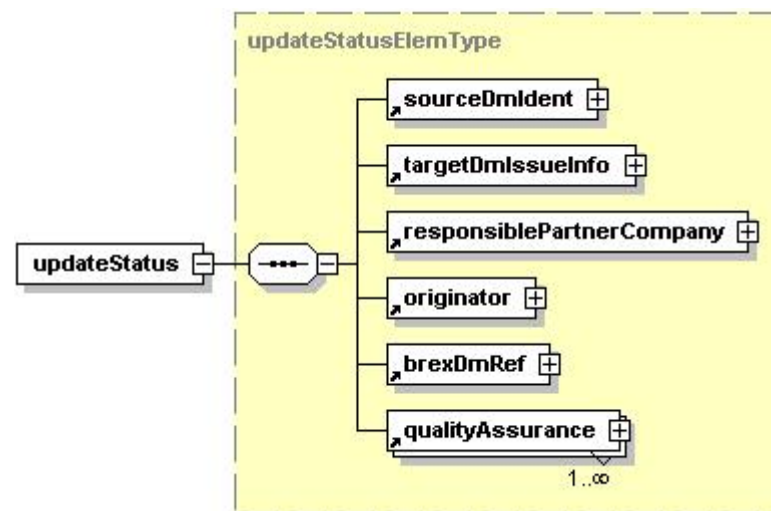

<issueInfo issueNumber="001" inWork="00"/>
...
</updateIdent>
<issueDate day="01" month="02" year="2011"/>
</updateAddress>
<updateStatus>...</updateStatus>
<targetDmStatus>...</targetDmStatus>
</updateIdentAndStatusSection>
<content>...</content>
</dataUpdateFile>

```

## 2.1.2 Data update file status

**Description:** The element `<updateStatus>` contains the status of the data update file. Among other information, the data update file status indicates from which data module the update was calculated.

**Markup element:** `<updateStatus>`

ICN-S1000D-A-04130202-A-FAPE3-00005-A-001-01

Fig 5 Element `<updateStatus>`

### Attributes:

- None

### Child elements:

- `<sourceDmIdent>`. the data module code of the data module from which the data update file was calculated. Refer to [Chap 3.9.5.1](#).
- `<targetDmIssueInfo>`. The issue information of the target data module, which is populated in the same way as normal data modules. Refer to [Chap 3.9.5.1](#).
- `<responsiblePartnerCompany>`. The responsible partner company of the data update file. Refer to [Chap 3.9.5.1](#).
- `<originator>`. The originator of the data update file. Refer to [Chap 3.9.5.1](#).
- `<brexDmRef>`. The reference to the BREX data module. Refer to [Chap 3.9.5.1](#).
- `<qualityAssurance>`. Refer to [Chap 3.9.5.1](#).

### Markup example:

```
<updateStatus>
<sourceDmIdent>
<dmCode modelIdentCode="S1000DLIGHTING" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="00G" infoCodeVariant="A" itemLocationCode="D"/>
<language languageIsoCode="en" countryIsoCode="US"/>
<issueInfo issueNumber="001" inWork="00"/>
</sourceDmIdent>
<targetDmIssueInfo inWork="00" issueNumber="002"/>
<responsiblePartnerCompany enterpriseCode="U8025">
<enterpriseName>UK MoD</enterpriseName>
</responsiblePartnerCompany>
<originator enterpriseCode="U8025">
<enterpriseName>UK MoD</enterpriseName>
</originator>
<brexDmRef>
<dmRef>
<dmRefIdent>
<dmCode modelIdentCode="S1000DBIKE" systemDiffCode="AAA"
systemCode="D00" subSystemCode="0" subSubSystemCode="0"
assyCode="00" disassyCode="00" disassyCodeVariant="AA"
infoCode="022" infoCodeVariant="A" itemLocationCode="D"/>
<issueInfo issueNumber="007" inWork="00"/>
</dmRefIdent>
</dmRef>
</brexDmRef>
<qualityAssurance><unverified/></qualityAssurance>
</updateStatus>
```

## 2.2 Data update file content section

**Description:** The element `<content>` contains the content section of the date update file.

**Markup element:** `<content>`

ICN-S1000D-A-04130202-A-FAPE3-00015-A-001-01

Fig 6 Element `<content>`

### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

### Child elements:

- `<refs>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<update>`. Refer to [Para 2.3](#).

## 2.3 Updates

**Description:** The element `<update>` contains the data module fragments that have been added, deleted or modified since a previous issue of the target data module. A fragment can be updated only once in a data update file.

**Markup element:** `<update>`

ICN-S1000D-A-04130202-A-FAPE3-00006-A-001-01

Fig 7 Element `<update>`

### Attributes:

- None

### Child elements:

- `<insertObjectGroup>`. Refer to [Para 2.3.1](#).
- `<replaceObjectGroup>`. Refer to [Para 2.3.2](#).
- `<deleteObjectGroup>`. Refer to [Para 2.3.3](#).
- `<reinststateObjectGroup>`. Refer to [Para 2.3.4](#).

### 2.3.1 Group of objects to insert

**Description:** The element `<insertObjectGroup>` contains all the data module fragments that have been added since a previous issue of the data module. When retrieving the new issue of the data module, these fragments must be inserted.

ICN-S1000D-A-04130202-A-FAPE3-00007-A-001-01

Fig 8 Element `<insertObjectGroup>`

**Markup element:** `<insertObjectGroup>`

### Attributes:

- None

### Child elements:

- `<insertObject>`. Refer to [Para 2.3.1.1](#).

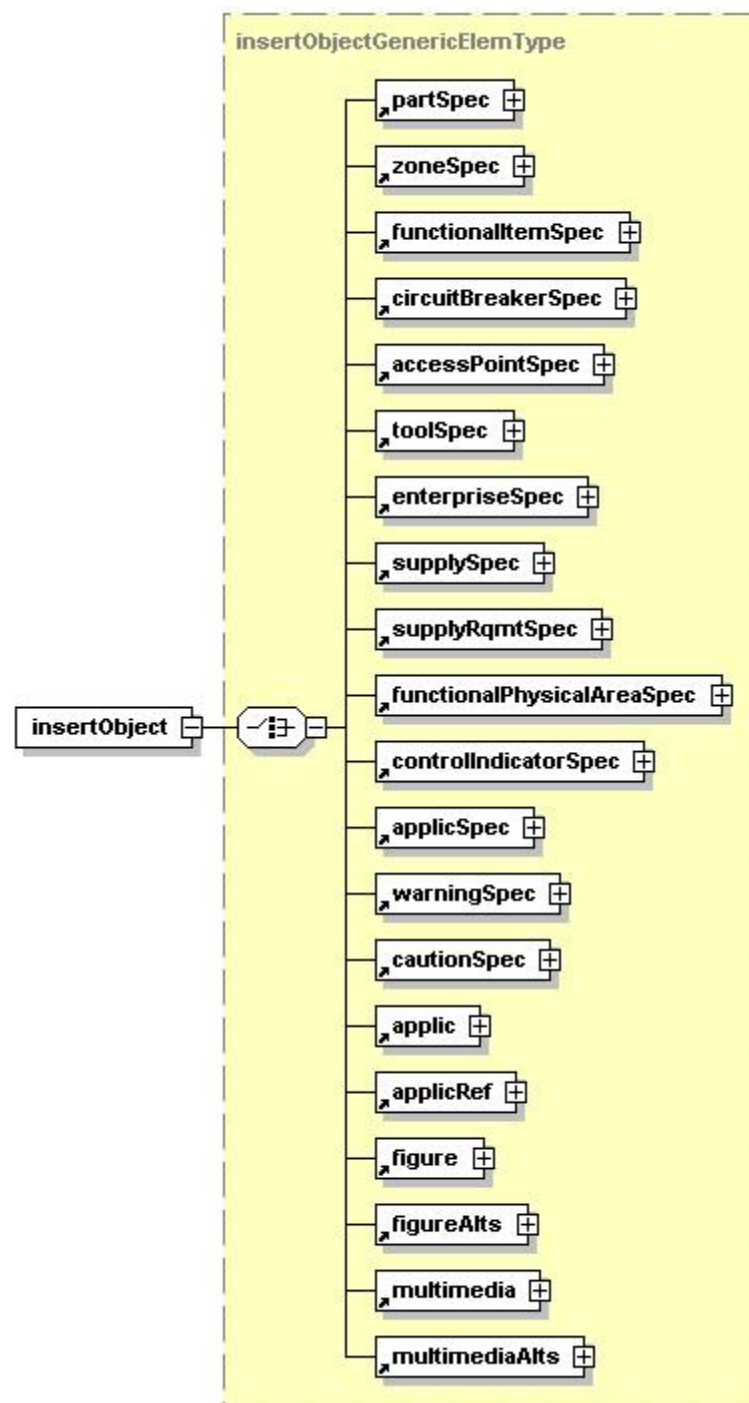

## 2.3.1.1 Object to insert

**Description:** The element `<insertObject>` represents one data module fragment that has been added since a previous issue of the data module. When retrieving the new issue of the data module, this fragment must be inserted.

The attributes of the `<insertObject>` indicate the place where the new object must be inserted. It is recommended that these two attributes are used.

Only the objects that are allowed into the data module can be used in a data update file. For instance the data update file related to the part CIR data module must insert `<partSpec>` elements only.

**Markup element:** `<insertObject>`

ICN-S1000D-A-04130202-A-FAPE3-00008-A-001-01

Fig 9 Element <insertObject>

**Attributes:**

- targetPath (O), the XPath expression that indicates whether before or after an object, that the subject object must be inserted

- insertionOrder (O), indicates whether the subject object must be inserted after or before. Possible values are:
  - "before"
  - "after"

#### Child elements:

- <functionalItemSpec>. An entry of the functional item CIR data module. Refer to [Chap 3.9.5.2.11.1](#).
- <circuitBreakerSpec>. An entry of the circuit breaker CIR data module. Refer to [Chap 3.9.5.2.11.2](#).
- <partSpec>. An entry of the part CIR data module. Refer to [Chap 3.9.5.2.11.3](#).
- <zoneSpec>. An entry of the zone CIR data module. Refer to [Chap 3.9.5.2.11.4](#).
- <accessPointSpec>. An entry of the access point CIR data module. Refer to [Chap 3.9.5.2.11.5](#).
- <enterpriseSpec>. An entry of the enterprise CIR data module. Refer to [Chap 3.9.5.2.11.6](#).
- <supplySpec>. An entry of the supply CIR data module. Refer to [Chap 3.9.5.2.11.7](#).
- <supplyRqmtSpec>. An entry of the supply requirement CIR data module. Refer to [Chap 3.9.5.2.11.8](#).
- <toolSpec>. An entry of the tool CIR data module. Refer to [Chap 3.9.5.2.11.9](#).
- <functionalPhysicalAreaSpec>. An entry of the functional and/or physical area CIR data module. Refer to [Chap 3.9.5.2.11.10](#).
- <controlIndicatorSpec>. An entry of the control and indicator CIR data module. Refer to [Chap 3.9.5.2.11.11](#).
- <applicSpec>. An entry of the applicability annotation CIR data module. Refer to [Chap 3.9.5.2.11.12](#).
- <warningSpec>. An entry of the warning CIR data module. Refer to [Chap 3.9.5.2.11.13](#).
- <cautionSpec>. An entry of the caution CIR data module. Refer to [Chap 3.9.5.2.11.14](#).
- <figure>. Refer to [Chap 3.9.5.2.1.7](#).
- <figureAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimedia>. Refer to [Chap 3.9.5.2.1.7](#).
- <multimediaAlts>. Refer to [Chap 3.9.5.2.1.7](#).
- <applic>. A referenced applicability annotation. Refer to [Chap 3.9.5.3](#).
- <applicRef>. A reference to an externalized applicability annotation. Refer to [Chap 3.9.5.2.1.12](#).

#### Markup example:

```
<dataUpdateFile>
<updateIdentAndStatusSection>
<updateAddress>
<updateIdent>

</insertObject>
</insertObjectGroup>
</update>
</content>
</dataUpdateFile>

```

## 2.3.2 Group of objects to replace

**Description:** The element `<replaceObjectGroup>` contains all the data module fragments that have been modified since a previous issue of the data module. When retrieving the new issue of the data module, these fragments must be replaced.

**Markup element:** `<replaceObjectGroup>`

**Attributes:**

- None

**Child elements:**

- `<replaceObject>`. Refer to [Para 2.3.2.1](#).

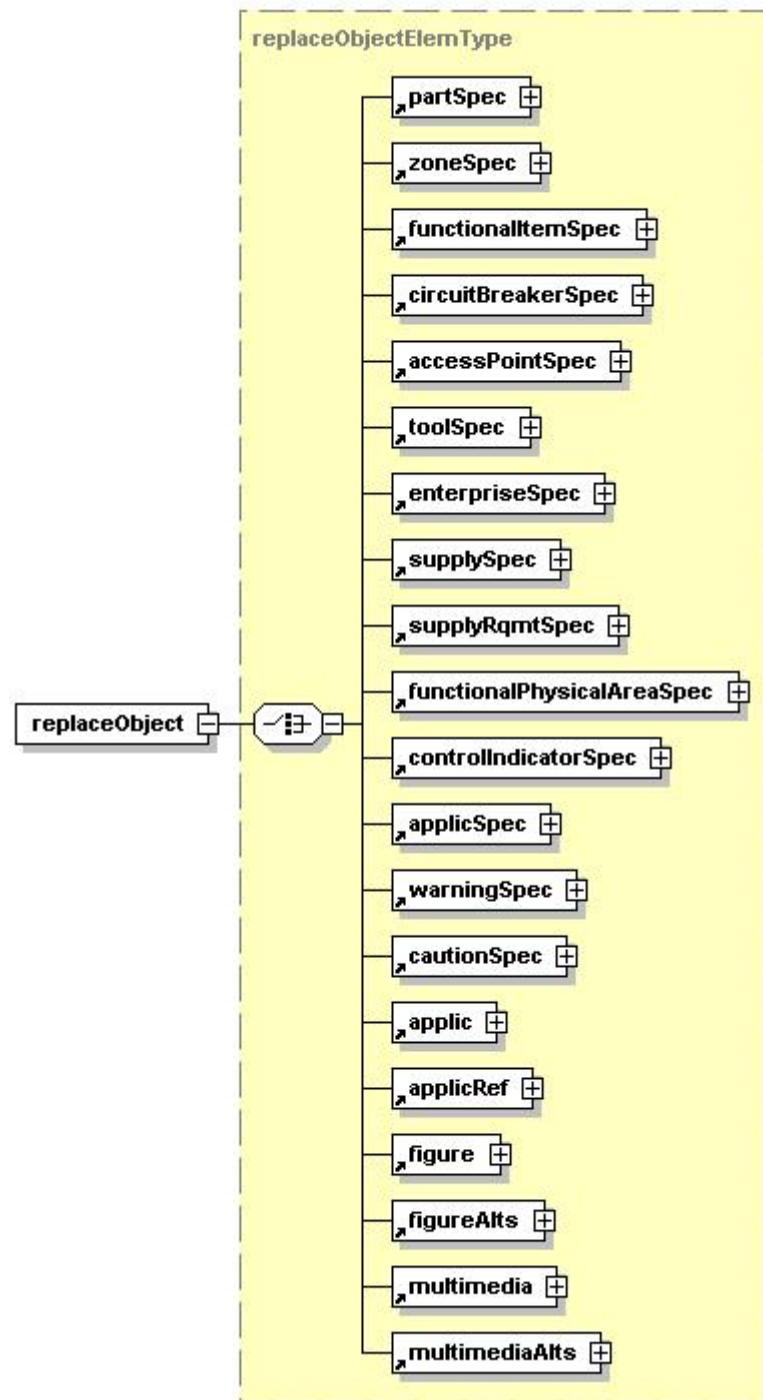

### 2.3.2.1 Object to replace

**Description:** The element `<replaceObject>` represents one data module fragment that has been modified since a previous issue of the data module. When retrieving the new issue of the data module, this fragment must be used instead of the previous one.

Only the objects that are allowed into the data module can be used in a data update file. For example the data update file related to the part CIR data module must replace `<partSpec>` elements only.

**Markup element:** `<replaceObject>`

ICN-S1000D-A-04130202-A-FAPE3-00010-A-001-01

Fig 10 Element <replaceObject>

**Attributes:**

- None

**Child elements:**

- <functionalItemSpec>. An entry of the functional item CIR data module. Refer to [Chap 3.9.5.2.11.1](#).

- `<circuitBreakerSpec>`. An entry of the circuit breaker CIR data module. Refer to [Chap 3.9.5.2.11.2](#).
- `<partSpec>`. An entry of the part CIR data module. Refer to [Chap 3.9.5.2.11.3](#).
- `<zoneSpec>`. An entry of the zone CIR data module. Refer to [Chap 3.9.5.2.11.4](#).
- `<accessPointSpec>`. An entry of the access point CIR data module. Refer to [Chap 3.9.5.2.11.5](#).
- `<enterpriseSpec>`. An entry of the enterprise CIR data module. Refer to [Chap 3.9.5.2.11.6](#).
- `<supplySpec>`. An entry of the supply CIR data module. Refer to [Chap 3.9.5.2.11.7](#).
- `<supplyRqmtSpec>`. An entry of the supply requirement CIR data module. Refer to [Chap 3.9.5.2.11.8](#).
- `<toolSpec>`. An entry of the tool CIR data module. Refer to [Chap 3.9.5.2.11.9](#).
- `<functionalPhysicalAreaSpec>`. An entry of the functional and/or physical area CIR data module. Refer to [Chap 3.9.5.2.11.10](#).
- `<controlIndicatorSpec>`. An entry of the control and indicator CIR data module. Refer to [Chap 3.9.5.2.11.11](#).
- `<applicSpec>`. An entry of the applicability annotation CIR data module. Refer to [Chap 3.9.5.2.11.12](#).
- `<warningSpec>`. An entry of the warning CIR data module. Refer to [Chap 3.9.5.2.11.13](#).
- `<cautionSpec>`. An entry of the caution CIR data module. Refer to [Chap 3.9.5.2.11.14](#).
- `<figure>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<figureAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimedia>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<multimediaAlts>`. Refer to [Chap 3.9.5.2.1.7](#).
- `<applic>`. A referenced applicability annotation. Refer to [Chap 3.9.5.3](#).
- `<applicRef>`. A reference to an externalized applicability annotation. Refer to [Chap 3.9.5.2.1.12](#).

#### Markup example:

```
<dataUpdateFile>
<updateIdentAndStatusSection>
<updateAddress>
<updateIdent>
<updateCode objectIdentCode="UPF"
modelIdentCode="S1000DLIGHTING" systemDiffCode="AAA"

### 2.3.3 Group of objects to delete

**Description:** The element `<deleteObjectGroup>` contains all the data module fragments that have been deleted since a previous issue of the data module. When retrieving the new issue of the data module, these fragments must be deleted.

**Markup element:** `<deleteObjectGroup>`

**Attributes:**

- None

**Child elements:**

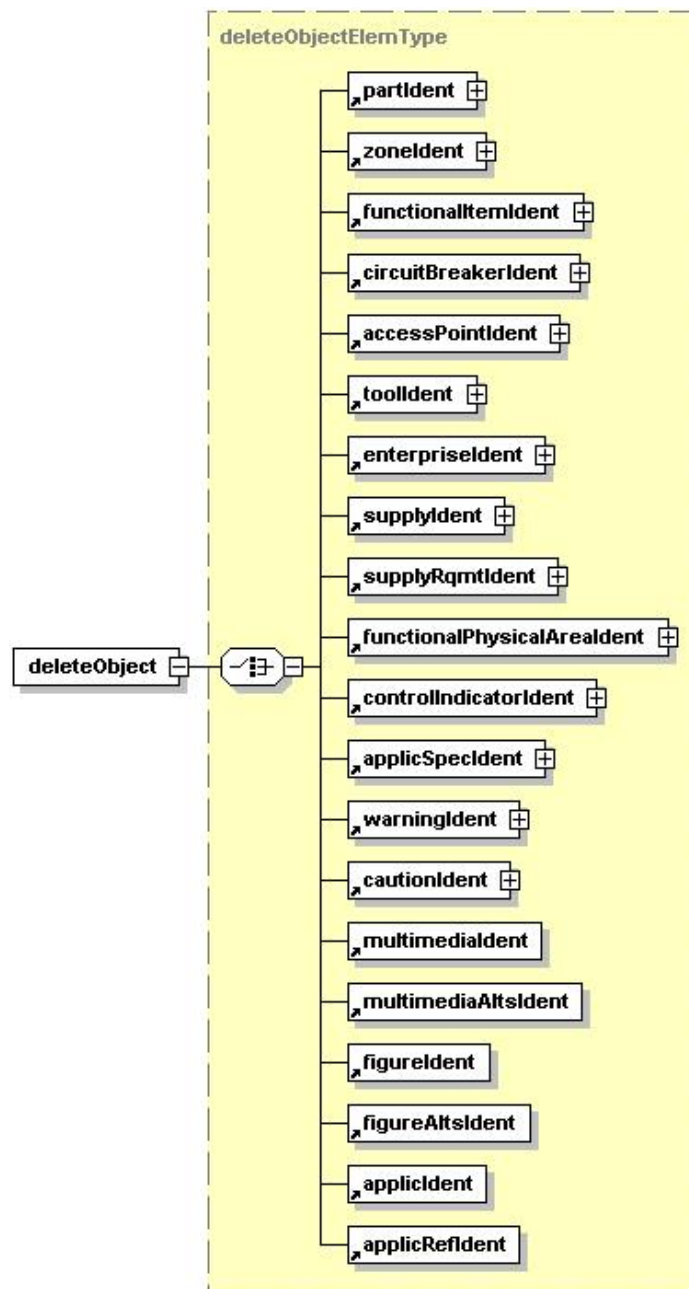

- `<deleteObject>`. Refer to [Para 2.3.3.1](#).

#### 2.3.3.1 Object to delete

**Description:** The element `<deleteObject>` represents one data module fragment that has been deleted since a previous issue of the data module. When retrieving the new issue of the data module, this fragment must be deleted. For deleted data module fragments, the data update file indicates the identifier of the object to delete only. For example, the data update file of the part CIR data module, the element `<deleteObject>` will contain the element `<partIdent>` indicating that the element `<partSpec>` containing this `<partIdent>` must be deleted.

Only the objects that are allowed into the data module can be used in a data update file. For example the data update file related to the part CIR data module must delete `<partSpec>` elements only.

**Markup element:** `<deleteObject>`

### 2.3.3.2

Figure identifier

**Description:** The element `<figureIdent>` identifies a figure.

**Markup element:** `<figureIdent>`

**Attributes:**

- `id` (M), the identifier of the markup element to be deleted

**Child elements:**

- None

**Markup example:**

```

<content>
<update>
<deleteObjectGroup>
<deleteObject>
<figureIdent id="fig-0010"/>
</deleteObject>
...
</deleteObjectGroup>
</update>
</content>

```

### 2.3.3.3

Figure alternates group identifier

**Description:** The element `<figureAltsIdent>` identifies a figure alternates group.

**Markup element:** `<figureAltsIdent>`

**Attributes:**

- `id` (M), the identifier of the markup element to be deleted

**Child elements:**

- None

**Markup example:**

```

<content>
<update>

```

```
<deleteObjectGroup>
<deleteObject>
<figureAltsIdent id="figalts-0010"/>
</deleteObject>
...
</deleteObjectGroup>
</update>
</content>
```

#### 2.3.3.4

##### Multimedia identifier

**Description:** The element `<multimediaIdent>` identifies the multimedia.

**Markup element:** `<multimediaIdent>`

**Attributes:**

- `id` (M), the identifier of the markup element to be deleted

**Child elements:**

- None

**Markup example:**

```
<content>
<update>
<deleteObjectGroup>
<deleteObject>
<multimediaIdent id="mul-0010"/>
</deleteObject>
...
</deleteObjectGroup>
</update>
</content>
```

#### 2.3.3.5

##### Multimedia alternates group identifier

**Description:** The element `<multimediaAltsIdent>` identifies a multimedia alternates group.

**Markup element:** `<multimediaAltsIdent>`

**Attributes:**

- `id` (M), the identifier of the markup element to be deleted

**Child elements:**

- None

**Markup example:**

```
<content>
<update>
<deleteObjectGroup>
<deleteObject>
<multimediaAltsIdent id="mulalts-0010"/>
</deleteObject>
...
```

```

</deleteObjectGroup>
</update>
</content>

```

#### 2.3.3.6 Applicability annotation identifier

**Description:** The element `<applicIdent>` identifies an applicability annotation. It must be used by projects or organizations, which do not externalize applicability.

**Markup element:** `<applicIdent>`

**Attributes:**

- `id` (M), the identifier of the markup element to be deleted

**Child elements:**

- None

**Markup example:**

```

<content>
<update>
<deleteObjectGroup>
<deleteObject>
<applicIdent id="appl-0010"/>
</deleteObject>
...
</deleteObjectGroup>
</update>
</content>

```

#### 2.3.3.7 Reference to externalized applicability annotation identifier

**Description:** The element `<applicRefIdent>` identifies a reference to an externalized applicability annotation. It must be used by projects or organizations, which do externalize applicability.

**Markup element:** `<applicRefIdent>`

**Attributes:**

- `id` (M), the identifier of the markup element to be deleted

**Child elements:**

- None

**Markup example:**

```

<content>
<update>
<deleteObjectGroup>
<deleteObject>
<applicRefIdent id="applref-0010"/>
</deleteObject>
...
</deleteObjectGroup>
</update>
</content>

```

#### 2.3.4 Group of objects to reinstate

**Description:** The element `<reinstateObjectGroup>` contains all the data module fragments that have been reinstated since a previous issue of the data module. When retrieving the new issue of the data module, these fragments must be inserted.

**Markup element:** `<reinstateObjectGroup>`

**Attributes:**

- None

**Child elements:**

- `<reinstateObject>`. Refer to [Para 2.3.5](#).

#### 2.3.5 Object to reinstate

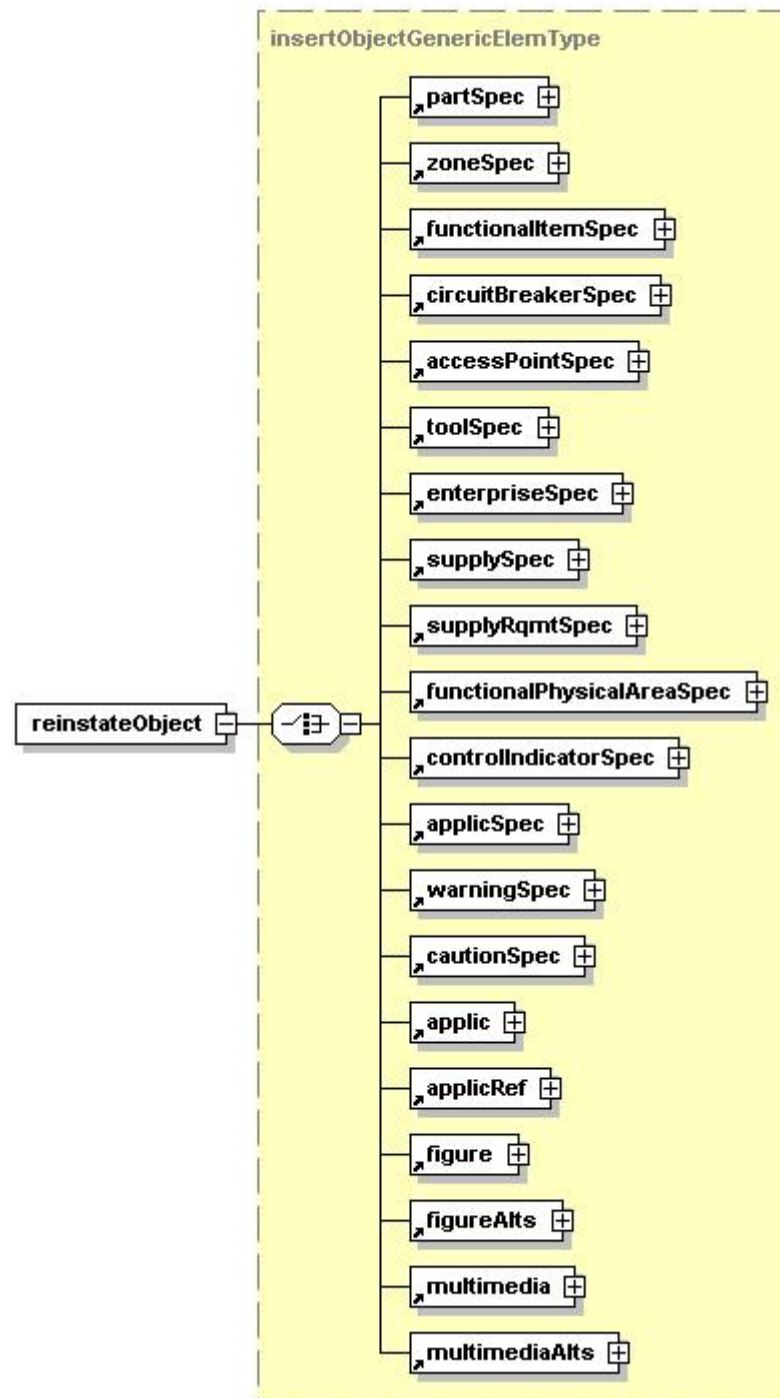

**Description:** The element `<reinstateObject>` represents one data module fragment that has been reinstated since a previous issue of the data module. When retrieving the new issue of the data module, this fragment must be inserted.

The attributes of the element `<reinstateObject>` indicate the place where the new object must be inserted. It is recommended that these two attributes are used for projects or organizations removing the deleted objects.

Only the objects that are allowed into the data module can be used in a data update file. For instance the data update file related to the part CIR data module must reinstate `<partSpec>` elements only.

**Markup element:** `<reinstateObject>`

ICN-S1000D-A-04130202-A-FAPE3-00014-A-001-01

Fig 12 Element <reinstallObject>

**Attributes:**

- targetPath (O), the XPath expression that indicates whether before or after an object, that the subject object must be inserted

- insertionOrder (O), indicates whether the subject object must be inserted after or before. The attribute can have one of the following values:
  - "before"
  - "after"

#### Child elements:

- <functionalItemSpec>. An entry of the functional item CIR data module. Refer to [Chap 3.9.5.2.11.1](#).
- <circuitBreakerSpec>. An entry of the circuit breaker CIR data module. Refer to [Chap 3.9.5.2.11.2](#).
- <partSpec>. An entry of the part CIR data module. Refer to [Chap 3.9.5.2.11.3](#).
- <zoneSpec>. An entry of the zone CIR data module. Refer to [Chap 3.9.5.2.11.4](#).
- <accessPointSpec>. An entry of the access point CIR data module. Refer to [Chap 3.9.5.2.11.5](#).
- <enterpriseSpec>. An entry of the enterprise CIR data module. Refer to [Chap 3.9.5.2.11.6](#).
- <supplySpec>. An entry of the supply CIR data module. Refer to [Chap 3.9.5.2.11.7](#).
- <supplyRqmtSpec>. An entry of the supply requirement CIR data module. Refer to [Chap 3.9.5.2.11.8](#).
- <toolSpec>. An entry of the tool CIR data module. Refer to [Chap 3.9.5.2.11.9](#).
- <functionalPhysicalAreaSpec>. An entry of the functional and/or physical area CIR data module. Refer to [Chap 3.9.5.2.11.10](#).
- <controlIndicatorSpec>. An entry of the control and indicator CIR data module. Refer to [Chap 3.9.5.2.11.11](#).

Table 1 References

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.3</a>	Data modules - Applicability
<a href="#">Chap 4.13.4</a>	Optimizing and reuse - Container data module

## 1 General

This chapter describes the concept of "alternates group" used in data module content. The "alternates group" mechanism can be used in data module content to group elements that represent alternates of the same information but for different applicability.

The alternates group concept is similar to the concept of container data modules described in [Chap 4.13.4](#), but is specific to the content of an individual data module.

## 2 Implementation of the alternates group in data module content

The elements defined in the XML Schemas to manage alternates groups are named `<xxxAlts>` where `xxx` is the name of the element for which alternates can be given in an alternates group. For example, the element `<commonInfoDescrParaAlts>` provides the ability to group alternates of the element `<commonInfoDescrPara>` (eg, depending on applicability).

This chapter applies to all alternates group elements in any S1000D XML Schema. Refer to default BREX rules BREX-S1-00150 to BREX-S1-00177.

The following alternates groups are available in

- most data module types:
  - `<figureAlts>`
  - `<multimediaAlts>`
  - `<commonInfoDescrParaAlts>`
- crew/operator, descriptive, learning and Service bulletin data modules:
  - `<levelledParaAlts>`
- procedural and Service bulletin data modules:
  - `<proceduralStepAlts>`
- fault data modules:
  - `<isolatedFaultAlts>`
  - `<detectedFaultAlts>`
  - `<observedFaultAlts>`
  - `<correlatedFaultAlts>`
  - `<warningMalfunctionAlts>`
  - `<assocWarningMalfunctionAlts>`
  - `<bitMessageAlts>`
  - `<isolationStepAlts>`
  - `<isolationProcedureEndAlts>`
- maintenance planning data modules:
  - `<taskDefinitionAlts>`
- wiring data data modules:
  - `<wireAlts>`
  - `<harnessAlts>`
  - `<electricalEquipAlts>`
- process data modules:
  - `<dialogAlts>`
  - `<dmNodeAlts>`
  - `<dmSeqAlts>`
  - `<proceduralStepAlts>`
  - `<messageAlts>`

The implementation of alternates groups in data module content is optional.

#### Business rule decision point BRDP-S1-00382 - Use of alternates groups in data module content:

- Decide whether to use alternates group elements. If used, specify which groups and in which data modules types.

All XML Schemas listed above propose a choice between grouping the elements into an alternates group (element `<xxxAlts>`) or using the elements (element `<xxx>`) directly. Within a given structure, the mix of using alternate groups and elements directly is allowed.

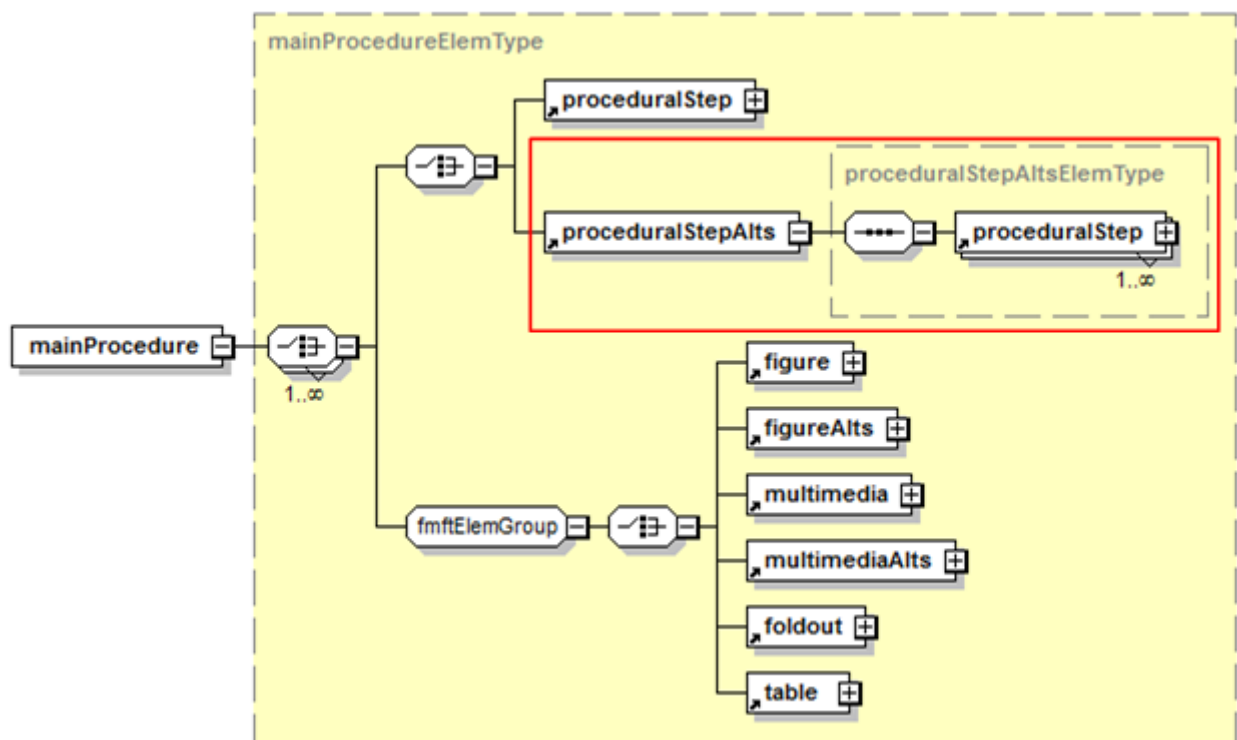

#### Business rule decision point BRDP-S1-00383 - Mix of alternates groups and elements:

- Decide whether alternates groups and elements can be mixed in a given structure.

## 3 Principle

An alternates group aims at grouping one to n alternates (or variants) of the same information, each of these alternates being valid for different applicability annotations (Product configuration, environment, other conditions, etc). This means that for a given applicability only one (or none) of the alternates is applicable. Refer to default BREX rules BREX-S1-00150 to BREX-S1-00177.

For example (refer to [Fig 1](#) and [Fig 2](#)), in a maintenance procedure, the maintenance step concerning the cleaning of a mountain bike ("Wash the Bike") can vary depending on the mountain bike version (determined by the applicability).

ICN-S3627-S1000D0592-001-01

Fig 1 Element `<proceduralStepAlts>`

When the end user consults the documentation for the "Mountain bicycle Mountain storm Mk1", only the first alternate step is applicable. When consulting for the "Mountain bicycle Brook trekker Mk9" the second alternate step is applicable.

- 5 Flush the sprockets, the derailleurs, the chain rings and the chain with water.

#### Note

If necessary, do the flush procedure again.

#### 6 Applicable to: Mountain bicycle Mountain storm Mk1

Wash the bike

- 6.1 Soak the [Sponge](#) into [Detergent A](#) and water.
- 6.2 Clean the bicycle with the soaked sponge.
- 6.3 Flush the bicycle and make sure that all [Detergent A](#) is removed.
- 6.4 Move the bicycle up and down on its tires to remove all water.

#### 7 Applicable to: Mountain bicycle Brook trekker Mk9

Wash the bike

- 7.1 Soak the [Sponge](#) into [Detergent B](#) and water.
- 7.2 Clean the bicycle with the soaked sponge.
- 7.3 Soak the [Sponge](#) into [Detergent A](#) and water.
- 7.4 Fully clean the bicycle with the soaked sponge.
- 7.5 Flush the bicycle to make sure that all detergents are removed.
- 7.6 Move the bicycle up and down on its tires to remove all water.

#### 8 Applicable to: All

Lubricate the bicycle. Refer to [S1000DBIKE-AAA-DA4-10-00-00AA-241A-A](#).

An alternates group for  
"Wash the bike"

cleaning the  
Mountain storm  
Mk1

2<sup>nd</sup> alternate for  
cleaning the  
Brook trekker Mk9

ICN-S3627-S1000D0593-004-01

Fig 2 Example of alternate steps in a maintenance procedure

#### Note

There is no need to display both alternates to the end user. The IETP can suppress the alternates group that is not applicable depending on configuration context. The same applies when customized page-oriented publications are distributed.

## 4 Benefits

### 4.1 General

The use of an alternates group (rather than a single alternate) has several benefits for data management and referencing purposes:

- Reduce the configuration dependencies in internal references. Refer to [Para 4.2](#).
- Control the configuration consistency. Refer to [Para 4.3](#).
- Ease the numbering of alternates. Refer to [Para 4.4](#).

### 4.2 Reduction of configuration dependencies in references

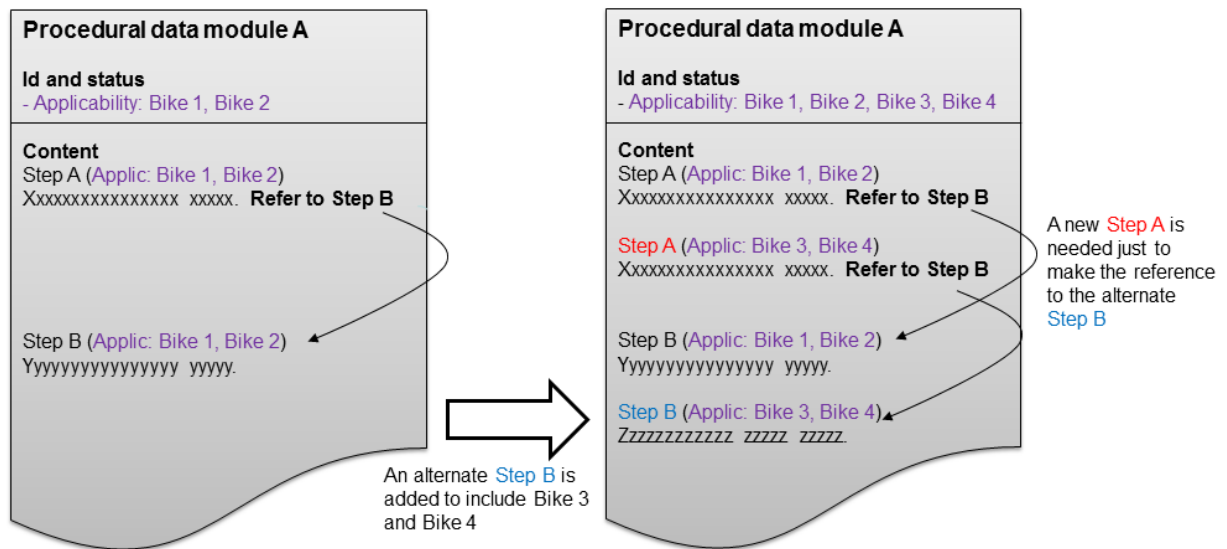

The use of an alternates group element in data module content limits the impact of evolutions due to configurations. This is illustrated in the following example:

For example (refer to [Fig 3](#) and [Fig 4](#)), in the first issue of a maintenance procedure data module, an author can create a cross-reference from one step to another step (eg, step A and step B are valid for bike 1 and bike 2 and step A is referencing step B).

In a further issue of the data module, the applicability is extended to include bike 3 and bike 4. As step B for bike 3 and bike 4 is different from step B for bike 1 and bike 2, the author must create a new alternate for step B which is valid for bike 3 and bike 4.

The impact of such a configuration change is different depending on the use of an alternates group or not.

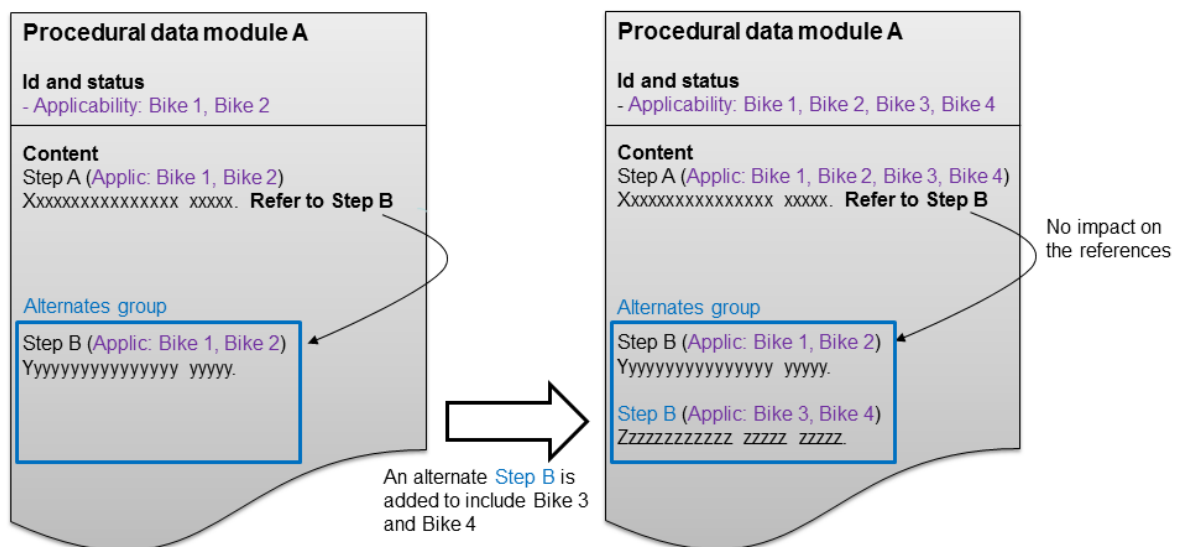

ICN-S3627-S1000D0594-001-01

Fig 3 Configuration dependencies - Alternates group not used

Alternates group elements used (refer to Fig 4):

- step A already refers to step B in an alternates group, so there is no impact on step A regarding the reference to step B.

ICN-S3627-S1000D0595-003-01

Fig 4 Configuration dependencies - Alternates group used

### 4.3 Configuration consistency check

The configuration consistency between the various alternates can be ensured. At a given point in time (ie, for a given Product configuration and a given operational condition), only one alternate is applicable in an alternates group. The applicability of an alternate within an

alternates group must not overlap the applicability of any other alternate within the same alternates group. Refer to [Chap 3.9.5.3](#).

The sum of all applicabilities of the alternates within an alternates group must not cover every possible Product configuration or technical condition. It is allowed to have a case where none of the alternates within an alternates group is applicable to a certain Product configuration or technical condition. If the information for a specific configuration (filtering mode) is displayed and none of the alternates in a given alternates group is applicable, no information will be displayed.

## 4.4 Improving the numbering of alternates

When a sequence of elements is displayed as numbered steps, they must reuse the same sequence number for the elements that are alternates of the same information. Using this numbering rule for alternates ensures that no "hole" will appear in the sequential numbering when the information is filtered with a given condition in an IETP or when distributed as customized page-oriented publications.

If the alternates are not gathered in an alternates group, there is no information in the data to detect that a given element is an alternate of another one (two consecutive elements with different applicability annotations are not necessarily alternates). Consequently, there is no possibility to develop a reliable numbering algorithm associating the same step number to all the alternates.

If alternates are grouped in an alternates group, the information that the elements are alternates of the same information is explicit. This enables the implementation of a simple numbering algorithm to associate the same number to all the alternates of the same element.

## 5 Examples

### 5.1 Alternates group example for procedural steps

This markup example shows the use of grouping alternate procedural steps in a maintenance procedure data module (element [<proceduralStepAlts>](#)) and corresponds to the one illustrated in [Fig 2](#).

```
<mainProcedure>
...
<!-- ProceduralStep alternates grouping (two alternates of step 6)-->
<proceduralStepAlts>
<!-- First procedural step (step 6) alternate with applicability:
"Model: Mountain storm Version: Mk1"-->
<proceduralStep applicRefId="apMK1">
<para>Wash the Bike</para>
<proceduralStep>
<para>Soak the <internalRef xlink:actuate="onRequest"
xlink:show="replace" xlink:href="#seq-0003" internalRefId="seq-0003"
internalRefTargetType="irtt05"></internalRef> into <internalRef
xlink:actuate="onRequest" xlink:show="replace" xlink:href="#sup-0002"
internalRefId="sup-0002" internalRefTargetType="irtt04"></internalRef>
and water.</para>
</proceduralStep>
<proceduralStep>
<para>Clean the bicycle with the soaked sponge.</para>
</proceduralStep>
<proceduralStep>
<para>Flush the bicycle and make sure that all <internalRef
xlink:actuate="onRequest" xlink:show="replace" xlink:href="#sup-0002"
internalRefId="sup-0002" internalRefTargetType="irtt04"></internalRef>
is removed.</para>
```

```

</proceduralStep>
<proceduralStep>
<para>Move the bicycle up and down on its tires to remove all
water.</para>
</proceduralStep>
</proceduralStep>
<!-- Second procedural step (step 6) alternate with
applicability:"Model: Brook trekker Version: Mk9"-->
<proceduralStep applicRefId="apMK9">
<para>Wash the Bike</para>
<proceduralStep>
<para>Soak the <internalRef xlink:actuate="onRequest"
xlink:show="replace" xlink:href="#seq-0003" internalRefId="seq-0003"
internalRefTargetType="irtt05"></internalRef> into <internalRef
xlink:actuate="onRequest" xlink:show="replace" xlink:href="#sup-0003"
internalRefId="sup-0003" internalRefTargetType="irtt04"></internalRef>
and water.</para>
</proceduralStep>
<proceduralStep>
<para>Clean the bicycle with the soaked sponge.</para>
</proceduralStep>
<proceduralStep>
<para>Soak the <internalRef xlink:actuate="onRequest"
xlink:show="replace" xlink:href="#seq-0003" internalRefId="seq-0003"
internalRefTargetType="irtt05"></internalRef> into <internalRef
xlink:actuate="onRequest" xlink:show="replace" xlink:href="#sup-0002"
internalRefId="sup-0002" internalRefTargetType="irtt04"></internalRef>
and water.</para>
</proceduralStep>
<proceduralStep>
<para>Fully clean the bicycle with the soaked sponge.</para>
</proceduralStep>
<proceduralStep>
<para>Flush the bicycle to make sure that all detergents are
removed.</para>
</proceduralStep>
<proceduralStep>
<para>Move the bicycle up and down on its tires to remove all
water.</para>
</proceduralStep>
</proceduralStep>
</proceduralStepAlts>
...
</mainProcedure>

```

## 5.2 Alternates group example for functional items

This markup example shows the use of grouping functional items in a CIR data module (element `<functionalItemAlts>`). The example illustrates the case where there are two alternate locations (thus two functional item alternates) for the mountain bike rear light depending on the mountain bike model and version ("Model: Mountain storm Version: Mk1" or "Model: Brook trekker Version: Mk9").

```

<functionalItemRepository id="ID00003">
...
<functionalItemSpec>
<functionalItemIdent functionalItemNumber="L2"
functionalItemType="fit01" id="fin-002"/>

```

<a href="#">Chap 3.9.5.3</a>	Data modules - Applicability
<a href="#">Chap 8.4.1</a>	Information codes - Short definitions

## 1 General

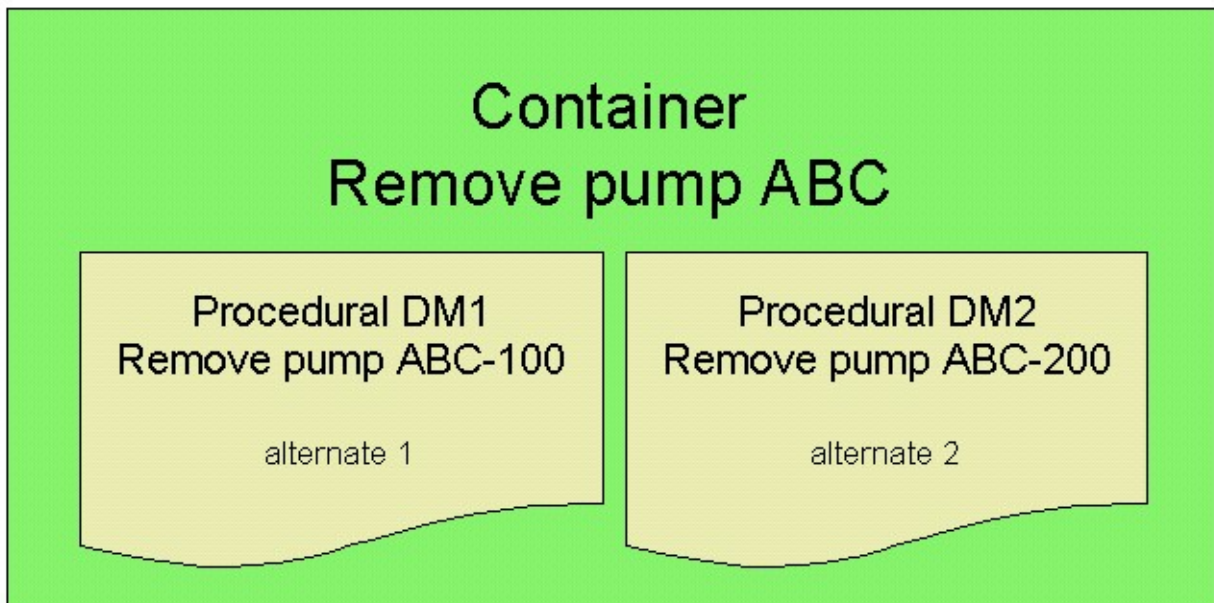

This chapter describes the container data module concept. The container data module is a production management mechanism to associate several data modules representing the same data. Refer to [Chap 3.9.5.2.12](#).

## 2 Container data module

### 2.1 Principle

The grouping of data modules can be used when several data modules achieve the same maintenance goal, but the detailed procedures differ due to Product configuration, maintenance environment or other conditions.

For example (refer to [Fig 1](#)), a maintenance action to remove a pump can be performed differently depending on the type of pump, such as "Remove pump ABC-100" (data module alternate 1) and "Remove pump ABC-200" (data module alternate 2). A container data module "Remove pump ABC" can be used to associate the two alternate data modules. References to the "Remove pump ABC" container data module will target the group of two alternate data modules.

ICN-S1000D-A-041303-A-FAPE3-00013-A-001-01

*Fig 1 Container data module "Remove pump ABC"*

As the container data module is a data management tool, there is no specific need to display it to the end user. The IETP process can suppress the container data module and display the accurate alternate data module 1 or data module 2 depending on configuration context.

### 2.2 Benefits

As the container is configuration independent, referencing a container data module has several benefits for data management and referencing purposes:

- reduction of configuration dependencies between data modules
- consistency of links
- configuration consistency checks
- content management
- reuse of classical configuration management processes and tools

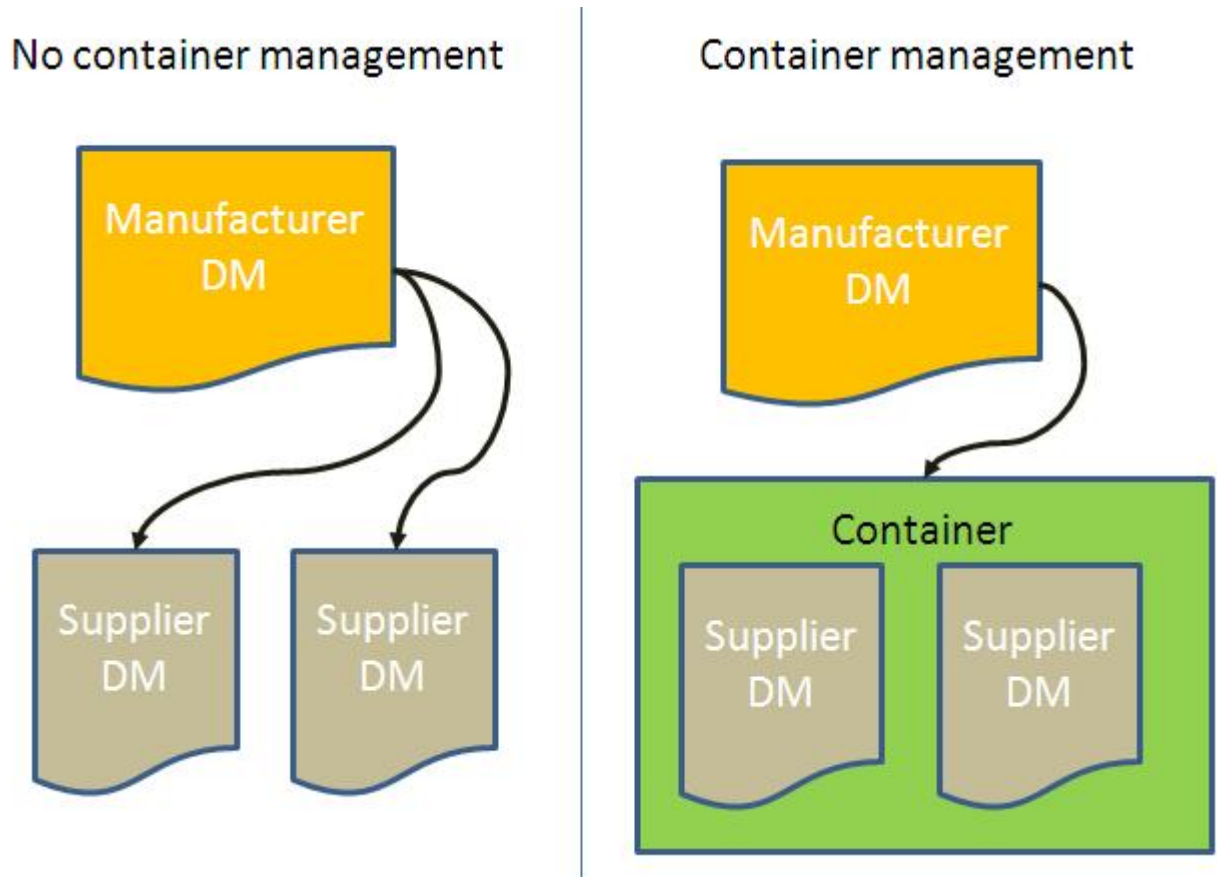

#### 2.2.1 Reduction of configuration dependencies between data modules

A container data module limits the impact of evolutions linked to configuration. For example, consider a data module referring to supplier data module (refer to [Fig 2](#)):

- left part describes the way of working without container

- right part describes the container data module approach, where the reference does not target the supplier's procedural data module directly, but targets the supplier's container data module

With configuration evolution, a second variant of the supplier procedural data module is created (description of a new configuration). The following figure illustrates the new situation.

ICN-S1000D-A-041303-A-FAPE3-00015-A-001-01

*Fig 2 Manufacturer and supplier relationship with configuration evolution*

Without the container data module, the manufacturer will have to create a new issue of the referencing data module in order to reference both the initial supplier procedural data module and the new "variant" of the supplier procedural data module. In other words, the manufacturer has to follow and react to each configuration evolution of the supplier procedural data modules.

With the container approach, a new issue of the manufacturer's data module is not necessary since the reference to the container data module remains valid. The workload of the manufacturer will be strongly reduced, and the opposite is also true in case of a supplier data module referencing a manufacturer's container data module.

The example illustrates how configuration dependency can be avoided and how workload can be reduced by use of container data module.

### 2.2.2 Consistency of links

The container data module helps to maintain the consistency of links by centralizing the link management and providing the capability to define the linking at the source instead of at the point of usage. Taking the previous example using the container data module and assuming a publication contains 10 separate links to the supplier data module, when the supplier adds the variant data module, the links only have to be changed one time in the container as opposed to

10 times at each usage. The container also provides the capability to have the supplier define and deliver the alternate data module relationships in container data modules as opposed to requiring the manufacturer to define them.

### **2.2.3 Configuration consistency checks**

The configuration consistency between the various alternate data modules can be ensured. At a given moment in time (ie, for a given Product configuration and under a given operational condition), only one alternate data module is applicable for a container data module. The applicability of one referenced data module within a container must not overlap the applicability of any other referenced data module within the same container. Refer to [Chap 3.9.5.3](#).

The sum of all applicability of referenced data modules within a container does not have to cover every possible Product configuration or technical condition. It is allowed to have a case where none of the referenced data modules within a container is applicable to a certain product attribute or condition.

The configuration check between alternate data modules is simplified by grouping the references to various alternates within an explicit structure of the container data module.

## **2.3 Identification of container data module**

### **2.3.1 General**

A container data module is used to associate a number of data modules with the same maintenance goal. Although it does not contain the procedure to perform the maintenance action, the target of the container data module has the same maintenance goal as the alternates it references. Therefore, the container can be considered a variant of the referenced data modules and could be identified as a variant. This method works well if the data modules referenced by the container have similar data module codes. It becomes more difficult when the data module codes differ (such as different SNS numbers or different information code numbers).

Container data modules are identified by one of the following methods:

- use of the disassembly code variant of the data module code. The disassembly code variant distinguishes the container data module from the referencing alternate data modules. The characters used for the container disassembly code variant and the number of characters for the container disassembly code variant is a project or an organization decision.
- use of the generic container information code. Refer to [Chap 8.4.1](#). The implication of using this method is that the maintenance goal represented by the container is not available.

The choice of the container identification method is a business rule decision.

### **2.3.2 Container identification example**

For example, the business rule decisions are:

- the disassembly code variant is used to identify the container
- the disassembly code variant character "A" is always used for container
- the disassembly code variant has one character of length

The following example illustrates the data module code for one container referencing two alternate data modules:

- the data module code for the container is AJ-A-35-13-51-00A-720A-A
- the data module code for the first alternate is AJ-A-35-13-51-00B-720A-A
- the data module code for the second alternate is AJ-A-35-13-51-00C-720A-A

**Business rule decision point BRDP-S1-00385 - Identification of container data module:**

- Decide which identification method to use for container data modules. The chosen method must be used systematically.

**2.4 Printing and displaying of container data modules**

The main purpose of the container data module is for data management, therefore the display or printing of a container data module provides no benefit to the end user. In fact, displaying or printing the container data module will force the user to select an additional link or look up an additional data module which is detrimental to the end user in both cases.

Although not prohibited, it is recommended that an IETP viewer process both the link to a container data module and the subsequent link to the target alternate data modules in a single operation. The container data module is hidden from the end user and it must appear that the target alternate data modules are linked at the source data module. Likewise, it is recommended that the same principle of hiding the container data module is used when composing a printed publication.

**2.5 Implementation rules**

Although not required by the XML Schema, the following rules must be respected:

- A container data module cannot refer to another container data module. A container data module can only refer to data modules with content (eg, procedural, descriptive).
- The configuration consistency between the various alternate data modules must be ensured. Refer to [Para 2.2.3](#).

It is recommended not to duplicate applicability annotations from the referenced data modules in the container data module. If necessary, the IETP could retrieve the applicability of referenced data modules.

**Business rule decision point BRDP-S1-00386 - Use of applicability within container data module content:**

- Decide whether applicability annotations are duplicated from the referenced data modules to the container data module.

## 1 General

Applying applicability to information objects, or parts thereof, identifies the context for which they are valid. This context is usually associated with the physical configuration of the Product but can include other aspects such as support equipment availability and environmental conditions. Applicability capabilities can vary greatly, from a simple annotation placed in the content of a data module to managing the life cycle of applicability which includes Product definition, applicability authoring and product instance configuration tracking. This chapter provides an overview of applicability capabilities and the mechanisms for managing applicability.

The applicability mechanism is supported by the applicability annotation within data modules, publications modules, data management lists, data update files and by three specific data module types:

- the Applicability Cross-reference Table (ACT) data module
- the Conditions Cross-reference Table (CCT) data module
- the Products Cross-reference Table (PCT) data module

[Chap 4.14.1](#) provides a detailed overview of the capabilities and mechanisms available in the ACT data module.

[Chap 4.14.2](#) provides a detailed overview of the capabilities and mechanisms available in the CCT data module.

[Chap 4.14.3](#) provides a detailed overview of the capabilities and mechanisms available in the PCT data module.

[Chap 4.14.4](#) provides a detailed overview of the capabilities and mechanisms available in the ACT catalog data module.

Detailed information for authoring applicability can be found in [Chap 3.9.5.3](#).

## 2 Applicability

### 2.1 Applicability concepts

#### 2.1.1 Static versus filtered view

##### 2.1.1.1 Filtered view

With the advent of cheap portable computing devices and viewers, it is possible to generate a tailored view of the data which is filtered for the product instance. It is the applicability model along with a defined set of rules for processing of applicability annotations that makes this filtered view possible.

For example, in the sample bicycle data set, the data module S1000DBIKE-AAA-D00-00-00-00AA-258A-A contains a procedural step with an applicability annotation specifying that the step information is appropriate for the "Mountain bicycle Mountain storm Mk1" bicycle. The next procedural step has an applicability annotation specifying that the step information is appropriate for the "Mountain bicycle Brook trekker Mk9" bicycle. The viewer could use the applicability annotations and the known model of the bicycle being serviced to filter the data module content and only show the information that is appropriate.

Filtering on applicability can also be used to perform customization during publication. In this scenario a master data module contains the information for all deliveries (customers) and during publishing for a specific delivery (customer) the data module is customized (filtered) to contain only data that is appropriate for that delivery (customer). Taking the above example, customer A only resells "Mountain bicycle Mountain storm Mk1" bicycles and does not want information about "Mountain bicycle Brook trekker Mk9" bicycles included in their manuals. During publication, all data modules are customized to remove any "Mountain bicycle Brook trekker Mk9" specific information. The applicability model with its filtering capability facilitates this. Refer to [Chap 4.12](#) for more information about customization.

- 2.1.1.2      **Static view**  
 With page-oriented publications or conditions where a viewer is not available, a static view of the applicability and associated data must be supported. In a static view, all information must be presented and the maintainer must determine which data is appropriate for the product instance.

**Note**

The data can be filtered before publishing.

Taking the example from [Para 2.1.1.1](#), both steps would have to be presented along with the applicability pertaining to each. The maintainer must decide which of the two steps are appropriate for the bicycle he/she is working on.

- 2.1.1.3      **Functionality comes at a cost**  
 The applicability model can support schemes from the very simple to the complex, supporting the full range from page-oriented to automated filtering in a viewer.
- If only static applicability is required and computation of applicability is not needed, then only a part of the applicability annotation is used within data modules. The ACT, CCT and PCT data modules are not needed.
- If applicability filtering is required, then the full applicability annotation, including the ACT, CCT and PCT data modules, are required. The project or the organization must decide to which level applicability must be implemented.
- Refer to [Chap 3.9.5.3](#) and subchapters for implementation details.

- 2.1.2      **Life cycle of applicability data**  
 The applicability model provides the mechanism to manage applicability throughout the life cycle as it relates to technical data. A project or an organization can elect to adopt only portions of the process depending upon business requirements. Refer to [Fig 1](#) for a diagram of the life cycle.

**Business rule decision point BRDP-S1-00387 - Use of applicability:**

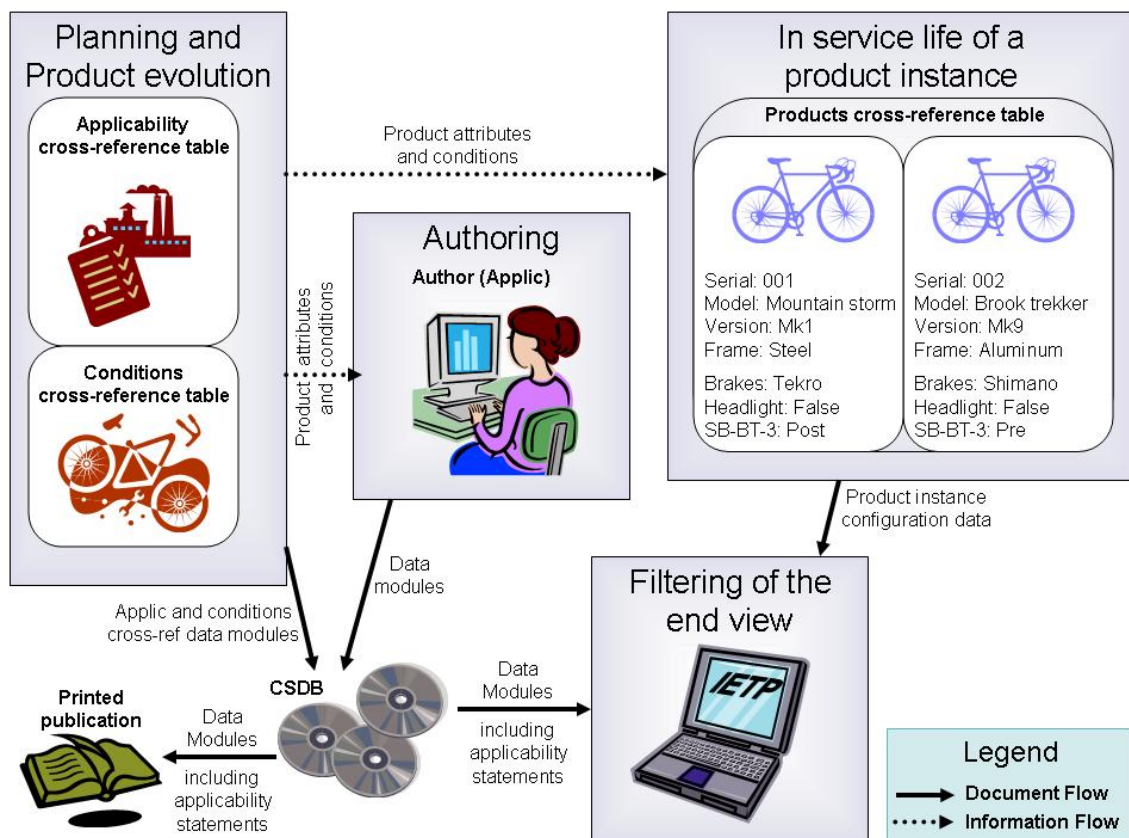

- Decide if the project or the organization will use applicability.

**Business rule decision point BRDP-S1-00388 - Applicability functionality:**

- Define the required functionality for applicability.

**Business rule decision point BRDP-S1-00389 - Use of applicability data module types (ACT, CCT and PCT):**

- If functionality is limited to print and static display, decide if applicability data module types (ACT, CCT and PCT) will be used.

ICN-AE-A-041400-A-76301-00001-A-001-01

Fig 1 Applicability life cycle

- 2.1.2.1 **Planning**  
During planning, information from engineering, logistics support analysis, manufacturing and other sources is used to identify attributes about the Product and an initial set of conditions which effect the applicability of technical data. These product attributes and conditions will be the basis for creating applicability annotations in data modules. Product attributes are declared and configuration managed in the ACT data module. Conditions are declared and configuration managed in the CCT data module.
- Business rule decision point BRDP-S1-00390 - Product attribute and conditions naming and identification scheme:**
- Define a consistent naming and identification scheme for product attributes and conditions, when ACT and CCT data modules are implemented.
- 2.1.2.2 **Authoring**  
During authoring, product attributes from the ACT data module and conditions from the CCT data module as well as some free text conditions are used to build applicability annotations. Applicability annotations can apply to an entire data module or to only a portion of the content.
- 2.1.2.3 **Product evolution**  
As the Product evolves, new product attributes and conditions will be identified. The ACT and CCT data modules, respectively, are modified and up-issued to reflect the new product attributes and conditions. New applicability annotations are created and existing applicability annotations are updated as needed within the data modules.

2.1.2.4 In-service life of a product instance  
As product instances are maintained throughout their life, the actual configuration of the product instance will change and is maintained in the PCT data module. The PCT data module can be published in cases where the product instance configuration is fairly static. The PCT data module can also be a transient file used only to convey the product instance configuration at a particular time between an authoritative source, such as a maintenance management system, and a viewer.

2.1.2.5 Filtering of the end view  
At the final point of usage, a viewer uses the product instance configuration information, from the PCT data module, as actual values to "plug in" to an applicability annotation in order to evaluate the outcome. A positive outcome indicates that the associated data is appropriate to display, a negative outcome indicates that the associated data is not appropriate to display. Thus the display can be tailored for the specific product instance.

**Business rule decision point BRDP-S1-00391 - Presentation of content that is not applicable:**

- Specify the method that content is presented which is not valid for the current maintenance context. The content can be removed, hidden or de-emphasized in some manner.

### 2.1.3 **Applicability annotation components**

The applicability annotation is divided into two parts:

- one part designed for human readability
- one part designed for computer processing

The project or the organization must determine which parts of applicability to implement depending on the requirements.

A project or an organization that is required to support a printed or static electronic display and does not need to support customized deliveries will only need to use the human-readable part of the applicability annotation. The computer processing part of the applicability annotation as well as the ACT, CCT and PCT data modules are not required. Refer to [Chap 3.9.5.3](#) for implementation details.

A project or an organization that is required to support filtering of the end view or customized deliveries will need to use the computer processing part of applicability. Applicability annotations will still need to be presented to the user in a human-readable form. This can be achieved either by providing the human-readable part of applicability or by relying on the viewer to generate the human-readable part from the computer processing part at the time of display. The project or the organization must decide whether to provide the human-readable part or rely on the viewer to generate the human-readable part.

**Business rule decision point BRDP-S1-00392 - Providing the human-readable part of applicability:**

- Decide whether to also provide the human-readable part of applicability or rely on the viewer to build the human-readable part, when providing the computer processing part of applicability.

Refer to [Chap 7.8](#) for details on generating the human-readable part from the computer processing part of applicability.

## 2.2 **Structure of applicability**

### 2.2.1 **General**

To facilitate the life cycle view of applicability, three specific data module types contain applicability information in addition to the applicability annotations contained in data modules

and publication modules. Although not prohibited, the ACT data module is not intended to be displayed to the end user.

**Business rule decision point BRDP-S1-00393 - Number of ACT, CCT and PCT data module instances:**

- Decide whether to provide one instance of each data module types (ACT, CCT and PCT) or to segregate the project or the organization into multiple instances of each data module type, and the method for segregation.

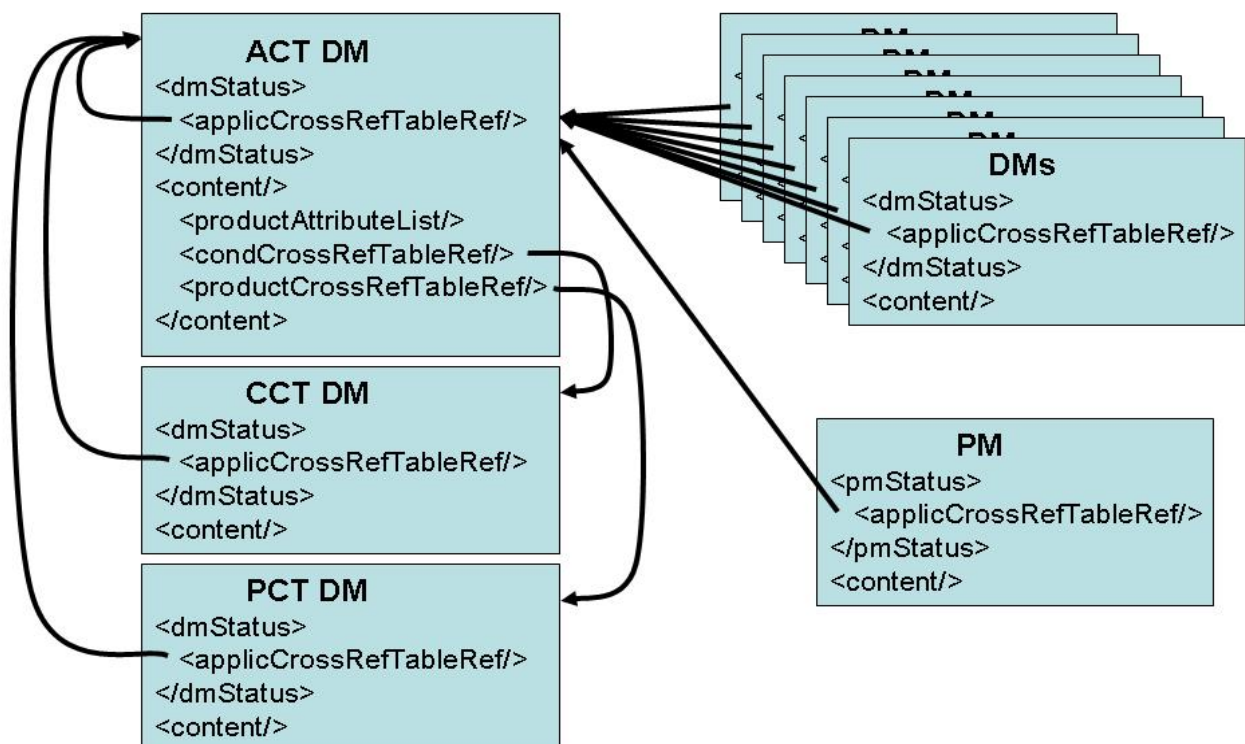

For projects or organizations managing several ACT/CCT/PCT sets, the ACT catalog data module can be used in order to ease the coordination between the different ACT/CCT/PCT sets. Refer to [Chap 4.14.4](#) for details on the ACT catalog data module concept.

## 2.2.2

### ACT data module

The ACT data module is used to declare product attributes that can affect applicability of data. Product attributes are properties of the Product that will typically not change throughout the service life of a product instance, such as model or serial number.

The ACT data module serves as the central point of reference for applicability definitions. It provides references to one CCT and one PCT data modules. All data modules, publication modules and SCORM content package modules requiring applicability filtering must reference one ACT data module from the identification and status section. Refer to [Fig 2](#).

ICN-S1000D-A-041400-A-76301-00002-A-002-01

Fig 2 Referencing scheme

Refer to [Chap 4.14.1](#) for details on the ACT data module.

### 2.2.3 CCT data module

The CCT data module is used to declare any type of condition that can affect applicability of data. Conditions can be technical, operational, environmental or any other type of condition that can affect technical data. Technical conditions are typically tied to the configuration of the Product, such as Service bulletins or modifications. The state of technical conditions can change throughout the service life of a product instance. Examples of operational and environmental conditions are location of maintenance, availability of support equipment, regulatory rules, temperature, wind speed and sandy conditions.

Similar to the ACT data module, a project or an organization can have multiple CCT data module instances. A project or an organization can decide to use more than one CCT data module instance to segregate conditions between major subsystems or to segregate between project partners.

The CCT data module is divided into three sections:

- an element to define common types of conditions
- an element to define specific conditions
- an optional incorporation status list for technical conditions

Refer to [Chap 4.14.2](#) for details on the CCT data module.

### 2.2.4 PCT data module

The PCT data module is a repository for defining product instances and the specific values for product attributes and conditions for each product instance. It is a formal method of defining product instances and the configuration of each product instance.

Similar to the ACT data module, a project or an organization can have multiple PCT data module instances. A project or an organization can decide to use more than one PCT data module instance to segregate conditions between major subsystems or to segregate between project partners.

Refer to [Chap 4.14.3](#) for details on the PCT data module.

### 2.2.5 Referencing scheme

The ACT data module serves as the central point of reference for applicability definitions. All data modules, publication modules and SCORM content package modules reference an ACT data module from the data module or publication module status section, respectively. The ACT data module references the CCT and PCT data modules. Thus all data modules and publication modules can gain access to all three applicability data modules with a single reference. Refer to [Fig 2](#).

## 1 General

The Applicability Cross-reference Table (ACT) data module is the central point of reference for applicability definitions when applicability filtering is required for either customized deliveries or filtering by a viewer. Refer to [Chap 4.14](#) for an overview of these processes.

The ACT data module contains the following elements:

- mandatory definition of product attributes
- optional reference to the Conditions Cross-reference Table (CCT) data module
- optional reference to the Products Cross-reference Table (PCT) data module

This combination provides access to all applicability definitions and product instance values from a single data module.

## 2 ACT data module

### 2.1 Product attribute definition

#### 2.1.1 Product attributes

A product attribute is a property of the Product that can affect the applicability of technical data. Product attributes are properties of the Product that are typically set at the time of manufacture of a product instance and will usually not change throughout the service life of a product instance. Examples of product attributes are model, series and serial number.

There are as many methods for classifying what is a Product's product attribute (or a Product's condition). These include, but are not limited to:

- Divide product attributes into properties that are set during Product manufacture and condition types into properties that are set after Product delivery
- Divide product attributes into properties that will not change during the life cycle of the Product and condition types into properties that can change

#### Note

The condition types are defined in the CCT data module. Refer to [Chap 4.14.2](#).

#### Business rule decision point BRDP-S1-00394 - Classifying product attributes and conditions in an ACT data module:

- Decide how to divide the properties of the Product into product attributes or condition types.

Modification of existing product attributes can have a significant effect on existing applicability statements. Therefore it is recommended that product attributes are configuration managed and that editing access to that content in ACT data modules is limited.

#### Business rule decision point BRDP-S1-00395 - Configuration management of product attributes in an ACT data module:

- Decide on the extent of configuration management and editing access to be applied to product attributes within an ACT data module.

#### 2.1.2 Definition of the product attributes

There are two kinds of product attribute definitions:

- the internal definition, using the element `<productAttribute>`
- the external definition, using the element `<externalProductAttribute>`

##### 2.1.2.1 Internal definition

The definition of a product attribute in the ACT data module includes a mandatory unique identifier, name and description as well as optional display name, Product identifier flag, data type, enumeration, pattern and user prompting labels.

The unique identifier is used to reference this product attribute from other data modules. The name and description provide help in identifying the product attribute.

A product attribute can optionally be specified as a product identifier. This specific product attribute (eg, serial number) can be used to uniquely identify a specific instance of the Product. The product attribute can be specified as a "primary" or "secondary" Product identifier. A "primary" product identifier is used to indicate that the specific product attribute is the preferred attribute to use for selecting a specific product instance. When a product attribute is identified as a "primary" product identifier, it must be included in the PCT data module for the product instance. A "secondary" product identifier is used to indicate an optional search key for identifying a specific product instance. When a product attribute is identified as a "secondary" product identifier, it can be included in the PCT data module Product description, but it is not required. Refer to [Chap 3.9.5.3.1](#).

The display name can be used when generating a human-readable applicability annotation. Refer to [Chap 7.8](#).

The data type indicates whether the product attribute contains a Boolean, string (the default), integer or real value. The enumeration and pattern together define the allowable values for a product attribute.

The values that are allowed for a product attribute are restricted by the data type. The values that are allowed for a product attribute can be further specified with either the enumeration or pattern or with both. The pattern specifies a format that values must adhere to. For example, a serial number must be three digits or the version of bicycle must be "Mk" followed by either 1 or 9. The enumeration specifies a number of discrete values or ranges allowable. For example, the model of bicycle must be "Brook trekker" or "Mountain storm", the serial number must be "1" thru "999", or the version of bicycle must be "Mk1" or "Mk9". There is some overlap in the capabilities of these two methods but there are also unique capabilities with each. The examples in this paragraph can be found in the bicycle sample data module DMC-S1000DBIKE-AAA-D00-00-00-00AA-00WA-D.

A product attribute value cannot contain the reserved tilde (~) or vertical bar (|) characters.

The prompting labels consist of authored sentences that are used to generate an interactive dialog for obtaining an attribute value from the user when the value has not been provided within the PCT data module. These are used when a simple dialog auto-generated with the display name is insufficient. Example of prompting label can be: "Serial Number (locate under the bottom bracket where the two pedal cranks meet)".

#### 2.1.2.2 External definition

The external product attribute is a product attribute which is identified in the ACT data module, so that it can be used in the applicability annotations of the data modules or in the PCT data module linked to this ACT data module, which definition (name, description, allowed values, etc) is available in another ACT data module.

For example, the external product attributes can be used in a multi-partner project, where each partner defines its own product attributes. One partner can use a product attribute already defined by one of the other partners.

The partner using an external product attribute can provide its own display name for this product attribute defined externally.

The use of external product attributes requires the implementation of the ACT catalog data module. Refer to [Chap 4.14.4](#) for more information on the external product attributes management and on the ACT catalog data module.

#### 2.1.3 Product attribute relationship to process data module variables

In the process data module, product attributes function as global variables, called global properties. These are used in expressions, assertions and all other such structures the same as local variables defined within the process data module. Refer to [Chap 3.9.5.2.10.3](#).

### 2.2 Reference to the CCT data module

If one or more sets of ACT/CCT/PCT data modules are used by a project or an organization, the reference to the associated CCT data module instance (if any) must be given in the ACT data module instance.

### 2.3 Reference to the PCT data module

If one or more sets of ACT/CCT/PCT data modules are used by a project or an organization, the reference to the associated PCT data module instance (if any) must be given in each ACT data module instance.

## Chapter 4.14.2

## 1 General

The Conditions Cross-reference Table (CCT) data module is used to declare conditions that have an effect on the applicability of data and is used to define the incorporation status for technical conditions. Refer to [Chap 4.14](#).

The CCT data module is divided into three sections:

- a definition of common types of conditions
- a definition of specific conditions
- an optional incorporation status list for technical conditions

## 2 Conditions cross-reference table

### 2.1 Conditions

A condition is any property other than a product attribute that has an effect on the applicability of data. Conditions differ from product attributes in that values of a condition are more likely to change throughout service life of a product instance or are often not tracked against a product instance. Conditions can be associated with the physical configuration of the Product, with maintenance conditions, with weather conditions or any other condition that has an effect on the applicability of data. Refer to [Chap 4.14.1](#) for business rules related to the classification and configuration management of product attributes and conditions of the Product.

#### 2.1.1 Technical conditions

Technical conditions are conditions that can be associated with the physical configuration of the Product. These technical conditions can be tracked against a product instance. Examples of technical conditions include but are not limited to Service bulletins, engineering orders and modifications.

#### 2.1.2 Operational conditions

Operational conditions are conditions that can be associated with the operation and/or at time of maintenance of the Product. These operational conditions are usually not considered as part of the configuration of the Product and are not tracked as such. An example of an operation condition is regulatory rules that are in effect, such as ETOPS. Examples of maintenance conditions include but are not limited to availability of support equipment, internal or external power and location of maintenance (such as indoor or outdoor).

#### 2.1.3 Environmental conditions

Environmental conditions are conditions that can be associated with environmental conditions at the time of maintenance or during operation prior to maintenance. Examples of environmental conditions include but are not limited to temperature, wind speed, rain, sandy conditions and volcanic ash.

#### 2.1.4 Other conditions

As systems become more integrated, other conditions can be associated with information not typically available to technical documentation. For example, as training and technical data become more integrated, conditions could be created to represent the qualifications and training records of the person performing maintenance and the technical data could be tailored for that person's qualifications. The extensible nature of the CCT data module will allow any condition to be created.

### 2.2 Definition of the conditions

The definition of a condition in the CCT data module is a process in two steps:

- first, a general condition type must be defined
- then, a specific condition must be defined of that type

For example, a generic Service bulletin type can be defined with allowable values of "pre" and "post", then a specific Service bulletin condition can be defined for whether a chain guard Service bulletin has been installed ("post") or not ("pre"). Many specific conditions can be defined which are the same general condition type.

#### 2.2.1 Condition types list definition

The definition of a condition type in the CCT data module includes a mandatory unique identifier, name, description and data type as well as an optional pattern, enumeration, references and interactive user prompting labels.

The unique identifier is used to reference this condition type when defining a specific condition.

The name and description provide help in identifying the condition type.

The data type indicates whether the product attribute contains a Boolean, string (the default), integer, or real value.

The enumeration and pattern together further define the allowable values for a condition type.

The prompting labels consist of authored sentences that are used to generate an interactive dialog for obtaining an attribute value from the user when the value has not been provided within the PCT data module. Since conditions can be based on environmental conditions, the value for a given condition can only be known at the time a maintenance procedure is executed. Example of prompting label can be: "SB 002 (requires incorporation of SB 001)".

The condition type definition is similar to the product attribute definition and follows the same rules with the exception that a display name does not exist in the condition type. Refer to [Chap 4.14.1](#).

## 2.2.2 Condition list definition

There are two kinds of condition definitions:

- the internal definition, using the element `<cond>`
- the external definition, using the element `<externalCond>`

### 2.2.2.1 Internal definition

The definition of a condition in the CCT data module includes a mandatory unique identifier, condition type reference, name and description as well as an optional display name and references. The unique identifier is used to reference this condition from other data modules and from the incorporation list of this data module. The name and description provide help in identifying the condition. The display name can be used when generating a human-readable applicability annotation. Refer to [Chap 7.8](#). The references are used if there is additional information associated with this condition. A common use of this is to refer to Service bulletin documentation for a Service bulletin condition.

### 2.2.2.2 External definition

The external condition is a condition which is identified in the CCT data module, so that it can be used in the applicability annotations of the data modules or in the PCT data module linked to this ACT data module, but which definition is available in another CCT data module. The definition means: name, description, reference.

For example, the external conditions can be used in a multi-partner project, where each partner defines its own conditions. One partner can use a condition already defined by one of the other partners. The partner using an external condition can provide its own display name for this condition defined externally.

#### Note

For external conditions, the condition type must be defined internally in the CCT data module (no use of external condition types).

The use of external condition requires the implementation of the ACT catalog data module. Refer to [Chap 4.14.4](#) for more information on the external condition management and the ACT catalog data module.

## 2.2.3 Condition relationship to process data module variables

In the process data module, conditions function as global variables, called global properties. These are used in expressions, assertions and all other such structures the same as local variables defined within the process data module. Refer to [Chap 3.9.5.2.10.3](#).

## 2.3 Incorporation status list

The optional incorporation status list of the CCT data module is used to document which technical conditions have been incorporated into the associated publications or data modules

for the relevant product instances. It has the capability to reference a condition defined earlier in the data module, to give the issue number of this technical condition and provide a list of documents the condition affects. The list can include a reference to the data module or publication affected, the status of the incorporation including optional date and applicability information which can identify which product instances are affected.

This information can be used to create incorporation status front matter.

**Business rule decision point BRDP-S1-00396 - Use of the incorporation status list in a CCT data module:**

- Decide whether to use the incorporation status list in the CCT data module.

#### **1 General**

The Products Cross-reference Table (PCT) data module is a repository of product instances and the values for product attributes and conditions for each product instance.

#### **2 Product**

##### **2.1 Definition**

A product instance is a single physical occurrence of the Product.

##### **2.2 Definition of Products and actual values**

The definition of a product instance in the PCT data module includes a list of assignments of actual values to product attributes and conditions for the product instance. Each assignment must include three pieces of information:

- a reference to the product attribute or condition
- an indicator whether this is a product attribute or condition
- the actual value

##### **2.3 Scope of Products**

The PCT data module can contain any number of product instances that are appropriate for the operating environment as defined by the project or the organization. In many cases only the product instances of a certain organization are listed. For example:

- A commercial airline listing only the Airbus A330 aircraft that it owns

Applicable to: All

**S1000D-A-04-14-0300-00A-040A-A**

**Chap 4.14.3**

- A battalion listing only the Abrams M1 battle tanks within the battalion
- United States (US) Naval Air squadron listing only the F/A-18 aircraft in the squadron

In other cases all product instances can be listed. For example:

- Airbus wanting an internal list of all A330 aircraft in-service regardless of owner
- US Navy wanting a list of all F/A-18 aircraft it owns

**Business rule decision point BRDP-S1-00397 - Scope of the product instances in a PCT data module:**

- Decide which product instances are contained in a PCT data module. Options include listing all product instances in-service or listing only the product instances within an organization.

## 2.4 Operational use of a temporary file

Many organizations already own and maintain systems to track the configuration of their product instances. These systems are often considered the authoritative source for configuration information and these organizations will not want to also maintain a PCT data module. In cases such as this, the PCT data module can be generated from the configuration management authoritative source and used as a temporary input to a viewer. The PCT data module provides a standard interface independent of which viewer is being used.

**Business rule decision point BRDP-S1-00398 - Use of a published or a temporary PCT data module:**

- Decide whether to publish a static issue of the PCT data module or use the data module as a temporary input between an external system and a viewer.

**Business rule decision point BRDP-S1-00399 - Management of the product instance configurations in PCT data modules:**

- Decide how to maintain the list of product instance configuration specifications and the associated values for product attributes and conditions.

**S1000D-A-04-14-0400-00A-040A-A**

**Chap 4.14.4**

## 1 General

The Applicability Cross-reference Table (ACT) catalog is a dedicated data module type to be used in the context of projects or organizations with several ACT data modules. The purpose of this ACT catalog data module is to coordinate different ACT/CCT sets in the same project or organization, in order to adequately address this scenario from a content management and IETP rendering perspective.

The implementation of the ACT catalog data module is a project or an organization business rule decision. All the more it is relevant only for multi-ACT data module projects or organizations.

**Business rule decision point BRDP-S1-00400 - Use of the ACT catalog data module:**

- Decide whether to use the ACT catalog data module.

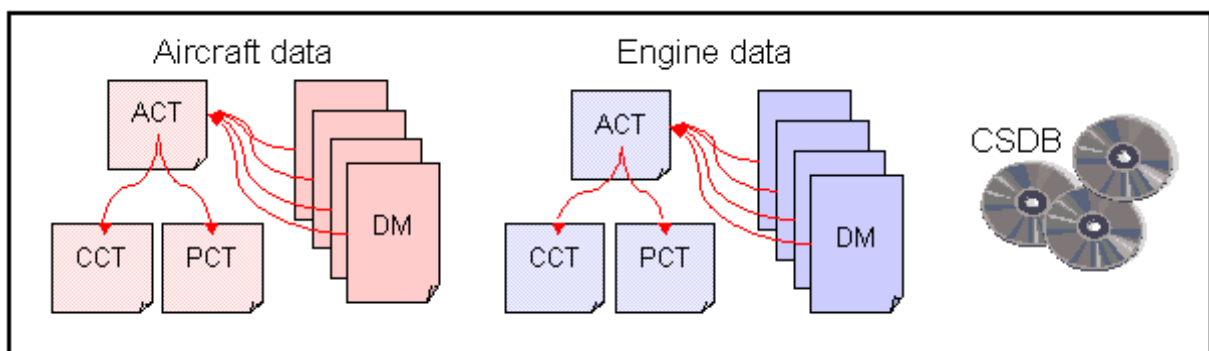

The ACT catalog is a branch of the ACT XML Schema, which is described in [Chap 3.9.5.3.4](#).

## 2 ACT catalog data module principle

### 2.1 Multi-partner project

In order to illustrate the ACT catalog data module principle, a classical multi-partner scenario is used in this chapter. This is a simple example to ease the understanding, but the ACT catalog can also fulfill more complex scenarios.

A multi-partner project contains a collection of data modules provided by several partners, for instance: data modules from an aircraft data provider and from an engine data provider. Each data provider is able to define and maintain its own ACT/CCT/PCT as shown in [Fig 1](#).

ICN-S1000D-A-04140400-A-FAPE3-00001-A-001-01

Fig 1 Example of multi-partner CSDB

### 2.2 Integrator and supplier

There is a hierarchy between the different partners:

- **The integrator:** The integrator is the company delivering the final and consistent publication for a given Product. This final publication can include data coming from different suppliers. The integrator can be the data provider of the main Product. For instance, the aircraft data provider is the integrator in our example. But the integrator can also be a company especially contracted to play this role.
- **The supplier:** The supplier is a data provider contributing to the Product publication. In our example, the engine data provider is a supplier.

The integrator can interact with several suppliers. It is up to the integrator to manage the ACT catalog data module.

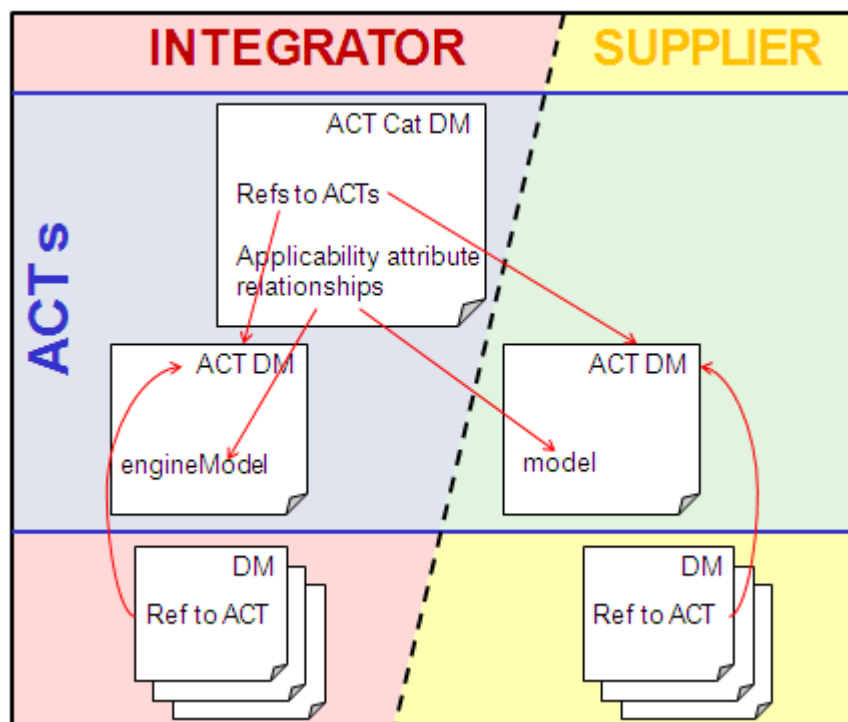

## 2.3 ACT catalog data module overview

The ACT catalog data module is a top-level data module providing relationships between the different applicability attributes (product attributes or conditions) defined in the different ACT and CCT data modules constituting the project or the organization.

The ACT catalog data module contains two parts:

- The list of ACT data modules constituting the project or the organization
- The list of applicability attributes relationships. An example of applicability attribute relationship is the equivalence between the product attributes "engineModel" as defined by the aircraft data provider, and model as defined by the engine data provider.

[Fig 2](#) shows the global picture of ACT catalog use:

ICN-S1000D-A-04140400-A-FAPE3-00002-A-001-01

Fig 2 ACT catalog use

## 2.4 ACT catalog data module purpose

The implementation of the ACT catalog data module supports:

- the use of supplier applicability attributes (ie, product attributes or conditions pertaining to the supplier Product definition) in integrator data module applicability annotations. For instance, the aircraft data provider can express the applicability of some procedures depending on the engine model.
- the capability to filter supplier data modules according to integrator applicability attributes via the IETP

## 3 Management of the ACT catalog data module within the IETP

The ACT catalog is not linked to a given set of data modules. This means that, by default, each IETP must look for an ACT catalog data module, to know if it is implemented or not in a given CSDB.

If the ACT catalog data module is implemented and thus found by the IETP, then the IETP can build the links between the different ACT data modules.

## 4 ACT catalog data module coding

A specific information code is allocated for the ACT catalog data module type: 0A3.

For a given integrator, there must be only one ACT catalog data module. The model identification code must follow the model identification code as defined by the integrator for the main Product, and for example, the SNS 00-00-00 can be used.

Example of data module coding for the bike ACT catalog data module:

S1000DBIKE-AAA-D00-00-00-00AA-0A3A-D

## 5 Use of supplier applicability attributes

If an integrator wants to use supplier applicability attribute(s) in its data module applicability annotations, then it must declare an identifier for these applicability attribute(s) in its own ACT and/or CCT data modules.

For example, the aircraft data provider can express the applicability in terms of engine model in its data modules. In this case a product attribute must be created for the engine model in its ACT data module.

Then there are two ways to define these supplier applicability attributes:

- The integrator provides its own definition of the applicability attribute (internal definition)
- The integrator uses the supplier definition for this applicability attribute (external definition)

**Business rule decision point BRDP-S1-00401 - Internal or external definition of supplier applicability attributes:**

- Decide whether the supplier applicability attributes are defined in the ACT data module or if the supplier definition is used.

Refer to [Chap 4.14.1](#) and [Chap 4.14.2](#) for more information on internal and external definitions of product attributes and conditions.

The use of an external definition requires the implementation of the ACT catalog data module. Refer to [Para 6](#) for more details on the use of the ACT catalog data module for applicability attribute external definitions.

## 6 Product definition relationships

A product definition relationship basically consists of an association between two applicability attributes or two applicability attribute values.

There are two kinds of associations that can be managed thru the ACT catalog data module.

### 6.1 External references

The external references support the use of external applicability attributes, when the integrator wants to use supplier applicability attributes.

This kind of association is always between two product attributes or two conditions.

In such a case, the integrator must create an external applicability attribute in its ACT or CCT data module (elements `<externalProductAttribute>` and `<externalCond>`).

Then the integrator must create a corresponding product definition relationship in its ACT catalog data module. This product definition relationship provides the association between the

integrator external applicability attribute and the supplier applicability attribute. The product association type must be set to "extref" value.

## 6.2 Examples

### 6.2.1 Engine ACT data module

```
<dmodule>
<identAndStatusSection>

<dmRef>DMC-AIR-AAA-XX-XX-XX-00AA-00WA-A</dmRef>
</applicCrossRefTableRef></externalAssert>
<associate associationType="extref">
<externalAssert applicPropertyIdent="model"
applicPropertyType="prodattr">
<applicCrossRefTableRef>
<dmRef>DMC-ENG-AAA-XX-XX-XX-00AA-00WA-A</dmRef>
</applicCrossRefTableRef></externalAssert></associate>
</productDefinitionRelationship>
</applicCrossRefTableCatalog>
</content>
</dmodule>

```

### 6.3 Alias

The use of an alias product definition relationship supports a consistent filtering of the CSDB: it provides the capability to the end user to filter supplier data modules according to an integrator product attribute via the IETP.

[Fig 3](#) shows an example of use of alias product definition relationships: the IETP is able to filter the integrator and supplier data modules against one applicability attribute.

ICN-S1000D-A-04140400-A-FAPE3-00003-A-001-01

**Fig 3** Filter the integrator and supplier data modules against one applicability attribute

Basically, an alias product definition relationship provides an equivalence between two applicability attributes or two applicability attribute values defined by different parties. For

example, the product attribute "engineModel" as defined by the aircraft data provider is equivalent to the product attribute model as defined by the engine data provider.

In such a case, the integrator must identify the applicability attribute or applicability attribute value subject to the alias in its own ACT data module using the attribute `aliasFlag`.

Then the integrator must create a corresponding product definition relationship in its ACT catalog data module. This product definition relationship provides the association between the integrator applicability attribute or applicability attribute value and the equivalent supplier applicability attribute or applicability attribute value. The product association type must be set to "`alias`" value.

## 6.4 Examples

### 6.4.1 Engine ACT data module

```

<a href="#">SCORM 2004</a>	SCORM 2004 4th Edition

#### 1 General

In S1000D, the support for managing learning information reflects how the information is structured and managed in accordance with Sharable Content Object Reference Model (SCORM). The incentive is to use a CSDB for managing learning information with same degree of control as applied to the technical publications.

#### 2 Content

The objects dedicated for learning information management, include:

- a learning data module that contains information for the development of learning content. Refer to [Chap 3.9.5.2.13](#).
- a Sharable Content Object (SCO) content data module that contains the learning content information, primarily by referencing reused content segments from other CSDB objects. Refer to [Chap 3.9.5.2.17](#). This data module exists to correspond to the SCO defined in the SCORM 2004 model.
- an aggregation object, the SCORM content package module, enabling aggregations of information into packages of learning information corresponding to the SCORM content package defined in the SCORM 2004 model.

The content section of the SCORM content package module is similar to the publication module in the sense that it contains references to data modules in the order and hierarchical structure the content is delivered. Even though it is not a requirement, a SCORM content package module would normally reference SCO content data modules, thus specifying an order and a structure of the learning content delivered.

[Chap 4.15.1](#) gives the structure of the SCORM content package module. [Chap 4.15.2](#) defines the SCORM content package module code. Building the SCORM content package module is described in [Chap 4.15.3](#) and updating is described in [Chap 15.4](#).

## 2.1 Key distinctions between the use and intention of SCORM content package modules in S1000D and SCORM

Several efforts have been made to harmonize selected S1000D and SCORM functions. One harmonization strategy centers on providing an aggregation object similar to the S1000D publication module to support the collection of learning content. In S1000D this object is called the “SCORM content package module”. In advance of the following chapters, it is important to clarify and distinguish between the descriptor SCORM content package module in the S1000D context, and a SCORM content package in the Learning Management System (LMS) context.

### 2.1.1 SCORM content package module in the S1000D context

The SCORM content package module operates as a file aggregation tool in the learning content development and assembly process. It is used for the express purpose of organizing references to data modules in a CSDB developed and selected for a pre-determined learning product. It contains no attributes that would make it a runtime environment and does not have to interface with external applications.

### 2.1.2 SCORM content package in the learning management system context

The SCORM content package descriptor in the LMS context is distinct from the S1000D context. The SCORM content package module used in an LMS contains code that helps track a learner’s progress through a course. It sends requests to a LMS through a pre-defined communication protocol. In essence, the SCORM content package in the LMS context is part of a runtime environment which serves, displays, and sequences learning content to a learner during self-directed training. It is designed to interface with external applications.

## 2.2 The SCORM content package module and the LMS

The SCORM content package module in S1000D is built and managed as an aggregation tool in a common source database. In employing SCO content data modules (refer to [Chap 3.9.5.2.17](#)) it mirrors the relationship between files and SCO in actual SCORM content package that is compiled for use in an LMS. In order to prepare it for a LMS, the SCORM content package module in S1000D requires a mapping and a transformation to the native aggregation model referenced in SCORM.

## 1 General

S1000D supports the aggregation of content used for learning, training, and performance products. The mechanism is executed by the coordinated use of two schemas:

- the SCORM Content Package Module (SCPM)
- the SCO content data module. This chapter describes how the SCPM operates. The SCO data module is described in [Chap 3.9.5.2.17](#).

### 1.1 Scope

The SCPM is used to define the hierarchical structure of learning events within a course or learning product. The structure and naming of the elements in this Schema, reflect the structure and naming conventions required by a typical Learning Management System (LMS).

### 1.2 Purpose

The SCORM content package module can aggregate a complete learning event (a course, for example) or it can aggregate a learning event subset (such as a lesson) that can then be referenced by other SCORM content package modules that are aggregated together to form a complete learning event. The structure of a SCORM content package module is project design decision.

The SCORM content package module has two purposes:

- Aggregation and structure of training and maintenance modules
- Reusability of technical information

The SCORM content package module is used to aggregate training modules and maintenance modules to describe a complete learning event or single learning product.

## 2 Content of the SCORM content package module

**Description:** The element `<scormContentPackage>` contains two major element wrappers: the element `<identAndStatusSection>` describes training life cycle and configuration information; the element `<content>` contains pointers to SCO content information which aggregates data modules used in a product deliverable.

**Markup element:** `<scormContentPackage>`

ICN-1654N-S1000D0047-001-01

Fig 1 Element `<scormContentPackage>`

#### Attributes:

- `id` (O), the identifier of the markup element. Refer to [Chap 3.9.5.2.1.2](#).

#### Child elements:

- `<identAndStatusSection>`. Refer to [Para 2.1](#).
- `<content>`. Refer to [Para 2.2](#).

## 2.1 Identification and status section

**Description:** The element `<identAndStatusSection>` contains the identification information required to name and control the SCORM content package module. It also provides the status information on the security and quality of the overall SCORM content package module.

**Markup element:** `<identAndStatusSection>`

ICN-1654N-S1000D0048-001-01

Fig 2 Element `<identAndStatusSection>`

#### Attributes:

- None

#### Child elements:

- `<scormContentPackageAddress>`. Refer to [Para 2.1.1](#).
- `<scormContentPackageStatus>`. Refer to [Para 2.1.2](#).
- `<lom>`. Refer to [Para 2.1.3](#).

### 2.1.1 SCORM content package module address

**Description:** The element `<scormContentPackageAddress>` contains the identification, title and issue details of the SCORM content package module.

**Markup element:** `<scormContentPackageAddress>`

ICN-1654N-S1000D0049-001-01

Fig 3 Element `<scormContentPackageAddress>`

#### Attributes:

- None

#### Child elements:

- `<scormContentPackageIdent>`. Refer to [Para 2.1.1.1](#).
- `<scormContentPackageAddressItems>`. Refer to [Para 2.1.1.3](#).

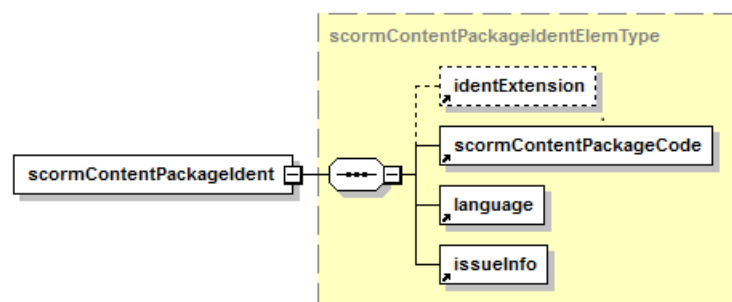

#### Markup example:

```
<scormContentPackageIdent>
<scormContentPackageCode modelIdentCode="S1000DBIKE"
scormContentPackageIssuer="AH019"
scormContentPackageNumber="00001"
scormContentPackageVolume="00" />
<language countryIsoCode="US" languageIsoCode="en" />
<issueInfo inWork="00" issueNumber="001" />
</scormContentPackageIdent>
```

#### 2.1.1.1 SCORM content package module identification

**Description:** The element `<scormContentPackageIdent>` contains the unique identification of the SCORM content package module..

**Markup element:** `<scormContentPackageIdent>`

ICN-1654N-S1000D0050-001-01

Fig 4 Element `<scormContentPackageIdent>`

#### Attributes:

- None

#### Child elements:

- `<identExtension>` the additional parameters needed to establish a unique identification of a SCORM content package module in those cases when SCORM content package module code, issue and in-work numbers together with the language and country

are insufficient to form a universally unique identity. This element establishes a producer unique subdomain for identification. Refer to [Chap 4.12](#).

- `<scormContentPackageCode>`. Refer to [Para 2.1.1.2](#).
- `<language>`. Refer to [Chap 3.9.5.1](#).
- `<issueInfo>`. Refer to [Chap 3.9.5.1](#).

#### 2.1.1.2 SCORM content package module code

**Description:** The element `<scormContentPackageCode>` contains the SCORM content package module code that forms part of the unique identifier of the SCORM content package module.

**Markup element:** `<scormContentPackageCode>`

##### Attributes:

- `modelIdentCode` (M). Refer to [Chap 4.3.1](#).
- `scormContentPackageIssuer` (M). Refer to [Chap 4.15.2](#).
- `scormContentPackageNumber` (M). Refer to [Chap 4.15.2](#).
- `scormContentPackageVolume` (M). Refer to [Chap 4.15.2](#).

##### Child elements:

- None

#### 2.1.1.3 SCORM content package module address items

**Description:** The element `<scormContentPackageAddressItems>` contains information that is supplementary to the SCORM content package module identification but not part of the unique identifier.

**Markup element:** `<scormContentPackageAddressItems>`

ICN-1654N-S1000D0051-001-01

Fig 5 Element `<scormContentPackageAddressItems>`

##### Attributes:

- None

##### Child elements:

- `<issueDate>`. Refer to [Chap 3.9.5.1](#).
- `<scormContentPackageTitle>`. Refer to [Para 2.1.1.4](#).

##### Markup example:

```

<scormContentPackageAddressItems>
  <issueDate day="12" month="01" year="2010"/>
  <scormContentPackageTitle>
    S1000D BIKE learning sample
  </scormContentPackageTitle>
</scormContentPackageAddressItems>
  
```

#### 2.1.1.4 SCORM content package module title

**Description:** The element `<scormContentPackageTitle>` contains the title of the SCORM content package module.

**Markup element:** `<scormContentPackageTitle>`

**Attributes:**

- None

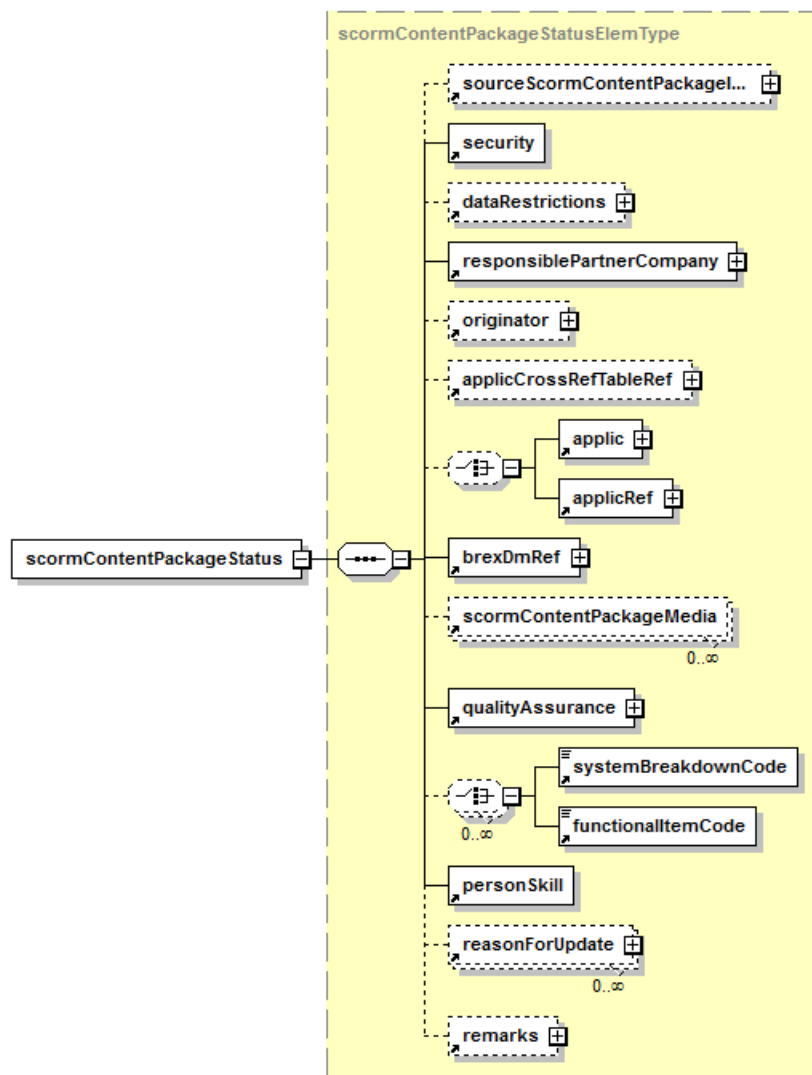

**Child elements:**

- None

#### 2.1.2 SCORM content package module status

**Description:** The element `<scormContentPackageStatus>` contains the status information of the SCORM content package module.

**Markup element:** `<scormContentPackageStatus>`

ICN-1654N-S1000D0052-001-01

Fig 6 Element `<scormContentPackageStatus>`

**Attributes:**

- `issueType` (O). Refer to [Chap 3.9.5.1](#).

**Child elements:**

- `<sourceScormContentPackageIdent>`. Refer to [Para 2.1.2.1](#).
- `<security>`. Refer to [Chap 3.9.5.1](#).
- `<dataRestrictions>`. Refer to [Chap 3.9.5.1](#).
- `<responsiblePartnerCompany>`. Refer to [Chap 3.9.5.1](#).
- `<originator>`. Refer to [Chap 3.9.5.1](#).
- `<applicCrossRefTableRef>`. Refer to [Chap 3.9.5.3](#).
- `<applic>`. Refer to [Chap 3.9.5.3](#).
- `<scormContentPackageMedia>`. Refer to [Para 2.1.2.2](#).
- `<qualityAssurance>`. Refer to [Chap 3.9.5.1](#).
- `<systemBreakdownCode>`. Refer to [Chap 3.9.5.1](#).
- `<functionItemCode>`. Refer to [Chap 3.9.5.1](#).
- `<personSkill>`. Refer to [Chap 3.9.5.1](#).
- `<reasonForUpdate>`. Refer to [Chap 3.9.5.1](#).
- `<remarks>`. Refer to [Chap 3.9.5.1](#).

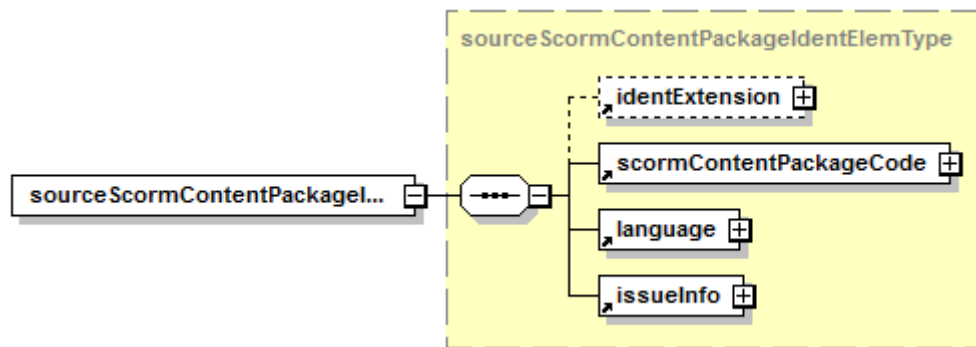

**Markup example:**

```
<scormContentPackageStatus>
<security securityClassification="01"/>
<responsiblePartnerCompany enterpriseCode="AH019"/>
<originator enterpriseCode="AH019"/>
<brexDmRef>
...
</brexDmRef>
<scormContentPackageMedia scormContentPackageMediaCode="DKS:1"
scormContentPackageMediaType=" "/>
<qualityAssurance>
<unverified/>
</qualityAssurance>
<personSkill skillLevelCode="sk01"/>
</scormContentPackageStatus>
```

**2.1.2.1 Source SCORM content package module identification**

**Description:** The element `<sourceScormContentPackageIdent>` contains the identification information of the source SCORM content package module on which the SCORM content package module is based.

**Markup element:** `<sourceScormContentPackageIdent>`

ICN-83007-0000000127-001-01

Fig 7 Element `<sourceScormContentPackageIdent>`

#### Attributes:

- None

#### Child elements:

- `<identExtension>`. Refer to [Chap 3.9.5.1](#).
- `<scormContentPackageCode>`. Refer to [Para 2.1.1.2](#).
- `<language>`. Refer to [Chap 3.9.5.1](#).
- `<issueInfo>`. Refer to [Chap 3.9.5.1](#).

### 2.1.2.2 SCORM content package module media

**Description:** The element `<scormContentPackageMedia>` contains the description of the media on which the SCORM content package module is delivered.

**Markup element:** `<scormContentPackageMedia>`

#### Attributes:

- `scormContentPackageMediaType` (M), the media type (eg, paper, CD-ROM, DVD, online)
- `scormContentPackageMediaCode` (M), the media identification (label)
- `volumeNumber` (O), the volume of the media defined by two numeric characters. It is used when the information given needs to be separated into several volumes due to media restrictions. It must correspond with the element `<scormContentPackageVolume>` within the SCORM module code.
- `mediaLocation` (O), the location of the media.

#### Child elements:

- None

#### Markup example:

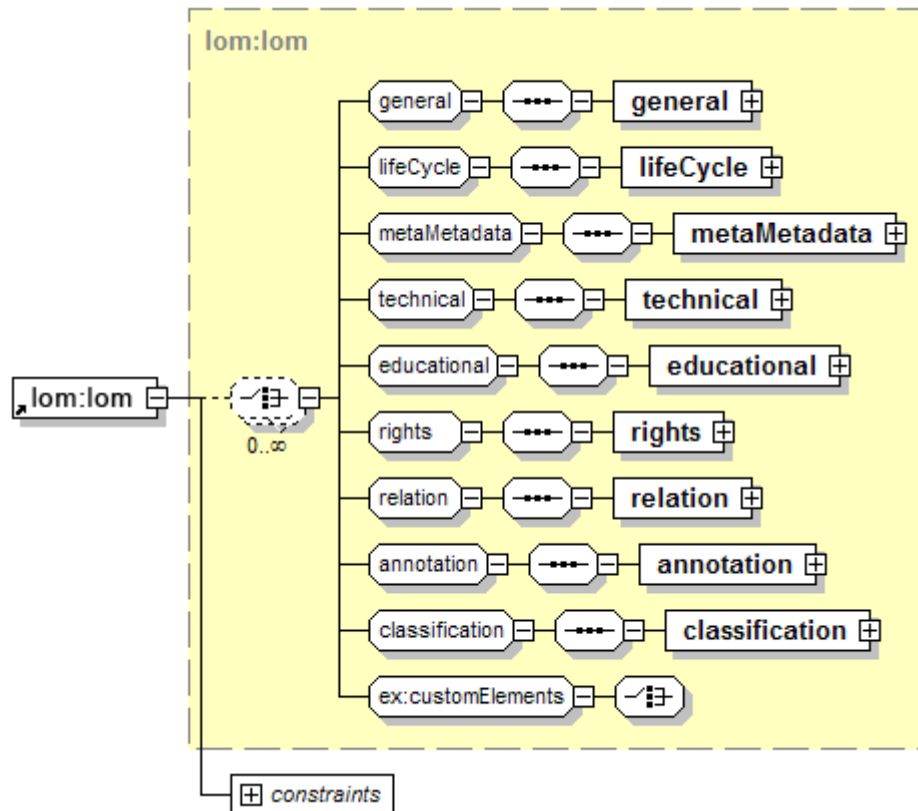

```
<scormContentPackageMedia scormContentPackageMediaCode="DKS:1"
scormContentPackageMediaType="CD" />
```

### 2.1.3 Learning object metadata

**Description:** The element `<lom>` contains a set of metadata for describing learning content, including element names, definitions, data types, and field lengths as defined in the IEEE Standard for learning object metadata, which is a part of SCORM 2004. The inclusion of the

LOM in the SCPM allows learning content developers to add metadata about the learning content references within the SCORM content package module.

The LOM, at this level, is used to describe metadata about the SCORM content package module. This is described in detail in the Content Aggregation Model (CAM) in SCORM 2004.

ICN-83007-0000000047-001-01

Fig 8 Element <lom>

**Markup element:** <lom>

**Attributes:**

- None

**Child elements:**

- Refer to the SCORM CAM documentation for this information at SCORM 2004.

**Markup example:**

```
<lom:lom>
<lom:general>
<lom:identifier>
<lom:entry>S1000D-SCORM-BIKE-SAMPLE</lom:entry>
</lom:identifier>
<lom:title>
<lom:string>
S1000D/SCORM Bike Sample
</lom:string>
</lom:title>
```

```

<lom:description>
<lom:string>

<lom:metadataSchema>SCORM_CAM_v1.3</lom:metadataSchema>
</lom:metaMetadata>
</lom:lom>

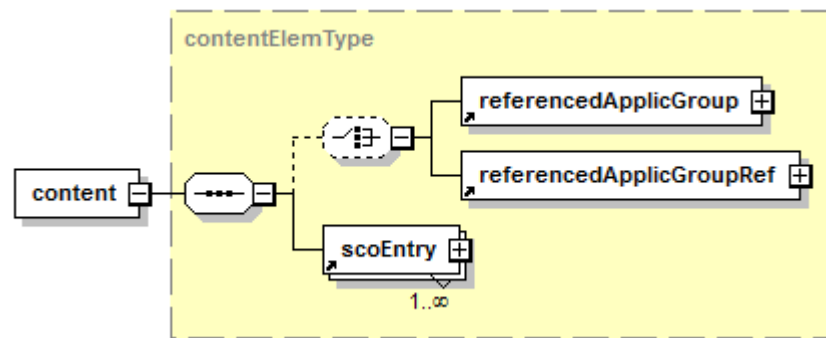

```

## 2.2 Content section

**Description:** The element `<content>` contains all the references to technical information required to build a learning deliverable.

Throughout this paragraph, the acronym SCO is used in various elements. There is a difference between the term SCO in SCORM and how it is used in S1000D. A SCO in SCORM is a single, reusable learning object that is able to launch a request to a LMS during a learning event. In S1000D, a SCO is the collection of aggregated technical information assembled during content production prior to being compiled into a SCORM package. The S1000D SCORM content package module does not communicate with a LMS. The naming similarities are intentional so to align the process of aggregating content to the structure of the content used during a runtime learning event.

**Markup element:** `<content>`

ICN-1654N-S1000D0053-001-01

Fig 9 Element &lt;content&gt;

#### Attributes:

- None

#### Child elements:

- <referencedApplicGroup>. Refer to [Chap 3.9.5.3](#).
- <referencedApplicGroupRef>. Refer to [Chap 3.9.5.3](#).
- <scoEntry>. Refer to [Para 2.2.1](#).

### 2.2.1

#### SCO entry

**Description:** The element <scoEntry> contains the title and references to the data modules that comprises the content of a learning event. It also contains LOM information to describe the referenced content. It is the central element for a SCORM content module package and can be defined recursively. This allows SCORM content package module structures in variable depth.

#### Note

SCO entry element relationship to the Instructional Management System (IMS) manifest is that the element <scoEntry> can be used to represent a "flat" listing of corresponding SCORM SCO type resources. When nested, it can be used to represent a more complex, recursive data structure translating to a course Table of contents that can be displayed by a LMS. Nesting SCO entry elements allows for hierarchical data representation of course structures. Hierarchical representations of course structures can be used in XSL transformation processes to direct output of SCPM data to corresponding XML structures found in the IMS/SCORM manifest "resources" and "organizations" structures.

**Markup element:** <scoEntry>

ICN-1654N-S1000D0054-001-01

Fig 10 Element &lt;scoEntry&gt;

#### Attributes:

- scoEntryType (O), the type of SCO entry (eg, SCO, asset). This attribute can have one the following values:

- "scot01" thru "scot99". Refer to [Chap 3.9.6.1](#).

The use of attribute scoEntryType indicates the need to transform the content of the element <scoEntry> to a corresponding data structure within an IMS/SCORM manifest.

#### Child elements:

- <scoEntryTitle>. Refer to [Para 2.2.1.1](#).
- <scoEntryItem>. Refer to [Para 2.2.1.2](#).

#### Markup example:

<!-- The following example provides data representation of the Drive Train unit of the S1000D Bike learning sample content. In this example, scoEntry elements are nested to provide data structures that can be used to represent a content Table of contents for the Bike steering system training module. In the SCORM, a "content module" is a term used to refer to a grouping of thematically related SCO within the organizations section of an IMS/SCORM manifest.

The recursive structure of the sample XML can be output to the the organizations section of an IMS manifest through custom XSL transformation processes. The organizations section of the IMS manifest typically provides the LMS the data needed for the presentation of the courseware Table of contents.

The optional scoEntryType attribute is used to further distinguish the use of SCO entry elements in the example. The value "scot01" is used to reference a SCO type resource. The dmRef elements point to SCO Content type data modules. SCO content data modules are aggregations of the content references for the content files comprising a single SCO. -->

```
<scoEntry>
<scoEntryTitle>Module 4 - Drive train</scoEntryTitle>
<scoEntryItem>
<scoEntry scoEntryType="scot01">
<scoEntryTitle>Drive train description</scoEntryTitle>

        <language countryIsoCode="US" languageIsoCode="en" />
      </dmRefIdent>
    </dmRef>
  </scoEntryItem></scoEntry>
</scoEntryItem></scoEntry>

```

### 2.2.1.1

#### SCO entry title

**Description:** The element `<scoEntryTitle>` contains the title of the SCO entry within the SCORM content package module.

**Markup element:** `<scoTitle>`

#### Attributes:

- None

#### Child elements:

- None

### 2.2.1.2

#### SCO entry item

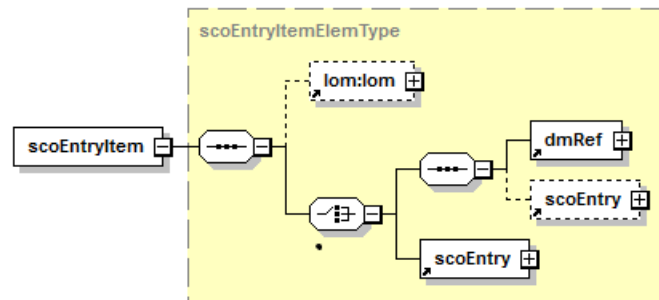

**Description:** The element `<scoEntryItem>` contains a reference to a data module that comprises the content of a learning event. It also contains LOM information to describe the referenced content. As shown in the example below, the element `<scoEntry>` can be nested within the element `<scoEntryItem>` in order to define the hierarchical structure of the course or learning event.

A SCO entry can be composed by references to the data modules containing the content that must be included or to sub SCO entry definitions or both. References can be made to any type of content data module within the element `<scoEntryItem>`.

#### Note

References to SCO content data modules can be used to reference aggregations of content data modules corresponding to SCOs. Use of the SCO content data module will improve reuse potentials of SCO aggregations within SCPM structures. Refer to [Chap 3.9.5.2.17](#).

Markup element: `<scoEntryItem>`

ICN-1654N-S1000D0055-001-01

Fig 11 Element `<scoEntryItem>`

#### Attributes:

- None

#### Child elements:

- `<lom>`. Refer to [Para 2.1.3](#).
- `<dmRef>`. Refer to [Chap 3.9.5.2.1.2](#).
- `<scoEntry>`. Refer to [Para 2.2.1](#).

Chap No./Document No.	Title
<a href="#">Chap 4.3.1</a>	Data module code - Model identification code
<a href="#">Chap 7.5.1</a>	Information interchange - File based transfer

## 1 General

The Shareable Content Object Reference Model (SCORM) content package module code is the standardized and structured identifier of a SCORM content package module or a final deliverable learning product.

## 2 Content

### 2.1 SCORM content package module code

**Description:** The element `<scormContentPackageCode>` contains the SCORM content package module code. The code is used to manage SCORM content package modules in the CSDB, to retrieve them, or to gain access to them in a learning environment. The SCORM content package module code is also used to refer to the SCORM content package modules from, for example, lists of applicable learning products, data modules and other SCORM content package modules.

The SCORM content package module code comprises up to 26 alphanumeric characters and is built up as shown in [Table 2](#). The minimum length is 14 characters.

YY - YYYYY - YYYYY - NN (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - YYYYY - NN (26 characters)

*Table 2 SCORM content package module code*

Breakdown	Rule
Model identification code	2 thru 14 uppercase alphanumeric characters
Issuing authority	5 uppercase alphanumeric characters
Number of the SCORM content package module	5 uppercase alphanumeric characters
Volume number	2 numeric characters

**Markup element:** <[scormContentPackageCode](#)>

**Attributes:**

- modelIdentCode (M). Refer to [Table 2](#) and [Para 2.1.1](#).
- scormContentPackageIssuer (M). Refer to [Table 2](#) and [Para 2.1.2](#)
- scormContentPackageNumber (M). Refer to [Table 2](#) and [Para 2.1.3](#).
- scormContentPackageVolume (M). Refer to [Table 2](#) and [Para 2.1.4](#).

**Child elements:**

- None

### 2.1.1 Model identification code

**Description:** The model identification code is given in the SCORM content package module code by the highlighted characters as follows:

YY - YYYYY - YYYYY - NN (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - YYYYY - NN (26 characters)

The model identification code is contained in the attribute modelIdentCode. Refer to [Chap 4.3.1](#).

### 2.1.2 Issuing authority

**Description:** The CAGE code of the issuing authority of the SCORM content package module is given in the SCORM content package module code by the highlighted characters as follows:

YY - **YYYYY** - YYYYY - NN (14 characters)

thru

YYYYYYYYYYYYYYY - **YYYYY** - YYYYY - NN (26 characters)

The CAGE code of the issuing authority is contained in the attribute scormContentPackageIssuer.

**Note**

The CAGE code used in this attribute must be a registered CAGE code.

**2.1.3 Number of the SCORM content package module**

**Description:** The number of the SCORM content package module is given in the SCORM content package module code by the highlighted characters as follows:

YY - YYYYY - **YYYYY** - NN (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - **YYYYY** - NN (26 characters)

The issuing authority assigns the number of the SCORM content package module. The number is a unique alphanumeric identifier depending on the model identification code (attribute `modelIdentCode`) and the issuing authority (attribute `scormContentPackageIssuer`).

The number of the SCORM content package module is contained in the attribute `scormContentPackageNumber`.

**2.1.4 Volume of the SCORM content package module**

**Description:** The volume of the SCORM content package module is given in the SCORM content package module code by the highlighted characters as follows:

YY - YYYYY - YYYYY - **NN** (14 characters)

thru

YYYYYYYYYYYYYYY - YYYYY - YYYYY - **NN** (26 characters)

This attribute is used in cases where a SCORM content package module has to be separated into volumes without assigning a new number. The default value is "00" if only one volume exists.

The volume of the SCORM content package module code is contained in the attribute `scormContentPackageVolume`.

**2.2 Use of hyphens**

The SCORM content package module code must be presented with hyphens [-] in the positions as shown above and without spaces in between. The hyphens delimit the contents of the codes, as shown, but are not included within the population of the SCORM content package module code elements. This rule applies also to cases where the SCORM content package module code is given as a single string.

**2.3 Example of the SCORM content package module codes**

Examples of SCORM content package module codes:

- J1-S3627-04567-01
- J1-S3627-39835-11

Example of extended SCORM content package module codes:

- SF518-USER001-J1-S3627-04567-01
- SF518-USER001-J1-S3627-39835-11

**Note**

For clarification, for example when publication module codes and SCORM content package module codes are presented it can be useful to add the prefix "SMC-" or "SME-" to the code.

The output media, contained in the status section of the SCORM content package module, can be added if required by the project (eg, when it is delivered on different media). In this case, the following abbreviations are recommended:

- CD = CD-ROM
- W = Web URL
- DVD = Digital Versatile Disc

Example of SCORM content package module codes:

- J1-S3627-04567-01-W
- J1-S3627-39835-11-DVD

The media must not be printed or be used as a reference.

**Note**

Refer to [Chap 7.5.1](#) for file naming conventions.

Chap No./Document No.	Title
<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 4.15.1</a>	Learning information - SCORM content package module

#### **1 General**

The SCORM content package module allows the building of the learning product to be independent of the end user presentation software. The preparation of the SCORM content package module is an authoring process.

#### **2 Content**

##### **2.1 SCO construction**

##### **2.1.1 Status information**

The status section gives the identification elements required to address and control the SCORM content package module as defined in [Chap 4.15.1](#). The elements of the status section are similar to the elements of the status section of the data module as defined in [Chap 3.9.5.1](#).

##### **2.1.2 Content information**

The content of the SCORM content package module is primarily built of data modules extracted from the CSDB.

The structure of the SCORM content package module is defined by the SCORM content package module entries. These can be recursively defined and give the navigation requirements for the LMS.

Each SCORM content package module entry can have a description of the content and references to one or more elements of the following type:

- data module
- other SCORM content packages

The generation of a SCORM content package module facilitates a top-down design for the structure of the learning product. The structure can be defined at an early stage of a project prior to population of the content.

### 3 Markup examples

There are two examples for the SCORM content package module construction. These examples are provided to show the two ways a SCORM content package module can be employed:

- as a description of a full learning event (eg, lesson)
- as a description of a single learning product or a collection of learning products that are not describing a full learning event

#### 3.1 SCORM content package module as a full learning event

The following XML markup example represents a valid SCORM content package module fragment where the SCORM content package module contains a collection of learning products that, together, make up a complete learning event such as a lesson.

##### Note

This example illustrates how a single SCORM content package can describe a full learning event (one or more learning products that make up a course or lesson). The Identification and status section gives all the identification elements required to address and control the SCORM content package module.

<a href="#">Chap 3.9.5.1</a>	Data modules - Identification and status section
<a href="#">Chap 5.3.1.1</a>	Common requirements - Front matter

#### **1 General**

Updates of learning products can be prepared as complete SCORM content package modules, including all referenced elements, or partly by updating the constituent SCORM content package modules and the referenced changed elements. The update of a learning product must be reflected in the front matter data modules (eg, Change record or Highlights). Refer to [Chap 5.3.1.1](#).

Updating of SCORM content package modules includes the element `<issueInfo>` in the element `<scormContentPackageIdent>` and attribute `issueType` in the element `<scormContentPackageStatus>` and follows the same rules as of data modules. Refer to [Chap 3.9.5.1](#).

<a href="#">Chap 4.13.1</a>	Optimizing and reuse - Common information repository concept

## 1 General

This chapter describes the concept of managing content specific data and quantity data inside data modules. Managing content specific data inside data modules can be supported by the use of the Common Information Repository (CIR) implemented as CIR data modules or as internal databases in the CSDB. Refer to [Chap 4.13.1](#).

Data modules can contain two types of specific information:

- Content specific data
  - Technical information objects such as circuit breakers, access points and consumables. These elements can have a dedicated CIR.
  - Paragraph significant data (data with a significant meaning) such as training level, manufacturer code, lubricant. These elements do not have a dedicated CIR.
- Quantity data (ie, numerical data such as torque value or weight)

The principle of managing content specific data and quantity data, is to use content specific markup in order to identify the technical information or numerical data.

This markup enables the information to be processed and specific display features.

For example, tagging of access points allows potential functionalities such as:

- Query the data for all access points identified in the paragraphs of a data module (or of a set of data modules)
- Query the data for all data modules where a given access point is identified
- Get further information on a given access point, such as equipment that can be accessed, enclosing zone, fastener used for a panel, man hours needed for opening the panel, etc. Refer to [Para 2.1.1.2](#).

In this sentence from a descriptive data module: "The access door 311AB allows setting the switch to...", the string "311AB" is a distinct identifier of the access point. The following markup example shows tagging which expresses this information and therefore allows the functionalities described above:

```
<para>The access door <accessPointRef accessPointNumber="311AB"/>
allows setting the switch to...</para>
```

Distinct tagging can also facilitate (eg, via the implementation of a circuit breaker consistency check) a check that circuit breakers opened at the beginning of a maintenance task are closed at the end of the task. In the following sentence: "Close the following circuit breakers: 68WV, 12WV.", the string "68WV" is a distinct identifier of the circuit breaker and the action to perform is to close this circuit breaker. The following tagging explicitly expresses this information:

```
<para>Close the following circuit breakers: <circuitBreakerRef
circuitBreakerNumber="68WV" circuitBreakerAction="close"/>,
<circuitBreakerRef circuitBreakerNumber="12WV"
circuitBreakerAction="close"/></para>
```

## 2 Content specific data and quantity data

### 2.1 Content specific data

#### 2.1.1 Technical information objects

##### 2.1.1.1 Object types

The technical information objects (content specific data which can have a dedicated CIR data module) correspond to the following objects (refer to [Chap 4.13.1](#)):

- **Functional items** (element [<functionalItemRef>](#)), used to uniquely identify an item performing a function in a given system at a given position. Refer to [Chap 3.9.5.1](#).
- **Circuit breakers** (element [<circuitBreakerRef>](#)), used to uniquely identify a device used to properly break an electrical circuit or to inactivate an electrical function. Refer to [Chap 3.9.5.2.1.9](#).
- **Parts** (element [<partRef>](#)), used to uniquely identify an item of the Product, forming part of an assembly or subassembly, which is not normally broken down further. Refer to [Chap 3.9.5.2.1.10](#).

- **Zones** (element <[zoneRef](#)>), used to uniquely identify a structural area of the Product. Refer to [Chap 3.9.5.2.1.10](#).
- **Access points** (element <[accessPointRef](#)>), used to uniquely identify an access point to be opened to gain access to the equipment. Refer to [Chap 3.9.5.2.1.10](#).
- **Support equipment** (element <[toolRef](#)>), used to uniquely identify any support equipment, including standard and special tools required to correctly accomplish a given action, task or procedure. Refer to [Chap 3.9.5.2.1.9](#).
- **Enterprises** (element <[enterpriseRef](#)>), used to identify a company with the CAGE code. Refer to [Chap 3.9.5.2.11.6](#).
- **Supplies and supply requirements** (elements <[supplyRef](#)> and <[supplyRqmtRef](#)>), used to uniquely identify both the consumable products and their use conditions (consumable requirement and use conditions). It covers any consumables (such as oils, greases, paints), materials (gasket sheet, sheet metal) and expendables (such as O-rings, gaskets, tab washers) required to correctly accomplish a given action, task or procedure. Refer to [Chap 3.9.5.2.1.9](#).
- **Functional and/or physical areas** (element <[functionalPhysicalAreaRef](#)>), used to identify the systems, subsystems etc, which compose the Product functional and/or physical breakdown. Refer to [Chap 3.9.5.2.11.10](#).
- **Controls and indicators** (element <[controlIndicatorRef](#)>), used to uniquely identify any control or indicator required to correctly accomplish a given action, task or procedure. Refer to [Chap 3.9.5.2.1.10](#).

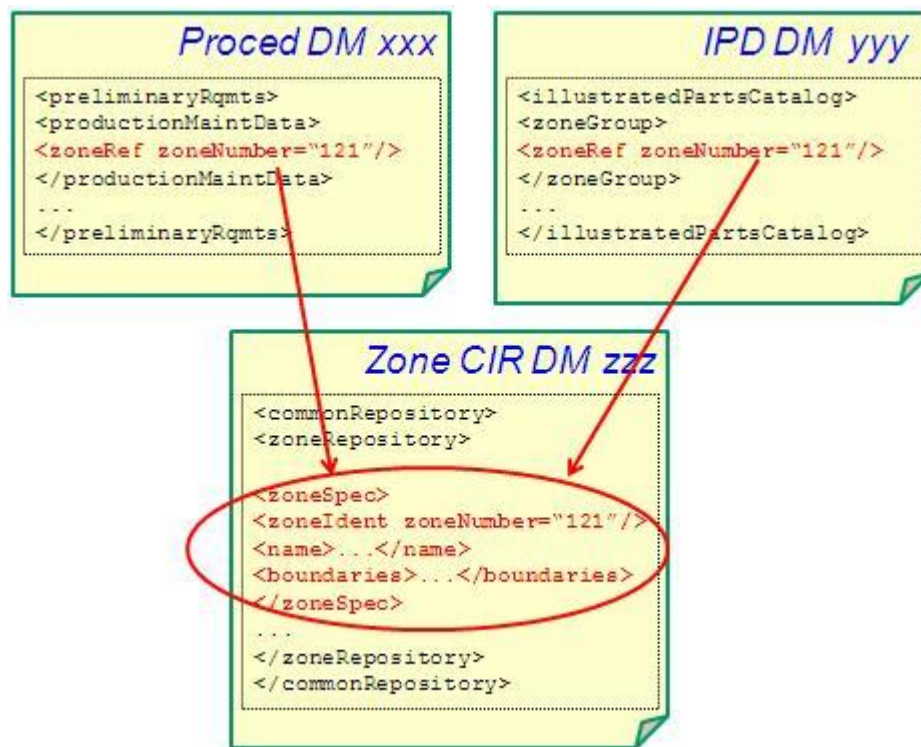

#### 2.1.1.2 Relation between content specific data and CIR data modules

##### 2.1.1.2.1 Principle

As described in [Chap 4.13.1](#), a project or an organization can decide to manage the detailed information associated with content specific data in dedicated CIR data modules. The types of information that can be managed in this way are listed in [Para 2.1.1.1](#).

The main advantage of this architecture (content specific data tagged inside data modules and the use of CIR data modules) is that detailed technical information is stored in a controlled manner and easily shared across the whole project. This allows an optimized method of organizing technical information.

ICN-S1000D-A-04160000-A-FAPE3-00001-A-001-01

Fig 1 Content specific data elements referencing detailed information in CIR data module

In the example given in [Fig 1](#), content specific data elements reference detailed information in the zones CIR data module.

#### 2.1.1.2.2 Reference methods

To enable referencing between content specific information and CIR data modules, two reference methods can be used as described in [Chap 4.13.1](#):

- **Implicit references:** the reference is resolved by using **only the attribute values** of the identifier of the considered information type element
- **Explicit references:** the reference is resolved by **both** referring to the corresponding **CIR** data module **and the attribute value** of the identifier of the considered information type element. An alternative to use the attribute value of the identifier is to use the attribute `referredFragment` on the element `<dmRef>`.

#### 2.1.1.3 Object properties stored within a data module

For some technical information objects, it is possible to add some of the object properties at the place where it is marked-up in data modules.

It contributes to the readability especially when delivering self-contained data modules. Usually, it is possible to add a name or a short name.

For each type of technical information object, refer to the element description in order to know which properties can be stored within data modules.

**Business rule decision point BRDP-S1-00403 - Technical information object properties to be included in the data module at delivery:**

- Decide which properties associated to the technical information objects (eg, names, short names) to store within the data module when delivered.

**2.1.2****Paragraph significant data**

The paragraph significant data consists of many other pieces of information which can be marked up within the element `<inlineSignificantData>`. Its attribute `significantParaDataType` specifies the type of data. Data types listed below can be extended according to the project or the organization needs:

- ammunition
- instruction disposition
- lubricant
- maintenance level
- manufacturer code
- manufacturers recommendation
- modification code
- qualification code
- training level
- control or indicator value

The definitions and use of the paragraph significant data elements are given in [Chap 3.9.5.2.1.10](#).

**2.2****Quantity data**

The quantity data element provides the capability to identify a portion of a paragraph as being a quantity (numerical value and unit of measure). The exact meaning of the quantity data element can be specified using a set of pre-defined S1000D values, or extended to support specific program needs.

The quantity data element also provides the ability to define numerical values to a very precise level and includes capabilities such as:

- specifying a unit of measure chosen from the quantity unit of measure attribute list given in [Chap 3.9.6.2](#)
- grouping values and tolerances together and managing unit of measure accordingly

The quantity data element `<quantity>` is described in [Chap 3.9.5.2.1.10](#).

## Chapter 5

### *Information sets and publications*

Chap No./Document No.	Title
<a href="#">Chap 5.2</a>	Information sets and publications - Information sets
<a href="#">Chap 5.3</a>	Information sets and publications - Publications

## 1 General

This chapter contains common and specific rules for information sets and publications for the Product.

It is based on the following definitions:

- An information set is the required information in a defined scope and depth (author view) in form of data modules managed in the CSDB. A project data module requirements list lists all required data modules for that project.
- A publication is the compilation and publishing of information for a customer. This can be an IETP, a paper publication compiled from data modules or a publication containing legacy data.

A publication can be a subset of or equal to an information set, but it can also be a superset of several Information sets or parts of them.

Requirements for Information sets are given in [Chap 5.2](#) and for publications in [Chap 5.3](#).

Throughout these chapters, examples of maintenance data module coding are given. For the sake of brevity, these examples are limited to 17 and 37 character coding. The project or the organization must adapt their data module coding strategies to suit their needs and not necessarily restrict themselves to either 17 or 37 character coding.

Data module coding examples are also given for training data modules. With the addition of the learn code and the learn event code, these examples are limited to 21 and 41 character coding. The project or the organization must adapt their data module coding strategies to suit their needs and not necessarily restrict themselves to either 21 or 41 character coding.

## 1 General

The complete production process involves agreeing the purpose, scope and depth of the technical information, establishing the business rules for data module coding, generating a data module requirements list, producing and publishing the data modules. Information sets are provided to assist the generation part of the process.

## 2 Common information sets

The following chapters provide the rules for the preparation and coding of common information sets.

General and specific guidance are given in the following chapters:

- Crew/Operator information, refer to [Chap 5.2.1.1](#)
- Description and operation, refer to [Chap 5.2.1.2](#)
- Maintenance information, refer to [Chap 5.2.1.3](#)
- Wiring data, refer to [Chap 5.2.1.4](#)
- IPD, refer to [Chap 5.2.1.5](#)
- Maintenance planning information, refer to [Chap 5.2.1.6](#)
- Mass and balance information, refer to [Chap 5.2.1.7](#)
- Recovery information, refer to [Chap 5.2.1.8](#)
- Equipment information, refer to [Chap 5.2.1.9](#)
- Weapon loading information, refer to [Chap 5.2.1.10](#)

<a href="#">Chap 5.2.2.7</a>	Air specific information sets - Aircrew information
<a href="#">Chap 5.2.3</a>	Information sets - Land/Sea specific information sets

#### **1      General**

This chapter contains references to the chapters for preparation and coding of data modules for crew/operator information.

#### **2      Crew/Operator information**

It covers the rules for the preparation of information needed to provide crew/operators with the necessary degree of understanding of the Product and its systems and the procedures to operate the Product, its system and equipment to their full potential under normal and failure modes. Unnecessary theory and superfluous engineering detail which is not of direct concern to the crew/operators must be excluded. Duplicated information concerning procedures, techniques or any other material contained in other documents (air vehicle, land or sea system equipment publications, regulations or official publications) should be avoided. Performance information can be included.

The requirements for the preparation of this information are given in the following chapters:

- Air vehicles, refer to [Chap 5.2.2.7](#)
- Land/Sea Systems, refer to [Chap 5.2.3](#)

Chap No./Document No.	Title
<a href="#">Chap 3.9.2</a>	Authoring - Illustration rules and multimedia
<a href="#">Chap 8.4</a>	SNS information and learn codes - Information codes

---

## **1 General**

### **1.1 Purpose**

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for the Product Description and Operation (D&O) information and related schematic diagrams.

### **1.2 Scope**

It covers the rules for the preparation of information which will enable skilled maintenance personnel to understand the construction, function, operation and control of a system, subsystem, sub-subsystem, and unit of the Product. The information must include the identification and location of related systems and maintenance overviews of training significant items.

The requirements for the preparation of schematic diagrams which are provided to illustrate the entire Product and some component circuits are also covered. The schematic diagrams must portray a system in sufficient detail to supplement fault isolation and understanding of the system operation by maintenance personnel.

### **1.3 Standards and definitions**

The standards and definitions given in this chapter are applicable with no exceptions.

## **2 Description and operation**

### **2.1 Introduction**

#### **2.1.1 Function, data and description**

The purpose of these data modules (IC 0YY) must explain the location, build-up and function of a complete system and its subsystems. Description of components must be included to understand their construction and functioning to the extent necessary for the adequate performance of maintenance functions. For simple systems, IC 040 (Description of how it is made and its function) must not be subdivided. The information must be presented so that it is understandable to the mechanic trainee and must be in a form suitable for training. It must be written in clear, logical, easy-to-read style and be well illustrated.

Systems must be described to reflect the levels of breakdown, indicated by the SNS. The levels are indicated by:

- System YY-00-00 (6 characters)
- System YYY-00-0000 (9 characters)

This level includes the purpose of the system and subsystems and its functional scope and interrelation to sub-subsystems as well as to other systems.

- Subsystem YY-Y0-00 (6 characters)
- Subsystem YYY-Y0-0000 (9 characters)

This level includes a description of the function, operation and control of the subsystem and the general purpose and scope of function of the major components within the subsystem. Information about the components location must also be given. Interrelations to other sub-subsystems or systems must be included. In simple systems, where no breakdown in subsystems is required, the above mentioned can be covered under "System".

- Sub-subsystem YY-YY-00 (6 characters)
- Sub-subsystem YYY-YY-0000 (9 characters)

This level includes a description of the function, operation and control of the sub-subsystem and the general purpose and scope of the function of the major components within the sub-subsystem. Information about the components location must also be given. Interrelations to

other sub-subsystems or systems must be included. If no breakdown in sub-subsystems is required, the above mentioned can be covered under "Subsystems".

- Assembly YY-YY-YY (6 characters)
- Assembly YYY-YY-YYYY (9 characters)

This level includes a detailed description of the function, operation and control of the individual major components or assemblies including tests. It also includes adjustments which affect the performance of the unit and special maintenance practices or handling procedures when applicable. Interrelations to other units must be included. The scope of coverage must be in accordance with the requirements of the maintenance concept of the Product.

Peculiarities of individual systems, subsystems, or sub-subsystems, can dictate minor changes in this style of presentation, but it must be followed as closely as possible.

Location information for all components must be prepared at the appropriate system, subsystem or sub-subsystem level in a standardized presentation preferably including the following:

- Component index. A listing of the related components cross references to the subsystem or sub-subsystem as appropriate.
- Access/Area identification. An illustrated listing of the access openings/locations indicating the means and location for gaining access to the indexed components. The component index and access/area identification illustration can be combined or presented separately.
- Component location/identification. Illustrations of the indexed components showing their physical location relative to known structural or system features. Components such as circuit breakers or fuses need not be illustrated provided that the panel location is illustrated and component references are listed. Component location/identification and access/area identification illustrations can be combined.

For details on the information codes, refer to [Chap 8.4](#).

## 2.2 Operation

These data modules (IC 1YY) provide all the necessary procedures to operate the Product. The procedures include data on the necessary controls and indicators, pre- and post-operation procedures, operation and emergency procedures.

For details on the information codes, refer to [Chap 8.4](#).

## 2.3 Illustrations

### 2.3.1 Presentation

Illustrations must be used as the primary source of information transfer. They must be developed uncluttered with limited information/learning points and presented in a self-explanatory style. The information breakdown must follow the whole-part-whole concept. Refer to [Chap 3.9.2](#).

### 2.3.2 Illustration types

Acceptable types of illustrations are shown in the examples [Fig 1](#) thru [Fig 7](#).

ICN-AE-A-050201-A-D0216-00003-A-001-01

Fig 7 Unit level illustration - Example

### 2.3.3 Schematic diagrams

Schematic diagrams data modules must be provided for all circuits of the Product.

The schematic diagrams must show the direction of flow through a system and the relationship of the components comprising the system. Every effort must be made to obtain the most logical presentation of information by showing signal or supply flow from left to right and/or top to bottom. Schematic diagrams of electro-mechanical systems, such as hydraulic, pneumatic, fuel, etc, must be drawn showing the mechanical and electrical relationships in an integrated presentation.

If necessary, the flow through pipelines must be identified by different patterns. Units and components of the system being presented must be outlined and identified by name and/or equipment identification and location. Splitting of black boxes on schematics must be held to a minimum.

Complex subsystems, sub-subsystems and/or functions and their interconnections will require more than one level of schematic as noted below:

First level	Block schematic diagrams (have broad scope but little depth)
Second level	Simplified schematic diagrams (have schematic symbols but do not show individual wires)
Third level	Detail schematic diagrams (show all components, applicable wiring, functional interfaces and give sufficient detail for maintenance)

Data modules must be coded:

YY-A-**SS**-YY-YY-NNY-054A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-**YSS**-YY-YYYY-**NN**YYY-054A-A (37 characters)

Where:

- "**SS**", the system to which data and information are applicable. Refer to [Chap 8.2](#). "00" is used if data and information are applicable to the Product as a whole.
- "**SS-YY-YY**"/"**YSS-YY-YYYY**" is the SNS the schematic diagram is related to.
- "**NN**" is a sequential number starting from "00", if more than one data module is needed.

#### 2.3.3.1 Block schematic diagrams

The block schematic must be used in the descriptive portion to simplify complex circuits. Non-specialist personnel should be able to obtain an understanding of the function and operation of the system, subsystem, or sub-subsystem. The block schematic is useful to show the arrangement of system components and current/signal flow through the system. It should be considered a training aid, supplementing the circuit description, without requiring extensive electrical background on the part of the reader or trainee. In general, the function of a particular system component is indicated without stating how this is accomplished.

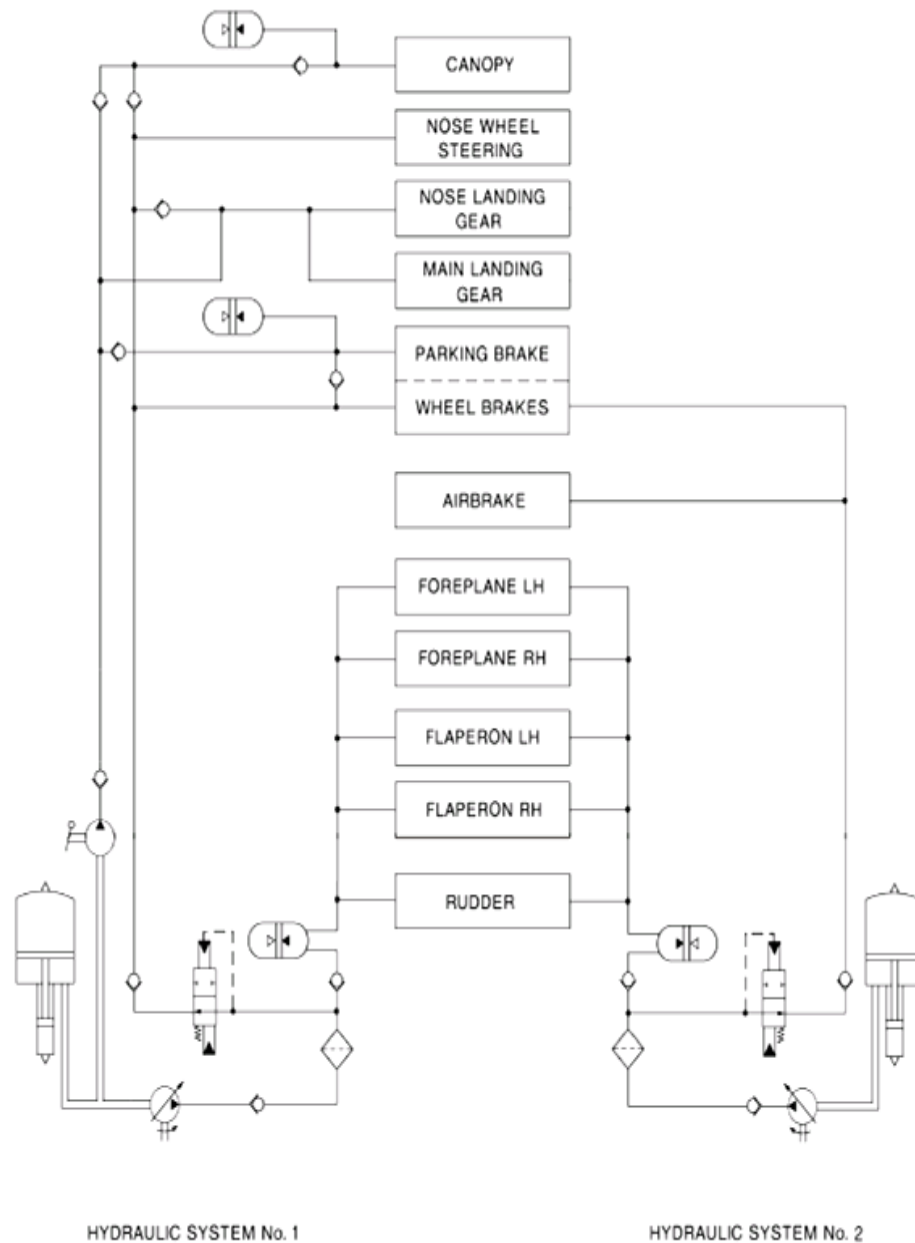

The primary purpose of the block schematic diagram must provide a rapid understanding of the major replacement items and their interrelationship. Signal flow information is limited to primary functions and does not include control, inhibiting, interlocking, etc.

The block schematic diagrams must only consist of one figure for the depicted system, subsystem or sub-subsystem.

Unit or component representation will generally be limited to rectangular shapes with restricted use of symbols and pictorial drawings.

Block schematic diagrams data modules must be prepared for each system except those instances where one or two subsystems comprise the entire function.

For an example of a block schematic diagram, refer to [Fig 8](#).

ICN-AE-A-050201-A-D0216-00010-A-001-01

*Fig 8 Block schematic diagram - Example*

### 2.3.3.2

#### Simplified schematic diagrams

The simplified schematic is in the same category as [Para 2.3.3.1](#) but must be broader in scope. A simplified circuit must be presented without regard to unit location in the air vehicle, land or sea system, but electrically accurate, to allow a clear presentation of the overall circuit. This type of schematic is valuable in showing the simplified electrical operation of the system, subsystem, or sub-subsystem components and their interconnections. It can be used for training to allow a more detailed understanding of the operation of the system. The primary purpose of simplified schematic diagrams must supplement the block of detail schematic diagrams to provide a better understanding of the performed function, or functions.

Simplified schematic diagrams data modules are normally prepared for systems, subsystems or sub-subsystems where the complexity is such that detail schematic diagrams do not enable easy understanding of the system.

Simplified schematic diagram data modules can consist of more than one figure.

For an example of a simplified schematic diagram, refer to [Fig 9](#).

ICN-AE-A-050201-A-D0216-00011-A-001-01

Fig 9 Simplified schematic diagram - Example

### 2.3.3.3 Detail schematic diagrams

The detail schematic diagrams must be used to depict electronic systems and components which use logic or two-state devices in their construction. It must be designed to aid the

---

understanding of the function and operation of a circuit without showing the physical construction.

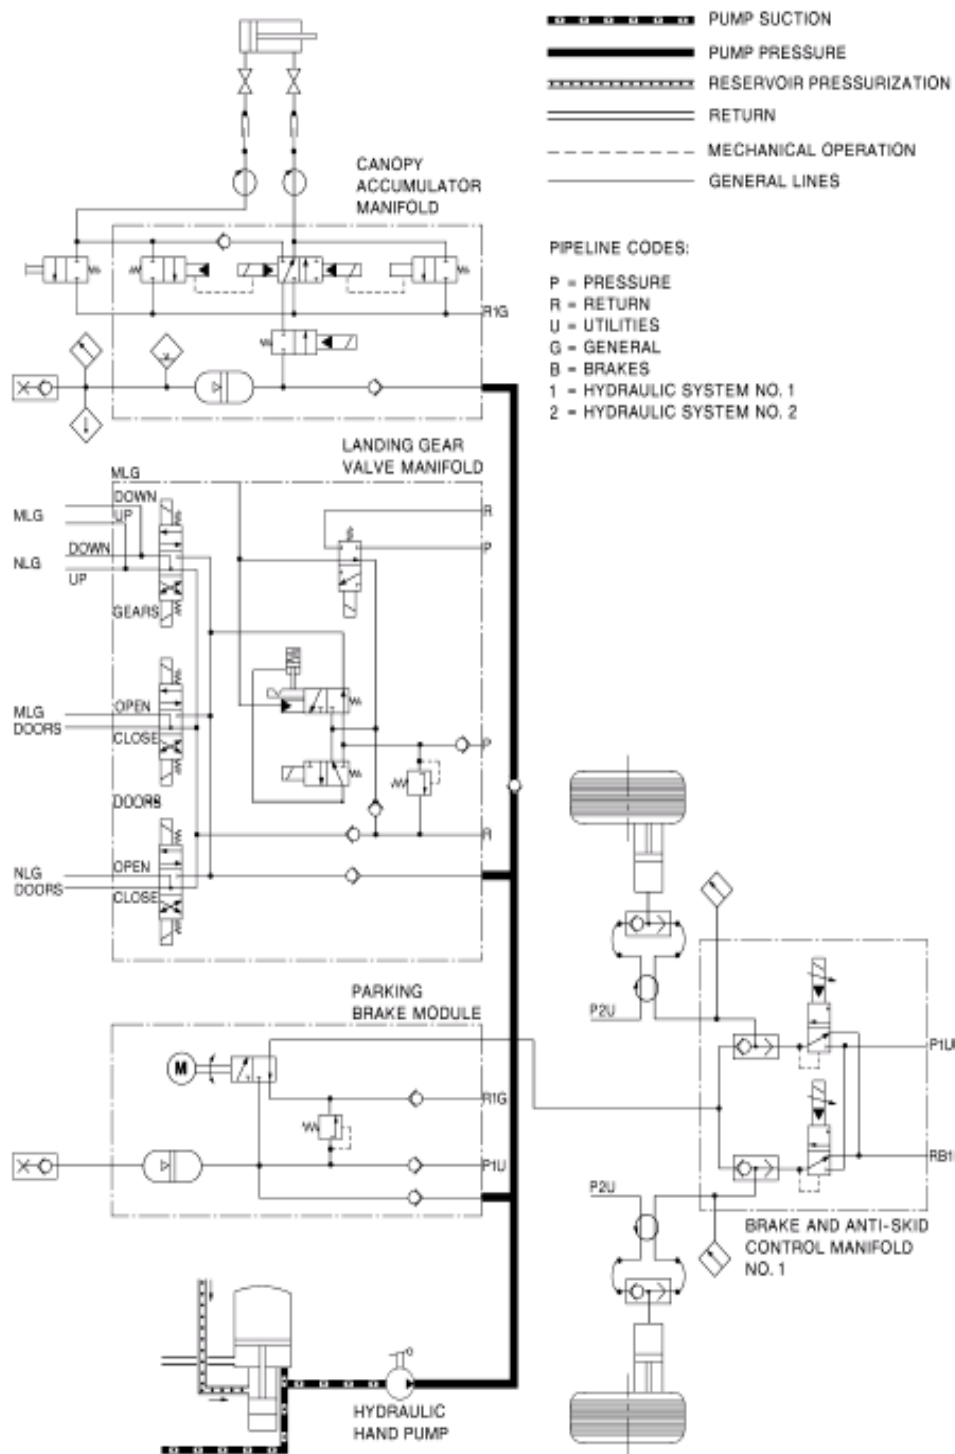

The primary purpose of the detail schematic diagrams must provide sufficient information for subsystem maintenance.

Detail schematic diagram data modules must be prepared for systems, subsystems, sub-subsystems and/or functions if required by its complexity.

Detail schematic diagram data modules can consist of more than one figure.

For an example of a detail schematic diagram, refer to [Fig 10](#).

ICN-AE-A-050201-A-D0216-00012-A-001-01

Fig 10 Detailed schematic diagram - Example

## 1 General

### 1.1 Purpose

This chapter specifies the rules and gives guidance for the preparation and coding of data modules for the Product maintenance procedures.

### 1.2 Scope

It covers the requirements for the preparation of information which will enable skilled maintenance personnel to carry out maintenance tasks on the Product and its installed components. The information must be given to enable personnel to:

- connect and disconnect test equipment and power supplies
- use any required special tool and support equipment
- maintain and service the Product and its systems/components
- perform tests which will show whether systems and components meet their minimum acceptable performance standards
- rectify failures
- remove and install all systems/components in a minimum amount of time

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Content

### 2.1 Introduction

If required, the introduction data modules contain explanations of the purpose, scope, structure, special format and use of the technical content of the Information set. They also contain necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-000-00-0000-**NN**AAA-018Y-A (37 characters)

Where "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different information sets.

### 2.2 General maintenance procedures

#### 2.2.1 Air vehicles, systems 00 thru 20 and 51, 60 and 70

For air vehicles, normally the following systems are applicable to maintenance procedure data modules:

- 00 - Product - General
- 06 - Dimensions and areas
- 07 - Lifting, shoring, recovering and transporting
- 09 - Handling and maneuvering
- 10 - Parking, mooring, storing and return to service
- 11 - Placards and markings
- 12 - Servicing
- 18 - Vibration and noise analysis and attenuation
- 20 - Standard practices - Airframe systems

System 51, Standard practices - Structures, System 60, Standard practices - Propeller/rotor and System 70, Standard practices - Engine, can also be included, although the main part of this information is covered in other information sets (eg, in the Structure Repair (SR) information set, refer to [Chap 5.2.2.2](#), and in the Engine Standard Practices (ESP) information set, refer to [Chap 5.2.2.6](#)).

## 2.2.2 Land and sea products, systems 00 thru 19

For land and sea products, the systems 00 thru 19 must be used where appropriate.

Land and sea applications utilize the SNS as defined in their specific program, but follow the information code examples within this chapter.

## 2.2.3 Breakdown of information

Applicable systems must normally be broken down into subsystems/sub-subsystems outlined in the SNS.

Example: System 09 "Handling and maneuvering" contains the subsystems "General", "Handling" and "Maneuvering". The subdivision of the information into data modules must follow applicable information code headings.

## 2.2.4 Data module coding

Guidelines for the information content of these systems are given in the detailed definitions of the SNS subsystems/sub-subsystems listed in [Chap 8.2](#) and [Chap 8.3](#).

Data modules must be coded:

YY-Y-YY-YY-YY-00Y-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00YYY-YYYY-A (37 characters)

## 2.3 Systems

### 2.3.1 Applicable systems

#### 2.3.1.1 Air vehicles

Information on air vehicles must be covered, as applicable, in the following systems:

- System 21 - Environmental control

thru

- System 99 - Electronic warfare

except systems 51, 60 and 70

#### 2.3.1.2 Land and sea products

For land and sea products, applicable systems can be determined by the project or the organization.

**Business rule decision point BRDP-S1-00404 - Applicable systems for land and sea products:**

- Decide the applicable systems for land and sea products.

## 2.3.2 Data module coding

Basically, the information breakdown must be structured in accordance with the data module code. Refer to [Chap 4.3](#).

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-A (17 characters)

Applicable to: All

S1000D-A-05-02-0103-01A-040A-A

Chap 5.2.1.3.1

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-YYYY-A (37 characters)

The following paragraphs give details on the information to be covered, as applicable, for each system.

### 2.3.3 Servicing

For details on servicing information (IC 2YY). Refer to the information code definitions given in [Chap 8.4](#).

Servicing procedure data modules must include those procedures that are normally required as a result of other maintenance actions. These servicing procedures must be self-contained, if possible, and can be either routine or restorative in nature.

### 2.3.4 Examinations, tests and checks

For detailed information on examinations, tests and checks (IC 3YY). Refer to the information code definitions given in [Chap 8.4](#).

Tests vary in complexity and stringency depending on the conditions under which a unit functions or was replaced. It is not intended that a complex functional test of a complete system with attendant narrow tolerances be performed if the replaced unit reactivates the system and operates within the confines of a go-no-go specification. To avoid duplication of test procedures, maintenance procedures must reference a test only if the major test procedure is so unitized that the individual assembly/unit test can be called out without overlap, and accomplishment does not require completion of the overall test. In this case, specific start and stop instructions must be given.

### 2.3.5 Disconnect, remove and disassemble procedures

For detailed information on disconnect, remove and disassemble procedures (IC 5YY), refer to the information code definitions given in [Chap 8.4](#).

These procedures which describe the removal of a component, assembly, subassembly, unit, combination of parts, etc, from the Product must clearly give the step-by-step operation in a logical work flow sequence, as necessary, to gain access to and subsequently remove the desired hardware. Where necessary, attention must be drawn to variations of remove procedures with regard to future installation of the same or a replacement item.

A list of required material, tools, fixtures, or support equipment must be listed in tabular form at the beginning of the procedure. Any prerequisite procedures (required conditions), such as "Open access panel xyz", to be performed prior to a particular removal or deactivation task, must be given or appropriately referenced. Panel opening instructions must reference the panel number. All measurements or values to be documented prior to an individual task must be listed at the beginning of the applicable step.

### 2.3.6 Repairs and locally make procedures and data

For detailed information on repairs and locally make procedures (IC 6YY). Refer to the definitions given in [Chap 8.4](#).

These procedures must consist of detailed step-by-step repair processes and specifications in a logical work flow sequence, as required, to restore a worn or damaged part to serviceable condition. The repair procedure must show the level of restoration required for the specified level of maintenance. Excluded are repairs contained in the SR information set. Each repair data module must be self-contained and must include basic information such as, but not limited to:

- views of the basic condition/location for all areas of restoration
- data such as pertinent finish, reference dimensions, flow rate
- special dimensional instructions

- inspection requirements necessary to determine the integrity of the repair. If a test is required following the repair, the specific test required must be referenced.

### 2.3.7 **Assemble, install and connect procedures**

For detailed information on assemble, install and connect procedures (IC 7YY). Refer to the information code definitions given in [Chap 8.4](#).

These procedures must describe the installation of a component, assembly, subassembly, unit, combination of parts, etc, and interrelated parts in the Product. If applicable, the procedures must also describe any post installation operations that must be rectified such as closing panels. The procedures must clearly describe the step-by-step operations in a logical work flow sequence, as necessary, to install the basic and the access hardware, if applicable.

All measurements or values (eg, special torques values) must be provided within the step-by-step text without reference to other sections.

The procedures must be accompanied by appropriate illustrations depicting the use of required tools or equipment. Each illustration must have its parts numerically highlighted (callout), with the step-by-step instructions referencing these numbers.

If a test is required as part of installation or reactivation, the specific test must be included or referenced.

# 1 General

## 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for the Product Fault Isolation (FI) information.

## 1.2 Scope

It covers the rules for the preparation of FI information which will enable skilled personnel to analyze reports provided by:

- the monitoring systems of the Product
- the crew/operators and/or maintenance personnel
- the result of post mission inspections

According to the level of accuracy of the data, the analysis must be followed by:

- an inspection, check and/or test
- a corrective action
- or a fault isolation procedure

The FI information contains the following topics:

- Isolated, detected, observed and correlated fault lists
- Fault isolation procedures, text and diagrams
- Fault isolation task supporting data
- Fault code index (derived information)
- Maintenance message index (derived information)

## 1.3 Standards and definitions

### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate.

- **Built in test (BIT):** An integrated capability of the mission system or equipment which provides an automated test capability to detect, diagnose, or isolate failures. A BIT is designed as an integrated part of the electronics system design. BIT functions are performed on-line by exercising devices within the electronic systems by use of software and hardware stimuli or monitoring circuits. BIT requires no external stimuli or measurement equipment to perform its functions.
- **Corrective action:** A maintenance process which makes a fault and its cause cease to exist.
- **Correlated fault:** A set of faults that are detected, filtered and grouped by the monitoring system as a unique fault with a unique reference to a fault isolation procedure.
- **Detected fault:** A fault which is detected by the monitoring system and is then automatically stored.
- **Fault:** Malfunction, impairment, or abnormal condition of the Product.
- **Fault code:** A code which uniquely identifies a fault in the FI information set.
- **Fault description:** A phrase which concisely describes a fault. For monitored faults and status messages, the fault description is the fault name as it appears on the display screen.

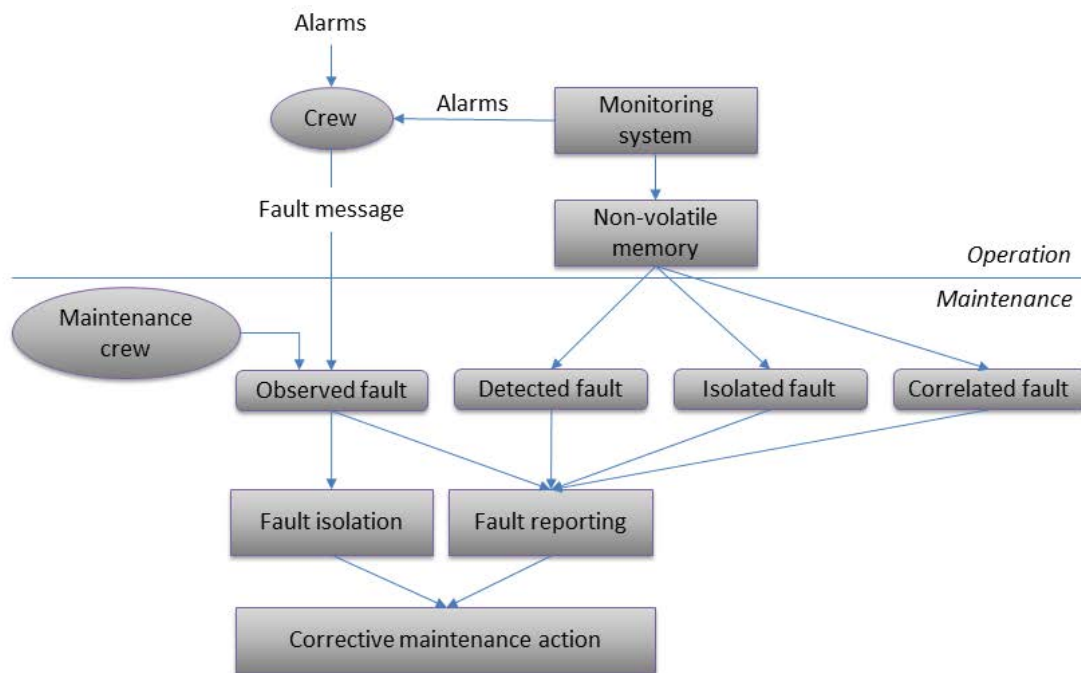

- **Fault isolation procedure:** The systematic process of identifying a malfunctioning element in the Product and determining the actions necessary to restore the system to its normal condition. Fault isolation procedure and troubleshooting are equivalent terms.
- **Isolated fault:** A fault which is detected and isolated by the monitoring system.
- **Maintenance message:** A message produced by an on-board maintenance computer to aid in determination of corrective action, but which is not normally made available for review by the crew.
- **Observed fault:** A fault detected by the crew or maintenance crew.
- **Symptom:** Event or phenomenon which reveals a fault.

## 2 Fault isolation

### 2.1 General

Faults are classified as follows (refer to [Fig 1](#)):

- isolated fault
- detected fault
- observed fault
- correlated fault

ICN-S3627-S1000D0190-006-01

Fig 1 Trouble shooting process overview - Example

### 2.2 Introduction

If required, the introduction data modules contain explanations of the purpose, scope, structure, special format and use of the technical content of the information set. They also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

## 2.3 Data modules must be coded:

YY-Y-00-00-00-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y00-00-0000-NNAAA-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed.

The information code variant is used to distinguish between the different information sets.

Data module coding

To assist in the coding of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-SS-YY-00-NNY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-YYYY-A (37 characters)

Where:

- "SS", the system to which data and information are applicable. Refer to [Chap 8.2](#). "00" is used if data and information are applicable to the Product as a whole.
- "SS-YY-00"/ "YSS-YY-0000" is the SNS to which the information, list or procedure is related
- "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

## 2.4 Isolated fault list

These data modules list all maintenance messages related to faults which can be isolated and stored by the monitoring system. The messages are sorted by the fault code and the faulty Line Replaceable Unit (LRU) at system level.

Data modules must provide the following information for each message:

- the message identification as it is displayed to the maintenance crew
- a concise and/or a more detailed description
- the LRU which detected the failure (identification, name and abbreviation)
- the faulty LRU (identification, name and abbreviation)
- the corrective action to be performed to restore the system to its normal condition

If the maintenance message contains it, the faulty Shop Replaceable Unit (SRU) will also be pointed out.

Data modules must be coded:

YY-Y-SS-YY-00-NNY-411Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-411Y-A (37 characters)

## 2.5 Detected fault list

These data modules list all maintenance messages related to faults which can be detected and stored by the monitoring system. The messages are sorted by fault code and potential faulty LRU at system level.

Data modules must provide the following information for each message:

- the message identification as it is displayed to the maintenance crew
- a concise and/or a more detailed description
- the LRU which detected the failure (identification, name and abbreviation)
- the list of potential faulty LRU (identification, name and abbreviation)

For each potential faulty LRU, the following information must be provided:

- the confirmation test (test or BIT description or maintenance procedure data module reference)
- if fault is confirmed for this LRU, the corrective action to be performed to restore the system to its normal condition

If the maintenance message contains it, potential faulty SRU will also be pointed out.

Data modules must be coded:

YY-Y-SS-YY-00-NNY-412Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-412Y-A (37 characters)

## 2.6 Observed fault list

These data modules list all symptoms related to observed faults which can be reported by crew/operators or observed by the maintenance crew. The description of symptoms must be simple and non-ambiguous. Symptoms can be related to suspected faulty LRUs. Symptoms are listed by the fault code at system level.

Data modules must provide the following information for each symptom:

- the symptom description as it appears to maintenance or operation crew (alarm description and occurrence conditions)
- the fault cause

If the fault is non-ambiguous (one LRU responsible for the fault), the fault cause provides the faulty LRU or the fault reason (eg, wiring failure, hydraulic leak on circuit 1) and the recovery action to be taken.

If the fault is ambiguous (several LRU are likely to have caused the observed symptoms), the fault cause provides information needed to isolate the failure as follows:

- the Product fault isolation procedure data module reference

or

- a list of potential faulty LRU

For each potential faulty LRU, the following information must be provided:

- the confirmation test (test or BIT description or maintenance procedure data module reference)
- if the fault is confirmed for this LRU, the corrective action to be performed to restore the system to its normal condition

Data modules must be coded:

YY-Y-SS-YY-00-NNY-413Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-413Y-A (37 characters)

## 2.7 Correlated fault list

These data modules list all sets of maintenance messages which have been correlated and which can be recognized by the monitoring system.

Data modules must provide the following information for each correlated fault:

- a list of messages and associated warnings/malfunctions that have been correlated and introduced through their fault code. Optionally, for each unitary fault part of the correlated fault (ie, a maintenance message or a warning/malfunction) data modules can contain:
  - a reference to the data module where the unitary fault has been introduced (eg, a "detected fault list" data module)
  - a concise and/or a detailed description of the fault
  - detection information
- isolation information for the whole correlated fault (either through a reference to an isolation procedure or through a list of potential faulty LRU)
- optional remarks

Data modules must be coded:

YY-Y-SS-YY-00-NNY-414Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-414Y-A (37 characters)

## 2.8 Fault isolation procedure

### 2.8.1 General

Each fault isolation procedure must contain all operations needed to isolate the fault and must terminate with instructions for correcting it. The fault isolation procedures are the most direct and shortest method of isolating the fault and must not include any unnecessary steps.

One isolation procedure can be used for several fault codes provided each can be adequately isolated within the one procedure.

Fault isolation must be carried out to the level of component replacement or other action capable of being accomplished on the Product (ie, wiring investigation, card replacement or adjustment).

Each data module contains the complete fault isolation procedures for each fault code even though certain information is normally associated with several different data modules. The procedures must not refer the user to another data module in order to complete the isolation.

If more than one component is involved in a given corrective action, then all components must be listed in order of fault probability.

Data modules must be coded:

YY-Y-SS-YY-00-NNY-**4XX**Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-**4XX**Y-A (37 characters)

where "**4XX**" in the information code, is a sequential number from 420 thru 428.

## 2.8.2 Content

The fault isolation procedure data module contains the following information:

- the fault code
- the fault description - a concise and/or a more detailed description of the fault
- prerequisites - any prerequisite steps which must be performed before starting the fault isolation procedure
- the fault isolation procedure

A fault isolation procedure can be described by a fault isolation diagram (refer to [Fig 2](#)) and/or a structured sequence of isolation steps (refer to [Chap 6.2.3.4](#)).

Each isolation step contains:

- an action (What must be done?)
- followed by a question (What is the result of the action?)
- and possible answers

Each isolation step refers to another isolation step in the procedure.

Chap 5.2.1.3.2

## 2.9 Fault isolation task supporting data module

Fault isolation task supporting data modules are only produced when absolutely necessary. Whenever possible, already available data modules (eg, block diagrams, wiring diagrams, location drawings, access layout) are used instead.

Data modules must be coded:

YY-Y-SS-YY-00-NNY-430Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYYY-430Y-A (37 characters)

## 2.10 Fault code index

The fault code index (refer to [Table 2](#)) is a list of all fault codes in numerical order for the applicable system. For each fault code, the fault code index gives one or more data module references (data module codes (DMC)) to fault isolation procedures.

The fault code index must contain:

- the fault code
- the fault description
- the maintenance messages
- the fault isolation data module reference

Data modules must be coded:

YY-Y-SS-YY-00-NNY-441Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYYY-441Y-A (37 characters)

*Table 2 Fault code index - Example*

993-07	NO LIBRARY loading	JP-A-99-35-00-00A-422A-A

## 2.11 Maintenance message index

The maintenance message index is a list of all maintenance messages in numerical order. For each maintenance message, the maintenance message index gives one or more data module references (DMC) to fault isolation procedures.

The maintenance message index must contain:

- the maintenance message
- the maintenance message text
- the fault isolation data module reference

---

Data modules must be coded:

YY-Y-SS-YY-00-NNY-442Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YSS-YY-0000-NNYYY-442Y-A (37 characters)

## 1 General

### 1.1 Purpose

There are a number of rules and guidelines that must be considered during the preparation and coding, where appropriate, of data modules that contain Product Non-Destructive Testing (NDT) information.

### 1.2 Scope

Explanation is provided for the preparation of information applicable to NDT which provides instructions and guidance to skilled non-destructive testing technicians when performing non-destructive testing techniques on systems, subsystems and their items.

NDT information not only includes coverage for primary and secondary structures and proprietary items, but all NDT procedures for engines and items that can be tested "on-Product". For those Product items/equipment which have equipment manuals, "off-Product" NDT information is included in those publications. The "off-Product" NDT information for items/equipment which do not have equipment manuals is included in the NDT information set. The NDT information must contain the following topics:

- general information
- dye penetrant
- magnetic particle
- eddy current
- x-ray
- ultrasonic
- gamma-ray
- resonance frequency
- thermographic

### 1.3 Standards and definitions

#### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

#### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate:

- **NDT:** A group of techniques (eg, radiographic, ultrasonic) which examine items for faults without making them unserviceable.
- **NDT technicians:** Persons who have been trained in NDT of the Product and its support equipment items, and have been approved by their national military and/or civil authority.
- **Critical area:** Determination of critical areas or items is based on:
  - flight safety considerations (primary structure as defined in the Structure Repair (SR) information set and non-redundant subsystem items, the failure of which can cause loss of the Product)
  - mission essential considerations (secondary structure as defined in the SR information set and subsystem items, the failure of which degrades the ability of the Product)

- maintenance economy considerations (structure and subsystem items that require extensive or repetitive disassembly to do visual inspection of internal areas)

#### Note

Critical areas are not necessarily limited to structural items. All subsystem components must be analyzed for criticality.

- **Technique:** The method used for non-destructive testing (eg, X-ray, dye penetrant).
- **Test:** The performance of a technique on an item. It can comprise more than one procedure.
- **Standard heading:** The first level of captioning a test (eg, Applicability, Item description, Procedures).
- **Non-relevant indication:** An equipment response that is due to factors other than discontinuities or faults of the tested item.

## 2

### 2.1 Non-destructive testing

#### General requirements

The NDT information must include all instructions, procedures and techniques for the Product. NDT techniques must be developed to test critical areas of items for potential service faults (eg, cracks, corrosion, wear, deformation). NDT technique development is required whenever one or more of the following criteria are met:

- The NDT technique improves safe operation or reliability of the system or item
- A saving in maintenance costs or man hours can be realized by using NDT techniques
- Operational effectiveness or life cycle costs are favorable effected

Emphasis must be placed on development of NDT techniques that can be applied to the system or item with little or no disassembly (on-condition maintenance). If necessary, multiple NDT techniques can be developed for assembled (on-condition maintenance) and disassembled items.

Routine visual examinations including optical examinations by using a magnifying glass, a borescope or fiber optics that are normally accomplished by technicians must not be included in the NDT information but must be included in the applicable Product maintenance data modules. Special cases can be included on request of the operators based on item criticality, or based on special preparation or test technique requirements. Visual or optical examinations can be included in the NDT information when used as a confirmation procedure and to identify the test area. The examinations need not be detailed procedures.

Other techniques than those given in [Para 1.2](#), can be included as necessary if they will provide significant improvements in inspection capability. Proposals for inclusion of techniques and equipment not presently used must be submitted to the publication authority as soon as identified. Support equipment requirements must be identified using relevant provisioning procedures.

### 2.2 Data module coding

To assist in the coding of NDT data modules, the following rules must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-SS-YY-YY-YYY-XXX-Y-A (17 characters)

thru

YYYYYYYYYYYY-YYYY-YSS-YY-YYYY-YYYY-XXX-Y-A (37 characters)

Where:

- "SS", the system to which data and information are applicable. Refer to [Chap 8.2](#). "00" is used if data and information are applicable to the Product as a whole.
- "SS-YY-YY"/"YSS-YY-YYYY", the SNS code of the item to be tested
- "YYY"/"YYYYY", the disassembly code, which must normally be "00", but can be used if required. Refer to [Chap 4.3.5](#) for detailed rules on the use of the disassembly code variant.
- "XXX", the information code:
  - 350 - Structure test
  - 351 - Test for surface cracks with dye penetrant
  - 352 - Test for surface cracks with magnetic particles
  - 353 - Test for cracks and other defects with eddy current
  - 354 - Test for cracks and other defects with X-rays
  - 355 - Test for cracks and other defects with ultrasonics
  - 357 - Gamma-ray test
  - 358 - Resonance frequency test
  - 359 - Thermographic test

The item location code must be "A".

## 2.3 Introduction

If required, the introduction data modules must contain an explanation of the purpose, scope, structure, special format, and use of the technical content of the information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-00-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-00-0000-**NNAAA**-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

## 2.4 General information

General data modules must include, but not limited to:

- reference data
- general applications

In the general applications data module, short descriptions of all NDT techniques must be given. Short definitions of non-destructive testing and the primary non-destructive testing techniques (eg, fluorescent penetrant Type I, Methods B, C and D with applicable test materials, or ultrasonic angle beam, straight beam tests, with applicable search units or manual/automatic eddy current tests with applicable probes) must also be included. The intention of these paragraphs is to provide general information.

Warnings, cautions and notes must be included related to:

- the needs of skilled NDT technicians
- the authorization to adjust equipment settings to obtain the necessary response
- radiation hazard warnings

## 2.5 Non-destructive testing techniques

The NDT data modules must have the standard headings given in [Para 2.6](#). Specific information requirements for each technique is given in [Para 2.7](#).

## 2.6 Tests

Each test must be a self-standing data module and must include a title and the following headings:

- 1 Applicability
- 2 Tools, equipment and materials
- 3 Item description
- 4 Preparation and cleaning
- 5 Test equipment adjustment
- 6 Procedures
- 7 Indication evaluation
- 8 Acceptance and rejection standards
- 9 Restoring the Product

### 2.6.1 Title

The data module title must contain the name of the item to be tested. The name of the item must be that given in the appropriate illustrated parts breakdown.

### 2.6.2 Applicability:

- Identify and locate affected part or parts, using the methods described in [Chap 3.4](#).
- Provide part number, serial number, Product series model number and/or any other necessary identifiers to show the complete applicability of the procedure.

### 2.6.3 Tools, equipment and materials:

- Give the minimum acceptable performance standards for instruments, equipment and materials required to perform the procedure.
- If instruments, equipment and/or materials cannot be given by minimum performance standards, then list all manufacturer's units and/or products approved.
- If only one manufacturer's unit or product is approved, this must be listed with the reason why it is the only one.
- List the fixtures, probes, transducers, reference standards and special tools required to perform the procedure and provide drawings for items that can be made locally by the operator. Include recommended sources for any special materials.
- Describe the type of viewing light and/or lighting conditions required.
- Indicate the film size, type and container to be used for X-ray and gamma-ray procedures.

### 2.6.4 Item description

The first section must describe and identify the item to be tested. The following information must be provided in the text and/or the illustration.

When the testing techniques are sensitive to surface condition, the text must include the material, the heat treatment condition, the method of manufacturing (eg, casting, forging, extrusion, sheeting), surface treatments, coatings, finishes. The backup procedure, if required, must be stated.

A concise statement or summary of purpose, or function, of the item including the direction and type of loads must be included when these factors have an effect on the test procedure.

The second section must be a description of the probable fault and its cause. The location of the fault must be shown on the illustration.

Symbols that must be used to represent NDT techniques and which provide detail in illustrating test procedures must be shown in the List of symbols. Wherever possible, the symbol for the primary and confirmation method must be placed adjacent to the area to be inspected in the next higher assembly illustration.

#### **2.6.5 Preparation and cleaning:**

- List the requirements for access to the part or area to be checked
- Specify whether the electrical power must be on or off
- Specify any special work stands required
- List any requirements for fluid removal (eg, fuel, water, hydraulic fluid) from the area to be checked
- Specify any special cleaning requirements
- Specify any surface coating removal requirements
- Include all necessary warnings and cautions (eg, radiation hazard protection)

#### **2.6.6 Test equipment adjustment**

The test equipment adjustment information for this heading is derived from the different test procedures specified in [Para 2.7](#).

#### **2.6.7 Procedure**

The procedural information for this heading is described in the different test procedures specified in [Para 2.7](#).

Each test must, if necessary, specify a confirmation (backup) test procedure by another means to verify the initial case where the initial test results do not provide incontestable data to determine the serviceability of the tested item.

It is desirable to perform the confirmation procedure by a technique employing direct visual examination (optical, magnetic particle or dye penetrant) when the initial procedure is done by an instrument technique (X-ray, gamma-ray, ultrasonic, resonance frequency or eddy current), provided it does not result in extensive disassembly. In those cases where direct examination techniques require considerable disassembly, the use of a different instrument technique is the preferred means of confirmation. In isolated cases, it can be necessary to disassemble for visual confirmation in order to provide the necessary information for determination of item serviceability.

#### **2.6.8 Indication evaluation**

This information is derived from the different test procedures in [Para 2.7](#).

#### **2.6.9 Acceptance and rejection standards**

This information is derived from the different test procedures in [Para 2.7](#).

#### **2.6.10 Restoring the Product**

If required, the information for this heading describes how to restore the Product to its ready for operate condition (ie, follow-on maintenance). Wherever possible, cross-references must be made to other existing and available information.

### **2.7 Specific information requirements for each technique**

#### **2.7.1 Dye penetrant technique**

##### **2.7.1.1 Test equipment adjustment**

Specify the temperature restrictions, penetrant stock, developer stock, washing system, drying system, and the normal operating temperature of the applied fluids and developer.

- 2.7.1.2 Procedure:
- Describe any treatment for the preservation of the part or for recording a fault
  - Provide acceptable industry penetrant inspection standards whenever possible
  - If no acceptable industry standard exists, the following information must be provided:
    - Give the type of penetrant and sensitivity class by noting its standard or equivalent standard, and whether the penetrant is visible or fluorescent
    - List all acceptable penetrants by manufacturer's identification. Advise if any class IV penetrants are acceptable. If only one penetrant is acceptable, this must be stated and the reasons given.
    - Identify the required developer system. If only one developer is acceptable, then state why.
    - When test standards are given, provide an illustration and/or instruction that shows how to test the system sensitivity
    - Describe the acceptable method for applying the penetrant material (dip, paint brush, aerosol, etc)
    - Describe the type and acceptable characteristics of the viewing light (long wave, short wave, visible, etc) and its specifications
    - Identify the washing media required before and after applying the penetrant material
    - Describe any required mechanical stress, application fixtures by part number, or give detailed illustrations
    - Include detailed procedures for cleaning, etching and finishing. References to other documents are not permitted.
    - Describe critical washing or inspection steps where irrelevant indications can cause incorrect readings
    - Illustrate examples of anticipated faults and their possible locations
    - Describe the required lighting conditions for viewing, such as subdued light (measured value) and long wave ultraviolet light, in Angstroms, together with the appropriate filter
- 2.7.1.3 Indication evaluation  
Describe the exact conditions by which faults must be measured.
- 2.7.1.4 Acceptance and rejection standards:
- Describe the fault and specify the required action
  - Include actual fault limits or cross-refer to the limits section in the appropriate publication or associated data modules
- 2.7.2 Magnetic particle technique**
- 2.7.2.1 Test equipment adjustment:
- Describe the exact orientation of the magnetizing coil, contact pads and magnetic poles. Include pictorial views and a schematic of the setup.
  - Specify the use of residual or continuous method as applicable
  - Include the formula and/or the tables for magnetizing values required for each test
- 2.7.2.2 Procedure:
- Provide a detail illustration of the part that shows the flux pattern and the areas of the part where irrelevant indication can occur. Also indicate where special attention is necessary due to weak flux fields. Include as many illustrations or tables indicating flux orientation type and magnitude as required.
  - Describe the order of test sequences. Include in-between demagnetization operations, include alternating current (AC) or direct current (DC) for each description as required.
  - Describe the anticipated fault orientation. Include a description of irrelevant indications that can confuse the inspection.
  - Describe any acceptable permanent magnets which can be used instead of portable equipment to perform the procedure

- Identify and describe any induced current cores, other magnetizing aids, and special fixtures required to perform the procedure
- Specify the type and size of magnetic particles and its suspension medium (colloid)

#### 2.7.2.3 Indication evaluation

Describe the exact standard by which the fault must be measured.

#### 2.7.2.4 Acceptance and rejection standards:

- Describe the fault and specify required actions
- Include actual fault limits or cross-refer to the limits section in the appropriate publication or associated data modules

### 2.7.3 Eddy current technique

#### 2.7.3.1 Test equipment adjustment:

- Illustrate the probe sensor position in relation to the part, and the expected fault
- Describe the scanning and indexing required
- When high speed rotating probes are used, specify requirements, if any, to mechanically hold the scanner assembly

#### 2.7.3.2 Procedure:

- Describe the scanning motion required
- Describe the signal response expected
- Describe any fixture operation necessary to perform the procedure
- Establish the threshold, low frequency (LF), for maximum penetration on given stack-up of material
- Provide acceptable response data so that locally-manufactured reference standards can be qualified (eg, "Standard probe instrument combination must produce a 50 % meter response when lift-off compensated for 0,15 mm, and have a maximum noise level of 5 % full scale"). The reference standard must be provided by the manufacturer for special applications.
- If an oscillograph recorder is required, provide full scale response time and chart speed

#### 2.7.3.3 Indication evaluation:

- Describe the exact condition the fault is measured by
- Include the acceptable noise level

#### 2.7.3.4 Acceptance and rejection standards:

- Describe the fault or specify required actions
- Include actual fault limits or cross-refer to the appropriate limits section in the publication or associated data modules

### 2.7.4 Radiographic (X-ray/Gamma-ray) technique

#### 2.7.4.1 Test equipment adjustment:

- Describe by diagram the source locations relative to the subject and film
- Describe the film placement relative to the parts being radio graphed and the radiation source
- Include all sizes and distances in International System (SI) units. If required, a conversion from SI units to non-SI units must also be given in brackets after the SI unit.
- Describe where to place the image quality indicator if used
- In situations where the source to film distance can be varied, specify the maximum angle of incidence that can be varied relative to the subject

#### 2.7.4.2 Procedures:

- Specify the X-ray intensity in kV and mA and the times of exposure in minutes and/or seconds

- Illustrations must identify any necessary supports, alignment fixtures and templates, showing how these are used with the procedure
- Specify the film type in accordance with American Society for Testing Materials E-94, or equivalent. The relative film speed must also be given.
- Where a film type other than that specified is acceptable, the following statement must be included: "Alternative film speeds can be used provided they produce equal or better definition of the subject"
- Give the screen type and combination
- Specify any required penetrometer in accordance with American Society for Testing Materials or equivalent
- Whenever practical, include a reference radiograph with a sample fault
- Expose radiograph at a definite value allowing for density adjustment (+) or (-) from a specified density on film
- Describe the location on the radiograph where the density must be measured
- Describe the minimum sensitivity required

#### 2.7.4.3 Indication evaluation:

- Describe the lighting conditions the radiograph must be viewed under
- Describe the faults anticipated and the location they will occur on the film
- Describe all necessary measuring aids such as overlays or comparators

#### 2.7.4.4 Acceptance and rejection standards:

- Describe the fault and specify required actions
- Include actual fault limits or cross refer to the limits section in the appropriate publication or associated data modules

### 2.7.5 Ultrasonic technique

#### 2.7.5.1 Test equipment adjustment:

- Illustrate the transducer position in relation to the part and the expected fault and/or the standard fault
- Describe the scanning required
- Where angle beam testing is utilized, include the complete formula for the generation of the required angles
- Describe the cause of any spurious signals that appear near the inspection window
- When very specific procedures call for the ultrasonic instrument to be operated in a particular manner, provide detailed operating instructions
- Specify requirements, if any, for reject gates or alarms
- When adjusting the amplitude of the standard signal, describe any other signal amplitude to be maintained
- Describe calibration amplitude by percent height of screen and by position, horizontal on the scope (eg, optimize the signal from the standard and adjust the instrument gain to provide an 80 % screen height standard signal at 30 % on the horizontal base line)

#### 2.7.5.2 Procedure:

- Describe the scanning motion required
- Describe the signal response expected
- Describe any fixture operation necessary for the procedure
- List acceptable transducers by characteristics
- Identify any required amplitude blocks by type (area or distance) and reflector size
- Illustrations and text must describe the setup for required "B" and "C" scan-type presentations
- If interface materials (couplings) are required, they must be listed

#### 2.7.5.3 Indications evaluation

Describe the exact criteria the fault must be measured by.

- 
- 2.7.5.4 Acceptance and rejection standards:
- Describe the fault and specify required action
  - Include actual fault limits or cross refer to the limits section in appropriate publication or associated data modules
- 2.7.6 Resonance frequency and thermographic techniques**
- 2.7.6.1 Test equipment adjustment  
As prescribed by industry standards.
- 2.7.6.2 Procedure  
As prescribed by industry standards.
- 2.7.6.3 Indication evaluation  
Describe the exact conditions the faults must be measured by.
- 2.7.6.4 Acceptance and rejection standards:
- Describe the fault or specify required actions
  - Include actual fault limits or cross-refer to the limits section in the appropriate publication or associated data modules

*Table 1 References*

Chap No./Document No.	Title
<a href="#">Chap 5.2.2.2</a>	Air specific information sets - Structure repair information
<a href="#">Chap 9.2</a>	Terms and definitions - Terms, acronyms and subject index

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Corrosion Control (CC) information.

### 1.2 Scope

It covers the rules for the preparation of information applicable to the Product CC which will provide instructions and guidance to personnel, at all maintenance levels, for corrosion prevention and control. With some minor changes, this detailed specification can serve as a guide for corrosion control of components and equipment.

The CC information set also includes repairs to corrosion damage which do not exceed the removal of the corrosion and the subsequent surface protection. For repairs exceeding this damage, reference is made to the air specific structural repair information set. Refer to [Chap 5.2.2.2](#).

### 1.3 Standards and definitions

#### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

#### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate:

- **Corrosion prone items/areas:** Corrosion prone items/areas are those that are classified in one or more of the following:
  - Dissimilar metal contacts
  - Structural areas where moisture can collect
  - Drainage provisions
  - Magnesium alloy components
  - High strength steel (over 1200 N/mm<sup>2</sup>)
  - Environmental conditions
  - Highly stressed parts
- **Critical items/areas:** Critical items/areas are those that are classified in one or more of the following:
  - Components critical to safety of operation
  - Components essential to mission completion
  - Components difficult to repair or replace
  - Expensive components
  - Plastic parts subject to wear

## 2 Corrosion control

### 2.1 General requirements

The CC information set contains the data and procedures required by maintenance personnel for determining the location and extent of corrosion damage to the air vehicle, land or sea system and its systems, and instructions for its classification, removal and treatment.

Wherever possible, cross-references must be made to data in general corrosion control publications if these are available to the customer. Cross-reference must also be made to the data given in each of the following information sets:

- Structural Repair (SR). Instructions for repair of specific items and sealing procedures
- Air vehicle, land or sea system Maintenance Instructions (MI) for gaining access to the corrosion, cleaning, temporary protection procedures, safety precautions and list of material and equipment

- Non-Destructive Testing (NDT). Instructions for non-destructive inspection of corrosion prone and critical items/areas

The following requirements must be taken into account in the content of the CC information set:

- Safety precautions concerning the use of toxic material and the hazards associated with their use must be included
- The CC must not refer to any contractor's process and/or material specification
- Special or proprietary equipment must not be specified in the CC

## 2.2 Technical content

The CC information set must be arranged as follows:

### 2.2.1 Introduction

If required, the introduction data modules contain an explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-00-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-000-00-0000-**NN**AAA-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different information sets.

#### 2.2.1.1 General corrosion control

These data modules must contain data on the approved material and procedures for general prevention and repair (detection, removal and/or repair and treatment) of corrosion on the Product structure and its systems. It must cover, but not be limited to, the following:

- General safety data (IC 012)
- General data on corrosion control (IC 010)
- Description of the Product corrosion control and prevention (IC 040) with data relative to:
  - Purpose of the corrosion control
  - Special material/consumables used, including corrosion preventative compounds
  - Types of corrosion
  - Factors in corrosion control
  - Corrosion preventive maintenance
  - Major structural group breakdown
  - Corrosion prone systems/components
- Cleaning and surface preparation (IC 250)
- Paint removal for corrosion control (IC 251)
- Inspection of corrosion damage (IC 310)
- Mechanical removal of corrosion (IC 258)
- Chemical corrosion removal and surface treatment (IC 258 and/or IC 640). Where applicable, specific instructions must be included for the following metallic surfaces:
  - aluminum alloys
  - magnesium alloys
  - stainless steel and nickel base alloys

- copper and copper base alloys
- titanium base alloys
- plated and phosphate surfaces
- Treatment of typical areas (IC 640)
- Corrosion prevention finish (IC 257) with data relative to application and touch-up of:
  - primers
  - enamels
  - top-coatings
- Corrosion prevention sealant systems (IC 259)

## 2.2.2 Systems corrosions control

These data modules contain data on approved material and procedures for the corrosion control of specific systems/components/items such as:

- fuel system
- flight/operation controls
- landing gear/chassis
- engines
- external stores
- external markings
- hulls
- deck machinery

For each corrosion prone and critical item/area, the following corrosion control data modules must, where applicable, be produced:

- Clean/wash systems and temporarily protect specific items/areas
- Gain access to corrosion prone and critical items/areas
- Examine corrosion prone and critical items/areas, including the use of non-destructive testing
- Identify the type of corrosion
- Remove paint from corroded areas
- Evaluate corrosion damage
- Remove corrosion damage
- Repaint or touch-up the finish system after the corrosion has been removed
- Seal corrosion prone and critical items/areas
- Close access to corrosion prone and critical items/areas

## 2.2.3 Structure corrosion control

### 2.2.3.1 General

Structure corrosion control is the main aim of CC information. Each major structural component must be discussed and the data contained must be divided further to cover corrosion prone and critical items/areas, corrosion removal, material treatment, finish processes and corrosion prevention sealant processes.

For air vehicle systems, corrosion control data must be presented for each of the following major structural items:

- System 52 - Doors
- System 53 - Fuselage
- System 54 - Nacelles/pylons
- System 55 - Stabilizers
- System 56 - Windows and canopies
- System 57 - Wings

Land and sea corrosion control data must be presented dependent on the type of equipment and must utilize the appropriate system number.

- 2.2.3.2 Component description (IC 041)  
Descriptive data modules must be given for each of the major structural items (for air vehicles, refer to [Para 2.2.3.1](#)). The data modules must also include corrosion prone and critical items/areas, and, where specific corrosion control data can be found.
- 2.2.3.3 Corrosion prone and critical items/areas (IC 350)  
Descriptive data modules must be given for each major structural item. The data modules must include:
- location, access and inspection of corrosion prone and critical items/areas
  - types of corrosion which can be found, and where it is most likely to occur
  - the cause of the corrosion which can be found in each item/area
  - necessary safety precautions for critical structure
  - preferred inspection method and/or reference to the NDT information
- 2.2.3.4 Corrosion removal (IC 258)  
For items/areas defined in [Para 2.2.3.3](#), the following corrosion removal data must be given:
- factors to be considered during corrosion removal, such as safety precautions, when you use the toxic material and hazards associated with their use, and/or safety precautions when working in hazardous areas (propellant areas, fuel areas, etc)
  - specific corrosion removal instructions or cross-references to general corrosion removal procedures (refer to [Para 2.2.1.1](#))
  - material removal limits or references to the structural repair information set
- 2.2.3.5 Material treatment and finish processes (IC 257)  
These data modules must give descriptive information on the material treatment protective finish to be used and the procedures for preparation and application peculiar to the items/areas defined in [Para 2.2.3.3](#). References to the maintenance information can be made. The original finish and alternate touch-up system must be identified for both exterior and interior surfaces of each item/area.
- 2.2.3.6 Corrosion prevention sealant processes (IC 259)  
These data modules must give the procedures for the preparation and application of corrosion preventive sealants to the item/area. The application of sealants, which are primarily for other purposes, are contained in the structural repair information set. The identification of the sealant type and the sealing method must be included.
- 2.2.3.7 Special equipment and material (IC 060 and 070)  
These data modules must give short descriptions of any special equipment and/or material used in the procedures mentioned in [Para 2.2.3.4](#) thru [Para 2.2.3.6](#).

## 2.3 Illustrations and tables

### 2.3.1 General

Illustrations and related tables must be included in the CC information with additions as necessary, to illustrate corrosion control procedures.

For specific systems (refer to [Para 2.2.2](#)), illustrations and tables must be included in the CC information to identify the corrosion prone and critical items/areas. The area of a component, which has a tendency to corrode, must be highlighted, and a location key must be used as reference in the text.

Illustrations and tables must be included in each data module for major structural items. Refer to [Para 2.2.3](#).

### 2.3.2 Structural items with corrosion prone and critical items/areas

For each major structural group, one or more illustrations must be provided which identifies the structural items with corrosion prone and critical items/areas. A table must be provided with an item index of each major structural group. This table must follow the format given in [Table 2](#). The table must show where the corrosion control information for each item can be found. The table consists of the following columns:

- 1 Fig/Ref: All required structural items, shown on the appropriate illustration, must be listed in this column in sequential order, starting with Fig/Ref No. 1. For variant items, the numbers 1A, 1B, 1C, etc, must be used.
- 2 Area/Item name and Part No.: This column gives the name and part number of the structural component. The applicable corrosion control procedures must be listed in this column for each item.
- 3 Corrosion control reference: This column gives the data module code of the detailed corrosion control procedure.

*Table 2 Major structural group component index - Example*

Fig/Ref (1)	Area/Item name and Part No. (2)	Corrosion control reference (3)
1	Component XX, P/N XXXXXXXX	
	Corrosion prone and critical item/area	E1-A-52-10-00-00A-350A-B
	Corrosion removal	E1-A-20-00-00-00A-258C-B
	Material treatment/finish system	E1-A-20-00-00-00A-257A-B
	Corrosion prevention sealant system	E1-A-20-00-00-00A-259D-B
2	Component YY, P/N YYYYYYYY	
3	.....	

### 2.3.3 Corrosion prone and critical items/areas

One or more illustrations must be given to identify corrosion prone and critical items/areas. These items/areas must be inspected and protected. An arrow must be used on structural illustrations to show the grain flow. The area of a component, which has a tendency to corrode, must be highlighted and a location key used to coincide with a key in the text and in the Fig/Ref No. of the corrosion control tables. Listed below are the requirements for the columns in [Table 3](#):

- 1 Fig/Ref: This column contains a Fig/Ref number for each corrosion prone and critical item/area which will be the key in the illustration and the text. Critical areas can be identified with a "C" in front of this index number.
- 2 Name: This column gives the name of the items/areas shown in the appropriate illustration.
- 3 Type of corrosion: This column identifies the type of corrosion, or deterioration, anticipated such as oxidation, pitting, galvanic, flaking, etc. A detailed description of what the corrosion will look like on each specific item, based on the use/location/exposure of the item, must be included in this column, or a reference to the discussion of known corrosion problems given in the text. General statements such as "red rust" for steel parts or "white or grey powder" for aluminum parts are not adequate. Specific locations on the item, where corrosion can be expected to start, must be identified.

- 4 Inspection method: This column gives the preferred inspection method in a brief form. Detailed procedures must be included in the text body of the paragraph and must be referenced in the table. Where applicable, non-destructive inspection procedures must be referenced to the corresponding NDT data modules.
- 5 Probable cause and material specification: This column gives the probable cause of the corrosion normally encountered in the item/area, and the material types involved in the corrosion process.

*Table 3 Component corrosion prone and critical items/areas - Example*

Fig/Ref	Name	Type of corrosion	Inspection method	Probable cause and material specification
(1)	(2)	(3)	(4)	(5)
1	...	...	...	...
2	...	...	...	
3	...	...		
4	...			

#### 2.3.4 Corrosion removal

A table which contains the recommended corrosion removal procedures must be given. The table must be keyed to one or more illustrations and text for the corrosion prone and critical items/areas. The table must follow the format given in [Table 4](#) and must have the following columns:

- 1 Fig/Ref: This column contains a Fig/Ref number for each corrosion prone and critical item/area which will be the key in the illustration and the text. Critical areas can be identified with a "C" in front of the index number.
- 2 Name: This column gives the name of the items/areas shown in the appropriate illustration.
- 3 Recommended removal procedure: This column specifies the mechanical and chemical recommended corrosion removal procedures, in a brief form, for each corrosion prone and critical item/area. For repairs due to corrosion damage exceeding corrosion removal and treatment, the word "Repair" must be inserted, and a reference must be made to the structural repair information in the column "Specific procedures". If corrosion removal is not recommended, the word "None" must be inserted in the relevant column.
- 4 Specific procedures: This column includes specific corrosion removal instructions, damage limits or references where the applicable data is contained. References to general corrosion removal procedures or to the structural repair data modules must be included. Any change of material as a result of a repair must be noted, and the procedure for the new material must also be given.

*Table 4 Component corrosion removal - Example*

Fig/Ref	Name	Recommended removal procedure (3)		Specific procedures
(1)	(2)	Mechanical	Chemical	(4)
1	...	Repair	None	E1-A-...

Fig/Ref	Name	Recommended removal procedure (3)	Specific procedures
C2	...		
2	...		

### 2.3.5 Material treatment and protective finishes

One or more illustrations and a table must be given for all types of protective finish required for all areas of the structural item. The exact area must be named. The table must follow the format given in [Table 5](#) and must be keyed to the corresponding illustrations. The area/reference name for a specific corrosion prone area must be used in the table, where applicable. Both interior and exterior areas must be shown. Protective finish application procedures in the general corrosion protective finish (refer to [Para 2.2.1.1](#)) must be referenced under the "alternate touch-up system" headings.

*Table 5 Material treatment and protective finishes - Example*

Fig/Ref	Name	Pretreatment	Primer	Topcoat
1	...	Exterior original finish system Alternate touch-up system		
2	...	Interior original finish system Alternate touch-up system		

### 2.3.6 Corrosion prevention sealant processes

A table for corrosion prevention sealant processes must be provided and must follow the format given in [Table 6](#). This table lists the corrosion prevention sealant processes for all items/areas of the structural item with area/reference key for the specific corrosion prone area used, where applicable. Illustrations must be used as necessary. In the "Specific procedures" column, cross-references must be made to the processes described under the heading "General corrosion control" (refer to [Para 2.2.1.1](#)), and/or to the structural repair data modules.

*Table 6 Component corrosion prevention sealant processes - Example*

Fig/Ref	Name	Type of sealing and material	Specific procedures
1	...	...	J1-A-...
2	...		

### 2.3.7 Special equipment

A table must be given that lists all special equipment specified in the CC information set for corrosion inspections and control.

### 2.3.8 Special material

A table must be given that lists all special material specified in the CC information set for corrosion inspections and control.

<a href="#">Chap 9.2</a>	Terms and data dictionary - Glossary of terms, abbreviations and acronyms

---

## **1 General**

### **1.1 Purpose**

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for the Product storage information.

### **1.2 Scope**

It covers the rules for the preparation of information applicable to the Product storage which will enable skilled personnel at all maintenance levels to store the Product, including installed systems, equipment and components, inspect them during storage and remove them from storage. It does not cover preparation and shipment of new Products before they are delivered to a using organization. It does not cover spare parts, except when stored as part of the Product.

The storage information set covers the following topics:

- general requirements for Product storage
- product storage information and procedures

### **1.3 Standards**

The standards given in this chapter are applicable with no exceptions.

### **1.4 Definitions**

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate.

- temporary storage: A period of storage not exceeding 90 days
- extended storage: A period of storage which exceeds 90 days

## **2 Storage**

### **2.1 General requirements**

Illustrations, diagrams and related tables must be included in the data modules with such additions as can be required to illustrate the Product storage operations.

The Product storage information includes an overview illustration showing location of all preservation covers, areas to be protected and tie-down points for temporary and extended storage.

Illustrations must be provided for specific Product systems which require special storage operations.

The storage information set includes procedures for processing systems for:

- temporary storage not exceeding 30 days
- temporary storage from 30 to 90 days
- extended storage (over 90 days)
- inspection and treatments during storage
- removal from storage
- if required, instructions for movement following extended storage, which includes transportation by land, sea or air

### **2.2 Data module coding**

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-10-30-00-**NN**A-**YYYY**-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-**NN**AAA-**YYYY**-A (37 characters)

Where:

- "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed for the same information code.
- "**YYY**", is the information code, described in [Para 2.4](#).

The information code variant is used to distinguish between the different information sets.

## 2.3 Introduction

If required, the introduction data modules contain an explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They also contain any necessary information, of a general nature, which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-10-30-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-**NN**AAA-018Y-A (37 characters)

Where "**NN**", in the disassembly code, is a sequential number starting from "00", when more than one data module is needed

The information code variant is used to distinguish between the different information sets.

## 2.4 Storage data modules

Storage data modules contain all data required by maintenance personnel for storage, inspection during storage and removal from storage of individual Products.

In many cases, cross-reference to existing data modules is sufficient.

The storage information set covers, but is not limited to the following types of data modules:

- general product storage information which provides definitions of types of storage
- temporary storage
- extended storage
- preservation
- removal of preservation materials
- procedures to put items into containers
- procedures to remove items from containers
- procedures to keep items serviceable in storage
- moving of stored items to another location
- preparing of items for use after storage
- acceptance of items from storage before use
- life data of items in storage
- tie-down points and strength of cables needed to secure the Product during storage

### 2.4.1 General Product storage information

These data modules provide information on the purpose of the Product storage information, how to use it and standards of repetitive procedures on storage. As a source of further general

information on storage, cross-references to other material are permitted. Information on the consumable materials, tools and equipment must be included with cross-references to appropriate (consolidated) lists. Definition of types of storage must be included.

Data modules must be coded:

YY-Y-10-30-00-NNA-800Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-800Y-A (37 characters)

#### 2.4.2 Temporary storage

These data modules provide information on how to protect the Product during temporary storage up to 30 days and from 30 to 90 days. This information must contain an overview illustration and instructions which include the following:

- items which must be removed from the Product before temporary storage, such as batteries, explosive devices, safety equipment, oxygen bottles
- location of protective covers and tie-down points
- any other procedures necessary to protect the Product during temporary storage

Data modules must be coded:

YY-Y-10-30-00-NNA-800Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-800Y-A (37 characters)

#### 2.4.3 Extended storage

These data modules provide information on how to protect the Product when stored for over 90 days. Extended storage is defined as a planned action from the first day of storage. This information must contain an overview illustration and instructions which include the following:

- items which must be removed from the Product before extended storage, such as batteries, explosive devices, safety equipment, oxygen bottles
- openings which must be sealed to prevent entry of rain, dust, birds or vermin to eliminate potential damage, corrosion and loose article hazards
- location of vent tubes or drain holes to ensure all areas of the Product are suitably ventilated
- location of acrylic windows or other surfaces which must be protected from sunlight
- general location of unpainted metal surfaces which need protection during extended storage
- any other procedure necessary to protect a specific system during extended storage

Data modules must be coded:

YY-Y-10-30-00-NNA-800Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-800Y-A (37 characters)

#### 2.4.4 Preservation

These data modules must provide information on how to make sure the Product stays serviceable when in storage.

Data modules must be coded:

YY-Y-10-30-00-NNA-810Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-810Y-A (37 characters)

#### 2.4.5 Preparation for transport

These data modules provide procedural information on how to prepare the Product for transport by land, sea or air.

Data modules must be coded:

YY-Y-10-30-00-NNA-811Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-811Y-A (37 characters)

#### 2.4.6 Removal of preservation materials

These data modules provide information on the procedures necessary to remove materials and parts used to keep the Product serviceable when in storage.

Data modules must be coded:

YY-Y-10-30-00-NNA-820Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-820Y-A (37 characters)

#### 2.4.7 Procedures to put the Product into containers

These data modules provide procedural information on how to install the Product in containers for storage or for transport by land, sea or air.

Data modules must be coded:

YY-Y-10-30-00-NNA-830Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-830Y-A (37 characters)

#### 2.4.8 Procedures to load vehicle into another

These data modules provide procedural information on how to load a vehicle into another one for transport by land, sea or air.

Data modules must be coded:

YY-Y-10-30-00-NNA-831Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-831Y-A (37 characters)

#### 2.4.9 Procedures to remove the Product from containers

These data modules provide procedural information on how to remove the stored Product from its containers, including the removal of material used for protection.

Data modules must be coded:

YY-Y-10-30-00-NNA-840Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-840Y-A (37 characters)

#### 2.4.10 Procedures to unload vehicle from another

These data modules provide procedural information on how to unload a vehicle from another one after transport by land, sea or air.

Data modules must be coded:

YY-Y-10-30-00-NNA-841Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-841Y-A (37 characters)

#### 2.4.11 Procedures to keep the Product serviceable in storage

These data modules provide procedural information on how to protect the stored Product during the time they are in storage. This includes all servicing or other periodic inspection and maintenance of the Product necessary to ensure it keeps the required level of efficiency during the time they are in storage.

Data modules must be coded:

YY-Y-10-30-00-NNA-850Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-850A-A (37 characters)

#### 2.4.12 Movement of stored Product to another location

These data modules provide procedural information on how to move the stored Product by land, sea or air. These procedures also contain information regarding packaging, crating etc. where applicable to the items being transported.

Data modules must be coded:

YY-Y-10-30-00-NNA-860Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-860Y-A (37 characters)

#### 2.4.13 Preparation of Product for use after storage

These data modules provide information on the procedures necessary to prepare the Product for use after storage. This includes preparation for ferry after storage.

Data modules must be coded:

YY-Y-10-30-00-NNA-870Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-870Y-A (37 characters)

#### 2.4.14 Preparation of Product for use after transport

These data modules provide information on the procedures necessary to set on condition the Product after transport by land, sea or air.

Data modules must be coded:

YY-Y-10-30-00-NNA-871Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-871Y-A (37 characters)

#### 2.4.15 **Acceptance of Product from storage before use**

These data modules provide procedural information on how to accept the Product from storage before they are prepared for use.

Data modules must be coded:

YY-Y-10-30-00-NNA-880Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-880Y-A (37 characters)

#### 2.4.16 **Life data of Product in storage**

These data modules identify the length of time the Product can be kept in a given storage condition and stay safe/serviceable.

Data modules must be coded:

YY-Y-10-30-00-NNA-890Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-30-0000-NNAAA-890Y-A (37 characters)

#### 2.4.17 **Tie down points and cable information**

Information for tie down points and strengths of cables required to secure the Product during storage can be referenced from the maintenance procedures.

Data modules must be coded:

YY-Y10-20-YY-00A-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y10-20-YYYY-00AAA-YYYY-A (37 characters)

## 1 General

### 1.1 Purpose

The preparation and coding of data modules for wiring data, and the preparation of page-oriented and interactive wiring publications for the Product must follow the rules given here.

#### Note

An electronic copy of the wiring Schema and corresponding data module examples is available for download from the S1000D website at [www.s1000d.org](http://www.s1000d.org).

### 1.2 Scope

The rules for the preparation of wiring information covered here describe sufficiently the electrical circuits to enable skilled maintenance personnel to do fault isolation and maintenance of electrical systems on the Product. The specification describes the information and data that is necessary to prepare data modules for:

- Introduction. Refer to [Para 2.2.1](#).
- Descriptive information. Refer to [Para 2.2.2](#).
- Standard practices. Refer to [Para 2.2.3](#).
- Wiring diagrams. Refer to [Para 2.2.4](#).

- Numeric index
- Alphabetic index
- Electrical and electronic wiring diagrams
- Harness drawings. Refer to [Para 2.2.5](#).
  - Harness installation drawings
  - Harness routing drawings
  - Harness flat layout drawings
- Equipment and panel locations. Refer to [Para 2.2.6](#).
- Electrical standard parts data. Refer to [Para 2.2.7](#).
- Electrical equipment information. Refer to [Para 2.2.8](#).
- Wire data. Refer to [Para 2.2.9](#).
- Harness data. Refer to [Para 2.2.10](#).

Additionally, special collections of wiring data, based on the data described in [Para 2.2.7](#) thru [Para 2.2.10](#) for easier access to the data, are described in:

- Generated data presentation. Refer to [Para 2.3](#).
  - Page-oriented wiring publications. Refer to [Para 2.3.2](#).
  - Interactive wiring publications. Refer to [Para 2.3.3](#).

For Interactive wiring publications the following functionalities are described in [Para 2.4](#):

- Analysis of network
- Views and filters
- Data presentation

## 1.3 Standards and definitions

### 1.3.1 Standards

The standards given in this specification are applicable with no exceptions.

### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate:

- **Panel:** This term covers all types of panels (eg, instrument panels, circuit breaker panels and relay panels)
- **Harness:** A cable harness is an assembly of wires and/or cables with all necessary end fittings and made on or off the Product, for example, a harness for a power plant installation
- **Screen:** A device used as a shield to prevent wires from interference

## 1.4 Wiring Schema

The wiring Schema provides a suitable structure to describe the electrical circuits of the Product.

### Note

For additional wiring information (eg, descriptive information, standard practices or harness drawings) it can be necessary to use the descriptive or procedural Schema.

The wiring Schema consists of the wiring data Schema and the wiring data description Schema.

### Note

It is not mandatory to use the wiring Schema. It is also possible to prepare wiring publication in form of tables and wiring diagrams by using the descriptive Schema. In this case, the interactive wiring publication functionalities (analysis of network, views and filters, context sensitive data presentation) are not available or required.

Interactive wiring publication functionalities as described in [Para 2.4](#) are only available if the wiring Schema is used.

#### 1.4.1 Wiring data Schema

The wiring data Schema is used to store wiring data information, such as wire data, harness data, electrical equipment information and electrical standard parts.

#### 1.4.2 Wiring data description Schema

For each relevant element of the wiring data Schema, an element field description is required. The wiring data description Schema describes for a project or an organization the specific configuration and usage of each element of the wiring data Schema.

The element field descriptions can be used in an interactive wiring publication application as short information or for configuring and mapping the interactive wiring publication according to the specific naming conventions of a project or an organization.

The wiring data description Schema describes every relevant element of the wiring data Schema with the following three elements:

- the element `<fieldName>` contains project or organization specific name conventions
- the element `<descr>` contains an explanatory description of the content of the element, for example, project or organization specific defined values (eg, the color of a wire can be red, yellow or green)
- the element `<refs>` contains the relevant reference to other data modules or technical publications for technical standard information, etc

The wiring data description data modules containing the data structure must be based on the wiring data description Schema.

Data modules must be coded:

YY-Y-YY-YY-00-00Y-029A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-0000-00YYY-029A-A (37 characters)

where "Y" thru "YYY", in the disassembly code variant, is used if more than one data module is needed

The explicit coding of wiring data description data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment the wiring data description data modules must be coded:

YY-Y-91-00-00-00Y-029A-A (17 characters)

thru

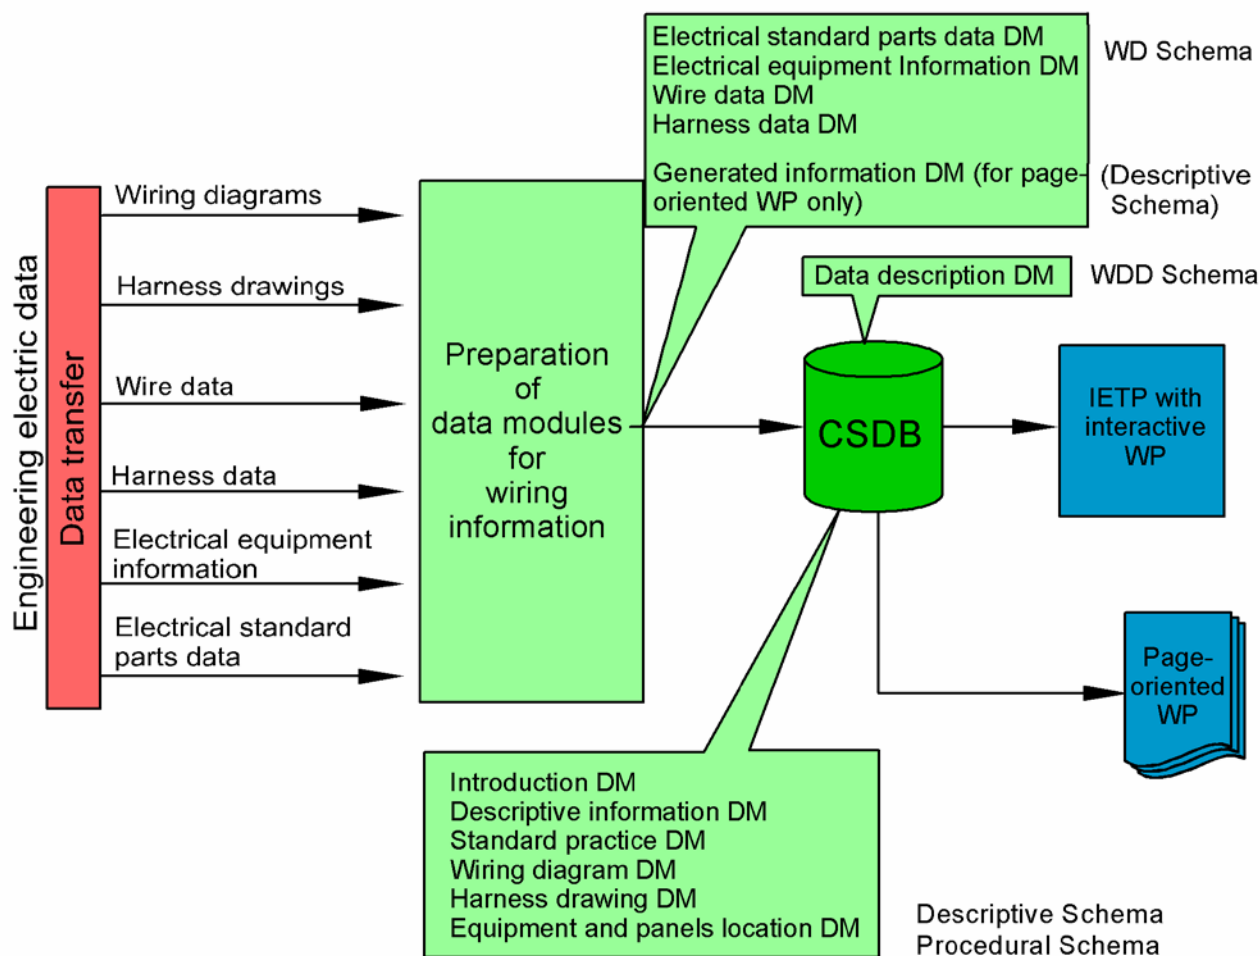

YYYYYYYYYYYYYY-YYYY-Y91-00-0000-00YYY-029A-A (37 characters)

#### **Business rule decision point BRDP-S1-00405 - How to use the element field descriptions in the wiring data description Schema:**

- Decide how to use the element field descriptions of the wiring data description Schema in an interactive wiring publication.

## 1.5 Preparation process for wiring information

[Fig 1](#) gives an overview of the standard preparation process for wiring information. The wiring data modules are typically produced from electric engineering source data.

ICN-C0419-S1000D0019-006-01

Fig 1 Preparation process for wiring information

## 2 Wiring data

### 2.1 General

The complete set of data modules for wiring data is specified in [Para 2.2](#).

The data modules are produced from such sources as electric engineering source data (eg, engineering data base, specifications, and drawings/diagrams). These form the basic information for a wiring publication, which is capable to show all electrical information.

It is recommended to use engineering source data unchanged.

### 2.2 Technical content

#### 2.2.1 Introduction

If required, the introduction data modules contain explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They also contain any necessary information of a general nature, which is not detailed in any of the specific data modules.

The introduction data modules in wiring publications include, for example, an explanation of the make-up and use of the Wiring data information set. They also include an explanation of the statements giving the configuration (eg, pre-mod, post-mod) of the Product depicted on diagrams.

Data modules containing an introduction must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-0000-**NN**AAA-018Y-A (37 characters)

where "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The information code variant must be used to distinguish between the different Information sets.

The explicit coding of introduction data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment the introduction data modules must be coded:

YY-Y-91-00-00-**NN**A-018A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-00-0000-**NN**AAA-018A-A (37 characters)

#### **Business rule decision point BRDP-S1-00406 - Use of introduction data modules for wiring publications:**

- Decide whether to produce introduction data modules for wiring publications. If required, the scope of these introduction data modules must be defined.

## **2.2.2**

### **2.2.2.1**

#### **Descriptive information**

Electrical identification system

A description must be given of the electrical identification system used on the Product. This also includes a list of the electrical and electronic/avionic systems of the Product with their system and subsystem codes.

Data modules containing descriptive information must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-00-01Y-040A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-0000-01YYY-040A-A (37 characters)

The explicit coding of data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, data modules that describe the electrical identification system must be coded:

YY-Y-91-00-00-01Y-040A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-00-0000-01YYY-040A-A (37 characters)

#### 2.2.2.2

##### Connection units

A description can be given for all kinds of connection units used on the Product, such as connectors, terminal boards, modular terminal boards, splices, bonding, etc. The description must be accompanied by illustrations.

Data modules containing descriptive information must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-00-02Y-040A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-0000-02YYY-040A-A (37 characters)

The explicit coding of data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, data modules that describe connection units must be coded:

YY-Y-91-00-00-02Y-040A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-00-0000-02YYY-040A-A (37 characters)

##### **Business rule decision point BRDP-S1-00407 - Optional descriptive information for connection units:**

- Decide whether to produce descriptive information for connection units including illustrations and tables.

#### 2.2.2.3

##### Wires, harnesses and conductors

A description can be given for all types of wires and harnesses installed in the Product, such as single wires, multiple wires, shielded wires, twisted wires. The description can also include, as necessary, illustrations and tables giving wire sizes, classification, conductors and wire types, etc.

Data modules containing descriptive information must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-00-03Y-040A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-0000-03YYY-040A-A (37 characters)

The explicit coding of data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, data modules that describe wires, harnesses and conductors must be coded:

YY-Y-91-00-00-03Y-040A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-00-0000-03YYY-040A-A (37 characters)

#### **Business rule decision point BRDP-S1-00408 - Optional descriptive information for wires and harnesses:**

- Decide whether to produce descriptive information for wires and harnesses including illustrations and tables.

### **2.2.3 Standard practices**

These data modules must contain project or organization specific standard electrical maintenance practices and repair information, for example, for the

- termination of wires
- installation of connectors and splices
- preparation of termination points for shielding, ground straps and ground studs and harnesses

The data modules must also contain any specific maintenance practices necessary for the

- installation
- maintenance
- repair

of electrical and electronic conductors, disconnects and termination points. The information to produce the data modules can be derived from project or organization specific specifications and instruction sheets.

The data modules must also contain information about tools and equipment needed to perform the work to be done. Standard practices such as:

- continuity testing
- insulation testing
- voltage breakdown testing
- coaxial cable testing (time domain reflectometry)
- optical fiber testing
- MIL-Bus testing
- bonding testing

are produced in data module form as required

Dependent on the requirements for the Product, data modules are prepared based on the procedural or descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-YYYY-Z (37 characters)

The explicit coding of standard practices data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, standard practices data modules must be coded:

YY-Y-20-YY-YY-YYY-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y20-YY-YYYY-YYYYY-YYYY-Z (37 characters)

**Business rule decision point BRDP-S1-00409 - Wiring standard practices data modules:**

- Define source and scope of wiring standard practices data modules. Decide whether to prepare standard wiring practice information as procedural or descriptive data modules.

## 2.2.4 Wiring diagrams

### 2.2.4.1 General

For a page-oriented wiring publication, wiring diagram data modules must be provided for all electrical systems of the Product.

For an interactive wiring publication, pre-prepared wiring diagrams are optional. The possibilities of an interactive wiring publication application to generate wiring diagrams according to user needs at runtime are described in [Para 2.4](#).

A wiring diagram data module must contain all sheets of the wiring diagram of an electrical or electronic system as defined by the SNS.

**Business rule decision point BRDP-S1-00410 - Wiring diagrams in an interactive wiring publication:**

- Decide whether to produce wiring diagrams for an interactive wiring publication.

### 2.2.4.2 Numeric index (page-oriented publication)

For each system "YY" a numeric index must be provided, listing all diagrams and give information such as:

- Title: Title of the figure (name of diagram)
- Data module code: Referenced data module
- Fig No.: Figure number in referenced data module
- Applic: Applicability

Data modules containing numeric indexes must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-00A-013A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-013A-A (37 characters)

The explicit coding of numeric index data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, numeric index data modules must be coded:

YY-Y-91-YY-00-00A-013A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-YY-0000-00AAA-013A-A (37 characters)

An example is given in [Table 2](#).

Table 2 Numeric index - Example data module 1F-A-91-24-00-00A-013A-A

Title	Data module code	Fig No.	Applicability
AC generation	1F-A-91-24-20-00A-051A-A	1	All
DC generation	1F-A-91-24-30-00A-051A-A	1	All
External power	1F-A-91-24-40-00A-051A-A	1	All
AC electrical load distribution	1F-A-91-24-50-00A-051A-A	1	All
DC electrical load distribution	1F-A-91-24-60-00A-051A-A	1	Twin
DC electrical load distribution	1F-A-91-24-60-00B-051A-A	1	Single

#### 2.2.4.3 Alphabetic index (page-oriented publication)

For each system "YY" an alphabetic index must be provided, listing all diagrams and give information such as:

- Title: Title of the figure (name of diagram)
- Data module code: Referenced data module
- Fig No.: Figure number in referred data module
- Applic: Applicability

Data modules containing alphabetic and alphanumeric indexes must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-00A-014A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YY-YY-YY-00AAA-014A-A (37 characters)

The explicit coding of alphabetic index data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, alphabetic index data modules must be coded:

YY-Y-91-YY-00-00A-014A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-YY-0000-00AAA-014A-A (37 characters)

#### 2.2.4.4 Interactive wiring publication index

An interactive wiring publication application represents the wiring diagrams only in one order, either numeric (refer to [Para 2.2.4.2](#)) or alphabetic (refer to [Para 2.2.4.3](#)).

#### 2.2.4.5 Electrical and electronic wiring diagrams

These data modules contain only wiring diagrams. The wiring diagrams (refer to [Fig 2](#)) show all:

- terminating points
- wire identification codes
- equipment identifications
- junction boxes
- shields
- internal jumpers

Applicable to: All

S1000D-A-05-02-0104-00A-040A-A

Chap 5.2.1.4

- ground connections
- etc

Each terminal point must be identified. At each point where a wire connects, the wire number must be indicated. Spare wires must be noted as "Spare". Wire connections between terminals and disconnect points and between electrical components must be drawn as direct as possible. Power distribution wiring diagrams must be provided for all primary and secondary busses up to and including the primary and secondary busses that feed the circuit breakers.

Data modules containing wiring diagrams must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-NNA-051A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-NNAAA-051A-A (37 characters)

where

- "YY-YY" is the SNS number referring to the system, subsystem and the sub-subsystem the wiring diagram is related to
- "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of wiring diagram data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, wiring diagram data modules must be coded:

YY-Y-91-YY-YY-NNA-051A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-YY-YY00-NNAAA-051A-A (37 characters)

An example is shown in [Fig 2](#).

## 2.2.5 Harness drawings

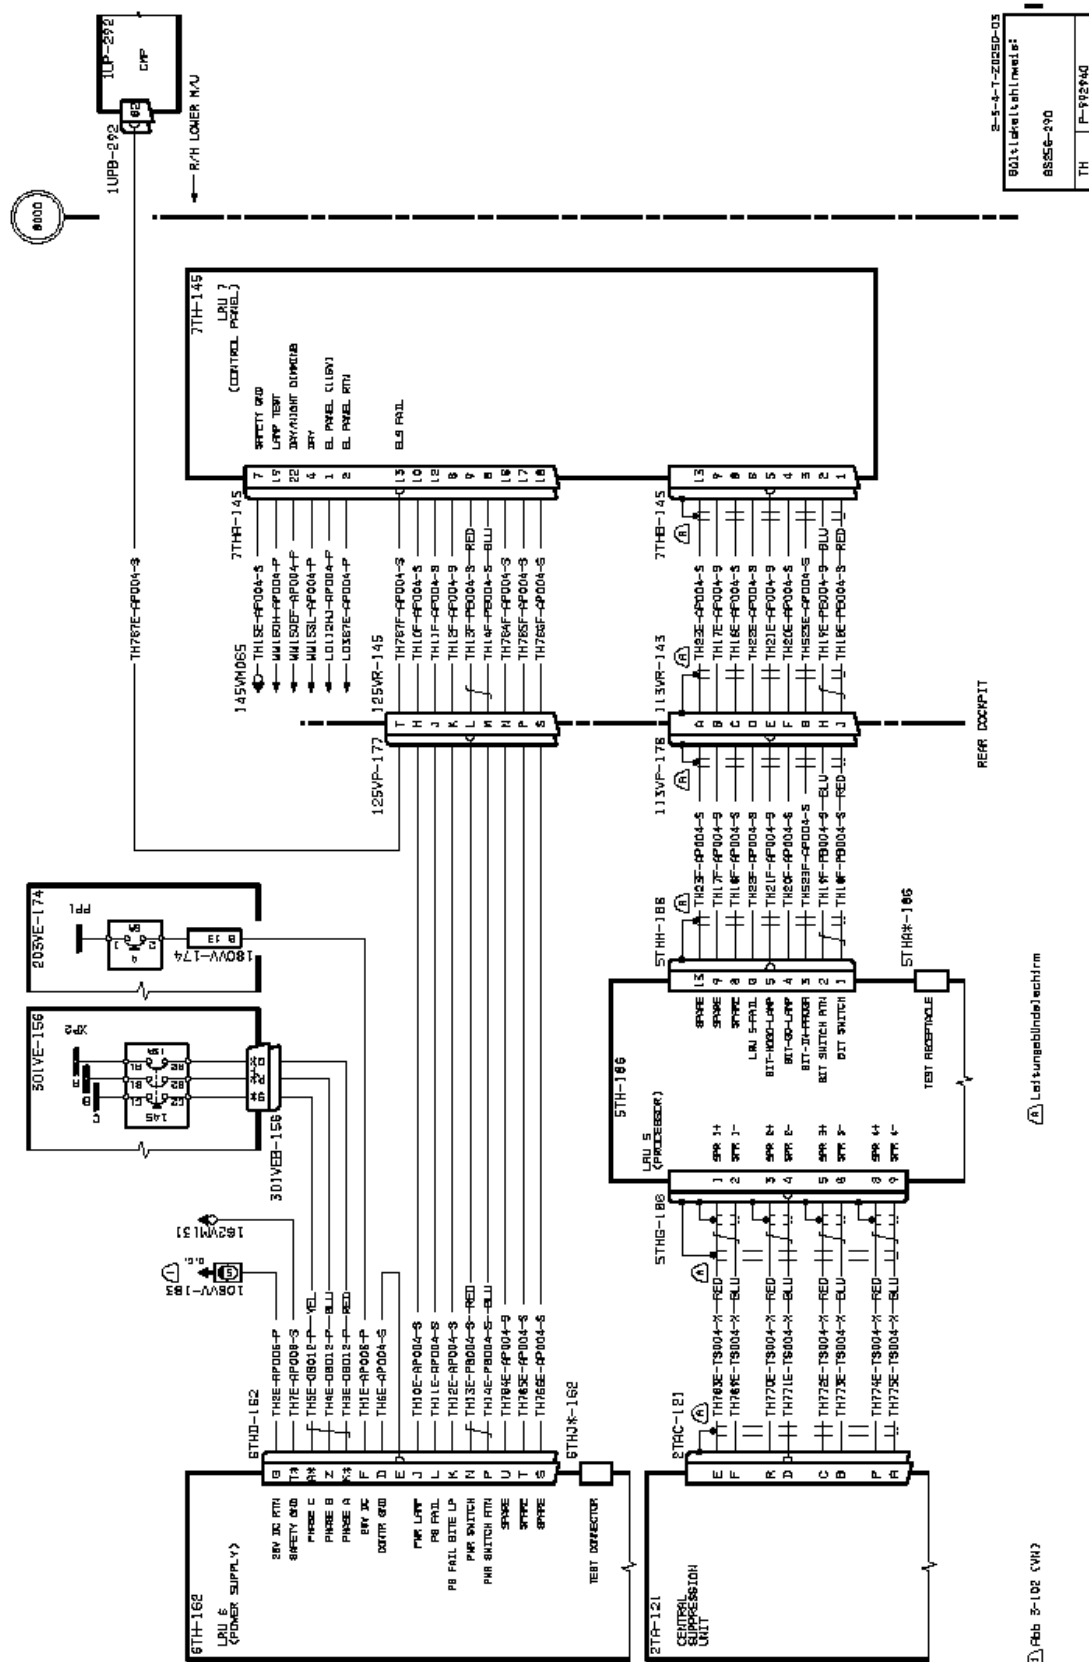

These data modules contain only the harness drawings and show, in each zone of the Product respectively across the Product the routings of harnesses naming them by the associated routes. These drawings can be simplified and route identification can be made, using perspective or orthographic views of the zone concerned, with identification to frames. Where possible, source drawings are used unchanged. As a general rule, the following types of illustrations are produced to satisfy the requirements:

- Harness installation
- Harness routing
- Harness flat layout

For detailed information of the zoning of a Product, refer to [Chap 3.4](#).

### Business rule decision point BRDP-S1-00411 - Harness routing drawings:

- Decide whether harness routing drawings are to be simplified and how their layout must look like.

ICN-C0419-S1000D0014-002-01

*Fig 2 Wiring diagram - Example*

Applicable to: All

**S1000D-A-05-02-0104-00A-040A-A**

#### Chap 5.2.1.4

## 2.2.5.1

### Harness installation drawings

These data modules include illustrations. They must be produced for each major area, zone or subzone of the Product, as appropriate and must show the installation of each harness in the Product.

An example is shown in [Fig 3](#).

Specific projects can have the requirement to produce information of harness installation as a list providing all harnesses that are installed in each of the major areas in textual form with a reference to the data modules that contain the information for each single harness routing installation within that major area. Illustrations need not be provided, where appropriate.

Data modules containing routing diagrams must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-**SS**-YY-**NNA**-052A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-**SS**-YYYY-**NNAAA**-052A-A (37 characters)

where

- "**SS**" are the first two characters of the zone code. Refer to [Chap 3.4](#).
- "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of harness installation drawing data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, data modules must be coded:

YY-Y-91-**SS**-00-**NNA**-052A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-**SS**-0000-**NNAAA**-052A-A (37 characters)

#### **Business rule decision point BRDP-S1-00412 - Coding of harness installation drawing data modules:**

- Decide whether to code harness installation drawing data modules by using zone information. If decided to use zone information for the coding, the structure of the data module code is possibly not appropriate. In this case, it must be decided on changes of the proposed structure for the Product (eg, population of the zone information in the unit or assembly group of the SNS instead of in the subsystem/sub-subsystem group).

#### **Business rule decision point BRDP-S1-00413 - Harness installation information:**

- Decide whether to prepare harness installation information for each major area in list form in addition to or instead of harness installation and routing drawings.

## 2.2.5.2

### Harness routing drawings

These data modules present a single harness illustration which shows the routing of the harness across the Product and all connectors at both ends in isometric view. The clipping points that fasten the harness to the Product's structure must also be included with their identification.

Examples are shown in [Fig 3](#) and [Fig 4](#).

Data modules containing routing diagrams must be prepared based on the descriptive Schema.

Applicable to: All

**S1000D-A-05-02-0104-00A-040A-A**

**Chap 5.2.1.4**

Data modules must be coded:

YY-Y-YY-**SS**-YY-**NNA**-052A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-**SS**-YYYY-**NNAAA**-052A-A (37 characters)

where

- "**SS**" are the first two characters of the zone code. Refer to [Chap 3.4](#).
- "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of harness routing drawing data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, data modules must be coded:

YY-Y-91-**SS**-00-**NNA**-052A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-**SS**-0000-**NNAAA**-052A-A (37 characters)

#### **Business rule decision point BRDP-S1-00414 - Coding of harness routing drawing data modules:**

- Decide whether to code harness routing drawing data modules by using zone information. If decided to use zone information for the coding, the structure of the data module code is possibly not appropriate. In this case, it must be decided on changes of the proposed structure for the Product (eg, population of the zone information in the unit or assembly group of the SNS instead of in the subsystem/sub-subsystem group).

#### 2.2.5.3 Harness flat layout drawings

These data modules provide harness flat layout illustrations shown as plan views across the Product with their segment lengths, sleeve codes, etc. An example is shown in [Fig 5](#).

Data modules containing routing diagrams must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-**NNA**-052A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-**NNAAA**-052A-A (37 characters)

where "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of harness flat layout drawing data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, harness flat layout drawing data modules must be coded:

YY-Y-91-00-00-**NNA**-052A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-00-0000-**NNAAA**-052A-A (37 characters)

Applicable to: All

**S1000D-A-05-02-0104-00A-040A-A**

**Chap 5.2.1.4**

Chap 5.2.1.4

## 2.2.6 Equipment and panel locations

The project or the organization must decide whether separate data modules containing equipment and panel location illustrations are to be produced. These illustrations (refer to [Fig 6](#)) show the locations of major electrical and electronic components or groups of components which are not contained in the location illustrations of the relevant system documentation. These locations must be identified by reference to major panels or station lines, water line and buttocks line or an equivalent locating system. The components illustrations include items such as panels, junction boxes, equipment and racks.

Data modules containing location diagrams must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-**NNA**-055A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-**YYY**-YY-YYYY-**NNAAA**-055A-A (37 characters)

where

- "YY" is the system code of the SNS
- "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of equipment and panel locations data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, data modules must be coded:

YY-Y-91-YY-00-**NNA**-055A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-**YY**-0000-**NNAAA**-055A-A (37 characters)

### Business rule decision point BRDP-S1-00415 - Equipment and panel location drawings:

- Decide whether to produce separate data modules containing equipment and panel location illustrations.

ICN-C0419-S1000D0018-001-01

Fig 6 Equipment and panel locations - Example

## 2.2.7 Electrical standard parts data

The project or the organization must decide whether data modules containing electrical standard parts data are to be produced. The electrical standard parts data include an extract of the technical information for each defined standard part and is based on technical standards. Numbering is based on a general or a project or an organization specific specification number which is different to the manufacturer's part number.

Data modules containing electrical standard parts data must be prepared based on the wiring data Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-**XX**A-031A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-**XX**AAA-031A-A (37 characters)

where "**XX**", in the disassembly code, shows the technical information as follows:

- 01 = Connectors including switches
- 03 = Distribution parts
- 04 = Wires
- 05 = Accessories
- 06 = Solder sleeves
- 07 = Shrink sleeves
- 08 = Identification sleeves
- 09 = Conduits

The explicit coding of electrical standard parts data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, standard parts data modules must be coded:

YY-Y-91-00-00-**XX**A-031A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-00-0000-**XX**AAA-031A-A (37 characters)

### Business rule decision point BRDP-S1-00416 - Production of electrical standard parts data:

- Decide whether to produce data modules containing electrical standard parts data.

Table 3 Standard parts list - Connectors, Example data module 1F-A-91-00-00-01A-031A-A

Part number	Alternatives (Supplier)	Number of contacts	Accessory	Applicability

Table 4 Standard parts list - Identification sleeves, Example data module 1F-A-91-00-00-08A-031A-A

Part number	Length	Mass	Diameter min / max	Applicability
JN1009-048A	48 mm	0,0001 kg	0,8 mm / 2,4 mm	All
JN1009-095A	47 mm	0,0003 kg	4,8 mm / 9,5 mm	All
JN1009-180A	42 mm	0,0005 kg	4,8 mm / 9,5 mm	All

## 2.2.8 Electrical equipment information

### 2.2.8.1 General

For each electrical or electronic item of equipment that has electrical connections, the project or the organization must define the required equipment information. The equipment information includes plugs and receptacles, terminals, splices, ground connections, switches, relays, lights, resistors, diodes and other electrical and electronic equipment with functional item references. Functional items are also known as reference designators. The information can be reduced to a single system code.

#### Business rule decision point BRDP-S1-00417 - Definition of required electrical equipment information:

- Define the required information for each electrical or electronic item of equipment that has electrical connections.

### 2.2.8.2 Electrical equipment information

These data modules must include all relevant information that is necessary to describe the Product's equipment. An electrical equipment information data module must be produced for each zone of the Product including all equipment installed. The electrical equipment must be listed with the functional item (also known as reference designator) in alphanumeric order. [Table 5](#) gives an example of data to be presented in electrical equipment lists.

General information must be given as an equipment list in tabular format. For an example refer to [Table 6](#).

Table 5 Data elements in equipment lists - Example

Data element	Markup element	M/O <sup>1</sup>
Each electrical equipment information consists of:		
– Functional item (also known as reference designator)	<functionalItemRef>	M
– Part number	<partNumber>	O
– Equipment description	<equipDescrRef>	O
– Location	<installationLocation>	O
– Illustration (eg, reference to equipment and panel location data module). Refer to <a href="#">Para 2.2.6</a> .	<illustrationRef>	O
Electrical equipment applicability:		
– Applicability of the Product	<applic> as referenced by the attribute applicRefId	O

<sup>1</sup> (M) Mandatory, (O) Optional

Data modules containing equipment lists must be prepared based on the wiring data Schema.

Data modules must be coded:

YY-Y-YY-**SS**-YY-**NN**A-056A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-**SS**-YYYY-**NN**AAA-056A-A (37 characters)

where

- "SS" are the first two characters of the zone code. Refer to [Chap 3.4](#).
- "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of electrical equipment information data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, electrical equipment information data modules must be coded:

YY-Y-91-**SS**-00-**NN**A-056A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y91-**SS**-0000-**NN**AAA-056A-A (37 characters)

#### **Business rule decision point BRDP-S1-00418 - Coding of electrical equipment information data modules:**

- Decide whether to code electrical equipment information data modules by using zone information. If decided to use zone information for the coding, the structure of the data module code is possibly not appropriate. In this case, it must be decided on changes of the proposed structure for the Product (eg, population of the zone information in the unit or assembly group of the SNS instead of in the subsystem/sub-subsystem group).

*Table 6 Equipment list - Example data module 1F-A-91-22-00-00A-056A-A*

Functional item	Part number	Equipment description	Location Shown in data module	Applicability
K1	9274-6686	1F-A-24-21-01-00A-042A-C	221BL 1F-A-91-24-00-12A-055A-A	All

## 2.2.9 Wire data

These data modules must include all relevant information that is used, for example, in the assembly of the Product's wiring. A wire list data module must be produced for each system of the Product as defined by the SNS including all wires installed. The wires must be listed with the wire identification in alphanumeric order. [Table 7](#) gives an example of data to be presented in wire lists.

*Table 7 Data elements in wire lists - Example*

Data element	Markup element	M/O <sup>1</sup>
For wire identification:		
– Circuit code	<circuitIdent>	O
– Wire identification number	<wireNumber>	M
– Wire section identification	<sectionIdent>	O
For wire information:		
– Harness identification	<harnessIdent>	O
– Color	<wireColor>	O
– Length	<length>	O
– EMC Code	<emcCode>	O
For wire connection (the wire connection includes the wire end information):		
– From equipment	<fromEquip>	M
– To equipment	<toEquip>	O
Each wire end information consists of:		
– Equipment identification	<functionalItemRef>	M
– Contact	<contactInfo>	O
– Screen	<screenGroup>	O
Wire applicability:		
– Applicability of the Product	<applic> as referenced by the attribute applicRefId	O
Wire traceability:		
– Traceability of the wire	<changeAuthorityDataGroup>	O
<sup>1</sup> (M) Mandatory, (O) Optional		

Spare wires must be indicated as shown in [Table 8](#). Wire preparation information is linked to standard practices airframe systems. Refer to [Para 2.2.3](#).

Data modules containing wire lists must be prepared based on the wiring data Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-**NN**A-057A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-**NN**AAA-057A-A (37 characters)

where "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of wire data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, wire data modules must be coded:

YY-Y-91-YY-00-**NN**A-057A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-YY-0000-**NN**AAA-057A-A (37 characters)

where

- "**YY**" is the system code of the SNS
- "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

Table 8 Wire list - Example data module 1F-A-91-94-00-00A-057A-A

Wire	Harness	Color	Length	Side 1:		Side 2:		Applic
				RFD	Contact	RFD	Contact	
AG0001FA	3001VB	C	1000	1AGA	A	2AGB	3	All
AG0002FA	3001VB	R	500	1AGA	B	100VR	1	All
AG0002FB	3005VB	R	1500	100VP	1	3AGC	G	All
AG0003FA	3001VB	B	500	1AGA	C	100VR	2	All
AG0003FB	3005VB	B	1500	100VP	2	3AGC	H	All
AG0004FA (Spare)	3001VB	C	1000	1AGA	STOW	2AGB	STOW	All

#### 2.2.10 Harness data

These data modules must include all relevant information that is necessary to describe the Product's harnesses. A harness data module must be produced for the installed harnesses in each zone of the Product. The harnesses must be listed with the harness identification in alphanumeric order. [Table 9](#) gives an example of data to be presented in harness lists.

Table 9 Data elements in harness lists - Example

Data element	Markup element	M/O <sup>1</sup>
Each harness information consists of:		
– Harness identification	<harnessIdent>	M
– Part number	<partNumber>	O
– Dash number	<harnessVariantIdent>	O
– Issue	<harnessVariantIssue>	O
– Illustration (eg, reference to harness drawing). Refer to <a href="#">Para 2.2.5</a> .	<illustrationRef>	O
Harness applicability:		
– Applicability of the Product	<applic> as referenced by the attribute applicRefId	O

<sup>1</sup> (M) Mandatory, (O) Optional

Data modules containing harness lists must be prepared based on the wiring data Schema.

Data modules must be coded:

YY-Y-YY-**SS**-YY-**NN**A-058A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-**SS**-YYYY-**NN**AAA-058A-A (37 characters)

where

- "SS" are the first two characters of the zone code. Refer to [Chap 3.4](#).
- "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The explicit coding of harness data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, harness data modules must be coded:

YY-A-91-**SS**-00-**NN**A-058A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-**SS**-0000-**NN**AAA-058A-A (37 characters)

#### Business rule decision point BRDP-S1-00419 - Coding of harness data modules:

- Decide whether to code harness data modules by using zone information. If decided to use zone information for the coding, the structure of the data module code is possibly not appropriate. In this case, it must be decided on changes of the proposed structure for the Product (eg, population of the zone information in the unit or assembly group of the SNS instead of in the subsystem/sub-subsystem group).

Table 10 Harness list - Example data module 1F-A-91-21-00-00A-058A-A

Harness identification	Part number	Issue	Routing Shown in data module	Applicability
3001VB	91223001-405	A	1F-A-91-21-00-00A-052A-A	All
3002VB	91223002-401	D	1F-A-91-21-00-01A-052A-A	All
3003VB	91223003-421	C	1F-A-91-21-00-02A-052A-A	All

## 2.3 Generated data presentation

### 2.3.1 General

Generated data presentation shows wiring information of the Product. It is based on and prepared from source data stored in the wiring data data module instances. The source data can be used to generate this information for a page-oriented wiring publication or within an interactive wiring publication.

Source data are wire data, harness data, electrical equipment information, electrical standard parts data (refer to [Para 2.2](#)) and they must include all pertinent information that is used in the assembly of the Product, junction boxes and pylons.

### 2.3.2 Page-oriented wiring publications

For page-oriented wiring publications, the information for generated data presentation, for example, harness wire lists, connection lists, is generated from source data, as described above, in a pre-processing. The result of the pre-processing must be stored in data modules.

Data modules must be prepared based on the descriptive Schema.

Data modules must be coded:

YY-Y-YY-YY-YY-NNA-XXXXA-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-NNAAA-XXXXA-A (37 characters)

where

"XXX" is the information code, which gives the contained technical information as follows:

- 031 = Electrical standard parts data
- 056 = Equipment lists
- 057 = Wire lists
- 058 = Harness lists

Use "A", "B" thru "Z", in the information code variant, if more than one list type as shown in [Para 2.3.2.1](#) thru [Para 2.3.2.3](#) is needed (eg, for different sort criteria).

The explicit coding of page-oriented wiring publication data modules concerning the system, subsystem and in some cases the sub-subsystem is different for air, land and sea systems. It is based on the SNS of the Product. Maintained SNS are listed in [Chap 8.2](#).

For air vehicle, engines and equipment, page-oriented wiring publication data modules must be coded:

YY-A-91-YY-00-NNA-XXXXA-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y91-YY-0000-NNAAA-XXXXA-A (37 characters)

Applicable to: All

S1000D-A-05-02-0104-00A-040A-A

Chap 5.2.1.4

#### Note

The generated lists described in [Para 2.3.2.1](#) thru [Para 2.3.2.3](#) can contain data from different main elements of the wiring data Schema, for example, wires and harnesses. Therefore it is recommended to use the descriptive Schema to provide generated lists in page-oriented wiring publications. It is also possible to use the wiring data Schema.

Examples of generated information for a page-oriented wiring publication such as harness wire lists, connection lists and hook-up lists are given in [Para 2.3.2.1](#) thru [Para 2.3.2.3](#).

#### 2.3.2.1 Harness wire lists

A harness wire list data module can be produced for the Product listing all harness conductors for each harness, in alphanumeric order and providing the following information:

- Harness identification
- Wire identification
- Harness installation and routing drawing data module where the installation and routing is shown. Refer to [Para 2.2.5.1](#) and [Para 2.2.5.2](#).
- Harness flat layout installation data module where the layout is shown. Refer to [Para 2.2.5.3](#).
- Applicability of the Product

#### Business rule decision point BRDP-S1-00420 - Generation of harness wire list data modules:

- Decide whether and how to generate harness wire list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.

Table 11 Harness wire list - Example data module 1F-A-91-00-00-00A-057B-A

Harness identification	Part number	Routing Shown in data module	Applicability
3001VB	91223001-405	1F-A-91-21-00-00A-052A-A	All
3002VB	91223002-401	1F-A-91-21-00-01A-052A-A	All
3003VB	91223003-421	1F-A-91-21-00-02A-052A-A	All

#### 2.3.2.2 Connection lists

A connection list data module can be produced for the Product, listing all used wires for one plug/receptacle in alphanumeric order and providing the following information:

- Plug and receptacle number
- Contact (used)
- Wire identification
- Harness identification
- Applicability of the Product

#### Business rule decision point BRDP-S1-00421 - Generation of connection list data modules:

- Decide whether and how to generate connection list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.

Table 12 Connection list - Example data module 1F-A-91-00-00-00A-057C-A

Connector (Mating connector)	Contact	Wire identification	Harness identification	Applicability
100VP (100VR)	A	AG0001FA	3001VB	All
100VP (100VR)	C	BD0001FA	3001VB	All
100VP (100VR)	D	BD0002FA	3001VB	0001 - 0012
100VR (100VP)	A	AG0001AA	1013VB	All
100VR (100VP)	C	BD0001AA	1013VB	All

### 2.3.2.3 Hook-up lists

The hook-up list data modules can comprise the following information:

- Plug and receptacle lists
- Terminal lists
- Splice lists
- Earth point lists

#### 2.3.2.3.1 Plug and receptacle lists

These lists can comprise the following information:

- Plug and receptacle numbers
- Contact (used and unused)
- Wire identification
- To/from routing
- Location
- Wiring diagram data modules on which the plugs and receptacles are shown
- Applicability of the Product

#### Business rule decision point BRDP-S1-00422 - Generation of plug and receptacle list data modules:

- Decide whether and how to generate harness plug and receptacle list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.

Table 13 Plug and receptacle list - Example data module 1F-A-91-00-00-00A-057D-A

Connector	Contact	Wire identification	to RFD	Contact	Location	Applicability
100VP	A	AG0001FA	1AGA	1	231	All
100VP	B				231	All
100VP	C	BD0001FA	1BDA	A	231	All
100VP	D	BD0002FA	1BDA	B	231	0001 - 0012
100VP	D				231	0013 - 9999
100VR	A	AG0001AA	2AGB	5	135	All
100VR	B				135	All

Applicable to: All

S1000D-A-05-02-0104-00A-040A-A

Chap 5.2.1.4

### 2.3.2.3.2 Terminal lists

These lists can comprise the following information:

- Terminal number
- Contact (used and unused)
- Wire identification
- Wiring diagram data modules on which the terminal is shown
- Specific location of the terminal
- Applicability of the Product

#### Business rule decision point BRDP-S1-00423 - Generation of terminal list data modules:

- Decide whether and how to generate terminal list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.

Table 14 Terminal list - Example data module 1F-A-91-00-00-00A-057E-A

Terminal number	Contact	Wire identification	Wiring diagram	Location	Applicability
1001VEA	1	AG0001FA	1F-A-91-94-00-00A-051A-A	231	All
1001VEA	2	AG0001FB	1F-A-91-94-00-00A-051A-A	231	All
1001VEA	3		1F-A-91-94-00-00A-051A-A	231	All
1001VEA	4		1F-A-91-94-00-00A-051A-A	231	All
1001VEB	1	BD0011FB	1F-A-91-93-00-00A-051A-A	212	0013 - 0022
1001VEB	2	BD0011FC	1F-A-91-93-00-00A-051A-A	212	0013 - 0022

### 2.3.2.3.3 Splice lists

These lists can comprise the following information:

- Splice number
- Contact (used and unused)
- Wire identification
- Wiring diagram data modules on which the splice is shown
- Specific location of the splice
- Applicability of the Product

#### Business rule decision point BRDP-S1-00424 - Generation of splice list data modules:

- Decide whether and how to generate splice list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.

Table 15 Splice list - Example data module 1F-A-91-00-00-00A-057F-A

Splice number	Contact	Wire identification	Wiring diagram	Location	Applicability
1001VS	1	AG0001FA	1F-A-91-94-00-00A-051A-A	231	0013 - 0022
1001VS	2	AG0001FB	1F-A-91-94-00-00A-051A-A	231	0013 - 0022
1002VS		BD0011FA	1F-A-91-93-00-00A-051A-A	212	All
1002VS		BD0011FB	1F-A-91-93-00-00A-051A-A	212	All
1002VS		BD0011FC	1F-A-91-93-00-00A-051A-A	212	All

#### 2.3.2.3.4 Earth point lists

These lists can comprise the following information:

- Earth point number
- Wire identification
- Wiring diagram data modules on which the earth point is shown
- Specific location of the earth point
- Applicability of the Product

#### Business rule decision point BRDP-S1-00425 - Generation of earth point list data modules:

- Decide whether and how to generate earth point list data modules for a page-oriented or an interactive wiring publication from the wiring data modules that are based on the wiring Schema.

Table 16 Earth point list - Example data module 1F-A-91-00-00-00A-057G-A

Earth point number	Wire identification	Wiring diagram	Location	Applicability
100VN	AG0001FA	1F-A-91-94-00-00A-051A-A	231	0013 - 0022
100VN	AG0001FB	1F-A-91-94-00-00A-051A-A	231	0013 - 0022
103VN	BD0011FA	1F-A-91-93-00-00A-051A-A	212	All
103VN	BD0011FB	1F-A-91-93-00-00A-051A-A	212	All
103VN	BD0011FC	1F-A-91-93-00-00A-051A-A	212	All

### 2.3.3 Interactive wiring publications

For interactive wiring publications, generated data presentation must be based on the wiring data data module instances as described in [Para 2.2.7](#) thru [Para 2.2.10](#). The information is generated by interactive wiring publication functionalities. It is therefore not part of the data exchange. No data module code is allocated. This generated information within an interactive wiring publication is described in [Para 2.4](#).

## 2.4 Interactive wiring publication functionalities

The following paragraphs describe functionalities for an interactive wiring publication.

## 2.4.1 Analysis of network

### 2.4.1.1 General

When starting from selected electrical/electronic equipment a network can be generated for each connected wire following the wire segment information up to the end of the signal. All affected junction boxes can be shown. Another network can be generated for all wires and connectors/terminals between two defined equipment.

### 2.4.1.2 Network information

The network gives information starting with the contacts of selected electrical/electronic equipment and the wires connected to them. In accordance with the wire end information the next electrical/electronic equipment can be shown fan-shaped with the identified contacts on, for example, a terminal bus. This procedure can be repeated until the end equipment is reached. Basic information is:

- Functional item references for all shown equipment. Functional items are also known as reference designators.
- Graphic of the shown electrical/electronic equipment with contact information, wire identification, harness information and change information

### 2.4.1.3 Switching across electrical components

If the end equipment is a relay, switch, etc, it is possible to select a contact. All related wires to the contact can be generated.

### 2.4.1.4 IETP specific elements for network analysis

To increase the performance of the network analysis, additional elements are introduced for IETP purposes only. The element [wireConnectionCode](#) and the element [networkAnalysisCode](#) are part of the wiring data Schema.

The element [wireConnectionCode](#) contains in child elements coded information about the individual connection of a wire end, contact structure, multiple contact connections, shield information, sort information and/or layout information. For detailed information on coding refer to [Chap 3.9.5.2.9.2](#).

The element [networkAnalysisCode](#) contains information about the connection parts behavior (element [connectionListClass](#)) taking into account the specific connection situation. Thus, the [networkAnalysisCode](#) information states if a desired network analysis can be achieved automatically, with manual interaction, or not at all across the respective connection part.

To provide detailed information about the equipment in an auto-generated plan of a network analysis, the element [electricalLogic](#) with the child elements [electricalEquipState](#), [electricalEquipConnection](#) and [electricalStateDescr](#) is available.

The element [electricalEquipConnection](#), a child element of the element [electricalEquipState](#), describes the electrical connections of the states of equipment (eg, a relay or a switch). The attribute `connectionType` of the element [electricalEquipConnection](#) describes the type of the connection. The element [electricalStateDescr](#) represents, if applicable, the switch or relay position.

If applicable, the additional information can be used to show more detailed equipment symbols and to support more interactive analysis thru switches and relays.

---

**2.4.2 Views and filters****2.4.2.1 Views**

Views allow to change the data presentation (eg, wire data in order of harness number, view of twisted wires, view of screened wires). It is recommended to implement all views context sensitive.

**2.4.2.2 Filters**

Filters reduce the presented data dependent on data fields. For example, only wires of one harness connected to an electrical equipment of a zone. This data reduction applies to all further functionalities until the filter changes.

**2.4.3 Context sensitive data presentation**

Context sensitive extract of basic electrical data can be displayed for all generated information and other interactive wiring publication functionalities.

Context sensitive data presentation in interactive wiring publications means that additional information is provided to the user by the wiring publication, depending on the item of the wiring that is in focus of the user.

For example, in a generated network all wires are shown with their wire identification only, equipment with the functional item (also known as the reference designator). If the user needs additional information (eg, for a specific wire) the wiring publication application provides additional information such as wire type, gauge, color, for this specific wire. The additional information can be shown when the user moves the mouse over the wire or clicks on the wire.

In generated lists it can be favorable to provide the references to data modules containing harness installation or routing drawings, wiring diagrams or preparation and finishing information, etc, as a hidden link on a pre-defined list element. For example, by clicking on the harness identification to which a wire belongs, the references to harness installation or routing drawings for this harness are shown by the wiring publication application.

#### **1      General**

This chapter contains a reference to the rules for the preparation and coding of data modules for IPD.

#### **2      IPD**

It covers the rules for the publication of spare parts information. By project decision, the IPD can be provided as part of another publication (eg, as part of an equipment maintenance publication) instead of the provision as a stand alone publication. In this case, an information set must be produced and integrated in the publication process. The rules for the preparation of the information set are the same as for the preparation of the IPD publication. Refer to [Chap 5.3.1.3](#).

## 1 General

### 1.1 Purpose

The rules for the preparation and coding, where appropriate, of data modules for Maintenance Planning (MP) information are given below.

### 1.2 Scope

The rules for the preparation of information applicable to product maintenance planning which will enable skilled personnel to manage the maintenance of the Product are covered.

Information about the necessary rules for preventive checks and maintenance (scheduled and unscheduled) are given. The MP information contains the following topics:

- time limits
- maintenance/inspection task lists
- scheduled and unscheduled checks
- acceptance and functional check flight
- maintenance allocation

The data and information are based on technical analyses using the objectives of an efficient maintenance program.

#### Note

The individual requirements and the frequency of applying the rules are normally derived from analyses using standard methods such as Operator/Manufacturer Scheduled Maintenance Development (MSG-3), Reliability Centered Maintenance (RCM) or those

given in the international specification for developing and continuously improving preventive maintenance ([S4000P](#)).

### 1.3 Standards

The standards given here are applicable with no exceptions.

### 1.4 Terms

The following terms and those stated in [Chap 9.2](#) must be used as appropriate:

- Check Maintenance (CM): Manufacturers' recommended thresholds (such as periodicity or rounds fired) for inspections and maintenance checks
- Scheduled maintenance check: A maintenance check or inspection of the Product, its systems and units/assemblies dictated by a threshold or interval
- Unscheduled maintenance check: A maintenance check or inspection of the Product, its systems and units/assemblies that is dictated by special or unusual conditions not related to a threshold or interval

## 2 Maintenance planning information

### 2.1 Introduction

The introduction data modules must contain explanations of the purpose, scope, structure, special format and use of the technical content of this information set. The introduction data modules must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

The zoning arrangement of the Product is covered by reference to the relevant data module (for air vehicles: SNS 06-30-YY).

A list of terms must be included which defines conditions (eg, "excessive"), damage (eg, "crack") and other relevant terms (eg, inspection types).

Data modules must be coded:

YY-Y-05-00-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-00-0000-**NNAAA**-018A-A (37 characters)

Where "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

### 2.2 Data module coding

To assist in the coding of data modules, the following rules must be used in addition to those given in [Chap 4.3](#).

#### 2.2.1 Time limits

Data modules must be coded:

YY-Y-05-10-**SS-NNA**-000Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-10-**SS00-NNA**AA-000Y-A (37 characters)

Where:

- "SS", the system to which data and information are applicable. Refer to [Chap 8.2](#). "00" is used if data and information are applicable to the Product as a whole.
- "NN", in the disassembly code, the subsystem (refer to [Chap 8.2](#)) if it is necessary to split the system into several subsystems (if not, use "00")

Example:

- Data and information about time limits for parts of the landing gear system (32) are coded: 1Y-A-05-10-32-00A-000A-A

## 2.2.2 Maintenance/inspection task lists

Data modules must be coded:

YY-Y-05-20-SS-NNA-000Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-20-SS00-NNAAA-000Y-A (37 characters)

Where:

- "SS", the system to which data and information are applicable. Refer to [Chap 8.2](#). "00" is used if data and information are applicable to the Product as a whole.
- "NN", in the disassembly code, the subsystem (refer to [Chap 8.2](#)) if it is necessary to split the system into several subsystems (if not, use "00")

Example:

- Data and information about maintenance/inspection tasks of the landing gear system (32) are coded: 1Y-A-05-20-32-00A-000A-A

## 2.2.3 Check definitions

Data modules must be coded:

YY-Y-05-SS-00-NNA-000Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-SS-0000-NNAAA-000Y-A (37 characters)

Where:

- "SS", the inspection type:
  - "40": Scheduled check (eg, Preflight inspection). For an example, refer to Fig 1.
  - "50": Unscheduled check (eg, Inspection after hard landing)
  - "60": Acceptance and functional check flight
- "NN", in the disassembly code, a sequential number to identify a specific check

Example:

- The definition of a check after hard landing is coded: 1F-A-05-50-00-18A-000A-A

## 2.2.4 Maintenance allocation

Data modules must be coded:

YY-Y-05-80-00-NNA-916Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y05-80-0000-NNAAA-916A-A (37 characters)

Where:

"NN", in the disassembly code, is a sequential number to provide further breakdown, if needed

## 2.3 Time limits

Each data module must contain a list of equipment which is built in the specified system, and which must be replaced with serviceable equipment at the end of a number of cycles or at given time intervals, where:

- each line entry is built up from the items defined in [Para 2.3.1](#) thru [Para 2.3.5](#)
- each item is filled up as necessary in accordance with the description given
- only one value is given for each item. If items are subject to various values, as many line entries as values are provided.

### 2.3.1 Equipment

The following information identifies the equipment that must be replaced:

- Name, the name of the system
- Identification number, the identification of a specific part or component (eg, the part number)
- Catalog sequence number (CSN), additional IPD that will help to identify the specific equipment
- Item sequence number (ISN), additional IPD that will help to identify the specific equipment

### 2.3.2 Quantity

The quantity is the total number of specific hardware installed on the next higher assembly.

### 2.3.3 Category

This must be defined by the project or the organization (eg, equipment replaced for safety reasons).

### 2.3.4 Time limit

The time limit is the elapsed time or cycle after which the equipment must be replaced. Permitted units of measure for the threshold interval are given in [Chap 3.9.6.1](#).

### 2.3.5 Applicability

For applicability attributes, refer to [Chap 3.9.5.3](#). The applicability annotation is given to each line entry in [Table 2](#).

Table 2 Time limits - Examples

Name	Part number	CSN	Time limit	Qty	Cat	Applicability
Shock strut, LH MLG	564-POL-801		1600 FH (-50 FH + 0 FH)	1	1	Serial No. = 1
Shock strut, LH MLG	564-POL-805		2000 FH (-50 FH + 0 FH)	1	1	Serial No. = [2-5]
Mounting assy		43-22-09-000B-10C	10 FH after LDG CNG	16	2	All

## 2.4 Maintenance/inspection task lists

Each data module must contain a list of maintenance/inspection tasks for the specified system, which must be carried out during one or more different checks (eg, for air vehicles: Postflight inspection), where:

- each line entry is built up from the items defined in [Para 2.4.1](#) thru [Para 2.4.9](#)
- each item is filled up as necessary in accordance with the description given
- only one value is given for each item. If items are subject to various values, as many line entries as values are provided (except items where several values are allowed)

### 2.4.1 Task

This provides a short description of the actions to be carried out for this task. Refer to [Chap 3.9.5.2.5](#).

### 2.4.2 Preliminary requirements

This gives the preliminary requirements for this task. Refer to [Chap 3.9.5.2.1.9](#).

### 2.4.3 Reference

This gives any references to a data module or publication that describes the maintenance/inspection task.

### 2.4.4 Name

This is the name of the system.

### 2.4.5 Equipment

This is information identifying the item or system.

### 2.4.6 Supervise

This is information about the required supervisor level.

### 2.4.7 Check interval/limit

This gives the time or cycles after which the task has to be performed. This item must only be used if no check interval or limit data for the check definitions are available.

### 2.4.8 Applicability

For applicability attributes refer to [Chap 3.9.5.3](#). The applicability annotation is given to the whole line entry. Refer to [Table 3](#).

Table 3 Maintenance/inspection tasks - Examples

Reference data module code	Name	Task	Check interval/Limit	Applicability
1Y-A-32-00-00-00A-240A-A	Landing gear system	Check visually		Serial No. = [GS004-GS158]
1Y-A-32-00-00-00B-240A-A	Landing gear system	Check visually		Serial No. = [GS159-GS255]
1Y-A-32-20-00-00A-240A-A	Nose landing gear	Visual examination and lubrication of contacting surface	Every 15 FH	All
1Y-A-32-43-10-00A-240A-A	Wheel brake units (LH and RH)	Ensure heat pack rotors are free to rotate		All

Reference data module code	Name	Task	Check interval/Limit	Applicability
1Y-A-32-60-10-00A-271A-A	Position and warning	Position and warning Examinations, tests and checks		Serial No. = [GS004-GS158]
1Y-A-32-60-10-00B-271A-A	Position and warning	Position and warning Examinations, tests and checks		Serial No. = [GS159-GS255]

#### 2.4.9 Related task

This identifies a related scheduled maintenance task. Such relationships are not mandatory but provide an opportunity to gain economic advantage. The attribute `relatedTaskDescr` indicates these relationships. Refer to [Table 4](#) for the task relationship definitions, and refer to [Chap 3.9.5.2.5](#) for the allowed values of attribute `relatedTaskDescr`.

Table 4 Task relationship codes

Code	Description	Definition
A	After	Perform maintenance requirement AFTER related requirement is started.
B	Before	Perform maintenance requirement BEFORE related requirement.
C	Complied	Maintenance requirement is COMPLIED with related requirement.
F	Finished	Cannot finish maintenance requirement until related requirement is FINISHED.
P	Precludes	Maintenance requirement PRECLUDES related requirement.
S	Started	Cannot finish maintenance requirement until related requirement is STARTED.
W	With	Perform maintenance requirement WITH related requirement.

## 2.5 Scheduled and unscheduled checks

There must be one data module for each check. Each data module must consist of two parts, one part containing information about the specific check, and another part containing a list of maintenance/inspection tasks that are carried out during this check. Refer to [Para 2.4](#).

Each data module contains the following information:

### 2.5.1 Limit

This gives the time, cycles or event after which the check has to be performed. Refer to [Chap 3.9.5.2.5](#).

### 2.5.2 Remarks

Remarks about the check described.

### 2.5.3 Requirement source

Requirement source gives the source from which the requirement is derived. Refer to [Chap 3.9.5.2.5](#).

### 2.5.4 Remarks

Remarks give notes and descriptions that apply to the task. Refer to [Chap 3.9.5.2.5](#).

Applicable to: All

S1000D-A-05-02-0106-00A-040A-A

Chap 5.2.1.6

**2.5.5 Equipment information**

Gives a statement of the equipment associated with the task. For structural items that do not have an equipment number, the equipment name is used. Refer to [Chap 3.9.5.2.5](#).

**2.5.6 List of maintenance/inspection tasks**

Each data module contains a list of tasks that are necessary for this check, where:

- each line entry is built up from the items defined in [Para 2.5.6.1](#) thru [Para 2.5.6.3](#)
- each item is filled up as necessary in accordance with the description given
- only one value is given for each item. If items are subject to various values, as many line entries as values are provided

**2.5.6.1 Reference**

This gives any references to the data module or the publication that describes the maintenance/inspection task.

**2.5.6.2 Task**

This provides a short description of the actions to be carried out for this task. This item is only used if no limit data from task definitions are available.

**2.5.6.3 Applicability**

For applicability attributes, refer to [Chap 3.9.5.3](#). The applicability annotation is given to the whole line entry. Applicability in check definitions need not to be the same as those in maintenance/inspection tasks.

**2.6 Acceptance and pre-operational checks/acceptance and functional checks flight for air vehicles**

This section consists of data modules that contain information on conditions and criteria for pre-operational checks/acceptance and functional checks flight. The data modules contain only references to the description of the specific pre-operational check/acceptance and functional check flight. The description of the check itself is not contained in these data modules.

Data concerning pre-operational checks/acceptance and functional checks flight are treated in the same way as those of other maintenance actions as described in [Para 2.4](#) and [Para 2.5](#) (eg, a pre-operational check/acceptance and functional check flight can be a complete check or one task of a check).

**2.7 Maintenance allocation**

This section consists of data modules that contain information on maintenance functions along with maintenance levels and time associated for each task.

The maintenance allocation gives the overall maintenance authority and the responsibility of the performance of maintenance functions on the identified end item or component. The maintenance functions can be grouped together. All the information necessary to build the maintenance allocation is included in the Logistics Support Analysis Record (LSAR).

The maintenance allocation also contains a list of tools and remarks.

### 3 Example

Table 1 References

Chap No./Document No.	Title
None	

#### 1 General

##### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for the Product Mass and Balance (MB) information.

##### 1.2 Scope

It covers the rules for the preparation of information applicable to the Product MB which will enable skilled maintenance personnel to control the mass and balance of the Product. The MB information must contain the following topics:

Applicable to: All

S1000D-A-05-02-0107-00A-040A-A

Chap 5.2.1.7

- leveling and weighing - General
- mass and balance
- leveling/trimming
- weighing
- mass and center of gravity data
- standards and definitions

### 1.3 Standards and definitions

The standards and definitions given in this specification are applicable with no exceptions.

## 2 Mass and balance information

### 2.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-08-00-00-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y08-00-0000-NNA-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

### 2.2 Leveling and weighing - General

#### 2.2.1 Charts, forms and records

These data modules must provide examples of charts, forms and records used for mass and balance. The following list gives a number of data modules which can be developed to record mass and balance data:

- record of mass and balance personnel
- basic mass checklist record
- weighing record
- basic mass and balance record
- loading data
- mass and balance clearance form/mass and balance manifest

Data modules must be coded:

YY-Y-08-00-1Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y08-00-1Y00-00AAA-000A-A (37 characters)

#### 2.2.2 Mass and balance computers/Automated systems

These data modules must provide information about computer programs used for the generation of mass and balance data, in lieu of the traditional mass and balance load adjusting and forms used to record the actual mass and balance status of a Product. This ensures that mass and center of gravity are within limits during all stages of operation.

These data modules must include, but are not limited to, the following information:

- objective
- calculations
- software
- program changes
- ease of operation
- computational requirements
- accuracy
- authority for use
- instruction book
- computer use restrictions
- hardware requirements

Data modules must be coded:

YY-Y-08-00-2Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y08-00-2Y00-00AAA-000A-A (37 characters)

## 2.3 Mass and balance

### 2.3.1 Principles

These data modules must discuss the principal elements which are important in controlling the platform during several stages of handling (eg, maintenance, loading, taxiing, flying).

The principal elements are:

- mass
- balance
- mass and balance effects
- mass and balance control
- performance effects

Data modules must be coded:

YY-Y-08-10-1Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y08-10-1Y00-00AAA-000A-A (37 characters)

### 2.3.2 Control (management)

These data modules must discuss all elements which are required in the mass and balance management of a Product. The requirements, procedures (and responsibilities) relative to the Product's mass and balance control system must be defined. The overall objectives of such a mass and balance control system is to provide current and correct information regarding the Product basic mass and moment, and to maintain the Product mass and center of gravity within permissible limits during all stages of handling (eg, maintenance, loading, taxiing/flying/sailing).

Such a control system must include, but is not limited to, the following elements:

- mass and balance classes
- mass and balance publications
- mass and balance flight clearance
- weighing requirements (not the weighing itself)
- mass and balance charts and forms
- ballast statements

Data modules must be coded:

YY-Y-08-10-2Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-10-2Y00-00AAA-000A-A (37 characters)

## 2.4 Leveling the Product

These data modules must give all information required for the leveling/trimming of the Product.

Data modules must be coded:

YY-Y-08-20-0Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-20-0Y00-00AAA-000A-A (37 characters)

## 2.5 Weighing the Product

### 2.5.1 Weighing

These data modules must give all information required for the weighing of the Product and must include, but are not limited to, the following elements:

- weighing equipment
- weighing accessories
- weighing procedures
- dimensions required for the center of gravity location
- projection of points on the hangar floor (air vehicles)
- taking measurement
- recording mass and dimensions
- verifying of weighing results
- weighing checklist

Data modules must be coded:

YY-Y-08-30-1Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-30-1Y00-00AAA-000A-A (37 characters)

### 2.5.2 Product reports

These data modules deal with all MB data specific to a single Product. The form and style of the report can be free or specified by the project and will be made by the contractor as part of the Product delivery documents. The following data must be given:

- make, model, serial and registration identification
- actual date of weighing
- diagram identifying the Product divisions used in the breakdown of the equipment list
- record of certification weighing and all subsequent adjustments up to the time of delivery
- delivery departure mass and balance clearance form/manifest
- list of equipment and fluids to define the Product configuration, positive identification and cross-reference to the SNS, the mass and balance arm of each item
- the Product configuration clearly defined by using a check (X) for each listed item in the Product and a check (0) for each listed item not present in the Product

Data modules must be coded:

YY-Y-08-30-2Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-30-2Y00-00AAA-000A-A (37 characters)

## 2.6 Mass and center of gravity data

### 2.6.1 Center of gravity loading calculations

These data modules must describe the principles and calculations involved in:

- calculating the most forward and most aft center of gravity conditions for a particular Product mission (within permissible limits)
- determining appropriate methods of correction for a mission whose center of gravity is found to be outside of the allowable limits

These data modules must include, but are not limited to, the following information:

- lateral and vertical center of gravity
- loading principles
- loading data
- most forward and most aft center of gravity calculations

Data modules must be coded:

YY-Y-08-40-1Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-40-1Y00-00AAA-000A-A (37 characters)

### 2.6.2 Load adjuster

These data modules must provide information about the load adjuster which is used to enable the crew/operator, mechanic or loading personnel to direct load and to control the center of gravity location of the particular Product.

These data modules must include, but are not limited to, the following information:

- description of the several types of load adjusters
- loading range
- load adjuster index
- loading scales
- using the loading scales

These data modules must also include a fully worked out example of a loading problem using the load adjuster.

Data modules must be coded:

YY-Y-08-40-2Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-40-2Y00-00AAA-000A-A (37 characters)

### 2.6.3 Vector diagram

- determine if the mass and center of gravity are within the allowable limits
- record the mass and center of gravity changes which occur during mission (eg, flight/sail)
- provide center of gravity controls which produce a desired center of gravity
- provide the user with a better understanding of center of gravity changes

These data modules must include, but are not limited to, the following information:

- description
- diagram construction
- diagram use

These data modules must also include a fully worked out example of a vector diagram.

Data modules must be coded:

YY-Y-08-40-3Y-00A-000A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y08-40-3Y00-00AAA-000A-A (37 characters)

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Recovery (R) information.

#### Scope

This chapter covers the rules for the preparation of information applicable to recovery to enable skilled maintenance personnel to recover the Product. The R information must contain the following topics:

- introduction
- survey and preparation
- stabilizing/lifting the Product
- moving the Product
- support and recovery equipment

### 1.2 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Recovery information

### 2.1 Introduction

The introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

It must include references to general the Product data and characteristics, such as type of Product, mass and cover, but is not limited to, the following contents:

- dimensions
- ground clearances
- jacking/lifting points
- station diagrams
- servicing point locations
- fuel tanks positions
- arrangements of payload/weapons/external stores
- strong points locations
- landing gear footprint dimension

Data modules must be coded:

YY-Y-07-00-00-NNA-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-00-0000-NNAAA-018Y-A (37 characters)

"NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

## 2.2 Survey and preparation

### 2.2.1 General and quick reference checklist

These data modules must contain the necessary administrative activities, which must be done before, or in sequence, with the recovery operation.

Data modules must be coded:

YY-Y-07-4Y-YY-**NNA-XXXA-A** (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-4Y-YYYY-**NNAAA-XXXA-A** (37 characters)

Where:

"NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

"XXX", in the information code, is set to either IC 121 or IC 125 for before, or in sequence with the recovery operation.

### 2.2.2 Preliminary examination

These data modules must include information on how to do the initial survey of the Product damage. They must also include data on the Product structural condition, the ground condition of the crash site and their influence on the approach to the recovery problem.

Data modules must be coded:

YY-Y-07-4Y-YY-00A-311A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-4Y-YYYY-00AAA-311A-A (37 characters)

### 2.2.3 Damage control and safety procedures

These data modules must contain the necessary data to avoid injury to persons or additional Product damage while the recovery procedures are done. This data must cover, but is not limited to, the following actions:

- To drain all the hazardous fluids (for air vehicles, data modules must be coded YY-Y-12-10-YY-00A-220A-A)
- To de-arm canopies, ejection seats, miniature detonating cords, capsules, crash recorders, etc (for air vehicles, data modules must be coded YY-Y-95-YY-YY-00A-500A-A)
- To release all gas and hydraulic fluid pressures (for air vehicles, data modules must be coded YY-Y-12-10-YY-00A-220A-A)
- To disconnect and remove batteries (for air vehicles, data module must be coded YY-Y-24-YY-YY-00A-500A-A)

References to applicable data modules or data in the maintenance information set must be made wherever possible. Refer to [Chap 5.2.1.14](#).

### 2.2.4 Mass and center of gravity

These data modules must include charts giving the changes on the mass, the moment arm and the center of gravity of the Product, while payload (eg, cargo air vehicles), weapons/external stores (eg, military air vehicles) and/or fuel are removed. Lists with the mass of all the primary removable components must also be included. References to applicable data modules or data

in the maintenance or mass and balance information sets must be made wherever possible. Refer to [Chap 5.2.1.3](#) and [Chap 5.2.1.7](#).

Data module must be coded:

YY-Y-08-40-YY-00A-050A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y08-40-YYYY-00AAA-050A-A (37 characters)

## 2.2.5 Removal of payload, weapons and external stores

These data modules must contain data on the normal and manual opening of the cargo door, the removal of payload for different configurations and type of payload, etc. For military Products, warnings on the handling of weapons/external stores and procedures for removal must also be included. Wherever possible, references to the data modules of the weapon loading or cargo loading information set must be made. Refer to [Chap 5.2.1.10](#) or [Chap 5.2.1.11](#).

Data modules must be coded:

YY-Y-94-10-YY-00A-520A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y94-10-YYYY-00AAA-520A-A (37 characters)

## 2.2.6 De-fueling

These data modules must contain illustrated de-fueling procedures (under probable circumstances), including abnormal Product attitudes, with or without the Product electrical power and for air vehicles from over-wing. All special adapters required must be listed. Fuel which cannot be removed due to various Product recovery attitudes must be listed. Cross-references to data modules of the maintenance information set must be made wherever possible. Refer to [Chap 5.2.1.3.1](#).

Data modules must be coded:

YY-Y-12-10-YY-00A-221A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y12-10-YYYY-00AAA-221A-A (37 characters)

## 2.2.7 Removal of primary components

These data modules must contain the removal procedures for any primary components which are not covered by data modules of the maintenance information set. The removal of all other primary components must be cross-referred to the appropriate data modules in the maintenance, information set. Refer to [Chap 5.2.1.3.1](#).

Data modules must be coded:

YY-Y-YY-YY-YY-00A-520A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-520A-A (37 characters)

## 2.3 Stabilizing/lifting the Product

### 2.3.1 General

If necessary, all general data must be included in these data modules.

Data modules must be coded:

YY-Y-07-00-YY-00A-010A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-00-YYYY-00AAA-010A-A (37 characters)

### 2.3.2 Preparation

These data modules must contain lists of all the special equipment (eg, steel-plates, air bags) and data on such things as build-up between the air bags and the structure/surface.

Data modules must be coded:

YY-Y-07-00-YY-00A-070A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-00-YYYY-00AAA-070A-A (37 characters)

### 2.3.3 Stabilizing procedures

These data modules must contain data on the procedures which can be used to stabilize the Product to prevent unwanted movement during the recovery procedures.

Illustrations/tables showing the effects of the prevailing winds on the Product during the recovery must also be included.

If necessary, other data such as the tensile strength of the cables for adequate restraint must be included.

Data modules must be coded:

YY-Y-07-10-YY-00A-100A-A (17 characters)

and

YY-Y-07-20-YY-00A-100A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-10-YYYY-00AAA-100A-A (37 characters)

and

YYYYYYYYYYYYYY-YYYY-Y07-20-YYYY-00AAA-100A-A (37 characters)

### 2.3.4 Lifting the damaged Product

These data modules must include methods and procedures to:

- lift the Product
- position the vehicle on lifting jacks (for air vehicles, so that either the landing gear can be lowered or other means used to move the air vehicle)
- davit lifting
- vehicle slinging

For air vehicles the following damaged or collapsed landing gear cases must be considered:

- nose landing gear damaged or collapsed
- one main landing gear damaged or collapsed
- nose landing gear and one main landing gear damaged or collapsed
- all main landing gear damaged or collapsed
- nose and all main landing gear damaged or collapsed

- others (eg, air vehicle inverted)

Data modules must be coded:

YY-Y-07-30-YY-00A-100A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-30-YYYY-00AAA-100A-A (37 characters)

## 2.4 Moving the Product

### 2.4.1 General preparation

These data modules must list all special equipment or material required to move the Product.

Data modules must be coded:

YY-Y-07-40-YY-00A-061A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-40-YYYY-00AAA-061A-A (37 characters)

### 2.4.2 Towing, winching and dragging-off in abnormal conditions

These data modules must contain the procedures on how to attach cables and ropes.

Illustrations must be given of the maximum forces permitted to apply to a landing gear or other attaching points. Towing, winching and dragging-off procedures must also be given unless they can be cross-referred to data modules in the maintenance information set. Refer to [Chap 5.2.1.3.1](#).

Data modules must be coded:

YY-Y-07-40-YY-00A-100A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-40-YYYY-00AAA-100A-A (37 characters)

### 2.4.3 Transportation of the damaged Product

These data modules must include data on:

- preparing the Product for transportation
- transporting an air vehicle when landing gears are unserviceable (using flatbeds, transportation sledges, pallets, etc)
- preserving the systems/primary components for shipping
- packing of components into shipping containers
- how to make shipping containers including illustrations

Cross-references to data modules in the storage information set must be made wherever possible. Refer to [Chap 5.2.1.3.5](#).

Data modules must be coded:

YY-Y-07-50-YY-00A-100A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-50-YYYY-00AAA-100A-A (37 characters)

## 2.5 Support and general recovering equipment

### 2.5.1 General

These data modules must include data applicable to support and general recovering equipment.

Data modules must be coded:

YY-Y-07-00-YY-00A-060A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-00-YYYY-00AAA-060A-A (37 characters)

### 2.5.2 **Special-to-type support equipment**

These data modules must list all the special-to-type support equipment and recovering equipment for the particular Product.

Data modules must be coded:

YY-Y-07-00-YY-00A-061A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-00-YYYY-00AAA-061A-A (37 characters)

### 2.5.3 **General support and recovering equipment**

These data modules must list all the general support and recovering equipment normally required during the recovery operations.

Data modules must be coded:

YY-AY-07-00-YY-00A-062A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y07-00-YYYY-00AAA-062A-A (37 characters)

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for:

- Support Equipment (SE) Maintenance information
- Training Equipment (TE) Maintenance information
- Component Maintenance (CM) information

This chapter will use the term "equipment" to refer to all three types. Distinction between the types will only be made where necessary for understanding.

## 1.2 Scope

It covers the requirements for the preparation of information which will enable skilled personnel to prepare, operate and maintain SE and TE and components removed from the Product.

CM information can also be used for maintaining components removed from SE or TE when the maintenance instructions for such components are not within SE or TE data modules.

## 1.3 Standards

The standards given in this chapter are applicable with no exceptions.

## 1.4 Definitions

The following definitions and those stated in [Chap 9.2](#) are used as appropriate.

## 1.5 General requirements

### 1.5.1 Content

The complete sets of SE, TE and CM data modules are specified in [Para 2](#) and subsequent paragraphs. The following types of data modules and information can be included:

- Front matter and introduction. Refer to [Para 2.1](#).
  - Security and data restrictions including regulatory, export, IP and warranty
  - Quality assurance including validation, verification and methods
  - Lists of abbreviations, terms, symbols, specification and documentation
  - General warnings, cautions and notes
  - Recommended repair stations
- Functional and technical descriptions. Refer to [Para 2.1.2](#).
  - Description of function
  - Technical descriptions
  - Electrical and electronic data
  - Software data
  - Diagrams and schematics
- Operation
- Maintenance and servicing
- Parts information

### 1.5.2 Data module coding

To assist in the codification of data modules, information codes are given and supplemented by additional specific requirements and/or explanations in subsequent paragraphs in addition to the rules given in [Chap 4.3](#).

The preferred method of data identification is to use a component specific model identification code. The code is part of the data module code and identifies the equipment to which the data applies.

To implement this method the equipment manufacturer must apply for a model identification code to identify each component or family of similar components. Refer to [Chap 4.3.1](#).

In certain cases there can be a contractually imposed project or product specific model identification code. This is not the preferred method for CM data modules because it constrains potential multiple-use of the information.

The information codes provided are typical for equipment maintenance. Other codes can be used as necessary.

### 1.5.3 Basic authoring rules

- The information set can apply to variants of the basic component. Typically this is based on a single common primary part number. It is acceptable to include components with different root part numbers only when such components are very similar. Disassembly principles are discussed in [Chap 3.8](#).
- Parts or equipment addressed must be identified by the Catalogue Sequence Number (CSN) given in the IPD data module. Refer to [Chap 3.9.5.2.7](#).
- Standard practices must be written as data modules that can be referenced directly from the maintenance data modules
- If a record of accomplishment is required, include a sample of the required form (IC 023).
- Each list of tools, equipment, materials and consumables must include a note to allow the use of equivalent substitutes except for those materials and consumables that become a part of the equipment configuration

## 2 Equipment information

### 2.1 Front matter and introduction

#### 2.1.1 Front matter

Front matter is required for all equipment publications. Refer to [Chap 3.9.4](#) and [Chap 5.3.1.1](#).

Front matter data modules can be authored by using the Descriptive Schema (refer to [Chap 3.9.5.2.2](#)) or by using The Front matter Schema which minimize manual authoring and in most cases support auto-generation of the Front matter data modules. Refer to [Chap 3.9.5.2.16](#).

Security and data restrictions including regulatory, export, intellectual property and warranty information must be documented in accordance with [Chap 3.6](#).

Quality assurance information including verification method and status must be documented in accordance with [Chap 3.7](#).

Common information and data such as abbreviations, terms and definitions and symbols must be included. [Chap 5.2.1.18](#) covers the rules for the preparation of consolidated lists of common information and data including:

- List of abbreviations - LOA
- List of terms - LOT
- List of symbols - LOS
- List of applicable specifications and documentation - LOASD

General warnings, cautions and notes that apply to the equipment or part thereof must be provided in accordance with [Chap 3.9.3](#).

Information related to recommended repair stations or other maintenance facilities that apply to the equipment or part thereof can be provided in descriptive data modules using IC 915.

#### 2.1.2 Introduction

The introduction data modules are authored using the Descriptive Schema (refer to [Chap 3.9.5.2.2](#)). These data modules provide statements explaining the organization, content, method for using the publication. They can include information covering the purpose, scope and revision service for the publication. They also provide necessary information of a general nature which is not detailed in any of the specific data modules such as:

- Advisement on observing the publication instructions
- Explanation of the publication arrangement and format
- Documentation of the process verifications. Refer to [Chap 3.7](#).
- Explanation of data module code numbering
- Explanation of callouts and cross-references

## 2.2 Functional and technical descriptions

Functional and technical descriptions are required for all equipment.

### 2.2.1 General

These descriptive data modules contain a brief outline of the nature of the item. They also provide all special or important physical, electrical/electronic, mechanical and operational characteristics and parameters. Refer to [Chap 3.9.5.2.2](#).

Wherever possible include graphics to illustrate these characteristics and parameters. As a minimum, provide one or more outline drawings of the item showing control features and connections.

**Business rule decision point BRDP-S1-00427 - Level of detail to be provided in the technical descriptions in Equipment information sets:**

- Decide what level of detail to provide in the functional and technical descriptions.

### 2.2.2 Description of function

Basic functional description information must always be provided in sufficient detail to perform the maintenance instructions provided in this Information Set. This information is to be provided in descriptive data modules using IC 040, IC 042, and/or IC 044. Other information codes can be used if applicable.

The description of function is to provide a description of how the equipment operates, not to describe "how to operate an item". Information to describe how to operate SE or TE is described in [Para 2.3.3](#).

The function must be described accurately and, whenever possible, illustrated with applicable diagrams and/or lists enabling the user to understand and follow the procedures provided in the information set. This includes:

- A functional description of the unit and each major subassembly (modules/cards) and their physical and functional relationship to each other and the end item unit. Include block diagrams of interconnections between subassemblies where necessary.
- A description of any special operating conditions that are not normally encountered during operation of the component. Examples of special operating conditions can include extreme ice, heat and cold conditions and their effects on the operation of the component.
- Critical values and special precautions
- A general description of how the unit functions within a system can be provided. Explicit references to the unit's installation and interface within a specific system must be avoided especially where the component can be used for different applications.
- A description of any complex fluid flows, pressures, temperatures, speeds, etc, that can occur during the operation of the mechanical component
- Simplified or partial block, circuit, and logic schematics must be used liberally to support the text explanations. These diagrams are for explanatory purposes only, they do not replace the schematics and other diagrams required in [Para 2.2.3.3](#). Reference to the detailed schematics and diagrams of [Para 2.2.3.3](#) can also be used.
- Block diagrams used to simplify complex circuits to give an understanding of the function and operation of the system, subsystem, etc, and show the arrangement of the system components and current/signal flow through the system
- Schematic diagrams which can replace or complement a block diagram for simple items or complex items respectively. In the latter case, references must enable easy cross-reference from the block diagram to the schematic diagram and vice versa.
- When relevant, include information on material used for the construction of the unit, and warnings and cautions for the handling of dangerous materials. Include fabrication process descriptions when such descriptions are required to support maintenance of the unit.

### 2.2.3 Technical description

Basic technical description information must always be provided. Describe important parameters in sufficient detail to support the maintenance instructions provided in this information set. Include the following when applicable:

- Basic physical characteristics including dimensions, weight, etc
- Power requirements
- Input and output characteristics
- Contents such as lubricant or hydraulic fluid
- Description of the major subassemblies in the unit including their physical location
- Provide at least one overall, external illustration of the unit that shows and identifies major subassemblies, controls, indicators and external connection as applicable
- Provide additional cutaway, cross-sectional or plan view illustrations and diagrams as necessary for a technician to understand the basic physical arrangement of the unit in sufficient detail to perform the maintenance instructions provided in this information set
- A description of configuration differences when more than one part number is covered. Provide interchangeability and modification information if applicable.

#### **Business rule decision point BRDP-S1-00428 - Use of Wiring Schema in Equipment information sets:**

- Decide whether the Wiring data Schema and the Wiring data description Schema are to be used or not. Interactive wiring publication functionalities are only to be made available if the Wiring Schema is used. Refer to [Chap 3.9.5.2.9](#).

### 2.2.3.1 Electrical and electronic data

For units that include electrical/electronic/photo electronic components include:

- A detailed explanation of the function and operation of the circuits
- A description of any complex or unusual circuits designed into the component
- Supporting diagrams of programmed devices can be included when necessary for the technician to perform the maintenance instructions
- Detailed descriptions of special or programmed integrated circuits for which manufacturer's literature would not include operational discussion for particular applications must be included
- Logic diagrams and information. Logic and timing information for industry standard or commercially available components can be provided by reference when such information is available in the public domain
- A description of any Non-Volatile Memory (NVM) in the equipment. Provide basic description of the NVM, its operation, and usage. Include the following information:
  - What information is recorded?
  - How, when and where information recorded and erased?
  - What format is used?
  - In-service functionality if applicable
  - Shop-only functionality if applicable
- A description of any self-test or condition-monitoring features built into the equipment and the capabilities of the features such as Built-In Test/Built-In Test Equipment (BIT/BITE) logic to enable the user to understand the function. Provide a basic description of the self-test, BIT/BITE function including its operation, and usage. Include the following information:
  - In-service functionality if applicable
  - Shop-only functionality if applicable
  - How, when, and where faults are reported and/or recorded and/or erased
  - What format is used to record faults

## 2.2.3.2

## Software data

When software contributes to the functionality of the equipment, include software description information sufficient to understand the functional behavior of the component for maintenance purposes. Include the following information:

- Description of normal operation (basic architecture and basic program functions) of the programmed device
- Functional description of software modules and their relationship to the unit including input and output data and logic flow information

## 2.2.3.3

## Diagrams and schematics

Include a complete set of circuit diagrams for the equipment or component. Where necessary, the procedures within other page blocks will refer to these diagrams.

Generally, the complexity of the component will determine what schematics and functional diagrams must be included. The method of presentation can be block diagram, simplified schematic, or complete schematic, depending upon complexity and requirements. Most CM wiring diagrams can be adequately documented using standard graphic elements. Complex equipment can require the use of the wiring data constructs and Schema. Refer to [Chap 3.9.5.2.9](#).

The diagrams can include:

- Wiring diagrams showing the physical arrangement of components, wiring harnesses, etc. Identify the connection points, interconnections and components (IC 051 and IC 053).
- Wiring list to include all wires shown on a wiring diagram for complex components. It must be arranged in termination order and give the following information: pin number (whether used or not), wire number, reference of the wiring diagram on which they appear and to-from routine. Include the system interface connector pins and associated signals to-from the equipment or component. Unused and spare wires must be identified. (IC 057 and IC 058).
- Schematic diagrams showing the electrical arrangement of circuits. If the schematic of a card or module does not contain a complete circuit, provide a separate diagram showing the complete signal flow. The diagram must show the inputs, outputs, connections between cards, and the main equipment connector. The ratings of individual parts must be shown adjacent to each part (IC 054).
- Functional items (also known as reference designators) as identified in the IPD data modules.

These diagrams must show the test and measurement points mentioned in the procedures where appropriate.

A revision reference sheet must be provided if equipment changes affect schematic and wiring diagrams. Significant configuration changes will normally require a new diagram, with identification such as serial numbers or part number to show the components affected. The purpose of the revision reference sheet is to provide a descriptive history of changes, each numbered the same as coded change arrows on the diagram. Error corrections can be listed on the reference sheet, but must not have change arrows on the diagram. Change arrows must not be removed at later revisions. Place the revision reference sheet immediately before the test point/parts location diagram. The reference sheet must:

- Explain the reason for the change and its effect on circuit operation, with details of the equipment function before and after the change
- Identify the components affected by the change with serial numbers, part numbers or other identification. Quote service bulletin numbers if applicable.

## 2.3

### Operation

Operation is only applicable to SE and TE.

**2.3.1 Controls and indicators**

These data modules describe the effect of operating SE or TE devices.

The information can be arranged by indicators of a same function or by sequential order when operating the item.

**2.3.2 Pre-operation procedures**

These data modules must provide information and instructions to prepare SE or TE for operation. They can include information to perform pre-operation procedures such as checks and serviceability tests and other pre-operations to ensure the equipment is ready for operation.

**2.3.3 Operation procedures**

These data modules must provide data and information to operate SE or TE.

If automatic and manual operations are applicable to items, both procedures must be given.

Instructions are only to deal with the devices (switches, pumps, etc) to be actuated during operation. The effect of the devices is described under "Controls and indicators". Refer to [Para 2.3.1](#).

Operation procedures must not include emergency procedures. They must be given in "Emergency procedures". Refer to [Para 2.3.4](#).

**2.3.4 Emergency procedures**

These data modules must provide information dealing with special controls and switches which must be operated when emergency actions are performed.

**2.3.5 Post-operation procedures**

These data modules provide information and instructions to post-operate the SE or TE. The workflow of the instructions to perform post-operation procedures such as tests, de-activation of systems (eg, pressure release), servicing, checks, post-operations themselves.

**2.4 Maintenance and servicing**

Maintenance data modules must use the Procedure Schema (refer to [Chap 3.9.5.2.3](#)), the Fault isolation Schema (refer to [Chap 3.9.5.2.4](#)) or the Process Schema (refer to [Chap 3.9.5.2.10](#)).

Supporting diagrams must be included when necessary for the technician to perform the maintenance instructions.

**Business rule decision point BRDP-S1-00429 - Level of detail to be provided in the maintenance and servicing data modules in Equipment information sets:**

- Decide what level of detail to provide in the maintenance and servicing data modules.

**2.4.1 Maintenance planning**

Refer to [Chap 5.2.1.6](#) for rules on preparation and coding of maintenance planning information.

**2.4.2 Maintenance environment**

Maintenance procedures must be specific for the maintenance environment in which they are to be performed.

- In-service maintenance covers information and procedures to perform maintenance on the equipment while in-service
- Shop or depot maintenance covers information and procedures to perform maintenance on the equipment or component in maintenance facility

### 2.4.3 Consolidated lists for consumables, materials, expendables, support equipment, etc

Each procedure provides a table of Support equipment, table of Consumables, materials and expendables and table of Spares for the particular work described in the procedure. When, for example, a service task or repair has to be done, it can be more convenient to have a consolidated lists for the Consumables, materials, expendables, Support equipment, etc, for the complete task. In general, if only one data module is affected the lists are included in data module content (table of Support equipment, table of Consumables, materials and expendables, etc).

Information codes for lists of consumables (IC Y01), materials (IC Y02), expendables (IC Y03), special support equipment (IC Y04), standard support equipment and tools (IC Y05) and parts (IC Y07) are given in [Chap 8.4](#) for each of the maintenance primary codes:

- Operation
- Servicing
- Examinations, tests and checks
- Fault reports and Isolation procedures
- Disconnect, remove and disassemble procedures
- Repairs and locally make procedures and data
- Assemble, install and connect procedures
- Package, handling, storage, and transportation
- Miscellaneous

#### **Business rule decision point BRDP-S1-00430 - Use of consolidated lists for Support equipment, Consumables, materials, expendables, etc, in Equipment information sets:**

- Decide whether to use consolidated lists for Support equipment, Consumables, materials, expendables, etc.

#### **Business rule decision point BRDP-S1-00431 - Use of equivalent substitutes in Equipment information sets:**

- Decide whether to allow the use equivalent substitutes for support equipment, consumables, materials and expendables.

The following lists can be included:

**List of consumables (IC Y01).** This is a list of general purpose items required to maintain the equipment (eg, oils, greases, paints, varnishes, cleaning agents).

**List of materials (IC Y02).** This is a list of bulk materials required to maintain the Product (eg, gasket sheet, sheet metal, plastic, copper).

Lists of consumables and materials must contain the following information for each item:

- the name
- an identification
  - CSN
  - NATO stock number
  - the identification number (manufacturer code and part number)
- nominal size or amount required

Identify consumables and materials by generic names, industry standard name or by the specification number where known.

For those consumable and material items that are used as part of the maintenance procedure only and do not become part of the correctly configured unit, include a note stating that equivalent substitutes can be used.

In those instances where consumable and material items do become part of the correctly configured unit, equivalent substitute items should not normally be allowed.

Reference to the consumable material data information (refer to [Chap 5.2.1.17](#)) for dangerous items must be given under the heading "Remarks".

**List of expendables (IC Y03).** This is a list of parts required to be replaced during the maintenance procedure, for example, O-rings, gaskets, tab washers.

In most cases these are specific replacement parts defined by the configuration of the unit. Equivalent substitute items should not normally be allowed.

**List of special support equipment and tools (IC Y04).** This is a list of special equipment including special tools used during maintenance. Refer to definitions in [Chap 9.2](#).

Lists of special equipment and tools must contain the following information for each item:

- the name
- an identification
  - CSN
  - NATO stock number
  - the identification number (manufacturer code and part number)
- its characteristics

List special equipment and tools that are suitable for performing the procedures specified in the maintenance environment specified.

If substitute equipment and tools can be used, include a note stating that equivalent substitutes can be used.

Special tools and equipment used for measuring or performing evaluations or that require calibration or adjustment to perform their function correctly must be listed. For these items also specify all appropriate physical, mechanical, electrical, and functional characteristics of the equipment, with allowable tolerances and accuracies, so the technician can select suitable equivalent equipment.

For special items that are to be made locally, include a notation "locally made" in the description or characteristics information.

The items listed can be divided into groups of items, such as:

- tools
- test and calibration equipment

**List of support equipment and tools (IC Y05).** This is a list of standard equipment including standard tools used during maintenance. Refer to definitions in [Chap 9.2](#).

Lists of standard support equipment and tools must contain the following information for each item:

- the name
- an identification
  - CSN
  - NATO stock number
  - the identification number (manufacturer code and part number)
- its characteristics

Specify equipment normally considered "standard" in the maintenance environment where the procedure is to be performed. Include a Note stating that equivalent substitute equipment and tools can be used.

Tools and equipment used for measuring or performing evaluations or that require calibration or adjustment to perform their function correctly must be listed. For these items also specify all appropriate physical, mechanical, electrical, and functional characteristics of the equipment, with allowable tolerances and accuracies, so the technician can select suitable equivalent equipment.

**List of software (IC Y06).** This is a list of the software required.

Lists of the software must contain the following information for each item:

- the name
- an identification
  - CSN
  - NATO stock number
  - the identification number (manufacturer code and part number)
- its revision level or revision date

For test software (IC 306) include the source test specification identification and revision information.

The project or the organization must decide the use of equivalent substitutes for consumables, materials, expendables equipment and tools.

#### 2.4.4 Servicing (IC 2YY)

For details on servicing refer to the information code definitions in [Chap 8.4](#).

These data modules provide the procedures and data necessary to do servicing on the equipment, or component. They include procedures to fill and drain containers, procedures to bleed, prime, lubricate, clean, adjust, align, calibrate, inspect, apply surface protection and markings, etc.

The servicing can be scheduled or not scheduled.

Procedures to do servicing must provide complete instructions and methods specific to the unit or refer to industry or manufacturer standard practices when available.

For each procedure list all consumables, materials, equipment and tools required. Identify consumables materials by generic names, industry standard name or by the specification number where known. Refer to [Para 2.4.3](#).

##### 2.4.4.1 Cleaning (IC 25Y)

Provide specific methods and processes for cleaning the equipment or references to applicable standard practices when appropriate. Provide step-by-step procedures that follow a logical workflow sequence. Cleaning procedures must take the repairs previously applied to the item into account such as bonded, filled or brazed parts.

Cleaning procedures include procedures for surface finish removal and repair or replacement including markings.

##### 2.4.4.2 Inspection (IC 28Y)

For each item requiring inspection including the SE, TE or component, their components, assemblies, etc, the following information must be tabled:

- description of the item
- part number

- CSN if applicable
- limit
- data module code of the procedure to be performed when the limit is reached

Limits must provide:

- the nature of the limit such as life limit, inspection intervals, time limit, shelf life
- the value and the unit (eg, 1000 starts, 2 years, 500 running hours, 15000 cycles)
- the tolerance applicable to the limit, as required

## 2.4.5 Examinations, tests and checks (IC 3YY)

### 2.4.5.1 General

For details on examinations, tests and checks (IC 3YY), refer to the information code definitions in [Chap 8.4](#).

Tests will vary in complexity and stringency according to the conditions under which a unit functions or was replaced. The information must clearly define those examinations, test, and checks required to determine the serviceability of the equipment. Procedures must be directed toward restoring the unit to service by replacement of parts, servicing, or repairing. The minimum set of examinations, tests and checks required to determine the serviceable condition of the unit must be clearly defined.

These procedures include but are not limited to:

- Visual examinations (IC 31Y)
- Operations tests (IC 32Y)
- Test preparation (IC 33Y)
- Function tests (IC 34Y)
- Structure tests (IC 35Y)
- Checks (IC 36Y)

Refer to industry standard practices for examination, test or check procedures whenever possible.

Based on the possible results of each examination/test/check, the procedure must give the conditions for one of the following determinations:

- Acceptable for continued operation within the defined serviceable limits
- Requires additional examination/test/checks to be performed in accordance with other referenced data modules in the procedure
- Restorable by replacement of parts or servicing procedures referenced in the procedure
- Repairable in accordance with specific repair procedures referenced in the procedure
- No longer serviceable, restorable or repairable

### 2.4.5.2 Visual examination (IC 31Y)

These data modules provide the visual inspection methods specific for examining the items. Otherwise, referencing to standard practices is the preferred method.

Procedures must provide instructions for the examination itself and the workflow of related instructions necessary to perform examinations such as removal of harnesses or pipes for access, equipment calibration, and close-up actions

Procedures must describe the nature and maximum allowable extent of the faults to be detected and provide references to appropriate procedures for corrective action. Refer to [Para 2.4.5.1](#).

### 2.4.5.3 Operation test (IC 320)

Operation tests are normally only applicable to SE and TE but can apply to certain components. They do not require test equipment other than those installed on the equipment.

These data modules include information such as:

- procedures and data to check the capability of the equipment to operate correctly before its use or its delivery
- check for freedom of movement of mechanical actions
- general operations such as actuator stroke length, voltage, current, continuity

Procedures must describe the nature and maximum allowable extent of the faults to be detected and provide references for corrective action. Refer to [Para 2.4.5.1](#).

#### 2.4.5.4 Test preparation (IC 33Y)

These data modules contain the procedures and data to:

- prepare the equipment and the test equipment for test
- to install/connect the item and the test equipment
- to disconnect/remove the item and the test equipment

The procedures must provide information necessary to perform all test preparation including but not limited to:

- removal of blanking
- checks of connectors
- safe to test checks to avoid damage to the item to be tested and the test equipment
- checks of connections (pneumatic, hydraulic, etc)

Test set-up diagrams must be provided or referenced for each different test set-up. Show all equipment needed (oscilloscope, flow meter, power supply, etc) to perform the supported tests and their name and part number or other identification as given in the tool and equipment lists for the procedure.

#### 2.4.5.5 Function tests (IC 34Y)

These data modules contain tests to evaluate the equipment's condition before and after maintenance actions to determine required maintenance activities and to define the functional requirements to verify that equipment can be returned to service.

Functional test procedures must as a minimum:

- Specify special conditions applicable to the test such as climatic conditions, room temperature, relative humidity, or dust protection
- Identify the test points
- Specify locations and desired measurement range for ratings, voltages, pressures, wave shapes, etc, needed to ensure proper operating and integrity of the component
- Provide detailed timing diagrams and/or precise test sequence data for any time critical measurements. Use line drawings for wave shapes in preference to photographs, where practical.
- Include temperature-rate-rise limits or leakage limits when applicable
- Specify acceptance limits for each value/measurement

Test parameters must be directed toward determining the serviceability of the unit and determining corrective action rather than manufacturer testing for final component approval for delivery.

Complex tests must be unitized as much as possible with re-entry points and specific start and stop instructions to permit retesting certain features without having to run the complete test every time.

#### 2.4.5.6 Automatic test (IC 342)

These data modules provide the methods and equipment specific to implementing testing on Automated Test Equipment (ATE). This type of test relies on computer based test equipment with software driven/defined test steps.

Test software must be included in the required lists for each data module. Refer to [Para 2.4.3](#).

Related test support data for the return to service test software such as a test specification, or source code can be included or referenced as a separate document or other media.

##### 2.4.5.6.1 *Built-in test or built-in test equipment, (IC 341 or IC 342)*

When the equipment design includes a BIT or BITE a procedure to run the BIT/BITE and interpret the results must be provided.

If the ATE procedures in [Para 2.4.5.6](#) do not include the required BIT/BITE information, provide them in a separate data module. Choose IC 341 or IC 342 based on whether the required read/decode/erase procedures are manual or automatic.

The procedures must include:

- Specific instructions and equipment to read and erase/rest the BIT/BITE memory
- A translation table or listing to provide simplified English translations and interpretations of the BIT/BITE codes
- References to specific procedures to correct a fault detected by the BIT/BITE
- Information and references to guide the user to the place in the functional test or fault isolation procedures where additional examinations, tests or checks can be performed to isolate a malfunction detected by the BIT/BITE

#### **Note**

BIT/BITE function and logic must be described in the technical data and descriptions section. Refer to [Para 2.2.3.1](#)

##### 2.4.5.6.2 *Non-volatile memory, (IC 341 or IC 342)*

When the equipment design includes Non-Volatile Memory (NVM) a procedure to read, interpret, and reset the NVM must be provided.

If the ATE procedures in [Para 2.4.5.6](#) do not include the required NVM information provide them in a separate data module. Choose IC 341 or IC 342 based on whether the required read/decode/erase procedures are manual or automatic.

The procedures must include:

- Specific instructions and equipment to read and erase/rest the NVM memory
- A translation table or listing to provide simplified English translations and interpretations of the NVM codes
- References to specific procedures to correct a fault recorded in NVM
- Information and references to guide the user to the place in the functional test or fault isolation procedures where additional examinations, tests or checks can be performed to isolate a malfunction recorded in NVM

#### **Note**

NVM logic and function must be described in the technical data and descriptions section. Refer to [Para 2.2.3.1](#)

#### 2.4.5.7 Structure tests (IC 35Y)

These data modules contain the detailed procedures needed to perform structural tests to determine the status of the parts (ie, serviceable, restorable, repairable or to be scrapped).

Specify tests required to determine the condition of the component. Describe the methods, techniques, and equipment required (eg, tests with dye penetrate (IC 351), magnetic particles (IC 352), eddy current (IC 353)).

Only procedures specific to the item must be described. Refer to industry standard practices for the test procedures whenever possible. Illustrations must be provided to indicate the critical areas to be tested and to locate and to identify defects. Defects can be coded and the procedure must refer to these codes whenever those defects are mentioned.

Procedures must describe the nature and maximum allowable extent of the faults to be detected and provide references to appropriate procedures for corrective action. Refer to [Para 2.4.5.1](#) and [Para 2.4.5.2](#).

If different levels of acceptable serviceability exist they must be covered.

#### 2.4.5.8 Checks (IC 36Y)

These data modules contain the detailed procedures needed to perform those checks necessary to determine the status of the parts with regard to their design data and tolerances including any in-service allowances (ie, serviceable, restorable, repairable or to be scrapped).

Specify those and checks required to determine the condition of the component. Describe the methods, techniques, and equipment required (eg, visual check, under magnifying glass, measure with a micrometer). Refer to industry standard practices for examination, test or check procedures whenever possible. Refer also to visual examination in [Para 2.4.5.1](#).

Only procedures specific to the item must be described. Refer to industry standard practices for the measurement or other procedures whenever possible. Illustrations must be provided to indicate the areas to be measured or where the check is made.

When measurement devices must be attached or installed to perform the check (eg, pressure, voltage, flow, leakage or other checks) include a set-up diagram showing where the measurement is made and how the measuring equipment is installed.

Any systematic or as-required measurements must be located on an illustration as simple as possible for easy reading. If dimensions, tolerances and clearances are coded on the illustration, their values must be given on a separate table.

Procedures must describe the workflow of the instructions necessary to be performed to check the item.

Permissible in-service/service-wear tolerances and clearances must be provided.

Procedures must describe the nature and maximum allowable extent of the faults or the pass/fail condition to be detected and provide references to appropriate procedures for corrective action. Refer to [Para 2.4.5.1](#) and [Para 2.4.5.2](#).

If different levels of acceptable serviceability exist they must be covered.

Measurements, clearances and torques which are specific to assembly procedures are not to be mentioned in check procedures.

#### 2.4.5.9 Supplemental data and information

Supplemental information and data provided to support specific examinations, tests or checks can be included in the specific data module it supports or in a separate data module. Separate data modules provided for this purpose can use the same information code as the specific procedure they support and must be referenced in that procedure. This information can include underlying test specifications, re-useable test code, material specifications, etc.

#### 2.4.6 Fault isolation procedures (IC 4YY)

These data modules contain the procedures required to detect malfunctions in the item and to isolate the faulty component or part in order to proceed with its replacement or repair.

In most instances faults, failures and related corrective actions will be covered in the required examinations, tests and checks described in [Para 2.4.5](#) however in some instances additional fault isolation procedures can be required to isolate the fault. When provided, fault isolation procedures are to be complementary to the examinations, tests and checks of [Para 2.4.5](#).

These procedures are also used to provide additional fault determination instructions as necessary to support fault reporting features such as BIT, BITE, fault recording and storage in NVM features, and other sources of fault reporting. Refer to [Para 2.2.3.1](#) for a BIT/BITE logic and functional information. Refer to [Para 2.4.5.6.1](#) for a description of the procedures to use BIT/BITE features. Refer to [Para 2.4.5.6.2](#) for a description of the procedures to use NVM features.

These procedures must be arranged in such a manner that they will progressively isolate and identify each assembly, subassembly or parts. Each fault isolation procedure must contain all operations needed to isolate the fault and must terminate with instructions for correcting it.

Include information for responding to fault codes and maintenance messages including lists of fault codes and maintenance messages with references to the applicable fault isolation or corrective procedure.

When the fault isolation procedures require additional examinations, tests, or checks, these procedures are to be provided in accordance with [Para 2.4.5](#) and referenced in the fault isolation procedure.

Servicing or repair procedures to be performed during the fault isolation process must refer to relevant data modules or to standard practices, except if they are simple (eg, fuse change, filling a reservoir). In these instances the applicable instructions can be given at the applicable step in the fault isolation procedure.

#### 2.4.7 Disconnect, remove and disassemble procedures (IC 5YY)

These data modules contain information to disconnect remove and disassemble an item. They must contain instructions for the disconnection, removal and disassembly of a given piece of equipment or item. All measurement and/or values that are documented prior to an individual action being performed must be described in the applicable step in the instructions. Instructions for features that require special attention such alignment or matched set must be included.

Provide the workflow of the instructions as necessary to gain access with the minimum of disturbance, to disconnect and/or remove other serviceable items and subsequently remove the given item. No unnecessary actions must be carried out such as opening of permanent joints, unsoldering of connections, unless required for maintenance of the item.

Other procedures required prior to disassembly such as cleaning, examination, test, check must be referenced.

If the use of special equipment and tools is not self-explanatory, data modules must provide or reference the data and information for their utilization.

Procedures can be supported by illustrations or sequence charts as required.

#### 2.4.8 Repair instructions (IC 6YY)

These data modules contain detailed repair processes and data required to restore a worn or damaged part to serviceable condition.

Repairs are activities that restore a unit to an approved serviceable condition that is different from the original approved configuration. For instance welding a crack, or build-up and machining of a worn shaft, are "repairs" because the configuration of the resulting part is

different from the original approved configuration. Note that such repairs and altered configurations must still be supported by approved engineering data.

Replacement of a worn bearing, bushing or shaft with an original configuration part or an approved alternate part is not a "repair". These are maintenance activities because they restore the unit to an originally approved configuration and are accomplished using the routine assembly/disassembly procedures.

Inspection (refer to [Para 2.4.4.2](#)), examination, test and check (refer to [Para 2.4.5](#)) and fault isolation procedures (refer to [Para 2.4.6](#)), must identify and quantify the extent of damage to be corrected.

The extent of the damage can be categorized as repairable damage, or non-repairable damage requiring the replacement of the equipment using IC 661 "Permitted damage".

For equipment, most repair procedures will fall under the following information codes:

- Temporary repair procedure (IC 662)
- Standard repair procedure (IC 663)
- Special repair procedure (IC 664)

Temporary repairs, or repairs with life limitations, must be avoided where possible.

Preliminary actions refer to the steps necessary to gain access or prepare the equipment to a state of readiness for the repair activity and must be included in the element [<preliminaryRqmts>](#) of the data module.

Each repair procedure must include illustrations as required to support the procedure. Include illustrations to show specific areas and locations and proximity to features or related items.

Repair procedures must not change the interchangeability of the repaired part or of the assembly when repaired with a repair size part such as a sleeve or a piston in a component. Refer to defined special repair parts such as oversize/undersize parts by part number. Repair parts must be listed in the IPD data module. Refer to [Para 2.5](#).

The procedures and data to locally make items, parts, or equipment must be provided using IC 670.

Repair procedures must include complete work instructions, or reference standard procedures, to perform the described repair. These can include machining, welding, soldering, or other workshop procedures, processes, and specifications as applicable. Include all dimensions, tolerances, finish requirements, chamfers, edge radii, and plating necessary to perform the repair.

Only procedures specific to the item or specific repair procedure must be provided, otherwise, refer to standard practices.

Each repair must be identified. This identifier is not to be changed or reused. A reference between the identifier and the data module code of the procedure to perform the repair must be provided. This identifier will provide a reference to be recorded in the maintenance history of the unit. Some projects can require that the repair identifier be marked on the unit. In this instance repair instructions must include a work step to correctly mark the unit. Simple "How to mark" instructions for the repaired parts must be included in the procedure for simple marking, otherwise refer to relevant data modules or standard practices. This is particularly important for equipment that can be installed on different versions of higher equipment.

If several repairs are applicable to the same part, a table can be provided to select the sequence of instructions so that they are not duplicated unnecessarily. This table must be a data module.

#### 2.4.9 **Assemble, install and connect procedures (IC 7YY)**

These data modules must provide instructions for the assembly, installation and/or connection of the equipment or item. Provide the workflow of the instructions as necessary to assemble, install and/or connect the item including all related instructions and procedures such as checks, assembling, storage fluid replacement, and closing up.

Assembly fits and clearances, adjustments and torque values must be given in the applicable steps. Instructions for features that requires special attention such alignment or matched sets must be included.

If the use of special equipment and tools is not self-explanatory, data modules must provide or reference the data and information for their utilization.

Procedures must be supported by illustrations or flow charts as required.

Provide the step-by-step instructions necessary to secure each part that must be locked when installed on the equipment. Illustrations must be provided to allow the user to visually identify the parts to be locked and the method to be used. Simple locking requirements and procedures can be provided at the applicable procedure step. Complex locking procedures can be provided in separate data module using IC 712.

Procedures for all calibration or tests which cannot be performed after final assembly or which are easier to perform during assembly must be referenced at the applicable step.

Procedures for programming, loading data or installing software that is part of the equipment's configuration must be provided at the applicable assembly step. These instructions can be provided as a separate procedure when appropriate (IC 750 or IC 752). In this case reference to this separate programming or software loading procedure must be given at the applicable step.

Procedures for loading operational or functional software which are not part of the defined configuration of the equipment must be provided as a separate data module (IC 750 or IC 752) and referenced after the unit is completely assembled and configured.

#### 2.4.10 **Storage procedures and data**

Include storage instructions when appropriate. Storage information must include storage time limits for life limited parts and procedures to keep equipment serviceable while in storage. Refer to [Chap 5.2.1.3.5](#) for preparing data modules for storage information.

### 2.5 **Parts information**

Provide at least one IPD data module for any equipment or component that has replaceable component, assemblies, subassemblies or parts. Refer to [Chap 3.9.5.2.7](#).

**Business rule decision point BRDP-S1-00432 - Level of detail to be provided in the IPD data modules in Equipment information sets:**

- Decide what level of detail to provide in the IPD data modules.

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Weapon Loading (WL) information.

## **1.2 Scope**

This chapter covers the rules for the preparation of information applicable to Product Weapon loading which will enable skilled personnel to load and offload munitions and to check the armament systems which are used to control/fire/release. The WL information must contain the following topics:

- basic information
- supplementary information
- loading procedures
- offloading procedures
- loading and offloading procedures checklists
- integrated combat turnaround procedures
- integrated combat turnaround procedures checklists
- cross servicing checklists

## **1.3 Standards and definitions**

### **1.3.1 Standards**

The standards given in this chapter are applicable with no exceptions.

### **1.3.2 Definitions**

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate.

- Accessory: An item which is required to mate the munitions to the Product and which remains as an integral part of the system (eg, pylon, missile launcher and adapter, multiple ejector racks).
- Singular: In this specification the expression "The context of all steps must be singular" means that even if more than one identical action (such as checking that multiple safety pins are fitted) could take place, each action must be a separate step. Do not use a plural step such as "Verify all safety pins are fitted".
- Plural: Similarly to the definition of singular, the expression "The context of all steps must be plural" means that the steps must contain those identical actions applicable to more than one item (such as performing a no-volt test at both holders).

## **2 Weapons loading information**

### **2.1 General**

The complete set of weapons loading data modules is specified in [Para 2.2](#).

### **2.2 Technical content**

#### **2.2.1 Introduction**

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-14-40-00-**NN**A-018Y-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-40-0000-**NN**AAA-018Y-Z (37 characters)

Where "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

### 2.2.2 Data module coding

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-14-4Y-SS-NNY-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-4Y-SS00-NNYYYY-YYYY-Z (37 characters)

Where:

- "14-4Y", are the codes given in [Chap 8.2.1](#).
- "SS", in the unit or assembly code, identifies the store number. "00" identifies all stores, "01" store No. 1, "02" store No. 2, etc.
- "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

### 2.2.3 Basic information

The basic information includes the following descriptions.

#### 2.2.3.1 General

All equipment and munitions, for which loading and offloading procedures information are required, must be described in sufficient detail for loading and offloading purposes.

#### 2.2.3.2 Product description

These data modules must contain descriptive information showing how the concerned Product's systems are made. Their function within the context of munitions loading/offloading must be provided for

- the Product controls
- munitions release or control systems
- any other equipment of direct concern to the loading crews, such as pylons, light and heavy duty ejector release units, adapters

Data modules must be coded:

YY-Y-14-41-00-NNA-040A-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-41-0000-NNAAA-040A-Z (37 characters)

#### 2.2.3.3 Munitions description

These data modules must contain descriptive information regarding how the munitions is made and its function must be provided for all types of munitions and their components approved for loading on the Product. The fuse compatibility for each fused munitions must be shown, specifically identifying those authorized for prefusing and retention of fuse on the munitions while offloading.

Data modules must be coded:

YY-Y-14-41-SS-NNA-040A-C (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-41-SS00-NNAAA-040A-C (37 characters)

- 2.2.3.4 Support equipment (information set) description  
These data modules must contain descriptive information regarding how the support equipment is made and its function must be provided for testers, handling and loading or offloading equipment listed in the required support equipment in the loading/offloading procedures.  
Data modules must be coded:  
YY-Y-YY-YY-YY-00A-040A-C (17 characters)  
thru  
YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-00AAA-040A-C (37 characters)
- 2.2.4 **Supplementary information**  
The supplementary information must contain, as a minimum, the following. Additional information can be defined by the project or the organization.
- 2.2.4.1 General safety requirements  
These data modules must contain general safety requirements pertinent to preparation, handling, loading and offloading of munitions.  
Data modules must be coded:  
YY-Y-14-42-SS-NNA-012A-Z (17 characters)  
thru  
YYYYYYYYYYYYYYY-YYYY-Y14-42-SS00-NNAAA-012A-Z (37 characters)
- 2.2.4.2 Product controls and indicators  
These data modules must illustrate those controls and indicators of the Product used by the loading crew.  
Data modules must be coded:  
YY-Y-YY-YY-YY-YYY-110Y-A (17 characters)  
thru  
YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-110Y-A (37 characters)
- 2.2.4.3 Product preparation  
These data modules must contain all steps required to prepare the basic Product for functional or no-volt tests and munitions loading. A standardized set of steps must be used for all individual munitions loading procedures.  
Data modules must be coded:  
YY-Y-14-42-00-NNA-330Y-A (17 characters)  
thru  
YYYYYYYYYYYYYYY-YYYY-Y14-42-0000-NNAAA-330Y-A (37 characters)
- 2.2.4.4 Emergency procedures  
These data modules must contain emergency procedures related to the authorized munitions and the Product loaded with these munitions; they consist of actions to be taken if munitions are involved in a fire. Procedures must be preceded by a brief explanation of actions to be accomplished by the loading crew. Information containing emergency procedures must be adequately marked and the words "Emergency procedures" must be included in the title.

Data modules must be coded:

YY-Y-14-42-SS-NNA-140Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-42-SS00-NNAAA-140Y-Z (37 characters)

#### 2.2.4.5 Installed accessory preparation

These data modules must contain all procedures to prepare each installed munitions accessory (eg, racks, launchers, pods) for functional tests. It must also contain those procedures required to prepare the accessories for loading the munitions.

Data modules must be coded:

YY-Y-14-42-SS-NNA-330Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-42-SS00-NNAAA-330Y-A (37 characters)

#### 2.2.4.6 Functional tests

These data modules must contain all functional test procedures applicable to the control/release and jettison system or mechanisms for the munitions.

Data modules must be coded:

YY-Y-14-42-SS-NNA-340Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-42-SS00-NNAAA-340Y-A (37 characters)

#### 2.2.4.7 No-volt tests

These data modules must contain all necessary procedures to perform no-volt test of stores control/release and jettison systems or mechanisms for the munitions.

Data modules must be coded:

YY-Y-14-42-SS-NNA-369Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-42-SS00-NNAAA-369Y-A (37 characters)

#### 2.2.4.8 Standard procedures

These data modules must contain general information which is applicable to more than one procedure, operation or step (eg, checking a multi-meter for proper operation, grounding procedures, marking of impulse cartridges).

Each procedure must be assigned an individual data module. The information code must be applicable to the context of the procedure.

Data modules must be coded:

YY-Y-14-42-SS-NNA-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-42-SS00-NNAAA-YYYY-Z (37 characters)

## 2.2.5 Loading procedures

### 2.2.5.1 General procedures

A general data module must be prepared for every authorized munitions, group of munitions, or combination of munitions as applicable. Each one of these data modules must list, in the correct sequence of operations, all the data modules which form a complete loading procedure. The titles of these general data modules must identify the applicable munitions (eg, "Bombs, general purpose, 500-pound MK82 - Snakeye I").

Data modules must be coded:

YY-Y-14-43-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-43-SS00-NNAAA-720Y-A (37 characters)

### 2.2.5.2 Detailed procedures

Detailed loading procedures must be prepared as given in Para 2.2.5.2.1 thru Para 2.2.5.2.9.

Data modules must be coded:

YY-Y-14-43-SS-NNA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-43-SS00-NNAAA-720Y-C (37 characters)

#### 2.2.5.2.1 Munitions preparation

These data modules must include procedures required to inspect and prepare each munitions, including any applicable component. They must include procedures required to assemble and install authorized fuses prior to munitions loading. Procedures must be included to verify the safety of each fused munitions. The context of all steps must be singular.

#### 2.2.5.2.2 Cartridge installation prior to loading

These data modules must include procedures required to install cartridges in those components that must have cartridges installed prior to loading the munitions.

The following steps are applicable:

- 1 Do required no-volt tests.
- 2 Do a test on impulse cartridges for serviceability.
- 3 Install impulse cartridges.

The context of all steps must be plural.

#### 2.2.5.2.3 Loading

These data modules must include procedures required to load the munitions. The context of all steps must be singular.

#### 2.2.5.2.4 Fusing

These data modules must include procedures required to test the prefused munitions and install those fuses that are not authorized to be installed prior to loading munitions. The context of all steps must be singular.

#### 2.2.5.2.5 Postloading

These data modules must include procedures required to ensure the safety and electrical compatibility of the munitions and its accessories. The context of all the steps must be plural.

- 2.2.5.2.6 *Cartridge installation after loading*  
These data modules must include procedures required to install cartridges that must be fitted only after loading the munitions. The following steps are applicable:
- 1 Do required no-volt tests.
  - 2 Do a test on impulse cartridges for serviceability.
  - 3 Install impulse cartridges.
- The context of all steps must be plural.
- 2.2.5.2.7 *Postloading inspection*  
These data modules must include procedures which ensure that all necessary safety devices have been removed or installed as required, bombs and fuses are installed properly, and fuse safety devices have been removed or installed as required. The context of all steps must be plural.
- 2.2.5.2.8 *Delayed operation or alert*  
These data modules must include procedures required to make safe the Product components, munitions and impulse cartridges when the Product is placed on delayed operation or alert. The context of all steps must be plural.
- 2.2.5.2.9 *Immediately prior to launch*  
These data modules must include procedures required to place the safe Product in a launch configuration. The context of all steps must be plural.
- 2.2.5.3 *Specific safety requirements*  
These data modules must contain all specific safety requirements pertaining to the munitions loading procedures.
- Data modules must be coded:
- YY-Y-14-43-SS-NNA-012A-Z (17 characters)
- thru
- YYYYYYYYYYYYYY-YYYY-Y14-43-SS00-NNAAA-012A-Z (37 characters)
- 2.2.5.4 *List of tools and support equipment*  
These data modules must list the special tools and support equipment that are required to accomplish the requirements of the loading procedures and the offloading procedures. Refer to [Para 2.2.5](#) and [Para 2.2.6](#).
- Data modules must be coded:
- YY-Y-14-43-SS-NNA-060A-A (17 characters)
- thru
- YYYYYYYYYYYYYY-YYYY-Y14-43-SS00-NNAAA-060A-A (37 characters)
- 2.2.6 Offloading procedures**
- 2.2.6.1 *General*  
A general data module must be prepared for every authorized munitions, or group of munitions, as applicable. Each one of these data modules must list, in the correct sequence of operations, all the Data Modules which form a complete offloading procedure. The titles of these general Data Modules must identify the applicable munitions (eg, "Bomb", general purpose, 500-pound MK82 - Snakeye I").

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

2.2.6.1.1 *Making safe*

These data modules must include essential procedures required to make the Product munitions safe and to install the required safety devices. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-44-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-720Y-A (37 characters)

2.2.6.1.2 *Pre-offloading*

These data modules must include procedures required to make the Product's munitions safe for offloading. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

2.2.6.1.3 *Fuse removal*

These data modules must include procedures required to make safe and to remove fuse or fuses from the munitions. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

2.2.6.1.4 *Removal of cartridges*

These data modules must include procedures required to remove cartridges from the munitions. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

2.2.6.2 *Offloading*

These data modules must include procedures required to offload the munitions from the Product. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

#### 2.2.6.3 Post-offloading

These data modules must include information on post-offloading actions, such as fitting pylon sole plates, installing dummy cartridges, etc. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

### 2.2.7 Loading and offloading procedure checklists

#### 2.2.7.1 General

The loading and offloading procedure checklists must contain specific safety requirements derived from the original loading/offloading procedures.

Any procedural step that applies only to a specific munitions Product configuration or accessory must be prefixed for identification. Torque values, preset dimensions, orifice identifiers, etc, included in the original procedure must be placed in the checklist.

Paragraph headings used in the checklist must be presented as in the original procedure.

#### 2.2.7.2 Detailed requirements

All required steps must be included for Product preparation and no-volt tests. Steps for other procedures must be kept to a minimum. Steps considered routine actions on the entire Product during loading and offloading procedures and within the capabilities of a trained technician can be omitted. Redundant actions/checks must be omitted. However, to assure maximum safety, separate procedures for each fuse combination must be included under appropriate subordinate headings, when applicable.

Steps must be shortened by the elimination of excess words and by the use of abbreviations so that one-line entries can be utilized to the greatest extent possible, but still be written to ensure ease of reading and interpretation. Steps must follow the same order as they appear in the original procedure and must be numbered in sequence. Warnings and cautions in the original procedure must be included in the checklist. Notes can be included if considered necessary.

Illustrations must be included, if directed by the project.

#### 2.2.7.3 Coding of loading and offloading procedure checklists

The checklist data modules must have the same data module code as its "original" procedure except for the subsection number which must be "5".

Examples, loading procedure:

- "Original" data module code - 1K-A-14-44-03-01A-720A-A
- Checklist data module code - 1K-A-14-45-03-01A-720A-A

### 2.2.8 Integrated combat turnaround procedures

#### 2.2.8.1 General

The integrated combat turnaround procedures are used by qualified personnel to service, maintain and load/offload munitions on the Product under combat or combat training,

turnaround conditions. Procedures must be preceded by a brief explanation of actions to be accomplished by the turnaround crew.

2.2.8.2 Precautionary information

2.2.8.2.1 *General safety requirements*

These data modules must contain safety requirements which apply Product servicing, munitions-loaded Product loading and offloading of munitions.

Data modules must be coded:

YY-Y-14-46-SS-NNA-012A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-012A-A (37 characters)

2.2.8.2.2 *Emergency procedures*

These data modules must be adequately marked and the words "Emergency Procedures" must be included in the title. They must contain all applicable emergency procedures. When more than one type of munitions is included and withdrawal distances differ, emergency procedures data modules must be provided for each type of munitions.

Data modules must be coded:

YY-Y-14-46-SS-NNA-140Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-140Y-A (37 characters)

2.2.8.3 Pre-positioning and munitions preparation

The pre-positioning and munitions preparation data modules must contain information covering tool and support equipment, pre-positioning/inspection and munitions preparation.

2.2.8.3.1 *List of tool and support equipment*

These data modules must list the special tools and support equipment that are required to accomplish an integrated combat turnaround (excluding firefighting and refueling equipment).

Data modules must be coded:

YY-Y-14-46-SS-NNA-060A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-060A-A (37 characters)

2.2.8.3.2 *Pre-positioning/inspection*

These data modules must include the specific requirements for items which need to be positioned and inspected. All steps must be singular.

Data modules must be coded:

YY-Y-14-46-SS-NNA-310Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-310Y-A (37 characters)

2.2.8.3.3 *Munitions preparation*

These data modules must include munitions and pre-loaded launcher inspections for serviceability and safety prior to the Product loading. All steps must be singular.

Data modules must be coded:

YY-Y-14-46-SS-NNA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-720Y-C (37 characters)

2.2.8.4 Product servicing/munitions loading and offloading

2.2.8.4.1 *Cursory inspection*

These data modules must include, as a minimum, the requirement to ensure the Product is secured/safe, operator/ground crew communication has been established, the Product is operational and ammunitions/fuel requirements have been determined prior to Product preparation. All steps must be plural.

Data modules must be coded:

YY-Y-14-46-SS-NNA-280Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-280Y-A (37 characters)

2.2.8.4.2 *Product preparation*

These data modules must include all procedures to ensure the Product is serviceable and is prepared for munitions loading/unloading.

Data modules must be coded:

YY-Y-14-46-SS-00A-330Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-00AAA-330Y-A (37 characters)

2.2.8.4.3 *Munitions offloading*

These data modules must include the requirements to make safe, to remove fuses and to offload munitions from the Product. All steps must be singular.

Data modules must be coded:

YY-Y-14-46-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-520Y-A (37 characters)

2.2.8.4.4 *Gun loading*

These data modules must contain gun loading procedures.

Data modules must be coded:

YY-Y-14-46-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-720Y-A (37 characters)

2.2.8.4.5 *Final cockpit/crew station preparation*

These data modules must include all the procedures to prepare the cockpit/crew station for the Product servicing/munitions loading. These procedures can include towing and positioning of the Product, if applicable. All steps must be singular.

Data modules must be coded:

YY-Y-14-46-SS-00A-120Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-00AAA-120Y-A (37 characters)

**2.2.8.4.6** *Product servicing/munitions preparation*

These data modules must include all the procedures for tank installation, refueling, servicing and loading of munitions. All steps must be singular.

Data modules must be coded:

YY-Y-14-46-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-720Y-A (37 characters)

**2.2.8.4.7** *Final Product preparation*

These data modules must include procedures to ensure safety devices have been removed or installed as required, tools and equipment have been removed, and the Product is ready for operating. All steps must be plural.

Data modules must be coded:

YY-Y-14-46-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-720Y-A (37 characters)

**2.2.8.4.8** *Immediately prior to launch*

These data modules must include all steps required to place the Product in a launch configuration.

Data modules must be coded:

YY-Y-14-46-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-46-SS00-NNAAA-720Y-A (37 characters)

**2.2.9** **Integrated combat turnaround procedure checklists**

The integrated combat turnaround checklists must meet the requirements detailed in [Para 2.2.8.](#) except as specifically noted below.

Paragraph headings used in the checklist must be presented the same as in the integrated combat turnaround procedures.

Data modules must be coded:

YY-Y-14-44-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-44-SS00-NNAAA-520Y-A (37 characters)

**2.2.10** **Cross servicing checklists**

**2.2.10.1** **General**

The cross servicing checklists must include the servicing procedures of the Product which enable the Product to carry out its operational mission.

Applicable to: All

**S1000D-A-05-02-0110-00A-040A-A**

**Chap 5.2.1.10**

The checklists must contain emergency procedures and loading/offloading procedures. Steps must be numbered in sequence under each heading.

All the abbreviations appearing in the checklist, together with the meaning of each, must be listed in alphabetical order.

Illustrations must convey location, if applicable, and dimensional data with tolerance information. The illustrations must be limited to the equipment upon which the tasks must be performed, plus sufficient surroundings to allow a technician to easily locate the equipment item.

Procedural steps that are applicable to a specific item must be prefixed for identification.

#### 2.2.10.2 General safety requirements

These data modules must contain all general safety requirements necessary for preparation, handling, loading and offloading of munitions.

Data modules must be coded:

YY-Y-14-48-SS-NNA-012A-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-012A-A (37 characters)

#### 2.2.10.3 Emergency procedures

These data modules must contain emergency procedures related to munitions loaded Product.

Data modules must be coded:

YY-Y-14-48-SS-NNA-140Y-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-140Y-Z (37 characters)

#### 2.2.10.4 Product general arrangement

These must contain the Product general arrangement in an illustrated form, showing the location of panels and switches used by loading crews.

Data module codes must be coded:

YY-Y-14-48-00-NNA-110Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y14-48-0000-NNAAA-110Y-A (37 characters)

#### 2.2.10.5 Product preparation

These data modules must include procedures which must be accomplished for munitions loading. The steps must give procedures for preparation of the Product and installed accessories for loading and a no-volt check for munitions/accessories as required. A configuration chart depicting authorized loading configuration for the specific munitions will be shown. The steps must include details to make safe any munitions item which might be on the Product prior to no-volt checks, (eg, Make safe missile motors, Disconnect missile igniter cables).

Data modules must be coded:

YY-Y-14-48-00-NNA-330Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-0000-NAAA-330Y-A (37 characters)

2.2.10.6 List of tools and support equipment

These data modules must list the special tools and support equipment that are required to accomplish munitions loading.

Data modules must be coded:

YY-Y-14-48-SS-NNA-060A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NAAA-060A-A (37 characters)

2.2.10.7 Specific safety requirements

These data modules must contain all specific safety requirements pertaining to the munitions loading procedures of the specific munitions.

Data modules must be coded:

YY-Y-14-48-SS-NNA-012A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNA-012A-A (37 characters)

2.2.10.8 Loading procedures

2.2.10.8.1 *Munitions preparation*

These data modules must include procedures for each single munitions and pre-loaded accessory, it must include steps required to assemble and install authorized fuses prior to munitions loading. Procedures must be included to verify the safety of each fused munitions. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NAAA-720Y-C (37 characters)

2.2.10.8.2 *Cartridge installation prior to loading*

These data modules must include steps required to check and install impulse cartridges in those accessories that must have cartridges installed prior to loading munitions. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NAAA-720Y-C (37 characters)

2.2.10.8.3 *Loading*

These data modules must include steps required to load the munitions. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-720Y-A (37 characters)

2.2.10.8.4 *Fusing*

These data modules must include steps required to test pre-fused munitions and/or install those fuses that are not authorized to be installed prior to loading munitions. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-720Y-A (37 characters)

2.2.10.8.5 *Cartridge installation*

These data modules must include procedures required to test impulse cartridges for serviceability and to properly install cartridges in all accessories as required. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-720Y-C (37 characters)

2.2.10.8.6 *Post-loading inspection*

These data modules must include steps required to ensure that accessory safety devices are installed. Bombs and fuses are installed as required and fuse safety devices have been removed or installed as required. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-720Y-C (37 characters)

2.2.10.9 *Offloading procedures*

2.2.10.9.1 *Making safe*

These data modules must include essential steps required to make safe the Material/munitions and the installed associated safety devices. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-48-SS-NNA-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-720Y-A (37 characters)

2.2.10.9.2 *Pre-offloading*

These data modules must include procedures required to make the Product safe for offloading. All steps required making the Product/munitions safe must be repeated in these procedures. The context of all steps must be plural.

Applicable to: All

S1000D-A-05-02-0110-00A-040A-A

Chap 5.2.1.10

Data modules must be coded:

YY-Y-14-48-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-520Y-A (37 characters)

#### 2.2.10.9.3 *Fuse removal*

These data modules must include procedures required to make safe and to remove the fuses from the munitions. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-48-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-520Y-A (37 characters)

#### 2.2.10.9.4 *Offloading*

These data modules must include procedures required to offload the munitions from the Product. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-48-SS-NNA-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-48-SS00-NNAAA-520Y-A (37 characters)

## **1 General**

### **1.1 Purpose**

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for the Product Cargo Loading (CL) information.

### **1.2 Scope**

It covers the rules for the preparation of information applicable to cargo loading which will enable skilled personnel to do the load planning and the loading/offloading of the Product equipped for carrying cargo. The CL information must contain the following topics:

- Cargo
- The Product-general
- Load planning
- Loading/Offloading

Applicable to: All

**S1000D-A-05-02-0111-00A-040A-A**

**Chap 5.2.1.11**

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Cargo loading information

### 2.1 General

#### 2.1.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the Information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-14-20-00-NNY-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-20-0000-NNYYY-018Y-A (37 characters)

"NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different Information sets.

#### 2.1.2 Data module coding

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-14-2X-00-NNY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-2X-0000-NNYYY-YYYY-A (37 characters)

Where:

- "14-2X", the codes are given in [Chap 8.2](#). According to the nature of the information given, the CL information is further subdivided into subsections as follows:
  - 14-20 - Cargo
  - 14-21 - Product general
  - 14-22 - Load planning
  - 14-23 - Loading/Offloading procedures
- "NN", the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

## 2.2 Technical content

### 2.2.1 Cargo

These data modules must give a general description of cargo planning, loading and off loading and provides an introduction to the successive information.

Data modules must be coded:

YY-Y-14-20-00-NNY-040Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-20-0000-NNYYY-040Y-A (37 characters)

### 2.2.2 The Product general

These data modules must provide the general data required for loading/offloading of the Product. Information must include, but is not limited to, the following context:

- General
- Dimensions and areas
  - compartment sizes and layout
  - door sizes
- Location and strength of tie-down points
- Safety precautions.

Data modules must be coded:

YY-Y-14-21-00-NNY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYYY-YYYY-Y14-21-0000-NNYYYY-YYYY-A (37 characters)

### 2.2.3 Load planning

These data models must provide the data required for planning the loading and offloading of the Product, and the distribution of cargo mass in the compartments of the Product. Information must include, but is not limited to, the following context:

- General
- Compartment loading:
  - General description
  - Maximum allowed floor loads
  - Maximum allowed integrated loading
  - Maximum package dimensions
- Equipments required to load/offload the cargo:
  - General (description)
  - Types of lashing devices
  - Types of containers/pallets etc
  - Conveyance systems - latches, splitters, guides etc
  - Types of tie down devices
- Center of gravity limits:
  - Operation (eg, takeoff, flight and landing)
  - Tipping limits
  - Determination of the center of gravity location
  - Permissible range of container/pallet load center of gravity
- Mass and balance limits
- Methods of stowing and securing:
  - General
  - Bulk loading
  - Required restraint
  - Effective restraint
  - Required number of tie down devices
  - Container/pallet loading:
    - Operation of conveyance systems/pallet loading systems equipments

- Maximum pallet loads
- Securing the pallet load

Data modules must be coded:

YY-Y-14-22-00-NNY-YYYY-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-22-0000-NNYYY-YYYY-A (37 characters)

#### 2.2.4 Loading/Offloading

These data modules must provide the data required for carrying out the loading and offloading. Information must include, but is not limited to, the following context:

- preparation of the Product for loading/offloading
- door operating instructions
- installation of lashing devices
- installation of tie down devices
- conveyance system operating instructions
- loading and securing containers/pallets etc
- loading ramp operating instructions
- examples of loading techniques

Data modules must be coded:

YY-Y-14-23-00-NNY-160Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-23-0000-NNYYY-160Y-A (37 characters)

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Product Stores Loading (SL) information.

### 1.2 Scope

It covers the rules for the preparation of information applicable to stores loading which will enable personnel, who can be unfamiliar with the specific Product, to safely load or offload non-munitions stores (such as external fuel tanks, reconnaissance packs, etc) which form part of the configuration of the Product. The SL information must contain the following topics:

- basic information
- supplementary information
- loading procedures
- offloading procedures
- loading and offloading procedures checklists

### 1.3 Standards and definitions

#### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

#### 1.3.2 Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate:

- Singular: In this specification the expression "The context of all steps must be singular" means that even if more than one identical action (such as checking that multiple safety pins are fitted) could take place, each action must be a separate step. Do not use a plural step such as "Verify all safety pins are fitted".
- Plural: Similarly to the definition of singular, the expression "The context of all steps must be plural" means that the steps must contain those identical actions applicable to more than one item (such as performing a no-volt test at both holders).

## 2 Stores loading information

### 2.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-14-30-00-NNY-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-30-0000-NNYYY-018Y-A (37 characters)

Where "NN", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.

The information code variant is used to distinguish between the different information sets.

## 2.2 Data module coding

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-14-3X-SS-NNY-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-3X-SS00-NNYYY-YYYY-Z (37 characters)

Where:

- "14-3X", the codes given in [Chap 8.2](#). According to the nature of the information given, the store loading information is further subdivided into subsections as follows:
  - 14-31 - Basic information
  - 14-32 - Supplementary information
  - 14-33 - Loading procedures
  - 14-34 - Offloading procedures
  - 14-35 - Loading and offloading procedure checklists
- "SS", in the subject code, identifies the store number. "00" identifies all stores, "01" store No. 1. "02" store No. 2 etc.
- "NN", in the Disassembly code, is a sequential number starting from "00", if more than one data module is needed. For instance, in a loading procedure, the following data modules could apply to "Store 04": Store preparation (DC 01), Cartridge installation (DC 02), Store loading (DC 03), Post loading (DC 04), etc.
- "Z" is the item location code. Refer to [Chap 4.3.8](#).

## 2.3 Basic information

### 2.3.1 General

All equipment and stores, for which loading and offloading procedures information are required, must be described in sufficient detail for loading and offloading purposes.

### 2.3.2 Product description

These data modules must contain descriptive information showing how the concerned Product systems are made. Their function within the context of stores loading/offloading must be provided for:

- Product controls
- stores release or control systems
- any other equipment of direct concern to the loading crews, such as pylons, light and heavy duty ejector release units, adapters

Data modules must be coded:

YY-Y-14-31-00-NNY-040Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-31-0000-NNYYY-040Y-A (37 characters)

### 2.3.3 Stores description

These data modules must contain descriptive information regarding how the store is made and its function must be provided for all types of stores and their components approved for loading on the Product.

Data modules must be coded:

YY-Y-14-31-SS-NNY-040Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-31-SS00-NNYYY-040Y-C (37 characters)

### 2.3.4 Support equipment description

These data modules must contain descriptive information regarding how the support equipment is made and its function must be provided for testers, handling and loading or offloading equipment listed in the "Tools and equipment lists" in the loading/offloading procedures.

Data modules must be coded:

YY-Y-AA-YY-YY-00Y-040Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YAA-YY-YYYY-00YYY-040Y-C (37 characters)

### 2.3.5 Supplementary information

This must contain, as a minimum, the following. Additional information can be defined by the project or the organization

### 2.3.6 General safety requirements

These data modules must contain general safety requirements pertinent to preparation, handling, loading and offloading of stores.

Data modules must be coded:

YY-Y-14-32-SS-NNY-012Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-SS00-NNYYY-012Y-Z (37 characters)

### 2.3.7 Product controls and indicators

These data modules must illustrate those controls and indicators of the Product used by the loading crew.

Data modules must be coded:

YY-Y-YY-YY-YY-YYY-110Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-YYY-YY-YYYY-YYYYY-110Y-A (37 characters)

**2.3.8 Product preparation**

These data modules must contain all procedures required to prepare the basic Product for functional or no-volt tests and stores loading. A standardized set of steps must be used for all individual stores loading procedures.

Data modules must be coded:

YY-Y-14-32-00-NNY-330Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-0000-NNYYY-330Y-A (37 characters)

**2.3.9 Emergency procedures**

These data modules must contain emergency procedures related to the authorized stores and the Product loaded with these stores. The data modules consist of actions to be taken if stores are involved in a fire, for example. Procedures must be preceded by a brief explanation of actions to be accomplished by the loading crew. Information containing emergency procedures must be adequately marked and the words "Emergency procedures" must be included in the title.

Data modules must be coded:

YY-Y-14-32-SS-NNY-140Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-SS00-NNYYY-140Y-Z (37 characters)

**2.3.10 Installed accessory preparation**

These data modules must contain all procedures to prepare each installed store accessory (eg, light/heavy duty ejector release units, pods, for functional tests). It must also contain those procedures required to prepare the accessories for loading the stores.

Data modules must be coded:

YY-Y-14-32-SS-NNY-330Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-SS00-NNYYY-330Y-A (37 characters)

**2.3.11 Functional tests**

These data modules must contain all functional test procedures applicable to the control/release and jettison system or mechanisms for the stores.

Data modules must be coded:

YY-Y-14-32-SS-NNY-340Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-SS00-NNYYY-340Y-A (37 characters)

**2.3.12 No-volt tests**

These data modules must contain all necessary procedures to perform no-volt test of stores control/release and jettison systems.

Data modules must be coded:

YY-Y-14-32-SS-NNY-369Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-SS00-NNYY-369Y-A (37 characters)

### 2.3.13 Standard procedures

These data modules must contain general information which is applicable to more than one procedure, operation or step (eg, checking a multi-meter for proper operation), Product grounding procedures, marking of impulse cartridges.

Each procedure must be assigned an individual data module. The information code must be applicable to the context of the procedure.

Data modules must be coded:

YY-Y-14-32-SS-NNY-YYYY-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-32-SS00-NNYYY-YYYY-Z (37 characters)

## 2.4 Loading procedures

### 2.4.1 General

A general data module must be prepared for every authorized store, group of stores, or combination of stores as applicable. Each one of these data modules must list, in the correct sequence of operations, all the data modules which form a complete loading procedure. The titles of these general data modules must identify the applicable store or stores (eg, "Conformal long range fuel tank with externally mounted infrared reconnaissance pack").

Data modules must be coded:

YY-Y-14-33-SS-NNY-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-A (37 characters)

#### 2.4.1.1 Stores preparation

These data modules must include procedures required to inspect and prepare each store, including any applicable component. Procedures must be included to verify the safety of each store. The context of all steps must be singular.

If separate data modules are needed these must be coded:

YY-Y-14-33-SS-NNYA-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-C (37 characters)

#### 2.4.1.2 Cartridge installation prior to loading

These data modules must include procedures required to install cartridges in those components that must have cartridges installed prior to loading the stores.

The following steps are applicable:

- 1 Do required no-volt tests.
- 2 Do a test on impulse cartridges for serviceability.

### 3 Install impulse cartridges.

The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-33-SS-NNY-720Y-C (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-C (37 characters)

#### 2.4.1.3 Loading

These data modules must include procedures required to load the stores. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-33-SS-NNY-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-A (37 characters)

#### 2.4.1.4 Post loading

These data modules must include procedures required to ensure the safety and electrical compatibility of the stores and its accessories. The context of all the steps must be plural.

Data modules must be coded:

YY-Y-14-33-SS-NNY-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-A (37 characters)

#### 2.4.1.5 Post loading inspection

These data modules must include procedures which ensure that all necessary safety devices have been removed or installed as required, and which verify that stores are installed properly. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-33-SS-NNY-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-A (37 characters)

#### 2.4.1.6 Immediately prior to launch

These data modules must include procedures required to place the air vehicles in a launch configuration. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-33-SS-NNY-720Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-720Y-A (37 characters)

#### 2.4.2 Specific safety requirements

These data modules must contain all specific safety requirements pertaining to the stores loading procedures.

Data modules must be coded:

YY-Y-14-33-SS-NNY-120Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-120Y-A (37 characters)

#### 2.4.3 List of tools and support equipment

These data modules must list the special tools and support equipment that are required to accomplish the requirements of the loading procedures and the offloading procedures. Refer to [Para 2.4](#) and [Para 2.5](#).

Data modules must be coded:

YY-Y-14-33-SS-NNY-060Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-33-SS00-NNYYY-060Y-A (37 characters)

### 2.5 Offloading procedures

#### 2.5.1 General

A general data module must be prepared for every authorized store, or group of stores, as applicable. Each one of these data modules must list, in the correct sequence of operations, all the data modules which form a complete offloading procedure. The titles of these general data modules must identify the applicable store or stores (eg, "Conformal long range fuel tank with externally mounted infrared reconnaissance pack").

Data modules must be coded:

YY-Y-14-34-SS-NNY-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-34-SS00-NNYYY-520Y-A (37 characters)

##### 2.5.1.1 Pre-offloading

These data modules must include procedures required to prepare the Product stores for offloading. The context of all steps must be plural.

Data modules must be coded:

YY-Y-14-34-SS-NNY-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-34-SS00-NNYYY-520Y-A (37 characters)

##### 2.5.1.2 Removal of cartridges

These data modules must include procedures required to remove cartridges from stores. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-34-SS-NNY-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-34-SS00-NNYYY-520Y-A (37 characters)

## 2.5.2 Offloading

These data modules must include procedures required to offload the stores from the Product. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-34-SS-NNY-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-34-SS00-NNYYY-520Y-A (37 characters)

## 2.5.3 Post-offloading

These data modules must include information on post-offloading actions, such as fitting pylon sole plates, installing dummy cartridges, etc. The context of all steps must be singular.

Data modules must be coded:

YY-Y-14-34-SS-NNY-520Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y14-34-SS00-NNYYY-520Y-A (37 characters)

## 2.6 Loading and offloading procedure checklists

### 2.6.1 General

If loading and offloading procedure checklists are required by the project, the following apply:

- The loading and offloading procedure checklists must contain specific safety requirements derived from the original loading/offloading procedures.
- Any procedural step that applies only to a specific store, Product configuration, or accessory must be prefixed for identification. Torque values, preset dimensions, orifice identifiers, etc, included in the original loading procedure must be placed in the checklist.
- Paragraph headings used in the checklist must be presented as in the original procedure.

### 2.6.2 Detailed requirements

All required steps must be included for the Product preparation and no-volt tests. Steps for other procedures must be kept to a minimum. Steps considered routine actions on the Product during loading and offloading procedures and within the capabilities of a trained technician can be omitted. Redundant actions/checks must be omitted. However, to assure maximum safety, separate procedures must be included under appropriate subordinate headings, when applicable.

Steps must be shortened by the elimination of excess words and by the use of abbreviations so that one-line entries can be utilized to the greatest extent possible, but still be written to ensure ease of reading and interpretation. Steps must follow the same order as they appear in the original procedure and must be numbered in sequence. Warnings and cautions in the original procedure must be included in the checklist. Notes can be included if considered necessary.

Illustrations must be included if directed by the project.

---

**2.6.3 Coding of loading and offloading procedure checklists**

The checklist data modules must have the same data module code as its "original" procedure except for the section number which must be "35".

Examples:

- "Original" data module code - 1K-B-14-34-03-01A-720A-A
- Checklist data module code - 1K-B-14-35-03-01A-720A-A

Chap No./Document No.	Title
<a href="#">Chap 4.3</a>	Information management - Data module code
<a href="#">Chap 8.2</a>	SNS, information and learn codes - Maintained

## **1 General**

### **1.1 Purpose**

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Product Role Change (RC) information.

### **1.2 Scope**

It covers the rules for the preparation of information applicable to Product Role change which will enable skilled maintenance personnel to change the role of the Product.

The RC information set must cover the following topics:

- Change of role - General
- Role change lists
- Role change procedures
- First installation procedures

### 1.3 Standards and definitions

The standards and definitions given in this chapter are applicable with no exceptions.

## 2 Role change information

### 2.1 Introduction

If required, the introduction data modules must contain explanation of the purpose, scope, structure, special format and use of the technical content of the information set. They must also contain any necessary information of a general nature which is not detailed in any of the specific data modules.

Data modules must be coded:

YY-Y-16-00-00-**NN**A-018Y-A (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y16-00-0000-**NN**AAA-018Y-A (37 characters)

Where "**NN**", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The information code variant is used to distinguish between the different information sets.

### 2.2 Data module coding

To assist in the codification of data modules, the rules which follow must be used in addition to those given in [Chap 4.3](#).

Data modules must be coded:

YY-Y-**16-XX**-00-**NN**A-YYY-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y**16-XX**-0000-**NN**AAA-YYY-Z (37 characters)

Where:

- "**16-XX**", the codes are given in [Chap 8.2](#). According to the nature of the information given, the role change information is further subdivided into subsections as follows:
  - 16-00 - Change of role - General
  - 16-11 - Role change lists
  - 16-12 - Role change procedures
  - 16-13 - First installation procedures
- "**NN**", in the disassembly code, is a sequential number starting from "00", if more than one data module is needed.
- "**YYY**", in the information code, must be those given below.

#### Note

Where data modules are already written they can be reused as part of a procedure to achieve the change of role, rather than writing new data modules with an SNS of 16-12-YY.

### 2.3 Change of role - General

These data modules must contain the definition of each role. All the components and equipment necessary to make up the required configuration must be listed. The special support equipment and/or specific materials necessary to carry out the change of role must also be included.

Data modules must be coded:

YY-Y-16-00-00-NNA-XXXY-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y16-00-0000-NNAAA-XXXY-Z (37 characters)

Where "XXX", in the information code, must be:

- 000 - General
- 060 - Support equipment, tools and software
- 070 - Consumables, material and expendables

## 2.4 Role change lists

These data modules must detail the different roles of the Product and must list, in a logical sequence, the procedures to be done to achieve the desired configuration (refer to [Table 1](#)). Each list must contain the references to the relevant role change procedures in System 16-12 (eg, passenger-to-freighter, strike-to-trainer). Each role must be illustrated.

For Products with a large number of roles (eg, military air vehicle with multiple-mission roles), the work packages must be listed in matrix format (refer to [Table 3](#)). All of these roles must be illustrated.

Data modules must be coded:

YY-Y-16-11-00-NNA-000A-Z (17 characters)

thru

YYYYYYYYYYYYYY-YYYY-Y16-11-0000-NNAAA-000A-Z (37 characters)

*Table 2 Role change list - Passenger-to-freighter, example*

Role change procedures	Data module
Preparation	F9-A-16-12-00-00A-000A-A
Removal of curtains and curtain rails	F9-A-16-12-00-01A-000A-A
Removal of cabin attendant seats equipment stowages	F9-A-16-12-00-02A-000A-A
Removal of partitions	F9-A-16-12-00-03A-000A-A
Removal of passenger seats	F9-A-16-12-00-04A-000A-A
Removal of carpets	F9-A-16-12-00-05A-000A-A
Removal of galley and toilet	F9-A-16-12-00-06A-000A-A
Removal of non-textile floor covering	F9-A-16-12-00-07A-000A-A
Removal of passenger service units	F9-A-16-12-00-08A-000A-A
Removal of overhead stowage compartments	F9-A-16-12-00-09A-000A-A
Removal of overhead stowage compartments supports	F9-A-16-12-00-10A-000A-A
Installation of cargo handling system	F9-A-16-12-00-11A-000A-A
Installation of the winch	F9-A-16-12-00-12A-000A-A
Adjustment/test and close-up	F9-A-16-12-00-13A-000A-A

## 2.5 Role change procedures

These data modules must contain the individual procedures to cover all changes from any role to any other role. Preparation, removal, installation, adjustment and test are examples of procedures to be included.

Cross-references to applicable data modules or data in the Product maintenance, weapon loading or stores loading information sets must be made, wherever possible. Data on those items to be reused, discarded or stored must also be included.

Data modules must be coded:

YY-Y-16-12-00-NNA-**XXXX**A-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y16-12-0000-NNA**AAA**-**XXXX**A-Z (37 characters)

Where "**XXX**", in the information code, must be:

- 120 - Preparation
- 270 - Adjustment
- 300 - Test
- 500 - Removal
- 700 - Installation

Table 3 Role change matrix to configuration "A", example

Data module	Description	B	C	D	E	F	G	H	I
G6-A-16-12-00-00A-120A-A	Preparation	X	X	X	X		X		
G6-A-YY-YY-YY-YYA-500A-A	Remove passenger seats	X		X	X	X		X	X
See note									
G6-A-16-12-00-10A-500A-A	Remove overhead stowage compartment supports		X	X		X	X	X	
G6-A-16-12-00-17A-700A-A	Install protective covers	X		X		X		X	
G6-A-16-12-00-26A-700A-A	Install ZZZZ	X	X		X	X		X	
G6-A-16-12-00-43A-700A-A	Install VVVVV	X	X	X	X		X	X	

### Note

In this example, the procedure for the removal of the passenger seats is written as an existing procedure, where the SNS (YYY-YY-YY) is the SNS for the passenger seats.

## 2.6 First installation procedures

These data modules must detail all procedures necessary to prepare units for the first installation, ie where assemblies must be assembled from delivered items and thereafter removed/installed as a complete unit.

Data modules must be coded:

YY-Y-16-13-00-NNA-710Y-Z (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y16-13-0000-NNA**AAA**-710Y-Z (37 characters)

## 1 General

### 1.1 Purpose

This chapter contains the rules for the preparation and coding, where appropriate, of data modules for Battle Damage Assessment and Repair (BDAR) information. Rules for preparation of page-oriented BDAR Publications (BDARP) and interactive BDARP are also given.

### 1.2 Scope

It covers the rules for the preparation of specific-to-type information applicable to Product battle damage assessment and repair, which will enable skilled maintenance personnel to assess and repair the Product. These data must sufficiently describe the information and data necessary to:

- mark the damaged zones or items
- access to the damaged area
- assess the damage
- decide on the action to be carried out (to repair, to isolate, to leave in damage state) taking its impact on the operation/mission into account
- repair or isolate items
- ensure, as required, the efficiency of the actions (function tests)
- be fully aware of the content of the battle damage repair kit

### 1.3 Standards and definitions

#### 1.3.1 Standards

The standards given in this chapter are applicable with no exceptions.

In addition the following guidelines must be used:

- To identify data and information which are common on different positions, the information code variant must be used and the title of the data module must describe the position
- The item subject to BDAR data/information must use the same hardware coding as used in other data modules in the CSDB as defined in [Chap 4.3](#)

In exceptional cases where the data/information cannot be allocated to a defined hardware, then system code 00-90 must be used, especially for first identification and assessment of zones, which contain more than one hardware system (where "system" could be the product frame for example).

### 1.3.2

#### Definitions

The following definitions and those stated in [Chap 9.2](#) must be used as appropriate:

- **Alternative material** - Material which can be used for the battle damage repair of an item and which has an ultimate tensile strength equal to or greater than the original
- **As received damage** - Designates battle damage on a specific Product in the original condition
- **Battle Damage Repair (BDR)** - The repair of battle damage on the Product within a maximum elapsed time defined by the project or the organization in order to restore it to a condition which will allow it to fulfill the requirements of at least one mission (operation, for example, for air vehicle a ferry flight)
- **Battle damage repair kit** - A kit containing tools, test equipment, expendables, materials, etc, necessary to perform BDR in autonomous conditions on a battlefield
- **Cleaned out damage** - Designates battle damage on the Product that has been trimmed to a regular shape
- **Component function ability, imperative** - The function of a component is imperative if its destruction or isolation prohibits any utilization of the product frame or engine
- **Component function ability, optional** - The function of a component is optional if its destruction or isolation does not affect the operation of the product frame or engine. It can however affect the information shown to the operator (eg, oil pressure indication).
- **Component function ability, performance** - The function of a component is performance if its destruction or isolation implies restrictions on the performance of the product frame or engine or one of their systems
- **Fire or overheat damage** - Damage caused by burning combustibles, hot gas leakage and/or burning munitions
- **Minimum undamaged edge distance** - The minimum acceptable distance between the edge of the damage area and the nearest load input point, for instance the centerline of the nearest integral rib or fastener line
- **Structural damage, category 1** - Damage on load bearing items that can be tolerated and cannot be repaired or replaced in BDR conditions. This damage is less than the specified limit and has no effect on the ability of the Product to complete at least one mission. Tolerated damage requires only clean-out or stop drilling of cracks.
- **Structural damage, category 2** - Damage on load bearing items that must be repaired or replaced when damage exceeds the specified limit
- **Structural damage, category 3** - Damage on items that are not loads bearing but which need repair for aerodynamic reasons or to seal the structure
- **Structural damage limit, penetration** - Damage caused by penetration of a projectile
- **Structural damage limit, fragmentation** - Damage caused by the explosion of a missile or shrapnel
- **Substitute material** - A material which has less ultimate tensile strength than the original but which can be used for the BDR of an item by adapting it
- **Product frame** - Term designating the whole Product without engine

## 2 Battle damage assessment and repair information

### 2.1 Technical content

#### 2.1.1 General requirements

The BDAR information is intended for battlefield/combat environments. Therefore it must be self-standing. There must be no reference to other publications, other than a general BDR publication and no requirement for special tools or special support equipment. BDR must be supported by a BDR kit. Refer to [Para 2.1.9](#).

Additional information for wiring harnesses can be given. Refer to [Para 2.1.5.7](#).

In this chapter:

- the information is applicable to the entire Product unless it is required for the product frame or engine specifically
- "SS" represents the coding of a zone in a data module (zone for a product frame, assembly/module for an engine)

#### 2.1.2 Introduction

The introduction data modules contain explanations of the purpose, scope, structure, special format and use of the technical content of the BDAR information set. They also contain any necessary information of a general nature that is not detailed in any of the specific data modules.

Example content of an introduction data module:

- The zone concept used for the product frame and engine
- How to find data/information in the BDAR publication
- How to use the BDAR publication

Use of illustrations and/or diagrams is preferred. Refer to [Fig 1](#).

The introduction must be prepared in three separate data modules:

- 1 Information common for product frame and engine
- 2 Information specific for the product frame
- 3 Information specific for the engine

This allows the publication to be separated into product frame and engine BDAR information if required by the project or the organization. A note must be given in the introduction.

#### **Business rule decision point BRDP-S1-00433 - Separation of product frame and engine BDAR information in the BDARP:**

- Decide whether to separate the BDARP into product frame and engine BDAR information.

If a general BDR publication is jointly used with the BDAR publication, its reference and purpose must be given in the introduction.

Data modules must be coded:

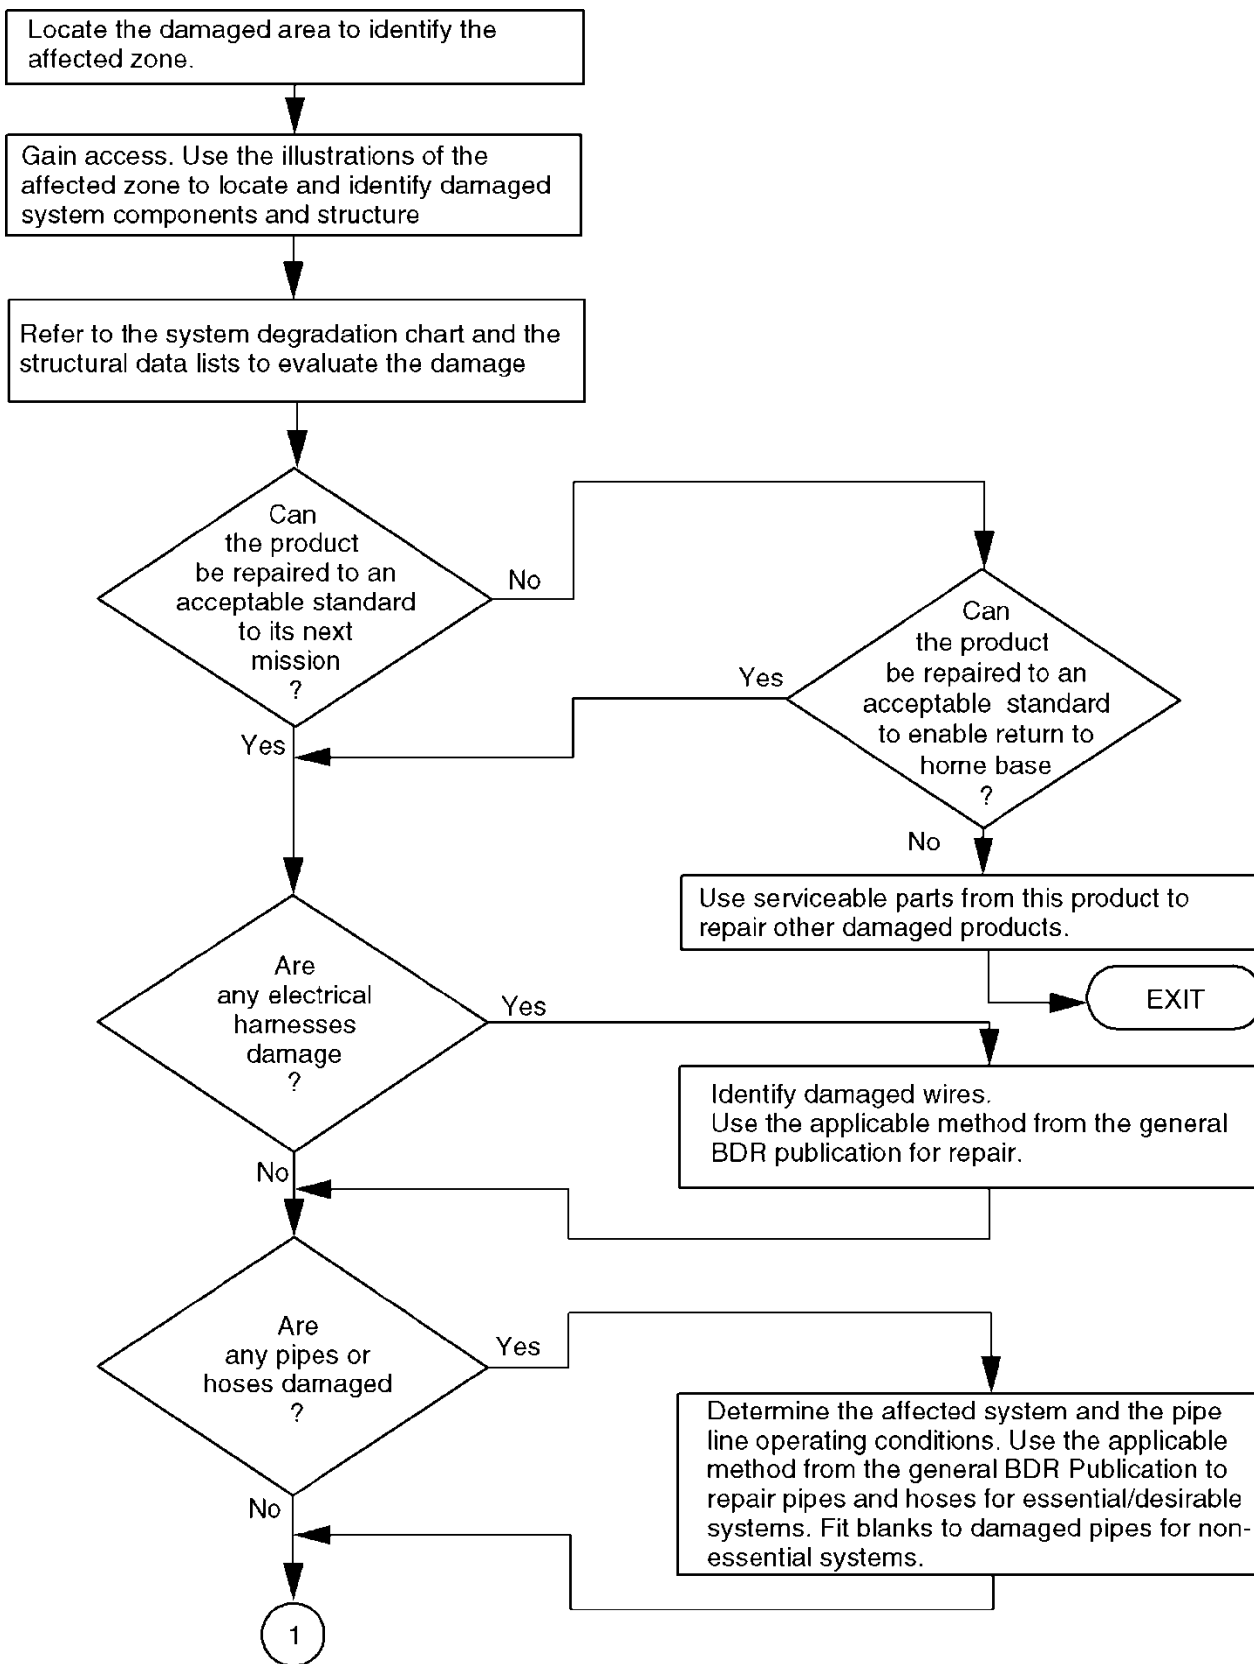

YY-Y-00-90-00-**NNA**-018Y-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-90-0000-**NNAAA**-018Y-A (37 characters)

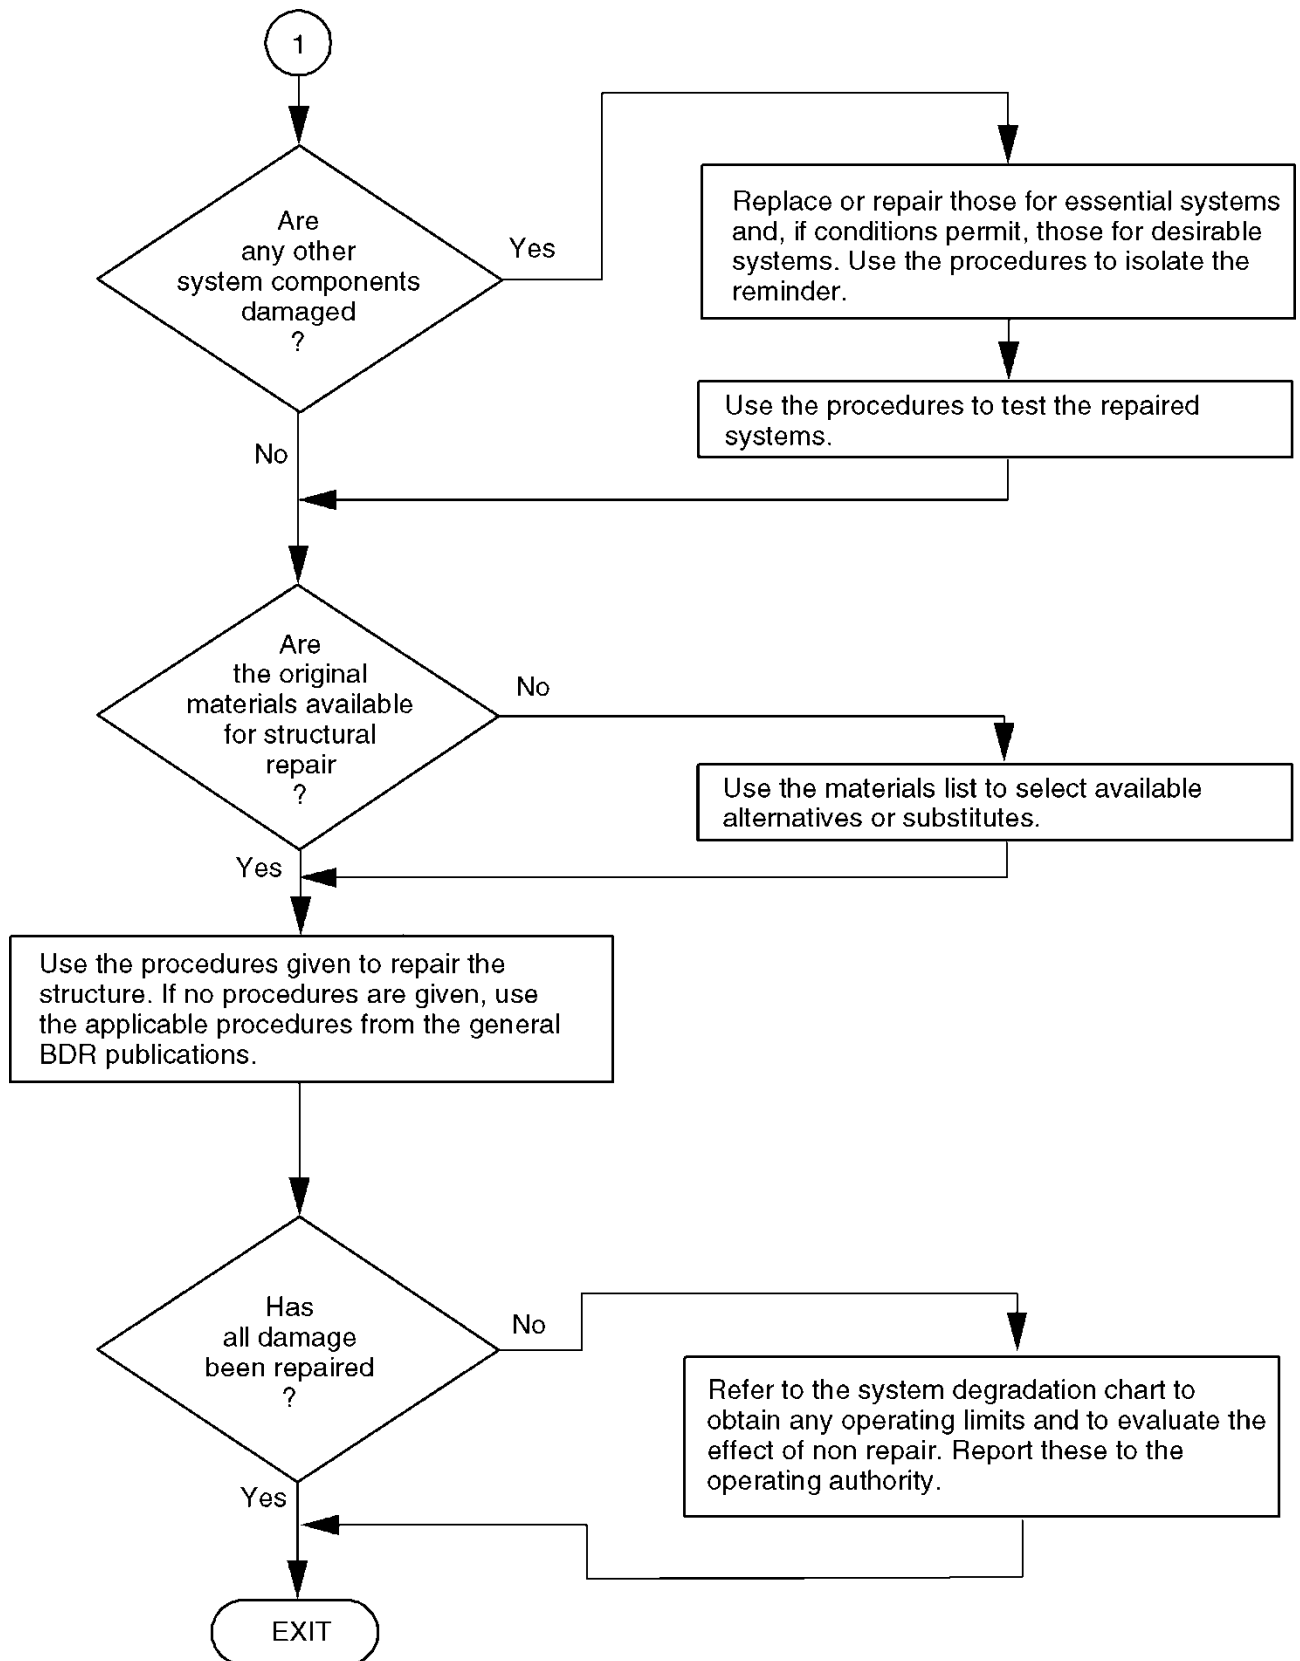

where "NN", in the disassembly code, is a sequential number starting from "00" if more than one data module is needed

The information code variant is used to distinguish between the different publications.

ICN-S3627-S1000D0355-002-01

Fig 1 Flow chart on "How to use the page-oriented publication" (Sheet 1 of 2)

ICN-S3627-S1000D0356-002-01

Fig 1 Flow chart on "How to use the page-oriented publication" (Sheet 2 of 2)

## 2.1.3 Damage repair symbol marking

### Note

If the content described under this heading is available in an existing general BDR publication, BDAR procedures refer to the relevant data modules contained in the general BDR publication.

Damage repair symbol marking data modules (information code 681) provide the rules and symbols that must be used to clearly mark the damaged zones, areas, components and parts. The information is further broken down into marking of structure and marking of systems as follows.

### 2.1.3.1 Marking of structures

These data modules describe the symbols, codes and colors that must be used to mark the structure of the product frame or the engine, the category of damage (refer to [Para 2.1.5.2](#)) and the type of action to be performed on the damaged area following the damage assessment.

Data modules must be coded:

YY-Y-00-90-00-00A-681A-A (17 characters)

thru

YYYYYYYYYYYYYYY-YYYY-Y00-90-0000-00AAA-681A-A (37 characters)

### 2.1.3.2 Marking of systems

These data modules describe:

- the tags, stickers and their colors
- the symbols and codes

These are used to mark a system or a component and the action that must be performed following the damage assessment.

Data modules must be coded:
